Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
404	Application not created. The *message* property in the *result* object contains additional information about the error.

Response body parameters (JSON)

Name	Description

error	Error information. This parameter is only returned if the request failed.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about why the request failed. Data type: String
error.message	Error message containing the reason the request failed. Data type: String

result	Result object containing information about the application.
	
	Data type: Object
	
	`"result": {`
	`  "data": "String",`
	`  "message": "String"`
	`}`

result.data	Sys_id of the application. Data type: String Table: CDM Application [sn_cdm_application]
result.message	Information about the successful or unsuccessful outcome of the request. Data type: String
status	Status of the request. This parameter is only returned if the request failed. Possible value: failure Data type: String

Example: cURL request

This example shows how to create a new application.

}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "message": "Application with name Demo Application 1234
 created successfully.",
    "data": "38e17dc3473d111072566862736d43c7"
  }
}
```

Digital Product Release API

The `Digital Product Release` API provides endpoints to manage releases and policy compliance.

This API requires the Digital Product Release (sn_dpr) application, which is available on the ServiceNow Store. For more information, see Digital Product Release.

Digital Product Release - GET /sn_dpr/digital_product_release/bundle/{sysId}

Retrieves release bundle details.

This endpoint can be extended to customize the fields and aggregated data returned in the response body. The default functionality of this endpoint is defined by the `getReleaseBundleDetails()` method in the `ReleaseBundleSNC` script include. To customize the functionality, override the `getReleaseBundleDetails()` method in the `ReleaseBundle` script include, which extends `ReleaseBundleSNC`. By default, aggregated data for enhancements, policies, release states, and task counts can be included in the response body.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin
- sn_dpr_model.release_coordinator
- sn_dpr_model.release_user

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/bundle/{sysId}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_dpr/digital_product_release/bundle/{sysId}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sysId	Sys_id of the release bundle. Table: Release Bundle [sn_dpr_model_release_bundle] Data type: String

Query parameters

Name	Description
sendAggregation	Flag that indicates whether to include aggregated data for enhancements, policies, release states, and task counts in the response body. Data type: Boolean Valid values: • true: Return aggregates for enhancements, policies, release states, and task counts. • false: Don't return aggregates. Default: false

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Authorization	Basic or bearer token for authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON)

Name	Description

aggregates	Aggregated data for enhancements, policies, release states, and task counts.
	
	This parameter is only included in the response body if the *sendAggregation* query parameter is set to `true` in the request.
	
	`"aggregates": {`
	`  "enhancementAggregate": {Object},`
	`  "policyAggregate": {Object},`
	`  "releaseAggregate": {Object},`
	`  "taskAggregate": {Object}`
	`}`
	
	Data type: Object

aggregates.enhancementAggregate	Lists the number of enhancements in each state.
	
	Data type: Object
	
	`"enhancementAggregate": {`
	`  "Closed": Number,`
	`  "Open": Number`
	`}`

aggregates.policyAggregate	Lists the number of policies in each execution status.
	
	Data type: Object
	
	`"policyAggregate": {`
	`  "Executed": Number,`
	`  "Pending": Number`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

aggregates.releaseAggregate	Lists the number of releases in each state. States are only included in this object if at least one release is in that state.
	
	Data type: Object
	
	`"releaseAggregate": {`
	`"Cancelled": Number,`
	`"Completed": Number,`
	`"Draft": Number,`
	`"In Progress": Number,`
	`"Pending": Number,`
	`"Restarting": Number,`
	`"Review": Number`
	`}`

aggregates.taskAggregate	Lists the number of tasks that are approved and not approved.
	
	Data type: Object
	
	`"taskAggregate": {`
	`"approval": Number,`
	`"nonApproval": Number`
	`}`

name	Name of the release bundle. Data type: String
owner	Owner of the release bundle. Data type: String

releases	Data about the releases included in the bundle.
	
	`"releases": {`
	`"count": Number,`
	`"list": [Array]`
	`}`
	
	Data type: Object

releases.count	Number of releases included in the bundle. Data type: Number
releases.list	List of sys_ids of releases included in the bundle. Table: Release [sn_dpr_model_release] Data type: Array
sysId	Sys_id of the release bundle. Table: Release Bundle [sn_dpr_model_release_bundle]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: cURL request

This example retrieves details about a specified release bundle, including aggregated data for enhancements, policies, release states, and task counts.

```
curl -X GET \
 "https://instance.service-now.com/api/sn_dpr/v1/digital_product
_release/bundle/9d0d0b4c874b1110dba83d5ebf867de2?sendAggregation
=true" \
--header "Accept: application/json" \
--header "Authorization: Basic <base64encoded-credentials>"
```

Response body.

```
{
   "sysId": "9d0d0b4c874b1110dba83d5ebf867de2",
   "name": "Release Bundle Q4",
   "owner": "jane.doe",
   "releases": {
      "count": 2,
      "list": ["rel1", "rel2"]
   },
   "aggregates": {
      "releaseAggregate": {
         "In Progress": 1,
         "Completed": 1
      },
      "taskAggregate": {
         "approval": 3,
         "nonApproval": 5
      },
      "policyAggregate": {
         "Executed": 2,
         "Pending": 1
      },
      "enhancementAggregate": {
         "Open": 1,
         "Closed": 1
      }
   }
}
```

Digital Product Release - GET /sn_dpr/digital_product_release/releases/{releaseId}/policies/status

Gets policy execution details by product for the current phase of a release.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin
- sn_dpr_model.release_coordinator
- sn_dpr_model.release_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before calling this endpoint, the release state must be **In Progress** and the current phase state must also be **In Progress**. You can view release information in the Digital Product Release Workspace in the **Releases** tab.

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/releases/{releaseId}/policies/status`

Default URL: `/api/sn_dpr/digital_product_release/releases/{releaseId}/policies/status`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
releaseId	Sys_id of the release. Table: Release [sn_dpr_model_release] Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
result	Object containing a compliance summary and product policy details. Data type: Object `"result": { "overallSummary": {Object}, "products": [Array] }`
result.overallSummary	Policy compliance summary for the current release phase. Data type: Object `"overallSummary": { "compliant": Boolean, "compliantCount": Number, "currentPhase": "String", "nonCompliantCount": Number, "timestamp": "String", "totalCount": Number }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.overallSummary.compliant	Flag that indicates whether all evaluated policies for the current release phase are compliant. Valid values: • true: All evaluated policies are compliant. • false: Not all evaluated policies are compliant. Data type: Boolean
result.overallSummary.compliantCount	Number of compliant policies. Data type: Number
result.overallSummary.currentPhase	Name of the current release phase. Data type: String
result.overallSummary.nonCompliantCount	Number of non-compliant policies. Data type: Number
result.overallSummary.timestamp	Date and time that policy compliance was last evaluated. Data type: String
result.overallSummary.totalCount	Total number of policies evaluated. Data type: Number
result.products	List of product-level compliance results. Each object in the array represents a product. Data type: Array `"products": [ { "policyExecutionDetails": [Array], "productId": "String", "productName": "String", "productVersion": "String", "summary": {Object}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`}` `]`
result.products.policyExecutionDetails	List of executed policies with compliance results. Each object in the array represents a policy. Data type: Array `"policyExecutionDetails": [ { "executionOutput": "Check sum OK; 0 violations. Execution log id: e23-9a.", "lastRunAt": "2025-09-26T08:30:00Z", "name": "Policy Name 1", "policyId": "policyVersionSysId1", "reason": "All checks passed", "status": "compliant" } ]`
result.products.policyExecutionDetails.executionOutput	Output message produced by the policy execution. Data type: String
result.products.policyExecutionDetails.lastRunAt	Date and time the policy was last evaluated for compliance. Data type: String
result.products.policyExecutionDetails.name	Display name of the policy. Data type: String
result.products.policyExecutionDetails.policyId	Sys_id of the policy. Table: Policy [sn_pace_policy] Data type: String
result.products.policyExecutionDetails.reason	Message explaining the reason the policy is compliant or non-compliant. Data type: String
result.products.policyExecutionDetails.status	Compliance state for the policy.

```
                    "executionOutput": "Validation failed at step
 3: required configuration missing.",
                    "reason": "Missing required configuration
 'payments.retry_limit'"
                }
            ]
        }
    ]
  }
}
```

Digital Product Release - POST /sn_dpr/digital_product_release/product_enhancement

Creates an enhancement for a product or service.

To access this endpoint, the caller must have the sn_dpr_model.product_manager role.

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/product_enhancement`

Default URL: `/api/sn_dpr/digital_product_release/product_enhancement`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Description of the enhancement. Data type: String
name	Required. Name of the enhancement. Data type: String
priority	Priority of the enhancement. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• high • medium • low Default: medium Data type: String
productFeatureSysId	Sys_id of the product feature to associate with the enhancement. Table: Product Feature [sn_dpr_model_product_feature] Data type: String
productSysId	Required. Sys_id of the product or service to associate with the enhancement. Table: Application Model [cmdb_application_product_model] or Service Model [cmdb_service_product_model] Data type: String
releaseSysId	Sys_id of the release to add the enhancement. The release must be associated with the version provided in the *`versionSysId`* parameter. Table: Release [sn_dpr_model_release] Data type: String
versionSysId	Sys_id of the product version or service version to associate with the enhancement. The version must be for the same product or service provided in the *`productSysId`* parameter. Table: Software Model [cmdb_software_product_model] or Service Offering Model [cmdb_service_offering_model] Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Created. The enhancement was successfully created.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Details about the API request.
	
	Data type: Object
	
	`"result": {`
	`  "error": Boolean,`
	`  "sysId": "String"`
	`}`

result.error	Flag that indicates whether there is an error with the API request. Possible values: • true: Error. • false: No error. Data type: Boolean
result.sysId	Sys_id of the created enhancement. Table: Product Enhancement [sn_dpr_model_product_enhancement]

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: cURL request

This example creates a product enhancement.

```
curl
 "https://instance.service-now.com/api/sn_dpr/digital_product_re
lease/product_enhancement" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"name\":\"Offline streaming\",
   \"productSysId\":\"de8e9c0dfff8f2108289ffffffffff61\",
   \"priority\":\"high\",
   \"description\":\"Enhancement description\",
   \"versionSysId\":\"da4b608dff7cf2108289ffffffffffc2\",
   \"releaseSysId\":\"9a4b608dff7cf2108289ffffffffffc3\",
   \"productFeatureSysId\":\"192d2905ff7436108289ffffffffff3f\"
}" \
--user 'username':'password'
```

Response body.

```
{
   "result": {
      "error": false,
      "sysId": "76417985ff7436108289ffffffffff5f"
   }
}
```

Digital Product Release - POST /sn_dpr/digital_product_release/release

Creates a release.

A release can be created as an independent release, or as a primary release that includes child releases. This endpoint can also be used to move an existing release from the Draft state to In Progress.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release`

Default URL: `/api/sn_dpr/digital_product_release/release`

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (JSON) (continued)

Name	Description
	Table: System Component Model [cmdb_sw_component_model] Data type: Array
isDraftRelease	Flag that indicates whether to create the release in the Draft state. Valid values: • true: The release is created with the state set to Draft. • false: The release is created with the state set to In Progress. Default: False Data type: Boolean
name	Required. Name of the release. Data type: String
productId	Required. Sys_id of the product. Table: Product Model [cmdb_model] Data type: String
productVersion	Sys_id of the product version. Table: System Component Model [cmdb_sw_component_model] Data type: String
releaseCalendar	Sys_id of the release calendar. Table: Release Calendar [sn_dpr_model_release_calendar] Data type: String
releaseDate	Release date in the format yyyy-MM-dd. Using this parameter creates a record in the Release Readiness Target [sn_dpr_model_release_target] table. Data type: String
releaseDescription	Description of the release. Data type: String
releaseOwner	Required. Sys_id of the release owner.

Request body parameters (JSON) (continued)

Name	Description
	Table: User [sys_user] Data type: String
releaseTarget	Sys_id of the release readiness target. Table: Release Readiness Target [sn_dpr_model_release_target] Data type: String
templateId	Sys_id of the template to use for the release. Table: Release Template [sn_dpr_model_release_template] Data type: String
validatesVersion	Flag that indicates whether the release validates a version. Valid values: • true: The release validates a version. • false: The release doesn't validate a version. Default: False Data type: Boolean

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Created. The release was successfully created.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON)

Name	Description

result	Details about the API request.
	
	Data type: Object
	
	`"result": {`
	`  "error": Boolean,`
	`  "message": "String",`
	`  "progressId": "String",`
	`  "releaseId": "String"`
	`}`

result.error	Flag that indicates whether there is an error with the API request. Possible values: • true: Error. • false: No error. Data type: Boolean
result.message	Message containing details about the success or failure of the API request. Data type: String
result.progressId	Sys id of the tracker for the creation progress of the child release versions listed in the *autoCreateIncludedVersions* request parameter. Table: Progress Worker [sys_progress_worker] Data type: String
result.releaseId	Sys_id of the created primary release. Table: Release [sn_dpr_model_release] Data type: String

Example: cURL request

This example creates a release with included versions.

Digital Product Release - POST /sn_dpr/digital_product_release/release/{releaseId}/key_date

Creates a key date for a release.

Key dates are used to track deadlines, milestones, and other important events during the release.

Before calling this endpoint, a timeline-oriented release must be created. A timeline-oriented release has fixed deadlines and follows a strict schedule, while a stage-oriented release is primarily focused on completing objectives and features rather than meeting due dates.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin
- sn_dpr_model.release_coordinator

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release/{releaseId}/key_date`

Default URL: `/api/sn_dpr/digital_product_release/release/{releaseId}/key_date`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
releaseId	Sys_id of the release. Table: Release [sn_dpr_model_release] Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
assignedTo	Sys_id of the user assigned to the key date. The user must have one of the following roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• sn_dpr_model.product_manager • sn_dpr_model.release_admin • sn_dpr_model.release_coordinator • sn_dpr_model.release_user Table: User [sys_user] Data type: String
description	Description of the key date. Data type: String
duedate	Required. Due date that the event or objective must be completed by. The due date must be between the release planned start and end dates. Format: yyyy-MM-dd Data type: String
name	Required. Name of the key date. Data type: String
state	Required. State of the key date. Valid values: • archived • missed • upcoming Data type: String
type	Required. Type of key date. Valid values: • deadline • important_date • key_event • milestone Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Created. The key date was successfully created.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Details about the API request.
	
	Data type: Object
	
	`"result": {`
	`  "error": Boolean,`
	`  "keyDateSysId": "String",`
	`  "message": "String"`
	`}`

result.error	Flag that indicates whether there is an error with the API request. Possible values: • true: Error. • false: No error. Data type: Boolean
result.keyDateSysId	Sys_id of the created key date.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Table: Release Key Date [sn_dpr_model_release_key_date] Data type: String
result.message	Message containing details about the success or failure of the API request. Data type: String

Example: cURL request

This example creates a project launch date for a specified release.

```
curl
 "https://instance.service-now.com/api/sn_dpr/digital_product_re
lease/release/eb7dd11d97b402107bc2341de053af34/key_date" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"name\": \"Project Launch\",
    \"type\": \"milestone\",
    \"dueDate\": \"2025-11-01\",
    \"state\": \"upcoming\",
    \"description\": \"Launching the new project phase.\",
    \"assignedTo\": \"62826bf03710200044e0bfc8bcbe5df1\"
}" \
--user 'username':'password'
```

Response body.

```
{
   "result": {
      "error": false,
      "message": "Release key date created successfully",
      "keyDateSysId": "eb0b0905ff7036108289ffffffffff6d"
   }
}
```

Digital Product Release - POST /sn_dpr/digital_product_release/release/{releaseId}/policies/run

Executes mapped policies for the current phase of a release.

To access this endpoint, the caller must have the sn_dpr_model.product_manager role.

Before calling this endpoint, the release state must be **In Progress** and the current phase state must also be **In Progress**. You can view release information in the Digital Product Release Workspace in the **Releases** tab.

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release/{releaseId}/policies/run`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_dpr/digital_product_release/release/{releaseId}/policies/run`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
releaseId	Sys_id of the release. Table: Release [sn_dpr_model_release] Data type: String

Query parameters

Example: cURL request

This example executes the mapped policies for the current phase of the specified release.

```
curl
 "https://instance.service-now.com/api/sn_dpr/digital_product_re
lease/release/d4982eeb474b621027d48b41516d4385/policies/run" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```
{
   "result": {
      "error": false,
      "errorCode": "",
      "message": "Policy execution scheduled.",
      "policyExecutionScheduled": true
   }
}
```

Digital Product Release - POST /sn_dpr/digital_product_release/release/{releaseId}/related_task

Adds related tasks to a release.

You can view release information in the Digital Product Release Workspace in the Releases tab. Related tasks for a release are shown in the Release Scope section of a release record.

Important: Before calling this endpoint, there must be existing task records that can be added as related tasks for the release. The records must be in tables that extend the Task [task] table, but not in the Task table itself. In the *sn_dpr_model.release_related_task_types* system property, list the tables that contain your task records.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release/{releaseId}/related_task`

Default URL: `/api/sn_dpr/digital_product_release/release/{releaseId}/related_task`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
releaseId	Sys_id of the release. Table: Release [sn_dpr_model_release] Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
taskIds	Required. List of task sys_ids to add as related tasks for the release. The task records must be from tables listed in the *sn_dpr_model.release_related_task_types* system property. For more information, see Digital Product Release properties. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

```
      "message": "Successfully created the mappings between the
 release and all the tasks."
   }
}
```

Digital Product Release - POST /sn_dpr/digital_product_release/release_calendar

Creates a release calendar.

To access this endpoint, the caller must have the sn_dpr_model.release_calendar_admin role.

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release_calendar`

Default URL: `/api/sn_dpr/digital_product_release/release_calendar`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Description of the release calendar. Data type: String
name	Required. Name of the release calendar. Data type: String
releaseAdmin	Required. Sys_id of the release calendar owner. Table: User [sys_user] Data type: String
schedules	Comma-separated list of schedule sys_ids to use for the release calendar. For example, `"sysId1,sysId2,sysId3"`. Table: Schedule [cmn_schedule]

Name	Description
	`"releaseCalendarId": "String"` `}`
result.error	Flag that indicates whether there is an error with the API request. Possible values: • true: Error. • false: No error. Data type: Boolean
result.message	Message containing details about the success or failure of the API request. Data type: String
result.releaseCalendarId	Sys_id of the created release calendar. Table: Release Calendar [sn_dpr_model_release_calendar] Data type: String

Example: cURL request

This example creates a release calendar.

```
curl
 'https://instance.service-now.com/api/sn_dpr/v1/digital_product
_release/release_calendar' \
--request POST \
--header 'Accept:application/json' \
--header 'Content-Type: application/json' \
--header 'Authorization: Basic <base64encoded-credentials>' \
--data '{
    "name": "Q1 2025 Release Calendar123",
    "releaseAdmin": "dc6770ae3b97a210532fb50f23e45a33",
    "description": "Calendar for Q1 releases"
}'
```

Response body.

```
{
   "result": {
      "error": false,
      "message": "",
      "releaseCalendarId": "5f6702c13bbc3a50532fb50f23e45a2b"
   }
}
```

Digital Product Release - POST /sn_dpr/digital_product_release/release_id/{releaseId}/complete_phase

Completes the current phase of a release.

Note: The current phase is only set to **Completed** if all policies for the phase are compliant.

© 2026 ServiceNow, Inc. All rights reserved.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin
- sn_dpr_model.release_coordinator

Before calling this endpoint, the release state must be **In Progress** and the current phase state must also be **In Progress**. You can view release information in the Digital Product Release Workspace in the **Releases** tab.

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release_id/{releaseId}/complete_phase`

Default URL: `/api/sn_dpr/digital_product_release/release_id/{releaseId}/complete_phase`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
releaseId	Sys_id of the release. Table: Release [sn_dpr_model_release] Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Created. The release phase was successfully completed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Details about the API request. The elements included in this object depend on whether the request succeeded or failed.
	
	Data type: Object
	
	Success object.
	`"result": {`
	`  "message": "String",`
	`  "phaseSysId": "String",`
	`  "status": "String",`
	`}`
	
	Error object.
	`"result": {`
	`  "error": Boolean,`
	`  "message": "String"`
	`}`

result.error	Flag that indicates whether there is an error with the API request. This parameter is only returned if the request failed so the only possible value is `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
result.message	Message containing details about the success or failure of the API request. Data type: String
result.phaseSysId	Sys_id of the release phase. Table: Release Phase [sn_dpr_model_release_phase] Data type: String
result.status	Status of the API request. This parameter is only returned if the request was successful so the only possible value is `success`. Data type: String

Example: cURL request

This example completes the current phase of the specified release.

```
curl
 "https://instance.service-now.com/api/sn_dpr/digital_product_re
lease/release_id/d4982eeb474b621027d48b41516d4385/complete_pha
se" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "status": "success",
    "message": "Release phase is marked as complete",
    "phaseSysId": "2498222f474b621027d48b41516d4342"
  }
}
```

Example: cURL request

This example shows an error response when an invalid release sys_id is provided.

```
curl
 "https://instance.service-now.com/api/sn_dpr/digital_product_re
lease/release_id/a/complete_phase" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Error response.

```
{
  "result": {
    "error": true,
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "message": "Release ID is invalid"
  }
}
```

Digital Product Release - POST /sn_dpr/digital_product_release/release_target

Creates a release readiness target or a set of recurring release readiness targets.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release_target`

Default URL: `/api/sn_dpr/digital_product_release/release_target`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Description of the readiness target. Data type: String
endDate	End date for a recurring readiness target. Required if *`isRecurring`* is `true`. Data type: String
isRecurring	Required. Flag that indicates whether the readiness target is recurring. Valid values: • true: The target is recurring. • false: The target is a single date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: Boolean
name	Required. Name of the release readiness target. Data type: String
releaseAdmin	Required. Sys_id of the readiness target owner. Table: User [sys_user] Data type: String
releaseCalendar	Required. Sys_id of the release calendar for the readiness target. Table: Release Calendar [sn_dpr_model_release_calendar] Data type: String

repeats	Sets the schedule for a recurring readiness target. Required if *isRecurring* is `true`.
	
	Data type: Object
	
	`"repeats": {`
	`"daysOfWeek": Number,`
	`"every": Number,`
	`"type": "String"`
	`}`

repeats.daysOfWeek	Number of working days in a week. Data type: Number

repeats.every	Number of intervals between each date. Used with *repeats.type* to define the frequency the target recurs.
	
	In this example, the target recurs every two weeks.
	
	`"repeats": {`
	`"every": 2,`
	`"type": "weekly"`
	`}`
	
	Data type: Number

repeats.type	Type of interval between each date. Used with *repeats.every* to define the frequency the target recurs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Valid values: • weekly • monthly Data type: String
scheduleSysId	Sys_id of the schedule to use for the release target. Table: Schedule [cmn_schedule] Data type: String
startDate	Required. Date for the readiness target, or the first date of a recurring readiness target. Data type: String
targetsWithOverlappingScheduleDetails	List of dates for a recurring readiness target. Data type: Array `"targetsWithOverlappingScheduleDetails": [ { "active": Boolean, "date": "String" } ]`
targetsWithOverlappingScheduleDetails.active	Flag that indicates whether the readiness target recurrence is active. Valid values: • true: Active. • false: Inactive. Data type: Boolean
targetsWithOverlappingScheduleDetails.date	Date for the readiness target recurrence. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Created. Release target(s) successfully created.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON)

Name	Description

result	Details about the API request.
	
	Data type: Object
	
	`"result": {`
	`  "count": Number,`
	`  "error": Boolean,`
	`  "message": "String"`
	`}`

result.count	Number of release targets created by the API request. Data type: Number
result.error	Flag that indicates whether there is an error with the API request. Possible values: • true: Error. • false: No error. Data type: Boolean
result.message	Error message. This parameter is empty for successful requests.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: cURL request

This example creates a set of four release readiness targets, with a target recurring every week on Friday.

```
curl
 "http://instance.service-now.com/api/sn_dpr/digital_product_rel
ease/release_target" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\": \"Weekly Friday patch\",
  \"releaseAdmin\": \"6816f79cc0a8016401c5a33be04be441\",
  \"isRecurring\": true,
  \"description\": \"\",
  \"startDate\": \"2025-10-24\",
  \"releaseCalendar\": \"d3d1f3b4ff60ba10509cffffffffffa8\",
  \"endDate\": \"2025-11-19\",
  \"repeats\": {
    \"type\": \"weekly\",
    \"every\": 1,
    \"daysOfWeek\": 5
  },
  \"scheduleSysId\": \"b862d589ff3c3210509cffffffffff97\",
  \"targetsWithOverlappingScheduleDetails\": [
    {
      \"active\": true,
      \"date\": \"2025-10-24\"
    },
    {
      \"active\": true,
      \"date\": \"2025-10-31\"
    },
    {
      \"active\": true,
      \"date\": \"2025-11-07\"
    },
    {
      \"active\": true,
      \"date\": \"2025-11-14\"
    }
  ]
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "error": false,
    "message": "",
    "count": 4
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
```

Example: cURL request

This example creates a release readiness target for a specified date.

```
curl
 "http://instance.service-now.com/api/sn_dpr/digital_product_rel
ease/release_target" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\": \"Fourth Thursday patch\",
  \"releaseAdmin\": \"6816f79cc0a8016401c5a33be04be441\",
  \"isRecurring\": false,
  \"description\": \"Last Thursday of October\",
  \"startDate\": \"2025-10-30\",
  \"releaseCalendar\": \"d3d1f3b4ff60ba10509cffffffffffa8\"
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "error": false,
    "message": "",
    "count": 1
  }
}
```

Digital Product Release - PUT /sn_dpr/digital_product_release/release/{sysId}/retarget

Changes the readiness target for a release.

The new readiness target can be an existing readiness target that is already defined, or an out-of-band date (a one-time readiness target not tied to the standard release calendar). To set an out-of-band date, the *sn_dpr.out_of_band_release_allowed* system property must be set to `true`.

The release phase duration is adjusted to reflect the new readiness target.

Before calling this endpoint, the release state must be **In Progress** or **Pending**.

To access this endpoint, the caller must have one of the following roles.

- sn_dpr_model.product_manager
- sn_dpr_model.release_admin

URL format

Versioned URL: `/api/sn_dpr/{api_version}/digital_product_release/release/{sysId}/retarget`

Default URL: `/api/sn_dpr/digital_product_release/release/{sysId}/retarget`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sysId	Sys_id of the release. Table: Release [sn_dpr_model_release] Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
outOfBand	Flag that indicates whether the readiness target is an out-of-band date (a one-time readiness target not tied to the standard release calendar). This parameter is required if *`releaseTarget`* is not used. Valid values: • true: The readiness target is out-of-band. • false: The readiness target is already defined and tied to the standard release calendar. Default: False Data type: Boolean
releaseCalendar	Sys_id of the release calendar to use for the readiness target. Required if using *`outOfBand`*. Table: Release Calendar [sn_dpr_model_release_calendar] Data type: String
releaseDate	Date for the readiness target. Required if using *`outOfBand`*. Data type: String
releaseTarget	Sys_id of the release readiness target. Use this parameter to select an existing readiness target. Either this parameter or *`outOfBand`* is required to set the new target.

Request body parameters (JSON) (continued)

Name	Description
	Table: Release Readiness Target [sn_dpr_model_release_target] Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Details about the API request.
	
	Data type: Object
	
	`"result": {`
	`  "error": Boolean,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"message": "String"` `}`
result.error	Flag that indicates whether there is an error with the API request. Possible values: • true: Error. • false: No error. Data type: Boolean
result.message	Error message. This parameter is empty for successful requests. Data type: String

Example: cURL request

This example updates the release readiness target using an existing readiness target.

```
curl
 "https://instance.service-now.com/api/sn_dpr/digital_product_re
lease/release/9b2e7ec9476c8e105b8e0dcfe16d43d4/retarget" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"releaseTarget\": \"3f6668e95427fd10f877ac7ac399daa6\"
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "error": false,
    "message": ""
  }
}
```

Example: cURL request

This example updates the release readiness target using an out-of-band readiness target.

```
curl
 "https://instance.service-now.com/api/sn_dpr/digital_product_re
lease/release/9b2e7ec9476c8e105b8e0dcfe16d43d4/retarget" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"outOfBand\": true,
   \"releaseCalendar\": \"fcb2eaa09f4302105c534d837a0a1c2b\",
   \"releaseDate\": \"2026-10-23\"
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "error": false,
    "message": ""
  }
}
```

Email API

The *Email* API provides endpoints that enable you to receive and send email messages using REST.

Users must have the email_api_send role to send email.

Note: You might get errors if you do not have read/write access to the Email [sys_email] table.

Email - GET /now/email/{id}

Returns the email details for the specified email record.

URL format

Versioned URL: `/api/now/{api_version}/email/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the email for which to return details. Data type: String Table: Email [sys_email]

Query parameters

Name	Description
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Indicates the record is not found or the requesting user does not have access to the record. Verify the user has the proper role and access permissions.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
bcc	List of the email addresses of the blind copied recipients of the email message. Maps to the blind_copied field. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
cc	List of the email addresses of the copied recipients for the email message. Maps to the copied field. Data type: Array
headers	Name-value pairs of the headers associated with the message and their values. Data type: Object
html	HTML-enabled body of the email message. Maps to the body field. Data type: String
id	Sys_id of the email record. Data type: String
importance	Importance of the email message. Maps to the importance field. Data type: String
state	Processing state of the email message. Indicates whether the system scheduled jobs have processed the email message. Possible include: • error • ignored • processed • ready Data type: String
subject	Subject of the email message. Maps to the subject field. Data type: String
text	Text-only body of the email message. Maps to the body_text field. Data type: String
to	List of the email addresses of the direct recipients of the email message. Maps to the recipients field. Data type: Array
type	Current state of the email message as incoming or outgoing mail. Possible values: • received • received-ignored • send-failed • send-ignored

Request body parameters (XML or JSON) (continued)

Element	Description
	Data type: Object
html	HTML-enabled body of the email message. Maps to the body field. Data type: String
importance	Importance of the email message. Maps to the importance field. Data type: String
subject	Subject of the email message. Maps to the subject field. Data type: String
table_name	Name of the table to save the email. Use this parameter to associate an email message to a particular related record elsewhere in the system. **Note:** This parameter also requires specifying the *`table_record_id`* parameter. Data type: String
table_record_id	Target-related record to which the email applies. Use this parameter to associate an email message to a particular related record elsewhere in the system. **Note:** This parameter also requires specifying the *`table_name`* parameter. Data type: String
text	Text-only body of the email message. Maps to the body_text field. Data type: String
to	Required. List of the email addresses of the direct recipients for the email message. Maps to the recipients field. **Note:** You can only specify up to 100 addresses in this field. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Requesting user does not have access to the record. Verify that the user has the proper role and access permissions.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
href	Link to the email record as an Email API GET request. Data type: String
id	Sys_id of the Email record. Data type: String
links	List of links to the Email record. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
rel	Type of link listed in the *href* parameter. Possible values: • self: The Email API GET request for the Email record. • status: The Email API GET request for the Email record showing only the id, type, state, and error fields. Data type: String

Example: Sample cURL request

```
curl "http://instance.servicenow.com/api/now/email" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'\
--data "{
  \"to\": [
    \"User1 <user1@example.com>\",
    \"User2 <user2@example.com>\"
  ],
  \"cc\": [
    \"User3 <user3@example.com>\",
    \"User4 <user4@example.com>\"
  ],
  \"bcc\": [
    \"User5 <user5@example.com>\",
    \"User6 <user6@example.com>\"
  ],
  \"subject\": \"Hello There\",
  \"text\": \"Test Message\",
  \"html\": \"<b>Test Message</b>\",
  \"table_name\": \"incident\",
  \"table_record_id\": \"136b2140bd0312004d7d1371f1abbdb6\",
  \"headers\": {
    \"X-Custom\": \"header\"
  }
}"
```

```
{
 "result": {
   "id": "b963219a44b02200964f63773cd6adfc",
   "links": [
     {
       "rel": "self",
       "href": "/now/v1/email/b963219a44b02200964f63773cd6adfc"
     },
     {
       "rel": "status",
       "href":
 "/now/v1/email/b963219a44b02200964f63773cd6adfc?sysparm_fields=
id,type,state,error"
     }
   ]
```

Entitlement API

The *Entitlement* API provides endpoints to create and retrieve entitlement records from an instance.

Entitlement checks occur as part of post-sales support services for customers that purchase a product, such as an appliance or computer. Entitlement checks are made by agents to determine what services customers are eligible to receive for the products they've purchased. Use the *Entitlement* API to define and retrieve entitlements.

This API accesses and stores data in the following tables:

- Account [customer_account]
- Consumer [csm_consumer]
- Household [csm_household]
- Install Base [sn_install_base_item]
- Product Model [cmdb_model]
- Product Offering [sn_prd_pm_product_offering]
- Sold Product [sn_install_base_sold_product]

To access this API, the following plugins must be activated on the associated instance:

- Customer Contracts and Entitlements (com.sn_pss_core)
- Customer Service Install Base Management (com.snc.install_base)
- Product Catalog Management Core (com.sn_prd_pm)

In addition, to successfully call this API you must have the sn_pss_core.pss_integrator role. This API runs in the `sn_pss_core` namespace.

