Request body parameters (JSON) (continued)

Name	Description

	`"id": "String",`
	`"internalId": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`
	`]`

serviceSpecification.id	Initial version or external ID of the service specification. Data type: String Table: In the sys_id or external_id field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalId	Initial version of the service specification. Data type: String Table: In the initial_version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalVersion	Version of the service specification. Data type: String Table: In the version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.name	Name of the service specification. Data type: String Table: Service Specification [sn_prd_pm_service_specification]
serviceSpecification.version	External version of the service specification. Data type: String Table: In the external_version field of the Service Specification [sn_prd_pm_service_specification] table.

validFor	Required. Date range the specification is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`"endDateTime": "String",`
	`"startDateTime": "String"`
	`}`

validFor.endDateTime	End date and time of the specification.

Request body parameters (JSON) (continued)

Name	Description
	Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
validFor.startDateTime	Start date and time of the specification. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
version	External version of the product specification. Data type: String Table: In the external_version field of the Product Specification [sn_prd_pm_product_specification] table.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad request. Possible reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• Empty payload. • Invalid payload. Mandatory field missing: <field name>
404	Not found. The requested item wasn't found.

Response body parameters

Name	Description
description	Description of the specification. Data type: String
href	Relative link to the resource record. Data type: String
id	Sys_id or external ID of the product specification. Data type: String Table: In the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table.
internalId	Required. Sys_id or internal ID of the product specification. Data type: String Table: In the initial_version field of the Product Specification [sn_prd_pm_product_specification] table.
internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Specification [sn_prd_pm_product_specification] table.
lastUpdate	Date the specification was last updated. Format: YYYY-MM-DD 00:00:00. Data type: String
name	Name of the specification. Data type: String
productSpecCharacteristic	Characteristics of the specification.

Name	Description
	Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array], "validFor": {Object}, "valueType": "String" } ]`
productSpecCharacteristic.description	Description of the characteristic. Data type: String
productSpecCharacteristic.name	Name of the characteristic. Data type: String
productSpecCharacteristic. productSpecCharacteristicValue	List of the possible values of the characteristic. Data type: Array of Objects `"productSpecCharacteristicValue": [ { "isDefault": Boolean, "isMandatory": Boolean, "validFor": {Object}, "value": "String" } ]`
productSpecCharacteristic. productSpecCharacteristicValue. isDefault	Flag that indicates whether the associated characteristic value is the default value for the characteristic. Possible values: • true: Default value. • false: Not the default value. Default: false
productSpecCharacteristic. productSpecCharacteristicValue. isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false

Name	Description

productSpecCharacteristic.productSpecCharacteristicValue.validFor	Date and time of when the characteristic is valid.
	
	Data type: Object
	
	`"validFor": {`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic.productSpecCharacteristicValue.validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String

productSpecCharacteristic.validFor	Date range the characteristic is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic.validFor.endDateTime	End date and time of the characteristic. Format: YYYY-MM-DD 00:00:00. Data type: String
productSpecCharacteristic.validFor.startDateTime	Start date and time of the characteristic. Format: YYYY-MM-DD 00:00:00. Data type: String
productSpecCharacteristic.valueType	Value type of the characteristic, such as choice or email. Can be of complex or non-complex type. Data type: String Accepted values: • Date,Address • Integer,Date/Time • Array.Integer • Array.Single Line Test • Single Line Test • Array.Object • Array.Date • Array.Decimal

Name	Description
	• Yes/No • Object • Array.Datetime • Checkbox • Email • Choice
productSpecificationRelationship	This specification's relationships to other product specifications. Data type: Array of Objects `"productSpecificationRelationship": [ { "id": "String", "type": "String", "validFor": {Object} } ]`
productSpecificationRelationship.id	Sys_id of the related specification. Data type: String
productSpecificationRelationship.type	Type of relationship. Data type: String
productSpecificationRelationship.validFor	Date range the relationship is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
productSpecificationRelationship.validFor.endDateTime	End date and type of the relationship. Format: YYYY-MM-DD Data type: String
productSpecificationRelationship.validFor.startDateTime	Start date and type of the relationship. Format: YYYY-MM-DD Data type: String
resourceSpecification	List of resource specifications related to this product specification. Data type: Array of Objects

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/catalog

Creates a product offering catalog.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/catalog`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Description of the product offering catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String Default: Blank string
externalId	Unique identifier for the product offering catalog from the external system. Data type: String Default: Blank string
name	Required. Name of the product offering catalog. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Data type: String
id	Sys_id of the product offering catalog Data type: String Table: Product Offering Catalog [sn_prd_pm_product_offering_catalog]
name	Name of the product offering catalog. Data type: String

Example: cURL request

This example creates a product offering catalog.

```
curl --location --request POST
 "https://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/catalog" \
--header "Content-Type: application/json" \
--data-raw '{
    "id": "testId",
    "name": "Catalog",
    "description": "Description"
}'
--user 'username':'password'
```

Response body:

```
{
   "id": "45715d02c3510110bc0526083c40dd6b",
   "description": "Description",
   "name": "Catalog1"
}
```

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/productOffering

Creates a product offering and associated product offering bundles.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering`

Supported request parameters

Path parameters

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOfferingPrice`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
@type	Required. Type of price list line. Always a value of `ProductOfferingPrice`. Data type: String
externalId	The external ID of the price list line. Data type: String
isBundle	Flag that indicates whether the price list line is part of a single product or a bundle of products. Valid values: • true: Price list line is part of a bundle. • false: Price list line isn't part of a bundle. Data type: Boolean Default: false
lastUpdate	Required. Date that the price line was last updated. Format: YYYY-MM-DD Data type: String
lifeCycleStatus	Required. Current life cycle status of the product list line. Valid values: • active • draft • inactive

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Default: draft
name	Required. Name to give the price list line. Data type: String

price	Required. List price details of the price list line.
	
	Data type: Object
	
	`"price": {`
	`  "unit": "String",`
	`  "value": "String"`
	`}`

price.unit	Required. Currency code of the price list line. For example, `USD` or `EUR`. Table: Currency [fx_currency] table. Data type: String
price.value	Required. Value of the price. Data type: String (represented with a number. For example, `"800"`.)

priceList	Required. Price list information associated with the price list line.
	
	Data type: Object
	
	`"priceList": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`

priceList.id	Required. Sys_id of the price list line. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
priceList.name	Name of the price list line. Data type: String
priceList.@type	The type of price list line. When sub-classing, this defines the sub-class extensible name. Value is always `priceList`. Data type: String
priceType	Required. Filter the price list line by the pricing method of the product offering.

Request body parameters (XML or JSON) (continued)

Name	Description
	Valid values: • recurring: Charge recurring pricing amounts with a specified frequency. Frequency is set in the *recurringChargePeriodType* parameter. • one_time: Supports one-time or recurring add-on charges and fees for a product offering. Data type: String Default: recurring

productOffering	Required. Product offering of the price list line.
	
	Data type: Object
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "internalVersion": "String"`
	`}`

productOffering.id	Required. Sys_id of the product offering. Table: Product offering [sn_prd_pm_product_offering] Data type: String
productOffering.internalVersion	Internal version number of the product offering. Data type: String (represented with a number. For example, `"1"`.)
productOffering.name	Name of the product offering. Data type: String
recurringChargePeriodType	Required if *priceType* is recurring. Commitment terms that are selected when the product offering was created. Valid values: • annually • monthly Data type: String

unitOfMeasure	Required. Details about the unit of measure associated with the price list line.
	
	Data type: Object
	`"unitOfMeasure": {`
	`  "id": "String",`
	`  "amount": Number,`

Request body parameters (XML or JSON) (continued)

Name	Description
	`"units": "String"` `}`
unitOfMeasure.amount	Amount of the unit of measure. Data type: Number
unitOfMeasure.id	Required. Sys_id of the unit of measure in the Price Line List table. Table: Price List Line [sn_csm_pricing_price_list_line] Data type: String
unitOfMeasure.units	Type of the unit of measure associated with the price list line. For example, `each` or `bundle`. Data type: String

validFor	Required. The duration of time that the price list line is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`"endDate": "String",`
	`"startDate": "String"`
	`}`

validFor.endDate	End date that the price list line is valid for. Data type: String (glide_date_time)
validFor.endDateTime	End date and time that the price list line is valid for. Format: YYYY-MM-DD HH:mm:ss Data type: String (glide_date)
validFor.startDate	Start date that the price list line is valid for. Data type: String (glide_date_time)
validFor.startDateTime	Start date and time that the price list line is valid for. Format: YYYY-MM-DD HH:mm:ss Data type: String (glide_date)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
id	Sys_id of the price list line. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
href	URL to the price list line record in the instance. Data type: String
lastUpdate	Date and time that the price list line was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
validFor	The duration of time that the price list line is valid for. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"validFor": {`
	`  "endDate": "String",`
	`  "startDate": "String"`
	`}`

validFor.endDate	End date and time that the price list line is valid for. Data type: String (glide_date_time)
validFor.startDate	Start date and time that the price list line is valid for. Data type: String (glide_date_time)
isBundle	Flag that indicates whether the price list line is part of a single product or a bundle of products. Valid values: • true: Price list line is part of a bundle. • false: Price list line isn't part of a bundle. Data type: Boolean
lifecycleStatus	Current life cycle status of the price list line. Valid values: • Active • Draft • Inactive Data type: String

productOffering	Product offering that is associated with the price list line.
	
	Data type: Object
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "internalVersion": "String"`
	`}`

productOffering.id	Sys_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalVersion	Internal version number of the product offering. For example, PRD0F01024. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
priceType	The pricing method of the product offering which is associated with this price list line. Possible values: • recurring: Charge recurring pricing amounts with a specified frequency. The value of *recurringChargePeriodType* indicates the frequency of the charge. • one_time: One-time or recurring add-on charges and fees for a product offering. Data type: String
recurringChargePeriodType	The periodicity or frequency of the product offering associated with this price list line. Returns a frequency type if *priceType* was set to `recurring`, otherwise returns an empty string. Possible values: • annually • monthly Data type: String

unitOfMeasure	Details about the unit of measure associated with the price list line.
	
	Data type: Object
	`"unitOfMeasure": {`
	`  "id": "String",`
	`  "amount": Number,`
	`  "units": "String"`
	`}`

unitOfMeasure.amount	Amount of the unit of measure. Data type: Number
unitOfMeasure.id	Sys_id of the unit of measure. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
unitOfMeasure.units	Type of the unit of measure associated with the price list line. For example, `year` or `bundle`. Data type: String
price	List price details of the price list line. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"price": {`
	`  "units": "String",`
	`  "value": "String"`
	`}`

price.units	Currency code of the price. For example, USD or EUR. Table: Currency [fx_currency] Data type: String
price.value	Value of the price. Data type: String (represented with a number)

priceList	Price list information associated with the price list line.
	
	Data type: Object
	
	`"priceList": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`

priceList.id	Sys_id of the price list in the Price List [sn_csm_pricing_price_list] table. Data type: String
priceList.name	Name of the price list. Data type: String
priceList.@type	The type of price list. When sub-classing, this defines the sub-class extensible name. Always has a value of `priceList`. Data type: String
@type	Always a value of `ProductOfferingPrice`. When sub-classing, this defines the sub-class extensible name. Data type: String
state	The state of the price list which is associated with this price list line. Data type: String
externalId	The external ID of this price list line. Data type: String

Example: cURL request

The following example creates a new price list line record according to data specified in the request body, and inserts it in the Price list line [sn_csm_pricing_price_list_line] table.

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/productSpecification

Creates a product specification record with the specified values.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productSpecification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Required. Description of the specification. Data type: String
externalId	Unique identifier for the product specification from the external system. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Default: Blank string
externalSystem	External system of the product specification, appended with `TMF620`. For example, if the external system is ABC then the value is `ABC - TMF620`. Data Type: String
id	Required. Sys_id or external ID of the product specification. Data type: String Table: In the initial_version or external_id of the Product Specification [sn_prd_pm_product_specification] table.
internalId	Required. Sys_id or internal ID of the product specification. Data type: String Table: In the initial_version field of the Product Specification [sn_prd_pm_product_specification] table.
internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Specification [sn_prd_pm_product_specification] table.
lastUpdate	Date the specification was last updated. Data type: String Format: YYYY-MM-DD HH:mm:SS. For example, `2025 - 01 - 31  09 : 35 : 43`. Default: Blank string
name	Required. Name of the specification. Data type: String

productSpecCharacteristic	Specification characteristic.
	
	Data type: Array of Objects
	
	`"productSpecCharacteristic": [`
	`  {`
	`  "description": "String",`
	`  "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	``
	"productSpecCharacteristicValue": [Array],
	"validFor": {Object},
	"valueType": "String"
	}
	]
	``

productSpecCharacteristic.description	Description of the characteristic. Data type: String Default: Blank string
productSpecCharacteristic.name	Required. Name of the characteristic. Data type: String

productSpecCharacteristic.
productSpecCharacteristicValue
	Required.
	List of the possible values of the characteristic.
	
	Data type: Array of Objects
	
	``
	"productSpecCharacteristicValue": [
	{
	"isDefault": Boolean,
	"isMandatory": Boolean,
	"validFor": {Object},
	"value": "String"
	}
	]
	``

productSpecCharacteristic. productSpecCharacteristicValue. isDefault	Flag that indicates whether the associated characteristic value is the default value for the characteristic. Possible values: • true: Default value. • false: Not the default value. Default: false
productSpecCharacteristic. productSpecCharacteristicValue. isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false

Request body parameters (JSON) (continued)

Name	Description

productSpecCharacteristic.productSpecCharacteristicValue.validFor	Date and time of when the characteristic is valid.
	
	Data type: Object
	
	`"validFor": {`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic.productSpecCharacteristicValue.validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String
productSpecCharacteristic.productSpecCharacteristicValue.value	Required. Value of the characteristic. Data type: String

productSpecCharacteristic.validFor	Date range the characteristic is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic.validFor.endDateTime	End date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Default: Blank string
productSpecCharacteristic.validFor.startDateTime	Start date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Default: Blank string
productSpecCharacteristic.valueType	Value type of the characteristic, such as choice or email. Can be of complex or non-complex type. Data type: String Accepted values:

Request body parameters (JSON) (continued)

Name	Description
	Table: In the external_version field of the Product Specification [sn_prd_pm_product_specification] table.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad request. Possible reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

Response body parameters

Name	Description
description	Description of the specification. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
externalSystem	External system of the product specification, appended with `TMF620`. For example, if the external system is ABC then the value is ABC - `TMF620`. Data Type: String
href	Relative link to the resource record. Data type: String Default: Blank string
id	Sys_id or external ID of the product specification. Data type: String Table: In the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table.
internalId	Required. Sys_id or internal ID of the product specification. Data type: String Table: In the initial_version field of the Product Specification [sn_prd_pm_product_specification] table.
internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Specification [sn_prd_pm_product_specification] table.
isBundle	Flag that indicates whether *`productSpecification`* represents a single product or a bundle of products. Valid values: • true: The product specification is a product bundle and contains multiple products. • false: The product specification contains a single product. Data type: Boolean Default: false
lastUpdate	Date the specification was last updated. Data type: String Format: YYYY-MM-DD HH:mm:SS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
lifecycleStatus	Current lifecycle status of the product specification. Possible values: • Active • Draft • Inactive Data type: String Default: Blank string
name	Name of the specification. Data type: String
productSpecCharacteristic	Specification characteristic. Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array], "validFor": {Object}, "valueType": "String" } ]`
productSpecCharacteristic.description	Description of the characteristic. Data type: String
productSpecCharacteristic.name	Name of the characteristic. Data type: String
productSpecCharacteristic. productSpecCharacteristicValue	List of the possible values of the characteristic. Data type: Array of Objects `"productSpecCharacteristicValue": [ { "isDefault": Boolean, "isMandatory": Boolean, "validFor": {Object}, "value": "String" } ]`
productSpecCharacteristic. productSpecCharacteristicValue. isDefault	Flag that indicates whether the associated characteristic value is the default value for the characteristic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • true: Default value. • false: Not the default value. Default: false
productSpecCharacteristic. productSpecCharacteristicValue. isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false

productSpecCharacteristic.
productSpecCharacteristicValue.
validFor
	Date and time of when the characteristic is valid.
	
	Data type: Object
	`"validFor": {`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic. productSpecCharacteristicValue. validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic. productSpecCharacteristicValue.value	Value of the characteristic. Data type: String

productSpecCharacteristic.validFor	Date range for which the characteristic is valid.
	
	Data type: Object
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic.validFor. endDateTime	End date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic.validFor. startDateTime	Start date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS

```

Product Catalog Search API

The *`Product Catalog Search`* API searches the product catalog and retrieves the eligible catalog-category hierarchy for a given context. Search supports multiple catalog types, with paginated and sortable results.

The *`Product Catalog Search`* API provides the ability to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Search products by search term across one or all catalogs and across one or all categories within a catalog.
- Retrieve the eligible catalog-category hierarchy for a context, with ineligible catalogs and categories filtered out.
- Filter results by catalog, category, and catalog type (defaults to Product Offering).
- Supply a header context object to apply account-specific pricing, price lists, currency, channel, shipping/billing address, and sales agreement to search results.
- Page through result sets using a zero-based page index and page limit.
- Control sort order and sort field (for example, by relevance score).
- Optionally pass an AI Search suggestion ID to support AI-assisted search flows.

This API delegates all data retrieval to the existing script include, ensuring consistent behavior between the UI and the REST interface. Endpoints are independent and can be called individually. There is no required call order and no dependency on other APIs.

The CatalogSearchAPI - Scoped, Global wraps this REST API.

Requirements

This API is included in the Product Catalog Management Core application, which is available on the ServiceNow Store.

This API is provided within the `sn_prd_pm` namespace and requires the Product Catalog Management Core plugin (sn_prd_pm) to access it.

The calling user must have the sn_prd_pm.product_catalog_viewer or sn_prd_pm.external_product_viewer roles.

Product Catalog Search - POST /api/sn_prd_pm/catalog/search

Searches the product catalog and returns a paginated list of products that match the supplied search parameters.

Use this endpoint whenever an external application or agent needs to retrieve products from the catalog. For example, to populate a shopping interface, drive an AI recommendation flow, or validate catalog availability. The endpoint delegates to the existing script include entry point and supports the same context-aware pricing and eligibility logic available in the Product Catalog UI.

Additional usage notes

- If *`headerContext`* is provided only with `account` but other context values such as *`pricelist`*, *`currency`* aren't provided, they are automatically fetched based on the given account to evaluate eligibility rules.
- If user has their own context variables for eligibility, those can be passed in *`headerContext`*.
- If *`headerContext`* isn't provided, the currency will default to the system currency and standard price list.
- Pass *`sortOrder`*, *`sortBy`* and *`aiSearchSuggestionId`* request parameters only if AI Search + RAG setup for product catalog search is done on the instance.

URL format

Base URL: `/api/sn_prd_pm/{api_version}/catalog/search`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Required. Version of the endpoint to access. Valid value: `v1`. Requests made without the version fails with a "Requested URI doesn't represent any resource" error. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
aiSearchSuggestionId	Sys_id of an AI Search suggestion record to associate with this search request. Used to support AI-assisted search flows. Data type: String Default: empty string
catalogType	Type of catalog items to search. Case-sensitive. Valid values: • `PRODUCT_OFFERING`: Fetch product offerings. • `SERVICE_SPECIFICATION`: Fetch service specifications. Data type: String

headerContext	Context object that controls pricing, eligibility, and localization applied to search results. When omitted, the API derives context from the account if one is provided.
	
	Data type: Object
	
	`"headerContext": {`
	`"account": "String",`
	`"currency": "String",`
	`"billing_city": "String",`
	`"billing_country": "String",`
	`"billing_location": "String",`
	`"billing_state": "String",`
	`"billing_street": "String",`
	`"billing_zip": "String",`

Request body parameters (XML or JSON) (continued)

Name	Description
	"pricelist": "String", "sales_agreement": "String", "shipping_city": "String", "shipping_country": "String", "shipping_location": "String", "shipping_state": "String", "shipping_street": "String", "shipping_zip": "String", "suppressPricing": String, "transaction_date": "String" }
headerContext.account	Sys_id of the account to use for context resolution. When provided and other context fields are omitted, pricing and eligibility are resolved from the account. Data type: String
headerContext.billing_city	City for the billing address. Data type: String
headerContext.billing_country	Country for the billing address. Example: USA Data type: String
headerContext.billing_location	Sys_id of the billing location record. Table: Location [location] Data type: String
headerContext.billing_state	State or province for the billing address. Example: TX Data type: String
headerContext.billing_street	Street address for billing. Data type: String
headerContext.billing_zip	Postal code for the billing address. Example: 75254-7536 Data type: String
headerContext.currency	Currency code to use for pricing. Example: USD. Data type: String Default: Derived from account if not supplied. If account not provided, resolves to system currency.
headerContext.pricelist	Sys_id of the price list to apply. Table: Pricing List [sn_csm_pricing_price_list]

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: Derived from account if not supplied. Data type: String
headerContext.sales_agreement	Sys_id of the sales agreement to apply. Table: Sales Agreement [sn_sales_agmt_core_sales_agreement] Data type: String
headerContext.shipping_city	City for the shipping address. Data type: String
headerContext.shipping_country	Country for the shipping address. Example: `USA` Data type: String
headerContext.shipping_location	Sys_id of the shipping location record. Table: Location [location] Data type: String
headerContext.shipping_state	State or province for the shipping address. Example: `TX` Data type: String
headerContext.shipping_street	Street address for shipping. Data type: String
headerContext.shipping_zip	Postal code for the shipping address. Example: `75254-7536` Data type: String
headerContext.suppressPricing	Optional. Flag that indicates whether to suppress pricing information in the response. Valid values: • `true`: Pricing is suppressed. • `false`: Pricing is included. Data type: Boolean Default: false
headerContext.transaction_date	Date and time of the transaction. Format: `yyyy-MM-dd HH:mm:ss` (Example: 2026-03-30 20:20:08)

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
pageIndex	Zero-based index of the page of results to return. Data type: Number (integer) Minimum value: 0 Default: 0
pageLimit	Number of search results per page. Data type: Number Default: 10
searchTerm	Keyword or phrase to search for in the product catalog. When null or empty, returns all products in the specified catalog. Data type: String Default: null
selectedCatalog	Sys_id of the catalog to search. Table: Product Offering Catalog [sn_prd_pm_product_offering_catalog] Data type: String Default: “allCatalog” (searches across all catalogs)
selectedCategory	Sys_id of the category to filter results by. If providing this value, you must pass the *selectedCatalog* to which that particular category belongs to. Table: Product Offering Category [sn_prd_pm_product_offering_category] Data type: String Default: “showAll” (returns results from all categories within the catalog)
sortBy	Field to sort results by. Accepted values are dependent on the value of *catalogType*. Valid values: • PRODUCT_OFFERING: ○ `code` ○ `description` ○ `display_name`

Request body parameters (XML or JSON) (continued)

Name	Description
	◦ `name` ◦ `score` • For SERVICE_SPECIFICATION: ◦ `description` ◦ `display_name` ◦ `name` ◦ `score` ◦ `specification_code` Data type: String
sortOrder	Sort direction for results. Valid values: • `ascending` • `descending` Data type: String Default: descending

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Media type accepted by the client. Set to application/json.
Content-Type	Media type of the request body. Set to application/json.
Authorization	Access to the instance. (OOB default ACL for scripted REST execute)

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	OK. The search completed successfully. The response body contains the paginated list of matching products.
401	Unauthorized. The calling user isn't authenticated.
403	Forbidden. The calling user doesn't have the sn_prd_pm.product_catalog_viewer or sn_prd_pm.external_product_viewer role required to access this endpoint.
500	Internal Server Error. Custom message - “The request couldn't be processed due to an internal server error. Please retry later."

Response body parameters (JSON or XML)

Name	Description
count	Number of product offerings in the `response` array. Data type: Number
leafCategoryList	A comma-separated string of eligible leaf category sys_ids used to filter product offerings, derived from the selected catalog and category hierarchy. Only included in the output when not already provided in the input filter. Data type: String
response	An array matching the current filter criteria, including search terms, selected category, and eligibility rules. Data type: Array of Objects `"response": [ { "code": {Object}, "description": {Object}, "listPrice": "String", "name": {Object}, "offerType": {Object}, "offerTypeVariation": "String", "priceList": "String", "pricingMethod": "String", "productOfferingFamily": {Object}, "productOfferingSysId": {Object}, "uom": {Object}`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`}` `]`

response.code	Product offering code.
	
	Data type: Object
	
	`"code": {`
	`  "value": "String",`
	`  "displayValue": "String"`
	`}`

response.code.displayValue	Display value of the field. Data type: String
response.code.value	Stored (raw) value of the field. Data type: String
response.derivedPrice	Flag that indicates whether the product's price is calculated dynamically based on related products, product characteristics, or predefined pricing rules rather than having a fixed catalog list price. Valid values: • true: Product's price is calculated dynamically. • false: Product's price is calculated using a fixed catalog list price. Data type: Boolean

response.description	Details about the product offering.
	
	Data type: Object
	
	`"description": {`
	`  "value": "String",`
	`  "displayValue": "String"`
	`}`

response.description.displayValue	Display value of the field. Data type: String
response.description.value	Stored (raw) value of the field. Data type: String
response.items.semanticSimilarity	Relevance or semantic score assigned to this result by the AI search engine. Field is absent from non-AI Search responses. Data type: Number

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
response.listPrice	Formatted list price of the product offering (for example, `"$50.00"`). May be absent if no price is configured. Data type: String

response.name	Display name of the product offering.
	
	Data type: Object
	
	`"name": {`
	`  "value": "String",`
	`  "displayValue": "String"`
	`}`

response.name.displayValue	Display value of the field. Data type: String
response.name.value	Stored (raw) value of the field. Data type: String

response.offerType	Type of the product offering (for example, `simple`, `config`, or `simple_with_spec`).
	
	Data type: Object
	
	`"offerType": {`
	`  "value": "String",`
	`  "displayValue": "String"`
	`}`

response.offerType.displayValue	Display value of the field. Data type: String
response.offerType.value	Stored (raw) value of the field. Data type: String
response.offerTypeVariation	Variation type of the offering, typically matching offerType. Data type: String
response.priceList	Sys_id of the associated price list record. May be absent if no price list is assigned. Data type: String
response.pricingMethod	Pricing method for the offering. Possible values: • `one_time` • `recurring`

Name	Description
	Data type: String
response.productOfferingFamily	Product offering family to which the offering belongs to. Data type: Object `"productOfferingFamily": { "value": "String", "displayValue": "String" }`
response.productOfferingFamily.displayValue	Display value of the field. Data type: String
response.productOfferingFamily.value	Stored (raw) value of the field. Data type: String
response.productOfferingSysId	List containing the sys_id(s) of the product offering record(s). Data type: Object `"productOfferingSysId": { "value": "String", "displayValue": "String" }`
response.productOfferingSysId.displayValue	Display value of the field. Data type: String
response.productOfferingSysId.value	Stored (raw) value of the field. Data type: String
response.uom	Unit of measure for the offering. Data type: Object `"uom": { "sysId": "String", "name": "String" }`
response.uom.name	Display name of the unit of measure (for example, `Each`). Data type: String
response.uom.sys_id	Sys_id of the unit-of-measure record. Data type: String
response.visual	URL to the product offering's image/ thumbnail, if configured and if

Name	Description
	sn_prd_pm.show_product_visuals system property is enabled. Data type: String
selectedCatalogHierarchy	List of all eligible catalog objects when no default catalog is configured and "All Catalogs" is the selected view. Data type: Array of Objects `"selectedCatalogHierarchy": [ { "id": "String", "label": "String", "children": [] } ]`

selectedCatalogHierarchy.children	Child category nodes. Dependent on the value set for *`selectedCategory`* in the request:
	
	• Value is empty or `showAll` (default): Returns an empty array ([ ]) when there are no children; the `showAll` node returns an empty object ({ }).
	• Value is a sys_id: Returns the child sys ID, display value, and any nested children associated with the given category sys_id.
	
	Data type: Object or Array
	
	`//'selectedCategory' is 'showAll'`
	
	`{ "id": "showAll", "label": "Show all", "children": {} }`
	
	`//'selectedCategory' is sys_id`
	
	`{ "id": "String", "label": "String", "children": [ { "id": "String", "label": "String", "children": [Array] } ] }`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
selectedCatalogHierarchy.id	Category identifier. A sys_id for catalog categories, or the literal `showAll` for the "Show all" option. Data type: String
selectedCatalogHierarchy.label	Display name of the category. Data type: String
spellCorrectedTerm	Spell-corrected version of the search term, returned when AI Search + RAG is enabled and a correction is available. Field is absent from non-AI Search responses. Data type: String
suggestedRecordDisplayName	Display name of a suggested record, returned when AI Search + RAG is enabled and a direct match suggestion exists. Data type: String

Example: cURL request

The following example searches for offerings matching the term 'modem' within a specific catalog and category, with an account context for pricing and eligibility.

```
curl
 "https://instance.servicenow.com/api/sn_prd_pm/v1/catalog/sear
ch" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{\"searchTerm\":\"modem\",\"selectedCatalog\":
\"eaf0159fd0a63110f8770dbf976be178\",\"selectedCategory\":
\"e6f0159fd0a63110f8770dbf976be18c\",\"headerContext\":
{\"account\":\"ffc68911c35420105252716b7d40dd55\"}}" \
--user 'username':'password'
```

Response body.

```

Product Inventory Open API

The *`Product Inventory Open`* API provides endpoints to create and retrieve product inventories.

Use this API to manage product inventory information between external systems and the ServiceNow AI Platform.

This API is included in the Product Inventory Advanced application, which is available on the ServiceNow Store.

This API is provided within the `sn_prd_invt` namespace.

The calling user must have the sn_prd_invt.product_inventory_integrator role.

This API creates and updates data in the following tables.

- Product Characteristics [sn_prd_invt_product_characteristics]
- Product Inventory [sn_prd_invt_product_inventory]
- Product Model [cmdb_model]
- Product Model Characteristic [sn_prd_pm_product_model_characteristic]

The *`Product Inventory Open`* API is a ServiceNow® implementation of the TM Forum Product Inventory Management API REST specification. This implementation is based on the TMF637 Product Inventory Management API User Guide v5.0.0, September 2024. The *`Product Inventory Open`* API is conformance certified by TM Forum.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: By default, *POST /sn_prd_invt/product* accepts and returns a single JSON object. GET endpoints return *status* as a display label, such as `Installation pending`, and the product reference field is named *product*. To change the default behavior, create a system property *sn_prd_invt.tmf637.version4* and set the value to `true`. When `true`, *POST /sn_prd_invt/product* accepts and returns a JSON array. GET endpoints return *status* as an internal value, such as `installation_pending`, and the product reference field is named *productId*. Set the property to `false` to return to the default behavior.

Note: By default, GET endpoints on this API return *valueType* as a display value, such as `Choice`. To change the default behavior and return the backend value instead (for example, `choice`) — matching the format used by the *Product Order Open* API — create a system property *sn_prd_invt.enableseamlessvaluetype* and set the value to `true`. Set the property to `false`, or leave it unset, to return to the default behavior.

Product Inventory Open API – DELETE /sn_prd_invt/order/product/{id}

Deletes a specified product inventory record.