Entitlement - GET /sn_pss_core/entitlement/{id}

Returns the specified entitlement record, its associated coverage, and its latest usage details.

The following is the list of tables in which the entitlement data is stored:

- Characteristics [sn_pss_core_entitlement_characteristic]
- Entitlement [service_entitlement]
- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Product Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.

URL format

Versioned URL: `/api/sn_pss_core/{api_version}/entitlement/{id}`

Default URL: `/api/sn_pss_core/entitlement/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the entitlement record to retrieve. Data type: String Table: Entitlement [service_entitlement]

Query parameters

Name	Description
display_value	Type of data to return. Valid values: • false: Return the `value` for all fields. For example, `"state":"draft"`. • true: Return the `display_value` for all fields. For example, `"state":"Draft"` • all: Return all information for all fields. Data type: String Default: false

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
account	Sys_id of the account record to which the entitlement belongs. Data type: String Table: Account [customer_account]
consumer	Sys_id of the consumer record to which the entitlement belongs. Data type: String Table: Consumer [csm_consumer]
contract	Sys_id of the contract record to which the entitlement belongs. Data type: String Table: Service Contract [sn_pss_core_service_contract]
end_date	End date of the entitlement. Data type: String Format: yyyy-mm-dd Default: Never ends until manually removed.

- Entitlement [service_entitlement]
- Entitlement Usage [sn_pss_core_entitlement_usage]
- Sold Products Covered [sn_install_base_m2m_contract_sold_product] - This table contains information for both sold products covered and install base items covered.

URL format

Versioned URL: `/api/sn_pss_core/{api_version}/entitlement`

Default URL: `/api/sn_pss_core/entitlement`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
account	Required if the *`consumer`* parameter is not passed. Sys_id of the account record to which the entitlement belongs. Data type: String Table: Account [customer_account]
consumer	Required if the *`account`* parameter is not passed. Sys_id of the consumer record to which the entitlement belongs. Data type: String Table: Consumer [csm_consumer]
end_date	End date of the entitlement. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Format: yyyy-mm-dd Default: Never ends until manually removed.
entitlement_characteristics	List of characteristics associated with the entitlement. Data type: Array of Objects `"entitlement_characteristics": [ { "characteristic": "String", "characteristic_option": "String", "entitlement_usage": {Object}, "type": "String", "value": "String" } ]` Stored in: Characteristic [sn_pss_core_entitlement_characteristic]
entitlement_characteristics.characteristic	Required. Sys_id of the characteristic record associated with the entitlement. Data type: String Table: Characteristic [sn_prd_pm_characteristic]
entitlement_characteristics.characteristic_option	Sys_id of the characteristic option record associated with the entitlement. Data type: String Table: Characteristic Option [sn_prd_pm_characteristic_option]
entitlement_characteristics.entitlement_usage	Used unit value for the associated entitlement characteristic. Only pass this parameter if the entitlement_characteristics are under the entitlement. Data type: Object `"entitlement_usage": { "used_units": "String" }` Stored in: Entitlement Usage [sn_pss_core_entitlement_usage]
entitlement_characteristics.entitlement_usage.usage_units	Usage of the associated entitlement characteristic. Data type: String
entitlement_characteristics.type	Type of entitlement characteristic.

Request body parameters (JSON) (continued)

Name	Description
	Valid values: • coverage • coverage_and_usage Data type: String
entitlement_characteristics.value	Required if the *input_type* parameter contained in the record specified in the *entitlement_characteristics.characteristic* parameter, is not `choice`. Value of the characteristic. Data type: String
entitlement_name	Required. Name of the entitlement. Data type: String
household	Only passed when the household plugins are active and the *consumer* parameter is passed. Sys_id of the household record associated with the entitlement. Data type: String Table: Household [csm_household]
install_base_items_covered	List of install base items covered under the entitlement. The information in this array is inserted in the Sold Product Covered#[sn_install_base_m2m_contract_sold_product] table. Data type: Array of Objects `"install_base_items_covered": [ { "added": "String", "install_base": "String", "removed": "String" } ]` For more information on Install Base Items Configure install base.
install_base_items_covered.added	Date that the associated install base item was added to the entitlement. Data type: String Format: yyyy-mm-dd Default: Current date

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Format: yyyy-mm-dd Default: Current date
sold_products_covered.removed	Date that the associated sold product was removed from the entitlement. Data type: String Format: yyyy-mm-dd Default: No end date
sold_products_covered.sold_product	Sys_id of the product covered by the entitlement. Data type: String Table: Sold Product [sn_install_base_sold_product]
start_date	Required. Start date of the entitlement. Data type: String Format: yyyy-mm-dd
state	Required. Current state of the entitlement. Valid values: (case-sensitive) • active • cancelled • draft • expired • suspended Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed and the records were created.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have permission to access the API.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
entitlement_characteristics	List of the entitlement characteristic objects#created under the entitlement. Data type: Array of Objects `"entitlement_characteristics" [ { "entitlement_usage": {Object}, "sys_id": "String" } ]`
entitlement_characteristics.entitlement_usage	Entitlement usage object inserted under the entitlement_characteristic. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"entitlement_usage": {`
	`  "sys_id": "String"`
	`}`

entitlement_characteristics.entitlement_usage.sys_id	Sys_id of the entitlement usage record. Data type: String Table: Entitlement Usage [sn_pss_core_entitlement_usage]
entitlement_characteristics.sys_id	Sys_id of a entitlement characteristics record associated with the entitlement. Data type: String Table: Characteristic [sn_pss_core_entitlement_characteristic]
entitlement_name	Name of the entitlement. Data type: String

install_base_items_covered	List of sys_ids of the install base items covered under the entitlement.
	
	Data type: Array of Objects
	
	`"install_base_items_covered": [`
	`  {`
	`  "sys_id": "String"`
	`  }`
	`]`

install_base_items_covered.sys_id	Sys_id of a install base items covered by the entitlement. Data type: String Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]

sold_prodocts_covered	List of sys_ids of the products covered under the entitlement.
	
	Data type: Array of Objects
	
	`"sold_products_covered": [`
	`  {`
	`  "sys_id": "String"`
	`  }`
	`]`

sold_products_covered.sys_id	Sys_id of a product associated with the entitlement. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Sold Product Covered [sn_install_base_m2m_contract_sold_product]
sys_id	Sys_id of the associated entitlement record. Data type: String Table: Entitlement [service_entitlement]

Example: cURL request

The following example shows how to create an entitlement template.

```
curl
 "https://instance.servicenow.com/api/sn_pss_core/entitlement" \
--request POST \
--header "Accept:application/json" \
--data
{
  "state": "active",
  "entitlement_name": "indep entl",
  "account": "4c325111d1f53110f8776589fa411f3d",
  "start_date": "2023-10-03",
  "end_date": "2024-12-03",
  "sold_products_covered": [
    {
      "sold_product": "0df21151d1f53110f8776589fa411f1b"
    }
  ],
  "install_base_items_covered": [
    {
      "install_base": "e2639951d1f53110f8776589fa411f2b"
    }
  ],
  "entitlement_characteristics": [
    {
      "characteristic": "63418db7539e61106bfcddeeff7b1238",
      "characteristic_option":
 "495149b7539e61106bfcddeeff7b1262",
      "value": "20",
      "type": "coverage_and_usage",
      "entitlement_usage": {
        "used_units": "25"
      }
    }
  ]
}
```

Response:

```
{
  "result": {
    "sys_id": "5a651515d1f53110f8776589fa411f7b",
    "entitlement_name": "indep entl",
    "sold_products_covered": [
      {
```

        }
      }
    ]
  }
}
```

Event Management Topic Open API

The *`Event Management Topic Open`* API provides an endpoint that enables you to send a topic through your message broker and store it on a ServiceNow instance.

Using this API you can store topics created through your message broker in the ServiceNow Topic [topic] table.

This API runs in the `sn-api-notif-mgmt` namespace and requires the sn_api_notif_mgmt.event_mgmt_integration role.

Event Management Topic Open - POST /sn_api_notif_mgmt/topic

Creates a new record in the Topic [sn_api_notif_mgmt_topic] table and saves the passed topic information to that record.

Use this endpoint to synchronize topics created in your message-bus middleware with those in your ServiceNow instance.

When topics are created using this endpoint, the user_created field in the associated topic record is set to `false` and the type field is set to `egress`.

URL format

Versioned URL: `/api/sn_api_notif_mgmt/{api_version}/topic`

Default URL: `/api/sn_api_notif_mgmt/topic`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
contentQuery	Filter to apply to the payload of the event. This query is a deeper event filter that is used to find in as event severity or ticket type. You can pass this parameter as a nested query. For example, for the following trouble ticket event payload, this query applies to the attributes tha *"event"* object of the payload: `{ "eventId":"dc2003c2c3bb3550054e20bdc0013136", "@type":"Troubleticket", "eventType":"TroubleTicketCreateEvent", "event":{ "troubleTicket":{ "short_description":"Test payload", "severity":3, "ticketType":"incident" } } }` This parameter supports the following conditions: • AND: such as `variable1=value1&variable2=value2&variable3=value3` • OR: such as `variable1=value1,value2,value3` • Hierarchical variables: such as `variable1.variable2.variable3=value1` For example: `"contentQuery": "troubleTicket.ticketType=incident&troubleTicket.severity=1",` This field is mapped to the content_query field in the associated topic record. For additional information, refer to the TMF688 Event Management API User Guide. Data type: String
externalId	Unique external identifier for the topic, such as a GUID. This field is mapped to the topic_id field i associated Topic record. Data type: String
headerQuery	Filter to apply to the event header properties. This query defines the type of events to listen to fo associated topic. You can pass this parameter as a nested query.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	This parameter supports the following conditions: • AND: such as `variable1=value1&variable2=value2&variable3=value3` • OR: such as `variable1=value1,value2,value3` • Hierarchical variables: such as `variable1.variable2.variable3=value1` For example: `"headerQuery": "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttributeCh` This field is mapped to the header_query field in the associated topic record. For additional information, refer to the TMF688 Event Management API User Guide. Data type: String
name	Name of the topic. This field is mapped to the topic_name field in the associated topic record. Data type: String
namespace	Namespace for the topic. Empty if there is no associated namespace. This field is mapped to the namespace field in the associated topic record. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	`Topic external id passed already exists. Please pass the unique topic external id`: Indicates that passed external ID already exists in the Topic table. `Please pass the unique combination of topic name, header query, content query and namespace` : Indicates that the combination of topic name, namespace, header query, and content query already exists.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
contentQuery	Value of the content_query field in the created topic record. Data type: String
externalId	Value of the topic_id field in the created topic record. Data type: String
headerQuery	Value of the header_query field in the created Topic record. This field is used by the topic picker framework to determine what event messages should be sent to a topic. Data type: String
id	Sys_id of the created topic record. Data type: String
name	Name of the topic. Data type: String
namespace	Value of the namespace field in the created topic record. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_api_notif_mgmt/topic" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--data
{
  "name": "HighPriorityTroubleTicket",
  "headerQuery":
 "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttribut
eChangeEvent",
  "contentQuery":
 "troubleTicket.ticketType=incident&troubleTicket.severity=1",
  "externalId": "ext001",
  "namespace": "telecomEvents"
}
```

Response:

```
{
  "externalId": "ext001",
  "name": "HighPriorityTroubleTicket",
  "headerQuery":
 "eventType=TroubleTicketStatusChangeEvent,TroubleTicketAttribut
eChangeEvent",
  "contentQuery":
 "troubleTicket.ticketType=incident&troubleTicket.severity=1",
  "namespace": "telecomEvents",
  "id": "7ee9850443c3f550461f99612bb8f223"
}
```

Event Notification Management Open API

The *`Event Notification Management Open`* API provides an endpoint to create, update, and delete events from the Events [em_event] table.

The *`Event Notification Management Open`* API (sn_ind_tmf688) is a ServiceNow implementation of the TM Forum Open API specification. This API is based on TMF688 Event Management API User Guide v4.0.0. You can locate additional alarm information in the TMF642 Alarm Management API User Guide.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Event Notification Management Open API Developer Guide.

Event Notification Management Open API – POST instance_name/scope_id/GUID

Places the payload of the associated request in the NowMQ queue. This queue is then processed in the background to create, update, and delete events within the Events [em_event] table.

This endpoint is different than other endpoints in the ServiceNow platform. Instead of having an endpoint for each specific task, such as create, update, and delete, there's only a single endpoint for all functionality. The parameter *`eventType`* in the call payload determines the task to perform based on its passed value of `AlarmCreateEvent`, `AlarmUpdateEvent`, or `AlarmDeleteEvent`.

The format of the REST call is also different than standard REST implementations. Each external system that will use this API, such as Kafka, database monitors, or other applications, must first register with the ServiceNow platform. They must also have their own webhook in place that uses the information provided during registration to generate the signature required to call this endpoint, including the `instance_name`, application `scope_id`, and unique `GUID`. The `GUID` identifies the external network system that the request came from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The payload that you pass for this endpoint must correlate with the payload that is defined in the `TMFAlarmAPIConstants` script include for the corresponding *`eventType`* parameter value. Any parameters that are passed in the payload and not defined in the schema are ignored by the endpoint.

- `AlarmCreateEvent`: `ALARM_CREATE_EVENT_SCHEMA`
- `AlarmUpdateEvent`: `ALARM_CHANGE_EVENT_SCHEMA`
- `AlarmDeleteEvent`: `ALARM_DELETE_EVENT_SCHEMA`

URL format

Default URL: `<instance_name>/<scope_id>/<GUID>`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters

Name	Description

event	Details about the event that occurred.
	
	Data type: Object
	
	`"event": {`
	`  "alarm": {Object}`
	`}`

event.alarm	Required when *`eventType`* is `AlarmCreateEvent`.
	
	Details about the associated alarm.
	
	Data type: Object
	
	`"alarm": {`
	`  "affectedService": [Array],`

Request body parameters (continued)

Name	Description
	`"perceivedSeverity": "String", "probableCause": "String", "sourceSystemId": "String", "specificProblem": "String", }`
event.alarm.affectedService	List of one or more services affected by the alarm. Data type: Array of Objects `"affectedService":[ { "href": "String", "id": "String" }, ]`
event.alarm.affectedService.href	URL reference that provides details of the affected service. Data type: String
event.alarm.affectedService.id	Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
event.alarm.alarmedObject	Required when creating an event. Details of the alarm object. Data type: Object `"alarmedObject": { "href": "String", "id": "String" }`
event.alarm.alarmedObject.href	Required when creating an event. URL reference to get the details of the alarm object. Data type: String
event.alarm.alarmedObject.id	Required when *`eventType`* is `AlarmCreateEvent`. Unique identifier of the alarm object. This value maps to a CI in the system. Data type: String
event.alarm.alarmType	Required when *`eventType`* is `AlarmCreateEvent`.

Request body parameters (continued)

Name	Description
	Type of alarm. Used to categorize the alarm. For example: "QualityOfServiceAlarm" Data type: String
event.alarm.crossedThresholdInfomation	Details about the crossed threshold. Data type: Object `"crossedThresholdInformation": { "thresholdId": "String" }`
event.alarm.crossedThresholdInfomation.thresholdId	Unique identifier of the threshold that caused the alarm. Data type: String
event.alarm.externalAlarmId	Required when *eventType* is `AlarmCreateEvent`. Required when *eventType* is `AlarmDeleteEvent` or `AlarmChangeEvent` if the *Id* parameter is not specified. Unique identifier for the alarm from the source system posting the alarm. Data type: String
event.alarm.href	URL reference to the alarm. For example: "http://api/alarm/ROUTER_IF@Cisco-0000-0-0-0-0-00-00-0--Xz0/00@00" Data type: String
event.alarm.id	Required when *eventType* is `AlarmDeleteEvent` or `AlarmChangeEvent` if *externalAlarmId* is not specified. Unique identifier of the alarm. Specified by the alarm owning system. For example: "8675399" Data type: String
event.alarm.perceivedSeverity	Required when *eventType* is `AlarmCreateEvent`. Possible severities associated with the alarm. The values are consistent with ITU-T

Request body parameters (continued)

Name	Description
	• AlarmChangeNotification • AlarmCreateNotification • AlarmDeleteNotification Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Returned for every call regardless of the actual processing status of the call. Only indicates that the endpoint received the request.

Response body parameters

Name	Description
None	This endpoint is asynchronous and therefore doesn't return any response data.

Example: cURL request

The following shows the possible payload for a create alarm event. This example reflects the parameters that are in the default implementation (`AlarmCreateEventSchema`).

```
--data "{
```

```
  "eventType": "AlarmCreateNotification",
  "event": {
    "alarm": {
      "id": "",
      "externalAlarmId": "ext123456",
      "alarmType": "QualityOfServiceAlarm",
      "perceivedSeverity": "MINOR",
      "alarmedObject": {
        "id": "vManage_000000",
        "href": " http://api/alarmedobject/000000"
      },
      "probableCause": "Threshold crossed",
      "sourceSystemId": "SOURCE_SYSTEM_vManage_00000_000_00",
      "href":
 "http://api/alarm/ROUTER_IF@Cisco-0000-0-0-0-0-00-00-0--
 Xz0/00@00",
      "specificProblem": "Inbound Traffic threshold crossed",
      "crossedThresholdInformation": {
        "thresholdId": "12fasdfasdfasd"
      },
      "affectedService": [
        {
          "id": "SD WAN Enterprise Solutions",
          "href": "http://api/service/vlan_dot0_dot0"
        }
      ]
    }
  }
}
```

No response returned.

Example: cURL request

The following shows the possible payload for a change alarm event. This example reflects the parameters that are in the default implementation (`AlarmChangeEventSchema`).

```
--data "{
  "eventType": "AlarmChangeEventSchema",
  "event": {
    "alarm": {
      "id": "",
      "externalAlarmId": "ext123456",
      "perceivedSeverity": "MAJOR",
      "probableCause": "Threshold crossed",
      "crossedThresholdInformation": {
        "thresholdId": "12fasdfasdfasd"
      },
      "affectedService": [
        {
          "id": "SD WAN Enterprise Solutions",
          "href": "http://api/service/vlan_dot0_dot0"
        }
      ]
    }
  }
```

```
}
```

No response returned.

Example: cURL request

The following shows the possible payload for a delete (clear) alarm event. This example reflects the parameters that are in the default implementation (`AlarmDeleteEventSchema`).

```
--data "{
  "eventType": "AlarmDeleteEventSchema",
  "event": {
    "alarm": {
      "id": "",
      "externalAlarmId": "ext123456",
      "perceivedSeverity": "MAJOR",
      "probableCause": "Threshold crossed",
      "crossedThresholdInformation": {
        "thresholdId": "12fasdfasdfasd"
      }
    }
  }
}
```

No response returned.

External Content Ingestion API

The *`External Content Ingestion`* API provides endpoints that enable ingestion of content from sources outside of your ServiceNow® instance into the ServiceNow® AI Search application's index.

External Content Ingestion API – DELETE /ais/external_content/deleteByQuery/{schema_table_name}

Deletes all external documents that match the specified query from the AI Search index.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/deleteByQuery/{schema_table_name}?query={query}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
schema_table_name	The name of the external content schema table that defines the schema for the indexed documents to delete. For example, `u_ext_content`. Data type: String

Query parameters

Name	Description
query	A valid URL-escaped query for the schema table specified by *`schema_table_name`*. For example, `title=Introduction` to query for documents whose title is `Introduction`. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Object describing the error encountered during processing of the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
result	Result from a successfully processed request. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Delete documents with title field values `Introduction` and `Report for 31 October` 2020 from the u_ext_content schema table.

```
curl
 "https://instance.service-now.com/api/now/v2/ais/external_conte
nt/deleteByQuery/u_ext_content?query=title%3DIntroduction%20OR%2
0title%3DReport%20for%2031%20October%202020" \
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--request DELETE \
--user "username":"password" \
--header "Accept: application/json"
```

```
{
  "result": "Delete By Query Successfully Executed"
}
```

External Content Ingestion API – DELETE /ais/external_content/deleteDocument/{schema_table_name}/{document_id}

Deletes the external document with a specified unique identifier from the AI Search index.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/deleteDocument/{schema_table_name}/{document_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
document_id	The unique identifier for the external document to delete. For example, `ADMIN-2027858531-16`. Data type: string
schema_table_name	The name of the external content schema table that defines the schema for the indexed document to delete. For example, `u_ext_content`. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description

error	Object describing the error encountered during processing of the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
result	Result from a successfully processed request. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Delete the document with identifier `ADMIN-2587918521-27` from the u_ext_content schema table.

```
curl
 'https://instance.service-now.com/api/now/v2/ais/external_conte
nt/deleteDocument/u_ext_content/ADMIN-2587918521-27' \
--request DELETE \
--user 'username':'password' \
--header 'Accept: application/json'
```

```
{
  "result":"Document removed"
}
```

External Content Ingestion API – POST /ais/external_content/ingestDocument/{schema_table_name}

Sends a list of external documents to the AI Search ingestion batcher for indexing. After indexing completes, content from the ingested documents becomes searchable.

You can use this endpoint to feed external documents with text content and metadata.

If you need to associate searchable binary content and metadata with an external document, follow these steps:

1. Store the binary content in AI Search using the *POST /ais/external_content/storeContent* endpoint. Record the value of the *result* response body parameter.
2. Send the external document to AI Search using this endpoint. Set the document's *content_pointer* request body parameter to match the recorded *result* response body parameter value.

During ingestion, AI Search parses the binary content and adds its searchable content to the indexed record that represents the external document. Parsing removes the stored content object.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/ingestDocument/{schema_table_name}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
schema_table_name	The name of the external content schema table that defines the schema for external documents in the request. For example, `u_ext_content`. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
[array]	Required. Unnamed array of objects in which each object represents an external document to ingest for indexing. Data type: Array `[ { "content_pointer": "String", "document_id": "String", "principals": {Object}, "properties": {Object} } ]`
[array].content_pointer	Identifier for an instance of binary content stored using the *`POST /ais/external_content/storeContent`* endpoint. During ingestion, AI Search parses the binary content and adds its searchable content to the indexed record that represents the external document. Parsing removes the stored content object. **Note:** This identifier should match the *`result`* response body element returned by the *`storeContent`* endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Data type: String
[array].document_id	Required. Unique identifier for the external document in the external content schema table specified by the *schema_table_name* path parameter. **Note:** When you ingest a document, it overwrites any existing document in the same external content schema table that has the same *document_id*. If two or more documents in the same ingestion request have the same *document_id*, the request fails. Data type: String

[array].principals	Object containing key-value pairs that describe the external document's access permissions for externally defined security principals (users and groups).
	
	Note:
	
	If you omit this parameter for a document, the request succeeds, but AI Search rejects the document with the ingestion feedback message `The principal of the document is missing`.
	
	If this parameter object does not include any key-value pairs that grant access to a document, the request succeeds, but AI Search rejects the document with the ingestion feedback message `The principal of the document is invalid`.
	
	Data type: Object
	
	`"principals": {`
	`  "everyone": Boolean,`
	`  "groups.deny": [Array],`
	`  "groups.read": [Array],`
	`  "none": Boolean,`
	`  "users.deny": [Array],`
	`  "users.read": [Array]`
	`}`
	
	Versions supported: Available starting in v2 of the API.

[array].principals.everyone	Flag that indicates whether access to the external document is allowed for all users. When this parameter is set to *true*, all ServiceNow AI Platform users can view the indexed record created from the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Note: If you set both this parameter and *[array].principals.none* to *true* for a document, the request succeeds, but AI Search rejects the document with ingestion feedback message `The principal of the document is invalid`. You can only set one of these two parameters to *true* in a request. Valid values: • *true*: Allow access to the document for all users. AI Search ignores all *[array].principals.groups.** and *[array].principals.users.** parameter settings for the document. • *false*: Do not allow all users to access the external document. Users can only access the document if *[array].principals.none* is set to false and if allowed by the interaction of their user mappings and the *[array].principals.groups.** and *[array].principals.users.** parameters. Data type: Boolean Default: *true* Versions supported: Available starting in v2 of the API.
[array].principals.groups.deny	Array of strings where each string is the name of an externally defined group that is denied access to the external document. ServiceNow AI Platform users mapped to any of these external groups cannot view the indexed search result record created from the document. If either *[array].principals.everyone* or *[array].principals.none* is set to *true*, this parameter has no effect. This parameter takes precedence over *[array].principals.groups.read*. If the same user is mapped to external groups with both read and deny access permissions for a document, AI Search denies that user access to the indexed record. By default, *[array].principals.users.read* takes precedence over this parameter. To reverse this precedence order for an indexed source, see Change the precedence of user read and group deny permissions for an external content indexed source. Data type: Array Values can be in any format, depending on the names of the externally defined groups specified. Examples include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	`"groups.deny": [ "hr-admin", "legal" ]` Versions supported: Available starting in v2 of the API.
[array].principals.groups.read	Array of strings where each string is the name of an externally defined group that is allowed to access the external document. ServiceNow AI Platform users mapped to any of these external groups can view the indexed search result record created from the document. If either *`[array].principals.everyone`* or *`[array].principals.none`* is set to *`true`*, this parameter has no effect. *`[array].principals.groups.deny`* takes precedence over this parameter. If the same user is mapped to external groups with both read and deny access permissions for a document, AI Search denies that user access to the indexed record. Data type: Array Values can be in any format, depending on the names of the externally defined groups specified. Examples include: `"groups.read": [ "devops", "it", "report-admins" ]` Versions supported: Available starting in v2 of the API.
[array].principals.none	Boolean option indicating whether access to the external document is denied for all users. When this parameter is set to *`true`*, only ServiceNow AI Platform users with the ais_high_security_admin elevated privilege role can view the indexed record created from the document. **Note:** If you set both this parameter and *`[array].principals.everyone`* to *`true`* for a document, AI Search rejects the document during ingestion with error message `The principal of the document is invalid`. You can only set one of these two parameters to *`true`* in a request. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	• *true*: Deny access to the document for all users except those with the ais_high_security_admin elevated privilege role. AI Search ignores all *[array].principals.groups.** and *[array].principals.users.** parameter settings for the document. • *false*: Do not deny access to the document for all users. Users can access the document if *[array].principals.everyone* is set to *true*, or if allowed by the interaction of their user mappings and the *[array].principals.groups.read* and *[array].principals.users.read* parameters. Data type: Boolean Default: *false* Versions supported: Available starting in v2 of the API.

[array].principals.users.deny	Array of strings where each string is the name of an externally defined user that is denied access to the external document. ServiceNow AI Platform users mapped to any of these external users cannot view the indexed search result record created from the document.
	
	If either *[array].principals.everyone* or *[array].principals.none* is set to *true*, this parameter has no effect.
	
	This parameter takes precedence over *[array].principals.users.read*. If the same user is mapped to external users with both read and deny access permissions for a document, AI Search denies that user access to the indexed record.
	
	Data type: Array
	
	Values can be in any format, depending on the names of the externally defined users specified. Examples include:
	`"users.deny": [`
	`  "ad\bow-ruggeri",`
	`  "abel-tuter@sharepoint"`
	`]`
	
	Versions supported: Available starting in v2 of the API.

[array].principals.users.read	Array of strings where each string is the name of an externally defined user that is allowed to access the external document. ServiceNow AI Platform users mapped to any of these external users can view the indexed search result record created from the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description

	If either *[array].principals.everyone* or *[array].principals.none* is set to *true*, this parameter has no effect.
	
	[array].principals.users.deny takes precedence over this parameter. If the same user is mapped to external users with both read and deny access permissions for a document, AI Search denies that user access to the indexed record.
	
	By default, this parameter takes precedence over *[array].principals.groups.deny*. To reverse this precedence order for an indexed source, see Change the precedence of user read and group deny permissions for an external content indexed source. .
	
	Data type: Array
	
	Values can be in any format, depending on the names of the externally defined users specified. Examples include:
	
	`"users.read": [`
	`  "ad\abel-tuter",`
	`  "beth-anglin@sharepoint"`
	`]`
	
	Versions supported: Available starting in v2 of the API.

[array].properties	Object containing name-value pairs where each pair represents a field name and value to ingest for the document. All field names and values must be specified as strings.
	
	After ingestion, these document field values are accessible through the indexed source defined for the external content schema table specified by the *schema_table_name* path parameter. Users can search for these field values in search sources derived from this indexed source.
	
	Data type: Object
	
	Field names can only contain lowercase letters and underscores. Values can include any characters. Value length is limited by the *max_length* attribute defined for the field in the external content schema table. Examples of field name-value pairs include:
	
	`"properties": {`
	`  "creation_date": "2020-11-03 12:27:43",`
	`  "file_size": "10285",`
	`  "title": "Introduction",`
	`  "url":`
	`  "file:///myhost/reports/Introduction.pdf"`
	`}`

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
202	Partial Success. The request was processed. Some documents have ingestion feedback warning or error messages.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Object describing the error encountered during processing of the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
result	JSON-formatted string representing the result object for the ingestion request. Data type: String `"result": "{\"duration_in_ms\": Number, \"feedback\": [Array] }"`
result.duration_in_ms	Time spent ingesting the external documents. Data type: Number Unit: Milliseconds
result.feedback	Array of objects in which each object represents feedback for a document ingested from the request body. Data type: Array `"feedback": [ { "document_id": "String", "messages": [Array] } ]`
result.feedback.document_id	Unique identifier for the external document as specified in the request body. Data type: String
result.feedback.messages	Array of unnamed objects in which each object represents an ingestion feedback message logged during indexing of the external document. Data type: Array `"messages": [ { "code": "String", "component": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"level": "String",`
	`"message": "String"`
	`}`
	`]`

result.feedback.messages.code	Code for an exception thrown by the indexing workflow component that logged the ingestion feedback message. Data type: String
result.feedback.messages.component	Identifier for the indexing workflow component that logged the ingestion feedback message. Data type: String
result.feedback.messages.level	Logging level for the ingestion feedback message. Valid values: • *ERROR* • *INFO* • *MINOR_ERROR* • *WARN* Data type: String
result.feedback.messages.message	Text logged for the ingestion feedback message. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Precedence order for principal permissions

The precedence order for *[array].principals* permissions depends on the value of the *user_read_takes_precedence_over_group_deny* attribute for the indexed source used to ingest an external document.

Attribute value	Precedence order for principal permissions
true	From highest precedence to lowest:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute value	Precedence order for principal permissions
	1. *[array].principals.everyone*, *[array].principals.none* 2. *[array].principals.users.deny* 3. *[array].principals.users.read* 4. *[array].principals.groups.deny* 5. *[array].principals.groups.read* **Note:** This is the default attribute value for external content indexed sources.
false	From highest precedence to lowest: 1. *[array].principals.everyone*, *[array].principals.none* 2. *[array].principals.users.deny*, *[array].principals.groups.deny* 3. *[array].principals.users.read*, *[array].principals.groups.read* **Note:** For instructions on setting this attribute value, see Change the precedence of user read and group deny permissions for an external content indexed source.

Example: cURL request

Feed two external documents (with content pointers to binary content objects previously stored using the *POST /ais/external_content/storeContent* endpoint) for indexing into the u_ext_content schema table.

```
curl
 'https://instance.servicenow.com/api/now/v2/ais/external_conte
nt/ingestDocument/u_ext_content' \
  --request POST \
  --user 'username':'password' \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --data '[
  {

External Content Ingestion API – POST ais/external_content/storeContent

Stores binary content as a content object in AI Search.

You can associate stored binary content with an external document by following these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Store the binary content using this endpoint. Record the value of the *result* response body parameter.
2. Send the external document to AI Search using the *POST /ais/external_content/ingestDocument/{schema_table_name}* endpoint. Set the document's *content_pointer* request body parameter to match the recorded *result* response body parameter value.

During ingestion, AI Search parses the binary content and adds its searchable content to the indexed record that represents the external document. Parsing removes the stored content object.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/storeContent`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Element	Description
[binary data]	Required. Binary content to store as a content object in AI Search.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Valid values: • *application/msword* • *application/octet-stream* • *application/pdf* • *application/vnd.ms-excel* • *application/vnd.ms-powerpoint* • *application/vnd.ms-powerpoint.presentation.macroenabled.12* • *application/vnd.openxmlformats-officedocument.presentationml.presentation* • *application/vnd.openxmlformats-officedocument.presentationml.template* • *application/vnd.openxmlformats-officedocument.spreadsheetml.sheet* • *application/vnd.openxmlformats-officedocument.wordprocessingml.document* • *application/vnd.openxmlformats-officedocument.wordprocessingml.template* • *text/html* • *text/plain*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Element	Description

error	Object describing the error encountered during processing of the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
result	Identifier for the binary content object stored by successful request. Data type: String `"result" : "91841766-2a5f-4c64-a20a-27ca485eca21"` **Note:** To attach the stored content to an ingested external document, specify this identifier as the *content_pointer* request body element for a request to the *ingestDocument* endpoint.
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Store binary content for a PDF file as a content object.

```
curl
 'https://instance.servicenow.com/api/now/v2/ais/external_conte
nt/storeContent' \
--request POST \
--user 'username':'password' \
--header 'Content-Type: application/pdf' \
--data-binary '@Report-2020-08-31.pdf'
```

The response body includes the unique identifier for the new content object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "result" : "fb439a4f-62ad-4dab-9654-5088d99a6ff9"
}
```

External ID Mapping API

Enables external Contact Center as a Service (CCaaS) platforms to store and retrieve routing identifiers for ServiceNow records.

As part of the Contact Center Integration Core (sn_ct_ctr_it_core) store application, this API enables CCaaS providers to get or set external IDs in the CCaaS External ID Mappings [sn_ct_ctr_it_core_ccaas_external_id_mapping] table. This API is in the sn_ct_ctr_it_core namespace and requires the sn_ct_ctr_it_core.admin role.

This API supports multi-provider environments, enabling organizations to integrate with multiple CCaaS platforms simultaneously while maintaining separate routing ID namespaces for each provider.

When a CCaaS platform (such as Genesys Cloud, Five9, or Amazon Connect) routes a case, task, or interaction to an external agent, it generates a unique routing ID. This API provides a centralized mechanism to map those external routing IDs to records, enabling bidirectional tracking and correlation between the CCaaS platform and ServiceNow.

Use cases

External routing correlation

The CCaaS platform generates a routing ID when it routes a case to an external agent. must store this ID to correlate future events, callbacks, or status updates from the CCaaS platform.

This API stores the external routing ID in a mapping table, associating it with the record and the provider that generated it.

Bidirectional tracking

You might have to track which external routing session corresponds to which case for reporting, analytics, and troubleshooting.

You can use this API to retrieve external routing IDs for any record, enabling dashboards and reports to show the complete routing history.

Integration flexibility

Different CCaaS platforms might require storing routing IDs for different tables, such as cases, tasks, interactions, or custom tables.

This API accepts any valid table name, making it extensible for future use cases. The endpoints can be called independently depending on the workflow.

For more information about integrating with CCaaS systems, see Integrating with contact centers.

External ID Mapping - GET /sn_ct_ctr_it_core/external_id_mapping/table/{tableName}/documentId/{documentId}

Retrieves the external routing ID mapping for a specific record.

This endpoint queries the mapping table to find the external routing ID that has been stored for a given record and provider. Use this endpoint to retrieve the external routing ID that was assigned to a record by a CCaaS platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_ct_ctr_it_core/external_id_mapping/table/{tableName}/documentId/{documentId}`

Supported request parameters

Path parameters

Name	Description
tableName	Required. The ServiceNow table name containing the record. Can be any valid table name. For example, sn_customerservice_case, sn_customerservice_task, interaction, or custom tables. Data type: String
documentId	Required. The sys_id of the ServiceNow record for which to retrieve the external ID mapping. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description

result	Result object containing information about the request.
	
	Data type: Object
	
	`"result": {`
	`  "data": "String",`
	`  "message": "String"`
	`}`

result.data	Data for the mapping.
	
	Data type: Object
	
	`"data": {`
	`  "document_id": "String",`
	`  "document_table": "String",`
	`  "external_id": "String",`
	`  "external_provider": "String"`
	`}`

result.data.document_id	The sys_id of the ServiceNow AI Platform record for which to retrieve the external ID mapping. Data type: String
result.data.document_table	The ServiceNow AI Platform table name containing the record. Data type: String
result.data.external_id	The external routing ID from the CCaaS platform. Max characters: 200

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.data.external_provider	The sys_id of the provider from the External Provider [awa_external_provider] table. Data type: String
result.error.message	If the request fails, message explaining why the request failed. Data type: String
result.error	If the request fails, message explaining why the request failed. Data type: String
result.error.message	If the request fails, message explaining why the request failed. Data type: String
result.message	Message that describes the outcome of the API request. Data type: String
result.status	Success or failure status of the request. Valid values: • success • failure Data type: String

This example queries the mapping for case with sys_id `f584a7b23b3d3e10c524c59a04e45a6f` to find which external routing ID has been assigned by the CCaaS platform.

```
curl
 "https://instance.service-now.com/api/sn_ct_ctr_it_core/externa
l_id_mapping/table/sn_customerservice_case/documentId/f584a7b23b
3d3e10c524c59a04e45a6f" \
--request GET \
--header "Accept:application/json" \
--user 'admin':'admin'
```

Response body:

```
{
  "result": {
    "data": {
      "document_table": "sn_customerservice_case",
      "document_id": "f584a7b23b3d3e10c524c59a04e45a6f",
      "external_id": "200",
      "external_provider": "8b592fb64f140210c0338ef0b1ce0b18"
    }
  }
}
```

External ID Mapping - PUT /sn_ct_ctr_it_core/external_id_mapping/table/{tableName}/documentId/{documentId}

Creates or updates an external routing ID mapping for a ServiceNow record.

This endpoint is idempotent, so calling it multiple times with the same parameter updates the existing mapping rather than creating duplicate mappings. The endpoint automatically determines whether to insert a new mapping or update an existing one based on the combination of table name, document ID, and external provider.

URL format

Default URL: `/api/sn_ct_ctr_it_core/external_id_mapping/table/{tableName}/documentId/{documentId}`

Supported request parameters

Path parameters

Name	Description
tableName	Required. The ServiceNow table name containing the record. Can be any valid table name. For example, sn_customerservice_case, sn_customerservice_task, interaction, or custom tables. Data type: String
documentId	Required. The sys_id of the ServiceNow record for which to retrieve the external ID mapping. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
external_id	Required. External agent ID from the CCaaS system. Data type: String Maximum length: 200 characters
external_provider	The sys_id of the provider record from the External Provider [awa_external_provider] table. This identifies which CCaaS platform generated the external ID. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
201	Created. The external ID mapping was successfully created, that is, a new mapping was inserted.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description

result	Result object containing information about the request.
	
	Data type: Object
	
	`"result": {`
	`  "data": "String",`
	`  "message": "String"`
	`}`

result.error.message	If the request fails, message explaining why the request failed. Data type: String
result.error	If the request fails, message explaining why the request failed. Data type: String
result.error.message	If the request fails, message explaining why the request failed. Data type: String
result.message	Message that describes the outcome of the API request. Data type: String
result.status	Success or failure status of the request. Valid values: • success • failure Data type: String

Example: cURL request

This example shows how to store an external ID from a CCaaS platform (identified by provider sys_id `8b592fb64f140210c0338ef0b1ce0b18`).

```
curl
 "https://instance.service-now.com/api/sn_ct_ctr_it_core/externa
l_id_mapping/table/sn_customerservice_case/documentId/f584a7b23b
3d3e10c524c59a04e45a6f" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"external_id\": \"200\",
    \"external_provider\": \"8b592fb64f140210c0338ef0b1ce0b18\"
}" \
--user 'admin':'admin'
```

Response body:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "result": {
    "message": "External ID mapping record updated for
 sn_customerservice_case [f584a7b23b3d3e10c524c59a04e45a6f]",
    "status": "success"
  }
}
```

Help Request API

The *`Help Request API`* provides an endpoint to track supervisor help actions.

This API records supervisor help for agents working on interactions, including the help start and end time and the type of help. For more information about help requests, see Agent help request for voice calls.

This API requires the Interactions Management plugin (com.glide.interaction). The calling user must have the interaction_integration_user role.

Help Request - POST /now/helprequest/action/create_or_update

Creates or updates a supervisor help action.

Call this endpoint when a supervisor accepts an interaction help request. A record to track the help is created in the Supervisor Help Action [supervisor_help_action] table. Call this endpoint again when the supervisor completes their help to update the help action record with the end time.

URL format

Versioned URL: `/api/now/{api_version}/helprequest/action/create_or_update`

Default URL: `/api/now/helprequest/action/create_or_update`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
action	Type of assistance provided by the supervisor. Required when creating a supervisor help action. Valid values (case sensitive): • barge_in • coach • monitor • observe For additional information about supervisor actions, see Monitoring calls. Data type: String
action_sys_id	Sys_id of the supervisor help action. Required when updating a single specified supervisor help action, but can be excluded to bulk update all supervisor help actions for an interaction. Table: Supervisor Help Action [supervisor_help_action] Data type: String
end_time	Date and time the supervisor ended assistance. **Note:** To update a single specified supervisor help action with an end time, a valid value must be provided for this parameter. However, when bulk updating all supervisor help actions for an interaction, excluding this parameter sets the current time as the end time. Data type: String
help_request	Sys_id of the interaction help request. Table: Interaction Help Request [interaction_help_request] Data type: String
interaction	Required. Sys_id of the interaction. Table: Interaction [interaction] Data type: String
start_time	Date and time the supervisor started assistance. Default: Creation date and time of the supervisor help action record. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description

result	Details about the result of the API request.
	
	Data type: Object
	
	`"result": {`
	`  "action_sys_id": "String",`
	`  "message": "String",`
	`  "success": Boolean`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.action_sys_id	Sys_id of the created or updated supervisor help action. Table: Supervisor Help Action [supervisor_help_action] Data type: String
result.message	Message with details about the success or failure of the API request. Data type: String
result.success	Flag that indicates whether the API request was successful. Possible values: • true: Success • false: Failure Data type: Boolean

Example: cURL request

This example creates a supervisor help action.

```
curl
 "https://instance.service-now.com/api/now/helprequest/action/cr
eate_or_update" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"interaction\": \"d4dec70f3b4bfe101baa9f7e53e45a5d\",
   \"action\": \"coach\"
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "success": true,
    "message": "Supervisor help action created successfully",
    "action_sys_id": "d25f034f3b4bfe101baa9f7e53e45a9f"
  }
}
```

Example: cURL request

This example updates a supervisor help action with an end time.

```
curl
 "https://instance.service-now.com/api/now/helprequest/action/cr
eate_or_update" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   \"interaction\": \"d4dec70f3b4bfe101baa9f7e53e45a5d\",
   \"action_sys_id\": \"d25f034f3b4bfe101baa9f7e53e45a9f\",
   \"end_time\": \"2026-02-18 11:30:00\"
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "success": true,
    "message": "Supervisor help action updated successfully",
    "action_sys_id": "d25f034f3b4bfe101baa9f7e53e45a9f"
  }
}
```

Example: cURL request

This example updates all supervisor help actions for an interaction with an end time.

```
curl
 "https://instance.service-now.com/api/now/helprequest/action/cr
eate_or_update" \
--request POST \

}
```

HR REST API

The *HR REST* API provides endpoints that return information about employees that work or live in the United States.

To access this API you must have the sn_hr_core.usa_employee_only role and the Human Resources Scoped App: Core (com_sn_hr_core) plugin activated.

HR REST - GET /get_usa_employee_profile

Returns employee profile information for employees based in the United States.

The returned information can be either:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Employee profile information for a specified employee ID.
- Information for employees that have been added, or whose information has been updated, on or after a specified date.

Note: Employees must either have their work or home country specified as the United States for this endpoint to include them in the return results.

In addition, the endpoint sends the following parameters to the integrated CIC Plus application (see the Returns section for descriptions):

- EmployeeIdentifier
- FirstName
- MiddleName
- LastName
- Email
- WorkAddress
- WorkCity
- WorkState
- WorkPostalCode
- WorkCountry
- HomeAddress
- HomeCity
- HomeState
- HomePostalCode
- HomeCountry
- BirthDate
- HireDate

URL format

Default URL: `/api/sn_hr_core/hr_rest_api/get_usa_employee_profile`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Parameter	Description
employee_identifier	Unique identifier of an employee. The calling system generates this value and can be in whatever format is consistent with their system. To obtain this value, first call the endpoint using the *updated_after* parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
	Note: This parameter is mutually exclusive with the *updated_after* parameter. This parameter defines a unique employee, whereas *updated_after* returns a group of employees created/updated after a specified date. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. Data type: Number Default: 1000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records.
updated_after	Date to use to determine the employee data to return. All United States-based employees (work or home) that were added to your instance, or whose information was updated on or after this date, are included in the return results. **Note:** This parameter is mutually exclusive with the *employee_identifier* parameter. Data type: String Format: YYYY-MM-DD HH:MM:SS or YYYY-MM-DD (time defaults to 00:00:00)

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Next-Page	Flag that indicates whether there is additional data to obtain in a subsequent call. For example, if there are a total of 120 employee records that match the search criteria, and sysparm_limit is set to 100, then *Next-Page* is true. If no additional results are available, *Next-Page* is false. Valid values: • true: Additional data is available, another call must be made to obtain the next chunk of data. • false: No additional data.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
BirthDate	Employee's birth date. Data type: String
Company	Company name. Data type: String
Email	Employee's email address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
EmployeeIdentifier	Unique employee identifier. Data type: String
FirstName	Employee's first name. Data type: String
HireDate	Date on which the employee was hired. Data type: String
LastName	Employee's last name. Data type: String
MiddleName	Employee's middle name. Data type: String
ReHire	For future use. Data type: String
ResidenceAddress	Employee's home street address. Data type: String
ResidenceCity	Employee's home city. Data type: String
ResidenceCountry	Employee's home country. Data type: String
ResidencePostalCode	Employee's home zip code. Data type: String
ResidenceState	Employee's home state. Data type: String
Suffix	Employee's suffix, such as Mr., Mrs., or Dr. Data type: String
WorkAddress	Employee's work street address. Data type: String
WorkCity	Employee's work city Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
WorkCountry	Employee's work country. Data type: String
WorkPostalCode	Employee's work zip code. Data type: String
WorkState	Employee's work state. Data type: String

Example: Sample cURL request for a specific employee's information

```
curl -X GET
 "https://instance.servicenow.com/api/sn_hr_core/V1/hr_rest_a
pi/get_usa_employee_profile?employee_identifier=231"
-H "accept: application/json" \
-u "username":"password"
```

```
{"result": [
 {
  "EmployeeIdentifier": "231",
  "FirstName": "Harold",
  "MiddleName": "William",
  "LastName": "Lewis",
  "Suffix": "Mr.",
  "Email": "Howard.Lewis@example.com",
  "BirthDate": "",
  "HireDate": "2021-02-18",
  "Company": "ServiceNow Inc",
  "ResidenceAddress": "",
  "ResidenceCity": "SD",
  "ResidenceState": "CA",
  "ResidencePostalCode": "",
  "ResidenceCountry": "",
  "WorkAddress": "2617 South Robinson Avenue, Oklahoma City",
  "WorkCity": "Oklahoma",
  "WorkState": "OK",
  "WorkPostalCode": "73109",
  "WorkCountry": "USA",
  "ReHire": ""
 }
]}
```

Example: Sample cURL request for a list of employees added/updated on or after 05/18/2019

```
curl -X GET
 "https://instance.servicenow.com/api/sn_hr_core/V1/hr_rest_a
pi/get_usa_employee_profile?update_after=2019-05-18"
-H "accept: application/json" \
-u "username":"password"
```

  "WorkState": "CA",
  "WorkPostalCode": "",
  "WorkCountry": "USA",
  "ReHire": ""
  }
]}
```

Identification and Reconciliation API

The *`Identification and Reconciliation`* API provides endpoints that use the Identification and Reconciliation engine (IRE) to minimize creation of duplicate Configuration Items (CIs) and to reconcile CI attributes by only accepting information from authorized sources when updating the Configuration Management Database (CMDB).

Users must have the itil or asset role to use this API.

For more information on the IRE, see Identification and Reconciliation engine (IRE).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Identification and Reconciliation - POST /now/identifyreconcile

Inserts or updates configuration items (CIs) in the CMDB by applying identification and reconciliation rules to the specified payload (request body). Use this API instead of updating the CMDB directly.

Use the Identification and Reconciliation - POST /now/identifyreconcile/query endpoint to simulate submission of a payload to this endpoint without committing changes to the database.

Use the Identification and Reconciliation - POST /now/identifyreconcile/enhanced endpoint instead if you need to specify Enhanced IRE options. For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE).

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile`

Default URL: `/api/now/identifyreconcile`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description
items	List of CIs to create or update. Data type: Array of Objects `"items": [ { "className": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	"internal_id": "String", "lookup": [Array], "related": [Array], "settings": {Object}, "sys_object_source_info": {Object}, "values": {Object} }]
items.className	Required. The sys_class_name (class/table name) of the CI to create or update. This value can be any CMDB table, such as cmdb_ci_linux_server or cmdb_ci_win_server. Data type: String
items.internal_id	Unique identifier for this item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup	Array of objects in which each object describes a lookup-based identification record. These records are used to identify the top-level configuration item based on a lookup table that has a reference back to the Configuration Item [cmdb_ci] table. Data type: Array off Objects "lookup": [{ "className": "String", "internal_id": "String",

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"sys_object_source_info": {Object}, "values": {Object} }`]
items.lookup.className	Required. The sys_class_name or class/table name of the CI to create or update. This value can be any CMDB class/table, such as cmdb_serial_number or cmdb_ci_network_adapter, or a non-CMDB hierarchy class. Data type: String
items.lookup.internal_id	Unique identifier for this lookup record in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup.sys_object_source_info	Object describing a unique CI identifier for a specified data source. Different sources may have different name-value pairs for the same CI. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
items.lookup.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this CI. Use if the source can have multiple feeds. Data type: String
items.lookup.sys_object_source_info.source_name	Data source for the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.lookup.sys_object_source_info.source_native_key	Unique key/id from the source for the CI. Can be any string that is unique to the item. Data type: String
items.lookup.sys_object_source_info.source_recency_timestamp	UTC date and time that the CI was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.lookup.values	Object describing fields for this lookup item as name/value pairs, where the name is the field name. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "ip_address": "String", "mac_address": "String", "serial_number": "String", "serial_number_type": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	"valid": "String" }
items.related	Array of objects in which each object describes an item record to create or update, based on a related table that has a reference to the top-level CI that is being identified. Rules in the Related Entry [cmdb_related_entry] table define what type of records can be in this array. The related table may or may not extend the Configuration Item [cmdb_ci] table. These records are not used to identify the configuration item. Data type: Array of Objects "related": [{ "className": "String", "internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} }]
items.related.className	Required. The sys_class_name or class/table name of the related item to create or update. Data type: String
items.related.internal_id	Unique identifier for this related item in this payload. Can be any value, but must be unique within the payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
items.related.sys_object_source_info	Object describing a unique CI identifier for a specified data source. Different sources may have different name-value pairs for the same CI. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`
items.related.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this related item. Use if the source can have multiple feeds. Data type: String
items.related.sys_object_source_info.source_name	Data source for the related item information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.related.sys_object_source_info.source_native_key	Unique key/id from the source for the related item. Can be any string that is unique to the item. Data type: String
items.related.sys_object_source_info.source_recency_timestamp	UTC date and time that the related item was scanned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Format: YYYY-MM-DD hh:mm:ss
items.related.values	Object describing fields to create or update for this related item as name/value pairs, where the name is the field name. For a reference field, the value must be the referenced sys_id. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "host_name": "String", "ip_address": "String", "name": "String", "os_name": "String", "sys_class_name": "String" }`
items.settings	Object containing parameters defining the types of updates that are permitted. Data type: Object `"settings": { "skipReclassificationRestrictionRules": Boolean, "updateWithoutDowngrade": Boolean, "updateWithoutSwitch": Boolean,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"updateWithoutUpgrade": Boolean }`
items.settings.skipReclassificationRestrictionRules	Flag that indicates whether IRE should skip running the Reclassification Restriction rule that matches the class for the payload item. Valid values: • true: Skip running the rule. • false: Run the rule. Default: false
items.settings.updateWithoutDowngrade	Flag that indicates whether update and downgrade are both permitted for this CI. Valid values: • true: Update the item but downgrade is not permitted. • false: Both item update and downgrade are permitted. Data type: Boolean Default: false
items.settings.updateWithoutSwitch	Flag that indicates whether this CI can be updated and its class switched. Valid values: • true: Update the item but class switching is not permitted. • false: Both item update and class switching are permitted. Data type: Boolean Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
items.settings.updateWithoutUpgrade	Flag that indicates whether update and upgrade are both permitted for this CI. Valid values: • true: Update the item but upgrade is not permitted. • false: Both item update and upgrade are permitted. Data type: Boolean Default: false
items.sys_object_source_info	Object describing a unique CI identifier. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`
items.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this CI. Use if the source can have multiple feeds. Data type: String
items.sys_object_source_info.source_name	Data source for the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
items.sys_object_source_info.source_native_key	Unique key/id from the source for the CI. Can be any string that is unique to the item. Data type: String
items.sys_object_source_info.source_recency_timestamp	UTC date and time that the CI was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.values	Object describing fields to create or update for this CI as name/value pairs, where the name is the field name. For a reference field, the value must be the referenced sys_id. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "host_name": "String", "ip_address": "String", "name": "String", "os_name": "String", "sys_class_name": "String" }`
referenceItems	List of reference between two items in the payload. The values of each reference item are populated before identifying a CI using the IRE rules defined on a class. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"referenceItems": [ { "referenced": "String", "referencedBy": "String", "referenceField": "String" } ]`
referenceItems.referenced	The *internal_id* defined for the item being referenced by another item. Data type: String
referenceItems.referencedBy	The *internal_id* defined for the item that references another item. Data type: String
referenceItems.referenceField	Name of the reference field in the class/table for the *referencedBy* item. Data type: String
relations	List of relationships between two items defined in the payload. An object in this array can use either of two formats: • The object can define a relationship between two top-level items (only) using *parent* and *child* name-value pairs, with values representing item indexes from the payload *items* array. • The object can define a relationship between any two items, including top-level, related, or lookup items, using *parent_id* and *child_id*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	key/value pairs, with values representing *internal_id* values defined for those items.
	
	Data type: Array of Objects
	
	`"relations": [ { "child": Number, "parent": Number, "sys_rel_source_info": {Object}, "type": "String" } ]`
	
	`"relations": [ { "child_id": "String", "parent_id": "String", "sys_rel_source_info": {Object}, "type": "String" } ]`

relations.child	Integer index of the CI object in the *items* array that represents the child in the relationship. Data type: Number
relations.child_id	The *internal_id* of the child item in the relationship. Data type: String
relations.parent	Integer index of the CI object in the *items* array that represents the parent in the relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Number
relations.parent_id	The *internal_id* of the parent item in the relationship. Data type: String
relations.sys_rel_source_info	Discovery source information for the relationship. For non-dependency relationships, this information is in the Relationship Sources [sys_rel_source] table. Data type: Object `"sys_rel_source_info": { "source_name": "String", "source_feed": "String" }`
relations.sys_rel_source_info.source_name	Discovery source name. Default: Discovery source passed in the API method parameter.
relations.sys_rel_source_info.source_feed	Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.
relations.type	Type of relationship existing between the parent and child items. This must be a name field value from the CI Relationship Type [cmdb_rel_type] table. Data type: String

Name	Description
	IRE Partial Payloads [cmdb_ire_partial_payloads] ta Data type: Array of Objects `"additionalRelatedIt s": [ { "className": "String", "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String } ]`
result.items.additionalRelatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.additionalRelatedItems.inputIndices	List of index values for CIs from the request body *items* array correspond to this related item Data type: Array `"inputIndices": [ Number ]`
result.items.additionalRelatedItems.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.items.additionalRelatedItems.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this related item. Data type: Array `"mergedPayloadIds": "String" ]`
result.items.additionalRelatedItems.sysId	Sys_id of this related CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.items.className	Sys_class_name of this CI. Data type: String
result.items.duplicateLookupIndices	Object containing arrays of ind values for *items.lookup* ar elements that reference the sa related CI. The array name indicates the first element from the request body *items.lookup* array th references a given related CI. I values are the set of additional elements from the same array t reference the same related CI. Data type: Object This example shows a case where the second element in th *items.lookup* array referen the same related CI as a later element from that array: `"duplicateLookupIndi s": [ "2": [Array] ]`
result.items.errorCount	Number of errors encountered while processing this CI. Data type: Number
result.items.errors	List of errors encountered whil processing this CI. Data type: Array of Objects `"errors": [ { "error": "String "message": "String" } ]`
result.items.errors.error	Type of error encountered whil processing this CI. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.identificationAttempts.attributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type "String", ]`
result.items.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"hybridEntryCiAttribes": [ "name": "String", "serial_number": "String" ]`
result.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt. Data type: String
result.items.identificationAttempts.searchOnTable	Name of the table searched for CI identification attempt. Data type: String
result.items.identifierEntrySysId	Sys_id for the identifier rule use identify this CI. Notable values: • Unknown: Identification of th failed. For details, see *erro* Data type: String
result.items.info	List of additional information al the processing of the item.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String" } ]`
result.items.relatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.relatedItems.inputIndices	List of index values for CIs and lookup items from the request body *items* and *items.lookup* arrays that correspond to this related item Data type: Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Numb } ]`
result.items.relatedItems.inputIndices.mainIndex	Index value from the request b *items* array that corresponds the CI parent of the related iter Data type: Number
result.items.relatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array th corresponds to the related iten Data type: Number
result.items.relatedItems.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.items.relatedItems.mergedPayloadIds	List of sys_id values for entries the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] ta that were merged into this CI during processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"mergedPayloadIds": "String" ]`
result.items.relatedSysIds	List of sys_id values for related items (table lookup items) from request body *items.looku* array. Data type: Array Notable values: • null: No sys_id was identified this related item. `"relatedSysIds": [ Number, Number ]`
result.items.sysId	Sys_id found for this CI through identification. Notable values: • Unknown: Identification of th failed. See *errors* for detai Data type: String
result.items.warnings	List of warnings encountered w processing this CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.items.warnings.error	Type of warning encountered w processing this CI. Data type: String
result.items.warnings.message	Warning message encountered while processing this CI. Data type: String

Example: cURL request

Submit a payload containing a Linux server (with serial number and network adapter related-item lookups) and an IP switch, with an IP Connection dependent relationship between them.

```
curl "https://instance.servicenow.com/api/now/identifyreconcile"
 \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{ \
  "items": [{ \
    "className": "cmdb_ci_linux_server", \
    "values": { \
      "sys_class_name": "cmdb_ci_linux_server", \
      "name": "lnux101", \
      "host_name": "lnux101.servicenow.com", \
      "ip_address": "10.11.12.173", \
      "os_name": "Linux Red Hat" \
    }, \
    "lookup": [{ \
      "className": "cmdb_serial_number", \
      "values": { \
        "serial_number": "lnux101", \
        "serial_number_type": "uuid", \
        "valid": "true" \
      } \
    }, { \
      "className": "cmdb_ci_network_adapter", \
      "values": { \
        "name": "eth0", \
        "ip_address": "10.11.12.173", \
        "mac_address": "00:55:51:21:26:2f" \
      } \
    }] \
  }, { \
    "className": "cmdb_ci_ip_switch", \
    "values": { \
      "name": "IP-Switch-1", \
      "serial_number": "Switch23587", \
      "serial_number_type": "uuid" \
    } \
  }], \
  "relations": [{ \
    "parent": 0, \
    "child": 1, \
    "type": "IP Connection::IP Connection" \
  }]
}'
```

The Linux server CI is identified via a Hardware Rule search for its name on the Hardware [cmdb_ci_hardware] table and is processed as an update to an existing CI in the Linux Server [cmdb_ci_linux_server] table. The IP switch is similarly identified via a Hardware Rule search for its name on the Hardware table and updates an existing CI in the IP Switch [cmdb_ci_ip_switch] table. Finally, the IP Connection dependent relationship between the server and the switch is inserted as a new record in the CI Relationship [cmdb_rel_ci] table.

Identification and Reconciliation - POST /now/identifyreconcile/enhanced

Inserts or updates configuration items (CIs) in the CMDB by applying identification and reconciliation rules to the specified payload (request body). Use this API instead of updating the CMDB directly.

Use the Identification and Reconciliation - POST /now/identifyreconcile/queryEnhanced endpoint to simulate submission of a payload to this endpoint without committing changes to the database.

This method is similar to the Identification and Reconciliation - POST /now/identifyreconcile method, but adds the following functionality:

- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is INSERT_AS_PARTIAL or INSERT_INCOMPLETE.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile/enhanced`

Default URL: `/api/now/identifyreconcile/enhanced`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
options	Comma-separated list of name-value pairs representing Enhanced IRE options applied f As an example, to override the default values for the partial payloads, partial commits, de Enhanced IRE options: `partial_payloads:false,partial_commits:false,deduplicate_pay` **Note:** By default or if *`partial_payloads`* is set to true, both *`partial_comm`* enabled, even if they are set to false, as those features are essential for partial paylo For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE) Valid values for each name-value pair: • true: Enable this Enhanced IRE option. • false: Disable this Enhanced IRE option. Data type: String
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the disco [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description
items	List of CIs to create or update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Array of Objects `"items": [ { "className": "String", "internal_id": "String", "lookup": [Array], "related": [Array], "settings": {Object}, "sys_object_source_info": {Object}, "values": {Object} } ]`
items.className	Required. The sys_class_name (class/table name) of the CI to create or update. This value can be any CMDB table, such as cmdb_ci_linux_server or cmdb_ci_win_server. Data type: String
items.internal_id	Unique identifier for this item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup	Array of objects in which each object describes a lookup-based identification record. These records are used to identify the top-level configuration item based on a lookup table that has a reference back to the Configuration Item [cmdb_ci] table. Data type: Array off Objects

Request body parameters (XML or JSON) (continued)

Name	Description
	"serial_number": "String", "serial_number_type": "String", "valid": "String" }
items.related	Array of objects in which each object describes an item record to create or update, based on a related table that has a reference to the top-level CI that is being identified. Rules in the Related Entry [cmdb_related_entry] table define what type of records can be in this array. The related table may or may not extend the Configuration Item [cmdb_ci] table. These records are not used to identify the configuration item. Data type: Array of Objects "related": [{ "className": "String", "internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} }]
items.related.className	Required. The sys_class_name or class/table name of the related item to create or update. Data type: String
items.related.internal_id	Unique identifier for this related item in this payload.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. Error message detail "Chunk [...] is not a valid entry" indicates that the *options* query parameter is not in the correct name-value pair format. For example, specifying an *options* parameter of `partial` produces a 500 status code with "Chunk [partial] is not a valid entry" in the message detail.

Response body parameters (JSON or XML)

Name	Description

result	List of results produced by the query.
	
	Data type: Array
	
	`"result": [`
	
	`"additionalCommitte tems": [Array],`

Name	Description
	• NO_CHANGE: No operation i performed for the dependen relationship CI. • UPDATE: An existing depend relationship CI in the target t is updated. Data type: String

result.items	List of CIs included in the requ body *items* array.
	