URL format

Default URL: `/api/sn_prd_invt/order/product/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product inventory to delete. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	No Content. Record successfully deleted.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON)

Name	Description
None	

Example: cURL request

This example deletes a product inventory record.

```
curl
 "https://instance.service-now.com/api/sn_prd_invt/product/01b2f
9972b8c72d07a83f395f291bf53" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

No response body is returned when a product inventory record is successfully deleted.

Product Inventory Open API - GET /sn_prd_invt/product

Retrieves a list of all product inventories.

URL format

Default URL: `api/sn_prd_invt/product`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
account	Filter product inventories by account. Only inventories associated with the specified account are returned in the response. Data type: String Default: Don't filter by account.
billingAccount	Filter product inventories by billing account. Only inventories associated with the specified billing account are returned in the response. Data type: String Default: Don't filter by billing account
contact and consumer (Related Party)	Filter product inventories by associated contact or related party. Only inventories linked to the specified contact or consumer record are returned in the response. Data type: String Default: Don't filter by contact or consumer
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by customer.
externalID	Filter product inventories by external identifier. Only inventories with an externalID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by externalID
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: Return all fields.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by status.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Product Inventory [sn_prd_invt_product_inventory]
name	Name of the product inventory. Data type: String
place	Location of the product. Data type: Array `"place": [ { "id": "String", "name": "String" } ]`
place.id	Location sys_id or external id. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
place.name	Name of the location. Data type: String Table: Location [cmn_location] Field: name
productCharacteristic	List of product characteristics. For additional information on product characteristics, see Create a product offering category. Data type: Array of Objects `"productCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productCharacteristic.valueType	Type of characteristic value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • `Address` • `Array Date` • `Array Datetime` • `Array Decimal` • `Array Integer` • `Array Object` • `Array Single Line Test` • `CheckBox` • `Choice` • `Date` • `Date / Time` • `Email` • `Integer` • `Object` • `Single Line Text` • `Yes / No` **Note:** By default, or if this property doesn't exist, this field returns the display values listed above. To return the internal value instead (matching the value format the TMF622 Product Order API already uses by default), create a true/false system property named *`sn_prd_invt.enableseamlessvaluetype`* and set it to `true`: `address`, `array.date`, `array.datetime`, `array.decimal`, `array.integer`, `array.object`, `array.single_line_text`, `attachment`, `checkbox`, `choice`, `date`, `date_time`, `decimal`, `duration`, `email`, `integer`, `object`, `single_line_text`, `yes_no`. Default: `false` Data type: String
productId	Sys_id of the product model for the product inventory. Data type: String Table: Product Model [cmdb_model]
productOffering	Product offering that the product inventory is associated with. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	`"productOffering": {`
	`"id": "String",`
	`"internalId": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

productOffering.id	Initial version or external ID of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: initial_version or external_id
productOffering.internalId	Internal version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: internal_version
productOffering.internalVersion	Version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: version
productOffering.name	Name of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.version	External version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: external_version
productPrice	Returns an empty array. Data type: Array

productRelationship	List of related products.
	
	Data type: Array of Objects
	
	`"productRelationship": [`
	`{`
	`"productId": "String",`
	`"relationshipType": "String"`

Name	Description
	Field: external_version

realizingResource	Resource that realizes the product. The realizing resource is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. Valid value: child Data type: String

realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Sys_id of the realizing service. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingService.type	Type of the realizing service. Valid value: child Data type: String

relatedParty	List of parties associated with the ticket.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "id": "String",`
	`  "@referredType": "String"`

Product Inventory Open API - GET /sn_prd_invt/product/{id}

Retrieves a specified product inventory record.

URL format

Default URL: `/api/sn_prd_invt/product/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product inventory to retrieve. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
account	Filter product inventories by account. Only inventories associated with the specified account are returned in the response. Data type: String Default: Don't filter by account.
billingAccount	Filter product inventories by billing account. Only inventories associated with the specified billing account are returned in the response. Data type: String Default: Don't filter by billing account
contact and consumer (Related Party)	Filter product inventories by associated contact or related party. Only inventories linked to the specified contact or consumer record are returned in the response. Data type: String Default: Don't filter by contact or consumer
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String Default: Don't filer y customer.
externalID	Filter product inventories by external identifier. Only inventories with an externalID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by externalID
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by status.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Record not found. Record associated with the ID is not found in the table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
billingAccount	Billing account of the product inventory record. Data type: String
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
name	Name of the product inventory. Data type: String
place	Location of the product. Data type: Array `"place": [ { "id": "String", "name": "String" } ]`
place.id	Location sys_id or external id. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
place.name	Name of the location. Data type: String Table: Location [cmn_location] Field: name
productCharacteristic	List of product characteristics. For additional information on product characteristics, see Create a product offering category. Data type: Array of Objects `"productCharacteristic": [ { "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"value": "String", "valueType": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productCharacteristic.valueType	Type of characteristic value. Possible values: • `Address` • `Array Date` • `Array Datetime` • `Array Decimal` • `Array Integer` • `Array Object` • `Array Single Line Test` • `CheckBox` • `Choice` • `Date` • `Date / Time` • `Email` • `Integer` • `Object` • `Single Line Text` • `Yes / No`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Note: By default, or if this property doesn't exist, this field returns the display values listed above. To return the internal value instead (matching the value format the TMF622 Product Order API already uses by default), create a true/false system property named *`sn_prd_invt.enableseamlessvaluetype`* and set it to `true`: `address`, `array.date`, `array.datetime`, `array.decimal`, `array.integer`, `array.object`, `array.single_line_text`, `attachment`, `checkbox`, `choice`, `date`, `date_time`, `decimal`, `duration`, `email`, `integer`, `object`, `single_line_text`, `yes_no`. Default: `false` Data type: String
productId	Sys_id of the product model for the product inventory. Data type: String Table: Product Model [cmdb_model]

productOffering	Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`"id": "String",`
	`"internalId": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

productOffering.id	Initial version or external ID of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: initial_version or external_id
productOffering.internalId	Internal version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: internal_version
productOffering.internalVersion	Version of the product offering. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Product Offering [sn_prd_pm_product_offering] Field: version
productOffering.name	Name of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.version	External version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: external_version
productPrice	Returns an empty array. Data type: Array
productRelationship	List of related products. Data type: Array of Objects `"productRelationship": [ { "productId": "String", "relationshipType": "String" } ]`
productRelationship.productId	Sys_id of the related product. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
productRelationship.relationshipType	Type of relationship. Data type: String
productSpecification	Product specification for the product. Data type: Object `"productSpecification": { "id": "String", "internalId": "String", "internalVersion": "String", "version": "String" }`
productSpecification.id	Initial version or external ID of the product specification. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Product Specification [sn_prd_pm_product_specification] Field: internal_version or external_id
productSpecification.internalId	Initial version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: initial_version
productSpecification.internalVersion	Version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: version
productSpecification.version	External version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: external_version

realizingResource	Resource that realizes the product. The realizing resource is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. Valid value: child Data type: String
realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory.

Name	Description

	Data type: Object
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Sys_id of the realizing service. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingService.type	Type of the realizing service. Valid value: child Data type: String

relatedParty	List of parties associated with the ticket.
	
	Data type: Array of Objects
	`"relatedParty": [`
	`  {`
	`  "id": "String",`
	`  "@referredType": "String"`
	`  }`
	`]`

relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]
relatedParty.type	Type of related party. Value is always `Related Party`. Data type: String
relatedParty.@referredType	Type of customer, such as a customer or customer contact. Data type: String
status	Current state of the product. Data type: String

Example: cURL request

This example retrieves a specified product inventory.

Product Inventory Open API - GET /sn_prd_invt/productinventory

Retrieves a list of all product inventories.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Inventory Open API - GET /sn_prd_invt/product.

URL format

Default URL: `api/sn_prd_invt/productinventory`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
account	Filter product inventories by account. Only inventories associated with the specified account are returned in the response. Data type: String Default: Don't filter by account.
billingAccount	Filter product inventories by billing account. Only inventories associated with the specified billing account are returned in the response. Data type: String Default: Don't filter by billing account
contact and consumer (Related Party)	Filter product inventories by associated contact or related party. Only inventories linked to the specified contact or consumer record are returned in the response. Data type: String Default: Don't filter by contact or consumer
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by customer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
externalID	Filter product inventories by external identifier. Only inventories with an externalID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by externalID
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields are returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by inventory status.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).

Name	Description
	Note: By default, or if this property doesn't exist, this field returns the display values listed above. To return the internal value instead (matching the value format the TMF622 Product Order API already uses by default), create a true/false system property named *`sn_prd_invt.enableseamlessvaluetype`* and set it to `true`: `address`, `array.date`, `array.datetime`, `array.decimal`, `array.integer`, `array.object`, `array.single_line_text`, `attachment`, `checkbox`, `choice`, `date`, `date_time`, `decimal`, `duration`, `email`, `integer`, `object`, `single_line_text`, `yes_no`. Default: `false` Data type: String

productOffering	Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String"`
	`}`

productOffering.id	Sys_id of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.name	Name of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]

productRelationship	List of related products.
	
	Data type: Array of Objects
	
	`"productRelationship": [`
	`  {`
	`  "productId": "String",`
	`  "relationshipType": "String"`
	`  }`
	`]`

productRelationship.productId	Sys_id of the related product. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Product Inventory [sn_prd_invt_product_inventory]
productRelationship.relationshipType	Type of relationship. Data type: String

productSpecification	Product specification for the product.
	
	Data type: Object
	
	`"productSpecification": {`
	`  "id": "String"`
	`}`

productSpecification.id	Sys_id of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification]

realizingResource	Realizing resource.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. Data type: String

realizingService	Realizing service.
	
	Data type: Object
	
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Sys_id of the realizing service. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

Name	Description
realizingService.type	Type of the realizing service. Data type: String
relatedParty	List of parties associated with the ticket. Data type: Array of Objects `"relatedParty": [ { "id": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact] or Consumer [csm_consumer]
relatedParty.@referredType	Type of related party. Value is always `Related Party`. Data type: String
relatedParty.type	Type of customer. Possible values: • consumer • customer • customerContact Data type: String
status	Current state of the product. Data type: String

Example: cURL request

This example retrieves all product inventories.

```
curl
 "https://instance.servicenow.com/api/sn_prd_invt/productinvento
ry" \
--request GET \
--user 'username':'password'
```

Response body.

```

Product Inventory Open API - GET /sn_prd_invt/productinventory/{inventoryId}

Retrieves a product inventory.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Inventory Open API - GET /sn_prd_invt/product/{id}.

URL format

Default URL: `/api/sn_prd_invt/productinventory/{inventoryId}`

Supported request parameters

Path parameters

Name	Description
inventoryId	Sys_id of the product inventory to retrieve. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

Query parameters

Name	Description
account	Filter product inventories by account. Only inventories associated with the specified account are returned in the response. Data type: String Default: Don't filter by account.
billingAccount	Filter product inventories by billing account. Only inventories associated with the specified billing account are returned in the response. Data type: String Default: Don't filter by billing account
contact and consumer (Related Party)	Filter product inventories by associated contact or related party. Only inventories linked to the specified contact or consumer record are returned in the response.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String Default: Don't filter by contact or consumer
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String
externalID	Filter product inventories by external identifier. Only inventories with an externalID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by externalID
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Record not found. Record associated with the ID is not found in the table.

Response body parameters (JSON)

Name	Description
id	Sys_id of the product inventory Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
name	Name of the product inventory. Data type: String

place	Place associated with the product.
	
	Data type: Object
	`"place": {`
	`  "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Product Inventory Open API – PATCH /sn_prd_invt/order/product/{id}

Updates a specified product inventory record.

URL format

Default URL: `/api/sn_prd_invt/order/product/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product inventory to update. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
bundle	Flag that indicates whether the product inventory record is part of a bundled product. Valid values: • true: Is part of a bundle. • false: Isn't part of a bundle. Data type: Boolean
name	Name of the product inventory. Data type: String
place	Location of the product. Data type: Array `"place": [ { "id": "String", "name": "String" } ]`
place.id	Location sys_id or external id. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]
relatedParty.name	Name of the of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Product Inventory Open API - POST /sn_prd_invt/product

Creates a product inventory record.

URL format

Default URL: `/api/sn_prd_invt/product`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
bundle	Flag that indicates whether the product inventory record is part of a bundled product. Valid values: • true: Is part of a bundle. • false: Isn't part of a bundle. Data type: Boolean Default: false
isBundle	Flag that indicates whether the product inventory record is part of a bundled product. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• true: Is part of a bundle. • false: Isn't part of a bundle. Data type: Boolean Default: false
name	Required. Name of the product inventory. Data type: String
pid	Unique identifier for the product inventory from the external system. Data type: String Default: Blank string
productCharacteristic	List of product characteristics. For additional information on product characteristics, see Create a product offering category. Data type: Array of Objects `"productCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String Default: Blank string
productCharacteristic.value	Value of the characteristic. Data type: String Default: Blank string
productCharacteristic.valueType	Type of characteristic value. Possible values: • `Address` • `Array Date` • `Array Datetime` • `Array Decimal`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• `Array Integer` • `Array Object` • `Array Single Line Test` • `CheckBox` • `Choice` • `Date` • `Date / Time` • `Email` • `Integer` • `Object` • `Single Line Text` • `Yes / No` **Note:** By default, or if this property doesn't exist, this field returns the display values listed above. To return the internal value instead (matching the value format the TMF622 Product Order API already uses by default), create a true/false system property named *`sn_prd_invt.enableseamlessvaluetype`* and set it to `true`: `address`, `array.date`, `array.datetime`, `array.decimal`, `array.integer`, `array.object`, `array.single_line_text`, `attachment`, `checkbox`, `choice`, `date`, `date_time`, `decimal`, `duration`, `email`, `integer`, `object`, `single_line_text`, `yes_no`. Default: `false` Data type: String

productOffering	Required. Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`"id": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

productOffering.id	Required. Initial_version or external_id of the product offering. Data type: String

Request body parameters (JSON) (continued)

Name	Description

realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Required if using the *`realizingService`* parameter. Sys_id of the realizing service. Data type: String
realizingService.type	Type of the realizing service. Valid value: child Data type: String

relatedParty	List of parties associated with the ticket.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "id": "String",`
	`  "@referredType": "String"`
	`  }`
	`]`

relatedParty.@referredType	Type of customer. Possible values: • consumer • customer • customer_contact Data type: String Default: Blank string
relatedParty.id	Required if using the *`relatedParty`* parameter. Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]
state	Current state of the product.

Request body parameters (JSON) (continued)

Name	Description
	Possible values: • active • change_pending • inactivation_pending • inactive • installation_pending Data type: String Default: installation_pending

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

Product Inventory Open API - POST /sn_prd_invt/productinventory

Creates a product inventory.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Inventory Open API - POST /sn_prd_invt/product.

URL format

Default URL: `/api/sn_prd_invt/productinventory`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
isBundle	Flag that indicates whether the product inventory record is part of a bundled product. Valid values: • true: Is part of a bundle. • false: Isn't part of a bundle. Data type: Boolean Default: false
name	Required. Name of the product inventory. Data type: String
pid	Unique identifier for the product inventory from the external system. Data type: String Default: Blank string
productCharacteristic	List of product characteristics. For additional information on product characteristics, see Create a product offering category. Data type: Array of Objects `"productCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
productCharacteristic.name	Name of the characteristic.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String Default: Blank string
productCharacteristic.value	Value of the characteristic. Data type: String Default: Blank string
productCharacteristic.valueType	Type of characteristic value. Possible values: • `Address` • `Array Date` • `Array Datetime` • `Array Decimal` • `Array Integer` • `Array Object` • `Array Single Line Test` • `CheckBox` • `Choice` • `Date` • `Date / Time` • `Email` • `Integer` • `Object` • `Single Line Text` • `Yes / No`

Request body parameters (JSON) (continued)

Name	Description
	Note: By default, or if this property doesn't exist, this field returns the display values listed above. To return the internal value instead (matching the value format the TMF622 Product Order API already uses by default), create a true/false system property named *`sn_prd_invt.enableseamlessvaluetype`* and set it to `true`: `address`, `array.date`, `array.datetime`, `array.decimal`, `array.integer`, `array.object`, `array.single_line_text`, `attachment`, `checkbox`, `choice`, `date`, `date_time`, `decimal`, `duration`, `email`, `integer`, `object`, `single_line_text`, `yes_no`. Default: `false` Data type: String

productOffering	Required. Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String"`
	`}`

productOffering.id	Required. Sys_id of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.name	Name of the product offering. Data type: String Default: Blank string Table: Product Offering [sn_prd_pm_product_offering]

productRelationship	List of related products.
	
	Data type: Array of Objects
	
	`"productRelationship": [`
	`  {`
	`  "productId": "String",`
	`  "relationshipType": "String"`
	`  }`
	`]`

Request body parameters (JSON) (continued)

Name	Description
productRelationship.productId	Required if using the *`productRelationship`* parameter. Sys_id of the related product. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
productRelationship.relationshipType	Type of relationship. The only valid value is `child`. Data type: String Default: Blank string

productSpecification	Required. Product specification for the product.
	
	Data type: Object
	
	`"productSpecification": {`
	`  "id": "String"`
	`}`

productSpecification.id	Required. Sys_id of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification]

realizingResource	Realizing resource.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Required if using the *`realizingResource`* parameter. Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. The only valid value is `child`. Data type: String Default: Blank string

Request body parameters (JSON) (continued)

Name	Description

realizingService	Realizing service.
	
	Data type: Object
	
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Required if using the *`realizingService`* parameter. Sys_id of the realizing service. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingService.type	Type of the realizing service. The only valid value is `child`. Data type: String Default: Blank string

relatedParty	List of parties associated with the ticket.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "id": "String",`
	`  "@referredType": "String"`
	`  }`
	`]`

relatedParty.@referredType	Type of customer. Possible values: • consumer • customer • customer_contact Data type: String Default: Blank string
relatedParty.id	Required if using the *`relatedParty`* parameter. Sys_id of the account or customer contact associated with the ticket. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_Consumer]
state	Current state of the product. Possible values: • active • change_pending • inactivation_pending • inactive • installation_pending Data type: String Default: installation_pending

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad Request. Could be any of the following reasons:

Product Offering Qualification API

The *`Product Offering Qualification`* API determines eligibility for product offerings in the ServiceNow® product catalog, scoped to a customer account, sales channel, and geographic location. Implements the TM Forum TMF679 standard.

The TMF679 *`Product Offering Qualification`* API is offered with the Telecommunications Open API application. It implements the TM Forum TMF679 standard.

The API exposes two operations:

- Check Product Offering Qualification: Validates a caller-supplied list of specific product offerings. Use this at the point of sale when confirming a customer's cart or a known shortlist. Enforced via configurable system property `sn_tmf_api.cpoq.max_items_per_request` (default: 20 items). This ensures the synchronous API remains within acceptable response times. Items beyond that limit are returned unprocessed.
- Query Product Offering Qualification: Discovers which offerings in the catalog are eligible for a given context. Use this to populate a storefront or drive CPQ catalog filtering. Supports category filtering, place-based eligibility scoping, and pagination via `limit` and `offset` query parameters.

API Access and Requirements

The *`Product Offering Qualification`* runs in the sn_tmf_api namespace and requires the `sn_tmf_api.product_offering_qualification_integrator` role. Administrators must add the following roles to the `sn_tmf_api.product_offering_qualification_integrator` role to enable access to the Product Offering Qualification API:

- `sn_customerservice.customer_data_viewer`
- `sn_csm_ctxrul_mgt.rule_matrix_viewer`

The API requires manual installation of the app-csm-price-mtrx (sn_csm_price_mtrx) application for product and pricing rules to work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pre-call setup required: *ProductOfferings* must be defined in the Product Catalog. Account, Channel, and Location records referenced in requests must exist. `sn_prd_pm.ProductEligibilityAPI` must be configured with eligibility rules.

Extending the API

Both operations expose default extension script includes that can be overridden to inject custom business logic before the final response is assembled.

Extension Script Includes

Script Include	Method
CheckProductOfferingQualificationExtension	checkProductOfferingQualificationExtension
QueryProductOfferingQualificationExtension	queryProductOfferingQualificationExtension

Both extensions receive the request payload and the built *contextJson* object. Return the (optionally modified) *contextJson*. If the Query extension returns a structurally invalid context, the API logs the error and falls back to the default-built context.

Defining eligibility rules and context variables

The eligibility engine (`sn_prd_pm.ProductEligibilityAPI`) evaluates each product offering against a set of configurable eligibility rules. To support new context variables (such as a custom customer attribute, a new channel type, or additional geographic data) or to define new eligibility rules that consume them, see Define product eligibility rules in a product eligibility matrix. This documentation covers how to create eligibility rule records, configure rule conditions, define context variables, and map them to the eligibility engine context that both CPOQ and QPOQ pass at runtime.

Example: Check endpoint extension script: Custom extension to inject a partner flag

This extension detects when a request is coming through the partner channel and sets a custom partner flag in the context header. The eligibility engine can then use this flag to apply partner-specific eligibility rules when evaluating the product offerings. You can customize the logic to apply channel-specific markings, validate partner permissions, or enforce special pricing and eligibility constraints for different sales channels.

```
var CheckProductOfferingQualificationExtension = Class.create();

CheckProductOfferingQualificationExtension.prototype = {
  initialize: function() {
    // Initialization logic here
  },

  checkProductOfferingQualificationExtension: function(payload,
 contextJson) {
    if (payload.channel && payload.channel.id === 'PARTNER') {
      contextJson.header.custom_partner_flag = true;
    }
    return contextJson;
  },

  type: 'CheckProductOfferingQualificationExtension'

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Query endpoint extension script: Custom extension to apply segment and channel-based filtering

This extension retrieves the customer segment from the account record and adds it to the context for segment-based eligibility filtering. It also excludes specific product categories for partner channel queries and returns the modified context for the eligibility engine to evaluate. You can customize the logic to match your business rules; filtering by geography, account status, subscription history, and other account-specific attributes.

```
var QueryProductOfferingQualificationExtension = Class.create();

QueryProductOfferingQualificationExtension.prototype = {
  initialize: function() {
    // Initialization logic here
  },

  queryProductOfferingQualificationExtension: function(payload,
 contextJson) {
    // Add customer segment to context for segment-based
 filtering
    if (payload.relatedParty && payload.relatedParty.length > 0)
 {
      var accountId =
 payload.relatedParty[0].partyOrPartyRole.id;
      var accountGR = new GlideRecord('customer');
      if (accountGR.get(accountId)) {
        contextJson.header.customer_segment =
 accountGR.getValue('segment');
      }
    }

    // Exclude certain categories for specific channels
    if (payload.channel && payload.channel.id === 'partner') {
      contextJson.header.exclude_categories = ['premium_only',
 'internal_use'];
    }

    return contextJson;
  },

  type: 'QueryProductOfferingQualificationExtension'
};
```

Product Offering Qualification - POST /api/sn_tmf_api/product_offering_qualification_api/v1/checkProductOfferingQualification

Synchronously evaluates one or more product offerings for eligibility. Returns green (eligible) or red (ineligible) per item, with structured reasons for ineligible items.

Use this operation when you already have a specific list of product offerings and need to verify eligibility for a customer.

Typical scenarios:

- Validating items in a customer's shopping cart before checkout.
- Confirming eligibility of a pre-defined product bundle.
- Batch-checking a known set of offerings against account, channel, and location.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The maximum number of `checkProductOfferingQualificationItem` entries per request is enforced via system property `sn_tmf_api.cpoq.max_items_per_request` (default: 20 items). Items beyond the limit are returned unprocessed.

URL format

Default URL: `/api/sn_tmf_api/product_offering_qualification_api/v1/checkProductOfferingQualification`

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
Content-Type	`application/json`

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200 OK	Qualification processed successfully. All valid items have `qualificationItemResult` set. Items beyond the 20-item limit are returned without qualification fields. Note: if a `PlaceRef` ID is not found, the item is returned with `qualificationItemResult: "red"` and an eligibility reason — this is still a **200** response, not an error.
400	Validation errors — schema failure, missing/empty `checkProductOfferingQualificationItem`, invalid `relatedParty`, channel, or geographic address. Response includes `code`, `reason`, `message`, and `details` array.
401	Unauthenticated — missing or invalid credentials. Enforced by the platform REST framework.
403	Forbidden — caller lacks the `sn_tmf_api.product_offering_qualification_integrator` role. Enforced by the REST endpoint ACL.
429	Too Many Requests — rate limit of 6,000 req/hr exceeded. Response includes a `Retry-After` header.

Product Offering Qualification - POST /api/sn_tmf_api/product_offering_qualification_api/v1/queryProductOfferingQualification

Discovers eligible product offerings for a given customer, channel, and location context. Supports category filtering and pagination via limit and offset query parameters.

Use this operation when you need to discover which offerings are eligible for a customer without a pre-defined list.

Typical scenarios:

- Populating a dynamic storefront or catalog UI filtered by customer eligibility.
- CPQ catalog filtering based on account and location.
- Finding available offerings in a specific product category for a given context.

URL format

Default URL: `/api/sn_tmf_api/product_offering_qualification_api/v1/queryProductOfferingQualification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
limit	Max number of items to return. Non-numeric value or value exceeding MAX_LIMIT returns a 404 error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Query parameters (continued)

Name	Description
	Data type: String Default: 20 (configurable via the sn_tmf_api.pagination.set_limit system parameter.) Maximum: 100 (configurable via the sn_tmf_api.pagination.maximum_limit system parameter).
offset	Zero-based index of the first result. Non-numeric value or value ≥ totalCount (when totalCount > 0) returns a 404 error. Data type: String Default: 0

Request body parameters (XML or JSON)

Name	Description
@type	Required. TMF discriminator for the request body. Set to `"QueryProductOfferingQualification"`. Informational; recommended for TMF conformance. Data type: String

category	Optional. Filters the catalog query to a specific product category. When provided, only offerings that belong to the referenced category are evaluated and returned.
	
	This is useful for building category-specific storefronts or CPQ catalog panels.
	
	The id must refer to an existing Product Category record.
	
	Data type: Object
	
	`"category": {`
	`  "id": "String",`
	`  "@type": "String"`
	`}`

category.@type	Conditional. Discriminator for the category reference. Mandatory when *`category`* is present. Set to `"CategoryRef"`. Data type: String
category.id	Conditional. Sys_id of the Product Category record. Mandatory when *`category`* is provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	The API filters the catalog to offerings linked to this category. A non-existent ID returns a 400 validation error. Data type: String

channel	Optional. Identifies the sales channel for this query.
	
	When provided, the eligibility engine applies channel-specific rules and may restrict results to offerings available through this channel. The channel is also echoed back in the response.
	
	The ID must match an existing Channel record; a missing or empty id is rejected with a 400.
	
	Data type: Object
	
	`"channel": {`
	`"id": "String",`
	`"@type": "String"`
	`}`

channel.@type	Conditional. Discriminator for the channel object. Mandatory when *`channel`* is present. Set to `"ChannelRef"`. Data type: String
channel.id	Conditional. The choice value identifying the channel. Mandatory when *`channel`* is present. This is the value field from the sys_choice table for the channel field (for example, `"web"`), not a sys_id. An empty string is rejected with a 400 validation error. Data type: String
channel.name	Optional. Display name of the channel. Informational; echoed back in the response. Example: `"Web"`, `"Retail"` Data type: String
relatedParty	Required. Identifies the customer account for which the catalog query is run. The eligibility engine uses this account to apply customer-segment and account-level eligibility rules; results are personalized to this customer.

Request body parameters (XML or JSON) (continued)

Name	Description

	Must contain at least one entry. If more than one entry is provided, only the first is used and a warnings message is added to the response.
	
	Data type: Array of Objects
	
	`"relatedParty" [`
	`{`
	`"@type": "RelatedParty",`
	`"partyOrPartyRole": {Object},`
	`"role": "String"`
	`}`
	`]`

relatedParty.@type	Required. Discriminator for this related party entry. Set to `"RelatedPartyOrPartyRole"`. Used to validate the entry structure. Data type: String

relatedParty.partyOrPartyRole	Optional. The account reference nested inside the related party. Contains the discriminator and the sys_id of the customer account to qualify against.
	
	Data type: Object
	
	`"partyOrPartyRole": {`
	`"@type": "String",`
	`"id": "String"`
	`}`

relatedParty.partyOrPartyRole.@type	Conditional. Discriminator for the account reference. Mandatory when *`partyOrPartyRole`* is present. Must be exactly `"AccountRef"`. Only account-based eligibility is supported. Any other value returns a 400 error. Data type: String
relatedParty.partyOrPartyRole.id	Conditional. Sys_id of the customer account record. Mandatory when *`partyOrPartyRole`* is present. The eligibility engine loads this account to evaluate account-level eligibility rules. A non-existent account ID returns a 400 error. Data type: String
relatedParty.role	Required. Describes the role of the related party in this query. Must not be empty.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Used by the eligibility engine to interpret the party's relationship to the qualification request. A missing or empty value returns a 400 validation error. Example: `"requester""customer"` Data type: String

searchCriteria	Optional. Container for location-based search filters. When provided, the eligibility engine uses the nested place array to restrict results to offerings available at the specified geographic location(s).
	
	The entire *`searchCriteria`* object is echoed back in the response. Omit this field entirely to run an unconstrained catalog query.
	
	Data type: Object
	
	`"searchCriteria": {`
	`"@type": "String",`
	`"place": [Array]`
	`}`

searchCriteria.@type	Optional. Discriminator for the *`searchCriteria`* object. Typically set to `"QueryProductOfferingQualification"`. Informational; echoed in the response. Data type: String

searchCriteria.place	Optional. List of location constraints for the query. The eligibility engine filters the catalog to offerings that are available at all provided locations.
	
	At most one entry per role value — one *`serviceLocation`* and one *`billingLocation`*. Passing an explicit null or empty array is rejected with a 400; omit the field entirely to skip place filtering.
	
	Data type: Array of Objects
	
	`"place": [`
	`{`
	`"@type": "String",`
	`"role": "String",`
	`"place": {Object}`
	`}`
	`]`

searchCriteria.place.@type	Conditional. Mandatory when a place entry is present. Discriminator for the place wrapper object. Set to `"Place"`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String

searchCriteria.place.place	The location reference, either a `PlaceRef` or `GeographicAddress`.
	
	Data type: Object
	
	`"place": {`
	`"@type": "String",`
	`"streetName": "String",`
	`"streetNumber": "String",`
	`"city": "String",`
	`"postcode": "String",`
	`"country": "String"`
	`}`

searchCriteria.place.place.@type	Conditional. Determines how the location is identified. Mandatory when a *`place`* entry is present. Valid values: • `PlaceRef`: Reference to an existing Location record. Only *`id`* is permitted; no other address fields may be present. • `GeographicAddress`: Inline address supplied by the caller. Address fields such as *`city`*, *`country`*, *`postcode`*, etc. are used; *`id`* is not permitted. Data type: String
searchCriteria.place.place.city	Optional. City name. Only applicable when *`@type`* is `"GeographicAddress"`. Used by location-based eligibility rules to match service territories. Example: `"Paris"`, `"San Diego"` Data type: String
searchCriteria.place.place.country	Optional. Country name or ISO code. Only applicable when *`@type`* is `"GeographicAddress"`. Example: `"France"`, `"US"` Data type: String
searchCriteria.place.place.id	Conditional. Sys_id of the Location record. Required when *`@type`* is `PlaceRef`. The API looks up this record to retrieve the address used for eligibility matching. An unresolved ID returns a 400 error with reason: `"Invalid Place Information". Must`

Request body parameters (XML or JSON) (continued)

Name	Description
	`not be provided when @type is "GeographicAddress".` Data type: String
searchCriteria.place.place.postcode	Optional. Postal or ZIP code. Only applicable when *`@type`* is `"GeographicAddress"`. Can be used by postcode-based service territory eligibility rules. Example: `"75001"` Data type: String
searchCriteria.place.place.stateOrProvince	Optional. State or province name. Only applicable when *`@type`* is `"GeographicAddress"`. Example: `"CA"` Data type: String
searchCriteria.place.place.streetName	Optional. Street name without the number. Only applicable when *`@type`* is `"GeographicAddress"`. Combined with *`streetNumber`* as `"{streetNumber} {streetName}"` when both are present. Example: `"Main Street"` Data type: String
searchCriteria.place.place.streetNumber	Optional. Street number. Only applicable when *`@type`* is `"GeographicAddress"`. Prepended to *`streetName`* when both are provided. Example: `"123"` Data type: String
searchCriteria.place.role	Conditional. Purpose of this location in the query. Mandatory when a *`place`* entry is present. Accepted values: • `serviceLocation`: Where the product will be delivered or used. • `billingLocation`: Customer billing address. Each role may appear at most once in the array; a duplicate role returns a 400 error. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Must be `application/json`.
Authorization	Basic auth or OAuth token. Unauthenticated requests return HTTP 401; missing role returns HTTP 403.
Accept	`application/json` (recommended).

Response headers

Header	Description
Content-Type	`application/json`
X-Total-Count	Total number of eligible offerings matching the query (before pagination is applied). Integer value, for example 4.
Content-Range	Range of records in this page. Format: `{start}-{end}/{total}`. For example, 1-3/4.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Query processed successfully. `qualifiedProductOfferingItem` may be an empty array if no offerings qualify.
400	Validation errors. Schema failure, invalid `place`, `relatedParty`, category, or channel validation failures. Response includes `code`, `reason`, `message`, and `details` array.
404	Non-numeric `limit` or `offset`; `limit` exceeding `MAX_LIMIT`; `offset` ≥ `totalCount` (when totalCount > 0).
401	Unauthenticated. Missing or invalid credentials. Enforced by the platform REST framework.
403	Forbidden. Caller lacks the `sn_tmf_api.product_offering_qualification_integrator` role. Enforced by the REST endpoint ACL.
429	Too Many Requests. Rate limit of 6,000 req/hr exceeded. Response includes a `Retry-After` header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Unexpected exception from the eligibility engine (`ProductEligibilityAPI`).

Response body parameters (JSON or XML)

Response body parameters (XML or JSON)

Name	Description
@type	TMF discriminator for the top-level response object. Always `"QueryProductOfferingQualification"`. Data type: String
state	Processing state of the query. Always `"done"` on a successful 200 response. An empty result set (`qualifiedProductOfferingItem: []`) is still "done"; it means no offerings matched the criteria, not that the query failed. Data type: String
qualifiedProductOfferingItem	List of product offerings that passed all eligibility rules for the provided customer, channel, category, and location context. Each entry represents one eligible offering. The array may be empty if no offerings qualify. The total count (before pagination) is in the X-Total-Count response header. Data type: Array of Objects `"qualifiedProductOfferingItem": [ { "@type": "String", "productOffering": {Object} } ]`
qualifiedProductOfferingItem.@type	TMF discriminator for each result item. Always `"QueryProductOfferingQualificationItem"`. Data type: String
qualifiedProductOfferingItem.productOffering	Required. Reference to the eligible product offering. Contains the fields needed to identify and link to the offering in the Product Catalog. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description

	`"productOffering": {`
	`"id": "String",`
	`"name": "String",`
	`"href": "String",`
	`"@type": "String"`
	`}`

qualifiedProductOfferingItem.productOffering.id	Sys_id of the product offering record. Use this value to retrieve full offering details from the Product Catalog API or to pass to *`POST / checkproductofferingqualification`* to confirm eligibility before purchase. Data type: String
qualifiedProductOfferingItem.productOffering.name	Human-readable display name of the product offering as configured in the Product Catalog. Use this to display the offering name in a storefront or CPQ interface. Example: `"All in one mobile plan starting from $39/month"` Data type: String
qualifiedProductOfferingItem.productOffering.href	Self-link to the product offering resource on this instance. Use this as a hypermedia link to fetch the full offering details. Format: `/api/sn_tmf_api/catalogmanagement/productOffering/{id}` Data type: String
qualifiedProductOfferingItem.productOffering.@type	Required. TMF discriminator for the product offering reference. Always `"ProductOfferingRef"`. Data type: String

channel	Echo of the channel object from the request. Returned as-is so callers can confirm which channel context was applied. Absent when channel was not provided in the request.
	
	Data type: Object
	`"channel": {`
	`"id": "String",`
	`"name": "String",`
	`"@type": "String"`
	`}`

channel.id	Choice value identifying the channel. This is the value field from the sys_choice table for the channel field (for example, `"web"`), not a sys_id. Echoed from the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
channel.name	Display name of the channel. Informational; echoed from the request. Example: `"Web"`, `"Retail"` Data type: String
channel.@type	Discriminator for the channel object. Always `"ChannelRef"`. Echoed from the request. Data type: String

category	Echo of the category filter from the request. Returned as-is so callers can confirm which category scope was applied. Absent when category wasn't provided in the request.
	
	Data type: Object
	
	`"category": {`
	`  "id": "String",`
	`  "@type": "String"`
	`}`

category.id	Sys_id of the Product Category record. The API used this to filter the catalog to offerings linked to this category. Echoed from the request. Data type: String
category.@type	Discriminator for the category reference. Always `"CategoryRef"`. Echoed from the request. Data type: String

relatedParty	Echo of the *`relatedParty`* array from the request. Returned as-is so callers can confirm which customer account the eligibility was evaluated for.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "@type": "String",`
	`  "role": "String",`
	`  "partyOrPartyRole": {Object}`
	`  }`
	`]`

relatedParty.@type	Discriminator for this related party entry. Always `"RelatedPartyOrPartyRole"`. Echoed from the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
relatedParty.role	Describes the role of the related party in this query. Echoed from the request. Example: `"requestor"`, `"customer"` Data type: String

relatedParty.partyOrPartyRole	The account reference nested inside the related party. Contains the discriminator and the sys_id of the customer account. Echoed from the request.
	
	Data type: Object
	
	`"partyOrPartyRole": {`
	`"id": "String",`
	`"@type": "String"`
	`}`

relatedParty.partyOrPartyRole.@type	Discriminator for the account reference. Always `"AccountRef"`. Echoed from the request. Data type: String
relatedParty.partyOrPartyRole.id	Sys_id of the customer account record. Echoed from the request. Data type: String

searchCriteria	Echo of the *`searchCriteria`* object from the request. Returned as-is so callers can confirm which location filters were applied. Absent when *`searchCriteria`* was not provided in the request.
	
	Data type: Object
	
	`"searchCriteria": {`
	`"@type": "String",`
	`"place": [Array]`
	`}`

searchCriteria.@type	Discriminator for the *`searchCriteria`* object. Echoed from the request. Data type: String

searchCriteria.place	List of location constraints used to filter the catalog. Echoed from the request.
	
	Data type: Array of Objects
	
	`"place": [`
	`{`
	`"@type": "String",`
	`"role": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (XML or JSON) (continued)

Name	Description

	`"place": {Object}`
	`}`
	`]`

searchCriteria.place.@type	Discriminator for the *`place`* wrapper object. Always `"Place"`. Echoed from the request. Data type: String
searchCriteria.place.role	Purpose of this location in the query (`"serviceLocation"` or `"billingLocation"`). Echoed from the request. Data type: String

searchCriteria.place	The location reference, either a PlaceRef or GeographicAddress. Echoed from the request.
	
	Data type: Object
	
	`"place": {`
	`"@type": "String",`
	`"streetName": "String",`
	`"streetNumber": "String",`
	`"city": "String",`
	`"postcode": "String",`
	`"country": "String"`
	`}`
	`}`

searchCriteria.place.place.@type	Determines how the location is identified (`"PlaceRef"` or `"GeographicAddress"`). Echoed from the request. Data type: String
searchCriteria.place.place.id	Sys_id of the Location record. Present when *`@type`* is `"PlaceRef"`. Echoed from the request. Data type: String
searchCriteria.place.place.city	City name. Present when *`@type`* is `"GeographicAddress"`. Echoed from the request. Data type: String
searchCriteria.place.place.country	Country name or ISO code. Present when *`@type`* is `"GeographicAddress"`. Echoed from the request. Data type: String
searchCriteria.place.place.stateOrProvince	State or province name. Present when *`@type`* is `"GeographicAddress"`. Echoed from the request.

Response body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
searchCriteria.place.place.streetName	Street name. Present when *@type* is `"GeographicAddress"`. Echoed from the request. Data type: String
searchCriteria.place.place.streetNumber	Street number. Present when *@type* is `"GeographicAddress"`. Echoed from the request. Data type: String
searchCriteria.place.place.postcode	Postal or ZIP code. Present when *@type* is `"GeographicAddress"`. Echoed from the request. Data type: String
warnings	Advisory messages about non-fatal issues with the request. Present when multiple *AccountRef* entries were supplied in *relatedParty*. which indicates that only the first entry was used for eligibility evaluation and the rest were ignored. Data type: Array of Strings `"warnings": [ "String" ]`
code	Numeric error code. Present only on error responses (4xx / 5xx). Identifies the error category (for example, 24 for invalid place information). Data type: Integer
reason	Short human-readable error category. Present only on error responses. Example: `"Invalid Place Information"`. Data type: String
message	Detailed error message. Present only on error responses. Describes the specific failure condition. Data type: String
details	Per-field validation errors. Present only on 400 error responses. Data type: Array of Objects `"details": [ { "message": "String", "datapath": "String"`

    }
  ]
}
```