	Data type: Array of Objects
	
	"items": [
	{
	
	"additionalRelatedI ms": [Array],
	"className": "String",
	
	"duplicateLookupInd es": {Object},
	"errorCount": Number,
	"errors": [Array
	
	"identificationAtte ts": [Array],
	
	"identifierEntrySys d": "String",
	"info": [Array],
	"inputIndices": [Array],
	"markers": [Array],
	
	"mergedPayloadIds": [Array],
	"operation": "String",
	"relatedItems": [Array],
	"relatedSysIds": [Array],
	"sysId": "String
	"warnings": [Array]
	}
	]

result.items.additionalRelatedItems	List of related CIs (table lookup CI) from the CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	IRE Partial Payloads [cmdb_ire_partial_payloads] ta Data type: Array of Objects `"additionalRelatedIt s": [ { "className": "String", "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String } ]`
result.items.additionalRelatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.additionalRelatedItems.inputIndices	List of index values for CIs from the request body *items* array correspond to this related item Data type: Array `"inputIndices": [ Number ]`
result.items.additionalRelatedItems.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.items.additionalRelatedItems.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this related item. Data type: Array `"mergedPayloadIds": "String" ]`
result.items.additionalRelatedItems.sysId	Sys_id of this related CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.items.className	Sys_class_name of this CI. Data type: String
result.items.duplicateLookupIndices	Object containing arrays of ind values for *items.lookup* ar elements that reference the sa related CI. The array name indicates the first element from the request body *items.lookup* array th references a given related CI. I values are the set of additional elements from the same array t reference the same related CI. Data type: Object This example shows a case where the second element in th *items.lookup* array referen the same related CI as a later element from that array: `"duplicateLookupIndi s": [ "2": [Array] ]`
result.items.errorCount	Number of errors encountered while processing this CI. Data type: Number
result.items.errors	List of errors encountered whil processing this CI. Data type: Array of Objects `"errors": [ { "error": "String "message": "String" } ]`
result.items.errors.error	Type of error encountered whil processing this CI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.errors.message	Error message encountered wh processing this CI. Data type: String
result.items.identificationAttempts	List of attempts made to identif this CI. Data type: Array of Objects `"identificationAttem s": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttri tes": [Array], "identiferName": "String", "searchOnTable": [Array] } ]`
result.items.identificationAttempts.attemptResult	Outcome of this CI identificatio attempt. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule tal which exactly matched the specified attributes. • MULTI_MATCH: Identificatior failed with an error. Duplicate were found in the identifier ru table when matching against specified attributes. • NO_MATCH: Identification fa No CI was found in the identi rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rul table search were not provid so the rule was not applied. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.identificationAttempts.attributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type "String", ]`
result.items.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"hybridEntryCiAttribes": [ "name": "String", "serial_number": "String" ]`
result.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt. Data type: String
result.items.identificationAttempts.searchOnTable	Name of the table searched for CI identification attempt. Data type: String
result.items.identifierEntrySysId	Sys_id for the identifier rule use identify this CI. Notable values: • Unknown: Identification of th failed. For details, see *erro* Data type: String
result.items.info	List of additional information al the processing of the item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array of Objects `"info": [ { "code": "String" "message": "String", "ruleSysId": "String" } ]`
result.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRA • SKIPPED_CLASS_UPGRADE
result.items.info.message	Message that provides additio insights into the reason for skipping the reclassification. Data type: String
result.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matche Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due payload or global flag. Data type: String
result.items.inputIndices	List of index values for CIs from the request body *items* array correspond to this CI. Data type: Array of Objects `"inputIndices": [ { Number } ]`
result.items.markers	List of marker values for interna use. Data type: Array `"markers": []`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this CI. Data type: Array `"mergedPayloadIds": "String" ]`
result.items.operation	Operation performed for this C Possible values: • DELETE: An existing CI is removed from the target tabl • INSERT: The CI is inserted in the target table as a new rec • NO_CHANGE: No operation i performed for the CI. • UPDATE: An existing CI in the target table is updated. • UPDATE_WITH_DOWNGRAD An existing CI in the target table is updated and its class changed to a more generic c (ancestor class). • UPDATE_WITH_SWITCH: An existing CI in the target table updated and its class is char to another class which is not ancestor or descendent clas • UPDATE_WITH_UPGRADE: A existing CI in the target table updated and its class is char to a more specialized class (descendent class). Data type: String
result.items.relatedItems	List of related CIs (table lookup CI) from the request body *items.lookup* array. Data type: Array of Objects `"relatedItems": [ { "className": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String" } ]`
result.items.relatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.relatedItems.inputIndices	List of index values for CIs and lookup items from the request body *items* and *items.lookup* arrays that correspond to this related item Data type: Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Numb } ]`
result.items.relatedItems.inputIndices.mainIndex	Index value from the request b *items* array that corresponds the CI parent of the related iter Data type: Number
result.items.relatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array th corresponds to the related iten Data type: Number
result.items.relatedItems.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.items.relatedItems.mergedPayloadIds	List of sys_id values for entries the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] ta that were merged into this CI during processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"mergedPayloadIds": "String" ]`
result.items.relatedSysIds	List of sys_id values for related items (table lookup items) from request body *items.looku* array. Data type: Array Notable values: • null: No sys_id was identified this related item. `"relatedSysIds": [ Number, Number ]`
result.items.sysId	Sys_id found for this CI through identification. Notable values: • Unknown: Identification of th failed. See *errors* for detai Data type: String
result.items.warnings	List of warnings encountered w processing this CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.items.warnings.error	Type of warning encountered w processing this CI. Data type: String
result.items.warnings.message	Warning message encountered while processing this CI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.logContextId	Context ID reported for this payload. Data type: String
result.relations	List of dependent relationship CIs from the request body *relations* array. Data type: Array of Objects `"relations": [ { "className": "String", "errorCount": Number, "errors": [Array "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "operation": "String", "warnings": [Array] } ]`
result.relations.className	The sys_class_name of this dependent relationship CI. Only supported value: • cmdb_rel_ci: The CI Relation table. Data type: String
result.relations.errorCount	Number of errors encountered while processing this depende relationship CI. Data type: Number
result.relations.errors	List of errors encountered whil processing this dependent relationship CI. Data type: Array of Objects `"errors": [ { "error": "String`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"message": "String" } ]`
result.relations.errors.error	Type of error encountered whil processing this dependent relationship CI. Data type: String
result.relations.errors.message	Error message encountered while processing this depende relationship CI. Data type: String
result.relations.inputIndices	List of index values for the dependent relationship CI obje in the request body *relatio* array that correspond to this dependent relationship CI. Data type: Array `"inputIndices": [ Number ]`
result.relations.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.relations.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this dependent relationship CI. Data type: Array `"mergedPayloadIds": "String" ]`
result.relations.operation	Operation performed for this dependent relationship CI. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• INSERT: The dependent relationship CI was inserted the target table as a new rec • INSERT_AS_INCOMPLETE: T dependent relationship CI ha errors and was inserted into CMDB IRE Incomplete Paylo [cmdb_ire_incomplete_paylo table. • INSERT_AS_PARTIAL: The dependent relationship CI ha errors and was inserted into the CMDB IRE Partial Payloa [cmdb_ire_partial_payloads] table. • NO_CHANGE: No operation w performed for the dependen relationship CI. • UPDATE: An existing depend relationship CI in the target t was updated. Data type: String
result.relations.warnings	List of warnings encountered while processing this depende relationship CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.relations.warnings.error	Type of warning encountered while processing this depende relationship CI. Data type: String
result.relations.warnings.message	Warning message encountered while processing this depende relationship CI. Data type: String

Example: cURL request

Submit a partial payload for a computer CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/enha
nced" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
  "items" : [ \
    { \
      "className" : "cmdb_ci_computer", \
      "sys_object_source_info" : { \
        "source_name" : "ServiceNow", \
        "source_native_key" : "ncomputer3367" \
      }, \
      "values" : { \
        "cpu_core_count" : "6", \
        "ram" : "8192", \
        "manufacturer" : "DELL", \
        "company" : "My Company" \
      } \
    } \
  ] \
}'
```

The response shows that the payload has been inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

```
{
  "result": {
    "items": [{
      "className": "cmdb_ci_computer",
      "operation": "INSERT_AS_PARTIAL",
      "sysId": "Unknown",
      "partialSysIds": ["1aec79151bb45010593876a61a4bcb28"],

      "inputIndices": [0]
    }],
    "additionalCommittedItems": [],
    "relations": [],
    "additionalCommittedRelations": []
  }
}
```

Submit a second partial payload that completes the description of the computer CI, with the summary generation Enhanced IRE option enabled.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/enha
nced?options=generate_summary:true" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
}'
```

The response shows that the computer CI is inserted, and displays a summary of operations performed.

```
{
  "result": {
    "relations": [],
    "hasError": false,
    "additionalCommittedItems": [],
```

Identification and Reconciliation - POST /now/identifyreconcile/query

Determines the CMDB operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Use this endpoint to simulate submission of a payload (request body) to the Identification and Reconciliation - POST /now/identifyreconcile endpoint.

Use the Identification and Reconciliation - POST /now/identifyreconcile/enhanced endpoint instead if you need to specify Enhanced IRE options. For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE).

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile/query`

Default URL: `/api/now/identifyreconcile/query`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description

items	List of CIs to create or update.
	
	Data type: Array of Objects
	
	`"items": [`
	`  {`

Request body parameters (XML or JSON) (continued)

Name	Description
	"className": "String", "internal_id": "String", "lookup": [Array], "related": [Array], "settings": {Object}, "sys_object_source_info": {Object}, "values": {Object} }]
items.className	Required. The sys_class_name (class/table name) of the CI to create or update. This value can be any CMDB table, such as cmdb_ci_linux_server or cmdb_ci_win_server. Data type: String
items.internal_id	Unique identifier for this item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup	Array of objects in which each object describes a lookup-based identification record. These records are used to identify the top-level configuration item based on a lookup table that has a reference back to the Configuration Item [cmdb_ci] table. Data type: Array off Objects "lookup": [{ "className": "String",

Request body parameters (XML or JSON) (continued)

Name	Description
	"internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} }]
items.lookup.className	Required. The sys_class_name or class/table name of the CI to create or update. This value can be any CMDB class/table, such as cmdb_serial_number or cmdb_ci_network_adapter, or a non-CMDB hierarchy class. Data type: String
items.lookup.internal_id	Unique identifier for this lookup record in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup.sys_object_source_info	Object describing a unique CI identifier for a specified data source. Different sources may have different name-value pairs for the same CI. Data type: Object "sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_t

Request body parameters (XML or JSON) (continued)

Name	Description
	`imestamp": "String" }`
items.lookup.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this CI. Use if the source can have multiple feeds. Data type: String
items.lookup.sys_object_source_info.source_name	Data source for the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.lookup.sys_object_source_info.source_native_key	Unique key/id from the source for the CI. Can be any string that is unique to the item. Data type: String
items.lookup.sys_object_source_info.source_recency_timestamp	UTC date and time that the CI was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.lookup.values	Object describing fields for this lookup item as name/value pairs, where the name is the field name. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "ip_address": "String", "mac_address": "String", "serial_number": "String",`

Request body parameters (XML or JSON) (continued)

Name	Description
	`"serial_number_type": "String", "valid": "String" }`
items.related	Array of objects in which each object describes an item record to create or update, based on a related table that has a reference to the top-level CI that is being identified. Rules in the Related Entry [cmdb_related_entry] table define what type of records can be in this array. The related table may or may not extend the Configuration Item [cmdb_ci] table. These records are not used to identify the configuration item. Data type: Array of Objects `"related": [ { "className": "String", "internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} } ]`
items.related.className	Required. The sys_class_name or class/table name of the related item to create or update. Data type: String
items.related.internal_id	Unique identifier for this related item in this payload. Can be any value, but

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
items.related.sys_object_source_info.source_recency_timestamp	UTC date and time that the related item was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.related.values	Object describing fields to create or update for this related item as name/value pairs, where the name is the field name. For a reference field, the value must be the referenced sys_id. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "host_name": "String", "ip_address": "String", "name": "String", "os_name": "String", "sys_class_name": "String" }`
items.settings	Object containing parameters defining the types of updates that are permitted. Data type: Object `"settings": { "skipReclassificationRestrictionRules": Boolean, "updateWithoutDowngrade": Boolean,`

Request body parameters (XML or JSON) (continued)

Name	Description

	``
	"updateWithoutSwitch": Boolean,
	
	"updateWithoutUpgrade": Boolean
	}
	``

items.settings.skipReclassificationRestrictionRules	Flag that indicates whether IRE should skip running the Reclassification Restriction rule that matches the class for the payload item. Valid values: • true: Skip running the rule. • false: Run the rule. Default: false
items.settings.updateWithoutDowngrade	Flag that indicates whether update and downgrade are both permitted for this CI. Valid values: • true: Update the item but downgrade is not permitted. • false: Both item update and downgrade are permitted. Data type: Boolean Default: false
items.settings.updateWithoutSwitch	Flag that indicates whether this CI can be updated and its class switched. Valid values: • true: Update the item but class switching is not permitted. • false: Both item update and class switching are permitted. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Array of Objects `"referenceItems": [ { "referenced": "String", "referencedBy": "String", "referenceField": "String" } ]`
referenceItems.referenced	The *internal_id* defined for the item being referenced by another item. Data type: String
referenceItems.referencedBy	The *internal_id* defined for the item that references another item. Data type: String
referenceItems.referenceField	Name of the reference field in the class/table for the *referencedBy* item. Data type: String
relations	List of relationships between two items defined in the payload. An object in this array can use either of two formats: • The object can define a relationship between two top-level items (only) using *parent* and *child* name-value pairs, with values representing item indexes from the payload *items* array. • The object can define a relationship between any two items, including top-level, related, or lookup

Request body parameters (XML or JSON) (continued)

Name	Description

	items, using *parent_id* and *child_id* key/value pairs, with values representing *internal_id* values defined for those items.
	
	Data type: Array of Objects
	
	`"relations": [ { "child": Number, "parent": Number, "sys_rel_source_info": {Object}, "type": "String" } ]`
	
	`"relations": [ { "child_id": "String", "parent_id": "String", "sys_rel_source_info": {Object}, "type": "String" } ]`

relations.child	Integer index of the CI object in the *items* array that represents the child in the relationship. Data type: Number
relations.child_id	The *internal_id* of the child item in the relationship. Data type: String
relations.parent	Integer index of the CI object in the *items* array that represents the parent in the relationship.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Number
relations.parent_id	The *internal_id* of the parent item in the relationship. Data type: String
relations.sys_rel_source_info	Discovery source information for the relationship. For non-dependency relationships, this information is in the Relationship Sources [sys_rel_source] table. Data type: Object `"sys_rel_source_info": { "source_name": "String", "source_feed": "String" }`
relations.sys_rel_source_info.source_name	Discovery source name. Default: Discovery source passed in the API method parameter.
relations.sys_rel_source_info.source_feed	Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.
relations.type	Type of relationship existing between the parent and child items. This must be a name field value from the CI Relationship Type [cmdb_rel_type] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	List of results produced by the query.
	
	Data type: Array
	
	`"result": [`
	
	`"additionalCommitte tems": [Array],`
	
	`"additionalCommitte elations": [Array],`
	`"items": [Array],`

Name	Description
result.items.errors.message	Error message encountered wh processing this CI. Data type: String
result.items.identificationAttempts	List of attempts made to identif this CI. Data type: Array of Objects `"identificationAttem s": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttri tes": [Array], "identiferName": "String", "searchOnTable": [Array] } ]`
result.items.identificationAttempts.attemptResult	Outcome of this CI identificatio attempt. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule tal which exactly matched the specified attributes. • MULTI_MATCH: Identificatior failed with an error. Duplicate were found in the identifier ru table when matching against specified attributes. • NO_MATCH: Identification fa No CI was found in the identi rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rul table search were not provid so the rule was not applied. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.identificationAttempts.attributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type "String", ]`
result.items.identificationAttempts.hybridEntryCiAttributes	List of CI identifier entry attribu used during this CI identificatio attempt. Data type: Array Attribute names and types dep on the request body data and t identifier in use, such as: `"hybridEntryCiAttribes": [ "name": "String", "serial_number": "String" ]`
result.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt. Data type: String
result.items.identificationAttempts.searchOnTable	Name of the table searched for CI identification attempt. Data type: String
result.items.identifierEntrySysId	Sys_id for the identifier rule use identify this CI. Notable values: • Unknown: Identification of th failed. For details, see *erro* Data type: String
result.items.info	List of additional information al the processing of the item.

Name	Description
	Data type: Array of Objects `"info": [ { "code": "String" "message": "String", "ruleSysId": "String" } ]`
result.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRA • SKIPPED_CLASS_UPGRADE
result.items.info.message	Message that provides additio insights into the reason for skipping the reclassification. Data type: String
result.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matche Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due payload or global flag. Data type: String
result.items.inputIndices	List of index values for CIs from the request body *items* array correspond to this CI. Data type: Array of Objects `"inputIndices": [ { Number } ]`
result.items.markers	List of marker values for interna use. Data type: Array `"markers": []`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.items.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this CI. Data type: Array `"mergedPayloadIds": "String" ]`
result.items.operation	Operation performed for this C Possible values: • DELETE: An existing CI is removed from the target tabl • INSERT: The CI is inserted in the target table as a new rec • NO_CHANGE: No operation i performed for the CI. • UPDATE: An existing CI in the target table is updated. • UPDATE_WITH_DOWNGRAD An existing CI in the target table is updated and its class changed to a more generic c (ancestor class). • UPDATE_WITH_SWITCH: An existing CI in the target table updated and its class is char to another class which is not ancestor or descendent clas • UPDATE_WITH_UPGRADE: A existing CI in the target table updated and its class is char to a more specialized class (descendent class). Data type: String
result.items.relatedItems	List of related CIs (table lookup CI) from the request body *items.lookup* array. Data type: Array of Objects `"relatedItems": [ { "className": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String" } ]`
result.items.relatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.relatedItems.inputIndices	List of index values for CIs and lookup items from the request body *items* and *items.lookup* arrays that correspond to this related item Data type: Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Numb } ]`
result.items.relatedItems.inputIndices.mainIndex	Index value from the request b *items* array that corresponds the CI parent of the related iter Data type: Number
result.items.relatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array th corresponds to the related iten Data type: Number
result.items.relatedItems.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.items.relatedItems.mergedPayloadIds	List of sys_id values for entries the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] ta that were merged into this CI during processing.

Name	Description
	Data type: Array `"mergedPayloadIds": "String" ]`
result.items.relatedSysIds	List of sys_id values for related items (table lookup items) from request body *items.looku* array. Data type: Array Notable values: • null: No sys_id was identified this related item. `"relatedSysIds": [ Number, Number ]`
result.items.sysId	Sys_id found for this CI through identification. Notable values: • Unknown: Identification of th failed. See *errors* for detai Data type: String
result.items.warnings	List of warnings encountered w processing this CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.items.warnings.error	Type of warning encountered w processing this CI. Data type: String
result.items.warnings.message	Warning message encountered while processing this CI. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.logContextId	Context ID reported for this payload. Data type: String
result.relations	List of dependent relationship CIs from the request body *relations* array. Data type: Array of Objects `"relations": [ { "className": "String", "errorCount": Number, "errors": [Array "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "operation": "String", "warnings": [Array] } ]`
result.relations.className	The sys_class_name of this dependent relationship CI. Only supported value: • cmdb_rel_ci: The CI Relation table. Data type: String
result.relations.errorCount	Number of errors encountered while processing this depende relationship CI. Data type: Number
result.relations.errors	List of errors encountered whil processing this dependent relationship CI. Data type: Array of Objects `"errors": [ { "error": "String`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"message": "String" } ]`
result.relations.errors.error	Type of error encountered whil processing this dependent relationship CI. Data type: String
result.relations.errors.message	Error message encountered while processing this depende relationship CI. Data type: String
result.relations.inputIndices	List of index values for the dependent relationship CI obje in the request body *relatio* array that correspond to this dependent relationship CI. Data type: Array `"inputIndices": [ Number ]`
result.relations.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.relations.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this dependent relationship CI. Data type: Array `"mergedPayloadIds": "String" ]`
result.relations.operation	Operation performed for this dependent relationship CI. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.

Example: cURL request

Simulate submission of a payload containing a Linux server (with serial number and network adapter related-item lookups) and an IP switch, with an IP Connection relationship between them.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/que
ry" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
  "items": [{ \
    "className": "cmdb_ci_linux_server", \
    "values": { \
      "sys_class_name": "cmdb_ci_linux_server", \
      "name": "lnux101", \
      "host_name": "lnux101.servicenow.com", \
      "ip_address": "10.11.12.173", \
      "os_name": "Linux Red Hat" \
    }, \
    "lookup": [{ \
      "className": "cmdb_serial_number", \
      "values": { \
        "serial_number": "lnux101", \
        "serial_number_type": "uuid", \
        "valid": "true" \
      } \
    }, { \
      "className": "cmdb_ci_network_adapter", \
      "values": { \
        "name": "eth0", \
        "ip_address": "10.11.12.173", \
        "mac_address": "00:55:51:21:26:2f" \
      } \
    }] \
  }, { \
    "className": "cmdb_ci_ip_switch", \
    "values": { \
      "name": "IP-Switch-1", \
      "serial_number": "Switch23587", \
      "serial_number_type": "uuid" \
    } \
  }], \
  "relations": [{ \
    "parent": 0, \
    "child": 1, \
    "type": "IP Connection::IP Connection" \
  }] \
}'
```

The Linux server CI is identified via a Hardware Rule search for its name on the Hardware [cmdb_ci_hardware] table and is processed as an update to an existing CI in the Linux Server [cmdb_ci_linux_server] table. The IP switch is similarly identified via a Hardware Rule search for its name on the Hardware table and updates an existing CI in the IP Switch [cmdb_ci_ip_switch]

Identification and Reconciliation - POST /now/identifyreconcile/queryEnhanced

Determines the CMDB operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Use this endpoint to simulate submission of a payload (request body) to the Identification and Reconciliation - POST /now/identifyreconcile/enhanced endpoint.

This method is similar to the Identification and Reconciliation - POST /now/identifyreconcile/query method, but adds the following functionality:

- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is INSERT_AS_PARTIAL or INSERT_INCOMPLETE.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

URL format

Versioned URL: `/api/now/{api_version}/identifyreconcile/queryEnhanced`

Default URL: `/api/now/identifyreconcile/queryEnhanced`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
options	Comma-separated list of name-value pairs representing Enhanced IRE options applied f As an example, to override the default values for the partial payloads, partial commits, de Enhanced IRE options: `partial_payloads:false,partial_commits:false,deduplicate_pay` **Note:** By default or if *`partial_payloads`* is set to true, both *`partial_commi`* enabled, even if they are set to false, as those features are essential for partial paylo For more on Enhanced IRE options, see Identification and Reconciliation engine (IRE) Valid values for each name-value pair: • true: Enable this Enhanced IRE option. • false: Disable this Enhanced IRE option. Data type: String
sysparm_data_source	Source of the CI information. This must be one of the choice values defined for the disco [cmdb_ci] table. Data type: String Default: Insert the API payload into the incomplete payloads table.

Request body parameters (XML or JSON)

Name	Description
items	List of CIs to create or update. Data type: Array of Objects `"items": [ { "className": "String", "internal_id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	"lookup": [Array], "related": [Array], "settings": {Object}, "sys_object_source_info": {Object}, "values": {Object} }]
items.className	Required. The sys_class_name (class/table name) of the CI to create or update. This value can be any CMDB table, such as cmdb_ci_linux_server or cmdb_ci_win_server. Data type: String
items.internal_id	Unique identifier for this item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup	Array of objects in which each object describes a lookup-based identification record. These records are used to identify the top-level configuration item based on a lookup table that has a reference back to the Configuration Item [cmdb_ci] table. Data type: Array off Objects "lookup": [{ "className": "String", "internal_id": "String", "sys_object_source_info": {Object},

Request body parameters (XML or JSON) (continued)

Name	Description
	`"values": {Object} }`]
items.lookup.className	Required. The sys_class_name or class/table name of the CI to create or update. This value can be any CMDB class/table, such as cmdb_serial_number or cmdb_ci_network_adapter, or a non-CMDB hierarchy class. Data type: String
items.lookup.internal_id	Unique identifier for this lookup record in this payload. Can be any value, but must be unique within the payload. Data type: String
items.lookup.sys_object_source_info	Object describing a unique CI identifier for a specified data source. Different sources may have different name-value pairs for the same CI. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`
items.lookup.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this CI. Use if the source can have multiple feeds.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
items.lookup.sys_object_source_info.source_name	Data source for the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.lookup.sys_object_source_info.source_native_key	Unique key/id from the source for the CI. Can be any string that is unique to the item. Data type: String
items.lookup.sys_object_source_info.source_recency_timestamp	UTC date and time that the CI was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss
items.lookup.values	Object describing fields for this lookup item as name/value pairs, where the name is the field name. Data type: Object Field names and types depend on the fields selected by the user, such as: `"values": { "ip_address": "String", "mac_address": "String", "serial_number": "String", "serial_number_type": "String", "valid": "String" }`

Request body parameters (XML or JSON) (continued)

Name	Description
items.related	Array of objects in which each object describes an item record to create or update, based on a related table that has a reference to the top-level CI that is being identified. Rules in the Related Entry [cmdb_related_entry] table define what type of records can be in this array. The related table may or may not extend the Configuration Item [cmdb_ci] table. These records are not used to identify the configuration item. Data type: Array of Objects `"related": [ { "className": "String", "internal_id": "String", "sys_object_source_info": {Object}, "values": {Object} } ]`
items.related.className	Required. The sys_class_name or class/table name of the related item to create or update. Data type: String
items.related.internal_id	Unique identifier for this related item in this payload. Can be any value, but must be unique within the payload. Data type: String
items.related.sys_object_source_info	Object describing a unique CI identifier for a specified data source. Different

Name	Description
	sources may have different name-value pairs for the same CI. Data type: Object `"sys_object_source_info": { "source_feed": "String", "source_name": "String", "source_native_key": "String", "source_recency_timestamp": "String" }`
items.related.sys_object_source_info.source_feed	Name that uniquely identifies the feed sending this related item. Use if the source can have multiple feeds. Data type: String
items.related.sys_object_source_info.source_name	Data source for the related item information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. Data type: String
items.related.sys_object_source_info.source_native_key	Unique key/id from the source for the related item. Can be any string that is unique to the item. Data type: String
items.related.sys_object_source_info.source_recency_timestamp	UTC date and time that the related item was scanned. Data type: String Format: YYYY-MM-DD hh:mm:ss

Request body parameters (XML or JSON) (continued)

Name	Description

	``
	"referencedBy": "String",
	
	"referenceField": "String"
	}
	]
	``

referenceItems.referenced	The *internal_id* defined for the item being referenced by another item. Data type: String
referenceItems.referencedBy	The *internal_id* defined for the item that references another item. Data type: String
referenceItems.referenceField	Name of the reference field in the class/table for the *referencedBy* item. Data type: String
relations	List of relationships between two items defined in the payload. An object in this array can use either of two formats: • The object can define a relationship between two top-level items (only) using *parent* and *child* name-value pairs, with values representing item indexes from the payload *items* array. • The object can define a relationship between any two items, including top-level, related, or lookup items, using *parent_id* and *child_id* key/value pairs, with values representing *internal_id* values defined for those items. Data type: Array of Objects

Request body parameters (XML or JSON) (continued)

Name	Description
relations.sys_rel_source_info	Discovery source information for the relationship. For non-dependency relationships, this information is in the Relationship Sources [sys_rel_source] table. Data type: Object `"sys_rel_source_info": { "source_name": "String", "source_feed": "String" }`
relations.sys_rel_source_info.source_name	Discovery source name. Default: Discovery source passed in the API method parameter.
relations.sys_rel_source_info.source_feed	Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.
relations.type	Type of relationship existing between the parent and child items. This must be a name field value from the CI Relationship Type [cmdb_rel_type] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. Error message detail "Chunk [...] is not a valid entry" indicates that the *options* query parameter is not in the correct name-value pair format. For example, specifying an *options* parameter of `partial` produces a 500 status code with "Chunk [partial] is not a valid entry" in the message detail.

Response body parameters (JSON or XML)

Name	Description

result	List of results produced by the query.
	
	Data type: Array
	
	`"result": [`
	
	`"additionalCommitte tems": [Array],`
	
	`"additionalCommitte elations": [Array], "items": [Array], "relations": [Arra ]`

Name	Description
	Data type: String
result.items.className	Sys_class_name of this CI. Data type: String
result.items.duplicateLookupIndices	Object containing arrays of ind values for *items.lookup* ar elements that reference the sa related CI. The array name indicates the first element from the request body *items.lookup* array th references a given related CI. I values are the set of additional elements from the same array t reference the same related CI. Data type: Object This example shows a case where the second element in th *items.lookup* array referen the same related CI as a later element from that array: `"duplicateLookupIndi s": [ "2": [Array] ]`
result.items.errorCount	Number of errors encountered while processing this CI. Data type: Number
result.items.errors	List of errors encountered whil processing this CI. Data type: Array of Objects `"errors": [ { "error": "String "message": "String" } ]`
result.items.errors.error	Type of error encountered whil processing this CI. Data type: String

Name	Description
	`"inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "sysId": "String" } ]`
result.items.relatedItems.className	The sys_class_name of the rela item. Data type: String
result.items.relatedItems.inputIndices	List of index values for CIs and lookup items from the request body *items* and *items.lookup* arrays that correspond to this related item Data type: Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Numb } ]`
result.items.relatedItems.inputIndices.mainIndex	Index value from the request b *items* array that corresponds the CI parent of the related iter Data type: Number
result.items.relatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array th corresponds to the related iten Data type: Number
result.items.relatedItems.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.items.relatedItems.mergedPayloadIds	List of sys_id values for entries the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] ta that were merged into this CI during processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"mergedPayloadIds": "String" ]`
result.items.relatedSysIds	List of sys_id values for related items (table lookup items) from request body *items.looku* array. Data type: Array Notable values: • null: No sys_id was identified this related item. `"relatedSysIds": [ Number, Number ]`
result.items.sysId	Sys_id found for this CI through identification. Notable values: • Unknown: Identification of th failed. See *errors* for detai Data type: String
result.items.warnings	List of warnings encountered w processing this CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.items.warnings.error	Type of warning encountered w processing this CI. Data type: String
result.items.warnings.message	Warning message encountered while processing this CI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.logContextId	Context ID reported for this payload. Data type: String
result.relations	List of dependent relationship CIs from the request body *relations* array. Data type: Array of Objects `"relations": [ { "className": "String", "errorCount": Number, "errors": [Array "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "operation": "String", "warnings": [Array] } ]`
result.relations.className	The sys_class_name of this dependent relationship CI. Only supported value: • cmdb_rel_ci: The CI Relation table. Data type: String
result.relations.errorCount	Number of errors encountered while processing this depende relationship CI. Data type: Number
result.relations.errors	List of errors encountered whil processing this dependent relationship CI. Data type: Array of Objects `"errors": [ { "error": "String`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"message": "String" } ]`
result.relations.errors.error	Type of error encountered whil processing this dependent relationship CI. Data type: String
result.relations.errors.message	Error message encountered while processing this depende relationship CI. Data type: String
result.relations.inputIndices	List of index values for the dependent relationship CI obje in the request body *relatio* array that correspond to this dependent relationship CI. Data type: Array `"inputIndices": [ Number ]`
result.relations.markers	List of marker values for interna use. Data type: Array `"markers": []`
result.relations.mergedPayloadIds	List of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this dependent relationship CI. Data type: Array `"mergedPayloadIds": "String" ]`
result.relations.operation	Operation performed for this dependent relationship CI. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• INSERT: The dependent relationship CI was inserted the target table as a new rec • INSERT_AS_INCOMPLETE: T dependent relationship CI ha errors and was inserted into CMDB IRE Incomplete Paylo [cmdb_ire_incomplete_paylo table. • INSERT_AS_PARTIAL: The dependent relationship CI ha errors and was inserted into the CMDB IRE Partial Payloa [cmdb_ire_partial_payloads] table. • NO_CHANGE: No operation w performed for the dependen relationship CI. • UPDATE: An existing depend relationship CI in the target t was updated. Data type: String
result.relations.warnings	List of warnings encountered while processing this depende relationship CI. Data type: Array of Objects `"warnings": [ { "error": "String "message": "String" } ]`
result.relations.warnings.error	Type of warning encountered while processing this depende relationship CI. Data type: String
result.relations.warnings.message	Warning message encountered while processing this depende relationship CI. Data type: String

Example: cURL request

Simulate submission of a partial payload for a computer CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/quer
yEnhanced" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password" \
--data '{ \
  "items" : [ \
    { \
      "className" : "cmdb_ci_computer", \
      "sys_object_source_info" : { \
        "source_name" : "ServiceNow", \
        "source_native_key" : "ncomputer3367" \
      }, \
      "values" : { \
        "cpu_core_count" : "6", \
        "ram" : "8192", \
        "manufacturer" : "DELL", \
        "company" : "My Company" \
      } \
    } \
  ] \
}'
```

The response shows that the payload would be inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

```
{
  "result": {
    "relations": [],
    "items": [
      {
        "identifierEntrySysId": "Unknown",
        "partialSysIds": [
          "1aec79151bb45010593876a61a4bcb28"
        ],
        "sysId": "Unknown",
        "errorCount": 0,
        "markers": [],
        "className": "cmdb_ci_computer",
        "inputIndices": [
          0
        ],
        "operation": "INSERT_AS_PARTIAL",
        "errors": [],

```
    ],
    "additionalCommittedRelations": [],
    "additionalCommittedItems": []
  }
}
```

Simulate submission of a second partial payload that would complete the description of the computer CI, with the summary generation Enhanced IRE option enabled.

```
curl
 "https://instance.servicenow.com/api/now/identifyreconcile/quer
yEnhanced?options=generate_summary:true" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{ \
}'
```

The response shows that the computer CI would be inserted, and displays a summary of operations that would be performed.

```
{
  "result": {
    "relations": [],
    "hasError": false,
    "additionalCommittedItems": [],

Import Set API

The *Import Set* API provides endpoints that allow you to interact with import set tables.

This API transforms incoming data based on associated transform maps. The import set API supports synchronous transforms. The Import Set API mirrors the existing SOAP interface.

Security

Access to tables via the REST API is restricted by BasicAuth. To allow access to tables without any authentication or authorization, add the table name to sys_public.list. ACLs defined on tables are still enforced, and it is the administrator's responsibility to deactivate ACLs.

Import Set - GET /now/import/{stagingTableName}/{sys_id}

Retrieves the specified import staging record and resulting transformation result.