Product Order Open API

The *`Product Order Open`* API provides endpoints that enable a standardized mechanism for placing product orders.

A product order is created based on a product offering that is defined and published in a product catalog. The product offering identifies the product or set of products that are available to a customer and includes the relevant product characteristics that capture the unique options of a product, and other relevant attributes such as pricing, contract terms, and availability.

To access this API, the Order Management for Telecommunications (sn_ind_tmt_orm) plugin must be activated. For more information, see Install Order Management. For information about Order Management tables and roles, see Components installed with Order Management.

This API is provided within the `sn_ind_tmt_orm` namespace.

The calling user must have the sn_ind_tmt_orm.order_integrator role.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Product Order Open API Developer Guide.

The *`Product Order Open`* API is a ServiceNow® implementation of the TM Forum Product Ordering Management API Specification. This implementation is based on the TMF622 Product Ordering Management API User Guide v5.0.0, September 2024. The *`Product Order Open`* API is conformance certified by TM Forum.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Version 3.0 updates

The *Product Order* POST endpoint now supports creation of account, consumer, contact, location, billing accounts and payment profiles, and inline creation of related party entities within order requests. See Product Order Open API - POST /sn_ind_tmt_orm/order/productOrder for more details. These features are available with version 3.0 and newer releases.

The *relatedParty* field's structure changed between V2 and V3. See endpoints for a side-by-side comparison.

Note: This API's *productCharacteristic.valueType* field always returns the backend value (for example, `choice`) and is unaffected by the *Product Inventory Open* API's *sn_prd_invt.enableseamlessvaluetype* system property, which lets that API match this format.

Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder

Retrieves all product orders.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

v3 updates for GET/LIST operations

When you retrieve product orders using GET or LIST operations in TMF 622 V3, the response now includes payment profile details and billing account information for each order line item. These new fields provide complete visibility into the payment methods and billing relationships associated with your orders, enabling you to manage billing, fulfillment, and reconciliation processes with comprehensive order data in a single API call.

URL format

Default URL: `/api/sn_ind_tmt_orm/order/productOrder`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
account	Filter product orders by the associated account. Use this to retrieve all orders for a specific customer account or business unit. Data type: String
consumer (relatedParty)	Filter product orders by the consumer or end-user. Use this to retrieve orders for a specific consumer within a customer account, useful in multi-party or wholesale scenarios. Data type: String
contact	Filter product orders by an associated contact. Use this to find all orders linked to a specific person (like order coordinator, and billing contact). Data type: String
externalId	Filter product orders by external identifier. Use this to locate orders using identifiers from external systems or legacy integrations (like legacy order numbers, or third-party reference IDs). Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the `offset` parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Example: Reading Payment Information from Orders

When you retrieve an order using GET or LIST operations, the payment object is included in the order line item response only if a payment profile is actively linked. If an order line item (OLI) does not have a linked payment profile, the payment field is not included in the response. When the payment object is present, it contains all four fields (id, paymentMethod, paymentMethodType, paymentReferenceId) representing the complete profile details.

Example GET response:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "ba_456"
        },
        "payment": {
          "id": "sys_id_payment_profile_123",
          "paymentMethod": "Credit Card",
          "paymentMethodType": "Visa",
          "paymentReferenceId": "REF-2024-001"
        }
      }
    ]
  }
}
```

Example GET response without payment profile:

```
{
  "productOrder": {
    "id": "order_003",
    "orderItem": [
      {
        "id": "order_line_003",
        "product": {
          "id": "prod_789"
        },
        "billingAccount": {
          "id": "ba_999"
        }
      }
    ]
  }
}
```

Example: Reading Billing Account Information from Orders

When you retrieve an order using GET or LIST operations, the billingAccount field is included in the order line item response with the system ID reference and any available billing account details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example GET response with billing account reference:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_456",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Example GET response with newly created billing account:

```
{
  "productOrder": {
    "id": "order_002",
    "orderItem": [
      {
        "id": "order_line_002",
        "product": {
          "id": "prod_456"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_789",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Product Order Open API - GET /sn_ind_tmt_orm/productorder

Retrieves all product orders.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

v3 updates for GET/LIST operations

When you retrieve product orders using GET or LIST operations in TMF 622 V3, the response now includes payment profile details and billing account information for each order line item. These new fields provide complete visibility into the payment methods and billing relationships associated with your orders, enabling you to manage billing, fulfillment, and reconciliation processes with comprehensive order data in a single API call.

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
account	Filter product orders by the associated account. Use this to retrieve all orders for a specific customer account or business unit. Data type: String
consumer (relatedParty)	Filter product orders by the consumer or end-user. Use this to retrieve orders for a specific consumer within a customer account, useful in multi-party or wholesale scenarios. Data type: String
contact	Filter product orders by an associated contact. Use this to find all orders linked to a specific person (like order coordinator, and billing contact). Data type: String
externalId	Filter product orders by external identifier. Use this to locate orders using identifiers from external systems or legacy integrations (like legacy order numbers, or third-party reference IDs). Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: All fields returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String Default: Don't order by state.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *Content-Range* header is `items 3-5`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

    "version": "1",
    "@type": "ProductOrder"
  }
]
```

Example: Reading Payment Information from Orders

When you retrieve an order using GET or LIST operations, the payment object is included in the order line item response only if a payment profile is actively linked. If an order line item (OLI) does not have a linked payment profile, the payment field is not included in the response. When the payment object is present, it contains all four fields (id, paymentMethod, paymentMethodType, paymentReferenceId) representing the complete profile details.

Example GET response:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "ba_456"
        },
        "payment": {
          "id": "sys_id_payment_profile_123",
          "paymentMethod": "Credit Card",
          "paymentMethodType": "Visa",
          "paymentReferenceId": "REF-2024-001"
        }
      }
    ]
  }
}
```

Example GET response without payment profile:

```
{
  "productOrder": {
    "id": "order_003",
    "orderItem": [
      {
        "id": "order_line_003",
        "product": {
          "id": "prod_789"
        },
        "billingAccount": {
          "id": "ba_999"
        }
      }
    ]
  }
}
```

Example: Reading Billing Account Information from Orders

When you retrieve an order using GET or LIST operations, the billingAccount field is included in the order line item response with the system ID reference and any available billing account details.

Example GET response with billing account reference:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_456",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
```

```
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Example GET response with newly created billing account:

```
{
  "productOrder": {
    "id": "order_002",
    "orderItem": [
      {
        "id": "order_line_002",
        "product": {
          "id": "prod_456"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_789",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Product Order Open API - GET /sn_ind_tmt_orm/productorder/{id}

Retrieves the specified product order.

> **Important:** Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - GET /sn_ind_tmt_orm/productorder/{id}.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

v3 updates for GET/LIST operations

When you retrieve product orders using GET or LIST operations in TMF 622 V3, the response now includes payment profile details and billing account information for each order line item. These new fields provide complete visibility into the payment methods and billing relationships associated with your orders, enabling you to manage billing, fulfillment, and reconciliation processes with comprehensive order data in a single API call.

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or external_id of the customer order to retrieve. Data type: String Table: Customer Order [sn_ind_tmt_orm_order]

Query parameters

Name	Description
account	Filter product orders by the associated account. Use this to retrieve all orders for a specific customer account or business unit. Data type: String
consumer (relatedParty)	Filter product orders by the consumer or end-user. Use this to retrieve orders for a specific consumer within a customer account, useful in multi-party or wholesale scenarios. Data type: String
contact	Filter product orders by an associated contact. Use this to find all orders linked to a specific person (like order coordinator, and billing contact). Data type: String
externalId	Filter product orders by external identifier. Use this to locate orders using identifiers from external systems or legacy integrations (like legacy order numbers, or third-party reference IDs). Data type: String
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String Default: Don't order by state.

Request body parameters (JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. Can be for any of the following reasons: • Missing query parameter • Invalid URI
404	Not found. The requested item wasn't found.

Example: Reading Payment Information from Orders

When you retrieve an order using GET or LIST operations, the payment object is included in the order line item response only if a payment profile is actively linked. If an order line item (OLI) does not have a linked payment profile, the payment field is not included in the response. When the payment object is present, it contains all four fields (id, paymentMethod, paymentMethodType, paymentReferenceId) representing the complete profile details.

Example GET response:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "ba_456"
        },
        "payment": {
          "id": "sys_id_payment_profile_123",
          "paymentMethod": "Credit Card",
          "paymentMethodType": "Visa",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          "paymentReferenceId": "REF-2024-001"
        }
      }
    ]
  }
}
```

Example GET response without payment profile:

```
{
  "productOrder": {
    "id": "order_003",
    "orderItem": [
      {
        "id": "order_line_003",
        "product": {
          "id": "prod_789"
        },
        "billingAccount": {
          "id": "ba_999"
        }
      }
    ]
  }
}
```

Example: Reading Billing Account Information from Orders

When you retrieve an order using GET or LIST operations, the billingAccount field is included in the order line item response with the system ID reference and any available billing account details.

Example GET response with billing account reference:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_456",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Example GET response with newly created billing account:

```
{
  "productOrder": {
    "id": "order_002",
    "orderItem": [
      {
        "id": "order_line_002",
        "product": {
          "id": "prod_456"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_789",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder/{id}

Updates the specified customer order.

v3 updates for GET/LIST operations

When you retrieve product orders using GET or LIST operations in TMF 622 V3, the response now includes payment profile details and billing account information for each order line item. These new fields provide complete visibility into the payment methods and billing relationships associated with your orders, enabling you to manage billing, fulfillment, and reconciliation processes with comprehensive order data in a single API call.

URL format

Default URL: `/api/sn_ind_tmt_orm/order/productOrder/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the customer order to update. Data type: String Table: Customer Order [sn_ind_tmt_orm_order]

}
```

Example: Reading Payment Information from Orders

When you retrieve an order using GET or LIST operations, the payment object is included in the order line item response only if a payment profile is actively linked. If an order line item (OLI) does not have a linked payment profile, the payment field is not included in the response. When the payment object is present, it contains all four fields (id, paymentMethod, paymentMethodType, paymentReferenceId) representing the complete profile details.

Example GET response:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "ba_456"
        },
        "payment": {
          "id": "sys_id_payment_profile_123",
          "paymentMethod": "Credit Card",
          "paymentMethodType": "Visa",
          "paymentReferenceId": "REF-2024-001"
        }
      }
    ]
  }
}
```

Example GET response without payment profile:

```
{
  "productOrder": {
    "id": "order_003",
    "orderItem": [
      {
        "id": "order_line_003",
        "product": {
          "id": "prod_789"
        },
        "billingAccount": {
          "id": "ba_999"
        }
      }
    ]
  }
}
```

Example: Reading Billing Account Information from Orders

When you retrieve an order using GET or LIST operations, the billingAccount field is included in the order line item response with the system ID reference and any available billing account details.

Example GET response with billing account reference:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_456",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Example GET response with newly created billing account:

```
{
  "productOrder": {
    "id": "order_002",
    "orderItem": [
      {
        "id": "order_line_002",
        "product": {
          "id": "prod_456"
        },
        "billingAccount": {
          "id": "sys_id_billing_account_789",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Product Order Open API - PATCH /sn_ind_tmt_orm/order/productOrder/{id}

Updates the specified customer order.

v3 updates for PATCH

- v3 of the *`Product Order Open`* API supports a `changeType=nonProduct` parameter to update order and line item administrative details without triggering product change workflows or state transitions.
- The `relatedParty` field also changed structure in v3:
  - The V2 item shape (`id/name/@referredType/@type`) only supported referencing an existing Account, Consumer, or Contact record by ID.
  - V3 introduces the `partyOrPartyRole` object in its place (`role/@type/partyOrPartyRole`) so the same field can support both reference and inline-creation patterns.

    On the POST endpoint, `partyOrPartyRole` can carry the attributes needed to create a new Account, Consumer, Contact, location, billing account, or payment record inline, rather

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

than requiring it to already exist. PATCH accepts either item shape but, unlike POST, only supports the reference pattern. See the request body parameters table below for the full field-by-field breakdown of both shapes.

relatedParty structure differences

The *relatedParty* field is present in both the deprecated V2 and the current V3 versions of the *Product Order Open* API, but the two versions use different structures for this field. Because V2 is deprecated, not removed, both structures may still be encountered depending on which endpoint version a caller is integrated with.

relatedParty field-by-field comparison

Aspect	V2	V3
Sample payload	`"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`	`"relatedParty": [ { "role": "String", "@type": "String", "partyOrPartyRole": {Object} } ]`
Party reference field	*relatedParty.id* — sys_id or external_id directly on the relatedParty item.	*relatedParty.partyOrPartyRole.id* — sys_id or external_id nested inside the *partyOrPartyRole* object.
Type annotation field	*relatedParty.@referredType* — possible values: `Consumer`, `Customer`, `CustomerContact`.	*relatedParty.@type* — possible values on PATCH: `Account`, `Consumer`, `Contact`.
Display name field	*relatedParty.name* — name of the account, customer, or consumer.	Not applicable on PATCH. (*partyOrPartyRole.name* exists but applies only to POST inline creation.)
Business role field	Not applicable. V2 has no equivalent field.	*relatedParty.role* — optional, not validated.
Record creation support	Not supported on PATCH.	Not supported on PATCH — only reference-existing-record patterns are accepted. (POST does support inline creation; this topic covers PATCH only.)
Not-found / invalid-reference behavior	Invalid Account: request rejected (`Invalid payload: Customer Account does not exist`). Invalid Consumer: request rejected (`Invalid payload: Consumer does not exist`). Invalid Contact, or a Contact not linked to the Account: request rejected (`Customer contact is not related to the account`).	Same three errors as V2, using the same message text.

	`"version": "String"`
	`}`

productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.internalId	Initial version of the product offering. The initial version is the sys_id of the fi version of the offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOrderItem.productOffering.internalVersion	Version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] table, fi version.
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.version	External version of the product offering Data type: String Table: In the external_version field of the Product Offering [sn_prd_pm_product_offering] table.
productOrderItem.productOrderItemRelationship	Conditional. Item-level relationships. If supplied, each entry requires an *id* an *relationshipType*. Data type: Array of Objects

Name	Description

	"productOrderItemRelationship": [
	{
	"id": "String",
	"relationshipType": "String"
	}
	]

productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] tabl Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Required. Type of relationship between the two line items. This information is u to identify the relationship hierarchy. Data type: String
productOrderItem.quantity	Number of the associated items to orde Data type: Number
productOrderItem.state	Current state of the product order item Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String

relatedParty	List of contacts for the order. Each con is an object in the array. Contains at least one item with customer account o consumer account information.
	
	Data type: Array of Objects
	"relatedParty": [
	{
	"id": "String",
	"name": "String",
	"@referredType": "String",
	"@type": "String"
	}
	]

Name	Description
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associa with the order. Table: Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.type	Type of customer. Possible values: • *Consumer* • *Customer* • *CustomerContact* Data type: String
requestedCompletionDate	Optional. Delivery date requested by th customer. Data type: String
requestedStartDate	Optional. Order start date requested by the customer. Data type: String
state	Current state of the order. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value i always `ProductOrder`. This informa is not stored. Data type: String

Example: cURL request

This example updates the channel for a product order.

```
curl -X PATCH
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder/8d75939453126010a795ddeeff7b126a" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
```

        }
    ],
    "state": "in_progress",
    "@type": "ProductOrder"
}
```

Example: Update Order Notes Only

Add or update internal notes at the order level without triggering product change workflows.

```
curl -X PATCH
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder/8d75939453126010a795ddeeff7b126a" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {
  "changeType": "nonProduct",
  "note": [
    {
      "text": "Billing contact updated per customer request."
    }
  ]
}
```

Response body:

```
HTTP 200 OK

{
  "id": "PO-0010047",
  "state": "in_progress",
  "href":
 "/api/sn_ind_tmt_orm/order/productOrder/a2b3c4d5e6f7g8h9"
}
```

Example: Update Order-Level Contact (V2 shape)

Change the primary contact for the entire order (e.g., billing contact, order coordinator) without modifying product specifications, using the V2 *relatedParty* shape (*id*+ *@referredType*).

```
curl -X PATCH
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder/8d75939453126010a795ddeeff7b126a" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {
  "changeType": "nonProduct",
  "relatedParty": [
    {
      "id": "8xc9d0e1f2g3h4i5j",
      "@referredType": "CustomerContact"
```

```
    }
  ]
}
```

Response body:

```
HTTP 200 OK

{
  "id": "PO-0010047",
  "state": "in_progress",
  "href":
 "/api/sn_ind_tmt_orm/order/productOrder/a2b3c4d5e6f7g8h9"
}
```

Example: Update Order-Level Contact (V3 shape)

The same update as the previous example, using the V3 *relatedParty* shape (*@type* + *partyOrPartyRole.id*). The referenced Contact record must already exist; PATCH does not create it.

```
curl -X PATCH
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder/8d75939453126010a795ddeeff7b126a" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {
  "changeType": "nonProduct",
  "relatedParty": [
    {
      "@type": "Contact",
      "partyOrPartyRole": {
        "id": "8xc9d0e1f2g3h4i5j"
      }
    }
  ]
}
```

Response body:

```
HTTP 200 OK

{
  "id": "PO-0010047",
  "state": "in_progress",
  "href":
 "/api/sn_ind_tmt_orm/order/productOrder/a2b3c4d5e6f7g8h9"
}
```

Example: Update Line Item Contact

Assign or change a technical contact for a specific product on the order (e.g., the person responsible for a particular service line item).

```
curl -X PATCH
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder/8d75939453126010a795ddeeff7b126a" \
```

productOrderItem.itemPrice	List that describes the price associated with the product. Data type: Array of Objects `"itemPrice": [ { "price": {Object}, "priceType": "String", "recurringChargePeriod": "String" } ]`
productOrderItem.itemPrice.price	Description of the price of the associated product. Data type: Object `"price": { "taxIncludedAmount": {Object} }`
productOrderItem.itemPrice.price.taxIncludeAmount	Description of the price of the associated product, including the tax. Data type: Object `"taxIncludedAmount": { "unit": "String", "value": Number }`
productOrderItem.itemPrice.price.taxIncludeAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludeAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring.

Name	Description
	Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String

productOrderItem.product	Description of the instance details of the product purchased by the customer.
	
	Data type: Object
	
	`"product": {`
	`"id": "String",`
	`"place": {Object},`
	`"productCharacteristic": [Array],`
	`"productSpecification": {Object},`
	`"relatedParty": {Object},`
	`"@type": "String"`
	`}`

productOrderItem.product.id	Unique identifier of the product sold. Located in the sys_id or sn_ind_tmt_orm_external_id field of the Product Inventory [sn_ind_tmt_orm_product_inventory] table. Data type: String

productOrderItem.product.place	Maps of the locations on which to install the product.
	
	Data type: Object
	
	`"place": {`
	`"id": "String",`
	`"@type": "String"`
	`}`

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. When employing the change action on a product order item (via the *`productOrderItem.action`* parameter), updating the request with a new place sys_id creates a move order, where the order is not changed but is fulfilled in a new location. Data type: String
productOrderItem.product.productCharacteristic	List of characteristics of the associated product.

Name	Description
	Data type: Array of Objects `"productCharacteristic": [ { "name": "String", "previousValue": "String", "value": "String", "valueType": "String" } ]`
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *`productOrderItem.action`* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productSpecification	Description of the product specification associated with the product. Data type: Object `"productSpecification": { "id": "String", "internalVersion": "String", "name": "String", "version": "String", "@type": "String" }`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the

Name	Description
	first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.productSpecification.internalVersion	Internal version of the product specification. Must match the value of *`version`* otherwise an error is thrown. Data Type: String Table: Product Specification [sn_prd_pm_product_specification]
productOrderItem.product.productSpecification.version	External version of the product specification. Must match the value of *`internalVersion`* otherwise an error is thrown. Data Type: String Table: Product Specification [sn_prd_pm_product_specification]
productOrderItem.product.relatedParty	Optional. List of contacts for line items. Data type: Array of Objects `"relatedParty": [ { "email": "String", "firstName": "String", "id": "String", "lastName": "String", "phone": "String", "@referredType": "String", "@type": "String" } ]`
productOrderItem.product.relatedParty.email	Email address of the contact.

Name	Description
	Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Required. Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact] table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.product.@type	Part of TMF Open API standard. Annotation for the product. This value is always `Product`. This information is not stored. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object `"productOffering": { "id": "String", "internalVersion": "String", "name": "String", "version": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOrderItemRelationship	Conditional. Item-level relationships. If supplied, each entry requires an *id* and *relationshipType*. Data type: Array of Objects `"productOrderItemRelationship": [ { "id": "String", "relationshipType": "String" } ]`
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Required. Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Data type: String
productOrderItem.quantity	Number of the associated items to order. Data type: Number
productOrderItem.state	Current state of the product order item. Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored.

Name	Description
	Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Contains at least one item with customer account or consumer account information. Data type: Array of Objects `"relatedParty": [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Table: Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.type	Type of customer. Possible values: • *Consumer* • *Customer* • *CustomerContact* Data type: String
requestedCompletionDate	Optional. Delivery date requested by the customer. Data type: String
requestedStartDate	Optional. Order start date requested by the customer. Data type: String
state	Current state of the order.

Name	Description
	Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String

Example: cURL request

The following code example updates the channel for a customer order.

```
curl -X PATCH
 "https://instance.servicenow.com/api/sn_ind_tmt_orm/productord
er/6be0a925c3a220103e2e73ce3640ddfe" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {
  "channel": [
    {
      "id": "1",
      "name": "Agent Assist"
    }
  ]
}
```

Response body.

Request body parameters (JSON) (continued)

Name	Description
	`"@referredType": "String"` `}`
productOrder.id	Required. Sys_id of the customer order to cancel. Data type: String Table: Customer Order [sn_ind_tmt_orm_order]
productOrder.href	URL of the customer order to cancel. Data type: String Default: Blank string
productOrder.@referredType	Value for this parameter should be `ProductOrder`. Data type: String Default: Blank string
requestedCancellationDate	Date to cancel the order. Data type: String Default: Blank string
@type	Value for this parameter should be `CancelProductOrder`. Data type: String Default: Blank string

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>. • Invalid order ID. • Invalid order ID: `This order is yet to be created in customer order table`. The cancel request was made for an order that has not been created yet. The order is in the Inbound Queue [sn_tmt_core_inbound_queue] table waiting for the scheduler to pick up the record.

Response body parameters (JSON)

Name	Description
cancellationReason	Reason for cancellation. Data type: String
href	URL of the cancelled order. Data type: String
id	Sys_id of the cancelled order. Data type: String

productOrder	Data about the product order.
	
	Data type: Object
	`"productOrder": {`

    "state": "done"
}
```

Product Order Open API - POST /sn_ind_tmt_orm/order/productOrder

Creates the specified customer order and customer order line items.

Once processed, records are created in the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

Version 3.0 updates

The *`Product Order`* POST endpoint now supports billing accounts and payment profiles at the order line item (OLI) level, and inline creation of related party entities within order requests. v3.0 contains the following features:

1. The system property, `sn_ind_tmt_orm.disableCharValueValidation`, indicates how to control characteristic value validation behavior for choice-type characteristics. The property isn't shipped by default and must be added manually.

   Behavior when set to:

   - true: Validation is inactive (disabled) and `characteristic_option_value` is set directly from the request payload without generating work notes.
   - false: (Default) Validates characteristic values against allowed choices and adds a work note to the record for any invalid value.

2. Related party entities: Previously in v1 and v2, all related parties were pre-created and referenced by a system ID (*`relatedParty.partyOrPartyRole`*). In v3, you can now pass entity data in the *`relatedParty`* array to create new parties or continue using the reference pattern to link to existing entity IDs. Inline creation allows you to create new entities in a single POST request and improve order processing time.

   When referencing or creating a new entity in a product order, note that:

   - *`@type`* is now required in all requests.
   - Pair *`id`* with *`@type`* when referencing existing entities.
   - Pass entity properties, like *`name`*, *`firstName`*, *`lastName`*, when creating new entities.

   See the *`relatedParty.@type`*parameter description for more information.

3. Billing accounts: TMF 622 Product Order API V3 now supports billing account associations at the order line item (*`productOrderItem`*) level. When you place a product order, you can associate a billing account with each line item by either referencing an existing billing account or providing billing account details that the system will create as a new record before persisting the order. This functionality streamlines order workflows by enabling automatic billing account creation and linking during the order placement process. Billing accounts are created before the order is persisted, ensuring data consistency and proper linkage to both the order line item and the associated Account party.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When referencing or creating a billing account in an order item, note that:

- *billingAccount.id* is required in all requests.
- Pass entity properties, like *name*, *@type*, *status*, *active* when creating new entities.

See the *productOrderItem.billingAccount* parameter description for more information.

4. The TMF 622 Product Order API V3 now supports payment profiles at the order line item (OLI) level. When you place a product order, you can associate a payment profile with one or more line items by either referencing an existing profile or creating a new one inline during the order request. The system automatically links the payment profile to the order line item's billing account. This functionality streamlines payment workflows by allowing payment method details to be captured and managed as part of the core order data. Payment information is returned in GET and LIST responses when an active profile is linked to the OLI. If no profile is linked, the payment field is omitted from the response.

   When referencing or creating a payment profile in an order item, note that:

   - *payment.id* is required in all requests.
   - Pass entity properties, like *paymentMethod*,*paymentMethodType*, and *paymentReferenceId*, when creating new entities.

   See the *productOrderItem.payment* parameter description for more information.

Status codes

Status code	Description
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • `The following Order Item characteristics does not exist: Review specification <characteristic.name> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <characteristic.name> with characteristic value: <characteristic.value>is invalid. Correct the characteristic values before approving the order.`
202	Accepted. Successful request for an order in asynchronous mode. That is, the request was made with the *mode* parameter set to `async` and the record is scheduled to be processed in the Inbound Queue [sn_tmt_core_inbound_queue] table.
400	Bad Request. Could be any of the following reasons: • `Invalid payload: Request body missing` - Payload was not passed in the request body. • `Invalid payload: productOrderItem is missing` - Product order line item object or JSON is missing. • `Invalid payload: productOrderItem id is missing` - The *id* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem action is missing` - The *action* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem productOffering is missing` - The product offering object or JSON is missing from the product order line item in the payload. • `Invalid payload: productOffering id is missing` - The *id* parameter is missing in the product order line item of the product offering object in the payload. • `Invalid payload: Product offering does not exist` - The product offering in the product order line item is not valid. • `Invalid payload: productOrderItem product is missing` - The product object or JSON in the product order line item is missing from the payload. • `Invalid payload: product productSpecification is missing` - The product specification object or JSON in the product order line item is missing from the payload. • `Invalid payload: productSpecification id is missing` - The *id* parameter in the product order line item of the product specification object is missing from the payload. • `Invalid payload: Product specification does not exist` - The product specification in the product order line item is not valid.

Example: Linking an Existing Payment Profile

To associate an existing payment profile with an order line item, include a payment object in your POST request with only the id field. Provide the system ID or External ID of the payment profile you want to link. The API locates the profile and establishes the association. When using the reference pattern, any other payment fields you include (paymentMethod, paymentMethodType, paymentReferenceId) are ignored. The system uses only the id to find and link the existing profile.

Request example:

```
{
  "productOrder": {
    "id": "order_001",
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
        },
        "billingAccount": {
          "id": "ba_456"
        },
        "payment": {
          "id": "sys_id_payment_profile_123"
        }
      }
    ]
  }
}
```

Example: Creating a Payment Profile Inline

To create a new payment profile during order placement, include a payment object with the payment details but omit the id field. Provide the paymentMethod, paymentMethodType, and

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

paymentReferenceId. The API creates the profile, links it to the order line item's billing account, and associates it with the OLI all in a single operation. Using the inline pattern, you don't need to pre-create the payment profile. This is useful when the payment information is only known at order time or when you want to streamline the order creation workflow without pre-staging payment records.

Request example:

```
{
  "productOrder": {
    "id": "order_002",
    "orderItem": [
      {
        "id": "order_line_002",
        "product": {
          "id": "prod_456"
        },
        "billingAccount": {
          "id": "ba_789"
        },
        "payment": {
          "paymentMethod": "Credit Card",
          "paymentMethodType": "Visa",
          "paymentReferenceId": "REF-2024-001"
        }
      }
    ]
  }
}
```

Example: Reference Existing Billing Accounts

To associate an existing billing account with an order line item, include a billingAccount object in your POST request with the id field set to the system ID or External ID of the billing account. The API locates the matching billing account and links it to the order line item. When using the reference pattern, any other billing account fields you include (name, status, active) are ignored. The system uses only the id to find and link the existing billing account.