URL format

Versioned URL: `/api/now/{api_version}/import/{stagingTableName}/{sys_id}`

Default URL: `/api/now/import/{stagingTableName}/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
stagingTableName	Name of the table from which to obtain the import data. Data type: String
sys_id	Sys_id of the record that contains the data. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Indicates the specified resource was not available. As import set tables are deleted frequently based on a schedule, GET requests may return 404 Not Found responses if the transformation result no longer exists.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
import_set	Name of the import set. Data type: String
result	List of objects that contain information on the data sets that were imported. Data type: Array `"result": [ { "display_name": "String", "display_value": "String", "record_link": "String", "status": "String", "sys_id": "String", "table": "String", "transform_map": "String" } ]`
result.display_name	Display name of the specific column in the table for which the display value is true. For example, `number`. Data type: String
result.display_value	Display value of the *`display_name`* column. For example, `CHG0000123`. Data type: String
result.record_link	Table API GET request for the imported record. Data type: String
result.status	Status of the import. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.sys_id	Sys_id of the import record. Data type: String
result.table	Name of the table in which the data was imported. Data type: String
result.transform_map	Name of the transform map. Data type: String
staging_table	Name of the import staging table. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/import/imp_user/e2928b
e64f411200adf9f8e18110c777" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "import_set": "ISET0010001",
  "staging_table": "imp_user",
  "result": [
    {
      "transform_map": "User",
      "table": "sys_user",
      "display_name": "name",
      "display_value": "John Public",
      "record_link":
 "https://instance.service-now.com/api/now/table/sys_user/ea928b
e64f411200adf9f8e18110c777",
      "status": "inserted",
      "sys_id": "ea928be64f411200adf9f8e18110c777"
    }
  ]
}
```

Import Set - POST /now/import/{stagingTableName}

Inserts incoming data into a specified staging table and triggers transformation based on predefined transform maps in the import set table.

Transformation occurs synchronously. For each transform map that you define, the responses include transformation results such as information on the target records.

Note: The status_message and error_message fields on transformation scripts are processed and returned in response, along with any custom response fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/now/{api_version}/import/{stagingTableName}`

Default URL: `/api/now/import/{stagingTableName}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Note: The Import Set POST method accepts only name-value pairs of String data types in request body parameters. If any other data type is provided, the resulting value stored in the import set table might not conform to the intended format. For example, the ":" notion of the nested JSON object is changed to "=".

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
stagingTableName	Name of the table from which to import the data. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
Call specific	Name-value pairs to insert in the import fields. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
201	Successful. The request was successfully created.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
import_set	Name of the import set. Data type: String
result	List of objects that contain information on the data sets that were imported. Data type: Array `"result": [ { "display_name": "String", "display_value": "String", "record_link": "String", "status": "String", "sys_id": "String", "table": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"transform_map": "String"`
	`}`
	`]`

result.display_name	Display name of the specific column in the table for which the display value is true. For example, `number`. Data type: String
result.display_value	Display value of the *`display_name`* column. For example, CHG0000123. Data type: String
result.record_link	Table API GET request for the imported record. Data type: String
result.status	Status of the import. Data type: String
result.sys_id	Sys_id of the import record. Data type: String
result.table	Name of the table in which the data was imported. Data type: String
result.transform_map	Name of the transform map. Data type: String
staging_table	Name of the import staging table. Data type: String

Example: Sample cURL request

```
curl "https://instance.servicenow.com/api/now/import/imp_user" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{'first_name':'John','last_name':'Public','user_id':'john.publ
ic','email':'john.public@company.com'}" \
--user "username":"password"
```

```
{
  "import_set": "ISET0010001",
  "staging_table": "imp_user",
  "result": [
    {
      "transform_map": "User",
      "table": "sys_user",
      "display_name": "name",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "display_value": "John Public",
      "record_link":
 "https://instance.servicenow.com/api/now/table/sys_user/ea928be
64f411200adf9f8e18110c777",
      "status": "inserted",
      "sys_id": "ea928be64f411200adf9f8e18110c777"
    }
  ]
}
```

Import Set - POST /now/import/{stagingTableName}/insertMultiple

Inserts multiple records into a specified staging table and triggers transformation based on predefined transform maps or Robust Transform Engine (RTE) configurations in a single request.

Transformation is asynchronous by default. To set synchronous transformation, create a new record in the Rest Insert Multiples [sys_rest_insert_multiple] table, select the source table, and set the transformation to synchronous.

This endpoint can send a request body in two possible formats.

Data source file format

If you generate a staging table from a JSON data source, match the JSON format of the source file.

Staging table column format

Default. Matches the staging table column request body format in key value pairs.

URL format

Versioned URL: `/api/now/{api_version}/import/{stagingTableName}/insertMultiple`

Default URL: `/api/now/import/{stagingTableName}/insertMultiple`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Note: The Import Set POST method accepts only name-value pairs of String data types in request body parameters. If any other data type is provided, the resulting value stored in the import set table might not conform to the intended format. For example, the ":" notion of the nested JSON object is changed to "=".

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
stagingTableName	Name of the import set table from which to import the data. Refer to Import sets key concepts. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
multi_import_set_id	Sys_id of an entry in the Multi Import Sets [sys_multi_import_set] table. If specified, adds the current import to this multiple import set instead of adding to a new multiple import set. Data type: String Table:
run_after	Sys_id of the entry to run. Enables running the current import set after the specified import set is complete. You can use this parameter to enforce the sequential order of imports. This parameter is only valid in asynchronous transformations. Data type: String Table: Import Sets [sys_import_set]

Request body (JSON)

Format	Description
Data source file	This request body format matches the JSON file format used to create the data source. Provide the request body in the same format as the JSON in the data source. JSON input varies depending on the properties in your data source. Refer to JSON information in File type data source. • This option is only available if the staging table was created using a JSON data source. Refer to Create a File type data source. • You must define the path of the data source in the Data Source [sys_data_source] table in the **Path for each row** field. • To change the default behavior for the REST Insert Multiple user, create an entry in the REST Insert Multiples [sys_rest_insert_multiple] table. • Enable the **Use data source format** in the REST insert multiple entry. Data type: Object
Staging table column (default)	This request body format matches staging table columns. Use the *records* array of key-value pairs matching the staging table column to insert in the import fields. Each JSON key is maps the table column to a JSON value representing the value to be inserted. JSON input varies depending on what fields are in your staging table. The column mapping default key value is to the column table. `{ "records":[ { "<ColumnLabel1>":"<value>", "<ColumnLabel2>":"<value>" }, { "<ColumnLabel1>":"<value>", "<ColumnLabel2>":"<value>"`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body (JSON) (continued)

Format	Description

	`}`
	`]`
	`}`
	
	You can modify mapping settings by adding an entry in the Rest Insert Multiples [sys_rest_insert_multiple] table and changing the **Column mapping** from **Label** to **Column name**.
	
	`{`
	`"records":[`
	`{`
	`"<column_name1>":"<value>",`
	`"<column_name2>":"<value>"`
	`},`
	`{`
	`"<column_name1>":"<value>",`
	`"<column_name2>":"<value>"`
	`}`
	`]`
	`}`
	
	The Data dictionary tables provides details on table fields in the system.
	
	Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
201	Successful. The request was successfully created.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body (JSON)

Name	Description
import_set_id	Sys_id of the added record. For asynchronous requests, you can use this value to run another import set after this import set process is complete. Data type: String Table: Import Sets [sys_import_set]
multi_import_set_id	Sys_id of the added record. Use this value to group multiple import sets into one set. Data type: String Table: Multi Import Sets [sys_multi_import_set]

Example: Sample cURL request

The following example shows how to run a transform on an import table called u_employee_import_set_table using the staging table column format.

```
curl
 "https://instance.servicenow.com/api/now/import/u_employee_impo
rt_set_table/insertMultiple" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"records\": [
  {
   \"Address\": \"Hollywood\",
   \"Name\": \"Tom\",
   \"ID\": \"123\"
  },
  {
   \"Address\": \"Vine\",
   \"Name\": \"Irene\",
   \"ID\": \"456\"
  }
  ]
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}" \
--user 'username':'password'
```

Results include sys_ids for new records in the Import Sets [sys_import_set] and Multi Import Sets [sys_multi_import_set] tables.

```
{
  "import_set_id": "<import_set_sys_id>",
  "multi_import_set_id": "<multi_import_set_sys_id>"
}
```

Install Base Item API

The *`Install Base Item`* API provides endpoints to access and manage install base items records within a ServiceNow instance.

An install base item represents an instance of a product that has been configured for a customer. Install base items enable you to track all purchases made by a customer.

You can also perform CRUD operations on the Install Base Related Parties related list using this API. In addition, you can read records in other install base items related lists, such as cases, contracts, entitlements, maintenance plans, sold products, and work orders.

To access this API you must have either the sn_install_base.ib_api_write or sn_install_base.ib_api_read role depending on the type of CRUD action that you are trying to perform.

To access the various endpoints in this API the following plugins must be installed:

- Customer Service Install Base Management (com.snc.install_base)
- Planned Work Management (sn_fsm_planned_wm) if you want to retrieve maintenance plan and work order data.

This API runs in the `sn_install_base` namespace.

Note: This API only returns non-empty fields in the endpoint responses. Also, none of the system level fields (those prefaced with "sys_") are returned except the sys_id field.

For additional information on install base items, see Create an install base item.

Install Base Item - DELETE /sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}

Disassociates a specified related parties record from a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]
related_party_sys_id	Sys_id of the related party record. Data type: String Table: Install Base Related Party [sn_install_base_related_party]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
result	Description of the endpoint results. Data type: Object
result.status	Status of the endpoint request. Possible values: • SUCCESS • FAILURE Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991/relatedpart
ies/2a42dfae872521100b6afc86dabb356b" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "status": "SUCCESS"
  }
}
```

Install Base Item - GET /sn_install_base/integrations/installbaseitems

Returns all install base items. You can pass parameters within the call to filter the return results.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems`

Default URL: `/api/sn_install_base/integrations/installbaseitems`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the install base item records. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the state field is set to "in_use" and the status field is set to "replacement", pass the follow: `&state=in_use&status=replacement`. Data type: String Default: All fields

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Table: Install Base Item [sn_istall_base_item]
related_party	Sys_id of a related party record. Filters the install base item records based on the specified related party. A related party can be linked to an install base item or a sold product. Valid values: • account sys_id: Located in the Account [customer_account] table. • consumer sys_id: Located in the Consumer [csm_consumer] table. • contact sys_id: Located in the Contact [customer-contact] table. • service organization sys_id: Located in the Service Organization [sn_customer_service_organization] table. • user sys_id: Located in the User [sys-user] table. Data type: String Table: Install Base Related Party [sn_install_base_related_party]
responsibility	Sys_id of the associated responsibility record. This record defines the access level for the install base information. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for Items Received. Data type: String
sys_class_name	If the desired records are in a table that extends the Install Base Items [sn_install_base_item] table, the name of the extended table to query. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

The following return results only describe the return values for records returned from the Install Base Items [sn_install_base_items] table.

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string

items	List of the install base items that matched the specified filter results.
	
	Data type: Array of Objects
	
	`"items":[`
	`  {`
	`  "account": {Object},`
	`  "active": "String",`
	`  "asset": {Object},`
	`  "configuration_item":`
	` {Object},`
	`  "consumer": {Object},`
	`  "consumer_profile": {Object},`

Name	Description
	"contact": {Object}, "health_status": {Object}, "health_status_last_updated": "String", "household": {Object}, "install_date": {Object}, "location": {Object}, "name": "String", "number": "String", "parent": {Object}, "product": {Object}, "service_context": {Object}, "service_organization" {Object}, "sys_class_name": "String", "sys_id": "String", "sys_mod_count": "String", "state": {Object}, "status": {Object}, "uninstall_date": "String" }]

items.account	Details about the customer account associated with the install base item record.
	
	Data type: Object
	
	"account": {
	"display_value": "String",
	"sys_id": "String"
	}

items.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
items.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
items.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String
items.asset	Details about the asset associated with the install base item record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Object
	`"asset": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
items.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String

items.configuration_item	Details about the configuration item associated with the install base item record.
	
	Data type: Object
	`"configuration_item": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
items.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String

items.consumer	Details about the consumer associated with the install base item record.
	
	Note: The consumer field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI.

Name	Description
	Data type: String
items.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String

items.consumer_profile	Details about the consumer profile associated with the install base item record.
	
	Note: The consumer profile field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer_profile": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
items.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String

items.contact	Details about the account contact responsible for the install base item record.
	
	Data type: Object
	
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
items.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String
items.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	Data type: Object
	`"health_status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

items.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
items.health_status.value	Internal value of the health status of the install base item. Data type: String
items.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String

items.household	Details about the household associated with the install base item record. Only returned if the Customer Household Data Model (com.snc.household) plugin is installed.
	
	Data type: Object
	`"household": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
items.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String

items.install_date	Details about the date when the install base item became active.
	
	Data type: Object
	`"install_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

Name	Description
items.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
items.install_date.value	Internal value of the install date. Data type: String

items.location	Details about the location of the install base item.
	
	Data type: Object
	
	`"location": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
items.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
items.name	Name of the install base item. Data type: String
items.number	Unique ID of the install base item. Data type: String

items.parent	Details about the parent record of the install base item record.
	
	Data type: Object
	
	`"parent": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
items.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String

Name	Description

items.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	
	`"product": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
items.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String

items.service_context	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.service_context.display_value	Text name of the service context associated with the install base item record. Use this value to display the service context name in the UI. Data type: String
items.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String

items.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed.
	
	Data type: Object
	
	`"service_organization": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

Name	Description
items.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
items.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
items.sys_class_name	Table containing the install base item record. Data type: String
items.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
items.sys_mod_count	Number of times that the associated install base item record has been modified. Data type: String

items.state	Details about the current state of the install base item.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

items.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
items.state.value	Internal value of the state of the install base item. Data type: String

items.status	Details about the status of the install base item.
	
	Data type: Object
	
	`"status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

items.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI.

Name	Description
	Data type: String
items.status.value	Internal value of the status of the install base item. Data type: String

items.uninstall_date	Details about the date when the install base item became inactive.
	
	Data type: Object
	
	`"uninstall_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

items.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
items.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_depth	Number of levels deep the returned child install base item is in the hierarchy. Data type: Integer
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows a simple call that only returns a single record starting at offset 5.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/v1/integra
tions/installbaseitems?sysparm_limit=1&sysparm_offset=5" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Return results:

```
{
  "result": {
    "sysparm_offset": "5",
    "sysparm_limit": 1,
    "has_more": true,
    "items": [
      {
        "sys_class_name": "sn_install_base_item",
        "number": "IBITM001100",
        "sys_id": "181df7ff530a1110539dddeeff7b12f4",
        "state": {
          "value": "in_use",
          "display_value": "In Use"
        },
        "sys_mod_count": "2",
        "active": "true",
        "configuration_item": {
          "sys_id": "62446ae8535e5510539dddeeff7b12db",
          "display_value": "boxeoproderp"
        },
        "name": "boxeoproderp",
        "account": {
          "sys_id": "86837a386f0331003b3c498f5d3ee4ca",
          "display_value": "Boxeo"
        }
      }
    ],
    "status": "SUCCESS"
  }
}
```

Example: cURL request

The following code example shows how to search for the fields *state* = "in_use" and *status* = "replacement" within the Install Base Item table.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems?state=in_use&status=replacement" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": "0",
    "sysparm_limit": "10",
    "has_more": false,
    "items": [
      {
        "parent": {
          "sys_id": "ffd023f453de9910539dddeeff7b1264",
          "display_value": "Point of Sale System"
        },
```

Install Base Item - GET /sn_install_base/integrations/installbaseitem/{id}

Returns a specified install base item record and its child hierarchy.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitem/{id}`

Default URL: `/api/sn_install_base/integrations/installbaseitem/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
sys_class_name	If the intended record is in a table that extends the Install Base Items [sn_install_base_item] table, the name of the extended table to query. This table must extend the sn_install_base_item table. Data type: String
sysparm_depth	Maximum depth of the child install base item's hierarchy to return. Data type: Integer Default: 7 Maximum: 10
sysparm_limit	Maximum number records to return in each child hierarchy. Data type: Integer Default: 10 Maximum: 100

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

childinstallbase	List of child install base item records associated with the specified install base item.
	
	Data type: Object
	
	`"childinstallbase": {`
	`  "items": [Array],`
	`  "sysparm_depth": Integer`
	`}`

childinstallbase.items	Child install base items associated with the specified install base item. The values within this array are defined under the *items[]* array further down in this section.
childinstallbase.sysparm_depth	Child-level of the install base item.

Name	Description
	Data type: Integer

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_children	Flag that indicates whether the requested install base item record has child install base item records. • true: Has child install base item records. • false: Doesn't have child install base item records. Data type: Boolean

item	Install base item that matched the specified filter results.
	
	Data type: Object
	
	`"item": {`
	`  "account": {Object},`
	`  "active": "String",`
	`  "asset": {Object},`
	`  "configuration_item": {Object},`
	`  "consumer": {Object},`
	`  "consumer_profile": {Object},`
	`  "contact": {Object},`
	`  "health_status": "Object",`
	`  "health_status_last_updated":`
	`  "String",`
	`  "household": {Object},`
	`  "install_date": {Object},`
	`  "location": {Object},`
	`  "name": "String",`
	`  "number": "String",`
	`  "parent": {Object},`
	`  "product": {Object},`
	`  "service_context": {Object},`
	`  "service_organization" {Object},`
	`  "sys_class_name": "String",`

Name	Description

	`"sys_id": "String",`
	`"state": {Object},`
	`"status": {Object},`
	`"uninstall_date": "String"`
	`}`

item.account	Details about the customer account associated with the install base item record.
	
	Data type: Object
	
	`"account": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String

item.asset	Details about the asset associated with the install base item record.
	
	Data type: Object
	
	`"asset": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
item.asset.sys_id	Sys_id of the asset record associated with the install base item record.

Name	Description
	Data type: String

item.configuration_item	Details about the configuration item associated with the install base item record.
	
	Data type: Object
	
	`"configuration_item": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
item.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String

item.consumer	Details about the consumer associated with the install base item record.
	
	Note: The consumer field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String

item.consumer_profile	Details about the consumer profile associated with the install base item record.
	
	Note: The consumer profile field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer_profile": {`
	`  "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	`"sys_id": "String"` `}`
item.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
item.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String

item.contact	Details about the account contact responsible for the install base item record.
	
	Data type: Object
	
	`"contact": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
item.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String

item.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed.
	
	Data type: Object
	
	`"health_status": {`
	`"display_value": "String",`
	`"value": "String"`
	`}`

item.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
item.health_status.value	Internal value of the health status of the install base item. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String

item.household	Details about the household associated with the install base item record. Only returned if the Customer Household Data Model (com.snc.household) plugin is installed.
	
	Data type: Object
	
	`"household": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
item.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String

item.install_date	Details about the date when the install base item became active.
	
	Data type: Object
	
	`"install_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
item.install_date.value	Internal value of the install date. Data type: String

item.location	Details about the location of the install base item.
	
	Data type: Object
	
	`"location": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

Name	Description
item.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
item.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String

item.parent	Details about the parent record of the install base item record.
	
	Data type: Object
	
	`"parent": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
item.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String

item.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	
	`"product": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String

Name	Description
item.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String

item.service_context	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.service_context.display_value	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String

item.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed.
	
	Data type: Object
	
	`"service_organization": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
item.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
item.sys_class_name	Table containing the install base item record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
item.sys_mod_count	Number of times that the associated install base item record has been modified. Data type: String

item.state	Details about the current state of the install base item.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item. Data type: String

item.status	Details about the status of the install base item.
	
	Data type: Object
	
	`"status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
item.status.value	Internal value of the status of the install base item. Data type: String

item.uninstall_date	Details about the date when the install base item became inactive.
	
	Data type: Object
	
	`"uninstall_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI.

Name	Description
	Data type: String
item.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to call this endpoint. The associated install base item doesn't have any children.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitem/f77c7542b7343300ece839a6ee11a991" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "status": "SUCCESS",
    "item": {
      "sys_class_name": "sn_install_base_item",
      "number": "IBITM0000901",
      "sys_id": "f77c7542b7343300ece839a6ee11a991",
      "product": {
        "sys_id": "8583ce8237732000158bbfc8bcbe5dd9",
        "display_value": "Fujitsu 1TB Hybrid Solid State Drive"
      },
      "active": "true",
      "name": "KX Series - KX5001",
      "account": {
        "sys_id": "86837a386f0331003b3c498f5d3ee4ca",
        "display_value": "Boxeo"
      }
    },
    "hasChildren": "false"
  }
}
```

Example: cURL request

The following code example shows how to call this endpoint specifying a maximum depth of four child-levels.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/e0a80e4b87b521100b6afc86dabb3565?depth=4" \
--request GET \
```

```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/cases

Returns the cases associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/cases`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/cases`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the case records. If you specify a different table in *sys_class_name*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the approval field is set to "rejected" and the category field is set to "2", pass the follow: `&approval=rejected&category=2`. Data type: String Table: Case [sn_customerservice_case] Default: All fields
sys_class_name	If using an extended case table (not sn_customerservice_case), the name of the extended table to query. Data type: String Default: sn_customerservice_case
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
cases	List of cases associated with the specified install base item record. Data type: Array of Objects

Element	Description
cases.approval	String that describes the type of approval required. Possible values: • approved • cancelled • duplicate • not_required • not requested • rejected • requested Data type: String Maximum characters: 40 Default: not requested
cases.approval_history	List of all approvals associated with the case. Data type: String Maximum characters: 4,000
cases.approval_set	Date and time that the associated action was approved. Data type: String
cases.asset	Sys_id of the asset record associated with the case. Data type: String Table: Asset [alm_asset]
cases.assigned_on	Date and time that the case was assigned to the person identified in the *assigned_to* parameter. Data type: String (Date) Maximum length: 40
cases.assigned_to	Sys_id of the person assigned to the case. Table: User [sys_user] Data type: String
cases.assignment_group	Sys_id of the customer service agent group assigned to the case. Data type: String Table: Group [sys_user_group]

Element	Description
cases.auto_close	Flag that indicates whether the case was automatically closed. Possible values: • true: Case was auto closed • false: Case wasn't auto closed Data type: Boolean Default: false
cases.business_duration	Length in calendar work hours, work days, and work weeks that it took to complete the case. Data type: String
cases.business_impact	Impact of the issue on the associated customer. Data type: String Maximum characters: 4,000
cases.business_service	Sys_id of the service record associated with the case. Data type: String Table: Service [cmdb_ci_service]
cases.calendar_duration	Length in calendar hours, days, and weeks that it took to complete the case. Data type: String (Duration) Maximum length: 40
cases.case	Case short description and case number. Data type: String Maximum length: 300
cases.case_report	Sys_id of the associated case report. Data type: String Table: Case Report [sn_customerservice_case_report]
cases.category	Case category. Possible values: • 0: Question • 1: Issue • 2: Feature Data type: Number (Integer)

Element	Description
	Default: 1
cases.cause	Details about the cause of the problem. Data type: String Maximum length: 4,000
cases.caused_by	Sys_id of the change request that caused the case to be created. Data type: String Table: Change Request [change_request]
cases.change	Sys_id of the change request that caused the case to be created. Data type: String Table: Change Request [change_request]
cases.child_case_creation_progress	Flag that indicates whether the case is a child case that was created from a major case. Possible values: • true: Child case created from a major case • false: Not a child case Data type: Boolean
cases.closed_at	Date and time that the case was closed. Data type: String
cases.closed_by	Sys_id of the user that closed the case. Data type: String Table: User [sys_user]
cases.close_notes	Notes made when the case was closed. Data type: String Maximum length: 4,000
cases.cmdb_ci	Sys_id of the configuration item associated with the case. Data type: String Table: Configuration Item [cmdb_ci]
cases.comments	Additional comments about the case. Data type: String

Element	Description
	Maximum length: 4,000
cases.comments_and_work_notes	Comments and work notes entered for the case. Data type: String Maximum length: 4,000
cases.company	Sys_id of the company associated with the case. Data type: String Table: Company [core_company]
cases.consumer	Business-to-consumer cases only. Sys_id of the person to contact with regard to this case. Data type: String Table: Consumer [csm_consumer]
cases.contact	Business-to-business based cases only. Sys_id of the person to contact regarding this case. Data type: String Table: Contact [customer_contact]
cases.contact_local_time	Contact local time. Data type: String Maximum length: 70
cases.contact_time_zone	Time zone of the contact associated with the case. Data type: String Maximum length: 40
cases.contact_type	Method in which the case was initially reported. Possible values: • chat • email • phone • social • web Data type: String Maximum length: 40
cases.contract	Sys_id of the contract associated with the case. This contract contains information about the type of support that is provided to the company associated

Element	Description
	to the case. A contract can include a company and contact and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs. Data type: String Table: Contract [ast_contract]
cases.contributor_groups	List of sys_ids of the user groups that have contributed to the case. Data type: String Table: Group [sys_user_group]
cases.contributor_users	List of sys_ids of the users that have contributed to the case. Data type: String Table: User [sys_user]
cases.correlation_display	Correlation display. Data type: String Maximum length: 100
cases.correlation_id	Correlation identifier. Data type: String Maximum length: 100
cases.delivery_plan	Sys_id of the parent execution plan for this case. Data type: String Table: Execution Plan [sc_cat_item_delivery_plan]
cases.delivery_task	Sys_id of the execution plan task. Data type: String Table: Execution Plan Task [sc_cat_item_delivery_task]
cases.description	Detailed description of the problem associated with the case. Data type: String Maximum length: 4,000
cases.due_date	Date that the case is due to be closed. Data type: String

Element	Description
cases.entitlement	Sys_id of the entitlement record associated with the case. Entitlements define the type of support that a customer receives as well as the supported communication channels. An entitlement can be associated with a product, an asset, an account, or a contract. Data type: String Table: Entitlement [service_entitlement]
cases.escalation	Current escalation level. Possible values: • 0: Normal • 1: Moderate • 2: High • 3: Overdue Data type: Number (Integer) Default: 0
cases.expected_start	Date and time when work is scheduled to begin on the case. Data type: String
cases.first_response_time	Date and time when the first action was taken on the case. Data type: String
cases.follow_the_sun	Flag that indicates whether the case should be handed-off for global follow-up. If a customer enters additional comments on a Priority 1 - Critical or a Priority 2 - High case, or if the case is escalated, the flag is automatically set to true. Possible values: • true: Case should be handed-off for global follow-up • false: Case shouldn't be handed-off for global follow-up Data type: Boolean Default: false
cases.follow_up	Date and time of the next follow-up action. Data type: String

Element	Description
cases.group_list	List of sys_ids of the group records associated with the case. Data type: Array Table: Group [sys_user_group]
cases.impact	Impact on customer. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
cases.internal_user	Sys_id of the internal user for this case. Data type: String Table: User [sys_user]
cases.initiated_as_request	Flag that indicates if this inquiry was initiated as a request by the customer. Possible values: • true: Inquiry initiated by customer. • false: Inquiry wasn't initiated by customer. Data type: Boolean Default: false
cases.knowledge	Flag that indicates if there is a knowledge base article available for the specified issue. Possible values: • true: Knowledge base article is available for this issue • false: Knowledge base article is not available for this issue Data type: Boolean Default: false
cases.location	Sys_id of the record describing the company location. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Table: Location [cmn_location]
cases.made_sla	Flag that indicates whether the case was resolved in alignment with the associated service level agreement. Possible values: • true: Case was resolved in alignment with SLA • false: Case wasn't resolved according to the SLA Data type: Boolean Default: true
cases.major_case_state	Current state of the major case. Possible values: • accepted: Initial state when a manager creates a major case or when a manager promotes a candidate case. • canceled: Case is canceled. • proposed: Initial state when an agent or manager creates or proposes a candidate case. • rejected: Manager rejected candidate case. Data type: String Maximum length: 40
needs_attention	Flag that indicates whether the case needs attention. Possible values: • true: Case needs additional attention • false: Case doesn't need additional attention Data type: Boolean Default: false
cases.notes_to_comments	Flag that indicates whether to add the resolution notes to the comments. Possible values: • true: Resolutions notes, when added, are also added to the comments • false: Resolution notes in comments aren't required Data type: Boolean
cases.notify	Method to use to notify contact/consumer.

Element	Description
	Possible values: • 1: Do not notify • 2: Send email • 3: Telephone Data type: Number (Integer) Default: 1
cases.number	Case number. Data type: String Maximum length: 40
cases.opened_at	Date and time that the case was opened. Data type: String
cases.opened_by	Sys_id of the person that initially opened the case. Data type: String Table: User [sys_user]
cases.order	Order of the case. Data type: Number (Integer)
cases.parent	Sys_id of the parent case to which this case (child) is associated. Data type: String Table: Task [task]
cases.partner	Sys_id of the partner associated with the case. Data type: String Table: Account [customer_account]
cases.partner_contact	Sys_id of the partner contact associated with the case. Data type: String Table: Contact [customer_contact]
cases.priority	Priority of the case. Possible values: • 1: Critical • 2: High

Element	Description
	• 3: Moderate • 4: Low Data type: Number (Integer) Default: 4
cases.proactive	Flag that indicates whether the inquiry is being proactively monitored. Possible values: • true: Being proactively monitored. • false: Not being monitored. Data type: Boolean Default:false
cases.probable_cause	Possible cause of the issue associated with the case. Data type: String Maximum length: 4,000
cases.problem	Sys_id of the issue that the customer is encountering. Data type: String Table: Problem [problem]
cases.product	Sys_id of the product model of the asset associated to the case. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). Data type: String Table: Product Model [cmdb_model]
cases.reassignment_count	Number of times that the case was reassigned to a person that is responsible for moving the case forward. Data type: Number (Integer) Default: 0
cases.recipient_list	Sys_id of the record that contains the list of recipients for communications about this case. Data type: String Table: Recipients List [sn_publications_recipients_list]
cases.rejection_goto	Sys_id of the task to execute if the case is rejected. Data type: String

Element	Description
	Table: Task [task]
cases.resolution_code	Resolution state for the case, such as "Solved - Fixed by Support/Guidance provided". Data type: String Maximum length: 40
cases.resolved_at	Date and time that the case was resolved. Data type: String
cases.resolved_by	Sys_id of the person that resolved the case. Data type: String Table: User [sys_user]
cases.route_reason	Reason that the case was routed to a different assignee. Data type: Number (Integer) Maximum length: 40
cases.service_offering	Sys_id of the service offering associated with the payment inquiry. Service offerings uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Data type: String Table: Service Offering [service_offering]
cases.short_description	Concise description of the case. Data type: String Maximum length: 160
cases.skills	List of the unique identifiers (sys_id) of the skills needed to complete the case. Data type: String Table: Skill [cmn_skill]
cases.sla_due	Date/time at which the case must be closed based on the associated service level agreement. Data type: String
cases.sn_app_cs_social_social_profile	Sys_id of the social media profile associated with the case. Data type: String

Element	Description
	Table: Social Profile [sn_app_cs_social_social_profile]
cases.sold_product	Sys_id of the associated product. Data type: String Table: Sold Product [sn_install_base_sold_product]
cases.stage	Stage of the inquiry, such as Closed Complete, Closed Rejected, Document Check, Authorization, and so on. Data type: String Maximum length: 40
cases.state	Current state of the case. Possible values: • 1: New • 3: Closed • 6: Resolved • 10: Open • 18: Awaiting Info Data type: Number (Integer) Default: 1
cases.subcategory	Case subcategory. Possible values: 0: Question Data type: Number (Integer) Default: 0
cases.support_manager	Sys_id of the CSM manager assigned to the case. Data type: String Table: User [sys_user]
cases.sync_driver	Flag that indicates whether there's driver synchronization. Possible values: • true: Driver is synchronized • false: Driver isn't synchronized Data type: Boolean
cases.sys_class_name	Table that contains the case record.

Element	Description
	Data type: String Maximum length: 80
cases.sys_domain	Domain associated with the case. Data type: String Maximum length: 32 Default: global
cases.sys_domain_path	Domain path. Data type: String Maximum length: 255 Default: /
cases.sys_id	Unique identifier for the case. Data type: String Maximum length: 32
cases.task_effective_number	Identifying number. If the task has a Universal Request associated with it, it's the UR number. Otherwise, it's the current task number. Data type: String Maximum length: 40
cases.time_worked	Total amount of time worked on the case. Data type: String
cases.universal_request	Sys_id of a universal task that this inquiry is part of. Data type: String Table: Task [task]
cases.upon_approval	Action to take if the case is approved. Possible values: • do_nothing • proceed Data type: String Maximum length: 40

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Default: proceed
cases.upon_reject	Action to take if the case is rejected. Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
cases.urgency	Urgency of the case. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
cases.user_input	Additional user input. Data type: String Maximum length: 4,000
cases.variables	Name-value pairs of variables associated with the case. Data type: String Maximum length: 40
cases.watch_list	List of sys_ids of the users who receive notifications about this case when additional comments are added or if the state of a case is changed to Resolved or Closed. Data type: Array Table: User [sys_user]
cases.wf_activity	Sys_id of the workflow activity record associated with the case. Data type: String Table: Workflow Activity [wf_activity]
cases.work_end	Date and time work ended on the case.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
cases.work_notes	Information about how to resolve the case, or steps taken to resolve it. Data type: String Maximum length: 4,000
cases.work_notes_list	List of sys_ids of the internal users who receive notifications about this case when work notes are added. Data type: Array Table: User [sys_user]
cases.work_start	Date and time that work started on the case. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
status	Status of the endpoint call. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. In the response, the boolean parameter *hasMore* is returned. It indicates whether there are more records to return that meet the filter criteria. Data type: Number Default: 10
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use

Element	Description
	`sysparm_offset=sysparm_offset +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/1474a3c853500010df5dddeeff7b12ec/cases" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/childinstallbaseitems

Returns the child install base items associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/childinstallbaseitems`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/childinstallbaseitems`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the child install base item records.If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the state field is set to "in_use" and the status field is set to "replacement", pass the follow: `&state=in_use&status=replacement`. Data type: String Default: All fields Table: Install Base Item [sn_install_base_item]
sys_class_name	If using an extended install base items table (not sn_install_base_item), the name of the extended table to query. Data type: String Default: sn_install_base_item
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string

items	List of the install base items that matched the specified filter results.
	
	Data type: Array of Objects
	
	`"items":[`
	`  {`
	`  "account": {Object},`
	`  "active": "String",`
	`  "asset": {Object},`

Name	Description
	"configuration_item": {Object}, "consumer": {Object}, "consumer_profile": {Object}, "contact": {Object}, "health_status": {Object}, "health_status_last_updated": "String", "household": {Object}, "install_date": {Object}, "location": {Object}, "name": "String", "number": "String", "parent": {Object}, "product": {Object}, "service_context": {Object}, "service_organization" {Object}, "sys_class_name": "String", "sys_id": "String", "sys_mod_count": "String", "state": {Object}, "status": {Object}, "uninstall_date": "String" }]

items.account	Details about the customer account associated with the install base item record.
	
	Data type: Object
	"account": {
	"display_value": "String",
	"sys_id": "String"
	}

items.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
items.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
items.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive.

Name	Description
	Data type: Boolean String

items.asset	Details about the asset associated with the install base item record.
	
	Data type: Object
	
	`"asset": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
items.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String

items.configuration_item	Details about the configuration item associated with the install base item record.
	
	Data type: Object
	
	`"configuration_item": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
items.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String

items.consumer	Details about the consumer associated with the install base item record.
	
	Note: The consumer field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

Name	Description
items.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
items.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String

items.consumer_profile	Details about the consumer profile associated with the install base item record.
	
	Note: The consumer profile field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer_profile": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
items.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String

items.contact	Details about the account contact responsible for the install base item record.
	
	Data type: Object
	
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
items.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String

Name	Description

items.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed.
	
	Data type: Object
	
	`"health_status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

items.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
items.health_status.value	Internal value of the health status of the install base item. Data type: String
items.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String

items.household	Details about the household associated with the install base item record. Only returned if the Customer Household Data Model (com.snc.household) plugin is installed.
	
	Data type: Object
	
	`"household": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
items.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String

items.install_date	Details about the date when the install base item became active.
	
	Data type: Object
	
	`"install_date": {`
	`  "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	`"value": "String"` `}`
items.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
items.install_date.value	Internal value of the install date. Data type: String

items.location	Details about the location of the install base item.
	
	Data type: Object
	
	`"location": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

items.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
items.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
items.name	Name of the install base item. Data type: String
items.number	Unique ID of the install base item. Data type: String

items.parent	Details about the parent record of the install base item record.
	
	Data type: Object
	
	`"parent": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

items.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
items.parent.sys_id	Sys_id of the parent record associated with the install base item record.

Name	Description
	Data type: String

items.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	
	`"product": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
items.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String

items.service_context	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

items.service_context.display_value	Text name of the service context associated with the install base item record. Use this value to display the service context name in the UI. Data type: String
items.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String

items.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed.
	
	Data type: Object
	
	`"service_organization": {`
	`  "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	`"sys_id": "String"` `}`
items.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
items.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
items.sys_class_name	Table containing the install base item record. Data type: String
items.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
items.sys_mod_count	Number of times that the associated install base item record has been modified. Data type: String

items.state	Details about the current state of the install base item.
	
	Data type: Object
	`"state": {`
	`"display_value": "String",`
	`"value": "String"`
	`}`

items.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
items.state.value	Internal value of the state of the install base item. Data type: String

items.status	Details about the status of the install base item.
	
	Data type: Object
	`"status": {`
	`"display_value": "String",`
	`"value": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
items.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
items.status.value	Internal value of the status of the install base item. Data type: String

items.uninstall_date	Details about the date when the install base item became inactive.
	
	Data type: Object
	
	`"uninstall_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

items.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
items.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_depth	Number of levels deep the returned child install base item is in the hierarchy. Data type: Integer
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/767f34d378d21110f877d304c76fdd2a/childinstal
lbaseitems?sysparm_limit=1" \
--request GET \
```

    ],
    "status": "SUCCESS"
  }
}
```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/contracts

Returns the contracts associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/contracts`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/contracts`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the contract records. By default this references the fields in the Contract [ast_contract] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records where the renewable field is set to "true", pass the follow: `&renewable=true`. Data type: String Default: All fields
sys_class_name	If using an extended contracts table (not ast_contract), the name of the extended table to query. Data type: String Default: ast_contract
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
contracts	List of the contracts associated with the specified install base item record. Data type: Array of Object `"contracts": [{ "active": "String", "approver": {Object}, "commitment": "String", "consumer": {Object}, "cost_adjustment": "String", "cost_adjustment_percentage": "String", "cost_per_unit": "String", "contract_composite": "String", "ends": "String", "expiration": {Object}, "lifetime_cost": "String", "monthly_cost": "String", "number": "String", "payment_amount": "String", "payment_schedule": {Object}, "ratecard": "String", "renewable": "String", "sales_tax": "String", "short_description": "String", "starts": "String", "state": {Object}, "sub_total_cost": "String", "sys_class_name": "String", "sys_domain_path": "String", "sys_id": "String", "tax_cost": "String",`

Name	Description
	`"tax_exempt": "String", "tax_rate": "String", "total_cost": "String", "vendor_contract": "String", "yearly_cost": "String" } ]`
contracts.active	Flag that indicates whether the contract is active. Possible values: • true: Contract is active. • false: Contract is inactive. Data type: Boolean string
contracts.approver	Details about the person authorized to approve the contract. Data type: Object `"approver": { "display_value": "String", "sys_id": "String" }`
contracts.approver.display_value	Text name of the approver associated with the contracts record. Use this value to display the approver name in the UI. Data type: String
contracts.approver.sys_id	Sys_id of the approver record associated with the contracts record. Data type: String
contracts.consumer	Details about the consumer associated with the contracts record. **Note:** The consumer field is only available if the B2B2C plugin is installed. Data type: Object `"consumer": { "display_value": "String", "sys_id": "String" }`
contracts.consumer.display_value	Text name of the consumer associated with the contracts record. Use this value to display the consumer name in the UI. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
contracts.consumer.sys_id	Sys_id of the consumer record associated with the contracts record. Data type: String
contracts.cost_adjustment	Type of cost adjustment applied to the contract. Possible values: • Fixed • Manual • CPI (consumer price index) Data type: String
contracts.cost_adjustment_percentage	Percentage increase or decrease in price of contract. To indicate a decrease in price, enter a negative percentage. Either a Cost adjustment or Cost adjustment percentage can be specified, but not both. Data type: String
contracts.cost_per_unit	Cost per unit from the product provider. Data type: String
contracts.ends	Date that the contract terminates. Data type: String

contracts.expiration	Details about the expiration status of the associated contract.
	
	Data type: Object
	
	`"expiration": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

contracts.expiration.display_value	Expiration status of the associated contract. Use this value to display the expiration status in the UI. Data type: String
contracts.expiration.sys_id	Sys_id of the expiration record associated with the contracts record. Data type: String
contracts.lifetime_cost	Lifetime cost of the contract. Data type: String
contracts.monthly_cost	Monthly cost of the contract.

Name	Description
	Data type: String
contracts.number	Contract number. Data type: String
contracts.payment_amount	Amount of money that has been directly paid to the receiving party of this contract. Data type: String

contracts.payment_schedule	Details about the payment schedule associated with the contract.
	
	Data type: Object
	
	`"payment_schedule": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

contracts.payment_schedule.display_value	Payment schedule for the associated contract. Use this value to display the payment schedule in the UI. Data type: String
contracts.payment_schedule.value	Internal value of the payment schedule for this contract, such as daily, weekly, or monthly. Data type: String
contracts.ratecard	Flag that indicates whether there's a rate card associated with this contract. Possible values: • true: Rate card. • false: No rate card. Data type: Boolean string Table: Rate Care [fm_contract_rate_card]
contracts.renewable	Flag that indicates whether the contract is renewable. Possible values: • true: Contract is renewable. • false: Contract isn't renewable. Data type: Boolean string
contracts.sales_tax	Flag that indicates whether sales tax is charged for items referenced by this contract.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • true: Sales tax is charged. • false: No sales tax is charged. Data type: Boolean string
contracts.short_description	Brief description of the contract. Data type: String
contracts.starts	Date that the contract begins. Data type: String

contracts.state	Details about the current state of the contract.
	
	Data type: Object
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

contracts.state.display_value	Text string of the current state of the contract. Use this value to display the state in the UI. Data type: String
contracts.state.value	Internal value or the state of the contract. Data type: String
contracts.sub_total_cost	Subtotal of the cost of the contract. Data type: String
contracts.sys_class_name	Table containing the contract record. Data type: String
contracts.sys_domain_path	Path to the domain in which this contract is available. Data type: String Default: "/" = Global domain
contracts.sys_id	Sys_id of the associated contract record. Data type: String
contracts.tax_cost	Total tax on the contract. This field is visible only if the applicable taxes field is selected as `Sales`.

Name	Description
	Data type: String
contracts.tax_exempt	Flag that indicates whether the items associated with this contract are tax exempt. Possible values: • true: Items are tax exempt. • false: Items aren't tax exempt. Data type: Boolean string
contracts.tax_rate	Tax rate charged for taxable items associated with the contract. Data type: String
contracts.total_cost	Final cost of the contract after adjustments have been applied. If a contract has one or more rate cards, this field shows the combined value of all rate cards. Data type: String
contracts.vendor_contract	Vendor's contract number. Data type: String
contracts.yearly_cost	Cost per year of the contract. Data type: String

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return.

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/entitlements

Returns the entitlements associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/entitlements`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/entitlements`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the entitlements records. By default this references the fields in the Entitlement [service_entitlement] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records that are active, pass the following: `&active=true`. Data type: String Default: All fields
sys_class_name	If using an extended entitlements table (not service_entitlement), the name of the extended table to query. Data type: String Default: service_entitlement
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

entitlements	List of the entitlements associated with the specified install base item record.
	
	Data type: Object
	
	`"entitlements": {`
	`"account": {Object},`
	`"active": "String",`
	`"business_hour": {Object},`
	`"contract": {Object},`
	`"end_date": "String",`
	`"entitlement_name": "String",`
	`"install_base_item": {Object},`
	`"per_unit": "String",`
	`"start_date": "String",`
	`"sys_id": "String",`
	`"total_units": "String",`
	`"remaining_units": "String",`
	`"unit": {Object}`
	`}`

entitlements.account	Details about the account associated with the entitlements record.
	
	Data type: Object
	
	`"account": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

entitlements.account.display_value	Text name of the account associated with the entitlements record. Use this value to display the account name in the UI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
entitlements.account.sys_id	Sys_id of the account record associated with the entitlements record. Data type: String
entitlements.active	Flag that indicates whether the entitlement is active. Possible values: • 0: Entitlement isn't active. • 1: Entitlement is active. Data type: String Default: 1
entitlements.business_hour	Details about the business hours for the entitlements record. Data type: Object `"business_hour": { "display_value": "String", "sys_id": "String" }`
entitlements.business_hour.display_value	Text name of the business hours record associated with the entitlements record. Use this value to display the business hours in the UI. Data type: String
entitlements.business_hour.sys_id	Sys_id of the business hours record associated with the entitlements record. Data type: String
entitlements.contract	Details about the contract associated with the entitlement record. Data type: Object `"contract": { "display_value": "String", "sys_id": "String" }`
entitlements.contract.display_value	Text name of the contract associated with the entitlement record. Use this value to display the contract name in the UI. Data type: String
entitlements.contract.sys_id	Sys_id of the contract record associated with the entitlement record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
entitlements.end_date	End date of the entitlement. Data type: String
entitlements.entitlement_name	Name of the entitlement. Data type: String

entitlements.install_base_item	Details about the install base item associated with the entitlements record.
	
	Data type: Object
	
	`"install_base_item": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

entitlements.install_base_item.display_value	Text name of the install base item associated with the entitlements record. Use this value to display the install base item name in the UI. Data type: String
entitlements.install_base_item.sys_id	Sys_id of the install base item record associated with the entitlements record. Data type: String
entitlements.per_unit	Number of products in a unit. For example, if the *unit* is `case`, this value would be 12 if there are 12 items per case. Data type: String
entitlements.start_date	Start date of the entitlement. Data type: String
entitlements.sys_id	Sys_id of the associated entitlements record. Data type: String
entitlements.total_units	Number of units that were originally available. Data type: String
entitlements.remaining_units	Number of units that are remaining. Data type: String
entitlements.unit	Details about the unit of the item associated with the entitlements record. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"unit": { "display_value": "String", "value": "String" }`
entitlements.unit.display_value	Text name of the unit of the item associated with the entitlements record. Use this value to display the unit name in the UI. Data type: String
entitlements.unit.value	Internal name of the unit of the item associated with the entitlements record. Data type: String
error	Details about the error that occurred when trying to process the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/42746a3b876121100b6afc86dabb3597/entitlemen
ts" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": 0,
    "sysparm_limit": 10,
    "has_more": false,
    "entitlements": [
      {
        "end_date": "2023-04-28",
        "remaining_units": "4978",

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/maintenanceplans

Returns the maintenance plans associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/maintenanceplans`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/maintenanceplans`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the maintenance plan records. By default this references the fields in the Maintenance Plan [sm_maint_plan] table. If you specify a different table in *`sys_class_name`*, then specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, to return only records that are active, pass the follow: `&active=true`. Data type: String Default: All fields

Name	Description
	Data type: String
maintenanceplans. allow_future_wo	Flag that indicates whether work orders can be associated with the maintenance plan. Possible values: • true: New work orders can be associated. • false: No new work orders can be associated. Data type: String

maintenanceplans.
maintenance_override_policy
	Details about the maintenance override policy for the maintenance plan.
	
	Data type: Object
	`"maintenance_override_policy": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

maintenanceplans. maintenance_override_policy. display_value	Text string describing the override policy. Use this value to display the override policy in the UI. Data type: String
maintenanceplans. maintenance_override_policy. value	Internal value of the override policy. Data type: String
maintenanceplans.model	Sys_id of the model record associated with the maintenance plan. Data type: String
maintenanceplans.number	Maintenance plan number. Data type: String
maintenanceplans. propagation_flag	Flag that indicates whether the maintenance plan can be propagated. Possible values: • true: Maintenance plan can be propagated. • false: Maintenance plan can't be propagated. Data type: String
maintenanceplans. sys_class_name	Table containing the maintenance plan record. Data type: String
maintenanceplans.sys_id	Sys_id of the associated maintenance plan. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
maintenanceplans.table	Table that contains the associated install base time record. Data type: String

maintenanceplans.type	Details about the type of maintenance plan.
	
	Data type: Object
	
	`"type": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

maintenanceplans.type.display_value	Text string describing the maintenance plan type. Use this value to display the type in the UI. Data type: String
maintenanceplans.type.value	Internal value of the maintenance plan type. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/167e96f05396191 0539dddeeff7b1298/maintenance
plans" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": 0,
    "sysparm_limit": 1,
    "has_more": true,
    "maintenanceplans": [
      {
```

Name	Description
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string
relatedparties	List of the related parties associated with the specified install base item record. Data type: Array of Objects `"relatedparties": [ { "account": {Object}, "consumer": {Object}, "contact": {Object}, "install_base_item": {Object}, "responsibility": {Object}, "service_organization": {Object}, "sys_class_name": "String", "sys_id": "String", "type": {Object}, "user": {Object} } ]`
relatedparties.account	Details about the account associated with the related parties record. Data type: Object `account": { "display_value": "String", "sys_id": "String" }`
relatedparties.account.display_value	Text name of the account associated with the related parties record. Use this value to display the account name in the UI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedparties.account.sys_id	Sys_id of the account record associated with the related parties record. Data type: String

relatedparties.consumer	Details about the consumer associated with the related parties record.
	
	Data type: Object
	
	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

relatedparties.consumer.display_value	Text name of the consumer associated with the related parties record. Use this value to display the consumer name in the UI. Data type: String
relatedparties.consumer.sys_id	Sys_id of the consumer record associated with the related parties record. Data type: String

relatedparties.contact	Details about the account contact responsible for the related parties record.
	
	Data type: Object
	
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

relatedparties.contact.display_value	Text name of the contact associated with the related parties record. Use this value to display the contact name in the UI. Data type: String
relatedparties.contact.sys_id	Sys_id of the contact record associated with the related parties record. Data type: String Table: Contact [customer_contact]

relatedparties.install_base_item	Details about the install base item associated with the related parties record.
	
	Data type: Object
	
	`"install_base_item": {`
	`  "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	`"sys_id": "String"` `}`
relatedparties.install_base_item.display_value	Text name of the install base item associated with the related parties record. Use this value to display the install base item name in the UI. Data type: String
relatedparties.install_base_item.sys_id	Sys_id of the install base item record associated with the related parties record. Data type: String

relatedparties.responsibility	Details about the access level for the install base information.
	
	Data type: Object
	`"responsibility": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

relatedparties.responsibility.display_value	Text display value for the access level for the install base information. Data type: String
relatedparties.responsibility.sys_id	Sys_id of the associated responsibility record. This record defines the access level for the install base information. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for Items Received Data type: String Table: Responsibility Definition [sn_customerservice_responsibility_def]

relatedparties.service_organization	Details about the service organization associated with the related parties record.
	
	Data type: Object
	`"service_organization": {`
	`"display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"sys_id": "String"` `}`
relatedparties.service_organization.display_value	Text name of the service organization associated with the related parties record. Use this value to display the service organization name in the UI. Data type: String
relatedparties.service_organization.sys_id	Sys_id of the service organization record associated with the related parties record. Data type: String Table: Service Organization [sn_customer_service_organization]
relatedparties.sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
relatedparties.sys_id	Sys_id of the associated related parties record. Data type: String

relatedparties.type	Details about the type of contact associated with the related parties record.
	
	Data type: Object
	
	`"type": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

relatedparties.type.display_value	Text name of the type of contact associated with the related parties record. Use this value to display the type of contact in the UI. For additional information, see Create related party configurations. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
relatedparties.type.sys_id	Sys_id of the type record associated with the related parties record. Data type: String

relatedparties.user	Details about the user associated with the related parties record.
	
	Data type: Object
	`"user": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

relatedparties.user.display_value	Text name of the user associated with the related parties record. Use this value to display the user name in the UI. Data type: String
relatedparties.user.sys_id	Sys_id of the user record associated with the related parties record. Data type: String Table: User [sys_user]
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/42746a3b876121100b6afc86dabb3597/relatedpart
ies" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
  "result": {
    "sysparm_offset": 0,
    "sysparm_limit": 10,
    "has_more": false,
    "relatedparties": [

    "status": "SUCCESS"
  }
}
```

Install Base Item - GET /sn_install_base/integrations/installbaseitems/{id}/soldproducts

Returns the sold products records associated with a specified install base item record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/soldproducts`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/soldproducts`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
field name-value pairs	Field-value pairs to use to filter the related parties records. By default this references the fields in the Sold Products [sn_install_base_sold_product] table. If you specify a different table in *`sys_class_name`*, specify the fields in that table. You can pass one or more field-value pairs to filter the return results. For example, if you wanted to filter on the products sold to a specific account, pass something similar to the following, where the passed value is the sys_id of the account: `&account=86837a386f0331003b3c498f5d3ee4ca`. Data type: String Default: All fields
sys_class_name	If using an extended sold products table (not sn_install_base_sold_product), the name of the extended table to query. Data type: String Default: sn_install_base_sold_product
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String
has_more	Flag that indicates whether there are more records in the table to return. Possible values: • true: More records to return. • false: No more records to return. Data type: Boolean string

soldproducts	List of the sold products associated with the specified install base item record.
	
	Data type: Array of Objects
	
	`"soldproducts":[`
	`  {`
	`  "account": {Object},`
	`  "contact": {Object},`
	`  "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"number": "String", "product": {Object}, "sys_class_name": "String", "sys_id": "String", "state": {Object} }]

soldproducts.account	Details about the account associated with the product record.
	
	Data type: Object
	account": {
	"display_value": "String",
	"sys_id": "String"
	}

soldproducts.account.display_value	Text name of the account associated with the product record. Use this value to display the account name in the UI. Data type: String
soldproducts.account.sys_id	Sys_id of the account record associated with the product record. Data type: String

soldproducts.contact	Details about the account contact responsible for the product.
	
	Data type: Object
	"contact": {
	"display_value": "String",
	"sys_id": "String"
	}

soldproducts.contact.display_value	Text name of the contact associated with the product. Use this value to display the contact name in the UI. Data type: String
soldproducts.contact.sys_id	Sys_id of the contact record associated with the product record. Data type: String
soldproducts.name	Name of the product. Data type: String
soldproducts.number	Product number. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
soldproducts.sys_class_name	Table containing the product record. Data type: String
soldproducts.sys_id	Sys_id of the associated product. Data type: String

soldproducts.state	Details about the current state of the product.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

soldproducts.state.display_value	Text string of the current state of the product. Use this value to display the state in the UI. Data type: String
soldproducts.state.value	Internal value of the state of the product. Data type: String
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991/soldproduc
ts?sysparm_limit=1" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": 0,
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Work order is part of a catalog. • false: Work order isn't part of a catalog. Data type: Boolean string
workorders.knowledge	Flag that indicates if there's a knowledge base article available for the specified work order issue. Possible values: • true: Knowledge base article is available for this issue. • false: Knowledge base article isn't available for this issue. Data type: Boolean string

workorders.location	Details about the location of the item that needs to be worked on.
	
	Data type: Object
	
	`"location": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

workorders.location.display_value	Text name of the location of the item to be worked on. Use this value to display the location in the UI. Data type: String
workorders.location.sys_id	Sys_id of the location record associated with the work order record. Data type: String
workorders.made_sla	Flag that indicates whether the work associated with the work order met the associated Service Level Agreement (SLA). Possible values: • true: SLA was met. • false: SLA wasn't met. Data type: Boolean string
workorders.needs_attention	Flag that indicates whether this work order needs attention. Possible values: • true: Work order needs attention. • false: Work order doesn't need attention.

Name	Description
	Data type: Boolean string
workorders.number	Unique number used to identify the work order. Data type: String

workorders.opened_at	Details about when the work order was opened.
	
	Data type: Object
	
	`"opened_at": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

workorders.opened_at.display_value	Date and time that the work order was opened. Use this value to display the value in the UI. Data type: String
workorders.opened_at.value	Date and time that the work order was opened. Data type: String

workorders.opened_by	Details about the person that opened the work order.
	
	Data type: Object
	
	`"opened_by": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

workorders.opened_by.display_value	Text name of the person that opened the work order. Use this value to display this name in the UI. Data type: String
workorders.opened_by.sys_id	Sys_id of the user record of the person that opened the work order. Data type: String

workorders.opened_for	Details about the person that the work order was opened for if different than the *opened_by* person.
	
	Data type: Object
	
	`"opened_for": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

workorders.opened_for.display_value	Text name of the person that the work order was opened for. Use this value to display this name in the UI.

Name	Description
	Data type: String
workorders.opened_for.sys_id	Sys_id of the user record of the person that the work order was opened for. Data type: String
workorders.priority	Priority of the work order. Data type: String
workorders.reassignment_count	Number of times that the work order was reassigned to a person that is responsible for moving the work order forward. Data type: String
workorders. reschedule_maintenance_if_canceled	Flag that indicates whether the work should be rescheduled if the associated work order is canceled. Possible values: • true: Reschedule the work. • false: Check before rescheduling the work. Data type: Boolean string
workorders.short_description	Brief text that describes the work associated with the work order. Data type: String
workorders.sla_suspended	Flag that indicates whether the SLA associated with the work order has been suspended. Valid values: • true: SLA has been suspended. • false: SLA hasn't been suspended. Data type: Boolean string
workorders.state	Current state of the work order. Data type: String
workorders.sys_class_name	Table containing the work order record. Data type: String
workorders.sys_domain_path	Domain path. Data type: String
workorders.sys_id	Sys_id of the associated work order record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
workorders.task_created	Flag that indicates whether a task has been created for this work order. Possible values: • true: Task has been created for this work order. • false: Task hasn't been created for this work order. Data type: Boolean string
workorders.task_effective_number	Unique number used to identify the work order. Data type: String
workorders. template_workflow_invoked	Flag that indicates whether the associated workflow has been invoked for this work order. Possible values: • true: Workflow has been invoked. • false: Worflow hasn't been invoked. Data type: Boolean string

workorders.upon_approval	Details about the next action to take if the work order is approved.
	
	Data type: Object
	`"upon_approval": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

workorders.upon_approval. display_value	Text string of the action to take if the work order is approved. Use this value to display this information in the UI. Data type: String
workorders.upon_approval.value	Action to take if the work order is approved. Possible values: • do_nothing • proceed Data type: String
workorders.upon_reject	Details about the next action to take if the work order is rejected. Data type: Object

Name	Description
	`"upon_reject": { "display_value": "String", "value": "String" }`
workorders.upon_reject.display_value	Text string of the action to take if the work order is rejected. Use this value to display this information in the UI. Data type: String
workorders.upon_reject.value	Action to take if the work order is rejected. Possible values: • cancel • goto Data type: String
workorders.urgency	Urgency of the work order. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991/workorde
rs?sysparm_limit=1" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "sysparm_offset": 0,
    "sysparm_limit": 10,
    "has_more": false,
    "workorders": [
      {
        "upon_reject": {

Install Base Item - PATCH /sn_install_base/integrations/installbaseitems/{id}

Updates a specified install base item record with specified field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required when creating an install base item for an account. Sys_id of the account to associate with the install base item. **Note:** If you pass the *`account`* parameter, you can't also pass the *`consumer`* parameter. Data type: String Table: Account [customer_account]
active	Flag that indicates whether the install base item is active. Valid values: • true, "true", or "0": Item is active. • false, "false", or "1": Item isn't active. Data type: Boolean Default: true
asset	Sys_id of the asset associated with the install base item record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Asset [alm_asset]
child_install_base_items	List of the child install base items associated with this install base item. **Note:** The following child install base item fields can't be different from its parent: • account • consumer • contact • service organization Data type: Array of Objects `"child_install_base_items": [ { "name": "String", "product": "String" } ]`
child_install_base_items.name	Name of the child install base item. Data type: String
child_install_base_items.product	Sys_id of the associated child base item record. Data type: String Table: Install Base Item [sn_install_base_item]
configuration_item	Sys_id of the configuration item associated with the install base item record. Data type: String Table: Configuration Item [cmdb_ci]
consumer	Required when creating an install base item for a consumer. Sys_id of the consumer associated with the install base item record. **Note:** If you pass the *consumer* parameter, you can't also pass the *account* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String Table: Consumer [csm_consumer]
consumer_profile	Sys_id of the consumer profile associated with the install base item record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Table: Consumer Profile [sn_csm_consumer_profile]
contact	Sys_id of the account contact record that is primarily responsible for the install base item. **Note:** Contacts can only be specified for account install base items. Data type: String Table: Contact [customer_contact]
household	Sys_id of the household associated with the install base item record. **Note:** This field is only valid when the Customer Household Data Model (com.snc.household) plugin is installed. Data type: String Table: Household [csm_household]
install_date	Date on which the install base item becomes active. Data type: String Format: yyyy-MM-dd HH:mm:ss
location	Sys_id of the location of the associated product. Data type: String Table: Location [cmn_location]
name	Name of the install base item. Data type: String
number	Unique identifier for the install base item. Data type: String Default: Automatically generated by the endpoint.
parent	Sys_id of the parent record for this install base item record. Data type: String Table: Install Base Item [sn_install_base_item]
product_model	Sys_id of the product model associated with the install base item record.

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Table: Product Model [cmdb_model]
quantity	Number of items installed. Data type: Integer
service_context	Sys_id of the service that is associated to the underlying CI for calculating the impact severity from Event Management. For more information, see Service health status for install base. **Note:** This field is only valid if the Proactive Customer Service Operations with Event Management plugin is installed. Data type: String
service_organization	Required when creating an install base item for a service organization. Sys_id of the service organization record that is involved in providing service to the customer. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The `service_organization` parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance. Data type: String Table: Service Organization [sn_customer_service_organization]
state	Current state of the install base item. Valid values: • in_use • inactive Data type: String
status	Status of the product. Valid values: • original • replacement

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
sys_class_name	Name of the extended install base table in which to update the install base item record. Data type: String
uninstall_date	Date on which the install base becomes inactive. Data type: String Format: yyyy-MM-dd HH:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String

item	Details about the install base item that was updated.
	
	Data type: Object
	
	`"item": {`
	`  "account": {Object},`
	`  "active": Boolean,`
	`  "name": "String",`
	`  "number": "String",`
	`  "state": {Object},`
	`  "sys_class_name": {Object},`
	`  "sys_id": "String"`
	`}`

item.account	Details about the customer account associated with the install base item record.
	
	Data type: Object
	
	`"account": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String

item.state	Details about the current state of the install base item.
	
	Data type: Object
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item. Data type: String

item.sys_class_name	Details about the table that contains the install base item.
	
	Data type: Object
	`"sys_class_name": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.sys_class_name.display_value	Text string of the name of the table that contains the install base item. Use this value to display the table name in the UI. Data type: String
item.sys_class_name.value	Internal value of the table that contains the install base item Data type: String
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to update the name and active fields in the install base item record.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/f77c7542b7343300ece839a6ee11a991" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\": \"KX Series - KX5001\",
  \"active\":true
}" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "status": "SUCCESS",
    "item": {
      "sys_class_name": {
        "value": "sn_install_base_item",
        "display_value": "Install Base Item"
      },
      "number": "IBITM0001001",
      "sys_id": "bc610d38cb76211050501ebfe8076d8b",
      "state": {
        "value": "inactive",
        "display_value": "Inactive"
      },
      "active": "false",
      "name": "NewTestIB",
      "account": {
```

```
        "sys_id": "8637a386f0331003b3c498f5d3ee4ca",
        "display_value": "Boxeo"
      }
    }
  }
}

}
```

Install Base Item - PATCH /sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}

Updates the specified related party record, associated with a specified install base item, with the values in the request body.

If you need to modify the type of related party associated with an Install Base Item, you must remove the type-specific fields for the current related party type and replace them with the type-specific fields of the new related party type. For example, to change from a type of Authorized Account to Authorized Consumer, pass the following:

- *type* = "Authorized Consumer"
- *account* = ""
- *consumer* = "<sys_id of consumer record>"
- *responsibility* = "<sys_id of responsibility of consumer>"

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/relatedparties/{related_party_sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]
related_party_sys_id	Sys_id of the related party record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Table: Install Base Related Party [sn_install_base_related_party]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required if the *type* parameter is one of the following: • `Authorized Account` • `Authorized Contact` • `Listed Account` • `Listed Contact` Sys_id of the account to associate with the install base item. **Note:** If you pass the *account* parameter, you can't also pass the *consumer* parameter. Data type: String Table: Account [customer_account]
consumer	Required if the *type* parameter is `Authorized Consumer` or `Listed Consumer`. Sys_id of the consumer associated with the install base item record. **Note:** If you pass the *consumer* parameter, you can't also pass the *account* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String Table: Consumer [csm_consumer]
contact	Sys_id of the contact record associated with the related parties record. Data type: String Table: Contact [customer_contact]
responsibility	Sys_id of the associated responsibility record. This record defines the access level for the install base information. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters.

Request body parameters (XML or JSON) (continued)

Name	Description
	For additional information, see Configure related parties for Items Received Data type: String Table: Responsibility Definition [sn_customerservice_responsibility_def]
service_organization	Required if the *type* parameter is one of the following: • `Authorized Member` • `Authorized Service Organization` • `Listed Member` • `Listed Service Organization` Sys_id of the service organization record that is involved in providing service to the customer. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The *service_organization* parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance. Data type: String Table: Service Organization [sn_customer_service_organization]
sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
type	Required. Sys_id of the type of related party to create. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Table: Related Party Configuration [sn_customerservice_related_party_configuration]
user	Required if the *type* parameter is one of the following related party types: • `Authorized Contributor` • `Authorized Member` • `Listed Contributor` • `Listed Member` Sys_id of the user record associated with the related parties record. Data type: String Table: User [sys_user] For `Authorized Member` and `Listed Member`, this user must be associated with the specified *service_organization* record.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String

item	Details about the related parties record.
	
	Data type: Array
	
	`"item": {`
	`  "account": {Object},`
	`  "consumer": {Object},`
	`  "contact": {Object},`
	`  "install_base_item": {Object},`
	`  "responsibility": {Object},`
	`  "service_organization": {Object},`
	`  "sys_class_name": "String",`
	`  "sys_id": "String",`
	`  "type": {Object},`
	`  "user": {Object}`
	`}`

item.account	Details about the account associated with the related parties record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	Data type: Object
	`account": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.account.display_value	Text name of the account associated with the related parties record. Use this value to display the account name in the UI. Data type: String
item.account.sys_id	Sys_id of the account record associated with the related parties record. Data type: String

item.consumer	Details about the consumer associated with the related parties record.
	
	Data type: Object
	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.consumer.display_value	Text name of the consumer associated with the related parties record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the related parties record. Data type: String

item.contact	Details about the account contact responsible for the related parties record.
	
	Data type: Object
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.contact.display_value	Text name of the contact associated with the related parties record. Use this value to display the contact name in the UI. Data type: String
item.contact.sys_id	Sys_id of the contact record associated with the related parties record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Contact [customer_contact]

item.install_base_item	Details about the install base item associated with the related parties record.
	
	Data type: Object
	
	`"install_base_item": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.install_base_item.display_value	Text name of the install base item associated with the related parties record. Use this value to display the install base item name in the UI. Data type: String
item.install_base_item.sys_id	Sys_id of the install base item record associated with the related parties record. Data type: String

item.responsibility	Details about the access level for the install base information.
	
	Data type: Object
	
	`"responsibility": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.responsibility.display_value	Text display value for the access level for the install base information. Data type: String
item.responsibility.sys_id	Sys_id of the associated responsibility record. This record defines the access level for the install base information. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for Items Received Data type: String Table: Responsibility Definition [sn_customerservice_responsibility_def]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
item.sys_id	Sys_id of the associated related parties record. Data type: String

item.type	Details about the type of contact associated with the related parties record.
	
	Data type: Object
	
	`"type": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.type.display_value	Text name of the type of contact associated with the related parties record. Use this value to display the type of contact in the UI. For additional information, see Create related party configurations. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
item.type.sys_id	Sys_id of the type record associated with the related parties record. Data type: String
item.user	Details about the user associated with the related parties record. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"user": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.user.display_value	Text name of the user associated with the related parties record. Use this value to display the user name in the UI. Data type: String
item.user.sys_id	Sys_id of the user record associated with the related parties record. Data type: String Table: User [sys_user]
status	Status of the endpoint call. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to update the contact record associated with the related party.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/relatedparties/f77c7542b7343300ece839a6ee11a991" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"contact\": \"dc0185d94f341200025ba3618110c77c\"
}" \
--user 'username':'password'
```