Request example:

```
{
  "productOrder": {
    "id": "order_001",
    "relatedParty": [
      {
        "role": "Account",
        "@type": "Account",
        "partyOrPartyRole": {
          "@type": "PartyRef",
          "id": "sys_id_account_123"
        }
      }
    ],
    "orderItem": [
      {
        "id": "order_line_001",
        "product": {
          "id": "prod_123"
```

© 2026 ServiceNow, Inc. All rights reserved.

```
        },
        "billingAccount": {
          "id": "sys_id_billing_account_456",
          "@type": "BillingAccountRef"
        }
      }
    ]
  }
}
```

Example: Creating a Billing Account Inline

To create a billing account during order placement, include a billingAccount object with the id field set to the External ID for the new billing account, along with optional name, status, and active fields. The API creates the billing account, associates it with the Account referenced in relatedParty, and links it to the order line item before the order is persisted. Using the inline pattern, you do not need to pre-create the billing account. This is useful when billing account information is only known at order time or when you want to streamline the order creation workflow without pre-staging billing account records. The id field you provide becomes the External ID of the newly created billing account. The system also generates a system ID internally. The order creation response includes the system ID reference to the newly created billing account.

Request example:

```
{
  "productOrder": {
    "id": "order_002",
    "relatedParty": [
      {
        "role": "Account",
        "@type": "Account",
        "partyOrPartyRole": {
          "@type": "PartyRef",
          "id": "sys_id_account_789"
        }
      }
    ],
    "orderItem": [
      {
        "id": "order_line_002",
        "product": {
          "id": "prod_456"
        },
        "billingAccount": {
          "id": "ext_ba_2024_001",
          "name": "Project 2024 Billing",
          "@type": "BillingAccountRef",
          "status": "Active",
          "active": true
        }
      }
    ]
  }
}
```

Example: Create account, contact, and location

The following example demonstrates how to create new Account, Contact, and Location records inline during a product order request. This pattern is useful when you have new customer information at order time and want to create the parties as part of the order placement process.

Request body:

```
{
  "productOrder": {
    "id": "order_new_customer_001",
    "expectedCompletionDate": "2025-06-30T23:59:59.000Z",

Product Order Open API - POST /sn_ind_tmt_orm/productorder

Creates the specified customer order and customer order line items.

> **Important:** Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - POST /sn_ind_tmt_orm/order/productOrder.

Once processed, new records are created in the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder`

Request body parameters (JSON) (continued)

Name	Description

	`"partyOrPartyRole": {`
	`  "@type": "PartyRef",`
	`  "id": "String"`
	`}`
	
	Account creation Object structure:
	
	`"partyOrPartyRole": {`
	`  "@type": "PartyRef",`
	`  "id": "String",`
	`  "accountNumber": "Strin`
	`  "status": "String"`
	`}`
	
	Contact creation Object structure:
	
	`"partyOrPartyRole": {`
	`  "@type": "PartyRef",`
	`  "id": "String",`
	`  "firstName": "String",`
	`  "lastName": "String",`
	`  "email": "String"`
	`  }`
	
	Location creation Object structure:
	
	`"partyOrPartyRole": {`
	`  "@type": "PartyRef",`
	`  "id": "String",`
	`  "name": "String",`
	`  "address": "String",`
	`  "city": "String",`
	`  "postalCode": "String",`
	`  "country": "String"`
	`  }`

relatedParty.partyOrPartyRole.@type	Required. Indicates the type of referen `PartyRef`. Data type: String
relatedParty.partyOrPartyRole.accountNumber	Required for Account party types. Exte the Account. It provides a business-fac from the system-generated ID. Data type: String
relatedParty.partyOrPartyRole.address	Required for Location party types. Stre Example: "123 Main Street" Data type: String
relatedParty.partyOrPartyRole.city	Required for Location party types. City

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • `The following Order Item characteristics does not exist: Review specification <characteristic.name> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <characteristic.name> with characteristic value: <characteristic.value>is invalid. Correct the characteristic values before approving the order.`
400	Bad Request. Could be any of the following reasons: • `Invalid payload: Request body missing` - Payload was not passed in the request body. • `Invalid payload: productOrderItem is missing` - Product order line item object or JSON is missing. • `Invalid payload: productOrderItem id is missing` - The *id* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem action is missing` - The *action* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem productOffering is missing` - The product offering object or JSON is missing from the product order line item in the payload. • `Invalid payload: productOffering id is missing` - The *id* parameter is missing in the product order line item of the product offering object in the payload. • `Invalid payload: Product offering does not exist` - The product offering in the product order line item is not valid. • `Invalid payload: productOrderItem product is missing` - The product object or JSON in the product order line item is missing from the payload. • `Invalid payload: product productSpecification is missing` - The product specification object or JSON in the product order line item is missing from the payload.

Status codes (continued)

Status code	Description
	• `Invalid payload: productSpecification id is missing` - The *`id`* parameter in the product order line item of the product specification object is missing from the payload. • `Invalid payload: Product specification does not exist` - The product specification in the product order line item is not valid. • `Invalid payload: Product Inventory does not exist` - In a change order (action = change), the quantity of an item is greater than what is in stock. • `Invalid payload: Product inventory ID is missing` - In change order, the *`product.id`* is missing in the payload. • `Invalid payload: Sold Product is inactive` - In a change order, a product specified in the payload is inactive. • `Invalid payload: relatedParty is missing` - The related party object is missing from the payload. • `Invalid payload: Customer Account or Consumer is missing` - The related party customer or consumer object is missing from the payload. • `Invalid payload: Consumer does not exist` - The specified related party consumer does not exist in the ServiceNow instance. • `Invalid payload: Customer Account does not exist` - The specified related party customer does not exist in the ServiceNow instance. • `Invalid payload: Order creation failed` - Not able to create the requested order.

Response body parameters (JSON)

Name	Description
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String
channel	List of channels to use for selling the products. Data type: Array of Objects `"channel": [ { "id": "String", "name": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
channel.id	Unique identifier of the channel to use to sell the associated products. Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
externalId	External identifier for the customer order, such as a purchase order number. Data type: String
externalSystem	External system of the product order, appended with `TMF622`. For example, if the external system is ABC then enter the value in *`externalSystem`* as ABC-`TMF622`. Data Type: String
id	Sys_id of the customer order created for this request. Data type: String
note	Optional. List of additional notes made by the customer when ordering. Data type: Array of Objects `"note": [ { "text": "String" } ]`
note.text	Additional notes/comments made by the customer while ordering. Data type: String
productOderItem.actionReason	Reason for adding the order line item. Data type: String Stored in: The action_reason field of the sn_ind_tmt_orm_order_line_item table.

Name	Description
	Data type: Array of Objects `"itemPrice": [ { "price": {Object}, "priceType": "String", "recurringChargePeriod": "String" } ]`
productOrderItem.itemPrice.price	Description of the price of the associated product. Data type: Object `"price": { "taxIncludedAmount": {Object} }`
productOrderItem.itemPrice.price.taxIncludeAmount	Description of the price of the associated product, including the tax. Data type: Object `"taxIncludedAmount": { "unit": "String", "value": Number }`
productOrderItem.itemPrice.price.taxIncludeAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludeAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String
productOrderItem.product	Description of the instance details of the product purchased by the customer.

Name	Description

	Data type: Object
	`"product": {`
	`"id": "String",`
	`"place": {Object},`
	`"productCharacteristic": [Array],`
	`"productSpecification": {Object},`
	`"relatedParty": {Object},`
	`"@type": "String"`
	`}`

productOrderItem.product.@type	Part of TMF Open API standard. Annotation for the product. This value is always `Product`. This information is not stored. Data type: String
productOrderItem.product.id	Unique identifier of the product sold. Located in the sys_id or sn_ind_tmt_orm_external_id field of the Product Inventory [sn_ind_tmt_orm_product_inventory] table. This parameter is only returned if *`productOrderItem.action`* is `change` or `delete`. If both sys_id and external_id are present, the external_id is returned. Data type: String

productOrderItem.product.place	Maps of the locations on which to install the product.
	
	Data type: Object
	`"place": {`
	`"id": "String",`
	`"@type": "String"`
	`}`

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. When employing the change action on a product order item (via the *`productOrderItem.action`* parameter), updating the request with a new place sys_id creates a move order, where the order is not

Name	Description
	Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object `"productOffering": { "id": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. If both sys_id and external_id are present, the external_id is returned. Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table.

Project Portfolio Management API

The *`Project Portfolio Management`* API provides endpoints to bulk import cost plans and project tasks.

The PPM Standard plugin (com.snc.financial_planning_pmo) is required to access this API. The calling user must have the it_project_manager role.

This API is provided within the `now` namespace.

Project Portfolio Management - POST /now/ppm/insert_cost_plans

Creates cost plans in the Cost Plan [cost_plan] table.

URL format

Default URL: `/api/now/ppm/insert_cost_plans`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
end_fiscal_period	Required. Sys_id of the ending fiscal period for the cost plan. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Table: Fiscal Period [fiscal_period]
name	Required. Name of the cost plan. Data type: String
resource_type	Required. Sys_id of the resource type. Data type: String Table: Resource Type Definition [resource_type_definition]
start_fiscal_period	Required. Sys_id of the starting fiscal period for the cost plan. Data type: String Table: Fiscal Period [fiscal_period]
task	Required. Sys_id of the project or demand for the cost plan. Data type: String Table: Project [pm_project] or Demand [dmn_demand]
unit_cost	Required. Unit cost for the cost plan. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description

result	Object containing information about the status of the API request.
	
	Data type: Object
	
	`"result": {`
	`  "status": "String"`
	`}`

result.status	Status of the API request. Data type: String

Example: cURL request

This example imports two cost plans.

```

Project Portfolio Management - POST /now/ppm/insert_project_tasks

Creates a project and associated project tasks.

Projects are created in the Project [pm_project] table and project tasks are created in the Project Task [pm_project_task] table.

URL format

Default URL: `/api/now/ppm/insert_project_tasks`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
child_tasks	Array of tasks for the project. Each task is an object in the array. Data type: Array `"child_tasks": [ { "child_tasks": [Array], "external_id": "String", "short_description": "String" } ]`
child_tasks.child_tasks	Array of child tasks for the parent task. Each child task is an object in the array. Each child task can have its own array of child tasks. Data type: Array `"child_tasks": [ { "child_tasks": [Array], "external_id": "String", "short_description": "String"`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	`}` `]`
child_tasks.external_id	Unique identifier of the task from the external system. Data type: String
child_tasks.short_description	Short description of the task. Data type: String
end_date	End date for the project. Data type: String
external_id	Unique identifier of the project from the external system. Data type: String
short_description	Short description of the project. Data type: String
start_date	Start date for the project. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description

result	Object containing information about the status of the API request.
	
	Data type: Object
	
	`"result": {`
	`  "status": "String"`
	`}`

result.status	Status of the API request. Data type: String

Example: cURL request

This example imports a project with two tasks (zpq_T1 and zpq_T2). The first task contains several child tasks, and the second task has dependencies on the child tasks from the first task.

```

      "status": "success"
   }
}
```

Push Installation API

The *Push Installation* API provides endpoints to register and unregister the tokens that enable mobile devices to receive push notifications from an application.

A push notification is a text message that appears on a user's mobile device to alert them about something important or to ask them to perform an action.

When creating custom mobile applications, in order to set up Push notifications, you must register the device with the manufacturer's service. The service must know the address of a user's device so it can properly send notifications to that device using push tokens. The device also needs to be able to receive the notifications and act on them. For instructions on how to register a device and get a push token, refer to the device's operating systems developer documentation. For example, for Apple devices, refer to https://developer.apple.com/documentation/usernotifications/registering_your_app_with_apns.

Push Installation - POST /now/push/{pushApplicationName}/installation

Adds or updates tokens that enable devices to receive push notifications from the specified application.

URL format

Versioned URL: `/api/now/{api_version}/push/{pushApplicationName}/installation`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/now/push/{pushApplicationName}/installation`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
pushApplicationName	Name of the application for which to register the push notifications. This parameter must be the same as the value in the Name column for the associated application. Data type: String Table: Push Application [sys_push_application]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
platform	Platform on which to register the push notification. Data type: String Table: In the Name field of the Push Platform [sys_push_platform] table.
token	Token supplied by the device manufacturer, such as Apple, when the mobile application registers to receive push notifications. Data type: String Stored in: Push Notification Installation [sys_push_notif_app_install]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
None	

Example: Sample cURL request

```
curl -X POST \

 https://instance.servicenow.com/api/now/push/ServiceNowPushA
pp/installation \
--header "Content-Type: application/json" \
--user "username":"password" \
--data
 '{"platform":"Apple","token":"544836d77ac2e551bbf78204630509a7d
494fc87f52e85da52e5b5d42910e2cf"}' \
```

```
None
```

Push Installation - POST /now/push/{pushApplicationName}/removeInstallation

Deactivates the tokens that enable mobile devices to receive push notifications from the specified application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/now/{api_version}/push/{pushApplicationName}/removeInstallation`

Default URL: `/api/now/push/{pushApplicationName}/removeInstallation`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
pushApplicationName	Name of the application for which to unregister the push notifications. Data type: String Table: In the Name field for the associated application in the Push Application [sys_push_application] table.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
platform	Platform on which to register the push notification. Data type: String Table: In the Name field of the Push Platform [sys_push_platform] table.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *`application/json`*.

200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
None	

Example: Sample cURL request

```
curl -X POST \

 https://instance.servicenow.com/api/now/push/ServiceNowPushA
pp/removeInstallation \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{"platform":"Apple"}' \
```

```
None
```

Push Metrics API

The `Push Metrics` API provides endpoints that enable you to push raw Metric Intelligence data from an external source to the MID Server.

This API is based on client-side tools that push the raw data from the external source to the MID Server. The Metric Intelligence extension is required to be configured with the **Enable REST Listener** option enabled. For more information on setting up the MID Server, see Get started with Metric Intelligence.

For information on authentication requirements, see Configure the MID Web Server extension.

Push Metrics - POST /mid/sa/metrics

Pushes raw Metric Intelligence data from an external source to the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/mid/sa/metrics`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
ci2metric_id	List of key-value pairs to use to identify the configuration item (CI). It is formerly known as *`ci_identifier`*. The script continues to accept *`ci_identifier`*. Data type: Object
metric_type	Name of the metric. Data type: String
node	IP address, FQDN, name of the CI, or host. In the example below, the name of the Linux server where the disks are installed. Data type: String
resource_path	The path of the resource for which metric data is being collected. In the example below, `C:\` is the resource for which metric data is collected. Data type: String
source	Data source monitoring the metric type. Data type: String
timestamp	Epoch time stamp of the metric. Data type: Number Unit: Milliseconds
unit	Unit type that is associated with the source metric type. Table: Monitoring System Metric Types [sa_source_metric_type] Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
value	Value of the metric. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

The request body must be surrounded by square brackets, as shown in this example.

```
curl -X POST "https://<mid-server-host>/api/mid/sa/metrics"
-H "Content-Type: application/json"
-U "username":"password"
-d "[{
    "metric_type": "Disk C: % Free Space",
    "resource_path": "C:\\",
    "node": "lnux100",
    "value": 50,
    "timestamp": 1473183012000,
    "ci2metric_id": {
        "node": "lnux100"
    },
    "source": "Splunk"
}]"
```

Quote Management API

The *Quote Management* API provides endpoints to create, update, and retrieve customer quote data.

The *Quote Management Open* API is a ServiceNow implementation of the TM Forum Quote Management API REST specification. This implementation is based on https://www.tmforum.org/resources/standard/tmf648-quote-management-api-rest-specification-r19-0-0/.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations and field mappings.

The *Quote Management* API requires the Quote Management (com.sn_quote_mgmt) plugin and the quote_integrator role. This API belongs to the sn_tmf_api namespace. See Install Quote Management.

The *Quote Management* API creates or updates data in the following tables:

- Quote [sn_quote_mgmt_core_quote]
- Sales Agreement [sn_sales_agmt_core_sales_agreement]
- Quote Line Item [sn_quote_mgmt_core_quote_line_item]
- Quote Line Characteristic [sn_quote_mgmt_core_quote_line_characteristic]
- Quote Pricing Adjustment [sn_quote_mgmt_core_pricing_adjustment]

Quote Management API - DELETE /sn_tmf_api/quote_management_api/quote/{id}

Deletes the specified quote.

URL format

Versioned URL: `/api/sn_tmf_api/{api_version}/quote_management_api/quote/{id}`

Default URL: `/api/sn_tmf_api/quote_management_api/quote/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the quote to delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String Table: Quote [sn_quote_mgmt_core_quote]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	Successful. Request completed successfully and the specified quote was deleted. No content.
400	Bad Request. A bad request type or malformed request was detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Header	Description
None	

Example: cURL request

This example shows how to delete a quote.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/quote_management
_api/quote/cb15734fd5692a10f8774663edf0ac19" \
--request DELETE\
--header "Accept:application/json" \
--user 'username':'password'
```

Quote Management API – GET /sn_tmf_api/quote_management_api/quote

Retrieves all quotes.

This API retrieves quote information from the following related tables:

- Quote [sn_quote_mgmt_core_quote]
- Sales Agreement [sn_sales_agmt_core_sales_agreement]
- Quote Line Item [sn_quote_mgmt_core_quote_line_item]
- Quote Line Characteristic [sn_quote_mgmt_core_quote_line_characteristic]
- Quote Pricing Adjustment [sn_quote_mgmt_core_pricing_adjustment]

URL format

Versioned URL: `/api/sn_tmf_api/{api_version}/quote_management_api/quote`

Default URL: `/api/sn_tmf_api/quote_management_api/quote`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • quoteNumber • href • id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• description • externalId • expectedQuoteCompletionDate • version • @type Data type: String Default: All fields returned.
id	Filter results by quote sys_id. Table: Quote [sn_quote_mgmt_core_quote] Data type: String Default: Empty
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
contactMedium	List of contact mediums. Contact information related to the quote requester. `"contactMedium": [ { "city": "String", "country": "String", "locationId": "String", "mediumType": "String", "postCode": "String", "stateOrProvince": "String", "street": "String", "@type": "String" } ]`
contactMedium.city	City in which the quote requester resides. Data type: String
contactMedium.country	Country in which the quote requester resides. Data type: String
contactMedium.locationId	Sys_id of the location listed in the Location [cmn_location] table or custom address. Data type: String
contactMedium.mediumType	Type of contact medium, such as email address, telephone number, or postal address. Data type: String
contactMedium.postCode	Postal code of the quote requester. Data type: String
contactMedium.stateOrProvince	State or province in which the quote requester resides. Data type: String
contactMedium.street	Street address of the quote requester. Data type: String
contactMedium.@type	Type of medium per the TMF Open API standard. For example, `GeographicalAddressContactMedium`. Data type: String
description	Description of the quote. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
expectedQuoteCompletionDate	The expected date from quote supplier to be able to send back a response for this quote. Data type: String
externalId	Unique consumer-provided ID for the quote. Data type: String
href	Relative link to access the quote. Data type: String Default: Empty string
id	Sys_id of the requested quote. Table: Quote [sn_quote_mgmt_core_quote] Data type: String
note	List of notes associated with the quote. Data type: Array `"note": [ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.author	User name of the person that authored the associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Contents of the note. Data type: String
note.@type	This value is always `Note`. Data type: String
quoteDate	Date and time at which the quote was created. Data type: String
quoteItem	A list of quote items. Each quote item describes an action for a product to be quoted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	"quoteItem": [
	{
	"action": "String",
	"id": "String",
	"product": {Object},
	"productOffering": {Object},
	"quantity": Number,
	"state": "String",
	"@type": "String"
	}
	]
	Data type: Array of Objects

quoteItem.action	Action to be performed on this quote item (add, modify, remove, etc.). Data type: String
quoteItem.id	Sys_id of the quote item. Table: Quote Line Item [sn_quote_mgmt_core_quote_line_item] Data type: String

quoteItem.product	List of products included in the quote.
	"product": {
	"characteristic": "String",
	"specification": "String",
	"@type": "String"
	}
	Data type: Object

quoteItem.product.characteristic	List of product characteristics.
	
	Data type: Array of Objects
	"characteristic": [
	{
	"id": "String",
	"name": "String",
	"@type": "String",
	"value": "String"
	}
	]
	See Create product characteristics and characteristic options.

quoteItem.product.characteristic.id	Sys_id of the product characteristic. Table: Quote Line Characteristic [sn_quote_mgmt_core_quote_line_characteristic]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
quoteItem.product. characteristic.name	Name of the product characteristic. Data type: String
quoteItem.product. characteristic.@type	This value is always `StringCharacteristic`. Data type: String
quoteItem.product. characteristic.value	Value of the characteristic. Data type: String
quoteItem.product. specification	Detailed description of a tangible or intangible object made available externally in the form of a ProductOffering to customers or other parties playing a party role. Data type: String
quoteItem.product.@type	This value is always `Product`. Data type: String

quoteItem.productOffering	A product offering reference (ProductOfferingRef). A product offering represents entities that are orderable from the provider of the catalog.
	
	`"productOffering": {`
	`  "href": "String",`
	`  "name": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`
	
	Data type: Object

quoteItem. productOffering.href	Reference of the related entity. Data type: String
quoteItem. productOffering.id	Sys_id of product offering. Table: Product Offering [sn_prd_pm_product_offering] Data type: String
quoteItem. productOffering.name	Name of the related entity. Data type: String
quoteItem. productOffering.@type	This value is always `ProductOfferingRef`. Data type: String
quoteItem.quantity	Quantity asked for this quote item. Data type: Number

Name	Description
	Data type: String
requestedQuoteCompletionDate	A date time (DateTime). This value represents the date specified by the quote requester by which to receive a complete response for this quote. Data type: String
state	State of the quote item. Data type: String
@type	Type of resource. This value is always `Quote`. This information isn't stored. Data type: String

Example: cURL request

This example retrieves all quotes.

```
curl
 "https://instance.service-now.com/api/sn_tmf_api/quote_manageme
nt_api/quote" \
--request GET \
--header "Accept:application/json" \
--user 'userName':'password'
```

Response body.

```

Quote Management API – GET /sn_tmf_api/quote_management_api/quote/{id}

Retrieves a specified quote.

This API retrieves quote information from the following related tables:

- Quote [sn_quote_mgmt_core_quote]
- Sales Agreement [sn_sales_agmt_core_sales_agreement]
- Quote Line Item [sn_quote_mgmt_core_quote_line_item]
- Quote Line Characteristic [sn_quote_mgmt_core_quote_line_characteristic]
- Quote Pricing Adjustment [sn_quote_mgmt_core_pricing_adjustment]

URL format

Versioned URL: `/api/sn_tmf_api/{api_version}/quote_management_api/quote/{id}`

Default URL: `/api/sn_tmf_api/quote_management_api/quote/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the quote to retrieve. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Table: Quote [sn_quote_mgmt_core_quote]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI

Status codes (continued)

Status code	Description
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
contactMedium	List of contact mediums. Contact information related to the quote requester. `"contactMedium": [ { "city": "String", "country": "String", "locationId": "String", "mediumType": "String", "postCode": "String", "stateOrProvince": "String", "street": "String", "@type": "String" } ]`
contactMedium.city	City in which the quote requester resides. Data type: String
contactMedium.country	Country in which the quote requester resides. Data type: String
contactMedium.locationId	Sys_id of the location listed in the Location [cmn_location] table or custom address. Data type: String
contactMedium.mediumType	Type of contact medium, such as email address, telephone number, or postal address. Data type: String
contactMedium.postCode	Postal code of the quote requester. Data type: String
contactMedium.stateOrProvince	State or province in which the quote requester resides. Data type: String
contactMedium.street	Street address of the quote requester. Data type: String

Name	Description
contactMedium.@type	Type of medium per the TMF Open API standard. For example, `GeographicalAddressContactMedium`. Data type: String
description	Description of the quote. Data type: String
expectedQuoteCompletionDate	The expected date from quote supplier to be able to send back a response for this quote. Data type: String
externalId	Unique consumer-provided ID for the quote. Data type: String
href	Relative link to access the quote. Data type: String Default: Empty string
id	Sys_id of the requested quote. Table: Quote [sn_quote_mgmt_core_quote] Data type: String
note	List of notes associated with the quote. Data type: Array `"note": [ { "author": "String", "date": "String", "text": "String", "@type": "String" } ]`
note.author	User name of the person that authored the associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Contents of the note. Data type: String
note.@type	This value is always `Note`.

Quote Management API - PATCH /sn_tmf_api/quote_management_api/quote/{id}

Updates the specified quote.

URL format

Versioned URL: `/api/sn_tmf_api/{api_version}/quote_management_api/quote/{id}`

Default URL: `/api/sn_tmf_api/quote_management_api/quote/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the quote to update. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Path parameters (continued)

Name	Description
	Table: Quote [sn_quote_mgmt_core_quote]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
contactMedium	List of contact mediums. Contact information related to the quote requester. `"contactMedium": [ { "city": "String", "country": "String", "locationId": "String", "mediumType": "String", "postCode": "String", "stateOrProvince": "String", "street": "String", "@type": "String" } ]`
contactMedium.city	City in which the quote requester resides. Data type: String
contactMedium.country	Country in which the quote requester resides. Data type: String
contactMedium.locationId	Sys_id of the location listed in the Location [cmn_location] table or custom address. Data type: String
contactMedium.mediumType	Type of contact medium, such as email address, telephone number, or postal address. Data type: String
contactMedium.postCode	Postal code of the quote requester. Data type: String
contactMedium.stateOrProvince	State or province in which the quote requester resides. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
contactMedium.street	Street address of the quote requester. Data type: String
contactMedium.@type	Type of medium per the TMF Open API standard. For example, `GeographicalAddressContactMedium`. Data type: String
description	Description of the quote. Data type: String
note	List of notes associated with the quote. Data type: Array `"note": [ { "text": "String", "@type": "String" } ]`
note.text	Contents of the note. Data type: String
note.@type	This value is always `Note`. Data type: String
quoteDate	Date and time at which the quote was created. Data type: String
quoteItem	A list of quote items. Each quote item describes an action for a product to be quoted. `"quoteItem": [ { "action": "String", "id": "String", "product": {Object}, "productOffering": {Object}, "productRelationship": {Object}, "quantity": Number, "state": "String", "@type": "String" } ]` Data type: Array of Objects

Request body parameters (JSON) (continued)

Name	Description
quoteItem.action	Action to be performed on this quote item (add, modify, remove, etc.). Data type: String
quoteItem.id	Sys_id of the quote item. Table: Quote Line Item [sn_quote_mgmt_core_quote_line_item] Data type: String

quoteItem.product	List of products included in the quote.
	
	`"product": {`
	`  "characteristic": "String",`
	`  "specification": "String",`
	`  "@type": "String"`
	`}`
	
	Data type: Object

quoteItem.product.characteristic	List of product characteristics.
	
	Data type: Array of Objects
	
	`"characteristic": [`
	`  {`
	`  "id": "String",`
	`  "name": "String",`
	`  "@type": "String",`
	`  "value": "String"`
	`  }`
	`]`
	
	See Create product characteristics and characteristic options.

quoteItem.product.characteristic.id	Sys_id of the product characteristic. Table: Quote Line Characteristic [sn_quote_mgmt_core_quote_line_characteristic] Data type: String
quoteItem.product.characteristic.name	Name of the product characteristic. Data type: String
quoteItem.product.characteristic.@type	This value is always `StringCharacteristic`. Data type: String
quoteItem.product.characteristic.value	Value of the characteristic. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
quoteItem.product. specification	Detailed description of a tangible or intangible object made available externally in the form of a ProductOffering to customers or other parties playing a party role. Data type: String
quoteItem.product.@type	This value is always `Product`. Data type: String

quoteItem.productOffering	A product offering reference (ProductOfferingRef). A product offering represents entities that are orderable from the provider of the catalog.
	
	`"productOffering": {`
	`  "href": "String",`
	`  "name": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`
	
	Data type: Object

quoteItem. productOffering.href	Reference of the related entity. Data type: String
quoteItem. productOffering.id	Sys_id of product offering. Table: Product Offering [sn_prd_pm_product_offering] Data type: String
quoteItem. productOffering.name	Name of the related entity. Data type: String
quoteItem. productOffering.@type	This value is always `ProductOfferingRef`. Data type: String

quoteItem.productRelationship	A list of quote items. Each quote item describes an action for a product to be quoted.
	
	`"productRelationship": [`
	`  {`
	`  "product": "String",`
	`  "relationshipType": "String"`
	`  }`
	`]`
	
	Data type: Array of Objects

Request body parameters (JSON) (continued)

Name	Description
	Possible values: • Consumer • Customer • CustomerContact Data type: String
relatedParty.role	The role of the party in the context of the quote (e.g., Account, Contact, or Customer). Data type: String
relatedParty.@type	This value is always `ProductOfferingRef`. Data type: String
state	State of the quote item. Data type: String
@type	Type of resource. This value is always `Quote`. This information isn't stored. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
contactMedium	List of contact mediums. Contact information related to the quote requester. `"contactMedium": [ { "city": "String", "country": "String", "locationId": "String", "mediumType": "String", "postCode": "String", "stateOrProvince": "String", "street": "String", "@type": "String" } ]`
contactMedium.city	City in which the quote requester resides. Data type: String
contactMedium.country	Country in which the quote requester resides. Data type: String
contactMedium.locationId	Sys_id of the location listed in the Location [cmn_location] table or custom address. Data type: String
contactMedium.mediumType	Type of contact medium, such as email address, telephone number, or postal address. Data type: String
contactMedium.postCode	Postal code of the quote requester.

Request body parameters (JSON) (continued)

Name	Description
contactMedium.mediumType	Type of contact medium, such as email address, telephone number, or postal address. Data type: String
contactMedium.postCode	Postal code of the quote requester. Data type: String
contactMedium.stateOrProvince	State or province in which the quote requester resides. Data type: String
contactMedium.street	Street address of the quote requester. Data type: String
contactMedium.@type	Type of medium per the TMF Open API standard. For example, `GeographicalAddressContactMedium`. Data type: String
description	Description of the quote. Data type: String
externalId	Unique consumer-provided ID for the quote. Data type: String
href	Relative link to access the quote. Data type: String Default: Empty string
note	List of notes associated with the quote. Data type: Array `"note": [ { "text": "String", "@type": "String" } ]`
note.text	Contents of the note. Data type: String
note.@type	This value is always `Note`. Data type: String
quoteDate	Date and time at which the quote was created.

relatedParty.id	Sys_id of the quote table to get the account, contact, or customer. Table: Quote [sn_quote_mgmt_core_quote] Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
relatedParty.role	The role of the party in the context of the quote (e.g., Account, Contact, or Customer). Data type: String
relatedParty.@type	This value is always `ProductOfferingRef`. Data type: String
state	State of the quote item. Data type: String
@type	Type of resource. This value is always `Quote`. This information isn't stored. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. Possible reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>.

Response body parameters (JSON)

Name	Description
contactMedium	List of contact mediums. Contact information related to the quote requester. `"contactMedium": [ { "city": "String", "country": "String", "locationId": "String", "mediumType": "String", "postCode": "String", "stateOrProvince": "String", "street": "String", "@type": "String" } ]`
contactMedium.city	City in which the quote requester resides. Data type: String
contactMedium.country	Country in which the quote requester resides.

Reassign Assessment API

The *Reassign Assessment* API provides an endpoint to reassign an assessment instance to a different user.

The *Reassign Assessment* API runs in the sn_smart_asmt namespace. This API is offered by default with the base system.

Use this API to transfer assessment ownership when you need to change which user is responsible for completing an in-progress assessment. This is useful when assessments are initially assigned incorrectly, when an employee changes roles, or when you need to delegate assessment completion to a more appropriate team member.

Common use cases

- Transferring assessment responsibility when an employee changes roles or leaves the organization
- Correcting an incorrectly assigned assessment
- Delegating assessment completion to a more appropriate team member

Requirements

The *Reassign Assessment* API requires the following roles to access it:

- Users with the sn_smart_asmt.actor role who have been assigned the assessment (only the primary owner)
- Assessment requestors with the sn_smart_asmt.assessment_reader role
- Users with the sn_smart_asmt.assessment_admin role

Important constraints

- The assessment must be in the Open state to be reassigned. Assessments in other states can't be reassigned using this endpoint.
- The requesting user must have write access to the assessment's persona assignment record to perform the reassignment.
- An assessment can't be reassigned to the user it's currently assigned to.

Reassign Assessment - PATCH /{userId}

Reassigns an assessment instance to a different user. Use this endpoint when you need to transfer ownership of an in-progress assessment from the current assignee to another user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The assessment must be in the "Open" state to be reassigned. This endpoint updates the primary owner on the assessment instance persona record, effectively changing who is responsible for completing the assessment.

Common use cases include:

- Transferring assessment responsibility when an employee changes roles or leaves the organization.
- Correcting an incorrectly assigned assessment.
- Delegating assessment completion to a more appropriate team member.

Note: The requesting user must have write access to the assessment's persona assignment record to perform the reassignment.

URL format

Versioned URL: PATCH `/api/sn_smart_asmt/{api_version}/instance/asmt/{asmtInstanceId}/user/{userId}`

Default URL: PATCH `/api/sn_smart_asmt/instance/asmt/{asmtInstanceId}/user/{userId}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
asmtInstanceId	Required. Sys_id of the assessment instance to reassign. Table: Assessment Instance [sn_smart_asmt_instance] Maximum length: 32 Data type: String
userId	Required. Sys_id of the user to whom the assessment will be reassigned. Table: User [sys_user] Maximum length: 32 Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported values: application/json, application/xml, text/xml. Default: application/json.
Authorization	Authentication credentials. Use Basic authentication with base64-encoded username:password, or an OAuth 2.0 bearer token.
Content-Type	Not required for this endpoint as there is no request body, but if provided, supported values are: application/json, application/xml, text/xml.