Return results:

```
{
"result":
  {
    "type": {
      "display_value":"Authorized Contact",
      "sys_id":"68ec8b2965e99110f87764df53db779f"
    },
    "install_base_item": {
```

    },
    "status":"SUCCESS",
  }
}
```

Install Base Item - PATCH /sn_install_base/integrations/installbaseitems/{id}/uninstall

Uninstalls the specified install base item.

An uninstall consists of setting the *active* field to `false` and setting the *unistall_date* field to a specified date. Empty if a date value isn't provided.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/uninstall`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/uninstall`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
uninstall_date	Date on which to uninstall the specified install base item. If not specified, it's uninstalled immediately. Data type: String Format: yyyy-mm-dd hh:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String

item	Description of the uninstalled item.
	
	Data type: Object
	
	`"item": {`
	`  "account": {Object},`
	`  "active": "String",`
	`  "asset": {Object},`
	`  "configuration_item": {Object},`
	`  "consumer": {Object},`
	`  "consumer_profile": {Object},`
	`  "contact": {Object},`
	`  "health_status": {Object},`
	`  "health_status_last_updated":`
	`  "String",`
	`  "household": {Object},`
	`  "install_date": {Object},`
	`  "location": {Object},`
	`  "name": "String",`
	`  "number": "String",`
	`  "parent": {Object},`
	`  "product": {Object},`
	`  "service_context": {Object},`

Name	Description

	`"service_organization" {Object},`
	`"sys_class_name": "String",`
	`"sys_id": "String",`
	`"state": {Object},`
	`"status": {Object},`
	`"uninstall_date": "String"`
	`}`

item.account	Details about the customer account associated with the install base item record.
	
	Data type: Object
	
	`"account": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String

item.asset	Details about the asset associated with the install base item record.
	
	Data type: Object
	
	`"asset": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
item.asset.sys_id	Sys_id of the asset record associated with the install base item record.

Name	Description
	Data type: String
item.child_install_base_items	List of the child install base items associated with this install base item. **Note:** The following child install base item fields can't be different from its parent: • account • consumer • contact • service organization Data type: Array of Objects `"child_install_base_items": [ { "name": "String", "product": "String" } ]`
item.child_install_base_items.name	Name of the child install base item. Data type: String
item.child_install_base_items.product	Sys_id of the associated child base item record. Data type: String Table: Install Base Item [sn_install_base_item]
item.configuration_item	Details about the configuration item associated with the install base item record. Data type: Object `"configuration_item": { "display_value": "String", "sys_id": "String" }`
item.configuration_display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
item.configuration_sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String
item.consumer	Details about the consumer associated with the install base item record.

Name	Description

	Note: The consumer field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String

item.consumer_profile	Details about the consumer profile associated with the install base item record.
	
	Note: The consumer profile field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer_profile": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
item.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String

item.contact	Details about the account contact responsible for the install base item record.
	
	Data type: Object
	
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

Name	Description
item.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String
item.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String

item.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed.
	
	Data type: Object
	
	`"health_status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
item.health_status.value	Internal value of the health status of the install base item. Data type: String
item.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String

item.household	Details about the household associated with the install base item record. Only returned if the Customer Household Data Model (com.snc.household) plugin is installed.
	
	Data type: Object
	
	`"household": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
item.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String

item.install_date	Details about the date when the install base item became active.
	
	Data type: Object
	
	`"install_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
item.install_date.value	Internal value of the install date. Data type: String

item.location	Details about the location of the install base item.
	
	Data type: Object
	
	`"location": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
item.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String

item.parent	Details about the parent record of the install base item record.
	
	Data type: Object
	
	`"parent": {`
	`  "display_value": "String",`

Name	Description
	`"sys_id": "String"` `}`
item.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
item.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String

item.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	`"product": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
item.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String
item.quantity	Number of items installed. Data type: Integer

item.service_context	Details about the service context associated with the install base item record.
	
	Data type: Object
	`"service_context": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.service_context.display_value	Details about the service context associated with the install base item record.
	
	Data type: Object
	`"service_context": {`
	`"display_value": "String",`

Name	Description
	`"sys_id": "String"` `}`
item.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String

item.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed.
	
	Data type: Object
	
	`"service_organization": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

item.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
item.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
item.sys_class_name	Table containing the install base item record. Data type: String
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *`sys_class_name`* parameter. Data type: String

item.state	Details about the current state of the install base item.
	
	Data type: Object
	
	`"state": {`
	`"display_value": "String",`
	`"value": "String"`
	`}`

item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item. Data type: String

Name	Description

item.status	Details about the status of the install base item.
	
	Data type: Object
	
	`"status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
item.status.value	Internal value of the status of the install base item. Data type: String

item.uninstall_date	Details about the date when the install base item became inactive.
	
	Data type: Object
	
	`"uninstall_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
item.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems/42746a3b876121100b6afc86dabb3597/uninstall"
 \
--request PATCH \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
```

      }
    }
  }
}
```

Install Base Item - POST /sn_install_base/integrations/installbaseitems

Creates one or more install base item records in the default Install Base Item table, or in its extended table if specified, and populates them with the specified field values.

When creating a single install base item record, you pass an object in the request body that contains all of the fields to include in the request body. When you create multiple install base item records in a single call, you pass an array of objects in the request body that contains all of the records to create. The endpoint processes and reports on each of the record creation objects individually. If one or more of the records fail to be created, it doesn't affect the creation of other record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems`

Default URL: `/api/sn_install_base/integrations/installbaseitems`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required when creating an install base item for an account. Sys_id of the account to associate with the install base item. **Note:** If you pass the *`account`* parameter, you can't also pass the *`consumer`* parameter. Data type: String Table: Account [customer_account]
active	Flag that indicates whether the install base item is active. Valid values: • true, "true", or "0": Item is active. • false, "false", or "1": Item isn't active. Data type: Boolean Default: true
asset	Sys_id of the asset associated with the install base item record. Data type: String Table: Asset [alm_asset]
child_install_base_items	List of the child install base items associated with this install base item.

Request body parameters (XML or JSON) (continued)

Name	Description
	Note: The following child install base item fields can't be different from its parent: • account • consumer • contact • service organization Data type: Array of Objects `"child_install_base_items": [ { "name": "String", "product": "String" } ]`
child_install_base_items.name	Name of the child install base item. Data type: String
child_install_base_items.product	Sys_id of the associated child base item record. Data type: String Table: Install Base Item [sn_install_base_item]
configuration_item	Sys_id of the configuration item associated with the install base item record. Data type: String Table: Configuration Item [cmdb_ci]
consumer	Required when creating an install base item for a consumer. Sys_id of the consumer associated with the install base item record. **Note:** If you pass the *consumer* parameter, you can't also pass the *account* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String Table: Consumer [csm_consumer]
consumer_profile	Sys_id of the consumer profile associated with the install base item record. Data type: String Table: Consumer Profile [sn_csm_consumer_profile]

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
contact	Sys_id of the account contact record that is primarily responsible for the install base item. **Note:** Contacts can only be specified for account install base items. Data type: String Table: Contact [customer_contact]
household	Sys_id of the household associated with the install base item record. **Note:** This field is only valid when the Customer Household Data Model (com.snc.household) plugin is installed. Data type: String Table: Household [csm_household]
install_date	Date on which the install base item becomes active. Data type: String Format: yyyy-MM-dd HH:mm:ss
location	Sys_id of the location of the associated product. Data type: String Table: Location [cmn_location]
name	Name of the install base item. Data type: String
number	Unique identifier for the install base item. Data type: String Default: Automatically generated by the endpoint.
parent	Sys_id of the parent record for this install base item record. Data type: String Table: Install Base Item [sn_install_base_item]
product_model	Sys_id of the product model associated with the install base item record. Data type: String Table: Product Model [cmdb_model]

Request body parameters (XML or JSON) (continued)

Name	Description
quantity	Number of items installed. Data type: Integer
service_context	Sys_id of the service that is associated to the underlying CI for calculating the impact severity from Event Management. For more information, see Service health status for install base. **Note:** This field is only valid if the Proactive Customer Service Operations with Event Management plugin is installed. Data type: String
service_organization	Required when creating an install base item for a service organization. Sys_id of the service organization record that is involved in providing service to the customer. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The *service_organization* parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance. Data type: String Table: Service Organization [sn_customer_service_organization]
state	Current state of the install base item. Valid values: • in_use • inactive Data type: String
status	Status of the product. Valid values: • original • replacement Data type: String
sys_class_name	Name of the extended install base table in which to create the install base item record. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: Install Base Item [sn_install_base_item] table
uninstall_date	Date on which the install base becomes inactive. Data type: String Format: yyyy-MM-dd HH:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String

item	Install base item that matched the specified filter results. Only non-empty fields are returned.
	
	Data type: Array of Objects
	
	`"item": {`
	`  "account": {Object},`
	`  "active": "String",`
	`  "asset": {Object},`
	`  "child_install_base_items":`
	`  {Object},`
	`  "condition": "String",`
	`  "configuration_item": {Object},`
	`  "consumer": {Object},`
	`  "consumer_profile": {Object},`
	`  "contact": {Object},`
	`  "health_status": {Object},`
	`  "health_status_last_updated":`
	`  "String",`
	`  "household": {Object},`
	`  "install_date": {Object},`
	`  "location": {Object},`
	`  "name": "String",`
	`  "number": "String",`
	`  "parent": {Object},`
	`  "product": {Object},`
	`  "quantity": Integer,`
	`  "service_context": {Object},`
	`  "service_organization" {Object},`
	`  "sys_id": "String",`
	`  "state": {Object},`
	`  "status": {Object},`
	`  "uninstall_date": "String"`
	`}`

Name	Description

item.account	Details about the customer account associated with the install base item record.
	
	Data type: Object
	
	`"account": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.account.display_value	Text name of the customer account associated with the install base item record. Use this value to display the customer account name in the UI. Data type: String
item.account.sys_id	Sys_id of the customer account record associated with the install base item record. Data type: String
item.active	Flag that indicates whether the install base item is active. Possible values: • true: Install base item is active. • false: Install base item is inactive. Data type: Boolean String

item.asset	Details about the asset associated with the install base item record.
	
	Data type: Object
	
	`"asset": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.asset.display_value	Text name of the asset associated with the install base item record. Use this value to display the asset name in the UI. Data type: String
item.asset.sys_id	Sys_id of the asset record associated with the install base item record. Data type: String
item.child_install_base_items	List of the child install base items associated with this install base item.

Name	Description
	Note: The following child install base item fields can't be different from its parent: • account • consumer • contact • service organization Data type: Array of Objects `"child_install_base_items": [ { "name": "String", "product": "String" } ]`
item.child_install_base_items.name	Name of the child install base item. Data type: String
item.child_install_base_items.product	Sys_id of the associated child base item record. Data type: String Table: Install Base Item [sn_install_base_item]
item.configuration_item	Details about the configuration item associated with the install base item record. Data type: Object `"configuration_item": { "display_value": "String", "sys_id": "String" }`
item.configuration_item.display_value	Text name of the configuration item associated with the install base item record. Use this value to display the configuration item name in the UI. Data type: String
item.configuration_item.sys_id	Sys_id of the configuration item record associated with the install base item record. Data type: String
item.consumer	Details about the consumer associated with the install base item record. **Note:** The consumer field is only available if the B2B2C plugin is installed. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.consumer.display_value	Text name of the consumer associated with the install base item record. Use this value to display the consumer name in the UI. Data type: String
item.consumer.sys_id	Sys_id of the consumer record associated with the install base item record. Data type: String

item.consumer_profile	Details about the consumer profile associated with the install base item record.
	
	Note: The consumer profile field is only available if the B2B2C plugin is installed.
	
	Data type: Object
	
	`"consumer_profile": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.consumer_profile.display_value	Text name of the consumer profile associated with the install base item record. Use this value to display the consumer profile name in the UI. Data type: String
item.consumer_profile.sys_id	Sys_id of the consumer profile record associated with the install base item record. Data type: String

item.contact	Details about the account contact responsible for the install base item record.
	
	Data type: Object
	
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.contact.display_value	Text name of the account contact associated with the install base item record. Use this value to display the account contact name in the UI. Data type: String

Name	Description
item.contact.sys_id	Sys_id of the account contact record associated with the install base item record. Data type: String

item.health_status	Details about the current health status of the install base item. Only returned if the Proactive Customer Service Operations (com.snc.proactive_cs_itom) plugin is installed.
	
	Data type: Object
	
	`"health_status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.health_status.display_value	Text string of the current health status of the install base item. Use this value to display the health status in the UI. Data type: String
item.health_status.value	Internal value of the health status of the install base item. Data type: String
item.health_status_last_updated	Date and time when the health status was last updated for the install base item. Data type: String

item.household	Details about the household associated with the install base item record. Only returned if the Customer Household Data Model (com.snc.household) plugin is installed.
	
	Data type: Object
	
	`"household": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.household.display_value	Text name of the household associated with the install base item record. Use this value to display the household name in the UI. Data type: String
item.household.sys_id	Sys_id of the household associated with the install base item record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

item.install_date	Details about the date when the install base item became active.
	
	Data type: Object
	
	`"install_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.install_date.display_value	Text install date. Use this value to display the install date in the UI. Data type: String
item.install_date.value	Internal value of the install date. Data type: String

item.location	Details about the location of the install base item.
	
	Data type: Object
	
	`"location": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.location.display_value	Text name of the install base item location. Use this value to display the location name in the UI. Data type: String
item.location.sys_id	Sys_id of the location record associated with the install base item record. Data type: String
item.name	Name of the install base item. Data type: String
item.number	Unique ID of the install base item. Data type: String

item.parent	Details about the parent record of the install base item record.
	
	Data type: Object
	
	`"parent": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

Name	Description
item.parent.display_value	Text name of the parent record associated with the install base item record. Use this value to display the parent name in the UI. Data type: String
item.parent.sys_id	Sys_id of the parent record associated with the install base item record. Data type: String

item.product	Details about the product model associated with the install base item record. Use this information to identify the services associated with any product model.
	
	Data type: Object
	
	`"product": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.product.display_value	Text name of the product model associated with the install base item record. Use this value to display the product name in the UI. Data type: String
item.product.sys_id	Sys_id of the product model record associated with the install base item record. Data type: String
item.quantity	Number of items installed. Data type: Integer

item.service_context	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.service_context.display_value	Details about the service context associated with the install base item record.
	
	Data type: Object
	
	`"service_context": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
item.service_context.sys_id	Sys_id of the service context record associated with the install base item record. Data type: String

item.service_organization	Details about the service organization associated with the install base item record. Only returned if the Service Organization (com.snc.service_organization) plugin is installed.
	
	Data type: Object
	
	`"service_organization": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

item.service_organization.display_value	Text name of the service organization associated with the install base item record. Use this value to display the service organization name in the UI. Data type: String
item.service_organization.sys_id	Sys_id of the service organization record associated with the install base item record. Data type: String
item.sys_class_name	Table containing the install base item record. Data type: String
item.sys_id	Sys_id of the install base item record. Located in the table specified in the *sys_class_name* parameter. Data type: String

item.state	Details about the current state of the install base item.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.state.display_value	Text string of the current state of the install base item. Use this value to display the state in the UI. Data type: String
item.state.value	Internal value of the state of the install base item. Data type: String
item.status	Details about the status of the install base item. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	`"status": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.status.display_value	Text string of the status of the install base item. Use this value to display the status in the UI. Data type: String
item.status.value	Internal value of the status of the install base item. Data type: String

item.uninstall_date	Details about the date when the install base item became inactive.
	
	Data type: Object
	
	`"uninstall_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

item.uninstall_date.display_value	Text uninstall date. Use this value to display the uninstall date in the UI. Data type: String
item.uninstall_date.value	Internal value of the uninstall date. Data type: String
status	Status of the endpoint call. Data type: String

Example: cURL request

The following code example shows how to create a single Install Base Item record.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\":\"Base Monitor\",
  \"quantity\": 4,
  \"account\":\"86837a386f0331003b3c498f5d3ee4ca\",
  \"contact\": \"dc0185d94f341200025ba3618110c77c\",
  \"configuration_item\":\"0c43baaac61122750182c132ee74bcf0\",
  \"state\":\"in_use\"
}" \
--user 'username':'password'
```

      "name": "Base Monitor",
      "account": {
        "sys_id": "86837a386f0331003b3c498f5d3ee4ca",
        "display_value": "Boxeo"
      }
    }
  }
}
```

Example: cURL request

The following code example shows how to create multiple Install Base Item records.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/installbaseitems" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "[
  {
    \"name\":\"AST4 Laptop\",
    \"consumer\":\"b119803fdb1b1200b6075200cf961917\",
    \"status\":\"replacement\",
    \"install_date\":\"2023-05-18 12:00:00\",
    \"uninstall_date\":\"2023-09-28 12:00:00\"
  },
{
    \"name\":\"Base Monitor\",
    \"quantity\": 4,
    \"account\":\"86837a386f0331003b3c498f5d3ee4ca\",
    \"contact\": \"dc0185d94f341200025ba3618110c77c\",
    \"configuration_item\":\"0c43baaac61122750182c132ee74bcf0\",
    \"state\":\"in_use\"
```

Install Base Item - POST /sn_install_base/integrations/installbaseitems/{id}/relatedparties

Creates a related party record and associates it with a specified install base item record. The values specified in the request parameters are stored in the newly created related party record.

URL format

Versioned URL: `/api/sn_install_base/{api_version}/integrations/installbaseitems/{id}/relatedparties`

Default URL: `/api/sn_install_base/integrations/installbaseitems/{id}/relatedparties`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the install base item record. Data type: String Table: Install Base Item [sn_install_base_item]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required if the *type* parameter is one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `Authorized Account` • `Authorized Contact` • `Listed Account` • `Listed Contact` Sys_id of the account to associate with the install base item. **Note:** If you pass the *`account`* parameter, you can't also pass the *`consumer`* parameter. Data type: String Table: Account [customer_account]
consumer	Required if the *`type`* parameter is `Authorized Consumer` or `Listed Consumer`. Sys_id of the consumer associated with the install base item record. **Note:** If you pass the *`consumer`* parameter, you can't also pass the *`account`* parameter. In addition, you can only associate a consumer with an install base item if the B2B2C plugin is installed on your instance. Data type: String Table: Consumer [csm_consumer]
contact	Sys_id of the contact record associated with the related parties record. Data type: String Table: Contact [customer_contact]
install_base_item	Sys_id of the install base item record associated with the related parties record. Data type: String
responsibility	Sys_id of the associated responsibility record. This record defines the access level for the install base information. This parameter is only valid if the *`related_party`* field is also specified. If specified, it only returns the install base items that match both the *`related_party`* and *`responsibility`* parameters. For additional information, see Configure related parties for Items Received Data type: String Table: Responsibility Definition [sn_customerservice_responsibility_def]
service_organization	Required if the *`type`* parameter is one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `Authorized Member` • `Authorized Service Organization` • `Listed Member` • `Listed Service Organization` Sys_id of the service organization record that is involved in providing service to the customer. **Note:** If you pass this parameter, you shouldn't also pass the account, contact, or consumer parameters. The *`service_organization`* parameter is only available when the Service Organization (com.snc.service_organization) plugin is installed on your instance. Data type: String Table: Service Organization [sn_customer_service_organization]
sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
type	Required. Sys_id of the type of related party to create. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String Table: Related Party Configuration [sn_customerservice_related_party_configuration]
user	Required if the *`type`* parameter is one of the following related party types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `Authorized Contributor` • `Authorized Member` • `Listed Contributor` • `Listed Member` For `Authorized Member` and `Listed Member`, this user must be associated with the specified *`service_organization`* record. Sys_id of the user record associated with the related parties record. Data type: String Table: User [sys_user]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

account	Details about the account associated with the related parties record.
	
	Data type: Object
	
	`account": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

account.display_value	Text name of the account associated with the related parties record. Use this value to display the account name in the UI. Data type: String
account.sys_id	Sys_id of the account record associated with the related parties record. Data type: String

consumer	Details about the consumer associated with the related parties record.
	
	Data type: Object
	
	`"consumer": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

consumer.display_value	Text name of the consumer associated with the related parties record. Use this value to display the consumer name in the UI. Data type: String
consumer.sys_id	Sys_id of the consumer record associated with the related parties record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

contact	Details about the account contact responsible for the related parties record.
	
	Data type: Object
	
	`"contact": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

contact.display_value	Text name of the contact associated with the related parties record. Use this value to display the contact name in the UI. Data type: String
contact.sys_id	Sys_id of the contact record associated with the related parties record. Data type: String Table: Contact [customer_contact]

error	Details about the error that occurred when trying to process the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional details about the associated error. Data type: String
error.message	Error message that describes the problem that occurred when trying to execute the request. Data type: String

install_base_item	Details about the install base item associated with the related parties record.
	
	Data type: Object
	
	`"install_base_item": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

install_base_item.display_value	Text name of the install base item associated with the related parties record. Use this value to display the install base item name in the UI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
install_base_item.sys_id	Sys_id of the install base item record associated with the related parties record. Data type: String

responsibility	Details about the access level for the install base information.
	
	Data type: Object
	
	`"responsibility": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

responsibility.display_value	Text display value for the access level for the install base information. Data type: String
responsibility.sys_id	Sys_id of the associated responsibility record. This record defines the access level for the install base information. This parameter is only valid if the *related_party* field is also specified. If specified, it only returns the install base items that match both the *related_party* and *responsibility* parameters. For additional information, see Configure related parties for Items Received Data type: String Table: Responsibility Definition [sn_customerservice_responsibility_def]
status	Status of the endpoint call. Data type: String
sys_class_name	Table containing the related parties record. Data type: String Default: sn_install_base_related_party
sys_id	Sys_id of the associated related parties record. Data type: String
sysparm_limit	Number of records that were returned. If this value isn't specified in the original request, it uses the default value. Data type: Number
sysparm_offset	Offset (starting point) in the associated table from which records were evaluated and retrieved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

type	Details about the type of contact associated with the related parties record.
	
	Data type: Object
	
	`"type": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

type.display_value	Text name of the type of contact associated with the related parties record. Use this value to display the type of contact in the UI. For additional information, see Create related party configurations. Possible types: • Authorized Account • Authorized Consumer • Authorized Contact • Authorized Contributor • Authorized Member • Authorized Service Organization • Listed Account • Listed Consumer • Listed Contact • Listed Contributor • Listed Member • Listed Service Organization Data type: String
type.sys_id	Sys_id of the type record associated with the related parties record. Data type: String

user	Details about the user associated with the related parties record.
	
	Data type: Object
	
	`"user": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

user.display_value	Text name of the user associated with the related parties record. Use this value to display the user name in the UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
user.sys_id	Sys_id of the user record associated with the related parties record. Data type: String Table: User [sys_user]

Example: cURL request

The following code example shows how to call this endpoint to create an Authorized Account related record and associate it with an install base item.

```
curl
 "https://instance.servicenow.com/api/sn_install_base/integratio
ns/relatedparties/f77c7542b7343300ece839a6ee11a991" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  "contact":"0a232a0013691200042ab3173244b075",
  "type":"68ec8b2965e99110f87764df53db779f",
  "account":"86837a386f0331003b3c498f5d3ee4ca",
  "install_base_item":"f77c7542b7343300ece839a6ee11a991",
  "responsibility":"c009bbedb3730010700b4d43c6a8dcef",
  "sys_class_name":"sn_install_base_related_party"
}" \
--user 'username':'password'
```

Return results:

```
{
"result":
  {
    "type": {
      "display_value":"Authorized Contact",
      "sys_id":"68ec8b2965e99110f87764df53db779f"
    },
    "install_base_item": {
      "display_value":"KX Series - KX5000",
      "sys_id":"f77c7542b7343300ece839a6ee11a991"
    },

}
```

Interaction Management API

The *`Interaction Management`* API provides endpoints to create interactions.

This class requires the Interaction Logging, Routing, and Queueing plugin (com.glide.interaction).

Interaction - POST /now/interaction

Inserts or updates a record in the interaction table.

URL format

Versioned URL: `/api/now/{api_version}/interaction`

Default URL: `/api/now/interaction`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
channel	Required. Sys_id for the interaction connector you want to create an interaction for. Data type: String
context	A Map or a table/sys_id pair. By default, interactions have a record in the interaction_json_blob table that stores context data as a JSON object. You can point an interaction to a different record for context. Use context or context_table/context_id to define the context for an interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	Data type: String
context_id	Document ID for a record you want to use to store context. The default is a new record in the insteraction_json_blob table. If you define the context ID, you also need to define the table. Data type: String
context_table	Context table you want to use to store interaction context for. The default is interaction_json_blob. If you define the context table, you also need to define the context ID. Data type: String
channel_metadata	Map or a table/sys_id pair. Channel metadata contains information that a connector can use to communicate through the associated channel. Data type: String
channel_metadata_id	Document ID for a record you want to use to store channel metadata. The default is a new record in the live_group_profile table. If you define the channel metadata ID, you also need to define the table. Data type: String
channel_metadata_table	Table you want to use to store channel metadata. The default is the live_group_profile table. If you define the channel metadata table, you also need to define the channel metadata ID. Data type: String
queue	Sys_id for the queue you want to associate with the interaction. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Indicates the query ran successfully.
400	Indicates that one or more mandatory parameters were missing from the request.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
assigned_to	The sys_id of the user the interaction is assigned to. Data type: String
channelMetadataDocument	The sys_id of the channel metadata document associated with the interaction. Data type: String
channelMetadataTable	The table name of the channel metadata table associated with the interaction. Data type: String
channel_metadata	Any channel metadata included for the interaction. Data type: String
closed_by	The sys_id of the user who closed the interaction. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
contextDocument	The sys_id for the context document associated with the interaction. Data type: String
contextTable	The name of the table associated with the interaction. Data type: String
number	The number of the new interaction. Data type: String
opened_for	The sys_id of the user who the interaction was opened for. Data type: String
queue	The sys_id for the queue you create the interaction for. Data type: String
state	The state the interaction is in. If you assign a queue, the state automatically changes to **Queued**, otherwise the default is **New**. Data type: String
sys_id	The sys_id of the interaction. Data type: String

Example: Sample cURL request

```
curl "http://instance.servicenow.com/api/now/interaction" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{\"channel\":\"28a59893873103002ae97e2526cb0b5d\",\"queue\":
\"f3a50867b30303002186a72256a8dcb7\"}" \
--user "username":"password"
```

```
{
  "result": {
    "channel": "28a59893873103002ae97e2526cb0b5d",
    "context": {
      "present": true
    },
    "queue": "f3a50867b30303002186a72256a8dcb7",
    "state": "queued",
    "number": "IMS0000075",
    "contextDocument": "1863a6f0d9471300964f387107a8a36d",
    "contextTable": "interaction_json_blob",
    "channelMetadataDocument":
 "9463a6f0d9471300964f387107a8a36c",
    "channelMetadataTable": "live_group_profile",
    "channel_metadata": {
```

}
```

Interaction - POST /now/interaction/{interaction_id}/close

Changes the state of an interaction to closed or closed complete.

URL format

Versioned URL: `/api/now/{api_version}interaction/{interaction_id}/close`

Default URL: `/api/now/interaction/{interaction_id}/close`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
interaction_id	Sys_id for the interaction you want to close. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
assigned_to	The sys_id of the user the interaction is assigned to. Data type: String
channelMetadataDocument	The sys_id of the channel metadata document associated with the interaction. Data type: String
channelMetadataTable	The table name of the channel metadata table associated with the interaction. Data type: String
channel_metadata	Any channel metadata included for the interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
closed_by	The sys_id of the user who closed the interaction. Data type: String
contextDocument	The sys_id for the context document associated with the interaction. Data type: String
contextTable	The name of the table associated with the interaction. Data type: String
number	The number of the new interaction. Data type: String
opened_for	The sys_id of the user who the interaction was opened for. Data type: String
queue	The sys_id for the queue you create the interaction for. Data type: String
state	The state the interaction is in. If you assign a queue, the state automatically changes to **Queued**, otherwise the default is **New**. Data type: String
sys_id	The sys_id of the interaction. Data type: String

Example: Sample cURL request

```
curl
 "http://instance.servicenow.com/api/now/interaction/b243cde4208
f1700964f959e0488dee8/close" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user "username":"password"
```