Response headers

Header	Description
Content-Type	Data format of the response body. Matches the Accept header value or defaults to application/json.
X-Is-Logged-In	Flag that indicates whether the requesting user is logged in. Possible values: true, false.
X-Transaction-ID	Unique identifier for the transaction, useful for debugging and support requests.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Success. The assessment was successfully reassigned to the specified user. No response body is returned.
400	Bad Request. The request is missing required path parameters. Possible error messages: • `Assessment id is not passed.` • `User id is not passed.`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
403	Forbidden. The requesting user doesn't have authorization to reassign this assessment. This occurs when the user lacks write access to the assessment's persona assignment record. Error message: `User not authorized to reassign.`
404	Not Found. The specified resource doesn't exist. Possible error messages: • `Assessment instance not found.` • `User not found.` • `Persona assignment record for assessor is not available for the assessment.`
406	Not acceptable. The reassignment can't be completed due to business rule constraints. Possible error messages: • `Assessment can't be reassigned as it's not in {state_name} state` - Assessment must be in Open state. • `Assessment can't be reassigned as it's already assigned to the current user` • `Unable to reassign the assessment` - Generic failure during update.

Response body parameters (JSON or XML)

Name	Description
Object	Return object containing results of the reassignment. `{ "error": {Object}, "status": "String" }`
error	Object containing error details. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.message	Human-readable description of the error that occurred. Examples:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• `Assessment ID isn't passed.` • `User not authorized to reassign.` • `Assessment instance not found.` Data type: String
error.detail	Additional details about the error, if available. May be empty. Data type: String
status	Indicates the outcome of the request. Possible values: `"failure"` (when an error occurs). Successful responses (HTTP 200) return an empty body with no status field.

Example: cURL request

This PATCH example reassigns the assessment with ID `4d812fed47f8835060b5e65d416d431a` to the user with ID `62826bf03710200044e0bfc8bcbe5df1`.

```
curl
 "https://testsae.service-now.com/api/sn_smart_asmt/instance/asm
t/4d812fed47f8835060b5e65d416d431a/user/62826bf03710200044e0bfc8
bcbe5df1" \
--request PATCH \
--header "Accept:application/json" \
--user 'admin':'admin'
```

Response:

```
{
  "error": {
    "message": "Assessment can't be reassigned as it is already
 assigned to the current user",
    "detail": ""
  },
  "status": "failure"
}
```

Remote help request API

The *`Remote help request`* API provides endpoints to create, view, and fetch lists of IT service requests and their details from an electronic medical record (EMR) system. An IT service request is associated with a task type such as an incident in the ServiceNow instance.

You can only use this API when the EMR Help application (sn_ind_rmt_help) is installed from the ServiceNow Store. Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Role required to access the endpoints of this API: sn_ind_rmt_help.requester.

Remote help request - POST /remote_help_request/{req_defn_id}

Inserts electronic medical record (EMR) system data into the corresponding ServiceNow tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You need to specify a request definition ID in addition to the parameters for the task and additional data from the EMR system persisted in the request data table associated with the task. You pass two types of data into this endpoint. The first is the request data, which the endpoint inserts into the Remote Request Data [sn_ind_rmt_help_request_data] table and its associated child tables. The second is the task parameters of the IT service request, which the endpoint inserts into the Remote Request Parameter [sn_ind_rmt_help_request_param] table. Only data or fields that are defined in the request definitions are processed by the endpoint. For additional information on this data model, see EMR Help data model.

Records are identified using the request definition ID.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_defn_id	Unique ID of the request definition. Data type: String Table: In the ID column of the Remote Request Definition [sn_ind_rmt_help_request_defn] table.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description

request_data	Required. Name-value pairs of the request data from the EMR system to add in the Remote Request Data [sn_ind_rmt_help_request_data] table and its child tables.
	
	For example:
	
	`"request_data":{`
	`  "additional_info": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	`"application": "String",`
	`"environment": "String",`
	`"issue_type": "String",`
	`"millennium_username": "String",`
	`"position": "String",`
	`"server": "String",`
	`"session_recording_id": "String",`
	`"user_is_physician": "String",`
	`"work_station": "String"`
	`}`
	
	Note: Only pass parameters configured in a request definition in the *`request_data`* object. Any other parameters are ignored. To learn more, see Configure request definitions for EMR systems.
	
	Data type: Object

source	Required. Name of the EMR system invoking the endpoint as specified in a request definition. For example: `"source":"Cerner"` Data type: String

task_parameters	Required. Name-value pairs that describe the task parameters of the IT service request. Each element in the object corresponds to a column in the corresponding task tables such as the Incident [incident] table.
	
	For example:
	`"task_parameters": {`
	`"caller_id": "String",`
	`"contact_type": "String",`
	`"impact": "String",`
	`"short_description": "String"`
	`}`
	
	Note: Only pass parameters configured in a request definition in the *`task_parameters`* object. Any other parameters are ignored. To learn more, see Configure request definitions for EMR systems.
	
	Data type: Object

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Result object.
	
	Data type: Object
	
	`"result": {`
	`  "code": "String",`
	`  "error": "String",`
	`  "errorTranslated": "String",`
	`  "status": "String",`
	`  "task_id": "String",`
	`  "task_table": "String",`
	`  "warning": "String",`
	`  "warningTranslated": "String"`
	`}`

result.code	Application error code when the *result.status* is returned as `failure`. Data type: String
result.error	Error message that is included if the *result.status* is failure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	This message is in English only. Data type: String
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Valid values: • failure • success Data type: String
result.task_id	Sys_id of the created task. Data type: String
result.task_table	Name of the task table in which the task was created as defined in the request definition. Data type: String
result.warning	Optional warning message. May be included if the *`result.status`* is `success`. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message. Data type: String

Example: cURL request

Insert data from a Cerner EMR system.

```
curl
 "https://instance.servicenow.com/api/sn_ind_rmt_help/v1/remote_
help_request/sn_it_request"
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data "{
  "source":"Cerner",
  "task_parameters":{
    "short_description":"Unable to load patient data",
    "caller_id":"82d4ecb4db40e8100e28aa594b96195c",
    "impact":"2",
    "contact_type":"email"
  },
  "request_data":{
    "application":"Powerchart",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "server":"CTXCHSITN453",
    "environment":"CTX24",
    "issue_type":"Helpdesk",
    "millennium_username":"JOHN JASON",
    "position":"Lab Tech",
    "session_recording_id":"s5ds34dd96491b959a35010651896k",
    "user_is_physician":"Yes",
    "work_station":"PC354FLR3STATION7",
    "additional_info":"MRN 222333"
  }
}" \
--user "username":"password"
```

The following output shows both a successful response and an error response.

```
// Successful response
{
  "result": {
    "task_id": "75b09061db2cac100e28aa594b9619fa",
    "status": "success",
    "task_table": "incident",
    "warning": "Ignored invalid fields on table incident :
 test1",
    "warningTranslated": "Ignored invalid fields on table
 incident : test1"
  }
}
```

```
// Error response
{
      "result": {
      "status": "failure",
      "code": "1001",
      "error": "Invalid request definition: test_request1",
      "errorTranslated": "Invalid request definition:
 test_request1"
      }
      }
```

Remote help request - PUT /remote_help_request/{req_defn_id/task/{task_id}

Updates a record in the specified remote request data table for the task.

Enables you to specify a request definition ID in addition to the task sys_id to update a remote request that was created earlier.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id/task/{task_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id/task/{task_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Request body parameters (JSON) (continued)

Name	Description

task_parameters	Required. Name-value pairs that describe the task parameters of the IT service request. Each element in the object corresponds to a column in the corresponding task tables such as the Incident [incident] table.
	
	For example:
	
	`"task_parameters": {`
	`  "impact":"1",`
	`  "contact_type":"phone"`
	`}`
	
	Note: Only pass parameters configured in a request definition in the *task_parameters* object. Any other parameters are ignored. To learn more, see Configure request definitions for EMR systems.
	
	Data type: Object

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Result object.
	
	Data type: Object
	
	`"result": {`
	`  "code": "String",`
	`  "error": "String",`
	`  "errorTranslated": "String",`
	`  "status": "String",`
	`  "warning": "String",`
	`  "warningTranslated": "String"`
	`}`

result.code	Application error code when the *`result.status`* is returned as `failure`. Data type: String
result.error	Error message that is included if the *`result.status`* is failure. This message is in English only. Data type: String
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Valid values: • failure • success Data type: String
result.warning	Optional warning message. May be included if the *`result.status`* is `success`. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: cURL request

Update an IT service request created earlier in a Cerner EMR system

```
curl
 "https://instance.servicenow.com/api/sn_ind_rmt_help/v1/remote_
help_request/sn_it_request/task/207e57c1db60a410f50fdc5b4b9619
2e"
--request PUT \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data "{
  "source":"Cerner",
  "task_parameters":{
    "impact":"1",
    "contact_type":"phone"
  },
  "request_data":{
    "additional_info" : "Please contact my office for more
 information."
  }
}" \
--user "username":"password"
```

The following output shows both a successful response and an error response.

```
// Successful response
{
  "result": {
    "status": "success"
  }
}

// Error response
{
      {
      "result": {
      "status": "failure",
      "code": "1018",
      "error": "Record with sys_id
 207e57js1db60a410f50fdc5b4b96192e does not exist in table
 incident",
      "errorTranslated": "Record with sys_id
 207e57js1db60a410f50fdc5b4b96192e incident does not exist in
 table incident"
      }
      }
      }
```

Remote help request - GET /remote_help_request/{req_defn_id}

Fetches a list of tasks that match the specified ID and query filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Reference and choice type fields are always returned as JSON objects with the value and display_value.
- DateTime fields are returned as strings and always in UTC.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_defn_id	Unique ID of the request definition to update. Data type: String Table: In the ID column of the Remote Request Definition [sn_ind_rmt_help_request_defn] table.

Query parameters

Name	Description
query	Required. Encoded query used to filter the result set. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Return results.
	
	Data type: Object
	
	`"result": {`
	`  "code": "String",`
	`  "error": "String",`
	`  "errorTranslated": "String",`
	`  "status": "String",`
	`  "task_list": [Array],`
	`  "warning": "String",`
	`  "warningTranslated": "String"`
	`}`

result.code	Application error code when the *result.status* is returned as `failure`. Data type: String
result.error	Error message that is included if the *result.status* is failure. This message is in English only. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Possible values: • failure • success Data type: String
result.task_list	List of tasks. Data type: Array
result.warning	Optional warning message. May be included if the *`result.status`* is `success`. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message. Data type: String

Example: cURL request

Fetch data from a Cerner EMR system

```
curl
 "https://instance.servicenow.com/api/remote_help_request/v1/sn_
it_request/?query=active=true" \
--header "Accept: application/json" \
--header "Content-Type: application/json"
{
  "source":"Cerner",
} \
--user "username":"password"
```

The following output shows both a successful response and an error response.

```
// Successful response
{
  "result": {
    "status": "success",
    "task_list": [
      {
        "number": "INC0010096",
        "short_description": "Unable to load data - 1",
        "assigned_to": {
          "value": "7a381da2dbfb5410f50fdc5b4b9619f2",
          "display_value": "Abel Tuter (IT agent)"
        },
```

    ]
  }
}

// Error response
{
  "result": {
  "status": "failure",
  "code": "1019",
  "error": "Invalid query in the request for table incident",
  "errorTranslated": "Invalid query in the request for table
 incident"
}
```

Remote help request - GET /remote_help_request/{req_defn_id}/task/{task_id}

Fetches a single task as specified in the *task_id*.

Enables you to specify a request definition ID and task ID and retrieve the task details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Reference and choice type fields are always returned as JSON objects with the value and display_value.
- DateTime fields are returned as strings and always in UTC.
- Only additional comments are supported in journal type fields.
- Additional comments are passed back as a JSON array of objects. Each object represents a comment with *created_on*, *created_by*, and *value* fields. The latest comments are sent first.

URL format

Versioned URL: `/api/sn_ind_rmt_help/{api_version}/remote_help_request/{req_defn_id}/task/{task_id}`

Default URL: `/api/sn_ind_rmt_help/remote_help_request/{req_defn_id}/task/{task_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_defn_id	Unique ID of the request definition. Data type: String Table: In the ID column of the Remote Request Definition [sn_ind_rmt_help_request_defn] table.
task_id	Sys_id of the task to return. This field is provided by the EMR system. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Return results.
	
	Data type: Object
	
	`"result": {`
	`  "code": "String",`
	`  "error": "String",`
	`  "errorTranslated": "String",`
	`  "status": "String",`
	`  "task_parameters": {Object},`
	`  "warning": "String",`
	`  "warningTranslated": "String"`
	`}`

result.code	Application error code when the *result.status* is returned as `failure`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.error	Error message that is included if the *result.status* is failure. This message is in English only. Data type: String
result.errorTranslated	Optional localized error message. Data type: String
result.status	Status of the response. Possible values: • failure • success Data type: String
result.task_parameters	Required. Name-value pairs that describe the task parameters of the IT service request. Each element in the object corresponds to a column in the corresponding task tables such as the Incident [incident] table. Data type: Object
result.warning	Optional warning message. May be included if the *result.status* is `success`. This message is in English only. Data type: String
result.warningTranslated	Optional localized warning message. Data type: String

Example: cURL request

Fetch data from a Cerner EMR system

```
curl
 "https://instance.servicenow.com/api/sn_ind_rmt_help/v1/remote_

  }
}
```

Resource Inventory Open API

The *`Resource Inventory Open`* API provides endpoints to create, retrieve, and delete resources.

Use this API to manage resources in the following tables.

- Cable [cmdb_ci_cable]
- Equipment Holder [cmdb_ci_equipment_holder]
- Interface Card [cmdb_ci_interface_card]
- IP Address [cmdb_ci_ip_address]
- Logical Connection [cmdb_ci_ni_logical_path]
- Network Interface [cmdb_ci_ni_interface]
- Network Site [cmdb_ci_ni_site]
- Physical Connection [cmdb_ci_ni_physical_link]
- Strand [cmdb_ci_strand]
- Topology [cmdb_ci_topology]
- Tables specified by the *`sn_ni_core.equipment_tables`* sys_property, and any tables that extend the specified tables.
- Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
- Child tables that extend any of the following tables:
  - Cable [cmdb_ci_cable]
  - Equipment Holder [cmdb_ci_equipment_holder]
  - Strand [cmdb_ci_strand]

This API is included in the Network Inventory Core application, which is available on the ServiceNow Store.

This API is provided within the `sn_ni_core` namespace.

The calling user must have the sn_ni_core.inventory_integrator role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API can be extended to make customizations around required parameters, request body validation, and field mappings. For more information, see the Resource Inventory Open API Developer Guide.

The *Resource Inventory Open* API is a ServiceNow® implementation of the TM Forum Resource Inventory API REST specification. This implementation is based on the TMF639 Resource Inventory API User Guide v4.0.1, July 2020.

Resource Inventory Open API - DELETE /sn_ni_core/resource/{id}

Deletes a specified resource record.

URL format

Default URL: `/api/sn_ni_core/resource/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the resource. Located in one of the following tables depending on the type of resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder]. **Note:** Resources in the IP Address [cmdb_ci_ip_address] table can't be deleted using this API. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
215	Request successfully received for processing. The request will be completed asynchronously.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Resource deletion failed. The resource might be required by its related resources.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
None	

Example: cURL request

This example deletes a resource.

```
curl
 "https://instance.service-now.com/api/sn_ni_core/resource/54ada
05e875c15109a9c0f65dabb3586" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body.

```
" "
```

Resource Inventory Open API - GET /sn_ni_core/resource

Retrieves a list of all resource records.

URL format

Default URL: `/api/sn_ni_core/resource`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
@type	Required. Table name of the type of resource to retrieve. You can only retrieve one type of resource per API call. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description to use to filter resources. Only resources with the specified description are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• description • href • id • name • note • place • relatedParty • resourceCharacteristic • resourceRelationship • resourceSpecification • startOperatingDate Data type: String Default: Returns all fields.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Default: 20 Data type: Number
name	Name to use to filter resources. Only resources with the specified name are returned in the response. Data type: String
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
resourceSpecification.id	Resource specification sys_id to use to filter resources. The sys_id must be from a model in one of the following tables. • Equipment Holder Models [sn_ni_core_equipment_holder_product_model] • Equipment Models [sn_ni_core_equipment_product_model] • Interface Card Models [sn_ni_core_interface_card_product_model] • Logical Connection Models [sn_ni_core_logical_connection_product_model]

Query parameters (continued)

Name	Description
	• Network Interface Models [sn_ni_core_network_interface_product_model] • Physical Connection Models [sn_ni_core_physical_connection_product_model] Only resources with a model matching the specified sys_id are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
	Note: If the total number of records is more than 100,000 this header always returns 100,000.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
206	Partial content. The request was successfully processed and returned a partial range of content specified by a paginated call.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
@type	Type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder].

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
description	Description of the resource. Data type: String
href	Relative link to the resource record. Data type: String

id	Sys_id of the resource. Located in one of the following tables depending on the type of resource.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

name	Name of the resource. Data type: String
note	List of notes about the resource. Data type: Array of Objects `"note": [ { "text": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
note.text	The note text. Data type: String

place	Network site for the resource.
	
	This parameter is not supported for Network Site, Physical Connection, or Logical Connection resources.
	
	Data type: Object
	
	`"place": {`
	`  "@referredType": "String",`
	`  "href": "String",`
	`  "id": "String"`
	`}`

place.@referredType	Type of place. This value is always `GeographicAddress`. Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Sys_id of the place record. Data type: String Table: Network Site [cmdb_ci_ni_site]

relatedParty	Details about contacts for the resource.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "@referredType": "String",`
	`  "href": "String",`
	`  "id": "String",`
	`  "role": "String"`
	`  }`
	`]`

relatedParty.@referredType	Type of related party. Located in the in the **Type** field. Data type: String Table: In the type field of Group [sys_user_group] table.
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Sys_id of the related party record. Data type: String Table: Group [sys_user_group]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedParty.role	Role of the related party. Data type: String Table: In the Group type field of the Teams [cmdb_rel_team] table.
resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics. • For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required. • For Equipment Holder resources, a `Container Type` characteristic is required. Data type: Array of Objects `"resourceCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
resourceCharacteristic.name	Field name from the resource table specified by the *`@type`* parameter. You can't use the fields model_id, name, network_site, operation_notes, operational_status, short_description, start_date, or any sys_ prefixed fields such as sys_id. Data type: String
resourceCharacteristic.value	The value of the characteristic. Data type: String
resourceCharacteristic.valueType	Type of value. Valid values: • boolean • datetime • float • integer • ph_number • reference • string Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
resourceRelationship	List of related resources. The following resource types require specific related resources. • For Interface Card resources, a relationship to an Equipment Holder resource where Container Type is Slot or Sub Slot is required. • For Network Interface resources, a relationship to an Equipment or Interface Card resource is required. • For Equipment Holder resources where Container Type is Slot or Sub Slot, a relationship to an Equipment or Interface Card resource is required. Data type: Array `"resourceRelationship": [ { "relationshipType": "String", "resource": {Object} } ]`
resourceRelationship.relationshipType	Type of relationship between the two resources in the format `[this resource descriptor]::[related resource descriptor]`. For example, `Contains::Contained by` indicates that the related resource is the child of this resource. Valid values for the descriptors are located in the CI Relationship Type [cmdb_rel_type] table in the **Parent descriptor** and **Child descriptor** columns. Data type: String
resourceRelationship.resource	Details about the related resource. The related resource must be one of the following resource types. • Cable • Equipment • Equipment Holder • Interface Card • Logical Connection • Network Interface • Network Site • Physical Connection • Strand • Topology Data type: Object `"resource": { "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"href": "String"` `}`
resourceRelationship.resource.id	Sys_id of the related resource. Located in one of the following tables depending on the type of related resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder] Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String

resourceSpecification	Resource specification.
	
	Data type: Object
	`"resourceSpecification": {`
	`"id": "String"`
	`}`

resourceSpecification.id	Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model. • Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model] • Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
startOperatingDate	Date and time that the resource first started operating. Data type: String

Example: cURL request

This example retrieves the *name*, *id*, and *href* fields for the first five Network Site resource records.

```
curl
 "https://instance.service-now.com/api/sn_ni_core/resource?@type
=cmdb_ci_ni_site&fields=name%2Cid%2Chref&limit=5" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```

URL format

Default URL: `/api/sn_ni_core/resource/{id}`

Supported request parameters

Path parameters

Name	Description

id	Sys_id of the resource. Located in one of the following tables depending on the type of resource.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid values: • description • href • id • name • note • place

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• relatedParty • resourceCharacteristic • resourceRelationship • resourceSpecification • startOperatingDate Data type: String Default: Returns all fields.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.

Resource Inventory Open API - PATCH /sn_ni_core/resource/{id}

Updates a specified resource record.

URL format

Default URL: `/api/sn_ni_core/resource/{id}`

Supported request parameters

Path parameters

Name	Description

id	Sys_id of the resource. Located in one of the following tables depending on the type of resource.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
@type	Type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description of the resource. Data type: String
href	Relative link to the resource record. Data type: String
name	Name of the resource. Data type: String
note	List of notes about the resource.

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (XML or JSON) (continued)

Name	Description
	Note: Removing relatedParty records from a resource is not supported by this endpoint. Records can be manually deleted from the Teams [cmdb_rel_team] table.
relatedParty.@referredType	Type of related party. Located in the in the **Type** field. Data type: String Table: In the type field of Group [sys_user_group] table.
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Required if the *relatedParty* parameter is used. Sys_id of the related party record. Data type: String Table: Group [sys_user_group]
relatedParty.role	Role of the related party. Data type: String Table: In the Group type field of the Teams [cmdb_rel_team] table.
resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics. • For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required. • For Equipment Holder resources, a `Container Type` characteristic is required. Data type: Array of Objects `"resourceCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
resourceCharacteristic.name	Required if the *resourceCharacteristic* parameter is used. Field name from the resource table specified by the *@type* parameter. You can't use the fields model_id, name, network_site, operation_notes,

Request body parameters (XML or JSON) (continued)

Name	Description
	sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder] Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String

resourceSpecification	Resource specification.
	
	Data type: Object
	`"resourceSpecification": {`
	`  "id": "String"`
	`}`

resourceSpecification.id	Required if the *resourceSpecification* parameter is used. Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model. • Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model] • Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model] Data type: String
startOperatingDate	Date and time that the resource first started operating. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/merge-patch+json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
415	The request body is in an unsupported format or the Content-Type request header is set incorrectly.

Response body parameters (JSON or XML)

Name	Description
@type	Type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand)

Example: cURL request

This example updates the name of a resource.

```
curl
 "http://instance.servicenow.com/api/sn_ni_core/resource/583e7b9
5405dc910f8772175cacd7292" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type: application/merge-patch+json" \
--user 'username':'password' \
--data '{"name": "new name"}'
```

Response body.

```
{
  "href":
 "/api/sn_ni_core/resource/583e7b95405dc910f8772175cacd7292",

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
@type	Type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *`sn_ni_core.equipment_tables`* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String
description	Description of the resource. Data type: String
name	Required. Name of the resource. Data type: String
note	List of notes about the resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: Array of Objects `"note": [ { "text": "String" } ]`
note.text	Required if the *note* parameter is used. The note text. Data type: String
place	Required for Equipment Holder resources where Container Type is Cage, Bay, Cabinet, Rack, Line Up, or Inventory Model Bundle. Required for all Equipment resources. Network site for the resource. This parameter is not supported for Network Site, Physical Connection, or Logical Connection resources. Data type: Object `"place": { "@referredType": "String", "href": "String", "id": "String" }`
place.@referredType	Type of place. This value is always `GeographicAddress`. Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Required if the *place* parameter is used. Sys_id of the place record. Data type: String Table: Network Site [cmdb_ci_ni_site]
relatedParty	Details about contacts for the resource. Data type: Array of Objects `"relatedParty": [ { "@referredType": "String", "href": "String", "id": "String", "role": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	`}` `]`
relatedParty.@referredType	Type of related party. Located in the in the **Type** field. Data type: String Table: In the type field of Group [sys_user_group] table.
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Required if the *`relatedParty`* parameter is used. Sys_id of the related party record. Data type: String Table: Group [sys_user_group]

resourceCharacteristic	List of characteristics of the resource. The following resource types require specific resource characteristics.
	
	• For Physical Connection and Logical Connection resources, a `Port A` or `Port Z` characteristic is required. If the Lifecycle Stage Status of the resource is In Use, both `Port A` and `Port Z` are required.
	• For Equipment Holder resources, a `Container Type` characteristic is required.
	
	Data type: Array of Objects
	
	`"resourceCharacteristic": [`
	`{`
	`"name": "String",`
	`"value": "String",`
	`"valueType": "String"`
	`}`
	`]`

resourceCharacteristic.name	Required if the *`resourceCharacteristic`* parameter is used. Field name from the resource table specified by the *`@type`* parameter. You can't use the fields model_id, name, network_site, operation_notes, operational_status, short_description, start_date, or any sys_ prefixed fields such as sys_id. Data type: String
resourceCharacteristic.value	Required if the *`resourceCharacteristic`* parameter is used. The value of the characteristic.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
resourceCharacteristic.valueType	Type of value. Valid values: • boolean • datetime • float • integer • ph_number • reference • string Data type: String
resourceRelationship	List of related resources. The following resource types require specific related resources. • For Interface Card resources, a relationship to an Equipment Holder resource where Container Type is Slot or Sub Slot is required. • For Network Interface resources, a relationship to an Equipment or Interface Card resource is required. • For Equipment Holder resources where Container Type is Slot or Sub Slot, a relationship to an Equipment or Interface Card resource is required. Data type: Array `"resourceRelationship": [ { "relationshipType": "String", "resource": {Object} } ]`
resourceRelationship.relationshipType	Required if the *`resourceRelationship`* parameter is used. Type of relationship between the two resources in the format `[this resource descriptor]::[related resource descriptor]`. For example, `Contains::Contained by` indicates that the related resource is the child of this resource. Valid values for the descriptors are located in the CI Relationship Type [cmdb_rel_type] table in the **Parent descriptor** and **Child descriptor** columns. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

resourceRelationship.resource	Required if the *resourceRelationship* parameter is used.
	Details about the related resource. The related resource must be one of the following resource types.
	• Cable
	• Equipment
	• Equipment Holder
	• Interface Card
	• Logical Connection
	• Network Interface
	• Network Site
	• Physical Connection
	• Strand
	• Topology
	
	Data type: Object
	`"resource": {`
	`"id": "String",`
	`"href": "String"`
	`}`

resourceRelationship.resource.id	Required if the *resourceRelationship* parameter is used. Sys_id of the related resource. Located in one of the following tables depending on the type of related resource. • Interface Card [cmdb_ci_interface_card] • Logical Connection [cmdb_ci_ni_logical_path] • Network Interface [cmdb_ci_ni_interface] • Network Site [cmdb_ci_ni_site] • Physical Connection [cmdb_ci_ni_physical_link] • Tables specified by the *sn_ni_core.equipment_tables* sys_property, and any tables that extend the specified tables. • Tables that extend Equipment Holder [cmdb_ci_equipment_holder] Data type: String
resourceRelationship.resource.href	Relative link to the related resource record. Data type: String
resourceSpecification	Resource specification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	Data type: Object
	`"resourceSpecification": {`
	`  "id": "String"`
	`}`

resourceSpecification.id	Required if the *resourceSpecification* parameter is used. Sys_id of the associated model for the resource. Located in one of the following tables depending on the type of model. • Cable Models [sn_ent_cable_model] • Equipment Holder Models [sn_ent_nw_holder_model] • Equipment Models [sn_ent_nw_equipment_model] • Interface Card Models [sn_ent_nw_interface_model] • Logical Connection Models [sn_ent_logical_nw_connection_model] • Network Interface Models [sn_ent_nw_interface_model] • Physical Connection Models [sn_ent_physical_nw_connection_model] • Strand Models [sn_ent_strand_model] • Topology Models [sn_ent_network_topology_model] Data type: String
startOperatingDate	Date and time that the resource first started operating. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.
Location	URL of the created resource.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
215	Request successfully received for processing. The request will be completed asynchronously.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Response body parameters (JSON)

Name	Description
@type	Type of resource. Valid values: • `cmdb_ci_cable` (Cable) • `cmdb_ci_interface_card` (Interface Card) • `cmdb_ci_ip_address` (IP Address) • `cmdb_ci_ni_logical_path` (Logical Connection) • `cmdb_ci_ni_interface` (Network Interface) • `cmdb_ci_ni_site` (Network Site) • `cmdb_ci_ni_physical_link` (Physical Connection) • `cmdb_ci_strand` (Strand) • `cmdb_ci_topology` (Topology) • Name of a table specified by the *sn_ni_core.equipment_tables* sys_property, or name of a table that extends the specified tables. • Name of a table that extends Equipment Holder [cmdb_ci_equipment_holder]. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
description	Description of the resource. Data type: String
href	Relative link to the resource record. Data type: String

id	Sys_id of the resource. Located in one of the following tables depending on the type of resource.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *`sn_ni_core.equipment_tables`* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

name	Name of the resource. Data type: String
note	List of notes about the resource. Data type: Array of Objects `"note": [ { "text": "String" } ]`
note.text	The note text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

place	Network site for the resource.
	
	This parameter is not supported for Network Site, Physical Connection, or Logical Connection resources.
	
	Data type: Object
	
	`"place": {`
	`  "@referredType": "String",`
	`  "href": "String",`
	`  "id": "String"`
	`}`

place.@referredType	Type of place. This value is always `GeographicAddress`. Data type: String
place.href	Relative link to the place record. Data type: String
place.id	Sys_id of the place record. Data type: String Table: Network Site [cmdb_ci_ni_site]

relatedParty	Details about contacts for the resource.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "@referredType": "String",`
	`  "href": "String",`
	`  "id": "String",`
	`  "role": "String"`
	`  }`
	`]`

relatedParty.@referredType	Type of related party. Located in the in the **Type** field. Data type: String Table: In the type field of Group [sys_user_group] table.
relatedParty.href	Relative link to the related party record. Data type: String
relatedParty.id	Sys_id of the related party record. Data type: String Table: Group [sys_user_group]

Resource Inventory Open API - POST /sn_ni_core/resourceinventoryviatemplate

Creates a resource configuration item (CI) and related CI hierarchy based on a template.

Before calling this endpoint, you must create an inventory template in the Inventory Template [sn_ni_core_inventory_template] table. You can define the entire hierarchy of related CIs in an inventory template. You can then create all of the CIs and relationships via a single API request.

URL format

Default URL: `/api/sn_ni_core/resourceinventoryviatemplate`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description

overrides	List of columns to override and the values to use.
	
	Data type: Object
	
	`"overrides": {`
	`  "column_name": "String"`
	`}`

overrides.column_name	Required if the *`overrides`* parameter is used. Column name and value. Data type: String

parentId	Required. Sys_id of the parent CI. Located in one of the following tables depending on the type of parent CI.
	• Cable [cmdb_ci_cable]
	• Equipment Holder [cmdb_ci_equipment_holder]
	• Interface Card [cmdb_ci_interface_card]
	• IP Address [cmdb_ci_ip_address]
	• Logical Connection [cmdb_ci_ni_logical_path]
	• Network Interface [cmdb_ci_ni_interface]
	• Network Site [cmdb_ci_ni_site]
	• Physical Connection [cmdb_ci_ni_physical_link]
	• Strand [cmdb_ci_strand]
	• Topology [cmdb_ci_topology]
	• Tables specified by the *`sn_ni_core.equipment_tables`* sys_property, and any tables that extend the specified tables.
	• Tables that extend Equipment Holder [cmdb_ci_equipment_holder].
	• Child tables that extend any of the following tables:
	  ○ Cable [cmdb_ci_cable]
	  ○ Equipment Holder [cmdb_ci_equipment_holder]
	  ○ Strand [cmdb_ci_strand]
	
	Data type: String

templateId	Required. Sys_id of the template.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String Table: Inventory Template [sn_ni_core_inventory_template]
templateOverrides	List of template overrides. Data type: Array of Objects `"templateOverrides": [ { "overrideTemplateId": "String", "templateId": "String" } ]`
templateOverrides.overrideTemplateId	Required if the *`templateOverrides`* parameter is used. Available template sys_id. Data type: String
templateOverrides.templateId	Required if the *`templateOverrides`* parameter is used. Related template sys_id. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.
Location	URL of the created CI at the top of the hierarchy.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
201	Resource created.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Error. An error occurred with the request. For example, the request failed validation checks.

Response body parameters (JSON)

Name	Description

result	Result object with information about the created CIs.
	
	Data type: Object
	
	`"result": {`
	`  "sys_id": "String"`
	`}`

result.sys_id	Sys_id of the created CI at the top of the hierarchy. Data type: String

Example: cURL request

This example creates a CI hierarchy using a template.

```
curl
 "https://instance.service-now.com/api/sn_ni_core/resourceinvent
oryviatemplate" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{

Response Templates API

The `Response Templates` API provides endpoints to handle records in the Response Templates [sn_templated_snip_note_template] table.

This script include requires the Templated Responses plugin (com.sn_templated_snip), which is activated by default, and runs within the `sn_templated_snip` namespace.

For additional information on response templates, see Response templates.

Response Templates - POST /response_templates/get_templates

Returns records from the Response Templates [sn_templated_snip_note_template] table.

URL format

Default URL: `/api/sn_templated_snip/response_templates/get_templates`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
errorFormat	HTML formatting to use for errors. Data type: String Default: `"<span style='color:#ff0000'>${%s}</span>"`
includeEvaluatedBody	Flag that indicates whether to render the template variables. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	• false: Do not render the template variables. The response contains the message variables.
	
	For example:
	
	`Please note that your case ${number} has been escalated to ${assignment_group}.`
	
	• true: Renders the template variables and returns *evaluated_response* in the return results.
	
	For example:
	
	`Please note that your case INC100001 has been escalated to Facilities.`
	
	Data type: Boolean
	
	Default: false

limit	Maximum number of response templates to return. Data type: Number Default: 50
offset	For pagination, the index at which to start the search. Data type: Number Default: 0
opts	Parameters to pass to the sn_templated_snip.response_template extension point. The format and content of these parameters are dependent on the implementation of the extension point. For additional information on extension points, see Using extension points to extend application functionality. Data type: Object
recordId	Required. Sys_id of the record to use to render the variables in the response template. Data type: String
searchTerm	Text to use to filter the list of matching response templates. The endpoint performs a CONTAINS search of this text on the name and body fields and a STARTS WITH search on the short name field. For example, if the search term is "crash", the endpoint returns any response template that matches the query criteria and has crash in the name or body or the short name starts with crash.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name. Data type: String Default: Return all matching response templates.
tableName	Required. Name of the table to use to search the Response Templates table to locate corresponding response templates. For example, "incident" or "sn_hr_core_case". Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
result	Array of objects that list all of the templates that match the specified search criteria. Data type: Array `"result": [ {Object} ]`
result.<object>	Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name. Data type: Object `{ "evaluated_response": [Array], "name": "String", "short_name": "String", "short_name_match": Boolean, "sys_id": "String", "template_body": "String" }`
result.<object>.evaluated_response	Array that lists the results of the template evaluation. Data type: Array `"elevated_response":[ "error": [Array], "evaluated_body": "String", "success": Boolean ]`
result.<object>.evaluated_response.error	List of entries for each evaluation error that occurred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Array
	`"error":[`
	`"inAccessibleVariables": "String",`
	`"message": "String",`
	`"unEvaluatedVariables": "String"`
	`]`

result.<object>.evaluated_response.error.inAccessibleVariables	Variables in the response template body that could not be resolved. Data type: String
result.<object>.evaluated_response.error.message	Error message. Data type: String
result.<object>.evaluated_response.error.unEvaluatedVariables	Variables in the response template body that were not evaluated. Data type: String
result.<object>.evaluated_response.evaluated_body	Evaluated response template body in HTML. Data type: String
result.<object>.evaluated_response.success	Flag that indicates whether all of the variables rendered properly. Possible values: • true: All variables rendered properly. • false: Variables did not render properly. Data type: Boolean
result.<object>.name	Name of the response template. Data type: String
result.<object>.short_name	Short name of the response template. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.<object>.short_name_match	Flag that indicates whether an exact match occurred on the short name of the response template. Possible values: • true: Search term is an exact match. • false: Search term is not an exact match. Data type: Boolean
result.<object>.sys_id	Sys_id of the response template. Data type: String
result.<object>.template_body	Response template body in HTML. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.service-now.com/api/sn_templated_snip/respons
e_templates/get_templates" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"tableName\": \"sn_hr_core_case_total_rewards\",
  \"recordId\": \"2c9e43320b30220097432da0d5673a9c\"
}" \
--user "username":"password"
```

```
{
   "result": [
      {
         "sys_id": "2552c4ec0b03320036e62c7885673a5a",
         "name": "Escalation Notes - Total Rewards",
         "short_name": "Escalation Notes - Total Rewards",
         "template_body": "<p>Dear
 ${subject_person},<\/p>\n<p>Please note that your case
 ${number} has been escalated to ${assignment_group}. An
 agent will be assigned on your case and will keep you
 updated. If you have more questions please reach out to our
 team.<\/p>\n<p>Regards,<\/p>\n<p>${sys_updated_by}<\/p>"
      },

```
        "template_body": "<p>Thank you ${subject_person}
 for reaching out to the Global HR Services Team for
 your inquiry. As discussed over the phone, we have
 resolved your case ${number}.<\/p>\n<p>We are happy to
 help if you have more questions for our team. Please
 reach out and mention the case number ${number} on the
 call.<\/p>\n<p>Regards,<\/p>\n<p>${assigned_to}<\/p>"
      }
   ]
}
```

Sales Agreement API

The `Sales Agreement` API provides methods for creating a new sales agreement and retrieving an existing sales agreement of a given sys_id.

This API works with data in the Sales Agreement Management application, which managers, agents, and administrators use to generate sales agreements from quotes.

The `Sales Agreement` API runs in the sn_sales_agmt_core#namespace and requires three plugins to access it:

- Sales Agreement Data Model (com.sn_sales_agmt_core)#,
- Product Catalog Management Core (com.sn_prd_pm),
- Pricing (com.sn_csm_pricing)

The API also requires the sn_sales_agmt_core.sales_agreement_integrator#role to access it.

Most data is retrieved from or updated in the following tables upon calling this API and must be populated for its endpoints to work successfully:

- Account [customer_account],
- Product Offering [sn_prd_pm_product_offering],
- Product Model [cmdb_model],
- Quote [quote],
- Quote Line [quote_line],
- Price List [price_list]
- Account [customer_account]
- Price List [sn_csm_pricing_price_list]
- Product Model [cmdb_model]
- Product Offering [sn_prd_pm_product_offering]
- Quote [sn_quote_mgmt_core_quote]
- Quote Line [sn_quote_mgmt_core_quote_line_item]
- Sales Agreement#[sn_sales_agmt_core_sales_agreement]
- Sales Agreement Line#[sn_sales_agmt_core_sales_agreement_line]
- Sales Agreement Line Adjustments#[sn_sales_agmt_core_sales_agreement_line_adjustment]
- Sales Agreement Line Characteristics #[sn_sales_agmt_core_sales_agreement_line_characteristic]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sales Agreement - GET /api/sn_sales_agmt_core/salesagreement/{id}

Retrieve a sales agreement associated with a given sys_id.

URL format

Versioned URL: GET `/api/sn_sales_agmt_core/v1/salesagreement/{id}`

Default URL: GET `/api/sn_sales_agmt_core/salesagreement/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Required. Sys_id of the sales agreement to retrieve. Table: Sales Agreement#[sn_sales_agmt_core_sales_agreement] Data type: String

Query parameters

Name	Description

display_value	Optional. Returns the sales agreement properties in a chosen format.
	
	Valid values:
	
	• all: Response contains the *`name`*, *`label`*, *`value`*, *`display_value`*, and *`type`* properties for all fields#n the sales agreement. For example:
	
	`"state": {`
	`  "display_name": "String",`
	`  "label": "String",`
	`  "name": "String",`
	`  "type": "String",`
	`  "value": "String"`
	`}`
	
	• false: Response contains just the *`value`* property for all fields#n the sales agreement. For example:
	
	`"state": {`
	`  "value": "draft"`
	`}`
	
	• true: Response contains just the *`display_value`* property for all fields#n the sales agreement. For example:
	
	`"state": {`
	`  "display_value": "Draft"`
	`}`

Example: cURL request

The following example returns the sales agreement information associated with the given sys_id and the optional *`display_value`* parameter set to `true` so that display values are provided in the response body.

```
curl
 "https://instance.service-now.com/api/sn_sales_agmt_core/v1/sal
esagreement/eb853fe5b5165610f87786d3c2884335?display_value=true"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
```

Response body. The response shows the display_values for every parameter of the given sales agreement.

```

Example: cURL request

The following example returns the sales agreement information associated with the given sys_id and the optional *display_value* parameter set to `true` so that display values are provided in the response body.

```
curl
 "https://instance.service-now.com/api/sn_sales_agmt_core/v1/sal
esagreement/eb853fe5b5165610f87786d3c2884335?display_value=true"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
```

Response body. The response shows the display_values for every parameter of the given sales agreement.

Sales Agreement - POST /api/sn_sales_agmt_core/salesagreement

Creates a new sales agreement#according to details provided in the request body.

URL format

Versioned URL: `/api/sn_sales_agmt_core/v1/salesagreement`

Default URL: `/api/sn_sales_agmt_core/salesagreement`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required. Sys_id of the account. Table: Account [customer_account]

Sales Cart REST API

The *`Sales Cart`* REST API gives an external system programmatic control of a ServiceNow sales cart. Operations include creating a cart and its line items, reading a cart or line item,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

removing a cart or line item, and submitting a cart. Submitting a cart causes Order Management to convert it into an order.

The *Sales Cart* REST API (*sales_cart*) is the checkout engine behind headless commerce front ends built on Order Management. For example, a telecommunications self-service portal can own its own user interface and call ServiceNow only for cart state, pricing, and order submission. The resource declares eight routes on API version 1: get carts by encoded query, create cart, update cart, get cart, get cart line item, submit order, delete cart, and delete cart line item.

This API is provided within the `sn_sales_cart` namespace (Sales Cart scoped application). Order-line entity attributes and mappings are owned by the `sn_ind_tmt_orm` (Order Management) scope; context variables by `sn_csm_ctxrul_mgt`.

The calling user must hold one of the following roles: `sn_customerservice.consumer` (an authenticated end customer acting on their own cart), or the pre-existing customer/cart-editor roles behind ACL `496fa8cbffca83503e5cffffffffff5a` (an account/contact-based business cart).

Two capabilities were added to this API in the 2026 September Order Management bundle:

- Consumer persona support: Before this release the API could only be called on behalf of an account and contact — a business-to-business shape. An authenticated end customer holding `sn_customerservice.consumer` can now call the API for their own cart. Cart attributes that were previously derived from the account are now derived from the consumer record instead: currency from the consumer's country, price list from a currency-only pricing context, and shipping and billing address from the consumer's own address fields.
- Billing account and payment profile on the cart line: The cart line item can now carry a billing account reference (*billing_account*) and a payment profile reference (*payment_profile*), assignable independently per line. This lets a cart containing a personal subscription and a business subscription bill each line to a different account. Both values propagate automatically to the order line when the cart is submitted.

The two new cart-line fields install only when the `com.snc.billing_account` plugin is present. On an instance without that plugin, these two request/response parameters don't exist.

Call order

The endpoints are stateful with respect to the cart record and must be called in this sequence:

1. Create the cart, and optionally its line items, with the create-cart endpoint. The response returns the cart identifier.
2. Optionally discover an existing cart first with the get-carts-by-encoded-query endpoint, rather than creating one. This is useful for resuming an abandoned basket.
3. Modify the cart with the update endpoint. Add further line items by calling create-cart again with the existing cart identifier, or remove a line item with the delete-line-item endpoint. Reassigning the billing account or payment profile on a line after creation is done through the update endpoint.
4. Read the cart or a line item to render current state, then submit the cart to create the order. The cart moves out of draft state. Delete and write operations available to a consumer no longer apply, because the consumer ACLs on those operations are conditioned on `state=draft`.

Association with other APIs and special processing

Cart creation and cart-to-order conversion are executed through the Lead-to-Cash entity mapping framework rather than by direct field assignment in the REST handler. Two mapping

configurations are involved: `sn_l2c_cart_to_cart`, applied at cart creation, and `sn_l2c_cart_to_order`, applied at submission. A field is only accepted or propagated if an `sn_l2c_core_entity_attribute` record exists for it on the source table and an `sn_l2c_core_entity_attribute_mapping` record wires it to the target attribute.

One naming asymmetry is deliberate and matters to anyone reading the payloads: the field is *`payment_profile`* on the cart line and *`payment`* on the order line. Both reference the Payment Profile [`sn_billing_account_payment_profile`] table. The *`billing_account`* field keeps the same name on both sides.

Extending the API

To make an additional cart-line or order-line field readable and writable through the API, register it with the Lead-to-Cash entity mapping framework. This also makes it propagate from cart to order. Use `sn_l2c_core_entity_attribute` plus `sn_l2c_core_entity_attribute_mapping` records for `sn_l2c_cart_to_cart`, `sn_l2c_cart_to_order`, or both. No change to the REST handler script is required. Install the target attribute definition before or together with the mapping rows that reference it. Installing mapping rows first resolves the target reference to null, and the mapping silently does nothing.

Sales Cart - POST /sn_sales_cart/sales_cart

Creates a sales cart in draft state with an optional set of line items, or adds line items to a cart that already exists.

Whether a cart is created or line items are added is decided by whether the payload carries an existing cart identifier:

- With an identifier, the endpoint adds lines to that cart (Case B).
- Without an identifier, it creates a new cart (Case A).

The response flag *`isCartCreated`* tells the caller which path ran.

Brazil release updates

A caller holding `sn_customerservice.consumer` may now create a cart for themselves by supplying a consumer reference instead of an account and contact. For a consumer cart, the endpoint derives currency from the consumer record's country and derives the price list from a currency-only pricing context. When *`shipping_city`* is not supplied, it also defaults shipping and billing address from the consumer record's own address fields and sets *`same_as_shipping_address`* to true.

A consumer may hold only one draft cart at a time. If a draft cart already exists for the consumer, the request is rejected (409). The identifier of the existing cart is returned so the caller can continue with it instead. The same guard already applied per contact for account-based carts.

URL format

Default URL: `/api/sn_sales_cart/sales_cart`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
attributes	Required. Cart header attributes. Each member is itself an object of the form `{ "value": "<value>" }`, not a bare scalar. Data type: Object
attributes.account	Conditional. Sys_id of the account for a business cart. Data type: String
attributes.consumer	Conditional. Sys_id of the consumer record the cart belongs to. Required for a consumer cart; mutually exclusive in practice with the *`attributes.account`*/*`attributes.contact`* pair. Table: Consumer [csm_consumer] Data type: String
attributes.contact	Conditional. Sys_id of the contact for a business cart. Required for an account-based cart. Data type: String
attributes.currency	Currency code for the cart. Data type: String Default: Server resolution
attributes.opened_by	Sys_id of the user the cart is opened by. Data type: String Table: User [sys_user] Default: Defaults to the contact for an account cart
attributes.price_list	Sys_id of the price list applied to the cart. Data type: String Default: Resolved by the server from the default price list for the resolved currency
attributes.same_as_shipping_address	Flag that indicates whether the billing address is the same as the shipping address.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Possible values: • true: The billing address is the same as the shipping address. • false: The billing address is different from the shipping address. Data type: Boolean Default: true when the server defaults the address block; otherwise unset
attributes.shipping_city	Shipping city. Data type: String Default: Defaulted from the consumer or account primary address
attributes.state	Cart state. Set to `draft` on creation. Consumer write and delete ACLs apply only while the cart is in draft. Data type: String Default: draft
cartId	Sys_id of an existing draft cart. Supply it to add line items to that cart instead of creating a new one (Case B). Data type: String
line_items	Line items to create on the cart. Each element carries a product offering reference plus the cart-line attributes described in the following rows. Data type: Array of Objects
line_items[].billing_account	Sys_id of the billing account this line is billed to. Nullable and independent per line item. Propagates to the order line field of the same name on submission. Table location: Billing Account [sn_billing_account_billing_account] Data type: String
line_items[].payment_profile	Sys_id of the payment profile used for this line. Propagates to the order line field named payment, not payment_profile. Table location: Payment Profile [sn_billing_account_payment_profile]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
skip_pricing	Flag that indicates whether the pricing engine is bypassed for this request. Possible values: • true: The pricing engine is bypassed for this request. • false: The pricing engine runs normally for this request. Data type: Boolean Default: false

Headers

Request headers

Header	Description
Accept	Data format of the response body. Only *`application/json`* is supported; the resource declares `produces: application/json`.
Content-Type	Data format of the request body. Only *`application/json`* is supported; the resource declares `consumes: application/json`.
Authorization	Standard ServiceNow inbound REST authentication (Basic or OAuth 2.0 bearer token). The authenticated user must hold one of the roles named in the Sales Cart REST API concept topic. Unauthenticated calls return 401.

Response headers

Header	Description
Content-Type	Always *`application/json`*.

Status codes

Status codes

Status code	Description
201	Created. The cart was created, or line items were added to the supplied cart.
400	Bad request. Missing or invalid input. Covers CONTACT_REQUIRED (no contact on an account cart), CONTACT_NOT_FOUND, CONSUMER_NOT_FOUND, and INVALID_PRODUCT_OFFERINGS (one or more product offerings did not resolve).
401	Unauthorized. The request was not authenticated.
404	Not found. In Case B, the supplied cart identifier does not resolve to a cart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
409	Conflict. Either a draft cart already exists for this consumer or contact (DRAFT_CART_EXISTS), or the target cart in Case B is not in draft state. The response data carries the identifier of the conflicting cart.
500	Internal server error. Returned when the handler's catch block traps an unexpected failure, including CART_CREATION_FAILED.

Response body parameters (JSON)

Response body parameters (JSON)

Name	Description
data	Supplementary error context. Data type: Object
error	Human-readable error message, present on failure only. Data type: String
result	Container for the response payload. Data type: Object
result.cartId	Sys_id of the created or updated cart. Data type: String
result.isCartCreated	Flag that indicates which path the request took. Possible values: • true: A new cart was created (Case A). • false: Line items were added to an existing cart (Case B). Data type: Boolean

Example: cURL request

A consumer creates a cart with a single line item, assigning a billing account and a payment profile to that line. No currency, price list, or address is supplied, so the server resolves all three from the consumer record.

```
curl --location --request POST
 'https://<instance>.service-now.com/api/sn_sales_cart/sales_ca
rt' \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --user '<consumer_user>:<password>' \
  --data '{
    "attributes": {
```

```
      "consumer": { "value":
 "b1f2c3d4e5f60718293a4b5c6d7e8f90" }
    },
    "skip_pricing": false,
    "line_items": [
      {
        "product_offering": { "value":
 "9a8b7c6d5e4f30211f0e9d8c7b6a5f40" },
        "quantity": { "value": "1" },
        "billing_account": { "value":
 "c1a1b2c3d4e5f60709acbffffffffff01" },
        "payment_profile": { "value":
 "d2b1c3a4e5f60718293a4b5c6d7e8f91" }
      }
    ]
  }'
```

Response body.

```
HTTP/1.1 201 Created
Content-Type: application/json

{
  "result": {
    "cartId": "7f3e2d1c0b9a8877665544332211ffee",
    "isCartCreated": true
  }
}
```

Sales Cart - PATCH /sn_sales_cart/v1/sales_cart

Updates an existing draft cart: header attributes, line item attributes, line characteristics, pricing adjustments, and child line items.

This is the endpoint a portal uses between cart creation and submission. Typical uses include changing a quantity, switching a configuration option, correcting a shipping address, or reassigning the billing account on a line. The cart must be in draft state. A non-draft cart is rejected with 409.

Line-level create and delete behavior differs by nesting depth. At the top level, a line item must carry a valid existing sys_id. New line creation and deletion are not supported at that level. Lines whose sys_id is missing or -1 are silently skipped rather than rejected. For nested child line items, an empty or -1 sys_id is an insert signal, and `"action": "Delete"` is a removal.

URL format

Versioned URL: `/api/sn_sales_cart/v1/sales_cart`

Default URL: `/api/sn_sales_cart/sales_cart`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
skip_pricing	Flag that indicates whether the pricing engine is bypassed for this update. Possible values: • true: The pricing engine is bypassed for this update. • false: The pricing engine runs normally for this update. Data type: Boolean Default: false

Request body parameters (JSON)

Name	Description
attributes	Cart header attributes to change, each as a `{ "value": "<value>" }` wrapper keyed by database field name. Omitted members are left untouched. Examples: shipping_location, shipping_city, notes. Data type: Object
cartId	Required. Sys_id of the draft cart to update. Data type: String
lineItems	Line items to update. Each element identifies an existing cart line and carries the nested collections described in the following rows. Elements whose sys_id is missing or `-1` are silently skipped at the top level. Data type: Array of Objects
lineItems.attributes	Line item fields to change, keyed by database field name, each a `{ "value": ... }` wrapper. Examples: quantity, term_month. Also accepts billing_account and payment_profile. Data type: Object
lineItems.attributes.billing_account	Sys_id of the billing account to assign to this line. Whether the API applies the same reference qualifier server-side as the form does was not confirmed. Table location: Billing Account [sn_billing_account_billing_account] Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
lineItems.attributes.payment_profile	Sys_id of the payment profile to assign to this line. Table location: Payment Profile [sn_billing_account_payment_profile] Data type: String
lineItems.characteristics	Line characteristics to change. Each element carries a sys_id wrapper and an attributes object. Data type: Array of Objects
lineItems.lineItems	Child line items of this line. Unlike the top level, this collection supports insert and delete: • A sys_id of `""` or `"-1"` signals a new child line. • An element carrying `"action": "Delete"` removes one. Data type: Array of Objects
lineItems.lineItems.action	Operation to perform on the child line. Valid value: `Delete` Omit for an update or insert. Data type: String
lineItems.pricingAdjustments	Pricing adjustments to change. Each element carries a sys_id wrapper and an attributes object. Data type: Array of Objects
lineItems.sys_id	Required on every top-level element. Sys_id of the existing cart line item, as a `{ "value": "<sys_id>" }` wrapper. Data type: Object

Headers

Request headers

Header	Description
Accept	Data format of the response body. Only *`application/json`* is supported; the resource declares `produces: application/json`.
Content-Type	Data format of the request body. Only *`application/json`* is supported; the resource declares `consumes: application/json`.

Request headers (continued)

Header	Description
Authorization	Standard ServiceNow inbound REST authentication (Basic or OAuth 2.0 bearer token). The authenticated user must hold one of the roles named in the Sales Cart REST API concept topic. Unauthenticated calls return 401.

Response headers

Header	Description
Content-Type	Always *application/json*.
X-Total-Count	Not emitted by this endpoint.

Status codes

Status codes

Status code	Description
200	Success. The cart was updated. The response reports which line items were matched and changed.
400	Bad request. Missing cartId, an invalid request body, or an invalid product offering sys_id on a new child line.
401	Unauthorized. The request was not authenticated.
404	Not found. The cart does not resolve, or the caller can't see it.
409	Conflict. The cart is not in draft state.
500	Internal server error. An Entity Pipeline service failure or an unexpected error.

Response body parameters (JSON)

Response body parameters (JSON)

Name	Description
result	Container for the update outcome. Data type: Object
result.cartId	Sys_id of the cart that was updated. Echoes the request. Data type: String
result.isCartUpdated	Flag that indicates whether the update was applied. Possible values: • true: The update was applied. • false: The update was not applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON) (continued)

Name	Description
	Data type: Boolean
result.lineItemIds	Sys_ids of the top-level line items matched and changed by this request. **Note:** Provide only the matched lines, not every root line the Entity Pipeline loaded. Don't treat it as a full cart line inventory. Data type: Array of Strings
error	Present on failure only, in the form `{ "message": "<string>" }`. **Note:** This differs from the create-cart endpoint, which returns error as a bare string. Data type: Object

Example: cURL request

A consumer changes the quantity on one cart line and reassigns that line to a different billing account and payment profile in the same call. Only the members supplied are compared and changed.

```
curl --location --request PATCH
 'https://<instance>.service-now.com/api/sn_sales_cart/v1/sales_
cart' \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --user '<consumer_user>:<password>' \
  --data '{
    "cartId": "7f3e2d1c0b9a8877665544332211ffee",
    "skip_pricing": false,
    "attributes": {
      "shipping_city": { "value": "Zurich" }
    },
    "lineItems": [
      {
        "sys_id": { "value":
 "1a2b3c4d5e6f708192a3b4c5d6e7f809" },
        "attributes": {
          "quantity": { "value": "3" },
          "billing_account": { "value":
 "c5a1b2c3d4e5f60709acbffffffffff05" },
          "payment_profile": { "value":
 "e3c2d4b5f60718293a4b5c6d7e8f90a2" }
        }
      }
    ]
  }'
```

Response body.

```
HTTP/1.1 200 OK
Content-Type: application/json
```

```

Sales Cart - GET /sn_sales_cart/v1/sales_cart

Returns a list of sales carts matching an arbitrary encoded query applied to the Sales Cart [sn_sales_cart] table.

Use this endpoint for discovery. An interface that does not already hold a cart identifier uses it to find the caller's carts. For example, filter on `state=draft` to resume an abandoned basket.

URL format

Versioned URL: `/api/sn_sales_cart/v1/sales_cart`

Default URL: `/api/sn_sales_cart/sales_cart`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
sysparm_query	Encoded query applied to the Sales Cart [sn_sales_cart] table, in standard GlideRecord encoded query syntax (for example `state=draft` or `state=draft^consumer=<sys_id>`). Data type: String Default: All carts readable by the caller are returned

Request body parameters (JSON)

Status codes

Status code	Description
200	Success. Returns the matching carts, including an empty list when nothing matches. Also returned when individual carts were skipped because they failed to expand.
400	Bad request. Not emitted by the handler for a malformed encoded query — no validation of sysparm_query syntax was found.
401	Unauthorized. The request was not authenticated.
403	Forbidden. The caller lacks execute access to the REST resource.
500	Internal server error. Returned when the Entity Pipeline service can't be obtained, with the INTERNAL_SERVER_ERROR message.

Response body parameters (JSON)

Response body parameters (JSON)

Name	Description
result	Container for the result set. Data type: Object
result.carts	Matching carts, each expanded into a full cart instance including its line items. A line item carries *billing_account* and *payment_profile*. Returns an empty array when nothing matches. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON) (continued)

Name	Description
result.count	Number of carts in the *carts* array. Counts successfully expanded carts, not rows matched by the query. A cart that failed to expand is omitted from both. Data type: Number
error	Present on failure only. The 500 case returns the INTERNAL_SERVER_ERROR constant message. Data type: String

Example: cURL request

A portal resumes a shopper's session by looking for an existing draft cart. The consumer sends state=draft; the query rule silently adds the ownership restriction, so the response contains only their own draft cart.

```
curl --location --request GET \

 'https://<instance>.service-now.com/api/sn_sales_cart/v1/sales_
cart?sysparm_query=state%3Ddraft' \
  --header 'Accept: application/json' \
  --user '<consumer_user>:<password>'
```

Response body.

```
HTTP/1.1 200 OK
Content-Type: application/json

      }
    ]
  }
}
```

Sales Cart - GET /sn_sales_cart/sales_cart/{cart_id}

Returns a sales cart with its line items, so a headless interface can render current cart state without keeping a copy of it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_sales_cart/sales_cart/{cartId}`

Supported request parameters

Path parameters

Name	Description
cartId	Sys_id of the cart to return. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

Request headers

Header	Description
Accept	Data format of the response body. Only *`application/json`* is supported; the resource declares `produces: application/json`.
Content-Type	Data format of the request body. Only *`application/json`* is supported; the resource declares `consumes: application/json`. Not required on this GET/DELETE request.
Authorization	Standard ServiceNow inbound REST authentication (Basic or OAuth 2.0 bearer token). The authenticated user must hold one of the roles named in Sales Cart REST API. Unauthenticated calls return 401.

Response headers

Header	Description
Content-Type	Always *`application/json`*.

Status codes

Status codes

Status code	Description
200	Success. The cart and its line items were returned.

© 2026 ServiceNow, Inc. All rights reserved.

Status codes (continued)

Status code	Description
401	Unauthorized. The request was not authenticated.
403	Forbidden. The caller lacks a role granted execute access to the REST resource.
404	Not found. No cart matches the identifier, or the caller can't see it.
500	Internal server error.

Response body parameters (JSON)

Response body parameters (JSON)

Name	Description
result	The cart record with its line items. Data type: Object
result.currency	Currency code resolved for the cart. For a consumer cart this was derived from the consumer's country. Data type: String
result.price_list	Sys_id of the price list applied to the cart. Data type: String
result.state	Cart state. A consumer can write to or delete the cart only while this is draft. Data type: String
<line items>[].billing_account	The billing account assigned to the line, from sn_billing_account_billing_account. Data type: String or Object
<line items>[].payment_profile	The payment profile assigned to the line, from sn_billing_account_payment_profile. Data type: String or Object

Example: cURL request

A consumer reads their own cart to render the checkout screen, including which billing account and payment profile each line is currently assigned to.

```
curl --location --request GET
 'https://<instance>.service-now.com/api/sn_sales_cart/sales_ca
rt/7f3e2d1c0b9a8877665544332211ffee' \
  --header 'Accept: application/json' \
  --user '<consumer_user>:<password>'
```

Response body.

        "payment_profile": "d2b1c3a4e5f60718293a4b5c6d7e8f91"
      }
    ]
  }
}
```

Sales Cart - GET /sn_sales_cart/sales_cart/{cartId}/line-item/{lineItemId}

Returns a single cart line item from a given parent cart.

This endpoint is useful when an interface needs to refresh one product row after a change rather than re-reading the whole cart.

URL format

Default URL: `/api/sn_sales_cart/sales_cart/{cartId}/line-item/{lineItemId}`

Supported request parameters

Path parameters

Name	Description
cartId	Sys_id of the parent cart. Data type: String
lineItemId	Sys_id of the cart line item to return. Table location: Sales Cart Line Item [sn_sales_cart_line_item] Data type: String

Query parameters

Name	Description
None

    "payment_profile": "d2b1c3a4e5f60718293a4b5c6d7e8f91"
  }
}
```

Sales Cart - POST /sn_sales_cart/sales_cart/{cart_id}/submitOrder

Converts a draft cart into an order, propagating billing account and payment profile data from the cart lines onto the order lines. Billing data captured on the cart is copied to the order.

Propagation is performed by the Lead-to-Cash `sn_l2c_cart_to_order` mapping configuration, not by the handler. For each cart line, *`billing_account`* is copied to the order line's *`billing_account`* and *`payment_profile`* is copied to the order line's payment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Both target fields already existed on the order line dictionary; the Brazil release added only the entity attribute definitions and mapping rows that connect them. There is nothing for the caller to pass; the propagation is a side effect of submission.

A cart line with *billing_account* and *payment_profile* unset produces an order line with those fields empty, without error. Behavior for cascaded child order lines was explicitly left out of scope. The source integration test asserts only that propagation occurred, not that exactly one order line carries the values.

Once the cart leaves draft state, the consumer write and delete ACLs no longer apply to it, so submission is effectively the end of consumer-side mutation.

URL format

Default URL: `/api/sn_sales_cart/sales_cart/{cartId}/submitOrder`

Supported request parameters

Path parameters

Name	Description
cartId	Sys_id of the draft cart to submit. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
Accept	Data format of the response body. Only *application/json* is supported; the resource declares `produces: application/json`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Always *application/json*.

Status codes

Status codes

Status code	Description
200 or 201	Success. The order and its order lines were created.
400	Bad request. Invalid or unsubmittable cart.
401	Unauthorized. The request was not authenticated.
403	Forbidden. The caller lacks execute access to the REST resource.
404	Not found. The cart does not resolve, or the caller can't see it.
409	Conflict. The cart is not in a submittable state, for example already submitted.
500	Internal server error, including a failure inside the cart-to-order mapping. If the order-line attribute definitions from app-ind-tmt-orm are absent, the mapping targets resolve to null and billing data is silently not propagated rather than erroring.

Response body parameters (JSON)

Response body parameters (JSON)

Name	Description
result	Container for the submission outcome. Data type: Object
result.orderId	Sys_id of the created order. Data type: String
result.orderLines	Created order lines. Each carries *billing_account* and *payment*, propagated from the corresponding cart line's billing_account and payment_profile. Data type: Array of Objects
error	Error message on failure. Data type: String

```

Response body.

```
HTTP/1.1 200 OK
Content-Type: application/json

{ "result": { "deleted": true } }
```

Sales CRM Pricing API

The `Sales CRM Pricing` API provides methods to calculate prices for transaction lines containing products.

The `Sales CRM Pricing` is used to calculate prices for transaction lines containing products. It also supports computing rollups at the transaction header level by aggregating values from all lines. In addition, the Pricing Engine can be used within a configurator to determine the price of products as they are selected or configured.

The caller has flexibility through various controls to specify whether the engine should compute:

- Prices only
- Costs
- Adjustments (discounts, markup)
- Rollups at line and/or header level

This API belongs to the sn_csm_pricing namespace and requires the [sn_csm_pricing.pricing_integrator] role.

Prerequisite: You need to set up a product offering that consists of these properties:

- Required:
  - Product offering characteristics
  - Unit of measure
  - Price list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Price list lines
- Attribute adjustments
- Optional
  - Context variables
  - Rule matrices

External ID support

With external ID resolution, you can use your own identifiers or codes for selected reference fields instead of a ServiceNow sys_id. For example, you might be integrating with other CRM or ERP systems that do not have a ServiceNow sys_id for its objects. You can use external codes for the following reference fields, including but not limited to:

- Product offering
- Price list
- Unit of measure

Note: External ID resolution applies to REST API pricing requests only and does not affect UI-based flows. Pricing execution can use internal system IDs, external IDs, or a combination of both IDs in pricing requests as configured in the context variable mapping.

Context variable configuration and mapping

As an admin, before submitting a REST API pricing request, create the context variables that define the reference fields for external IDs or codes that are participating in external ID resolution. You also add the external IDs or codes to the reference tables called by pricing requests. For details on defining context variables, see External ID support in Sales CRM Pricing API.

How external IDs work in pricing requests

Request intake

The caller sends a Pricing REST API request that can include:

- External IDs or codes
- ServiceNow sys_ids
- A combination of both

Requests must include (`"use_external_code": true`) in the settings object to enable external code resolution.

Sales CRM Pricing - DELETE - /api/sn_csm_pricing/v1/pricingengine/pricing_context/{pricing_context_id}

Terminate a session with a given ID that was established during a configurator session.