```
{
  "result": {
    "channel": "28a59893873103002ae97e2526cb0b5d",

  }
}
```

Knowledge Management REST API

The *`Knowledge Management`* API provides endpoints for searching, viewing, and fetching lists of the most-viewed and featured knowledge articles.

You can only use this API when the Knowledge API (sn_km_api) plugin is activated. The *`Knowledge Management REST`* API was originally released in Orlando using the Knowledge API app available in the ServiceNow Store.

Note: The *`Knowledge Management REST API`* is publicly accessible and makes any knowledge base that is publicly accessible available to all users, including unauthenticated users. For version 1.0.1 and later, the API was made editable, allowing admins to configure each endpoint to disallow unauthenticated access by selecting the **Requires Authentication** flag on the Scripted REST Service Security tab associated with the API.

To enable other domains to use *`Knowledge Management REST API`* endpoints, define a Cross-Origin Resource Sharing (CORS) rule. For more information, see Define a CORS rule.

To view an article from the scoped knowledge base using this REST API, allow the sn_km_api scope read access from the requesting scope in the Restricted Caller Access Privileges [sys_restricted_caller_access] table. For more information, see Define cross-scope access to an application resource.

By default, this API has a rate limit of 500 per hour for unauthenticated and snc_external users. For more information about rate limiting, see Inbound REST API rate limiting.

Knowledge Management - GET /knowledge/articles

Returns a list of knowledge base (KB) articles which can be searched and filtered using various parameters.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles`

Default URL: `/api/sn_km_api/knowledge/articles`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
filter	Encoded query to use to filter the result set. Syntax: `filter=<attr><operator><value>`. • `<attr>`: Name of the table column. • `<operator>`: Valid values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>. ○ ^: Enables you to specify more than one condition and logically AND them. ○ ^OR: Enables you to specify more than one condition and logically OR them. ○ LIKE: <attr> contains the specified string. Only works for <attr> fields whose data type is string. ○ STARTSWITH: <attr> starts with the specified string. Only works for <attr> fields whose data type is string. ○ ENDSWITH: <attr> ends with the specified string. Only works for <attr> fields whose data type is string. • `<value>`: Value to match against. All parameters are case-sensitive. Query can contain more than one entry, such as `filter=<attr><operator><value>[<operator><attr><operator><value>]`. Data type: String Default: empty
fields	Comma-separated list of fields from the Knowledge [kb_knowledge] table to show details in results. Data type: String Default: None
kb	Comma-separated list of knowledge base sys_ids from the Knowledge Bases [kb_knowledge_base] table to restrict results to. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
language	List of comma-separated languages in two-letter ISO 639-1 language code format to restrict results to. Alternatively type 'all' to search in all valid installed languages on an instance. Data type: String Default: User's session language or en
limit	Maximum number of records to return. Unusually large *limit* values can impact system performance. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 30
offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time this endpoint is called, *offset* is set to "0". To page through all available records, use `offset=offset+limit` until the end of the all records is reached. Data type: Number Default: 0
query	Text to search for, can be empty. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
articles	List of articles returned in response. Data type: Array `"articles": [ { "fields": {Object}, "link": "String", "id": "String", "number": "String", "rank": Number, "score": Number, "snippet": "String", "title": "String" } ]`
articles.fields	Values of requested fields, if any. Data type: Object `"fields": { "<field_name>": {Object} }`
articles.fields.<field_name>	Lists each field requested using the fields parameter, if any. Data type: Object `"<field_name>": { "display_value": "String", "label": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"name": "String", "type": "String", "value": "String" }`
articles.fields.<field_name>.display_value	Display value of the requested field. Data type: String
articles.fields.<field_name>.label	Label representing the requested field. For example, `Knowledge`. Data type: String
articles.fields.<field_name>.name	Name of the requested field. Matches *`<field_name>`*. Data type: String
articles.fields.<field_name>.type	Data type of requested field. Data type: String
articles.fields.<field_name>.value	Value of the requested field. Data type: String
articles.id	Knowledge article sys_id from the Knowledge [kb_knowledge] table. Data type: String
articles.link	Link to the article. Data type: String
articles.number	Knowledge article number. Data type: String
articles.rank	Search rank of article specific to this search. Data type: Number (Float)
articles.snippet	Text showing a small portion of the knowledge article. Data type: String
articles.score	Relevancy score, results sorted in descending order by score. Data type: String
articles.title	Short description or title of the knowledge article. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

meta	Meta information of the results and request parameters.
	
	Data type: Object
	
	`"meta": {`
	`  "count": Number,`
	`  "end": Number,`
	`  "fields": "String",`
	`  "filter": "String",`
	`  "kb": "String",`
	`  "language": "String",`
	`  "query": "String",`
	`  "start": Number,`
	`  "status": {Object},`
	`  "ts_query_id": "String"`
	`}`

meta.count	Number of available KB articles. Data type: Number
meta.end	Ending index of the result set. Data type: Number
meta.fields	Fields in the article. Data type: String
meta.filter	Filter used to acquire the data. Data type: String
meta.kb	List of knowledge base article sys_ids. Data type: String
meta.language	List of comma-separated languages of the KB articles that were requested. Data type: String
meta.query	Specified request query. Data type: String
meta.start	Starting index of result set. Data type: Number
meta.status	Status of the call. Data type: String
meta.ts_query_id	Sys_id of the query.

Knowledge Management - GET /knowledge/articles/{article_sys_id}/attachments/{attachment_sys_id}

Returns a knowledge article attachment as a file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles/{article_sys_id}/attachments/{attachment_sys_id}`

Default URL: `/api/sn_km_api/knowledge/articles/{article_sys_id}/attachments/{attachment_sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
article_sys_id	Sys_id of the knowledge article with the attachment you intend to retrieve. Data type: String Table: Knowledge Bases [kb_knowledge]
attachment_sys_id	Sys_id of record to which the attachment belongs. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

Name	Description
articles.id	Knowledge article sys_id from the Knowledge [kb_knowledge] table. Data type: String
articles.link	Link to the article. Data type: String
articles.number	Knowledge article number. Data type: String
articles.rank	Search rank of article specific to this search. Data type: Number (Float)
articles.score	Relevancy score, results sorted in descending order by score. Data type: String
articles.snippet	Text showing a small portion of the knowledge article. Data type: String
articles.title	Short description or title of the knowledge article. Data type: String

meta	Meta information of the results and request parameters.
	
	Data type: Object
	
	`"meta": {`
	`  "count": Number,`
	`  "end": Number,`
	`  "fields": "String",`
	`  "filter": "String",`
	`  "kb": "String",`
	`  "language": "String",`
	`  "query": "String",`
	`  "start": Number,`
	`  "status": {Object},`
	`  "ts_query_id": "String"`
	`}`

meta.count	Number of available KB articles. Data type: Number
meta.end	Ending index of the result set. Data type: Number

Name	Description
meta.fields	Fields in the article. Data type: String
meta.filter	Filter used to acquire the data. Data type: String
meta.kb	List of knowledge base article sys_ids. Data type: String
meta.language	List of comma-separated languages of the KB articles that were requested. Data type: String
meta.query	Specified request query. Data type: String
meta.start	Starting index of result set. Data type: Number
meta.status	HTTP status of the call. Data type: String
meta.ts_query_id	Sys_id of the query. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_km_api/knowledge/articl
es/featured?fields=short_description&limit=3" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{

Knowledge Management - GET /knowledge/articles/{id}

Returns specific knowledge article content and its field values.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles/{id}`

Default URL: `/api/sn_km_api/knowledge/articles/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or knowledge base (KB) number of a knowledge article. Data type: String Table: Knowledge [kb_knowledge]

Query parameters

Name	Description
fields	Comma-separated list of fields from the Knowledge [kb_knowledge] table to show details in results. Data type: String Default: None
language	Two letter ISO 639-1 language code; for example, "fr" for French. Results display only when searches use the knowledge article KB number as the *`id`* and a translated version of the article is available in the language specified. **Note:** Only valid when setting the *`id`* parameter as a KB number (not sys_id). Data type: String
search_id	Optional unless using *`search_rank`*. Unique identifier of search that returned this article. You can retrieve *`search_id`* using one of the following APIs that returns the *`articles.id`* element:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Knowledge Management - GET /knowledge/articles • Knowledge Management - GET /knowledge/articles/featured • Knowledge Management - GET knowledge/articles/most_viewed Passing the *search_id* and *search_rank* parameter increments the article view count and records an entry for the article in the Knowledge Use [kb_use] table. You can also verify incremented view counts in Knowledge Base [kb_view2] page. Data type: String
search_rank	Optional unless using *search_id*. Article search rank by click-rate that you can retrieve using one of the following APIs that returns the *articles.rank* element: • Knowledge Management - GET /knowledge/articles • Knowledge Management - GET /knowledge/articles/featured • Knowledge Management - GET knowledge/articles/most_viewed Data type: Number
update_view	Update view count and record an entry for the article in the Knowledge Use [kb_use] table. True whether present as a standalone parameter or set to true. **Note:** If you pass *update_view* with *search_id* and *search_rank*, *update_view* is ignored because the view count will already be incremented. Data type: Boolean that is always handled as true when passed whether set to `"true"`, `"false"`, or not set at all.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
attachments	Provides attachment details for each instance if attachment exists. Only displays if `display_attachments = true`. Data type: Array of Objects `"attachments": [ { "file_name": "String", "size_bytes": "String", "state": "String", "sys_id": "String" } ]`
attachments.file_name	File name of attachment. Data type: String
attachments.size_bytes	File size. Data type: String Unit: Bytes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
attachments.state	State. Possible values: • available • available_conditionally • not_available • pending Data type: String
attachments.sys_id	Sys_id of the attachment. Data type: String
content	Entire HTML content of the article. Data type: String
display_attachments	Flag that indicates whether the *display_attachments* flag is active for that article. Attachments are returned only if *display_attachments* is true (active) in the knowledge article record. • true: *display_attachments* is active. • false: *display_attachments* is inactive. Data type: Boolean
embedded_content	Lists each attachment containing embedded content by sys_id and includes relevant attachment information. Only displays if `display_attachments = true`. Data type: Array of Objects `"attachments": [ { "file_name": "String", "size_bytes": "String", "state": "String", "sys_id": "String" } ]`
embedded_content.file_name	File name of the attachment. Data type: String
embedded_content.size_bytes	Size of the attachment. Data type: String Unit: Bytes
embedded_content.state	State of the attachment.

Name	Description
	Possible values: • available • available_conditionally • not_available • pending Data type: String
embedded_content.sys_id	Sys_id of the attachment. Data type: String

fields	Values of requested fields (if any).
	
	Data type: Object
	`"fields": {`
	`  "<field_name>": {Object}`
	`}`

fields.<field_name>	Lists each field requested using the fields parameter, if any.
	
	Data type: Object
	`"<field_name>": {`
	`  "display_value": "String",`
	`  "label": "String",`
	`  "name": "String",`
	`  "type": "String",`
	`  "value": "String"`
	`}`

fields.<field_name>.display_value	Display value of the requested field. Data type: String
fields.<field_name>.label	Label representing the requested field. For example, `Knowledge`. Data type: String
fields.<field_name>.name	Name of the requested field. Matches *<field_name>*. Data type: String
fields.<field_name>.type	Data type of requested field. Data type: String
fields.<field_name>.value	Value of the requested field. Data type: String
language	Two-letter ISO 639-1 language code for the current article (if translation is available).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
languages	For each translated version of a knowledge article (if translated): `"languages": [ { "label": "String", "language": "String", "sys_id": "String" } ]` Data type: Array
languages.label	String representation for language. Data type: String
languages.language	Two-letter ISO 639-1 code language. Data type: String
languages.sys_id	Unique identifier for translated version of knowledge article. Data type: String
number	Article number. Data type: String
short_description	Short description or title of the knowledge article. Data type: String
sys_id	Knowledge article sys_id from the Knowledge [kb_knowledge] table. Data type: String
template	Flag that indicates whether a returned article is a template. Possible values: • true: Article is a template. • false: Article is not a template. Data type: Boolean
template_table	Name of template table, only returns if knowledge article is a template. Data type: String

    "sys_id": "9e528db1474321009db4b5b08b9a71a6",
    "short_description": "Windows: Should I upgrade to Windows
 8.x?\t\t",
    "display_attachments": true,
    "attachments": [],
    "embedded_content": []
  }
}
```

Knowledge Management - GET knowledge/articles/most_viewed

Returns a list of knowledge articles prioritized by most-viewed.

URL format

Versioned URL: `/api/sn_km_api/{api_version}/knowledge/articles/most_viewed`

Default URL: `/api/sn_km_api/knowledge/articles/most_viewed`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
fields	Comma-separated list of fields from the Knowledge [kb_knowledge] table to show details in results. Data type: String Default: None
kb	Comma-separated list of knowledge base sys_ids from the Knowledge Bases [kb_knowledge_base] table to restrict results to. Data type: String
language	List of comma-separated languages in two-letter ISO 639-1 language code format to restrict results to. Alternatively type 'all' to search in all valid installed languages on an instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String Default: User's session language or en
limit	Maximum number of records to return. Unusually large *`limit`* values can impact system performance. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Data type: Number Default: 30
offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time this endpoint is called, *`offset`* is set to "0". To page through all available records, use `offset=offset+limit` until the end of the all records is reached. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

lead API

The *lead* API provides endpoints that enable you to create, update, and query/retrieve marketing leads and their associated lead line items from an instance.

Use this API to integrate your instance with external websites and systems such as automated lead capture systems, or to provide lead information to external reporting systems.

This API is provided within the `sn_lead_mgmt_core` namespace. To access the API, the Lead Management Data Model (sn_lead_mgmt_core) plugin must be activated on the instance, and the calling user must have the sn_lead_mgmt_core.lead_integrator role.

For additional information on Lead Management, see Using Lead Management.

Extending the Lead API

You can extend the *lead* API by overriding the methods in its associated script includes. The default API functionality is located in script includes ending in "OOB", such as *LeadAPIProcessUtilOOB*. To override this functionality, create methods with identical names and parameters in the script include that has the same file name, but doesn't end in "OOB", such as *LeadAPIProcessUtil*.

The following is a list of the script includes that you can override to change the behavior of the *lead* API:

- *LeadAPIProcessUtilOOB*: Contains methods that handle the retrieval and creation of lead and lead line item records.
- *LeadApiValidationUtilOOB*: Contains methods that validate the JSON request object for the POST and PATCH endpoints.
- *LeadAPIHelperOOB*: Contains API helper methods that:
  - Return an array of leads and related lead line items.
  - Return a JSON object from the associated GlideRecord.
  - Remove all ignored fields from a JSON object and perform other transformations.
- *LeadAPIConstantsOOB*: Contains constants, status codes, and messages for all API operations. It also includes the list of fields that are ignored by the POST and PATCH endpoints.

lead - GET /sn_lead_mgmt_core/lead

Retrieves all leads and associated lead line items based on the filter criteria passed in the query parameters.

This endpoint returns a paginated response as per the specified limit and offset. It retrieves information from the following tables:

- Lead [sn_lead_mgmt_core_lead]
- Lead Line Item [sn_lead_mgmt_core_lead_line_item]

URL format

Versioned URL: `/api/sn_lead_mgmt_core/{api_version}/lead`

Default URL: `/api/sn_lead_mgmt_core/{api_version}/lead`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_fields	Comma-separated list of fields to return in the response. Invalid fields are ignored. Data type: String Default: Return all fields.
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. This limit is applied before ACL evaluation. If no records return, including records you have access to, rearrange the record order so records you have access to return first. **Note:** Unusually large *`sysparm_limit`* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset +sysparm_limit`, until you reach the end of all records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)` The encoded query supports *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in *`sysparm_query`*. For example, `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory` filters all active records and orders the results in ascending order by number first, and then in descending order by category.

Query parameters (continued)

Name	Description
	If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the valid portion of the query. You can control this behavior using the property *glide.invalid_query.returns_no_rows*. Set this property to true to return no rows on an invalid query. **Note:** The *glide.invalid_query.returns_no_rows* property controls the behavior of all queries across the instance, such as in lists, scripts (*GlideRecord.query()*), and web service APIs. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Range	Range of content returned in a paginated call. For example, if offset=2 and limit=3, the value of the Content-Range header is items 3-5.
Links	Links through which to navigate the query results: • first • last • next • previous • self
Total-Count	Total number of filtered records.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request was successfully processed. All responses returned (no pagination).
206	Request successfully processed. Partial resource returned in response (with pagination).
400	Error. Possible reasons: • Invalid limit/limit greater than maximum allowed. • Invalid offset.
403	Record denied access. Insufficient permission to query the record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters

Name	Description

account	Account linked to the lead.
	Data type: Object
	`"account": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

account.name	Name of the account. Data type: String
account.sys_id	Sys_id of the associated account record. Data type: String Table: Account [customer_account]
business_phone	Lead's business phone number. Data type: String
city	City in which the lead resides. Data type: String
closed_date	Date and time when the lead was closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Object
	`"closed_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

closed_date.display_value	Date and time as displayed in the UI. Data type: String Format: User's format and time zone.
closed_date.value	Date and time that the lead closed as defined in the associated record. Data type: String Format: UTC
company	Lead's company name. Data type: String

consumer	Consumer associated with the lead.
	
	Data type: Object
	`"consumer": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

consumer.name	Name of the associated consumer. Data type: String
consumer.sys_id	Sys_id of the associated consumer record. Data type: String Table: Consumer [csm_consumer]

contact	Contact associated with the lead account.
	
	Data type: Object
	`"contact": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

contact.name	Contact's name. Data type: String
contact.sys_id	Sys_id of the associated contact record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Contact [customer_contact]
country	Country in which the lead resides. Data type: String
do_not_call	Flag that indicates whether the mode of communication is by phone. Valid values: • true: Can call contact. • false: Don't call contact. Data type: Boolean
do_not_email	Flag that indicates whether the mode of communication is by email. Valid values: • true: Can email contact. • false: Don't email contact. Data type: Boolean
do_not_share	Flag that indicates whether the lead details can be shared. Valid values: • true: Lead details can be shared. • false: Lead details can't be shared. Data type: Boolean
email	Lead's email address. Data type: String
external_id	ID used by the system that generated the lead to identify the lead in the associated system. Data type: String
external_system	Name of the external system associated with the lead, such as HubSpot or pipedrive. Data type: String
first_name	First name of the contact associated with the lead. Data type: String
industry	Industry to which the lead belongs. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Located in the *industry* field of the Account [customer_account] table.
last_name	Last name of the contact associated with the lead. Data type: String

lead_group	Group to which the lead belongs.
	
	Data type: Object
	
	`"lead_group": {`
	`  "name: "String",`
	`  "sys_id": "String"`
	`}`

lead_group.name	Lead group's name. Data type: String
lead_group.sys_id	Sys_id of the lead group record. Data type: String Table: Group [sys_user_group]

lead_line_items	Details of the lead line items associated with the lead.
	
	Data type: Array of Objects
	
	`"lead_line_items": [`
	`  {`
	`  "external_id": "String",`
	`  "external_system": "String",`
	`  "lead": {Object},`
	`  "number": "String",`
	`  "product_offering": {Object},`
	`  "quantity": Number,`
	`  "sys_created_by”: "String",`
	`  "sys_created_on {Object},`
	`  "sys_domain": "String",`
	`  "sys_domain_path": "String",`
	`  "sys_id": "String",`
	`  "sys_mod_count": Number,`
	`  "sys_tags": [Array],`
	`  "sys_updated_by: "String",`
	`  "sys_updated_on: {Object},`
	`  "unit_of_measurement": {Object},`
	`  "work_notes": [Array]`
	`  }`
	`]`

lead_line_items.external_id	ID used by the system that generated the lead line item to identify the line item in the associated system. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
lead_line_items.external_system	Name of the external system associated with the lead line item, such as HubSpot or pipedrive. Data type: String

lead_line_items.lead	Details about the lead associated with the line item.
	
	Data type: Object
	
	`"lead: {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

lead_line_items.lead.name	Associated lead's name. Data type: String
lead_line_items.lead.sys_id	Sys_id of the associated lead record. Data type: String
lead_line_items.number	Unique system-generated number of the lead line item record. Data type: String

lead_line_items.product_offering	Information about the product offering associated with the lead line item.
	
	Data type: Object
	
	`"product_offering": {`
	`  "code": " String",`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

lead_line_items. product_offering.code	Code linked to the product offering. **Note:** This is a system-generated alphanumeric number based on the product name. Although system generated, you can edit the code to represent a SKU or any other industry specific product codes. Data type: String
lead_line_items. product_offering.name	Product offering's name. Data type: String
lead_line_items. product_offering.sys_id	Sys_id of the product offering record associated with the lead line item. Data type: String Table: Product Offering [sn_prd_pm_product_offering]

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
lead_line_items.quantity	Quantity of items the lead wants to purchase of the associated product offering. Data type: Number (Integer)
lead_line_items.sys_created_by	User name of the person that created the lead line item. Data type: String

lead_line_items.sys_created_on	System-generated date and time that the lead line item was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items. sys_created_on.display_value	Date and time that the lead line item was created. Data type: String Format: Default instance format and time zone
lead_line_items. sys_created_on.value	Date and time that the lead line item was created. Data type: String Format: UTC
lead_line_items.sys_domain	Sys_id of the domain record to which the lead line item belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_domain_path	Path of the domain to which the lead line item belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_id	Sys_id of the lead line item record. Data type: String
lead_line_items.sys_mod_count	Number of times the associated lead line item record has been modified. Data type: Number (Integer)
lead_line_items.sys_tags	List of system tags associated with the lead line item. Data type: Array

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
lead_line_items.sys_updated_by	User name of the person that last updated the associated lead line item. Data type: String

lead_line_items.sys_updated_on	System-generated date and time when the lead line item was last updated.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items.sys_updated_on.display_value	Date and time that the lead line item was last updated. Data type: String Format: Default instance format and time zone
lead_line_items.sys_updated_on.value	Date and time that the lead line item was last updated. Data type: String Format: UTC

lead_line_items.unit_of_measurement	Details of the measuring unit of lead line item.
	
	Data type: Object
	
	`"unit_of_measurement": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

lead_line_items.unit_of_measurement.name	Name of the measuring unit such as, each or cubic foot. Data type: String
lead_line_items.unit_of_measurement.sys_id	Sys_id of the record that describes the measuring unit. Data type: String Table: Unit of Measure [sn_prd_pm_uom]

lead_line_items.work_notes	List that describes the work notes created for the lead line item.
	
	Data type: Array of Objects
	
	`"work_notes": [`
	`  {`
	`  "author": "String",`
	`  "date": "String",`
	`  "text": "String"`

Name	Description
	`}` `]`
lead_line_items.work_notes.author	User name of the person that authored the associated work note. Data type: String
lead_line_items.work_notes.date	Date that the note was created. Data type: String
lead_line_items.work_notes.text	Text of the note made by the author. Data type: String
lead_rating	Rating for the lead such as, 100_cold, 200_warm, 300_hot, or 400_super_hot. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_rating field of the Leads table. Data type: String
lead_score	Score for the lead. Data type: Decimal Range: 1 to 100
lead_source	Originator of the lead. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_source field of the Leads table. Data type: String
lead_type	Type of lead, such as New Business or Existing Business. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_type field of the Leads table. Data type: String
middle_name	Middle name of the contact for the lead. Data type: String
mobile_phone	Phone number of the contact for the lead. Data type: String
number	Unique system-generated number of the lead record.

Name	Description
	Data type: String
other_reason	Additional reason for the lead disqualification. Data type: String Max length: 160 characters

owner	Details of the person associated with the lead.
	
	Data type: Object
	
	`"owner": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

owner.name	Name of the person that owns the lead. Data type: String
owner.sys_id	Sys_id of the user record of the person that owns the lead. Data type: String Table: User [sys_user]
reason	Reason for the lead disqualification such as, Disqualify. Data type: String Max length: 40 characters
short_description	Short description of the lead. Data type: String Max length: 160 characters

similar_lead	Details on any similar lead. Use this for possible lead disqualification.
	
	Data type: Object
	
	`"similar_lead": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

similar_lead.name	Name of the duplicate lead. Data type: String
similar_lead.sys_id	Sys_id of the lead record that is a possible duplicate lead. Data type: String

Name	Description
	Table: Lead [sn_lead_mgmt_core_lead]
stage	Stage of the lead such as, 100_new. **Note:** This is a choice field. It must contain one of the choice items defined in the stage field of the Leads table. Data type: String
state	State in which the lead resides. Data type: String
street	Street on which the lead resides. Data type: String
sys_class_name	System-generated class name of the Lead table. Data type: String
sys_created_by	User name of the person that created the lead. Data type: String

sys_created_on	System-generated date and time that the lead was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

sys_created_on.display_value	Date and time when the lead was created. Data type: String Format: Default instance format and time zone
sys_created_on.value	Date and time when the lead was created. Data type: String Format: UTC
sys_domain	Sys_id of the domain record to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
sys_domain_path	Path of the domain to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled.

Name	Description
	"date": "String", "text": "String" }]
work_notes.author	User name of the person that authored the associated work note. Data type: String
work_notes.date	Date that the note was created. Data type: String
work_notes.text	Text of the note made by the author. Data type: String
zip	Zip code of the associated lead. Data type: String

Example: cURL request

The following code example shows how to pass query parameters to specify the leads to return.

```
curl
 "https://instance.service-now.com/api/sn_lead_mgmt_core/lead?sy
sparm_query=stage%3D400_closed_won&sysparm_fields=sys_id%2Cfirst
_name%2Clast_name%2Cshort_description%2Cstage%2Clead_line_items&
sysparm_offset=2" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Leads are return in an array of objects:

```
[
  {
    "short_description": "Looking for a quote on preventative
 maintenance plans for their corporate office building
 elevators.",
    "reason": null,
    "country": "USA",
    "closed_date": null,
    "city": "San Francisco",
    "lead_source": "inbound_phone",
    "external_id": null,
    "industry": "manufacturing",
    "sys_updated_on": {
      "value": "2024-05-31 11:01:55",
      "display_value": "2024-05-31 04:01:55"
    },
    "title": "Director of Building operations",
    "sys_class_name": "Lead",
    "number": "LEAD0000001",
```

lead - GET /sn_lead_mgmt_core/lead/{sys_id}

Returns the lead record and all associated lead line items for the specified sys_id.

This endpoint retrieves information from the following tables:

- Lead [sn_lead_mgmt_core_lead]
- Lead Line Item [sn_lead_mgmt_core_lead_line_item]

URL format

Versioned URL: `/api/sn_lead_mgmt_core/{api_version}/lead/{sys_id}`

Default URL: `/api/sn_lead_mgmt_core/{api_version}/lead/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the lead to retrieve. Data type: String Table: Lead [sn_lead_mgmt_core_lead]

Query parameters

Name	Description
None

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

account	Account linked to the lead.
	
	Data type: Object
	
	`"account": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

account.name	Name of the account.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
account.sys_id	Sys_id of the associated account record. Data type: String Table: Account [customer_account]
business_phone	Lead's business phone number. Data type: String
city	City in which the lead resides. Data type: String

closed_date	Date and time when the lead was closed.
	
	Data type: Object
	
	`"closed_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

closed_date.display_value	Date and time as displayed in the UI. Data type: String Format: User's format and time zone.
closed_date.value	Date and time that the lead closed as defined in the associated record. Data type: String Format: UTC
company	Lead's company name. Data type: String

consumer	Consumer associated with the lead.
	
	Data type: Object
	
	`"consumer": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

consumer.name	Name of the associated consumer. Data type: String
consumer.sys_id	Sys_id of the associated consumer record. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Consumer [csm_consumer]

contact	Contact associated with the lead account.
	
	Data type: Object
	
	`"contact": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

contact.name	Contact's name. Data type: String
contact.sys_id	Sys_id of the associated contact record. Data type: String Table: Contact [customer_contact]
country	Country in which the lead resides. Data type: String
do_not_call	Flag that indicates whether the mode of communication is by phone. Valid values: • true: Can call contact. • false: Don't call contact. Data type: Boolean
do_not_email	Flag that indicates whether the mode of communication is by email. Valid values: • true: Can email contact. • false: Don't email contact. Data type: Boolean
do_not_share	Flag that indicates whether the lead details can be shared. Valid values: • true: Lead details can be shared. • false: Lead details can't be shared. Data type: Boolean
email	Lead's email address. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
external_id	ID used by the system that generated the lead to identify the lead in the associated system. Data type: String
external_system	Name of the external system associated with the lead, such as HubSpot or pipedrive. Data type: String
first_name	First name of the contact associated with the lead. Data type: String
industry	Industry to which the lead belongs. Data type: String Table: Located in the *industry* field of the Account [customer_account] table.
last_name	Last name of the contact associated with the lead. Data type: String

lead_group	Group to which the lead belongs.
	
	Data type: Object
	
	`"lead_group": {`
	`  "name: "String",`
	`  "sys_id": "String"`
	`}`

lead_group.name	Lead group's name. Data type: String
lead_group.sys_id	Sys_id of the lead group record. Data type: String Table: Group [sys_user_group]

lead_line_items	Details of the lead line items associated with the lead.
	
	Data type: Array of Objects
	
	`"lead_line_items": [`
	`  {`
	`  "external_id": "String",`
	`  "external_system": "String",`
	`  "lead": {Object},`
	`  "number": "String",`
	`  "product_offering": {Object},`
	`  "quantity": Number,`
	`  "sys_created_by": "String",`
	`  "sys_created_on {Object},`

Name	Description
	"sys_domain": "String", "sys_domain_path": "String", "sys_id": "String", "sys_mod_count": Number, "sys_tags": [Array], "sys_updated_by: "String", "sys_updated_on: {Object}, "unit_of_measurement": {Object}, "work_notes": [Array] }]
lead_line_items.external_id	ID used by the system that generated the lead line item to identify the line item in the associated system. Data type: String
lead_line_items.external_system	Name of the external system associated with the lead line item, such as HubSpot or pipedrive. Data type: String

lead_line_items.lead	Details about the lead associated with the line item.
	
	Data type: Object
	"lead: {
	"name": "String",
	"sys_id": "String"
	}

lead_line_items.lead.name	Associated lead's name. Data type: String
lead_line_items.lead.sys_id	Sys_id of the associated lead record. Data type: String
lead_line_items.number	Unique system-generated number of the lead line item record. Data type: String

lead_line_items.product_offering	Information about the product offering associated with the lead line item.
	
	Data type: Object
	"product_offering": {
	"code": " String",
	"name": "String",
	"sys_id": "String"
	}

lead_line_items. product_offering.code	Code linked to the product offering.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Note: This is a system-generated alphanumeric number based on the product name. Although system generated, you can edit the code to represent a SKU or any other industry specific product codes. Data type: String
lead_line_items.product_offering.name	Product offering's name. Data type: String
lead_line_items.product_offering.sys_id	Sys_id of the product offering record associated with the lead line item. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
lead_line_items.quantity	Quantity of items the lead wants to purchase of the associated product offering. Data type: Number (Integer)
lead_line_items.sys_created_by	User name of the person that created the lead line item. Data type: String

lead_line_items.sys_created_on	System-generated date and time that the lead line item was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items.sys_created_on.display_value	Date and time that the lead line item was created. Data type: String Format: Default instance format and time zone
lead_line_items.sys_created_on.value	Date and time that the lead line item was created. Data type: String Format: UTC
lead_line_items.sys_domain	Sys_id of the domain record to which the lead line item belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_domain_path	Path of the domain to which the lead line item belongs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Note: This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_id	Sys_id of the lead line item record. Data type: String
lead_line_items.sys_mod_count	Number of times the associated lead line item record has been modified. Data type: Number (Integer)
lead_line_items.sys_tags	List of system tags associated with the lead line item. Data type: Array
lead_line_items.sys_updated_by	User name of the person that last updated the associated lead line item. Data type: String

lead_line_items.sys_updated_on	System-generated date and time when the lead line item was last updated.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items.sys_updated_on.display_value	Date and time that the lead line item was last updated. Data type: String Format: Default instance format and time zone
lead_line_items.sys_updated_on.value	Date and time that the lead line item was last updated. Data type: String Format: UTC

lead_line_items.unit_of_measurement	Details of the measuring unit of lead line item.
	
	Data type: Object
	
	`"unit_of_measurement": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

lead_line_items.unit_of_measurement.name	Name of the measuring unit such as, each or cubic foot. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
lead_line_items. unit_of_measurement.sys_id	Sys_id of the record that describes the measuring unit. Data type: String Table: Unit of Measure [sn_prd_pm_uom]
lead_line_items.work_notes	List that describes the work notes created for the lead line item. Data type: Array of Objects `"work_notes": [ { "author": "String", "date": "String", "text": "String" } ]`
lead_line_items.work_notes. author	User name of the person that authored the associated work note. Data type: String
lead_line_items.work_notes.date	Date that the note was created. Data type: String
lead_line_items.work_notes.text	Text of the note made by the author. Data type: String
lead_rating	Rating for the lead such as, 100_cold, 200_warm, 300_hot, or 400_super_hot. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_rating field of the Leads table. Data type: String
lead_score	Score for the lead. Data type: Decimal Range: 1 to 100
lead_source	Originator of the lead. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_source field of the Leads table. Data type: String
lead_type	Type of lead, such as New Business or Existing Business.

Name	Description
	Note: This is a choice field. It must contain one of the choice items defined in the lead_type field of the Leads table. Data type: String
middle_name	Middle name of the contact for the lead. Data type: String
mobile_phone	Phone number of the contact for the lead. Data type: String
number	Unique system-generated number of the lead record. Data type: String
other_reason	Additional reason for the lead disqualification. Data type: String Max length: 160 characters

owner	Details of the person associated with the lead.
	
	Data type: Object
	
	`"owner": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

owner.name	Name of the person that owns the lead. Data type: String
owner.sys_id	Sys_id of the user record of the person that owns the lead. Data type: String Table: User [sys_user]
reason	Reason for the lead disqualification such as, Disqualify. Data type: String Max length: 40 characters
short_description	Short description of the lead. Data type: String Max length: 160 characters
similar_lead	Details on any similar lead. Use this for possible lead disqualification. Data type: Object

Name	Description

	`"similar_lead": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

similar_lead.name	Name of the duplicate lead. Data type: String
similar_lead.sys_id	Sys_id of the lead record that is a possible duplicate lead. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
stage	Stage of the lead such as, 100_new. **Note:** This is a choice field. It must contain one of the choice items defined in the stage field of the Leads table. Data type: String
state	State in which the lead resides. Data type: String
street	Street on which the lead resides. Data type: String
sys_class_name	System-generated class name of the Lead table. Data type: String
sys_created_by	User name of the person that created the lead. Data type: String

sys_created_on	System-generated date and time that the lead was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

sys_created_on.display_value	Date and time when the lead was created. Data type: String Format: Default instance format and time zone
sys_created_on.value	Date and time when the lead was created. Data type: String

Name	Description
	Format: UTC
sys_domain	Sys_id of the domain record to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
sys_domain_path	Path of the domain to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
sys_id	Sys_id of the lead record. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
sys_mod_count	Number of times the associated lead record has been modified. Data type: Number (Integer)
sys_tags	List of system tags associated with the lead. You can use these tags to categorize leads. Data type: Array
sys_updated_by	User name of the person that last updated the lead record. Data type: String

sys_updated_on	System-generated date and time when the lead was last updated.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

sys_updated_on.display_value	Date and time that the lead was last updated. Data type: String Format: Instance's default format and time zone
sys_updated_on.value	Date and time that the lead was last updated. Data type: String Format: UTC

Name	Description
title	Lead's title. Data type: String
website	Lead's website URL. Data type: String
work_notes	List of work notes created for the lead. Data type: Array of Objects `"work_notes": [ { "author": "String", "date": "String", "text": "String" } ]`
work_notes.author	User name of the person that authored the associated work note. Data type: String
work_notes.date	Date that the note was created. Data type: String
work_notes.text	Text of the note made by the author. Data type: String
zip	Zip code of the associated lead. Data type: String

Example: cURL request

The following code example shows how to retrieve the lead record with the sys_id of 856b6a95ffde8210b85dffffffffffd7.

```
curl
 "https://instance.service-now.com /
api/sn_lead_mgmt_core/lead/856b6a95ffde8210b85dffffffffffd7" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

The following are the return results:

```
{
  "short_description": "Looking for a quote on preventative
 maintenance plans for their corporate office building
 elevators.",
  "reason": null,
  "country": "USA",
```

lead - PATCH /sn_lead_mgmt_core/lead/{sys_id}

Updates the specified lead record and its associated lead line items. You can also use this endpoint to associate new lead line items to the specified lead.

This endpoint updates information in the following tables:

- Lead [sn_lead_mgmt_core_lead]
- Lead Line Item [sn_lead_mgmt_core_lead_line_item]

Rules for passed-in parameters:

- Invalid parameter names are ignored.
- Invalid values for non-mandatory choice and reference fields are ignored.
- If field WRITE access is denied for one or more fields, the restricted fields are ignored.
- You can't insert system field values using this API. Any provided values are ignored. System fields are a part of the ignored fields list, which is configurable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The values of the parameters *account*, *contact*, and *consumer* are ignored if both the *account* and *consumer* parameters are non-empty.
- Unless otherwise specified, the default value for all non-passed parameters is 'null'.

Note: This endpoint only modifies the specified parameters. If a parameter that exists in the current lead or lead line item record is not specified in the call, its contents remain unchanged.

URL format

Versioned URL: `/api/sn_lead_mgmt_core/{api_version}/lead/{sys_id}`

Default URL: `/api/sn_lead_mgmt_core/{api_version}/lead/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the lead record to update. Data type: String Table: Lead [sn_lead_mgmt_core_lead]

Query parameters

Name	Description
None	

Request body parameters

Name	