URL format

Versioned URL: `/api/sn_csm_pricing/v1/pricingengine/pricing_context/{pricing_context_id}`

Default URL: `/api/sn_csm_pricing/pricingengine/pricing_context/{pricing_context_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
pricing_context_id	ID from pricing engine request when scope is configurator.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
status	Indicates the overall outcome of the requested operation.
message	A human-readable message that provides more detail about the status. It is useful for logging or for displaying a confirmation to an end-user. In this case, it explicitly states that the deletion was successful.
pricing_context_id	The unique of the resource that was affected by the operation. By returning the ID, the API confirms exactly which pricing context has been deleted, which helps prevent ambiguity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

```
curl -i -X DELETE \
'https://instance.servicenow.com/api/sn_csm_pricing/v1/pricingen
gine/pricing_context/{pricing_context_id}' \
--user 'username:password'
```

Sales CRM Pricing - POST /api/sn_csm_pricing/{api_version}/pricingengine/computePrice

Enables callers to compute the price of products specified in the request payload. The pricing settings included in the payload determine and control the execution flow of the Pricing Engine, such as whether to apply validations, adjustments, or rollups.

URL format

Versioned URL: `/api/sn_csm_pricing/{api_version}/pricingengine/computePrice`

Default URL:

Request body parameters (XML or JSON)

Name	Description
header	Required. Contains transaction-level details, line items, currency, price transaction date. Data type: Object `{ "header": { "source_system": "String", "requesting_record_id": "String", "currency": "String", "lineItems": [Array], "pricelist": "String", "transaction_date": "String" } }`
header.source_system	Required. The system initiating the request. Data type: String Example: `ServiceNow REST API`
header.requesting_record_id	Required. Unique identifier for this request. Data type: String Example: `QT0001101`
header.currency	Required. Currency code for pricing. Supports only ServiceNow curren Data type: String Example: USD
header.transaction_date	Required. The date and time of the transaction. Format: Format: glide_date_time value, such as `yyyy-MM-dd HH:mm` Data type: datetime Example: `2023-12-18 23:37:11`
header.pricelist	Required. The default pricelist ID to use for the transaction. Data type: String Example: `19d29513d0e63110f8770dbf976be122`
header.lineItems	Required. Array of line-item objects detailing products, quantities, and `{ "lineItems": [ { "line_id": "String", "pricelist": "String", "product_offering": "String",`

Request body parameters (XML or JSON) (continued)

Name	Description
	`"periodicity": "String", "quantity": "String", "unit_of_measure": "String", "transaction_date": "String", "account_tier": "String", "selected": "Boolean", "top_product_offer": "String", "parent_product_offer": "String", "settings": {Object} } ] }`
header.lineItems[].line_id	Required. Unique identifier for this line item. Data type: String Example: `CONNECTEDC1100`
header.lineItems[].pricelist	Required. Pricelist ID for this line item. Data type: String Example: `19d29513d0e63110f8770dbf976be122`
header.lineItems[].product_offering	Required. Product offering ID for this line item. Data type: String Example: `db61dd9fd0a63110f8770dbf976be19c`
header.lineItems[].periodicity	Identifies the frequency. Possible values are `monthly`, `annually`, o Data type: String Example: `monthly`
header.lineItems[].quantity	Required. Quantity of the product. Data type: String Example: `1`
header.lineItems[].unit_of_measure	Required. Unit of measure ID. Data type: String Example: `cb2795d553020110286eddeeff7b12ff`
header.lineItems[].transaction_date	Required. Date of the transaction specific to this line item. Format: glide_date_time value Data type: datetime

Request body parameters (XML or JSON) (continued)

Name	Description
	Example: `2023-12-18 23:37:11`
header.lineItems[].account_tier	Optional account tier (e.g., "gold") for pricing logic. If account_tier is a c used in rule matrices. Data type: String
header.lineItems[].selected	Indicates if the line item is selected in a configurator scenario. Only ap lines in bundle. Data type: Boolean Example: `true`
header.lineItems[].top_product_offer	Identifier for top-level product in a configuration bundle. Data type: String Example: `db61dd9fd0a63110f8770dbf976be19c`
header.lineItems[].parent_product_offer	Identifier for the parent product in a bundle line item. Data type: String Example: `26d07c3211707110f877366201dea60c`
settings	Required. Contains pricing engine settings and options. Data type: Object `{ "settings": { "pricing_elements": "String", "disable_validation": boolean } }`
settings.pricing_elements	Required. Comma-separated list of elements to return. Data type: String Example: `PRICE,COST,NET_PRICE,LINE_ROLLUPS,HEADER_ROLLUPS`
settings.disable_validation	Whether to disable validation checks on request. Data type: Boolean Example: `true`
settings.config_lines_expanded	Indicates if all the lines for bundle are sent on the request. At this mom configurator we expect all lines to be sent for every pricing call coming configurator. Data type: Boolean

Request body parameters (XML or JSON) (continued)

Name	Description
	Example: `true`
settings.scope	Scope of pricing. Data type: String Example: `configurator`
settings.config_top_line_identifier	The line ID of the top-level product in configuration. Data type: String Example: `HOMEAUTOMA2000`
settings.use_external_code	Indicates if the system performs external code lookup. Data type: Boolean Example: `true`

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
header.currency	Currency code used in the pricing response. Similar to the one sent in the request. Data type: String Example: `USD`
header.costbook	Identifier of the costbook used for pricing. Data type: String (Sys_id)

header.lineItems	Contains pricing details for each line item.
	
	Data type: Array<Object>
	
	{
	"lineItems": [
	{
	"line_id": "String",
	"status": "String",

Name	Description

	`},`
	`"total_recurring_price": {`
	`"value": "String",`
	`"displayValue": "String"`
	`},`
	`"pricingAdjustments": [],`
	`"total_adjustment_amount": []`
	`}`
	`]`
	`}`

header.lineItems[].line_id	Identifier of the line item. Data type: String Example: `CONNECTEDC1100`
header.lineItems[].status	Status of the pricing calculation for the line item. Valid options: • Success • Failure Data type: String Example: `Success`

header.lineItems[].base_price	Base price before adjustments.
	
	Data type: Object
	`{`
	`"base_price": {`
	`"value": "String",`
	`"displayValue": "String"`
	`}`
	`}`

header.lineItems[].list_price	List price which is base price and attribute adjustments included.
	
	Data type: Object
	`{`
	`"list_price": {`
	`"value": "String",`
	`"displayValue": "String"`
	`}`
	`}`

header.lineItems[].pricelist	Price list reference.

Name	Description
	Data type: String (Sys_id)
header.lineItems[].quantity	Quantity sent as part of request. Data type: String Example: `1`
header.lineItems[].price_list_line	Price list line reference. Data type: String (Sys_id) Example: `3e93e785d07a7910f8770dbf976be1ee`
header.lineItems[].product_offering	Product offering reference. Data type: String (Sys_id) Example: `db61dd9fd0a63110f8770dbf976be19c`
header.lineItems[].one_time_price	One-time price for the product, unit net price * quantity. Data type: Object `{ "one_time_price": { "value": "String", "displayValue": "String" } }`
header.lineItems[].monthly_recurring_price	Monthly recurring price for the product inclusive of all quantities. Data type: Object `{ "monthly_recurring_price": { "value": Integer, "displayValue": Integer } }`
header.lineItems[].annual_recurring_price	Annual recurring price for the product inclusive of all quantities. Data type: Object `{ "annual_recurring_price": { "value": "String", "displayValue": "String"`

Name	Description
	`}` `}`

header.lineItems[].unit_net_price	Net price per unit after auto adjustments.
	
	Data type: Object
	
	`{`
	`"unit_net_price": {`
	`"value": "String",`
	`"displayValue": "String"`
	`}`
	`}`

header.lineItems[].cumulative_net_price	[One time price + (Monthly Recurring price * Term)] + (if parent line) sum of all CNP for immediate and grand child lines
	
	Data type: Object
	
	`{`
	`"cumulative_net_price": {`
	`"value": "String",`
	`"displayValue": "String"`
	`}`
	`}`

header.lineItems[].cumulative_one_time_price	For Child- One time price for the line item. For Parent line item - One time price for the line item + One time price for all child and grand child line items.
	
	Data type: Object
	
	`{`
	`"cumulative_one_time_price":`
	`{`
	`"value": "String",`
	`"displayValue": "String"`
	`}`
	`}`

header.lineItems[].cumulative_monthly_recurring_price	If price method = recurring. Monthly Recurring price for the line + (if parent line) sum of all monthly recurring price of child lines.
	
	Data type: Object
	
	`{`
	`"cumulative_monthly_recurring_price": {`
	`"value": "String",`
	`"displayValue": "String"`
	`}`
	`}`

Name	Description
header.lineItems[].unit_margin_percentage	Profit margin percentage per unit. Data type: Object
header.lineItems[].one_time_cost	One-time cost for the product inclusive of all quantities. Data type: Object
header.lineItems[].monthly_recurring_cost	Monthly recurring cost for the product inclusive of all quantities. Data type: Object
header.lineItems[].cumulative_one_time_cost	For Child- One time cost for the line item. For Parent line item - One time cost for the line item + One time cost for all child and grand child line items. Data type: Object
header.lineItems[].cumulative_monthly_recurring_cost	If price method = recurring. Monthly Recurring cost for the line + (if parent line) sum of all monthly recurring cost of child lines. Data type: Object
header.lineItems[].cumulative_net_cost	[One time cost + (Monthly Recurring cost * Term)] + (if parent line) sum of all CNC for immediate and grand child lines Data type: Object
header.lineItems[].cumulative_margin_percentage	Overall margin percentage. Data type: Object
header.status	Status of the overall pricing request. Valid options are: • Success • Failure • Partial Failure Data type: String Example: `Success`
header.total_monthly_recurring_price	Aggregated monthly recurring price. Data type: Object
header.total_annual_recurring_price	Aggregated annual recurring price. Data type: Object

Name	Description
header.total_amount	Total transaction amount. Data type: Object
header.total_one_time_price	Aggregated one-time price. Data type: Object
header.total_one_time_cost	Aggregated one-time cost. Data type: Object
header.total_monthly_cost	Aggregated monthly cost. Data type: Object
header.total_cost	Total cost (one-time + recurring). Data type: Object
header.total_one_time_margin	Total margin from one-time charges. Data type: Object
header.total_monthly_margin	Total margin from monthly charges. Data type: Object
header.total_margin_amount	Total profit margin amount. Data type: Object
header.total_one_time_margin_percentage	Margin percentage for one-time charges. Data type: Object
header.total_monthly_margin_percentage	Margin percentage for monthly charges. Data type: Object
header.total_margin_percentage	Overall margin percentage. Data type: Object
settings.pricing_elements	Elements included in the pricing response (PRICE, COST, NET_PRICE, etc.). Data type: String
settings.pricing_context_id	Identifier for pricing session when scope is configurator. Data type: String

Example usage

These examples demonstrate basic usage, to include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Calculating a price for a single product
- Calculate prices for multiple products with header roll-ups
- Initiate a product configuration session
- Update a product configuration (change a characteristic option)

Example: Calculate price for a single product

This example demonstrates a basic price calculation for a single product offering.
The API is called with one line item, and the request specifies that the PRICE, COST,NET_PRICE,LINE_ROLLUPS,HEADER_ROLLUPS and ADJUSTMENTS should be calculated and returned. This is a foundational request for getting the price of an individual item without any complex configurations or adjustments.

Example: cURL request.

```
curl
 "https://instance.servicenow.com/api/sn_csm_pricing/v1/pricinge
ngine/computePrice" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data '{
    "header": {
        "source_system": "ServiceNow Headless API",

Example: Calculate prices for multiple products with header roll-ups

This example shows how to send a list of multiple, distinct products to be priced in a single transaction. A key difference in this request is the inclusion sending multiple products in same request. This instructs the pricing engine to calculate the individual price for each line item and to compute and return the aggregated totals for the entire request.

Example: cURL request.

```
curl
 "https://instance.servicenow.com/api/sn_csm_pricing/v1/pricinge
ngine/computePrice" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data '{
    "header": {
        "source_system": "Test Source System",
        "requesting_record_id": "QT0001101",
        "currency": "USD",
        "lineItems": [
            {
```

Example: Initiate a product configuration session

This example demonstrates how to start a stateful product configuration session. This is used for complex products that are sold as a bundle with multiple components and user-selectable options. By setting the scope to "configurator", we tell the pricing engine to create a persistent session. The engine processes the entire product hierarchy, calculates initial prices, and returns a unique pricing_context_id.

Important: The unique `pricing_context_id` must be captured and sent in all subsequent requests for this configuration (e.g., when changing a quantity or selecting an option) to maintain the session's state.

Example: cURL request.

```
curl
 "https://instance.servicenow.com/api/sn_csm_pricing/v1/pricinge
ngine/computePrice" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \

Example: Update a product configuration (change a characteristic option)

This example demonstrates how to update an active product configuration session by changing a user-selectable option (characteristic). This is a common action in a product configurator, such as changing a color, size, or feature.

Prerequisite: You need to include the `pricing_context_id` that is returned when initiating a product configuration session. This tells the pricing engine which session to update.

Note: The lineItems array only needs to contain the specific item that is being modified, it is not necessary to send the entire product hierarchy again.

Example: cURL request.

```
curl
 "https://instance.servicenow.com/api/sn_csm_pricing/v1/pricinge
ngine/computePrice" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data '{
    "header": {
        "source_system": "ServiceNow Headless API",
        "requesting_record_id": "QT0001101",
```

Example: Update a product configuration (deselect a product)

This example demonstrates how to update an active product configuration by deselecting or removing a product from the bundle. This is achieved by sending a request for the specific line item with its `selected` flag set to `false`.

Just like in the previous use case, this request must include the correct `pricing_context_id` to ensure the change is applied to the correct session. The pricing engine will then recalculate all prices for the entire bundle with that item removed, which may affect overall discounts and roll-ups.

Prerequisite: You need to include the `pricing_context_id` that is returned when initiating a product configuration session. This tells the pricing engine which session to update.

Note: The lineItems array only needs to contain the specific item that is being modified, it is not necessary to send the entire product hierarchy again.

Example: cURL request.

        }
    }
}
```

Example: Stateless Pricing for a Multi-Line transaction

This example demonstrates how to price a complete, multi-line transaction in a single API call. The request includes a mix of standalone products and a product bundle.

By including HEADER_ROLLUPS in the pricing_elements, the API will calculate the price for each individual line item and also return the aggregated grand total for the entire transaction in the header.

Example: `"pricing_elements": "PRICE,COST,NET_PRICE,LINE_ROLLUPS,HEADER_ROLLUPS,ADJUSTMENTS"`

Example: cURL request.

```
curl
 "https://instance.servicenow.com/api/sn_csm_pricing/v1/pricinge
ngine/computePrice" \

    }
}
```

Example: External ID resolution

This example shows setting the external ID resolution feature to true while setting the `pricelist` and `product_offering` to a custom-mapped variable called DOORSENSOR1.

Example:

- `"use_external_code": true`: Enables external code resolution
- `"pricelist": "DOORSENSOR1"`: Value maps to a custom context variable for the price
- `"product_offering": "DOORSENSOR1"`: Value maps to a custom context variable for the product

Example: cURL request.

```
curl
 "https://instance.servicenow.com/api/sn_csm_pricing/v1/pricinge
ngine/computePrice" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \

SAM-Software Usage Data Integration API

The *SAM-Software Usage Data Integration* API provides endpoints to create and update records in the Software Usage [samp_sw_usage] table.

This API requires activation of the Software Asset Management Professional (com.snc.samp) plugin. It also requires that you have either the sam_admin or sam_developer role to access the endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM-Software Usage Data Integration - POST /sam_software_usage_integration/createOrUpdate

Creates or updates a specified record in the Software Usage [samp_sw_usage] table.

You can create/update one or more software usage records in a single call.

URL format

Versioned URL: `/api/now/{api_version}/sam_software_usage_integration/createOrUpdate`

Default URL: `/api/now/sam_software_usage_integration/createOrUpdate`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

items	List of column names and values for each field to store in the software usage record.
	
	The column information that you must pass depends on the value you specify for *`reclamation_type`* (which is a required field):
	
	Possible *`reclamation_type`* values and the column information that must be passed:
	• total_usage:
	  ○ configuration_item
	  ○ last_used_time
	  ○ month_used
	  ○ norm_product
	  ○ year
	• last_used_date:

Request body parameters (XML or JSON) (continued)

Name	Description
	○ configuration_item ○ norm_product The combination of these fields uniquely identify a record. If the record is not found in the table, a new record with the specified fields is created; otherwise the existing record is updated. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
items	Name-value pair list of all fields in the software usage record. Data type: Array (content varies)

Example: cURL request

The following example illustrates how to create a new software usage record.

```
curl -X POST
 "https://instance.servicenow/api/now/sam_software_usage_integra
tion/createOrUpdate" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-d "{'items': [\
  {
    'configuration_item':'eaa9604d3790200044e0bfc8bcbe5dc1',\
    'month_used':2,\
    'norm_product':'40209c060b3022002d6c650d37673a89',\
    'norm_publisher':'24dcccc20b3022002d6c650d37673ab3',\
    'reclamation_type':'total_usage',\
    'usage_count': 13,\
    'total_usage_time':13,\
    'year':2020
  }\
]}"
```

```
{
  "result": {
    "reply": {
      "items": [
        {
          "configuration_item":
 "eaa9604d3790200044e0bfc8bcbe5dc1",
          "month_used": 2,
          "norm_product": "40209c060b3022002d6c650d37673a89",
          "norm_publisher": "24dcccc20b3022002d6c650d37673ab3",
          "reclamation_type": "total_usage",
          "usage_count": 13,
          "total_usage_time": 13,
          "year": 2020,
          "sysId": "13d15fe59d511010f8772c637e39afe5",
          "status": "INSERT"
        }
```

SAP SuccessFactors XCC

The *`SAP SuccessFactors XCC`* API.

Automates data uploads and crawl triggers for the SAP SuccessFactors external content connector.

Lets a caller programmatically attach the trainings, library-and-assignment-profile-mapping, and user data CSV (or zipped CSV) files that a SAP SuccessFactors Learning administrator exports. Starts the document and user mapping crawls that index that data for AI Search, as an alternative to the connector's admin configuration UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API works with CSV data files from the Export SAP SuccessFactors Learning data for external content indexing application.

Supports upload and crawl-start operations.

Authentication Supports both HTTP Basic authentication and OAuth 2.0; OAuth is recommended for production integrations.

OAuth 2.0 uses the Resource Owner Password Credentials grant. Register an OAuth client for external APIs in the instance's Application Registry, with a broadly scoped client scope restriction, then request a token:

```
curl -X POST "https://<instance-url>/oauth_token.do" \
  -H "Content-Type: application/x-www-form-urlencoded" \
  -d
 "grant_type=password&client_id=<client_id>&client_secret=<clien
t_secret>&username=<username>&password=<password>"
```

Send the returned token on every request as `Authorization: Bearer <access_token>`.

- Mapping to ServiceNow Data Model
- Connector configuration: Uploaded file attachments map to the `sn_ext_conn_sap_sf_configuration` table.
- Crawl jobs: Crawl-start operations create records in the `sn_ext_conn_connector_job` table.

Behavioral notes Both crawl-start operations require the trainings, library-and-assignment-profile-mapping, and user data files to already be attached to the connector configuration. Requests are rejected for if a crawl of the same type is already queued or in progress for that connector. Both return immediately after queuing the crawl job; the crawl itself, including indexing new content and permissions in AI Search, completes asynchronously. Uploads reject files larger than the maximum size allowed by the `com.glide.attachment.max_size` system property (1 GB by default).

Requires:

- plugin: `com.sn_ext_conn_sap_sf` (External Content Connectors SAP SuccessFactors)
- depends on: `com.sn_ext_conn_admin` (External Content Connectors Admin)
- role: Not restricted to a specific role. Every operation requires authentication, and the platform's default Scripted REST access control denies requests from sessions holding the `snc_external` role.

Namespace information:

- Namespace: `sn_ext_conn_sap_sf`
- Base URI: `/api/sn_ext_conn_sap_sf/automate_successfactors_connector`

SAP SuccessFactors XCC - PUT /users

Uploads the user-to-assignment-profile mapping data file that a SAP SuccessFactors Learning administrator exports, as an attachment on the connector configuration record identified by conn_sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Versioned URL: `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/users`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description	Data type
None	This endpoint does not accept query parameters.	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	This endpoint returns no custom response headers.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
201	Users file uploaded and attached to the connector configuration.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
415	
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description	Data type
result	Example: {"success": true, "message": "principal_full crawl started successfully", "crawl_job_id": "5a6b7c8d9e0f1a2b3c4d5e6f7a8b9c0d"}.	object

Example: cURL request

Example PUT request to `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/users`.

```
curl
 "https://instance.servicenow.com/api/sn_ext_conn_sap_sf/automat
e_successfactors_connector/users" \
--request PUT \
--header "Accept:application/json" \
--user 'username':'password'
```

```
{
  "result": {
    "result": {
      "success": true,
      "message": "File uploaded successfully",
      "attachment_sys_id": "a2b3c4d5e6f7a8b9c0d1e2f3a4b5c6d7",
      "content_type": "text/csv",
      "size_bytes": 51340,
      "created_on": "2026-08-19 12:41:18"
    }
  }
}
```

SAP SuccessFactors XCC - PUT /training

Uploads the trainings data file that a SAP SuccessFactors Learning administrator exports, as an attachment on the connector configuration record identified by conn_sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Versioned URL: `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/training`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description	Data type
None	This endpoint does not accept query parameters.	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	This endpoint returns no custom response headers.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
201	Trainings file uploaded and attached to the connector configuration.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
415	
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description	Data type
result	Example: {"success": true, "message": "principal_full crawl started successfully", "crawl_job_id": "5a6b7c8d9e0f1a2b3c4d5e6f7a8b9c0d"}.	object

Example: cURL request

Example PUT request to `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/training`.

```
curl
 "https://instance.servicenow.com/api/sn_ext_conn_sap_sf/automat
e_successfactors_connector/training" \
--request PUT \
--header "Accept:application/json" \
--user 'username':'password'
```

```
{
  "result": {
    "result": {
      "success": true,
      "message": "File uploaded successfully",
      "attachment_sys_id": "a2b3c4d5e6f7a8b9c0d1e2f3a4b5c6d7",
      "content_type": "text/csv",
      "size_bytes": 51340,
      "created_on": "2026-08-19 12:41:18"
    }
  }
}
```

SAP SuccessFactors XCC - PUT /ap_lib_mapping

Uploads the library-and-assignment-profile-mapping data file that a SAP SuccessFactors Learning administrator exports, as an attachment on the connector configuration record identified by `conn_sys_id`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Versioned URL: `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/ap_lib_mapping`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description	Data type
None	This endpoint does not accept query parameters.	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	This endpoint returns no custom response headers.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
201	Library-and-assignment-profile-mapping file uploaded and attached to the connector configuration.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
415	
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description	Data type
result	Example: {"success": true, "message": "principal_full crawl started successfully", "crawl_job_id": "5a6b7c8d9e0f1a2b3c4d5e6f7a8b9c0d"}.	object

Example: cURL request

Example PUT request to `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/ap_lib_mapping`.

```
curl
 "https://instance.servicenow.com/api/sn_ext_conn_sap_sf/automat
e_successfactors_connector/ap_lib_mapping" \
--request PUT \
--header "Accept:application/json" \
--user 'username':'password'
```

```
{
  "result": {
    "result": {
      "success": true,
      "message": "File uploaded successfully",
      "attachment_sys_id": "a2b3c4d5e6f7a8b9c0d1e2f3a4b5c6d7",
      "content_type": "text/csv",
      "size_bytes": 51340,
      "created_on": "2026-08-19 12:41:18"
    }
  }
}
```

SAP SuccessFactors XCC - POST /start_user_mapping_crawl

Queues a user mapping crawl job that reads the connector's most recently uploaded user and library-and-assignment-profile-mapping data files. Updates the access-control relationships AI Search uses to enforce each search user's original document access restrictions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/start_user_mapping_crawl`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description	Data type
None	This endpoint does not accept query parameters.	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	This endpoint returns no custom response headers.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
409	
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description	Data type
result	Example: {"success": true, "message": "principal_full crawl started successfully", "crawl_job_id": "5a6b7c8d9e0f1a2b3c4d5e6f7a8b9c0d"}.	object

Example: cURL request

Example POST request to `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/start_user_mapping_crawl`.

```
curl
 "https://instance.servicenow.com/api/sn_ext_conn_sap_sf/automat
e_successfactors_connector/start_user_mapping_crawl" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

```
{
  "result": {
    "result": {
      "success": true,
      "message": "principal_full crawl started successfully",
      "crawl_job_id": "5a6b7c8d9e0f1a2b3c4d5e6f7a8b9c0d"
    }
  }
}
```

SAP SuccessFactors XCC - POST /start_document_crawl

Queues a document crawl job that reads the connector's most recently uploaded trainings, library-and-assignment-profile-mapping, and user data files. Sends the discovered training content and metadata to AI Search for indexing.

URL format

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Versioned URL: `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/start_document_crawl`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description	Data type
None	This endpoint does not accept query parameters.	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	This endpoint returns no custom response headers.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
409	
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description	Data type
result	Example: {"success": true, "message": "principal_full crawl started successfully", "crawl_job_id": "5a6b7c8d9e0f1a2b3c4d5e6f7a8b9c0d"}.	object

Example: cURL request

Example POST request to `/api/sn_ext_conn_sap_sf/automate_successfactors_connector/start_document_crawl`.

```
curl
 "https://instance.servicenow.com/api/sn_ext_conn_sap_sf/automat
e_successfactors_connector/start_document_crawl" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

```
{
  "result": {
    "result": {
      "success": true,
      "message": "principal_full crawl started successfully",
      "crawl_job_id": "5a6b7c8d9e0f1a2b3c4d5e6f7a8b9c0d"
    }
  }
}
```

Schema Registry API

Use the *`Schema Registry`* API to retrieve Avro schemas generated by Stream Connect, along with their subject and version history.

This API is a ServiceNow implementation of the Schema Registry API for Confluent Platform. Avro schemas are generated by Stream Connect for tables published to Kafka. This API is read-only; schemas and their evolution history are generated and maintained internally by Stream Connect.

This API requires the ServiceNow IntegrationHub Stream Connect Schema plugin (`com.glide.hub.stream_connect.schema`). This plugin provides the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Table Message Schema [sys_table_message_schema]: Stores each generated Avro schema.
- Table Message Schema Evolution [sys_table_message_schema_evolution]: Tracks the subject and version for each schema. Schema subjects correspond to a table's Stream Connect topic name.

The calling user must have the message_schema_viewer role.

Schema Registry - GET /schemas

Retrieves all schemas. Optional query parameters can be used for filtering and pagination.

URL format

Default URL: `/api/now/schemaregistry/schemas`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
latestOnly	Flag that indicates whether to return all schema versions for each subject in the response. Valid values: • true: Returns only the latest schema versions for each subject in the response. • false: Returns all schema versions for each subject in the response. Default: false Data type: Boolean
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Default: 10,000 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
subjectPrefix	Restrict results to subject names starting with this string. Default: No filtering on subject names.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/vnd.schemaregistry.v1+json*, *application/vnd.schemaregistry+json*, and *application/json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
deleted	Flag that indicates whether the schema entry is marked as deleted. Valid values: • true: The schema entry is marked as deleted. • false: The schema entry isn't marked as deleted. Data type: Boolean
guid	Globally unique identifier of the schema in the format *<subject>:<version>*. Data type: String
id	The numeric schema ID. Data type: Number
schema	The Avro schema definition as a JSON-encoded string. Data type: String
schemaType	The schema format (Avro). Data type: String
subject	The subject name, corresponding to the table's Stream Connect topic. Data type: String
ts	The creation timestamp for the schema record in epoch milliseconds. Data type: Number
version	The version number for the schema under this subject. Data type: Number

Example: cURL request

This example retrieves every registered schema entry.

```
curl -s
 "https://instance.servicenow.com/api/now/schemaregistry/schem
as" \
  --request GET \
  --header "Accept:application/vnd.schemaregistry.v1+json" \
  --user 'username':'password'
```

Response body.

```

]
```

Schema Registry - GET /schemas/ids/{id}

Retrieves the full schema entry for the specified schema ID.

URL format

Default URL: `/api/now/schemaregistry/schemas/ids/{id}`

Supported request parameters

Path parameters

Name	Description
id	Numeric schema ID. Table: Table Message Schema [sys_table_message_schema] Field: Schema ID Data type: Number

Query parameters

Name	Description
subject	Scopes the schema lookup to the specified subject context. Default: No filtering on subject. Returns the latest version registered for the schema across all subjects that use it. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/vnd.schemaregistry.v1+json*, *application/vnd.schemaregistry+json*, and *application/json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
deleted	Flag that indicates whether the schema entry is marked as deleted. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: The schema entry is marked as deleted. • false: The schema entry isn't marked as deleted. Data type: Boolean
guid	Globally unique identifier of the schema in the format *<subject>:<version>*. Data type: String
schema	The Avro schema definition as a JSON-encoded string. Data type: String
subject	The subject name, corresponding to the table's Stream Connect topic. Data type: String
ts	The creation timestamp for the schema record in epoch milliseconds. Data type: Number
version	The version number for the schema under this subject. Data type: Number

Example: cURL request

This example retrieves the schema entry for schema 1879111090.

```
curl -s
 "https://instance.servicenow.com/api/now/schemaregistry/schem
as/ids/1879111090" \
  --request GET \
  --header "Accept:application/vnd.schemaregistry.v1+json" \
  --user 'username':'password'
```

Response body.

```
{
  "subject": "sn_incident",
  "version": 1,
  "schema":
 "{\"type\":\"record\",\"name\":
\"stream_producer_table\", ... }",
  "guid": "sn_incident:1",
  "ts": 1781633080000,
  "deleted": false
}
```

Schema Registry - GET /schemas/ids/{id}/schema

Retrieves the Avro schema definition string for the specified schema ID.

To retrieve the full schema entry, including subject and version information, call GET /schemas/ids/{id}.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
String	The Avro schema definition as an unescaped JSON-encoded string.

Example: cURL request

This example retrieves the schema string for schema 1879111090.

```
curl -s
 "https://instance.servicenow.com/api/now/schemaregistry/schem
as/ids/1879111090/schema" \
  --request GET \
  --header "Accept:application/vnd.schemaregistry.v1+json" \
  --user 'username':'password'
```

Response body.

```
"{\"type\":\"record\",\"name\":\"stream_producer_table\",
\"fields\":[ ... ]}"
```

Schema Registry - GET /schemas/ids/{id}/subjects

Retrieves all subjects associated with the specified schema ID.

URL format

Default URL: `/api/now/schemaregistry/schemas/ids/{id}/subjects`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Schema Registry - GET /schemas/ids/{id}/versions

Retrieves all subject-version pairs associated with a specified schema ID.

A schema can have multiple versions and be associated with multiple subjects. This endpoint returns every subject-version pair associated with the schema ID as a JSON array, ordered by subject and then by version.

URL format

Default URL: `/api/now/schemaregistry/schemas/ids/{id}/versions`

Supported request parameters

Path parameters

Name	Description
id	Numeric schema ID. Table: Table Message Schema [sys_table_message_schema] Field: Schema ID Data type: Number

Query parameters

Name	Description
subject	Scopes the schema lookup to the specified subject context. Returns only versions for the specified subject. Default: No filtering on subject. Returns all subject-version pairs associated with a specified schema ID. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/vnd.schemaregistry.v1+json*, *application/vnd.schemaregistry+json*, and *application/json*.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

The response is a JSON array. Each element is an object with these fields, listed alphabetically:

Name	Description
Array	JSON array of objects, each containing a subject-version pair.
<Array>.subject	The subject name. Data type: String
<Array>.version	The version number for the schema registered under this subject. Data type: Number

Example: cURL request

This example retrieves all subject-version pairs for schema 1879111090.

```
curl -s
 "https://instance.servicenow.com/api/now/schemaregistry/schem
as/ids/1879111090/versions" \
  --request GET \
  --header "Accept:application/vnd.schemaregistry.v1+json" \
  --user 'username':'password'
```

Response body.

```
[
  {
    "subject": "sn_incident",
    "version": 1
  }
]
```

Schema Registry - GET /subjects

Retrieves all subjects from the schema registry.

This endpoint returns a list of distinct subject names that have at least one registered schema version. Subjects are registered in the Table Message Schema Evolution [sys_table_message_schema_evolution] table.

URL format

Default URL: `/api/now/schemaregistry/subjects`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Default: No limit Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number

```
  --header "Accept:application/vnd.schemaregistry.v1+json" \
  --user 'username':'password'
```

Response body.

```
[1,2,3]
```

Schema Registry - GET /subjects/{subject}/versions/{version}

Retrieves the full schema entry for the specified subject and version.

URL format

Default URL: `/api/now/schemaregistry/subjects/{subject}/versions/{version}`

Supported request parameters

Path parameters

Name	Description
subject	Subject name. Data type: String
version	Version number. To use the latest version, pass `latest` or `-1`. To use a specific version number, pass a positive integer. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
422	Unprocessable content. The value provided for *version* isn't valid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
deleted	Flag that indicates whether the schema entry is marked as deleted. Valid values: • true: The schema entry is marked as deleted. • false: The schema entry isn't marked as deleted. Data type: Boolean
guid	Globally unique identifier of the schema in the format *<subject>:<version>*. Data type: String
id	The numeric schema ID. Data type: Number
schema	The Avro schema definition as a JSON-encoded string.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
schemaType	The schema format (Avro). Data type: String
subject	The subject name, corresponding to the table's Stream Connect topic. Data type: String
ts	The creation timestamp for the schema record in epoch milliseconds. Data type: Number
version	The version number for the schema under this subject. Data type: Number

Example: cURL request

This example retrieves the schema entry for v1 of the sn_incident subject.

```
curl -s
 "https://instance.servicenow.com/api/now/schemaregistry/subjec
ts/sn_incident/versions/1" \
  --request GET \
  --header "Accept:application/vnd.schemaregistry.v1+json" \
  --user 'username':'password'
```

Response body.

```
{
  "subject": "sn_incident",
  "id": 1879111090,
  "version": 1,
  "schemaType": "AVRO",
  "schema":
 "{\"type\":\"record\",\"name\":
\"stream_producer_table\", ... }",
  "guid": "sn_incident:1",
  "ts": 1781633080000,
  "deleted": false
}
```

Schema Registry - GET /subjects/{subject}/versions/{version}/schema

Retrieves the Avro schema definition string for a specified subject and version.

To retrieve the full schema entry, including subject and version information, call GET /subjects/{subject}/versions/{version}.

URL format

Default URL: `/api/now/schemaregistry/subjects/{subject}/versions/{version}/schema`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
subject	Subject name. Data type: String
version	Version number. To use the latest version, pass `latest` or `-1`. To use a specific version number, pass a positive integer. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/vnd.schemaregistry.v1+json`*, *`application/vnd.schemaregistry+json`*, and *`application/json`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
422	Unprocessable content. The value provided for *version* isn't valid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
String	The Avro schema definition as a raw unescaped string.

Example: cURL request

This example retrieves the schema definition string for v1 of the sn_incident subject.

```
curl -s
 "https://instance.servicenow.com/api/now/schemaregistry/subjec
ts/sn_incident/versions/1/schema" \
  --request GET \
  --header "Accept:application/vnd.schemaregistry.v1+json" \
  --user 'username':'password'
```

Response body.

```
{"type":"record","name":"stream_producer_table","fields":[ ..
. ]}
```

Scorecards API

The *Scorecards* API provides endpoints that enable you to query data about Performance Analytics indicators. The query parameters equate to the functions available on the Analytics Hub for drilling down into an indicator.

Scorecards - GET /now/pa/scorecards

Retrieves details about indicators from the Analytics Hub .

Access to tables through the REST API is restricted by BasicAuth. Access control lists defined for tables are enforced to restrict access to data.

To make queries using the Performance Analytics API, you must also have the pa_viewer role.

Almost all queries use the *sysparm_uuid* parameter. This parameter consists of the indicator sys_id followed by a colon-separated list of additional, optional sys_ids. The *sysparm_uuid* is always the first parameter.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/now/{api_version}/pa/scorecards`

Default URL: `/api/now/pa/scorecards`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Parameter	Description
sysparm_breakdown	Sys_id of a breakdown to return chart information organized as defined by the breakdown. For example, the sys_id of a priority breakdown to return separate task chart information for each priority value, such as the number of open incidents / Priority / 2 - High. Data type: String
sysparm_breakdown_relation	Sys_id of a breakdown relation to break down the returned data using that relation. Data type: String
sysparm_contains	Comma-separated list of names or descriptions to return results only from indicators with a matching value. All the comma-separated list items must match, or no results are returned: The list follows AND logic, not OR logic. Data type: String
sysparm_display	Flag that indicates the type of indicators to return. Valid values: • true: Return only indicators that display on the Analytics Hub . • all: Return all indicators. Data type: String Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone. • Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false **Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
sysparm_elements_filter	Sys_id of an elements filter to apply to the returned data. Data type: String
sysparm_exclude_reference_link	Flag that indicates whether to hide additional information provided for reference fields, such as the URI to the reference resource. Valid values: • true: Hide additional information provided for reference fields. • false: Do not hide additional information provided for reference fields. Data type: Boolean

Query parameters (continued)

Parameter	Description
	Default: false
sysparm_favorites	Flag that indicates whether to return only indicators that are favorites of the querying user. Valid values: • true: Return only indicators that are favorites of the querying user. • false: Return all indicators. Data type: Boolean Default: false
sysparm_from	Earliest date to return scores from. Only scores from this date or later are returned. This parameter requires that *`include_scores`* is set to `true`. Format: ISO-8601 standard Date type: String
sysparm_include_aggregates	Flag that indicates whether to return all possible aggregates for an indicator, including aggregates that have already been applied. Valid values: • true: Return all possible aggregates for an indicator, including aggregates that have already been applied. • false: Return no aggregates. Data type: Boolean Default: false
sysparm_include_available_aggregates	Flag that indicates whether to return all available aggregates for an indicator when no aggregate has been applied. Valid values: • true: Return all available aggregates for an indicator when no aggregate has been applied. • false: Return no aggregates. Data type: Boolean Default: false
sysparm_include_available_breakdowns	Flag that indicates whether to return all available breakdowns for an indicator.

Query parameters (continued)

Parameter	Description
	Valid values: • true: Return all available breakdowns for an indicator. • false: Return no breakdowns. Data type: Boolean Default: false
sysparm_include_forecast_scores	Flag that indicates whether to return the forecast_scores element that contains an array of date-value pairs that define the forecast data for the Analytics Hub . This parameter requires that the *`include_scores`* parameter is also set to `true`. Valid values: • true: Return the forecast_scores element. • false: Do not return the forecast_scores element. Data type: Boolean Default: false
sysparm_include_realtime	Flag that indicates whether to return the realtime_enabled element which indicates if real-time scores are enabled for the indicator, and the realtime_value element which contains the real-time score value. This parameter is not supported for formula indicators. Valid values: • true: Return the realtime_enabled element. • false: Do not return the realtime_enabled element. Data type: Boolean Default: false
sysparm_include_score_notes	Flag that indicates whether to return all notes associated with the score. The note element contains the note text as well as the author and timestamp when the note was added. Valid values: • true: Return all notes associated with the score. • false: Do not return all notes associated with the score. Data type: Boolean Default: false
sysparm_include_scores	Flag that indicates whether to return indicator scores for the entire time range selected on the Analytics Hub . If a value is

Query parameters (continued)

Parameter	Description
	not specified, this parameter defaults to false and returns only the most recent score value. To constrain the date range of the scores that are returned, combine this parameter with *from* and *to*. Valid values: • true: Return indicator scores for the entire selected time range. • false: Do not return indicator scores for the entire selected time range. Data type: Boolean Default: false
sysparm_include_target_color_scheme	Flag that indicates whether to return the target_color_scheme element that contains the minimum and maximum values, and the color of each section of the target color scheme for the Analytics Hub . Valid values: • true: Return the target_color_scheme element. • false: Do not return the target_color_scheme element. Data type: Boolean Default: false
sysparm_include_trendline_scores	Flag that indicates whether to return the trendline_scores element that contains an array of date-value pairs that define the Analytics Hub trendline. This parameter requires that the *include_scores* parameter is also set to `true`. Valid values: • true: Return the trendline_scores element. • false: Do not return the trendline_scores element. Data type: Boolean Default: false
sysparm_key	Flag that indicates whether to return results only for key indicators. Valid values: • true: Return the trendline_scores element. • false: Do not return the trendline_scores element .

Query parameters (continued)

Parameter	Description
	Data type: Boolean Default: false
sysparm_limit	Maximum number of scores to return. Data type: Number
sysparm_page	Page number. For example, when querying 20 indicators with the default sysparm_per_page value (10), specify a sysparm_page value of 2 to retrieve indicators 11-20. Data type: Number
sysparm_per_page	Maximum number of indicators each query can return on a page. Default: 10 Maximum: 100 Data type: Number
sysparm_sortby	Value to use when sorting results. Valid values: • bullet • change • changeperc • date • default • direction • duedate • frequency • gap • gapperc • group • indicator_group • name • order • target • trend • value Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Default: value
sysparm_sortdir	Sort direction. Valid values: • asc: Denotes ascending • des: Denotes descending Data type: String Default: Descending
sysparm_step	Numeric value to skip scores, based on the indicator frequency. For example, specify a value of 3 to return only scores from every third day for a daily indicator, or from every third week for a weekly indicator. Data type: Number
sysparm_tags	Indicator group sys_id in which to return the indicators of that group. Do not use *sysparm_uuid* with this parameter. You cannot obtain the sys_id of an indicator group through this API. Instead, get the sys_id from the indicator group record. For more information about obtaining sys_ids from records, see Unique record identifier (sys_id). Data type: String
sysparm_target	Flag that indicates whether to return results only for indicators that have a target set on the Analytics Hub . Valid values: • true: Only return results for indicators that have a target set. • false: Return results for all applicable indicators. Data type: Boolean Default: false
sysparm_to	Latest date from which to return scores. Only scores from this date or earlier are returned. This parameter requires that *include_scores* is set to `true`. Data type: String Format: ISO-8601 standard
sysparm_uuid	Colon-separated list of sys_id values to specify which indicators, breakdowns, aggregates, and domains to query. The parameter follows this format:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	<indicator_sys_id>:<breakdown_sys_id>:<elements_filter_sys_id or element_sys_ids>:<lvl-2 breakdown_sys_id>:<lvl-2 elements_filter_sys_id or element_sys_ids>:<aggregate_sys_id>;<domain_sys_id> The parameter must begin with the sys_id of an indicator record. Optionally, you can append the sys_id values of a breakdown and breakdown element to group the response based on the breakdown, and the sys_id of an aggregate to apply that aggregate. You can use a breakdown with an aggregate, or use only one. **Note:** If an indicator is configured to use a **Default time series**, all values that this API retrieves for that indicator use the selected aggregate. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
Depends on request parameters.	

Example: Retrieving all indicators on the Analytics Hub

```
# Request a list of all indicators that
# are displayed in the Analytics Hub,
# including their unique record identifiers.

curl --verbose --user "user:password" \
--header "Accept:application/json" \
"https://instance.service-now.com/api/now/v1/pa/scorecards"
```

```
// The following response is truncated
// to show only the Number of open incidents
// indicator, which is used in the other
// examples on this page.
{
  "result" : [
...

    {
      "change_formatted" : "",
      "key" : false,
      "value_unit" : "",
      "value_formatted" : "",
      "period_title" : null,
      "gapperc" : null,
      "gap" : null,
      "target" : null,
      "period" : null,
      "target_formatted" : "",
      "favorite" : false,
      "direction_label" : "Minimize",
      "uuid" : "fb007202d7130100b96d45a3ce6103b4",
      "name" : "Number of open incidents",
      "value_color" : "#000000",
      "frequency_label" : "Daily",
      "change" : null,
      "gap_formatted" : "",
      "gapperc_formatted" : "",

  ]
}
```

Example: Return indicator details

You can query the Analytics Hub for a particular indicator by providing the *sysparm_uuid* parameter with an indicator sys_id value.

```
# In this example, you use the sys ID for the
# Number of open incidents indicator,
# which you retrieved in the first example,
# when you got all the indicators in the
# Analytics Hub:
# "uuid" : "fb007202d7130100b96d45a3ce6103b4",
# "name" : "Number of open incidents"

curl --verbose --user "user:password" \
--header "Accept:application/json" \
"https://instance.service-now.com/api/now/v1/pa/scorecards?syspa
rm_uuid=fb007202d7130100b96d45a3ce6103b4"
```

```
{
  "result" : [
    {
      "change_formatted" : "",
      "key" : false,
      "value_unit" : "",
      "value_formatted" : "",
      "period_title" : null,
      "gapperc" : null,
      "gap" : null,
      "target" : null,
```

    }
  ]
}
```

Example: Return all breakdowns and aggregates for an indicator

Query a list of available breakdowns and aggregates for an indicator by setting the *sysparm_include_available_breakdowns* and *sysparm_include_available_aggregates* parameters to true.

```
curl -v -u "user:password" -H "Accept:application/json" \
"https://instance.service-now.com/api/now/v1/pa/scorecards?syspa
rm_uuid=fb007202d7130100b96d45a3ce6103b4&sysparm_include_availab
le_breakdowns=true&sysparm_include_available_aggregates=true"
```

```
{
  "result" : [
    {
      "key" : false,
      "change_formatted" : "",
      "aggregates" : [
        {
          "display_value" : "7d running SUM",
```

Example: Return the elements for a breakdown

```
# To get the scores associated with
# each element of a breakdown and
# the sys_ids of those elements, pass
# the sysparm_breakdown
# parameter with the sys_id of the breakdown.
# In this example, you get the elements of
# the Assignment Group breakdown for the
# Number of open incidents indicator.
```

Example: Return scores across a range of dates for two levels of breakdown

To request a list of individual scores for all available dates, set the sysparm_include_scores parameter to true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To specify the date range of scores, also use the *sysparm_from* and *sysparm_to* parameters.

```
# In this example, the level 1 breakdown and
# element are Assignment Group: Software
# (sys_id baec0752bf130100b96dac808c0739ed
# and 8a4dde73c6112278017a6a4baf547aa7).
# The level 2 breakdown and element are Priority: 1 -
# Critical (sys_id 0df47e02d7130100b96d45a3ce610399
# and e59001402003310076659782 99a805f3).
# Only scores on and after 30 November 2018 are returned.

Example: Return breakdown relations for a breakdown and element

To obtain the sys_id values for all breakdown relations associated with an indicator, use the *sysparm_include_available_breakdowns* parameter. In the *sysparm_uuid*parameter, include the sys_ids of the first-level breakdown and element whose relations you want to find.

```
# In this example, the sysparm_uuid
# parameter includes the sys_id for the
# Assignment Group breakdown and the
# sys_id for the Software element.
# The sys_id of the Assignment Group
# was obtained in the example where all
# breakdowns and aggregates were returned.
# The sys_id of the Software element was
# obtained in the previous example, where
# all the elements of Assignment Group were
# returned. The sys_id of the Assignment
# Group breakdown is
# baec0752bf130100b96dac808c0739ed
# and of the Software element is
# 8a4dde73c6112278017a6a4baf547aa7.
# The breakdown relation is obtained for the
# Number of open incidents indicator,
# whose sys_id is
# fb007202d7130100b96d45a3ce6103b4.

```
    // Followed by an indicator object with an element object
 for every element in the Sibling Group
  ]
}
```

Example: Return a filtered set of elements for a breakdown

To apply an elements filter to the Analytics Hub data, use the **sysparm_elements_filter** parameter with the sys_id of a Performance Analytics element filter record.

```
# In this example, the element filter applies
# to the Groups breakdown source, with the
# condition [[Parent][is][Database]].
# The sys_id of this element filter is
# 7b9eb563eb11020065deac6aa206fe11.
# The example gets the elements of the Assignment
# Group breakdown that have the element Database
# as a parent.

Script Debugger API

The *`Script Debugger`* API provides endpoints to debug lines of server-side JavaScript code, such as business rules and script includes.

For more information about the Script Debugger, see Script Debugger and Session Log.

This API is available by default.

Script Debugger - GET /js/debugpoints/script/{tableName}/{sysId}/{fieldName}

Retrieve a list of breakpoints or logpoints in a server-side script, such as a business rule or script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/now/js/debugpoints/script/{tableName}/{sysId}/{fieldName}`

Supported request parameters

Path parameters

Name	Description
tableName	Name of the table that contains the server-side script, such as sys_script or sys_script_include. Data type: String
sysId	Sys_id for the server-side script. Data type: String
fieldName	Name of the field that contains the server-side script content. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	User Not Authorized. The user who executed the request does not have permission to access breakpoint or log point information for the specified record.

Response body parameters (JSON or XML)

Name	Description
canWrite	Flag indicating whether the currently logged in user can set or modify breakpoints for the script. Possible values: • true: You can set or modify breakpoints. • false: You cannot set or modify breakpoints. Data type: Boolean

debugpoints	List of all the breakpoints and logpoints in the script.
	`"debugpoints": {`
	`  "breakpoint": {Object}`
	`  "logpoint": {Object}`
	`}`
	
	Data type: Object

debugpoints.breakpoint	List of all the breakpoints in the script, presented as key-value pairs. The key is the line number for the breakpoint. The value is an object containing the breakpoint's sys_id and text.
	`"breakpoint": {`
	`  <line_number>:`
	`  {Object}`
	`}`
	
	Data type: Object

debugpoints.breakpoint.<line_number>	Line number for the breakpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`<line_number>: { "evaluationString": "String" "sysId": "String" }` Data type: Object
debugpoints.breakpoint.<line_number>.evaluationString	Text of the breakpoint. If the breakpoint is conditional, the evaluationString contains the condition text. If the breakpoint is not conditional, the evaluationString is an empty string. Data type: String
debugpoints.breakpoint.<line_number>.sysId	Sys_id of the breakpoint. Data type: String
debugpoints.logpoint	List of all the logpoints in the script, presented as key-value pairs. The key is the line number for the logpoint. The value is an object containing the logpoint's sys_id and text. `"logpoint": { <line_number>: {Object} }` Data type: Object
debugpoints.logpoint.<line_number>	Line number for the logpoint. `<line_number>: { "evaluationString": "String" "sysId": "String" }` Data type: Object
debugpoints.logpoint.<line_number>.evaluationString	Text of the logpoint. Contains the message being logged. Data type: String
debugpoints.logpoint.<line_number>.sysId	Sys_id of the logpoint. Data type: String
key	Object providing details about the script being debugged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"key": { "scriptField": "String" "scriptId": "String" "scriptType": "String" "value": "String" }` Data type: Object
key.scriptField	Name of the field that contains the script. Data type: String
key.scriptId	Sys_id of the script. Data type: String
key.scriptType	Name of the table that contains the script. Data type: String
key.value	The path parameters used to make the request. Listed in the following order. • tableName • sysId • fieldName Data type: String
name	Name of the script. Data type: String
script	Text displaying the script's code. Data type: String

Example cURL request

Example: cURL request

Retrieves a list of logpoints and breakpoints for a server-side script. This script has a logpoint on line 2, a breakpoint on line 11, and a conditional breakpoint on line 18.

```
curl
 "https://instance.servicenow.com/api/now/js/debugpoints/scri
pt/sys_script_include/d65f78c40a0a0b6900196656f35913d3/script" \
--request GET \
--header "Accept:application/json" \
```

  }
}
```

Script Debugger - POST js/debugpoints/process

Add, update, or remove breakpoints or logpoints in a server-side script, such as a business rule or script include. Process several breakpoints or logpoints at a time.

URL format

Default URL: `/api/now/js/debugpoints/process`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
fetchAll	When true, returns a list of all the breakpoints or logpoints added or updated by the user. Data type: Boolean Default: false
fetchAllFilter	Returns a filtered list of all the breakpoints or logpoints added or updated by the user. Valid values: • debugpointType. Set to either breakpoint or logpoint. • scriptId. Set to the sys_id of the script in which to search for debug points. • scope. Set to the name of the scope in which to search for debug points. Use the caret (^) symbol as a separator for multiple properties. For example, `fetchAllFilter=debugpointType=logpoint^scope=MyApp` Data type: String

Request body parameters (XML or JSON)

Name	Description
debugpointType	Required. Type of debug point to add, delete, or update. Valid values: • breakpoint • logpoint Data type: String
evaluationString	Text for a logpoint or conditional breakpoint. For a logpoint, the *`evaluationString`* is the log message. For a conditional breakpoint, the *`evaluationString`* is the condition. For example, if you're looping through a list of user IDs and you want the debugger to pause only when the user ID is 38493, you can add a conditional breakpoint inside the loop with `userID == 38493` as the condition. The debugger will only pause at this breakpoint when the condition is true. If the breakpoint is not a conditional breakpoint, the *`evaluationString`* is an empty string. Data type: String
fieldName	Required. Name of the field that contains the server-side script content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
lineNumber	Line number in the server-side script specifying where to add, delete, or update the breakpoint or logpoint. Data type: Number
operation	Required. Operation to perform for the breakpoint or logpoint. Valid values: • add • delete • update Data type: String
scriptId	Required. Sys_id for the server-side script. Data type: String
tableName	Required. Name of the table that contains the server-side script, such as sys_script or sys_script_include. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
requestedDebugpoints	List of the requested breakpoints and logpoints. Presented as an array of objects. `"requestedDebugpoints": [ { "scriptId": "String", "evaluationString": "String", "operation": "String", "tableName": "String", "fieldName": "String", "status": "String", "lineNumber": Number, "debugpointType": "String" } ]` Data type: Array
requestedDebugpoints.ScriptId	Sys_id for the server-side script. Data type: String
requestedDebugpoints.evaluationString	Text added for a logpoint or conditional breakpoint. For a logpoint, the *evaluationString* is the log message. For a conditional breakpoint, the *evaluationString* is the condition. Data type: String
requestedDebugpoints.operation	Operation performed for the breakpoint or logpoint. Possible values: • add • delete • update Data type: String
requestedDebugpoints.tableName	Name of the table that contains the server-side script, such as sys_script or sys_script_include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
requestedDebugpoints.fieldName	Name of the field that contains the server-side script content. Data type: String
requestedDebugpoints.status	Result of the instruction to add, delete, or update a specific breakpoint or logpoint. Possible values: • failure • ignored • success A request to add, delete, or update a debug point is ignored in the following situations: • It requests to delete a breakpoint or logpoint that doesn't exist. • It requests to add a breakpoint or logpoint identical to one that already exists. Data type: String
requestedDebugpoints.lineNumber	Line number in the server-side script specifying where the breakpoint or logpoint was added, deleted, or updated. Data type: Number
requestedDebugpoints.debugpointType	Type of debug point added, deleted, or updated. Possible values: • breakpoint • logpoint Data type: String
status	Result of the overall action. The status code for the HTTP call. Data type: Number

Example: cURL request

This example adds a conditional breakpoint at line 12 in the script.

```
curl
 "https://instance.servicenow.com/api/now/js/debugpoints/proce
ss" \
```

Service Catalog API

The *`Service Catalog`* API provides endpoints that access Service Catalog configuration and actions from within a Service Portal.

Service Catalog - DELETE /sn_sc/servicecatalog/cart/{cart_item_id}

Deletes the specified item from the current cart.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart/{cart_item_id}`

Default URL: `/api/sn_sc/servicecatalog/cart/{cart_item_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
cart_item_id	Sys_id of the item to delete from the current cart. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	Indicates that the request completed successfully and the specified item was deleted from the cart.
400	Indicates that either the specified *cart_item_id* is invalid or the user does not have access to the cart item.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/v1/servicecatalog/ca
rt/1f4cc597db2112006430115 0f0b8f5fc" \
--request DELETE \
--user "username":"password"
```

```
None
```

Service Catalog - DELETE /sn_sc/servicecatalog/cart/{sys_id}/empty

Deletes a specified cart, and the contents of the cart.

The capabilities of what a user can delete (items and/or cart) depends on the role in which they use to authenticate.

User roles needed to delete cart and cart contents:

- admin/catalog_admin: Can empty any user cart.
- admin: Can delete the cart after all the contents of the cart are deleted.
- catalog_admin: Can delete all the items in the cart.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart/{sys_id}/empty`

Default URL: `/api/sn_sc/servicecatalog/cart/{sys_id}/empty`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Indicates that the request completed successfully. If there is no item in the cart, it returns basic cart information and pricing for user. If the cart contains any items, then the information about the items and their individual pricing is also included.
400	Indicates that the cart is empty and cannot check out.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description
cart_id	Sys_id of the cart. Data type: String

<recurring_frequency>	List of items in the cart having a specific recurring frequency. Possible values include:
	• daily
	• monthly
	• yearly
	• none (no recurring fees)
	
	Data type: Object
	`"<recurring_frequency>": {`
	`"frequency_label": "String",`
	`"items": [Array],`
	`"show_subtotal_price": "String",`
	`"subtotal_price": "String",`
	`"subtotal_recurring_frequency": "String",`
	`"subtotal_recurring_price": "String",`
	`"subtotal_title": "String",`
	`"total_title": "String"`

<recurring_frequency>.frequency_label	Frequency of the associated recurring fee. Data type: String Default: Null

<recurring_frequency>.items	List of objects that contain details of each item associated with the specified recurring frequency category.
	
	Data type: Array
	`"items": [{`
	`"cart_item_id": "String",`
	`"catalog_item_id": "String",`
	`"created.by": "String",`
	`"created_on": "String",`

Parameter	Description
	"picture": "String", "price": "String", "quantity": "String", "recurring_frequency": "String", "recurring_price": "String", "recurring_subtotal": Number, "recurring_subtotal_price": "String", "short_description": "String", "show_price": Boolean, "show_quantity": Boolean, "show_recurring_price": Boolean, "subtotal": Number, "subtotal_price": "String", "sys_class_name": "String", "sys_id": "String", "updated_by": "String", "updated_on": "String", "variables": {Object} }]
<recurring_frequency>.items.cart_item_id	Sys_id of the item in this cart. Data type: String
<recurring_frequency>.items.catalog_item_id	Sys_id of catalog associated the item. Data type: String
<recurring_frequency>.items.created.by	User that initially placed the item in the cart. Data type: String
<recurring_frequency>.items.created_on	Date on which the item was initially placed in the cart. Data type: String
<recurring_frequency>.items.delivery_time	Time that the specified item takes to be delivered. Data type: String
<recurring_frequency>.items.item_id	Catalog sys_id of the item. Data type: String
<recurring_frequency>.items.item_name	Name of the specified item. Data type: String
<recurring_frequency>.items.localized_price	Price of the item in local currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Parameter	Description
	Data type: String
<recurring_frequency>.items.localized_recurring_price	Recurring fee for the specified item in local currency. Data type: String
<recurring_frequency>.items.name	Item name. Data type: String
<recurring_frequency>.items.order_guide	Name of the order guide to which this item is associated. Data type: String
<recurring_frequency>.items.picture	File name of the picture of the item. Data type: String
<recurring_frequency>.items.price	Price of the item. Data type: String
<recurring_frequency>.items.quantity	Number of the specified item in the cart. Data type: String
<recurring_frequency>.items.recurring_frequency	How often the recurring fee is charged for the specified item. Data type: String Default: Null
<recurring_frequency>.items.recurring_price	Recurring fee for the specified item. Data type: String
<recurring_frequency>.items.recurring_subtotal	Subtotal of the recurring fees for the item (*recurring_price* x *quantity*). Data type: Number
<recurring_frequency>.items.recurring_subtotal_price	Subtotal of the recurring fees for the item. Data type: String
<recurring_frequency>.items.short_description	Short description of the item. Data type: String
<recurring_frequency>.items.show_price	Flag that indicates whether the price of the item is shown in the cart. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	• true: Show the price of the item in the cart. • false: Do not show the price of the item in the cart. Data type: Boolean
<recurring_frequency>.items.show_quantity	Flag that indicates whether to show the item quantity in the cart. Possible values: • true: Show the item quantity in the cart. • false: Do not show the item quantity in the cart. Data type: Boolean
<recurring_frequency>.items.show_recurring_price	Flag that indicates whether the recurring fees should appear in the cart. Possible values: • true: Show the recurring fees in the cart. • false: Do not show the recurring fees in the cart. Data type: Boolean
<recurring_frequency>.items.subtotal	Subtotal number of items. Data type: Number
<recurring_frequency>.items.subtotal_price	Subtotal for the item (*price* x *quantity*). Data type: String
<recurring_frequency>.items.sys_class_name	System classification name of the item. Data type: String
<recurring_frequency>.items.sys_id	Sys_id of the item record. Data type: String
<recurring_frequency>.items.updated_by	User that updated the item after it was initially placed in the cart. Data type: String
<recurring_frequency>.items.updated_on	Last date/time on which the item was either initially placed in the cart or updated. Data type: String
<recurring_frequency>.items.variables	List of name/value pairs of the item variables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: Object
<recurring_frequency>.show_subtotal_price	Flag that indicates whether to show a subtotal for the associated recurring fee category. Possible values: • true: Show subtotals in the cart. • false: Do not show subtotals in the cart. Data type: Boolean
<recurring_frequency>.subtotal_price	Subtotal of the cost of all items for the associated recurring frequency category. Data type: String
<recurring_frequency>.subtotal_recurring_frequency	Type of subtotal recurring frequency, such as daily, monthly, etc. Same as *`subtotal_recurring_frequency`*. Data type: String
<recurring_frequency>.subtotal_recurring_price	Subtotal of the recurring fees of the items within the associated recurring frequency category. Data type: String
<recurring_frequency>.subtotal_title	If the *`show_subtotal_price`* is set to `true`, the text to display in the cart for the associated subtitle. Data type: String
<recurring_frequency>.total_title	Text to display for the total title for the associated recurring frequency category. Data type: String
show_subtotal_price	Flag that indicates whether to show the subtotal price in the cart. Possible values: • true: Show subtotals in the cart. • false: Do not show subtotals in the cart. Data type: String
subtotal_price	Subtotal of all items in the cart in whole dollars. Data type: String

Service Catalog - GET /sn_sc/servicecatalog/cart/delivery_address/{user_id}

Retrieves the shipping address of the specified user based on the *glide.sc.req_for.roles* property and the default behavior configured in the *glide.sc.req_for.roles.defaultproperty*.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/cart/delivery_address/{user_id}`

Default URL: `/api/sn_sc/servicecatalog/cart/delivery_address/{user_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the user whose shipping address to retrieve. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Address of the specified user. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_sc/servicecatalog/ca
rt/delivery_address/62826bf03710200044e0bfc8bcbe5df1" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
'result': '25 New Chardon Street, Boston\nBoston, MA,
 02114-1801\nUSA'
}
```

Service Catalog - GET /sn_sc/servicecatalog/catalogs

Retrieves a list of catalogs to which the user has access based on the passed in parameters.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/catalogs`

Default URL: `/api/sn_sc/servicecatalog/catalogs`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_text	Keyword to search for in the "title" field of the available service catalogs. Data type: String
sysparm_view	Device on which the item can display: • *desktop*: On the desktop. • *mobile*: On a mobile device. • *both*: Both on a desktop and on a mobile device. Data type: String

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Indicates that the request completed successfully. If a valid query returns no results, the response body only contains an empty result array.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
description	Description of the catalog. Data type: String
desktop_image	Image that appears on the desktop for this catalog. Data type: String
has_categories	Flag that indicates whether the catalog contains categories. Possible values: • true: Catalog contains categories. • false: Catalog does not contain categories. Data type: Boolean
has_items	Flag that indicates whether the catalog contains items. Possible values: • true: Catalog contains items. • false: Catalog does not contain items. Data type: Boolean
sys_id	Sys_id of the catalog. Data type: String

Service Catalog - GET /sn_sc/servicecatalog/catalogs/{sys_id}/categories

Retrieves the list of available categories for the specified catalog.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/catalogs/{sys_id}/categories`

Default URL: `/api/sn_sc/servicecatalog/catalogs/{sys_id}/categories`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the catalog whose categories are requested. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_top_level_only	Only return those categories whose parent is a catalog. Valid values: • true: Only return those categories whose parent is a catalog. • false: Return all categories. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
sysparm_view	UI view for which to render the data. Determines the fields returned in the response. Valid values: • desktop • mobile • both If you also specify the *sysparm_fields* parameter, it takes precedent. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Returns a list of categories in a catalog. If there are no query results, then an empty array is returned.
400	Indicates that the request or catalog sys_id is invalid.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
count	Number of items within the category. Data type: Number
description	Brief category description. Data type: String
full _description	Detailed category description. Data type: String
header_icon	Icon used on category headers. Data type: String
homepage_image	Image that appears for this category on the category's home page. Data type: String
icon	Icon to use to signify this category. Data type: String

subcategories	List of subcategories within the category.
	
	Data type: Array
	
	`"subcategories": [`
	`  "sys_id": "String",`
	`  "title": "String`
	`]`

subcategories.sys_id	Sys_id of the subcategory. Data type: String
subcategories.title	Title of the subcategory. Data type: String

Service Catalog - GET /sn_sc/servicecatalog/catalogs/{sys_id}

Retrieves the available information for a specified catalog.

URL format

Versioned URL: `/api/sn_sc/{api_version}/servicecatalog/catalogs/{sys_id}`

Default URL: `/api/sn_sc/servicecatalog/catalogs/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the catalog to retrieve. Data type: String

Query parameters

Name	Description
sysparm_view	Device on which the item can display: • *`desktop`*: On the desktop. • *`mobile`*: On a mobile device. • *`both`*: Both on a desktop and on a mobile device. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Indicates that the request has completed successfully and returns the available information for the specified catalog.
400	Indicates that request is invalid for one of the following reasons: • User does not have access to the catalog. • Invalid sys_id.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
categories	List of objects that describe categories within the catalog. Data type: Array `"categories": [ "description": "String", "header_image": "String", "sys_id": "String", "title": "String ]`
categories.description	Description of the category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
categories.header_image	Category header image. Data type: String
categories.sys_id	Unique category identifier (sys_id). Data type: String
categories.title	Category title. Data type: String
description	Catalog description. Data type: String
desktop_image	Source of the image that displays with the catalog in the desktop view. Data type: String
has_categories	Flag that indicates whether the catalog has categories. Possible values: • true: Catalog has categories. • false: Catalog does not have categories. Data type: Boolean
has_items	Flag that indicates whether there are items within the category. Possible values: • true: Catalog has items associated with it. • false: Catalog does not have any items associated with it. Data type: Boolean
sys_id	Unique catalog sys_id. Data type: String
title	Catalog title. Data type: String

Example: cURL request

```
curl "https://instance.servicenow.comaqsw" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Indicates that request is invalid for one of the following reasons: • User does not have access to the category. • Invalid sys_id.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
child_categories	List of objects that describe the child categories that belong to this category. Data type: Array `"child_categories": [ "count": Number, "isParentCategory": "String", "parent": "String", "subcategories": [Array], "sys_id": "String", "title": "String" ]`
child_categories.count	Number of items in the child category. Data type: Number
child_categories.isParentCategory	Flag that indicates if this is a parent category. Possible values: • true: Parent category. • false: Not the parent category. Data type: Boolean
child_categories.parent	Sys_id of the child category's parent. Data type: String
child_categories.subcategories	List of objects that describe the subcategories for this child category. Data type: Array
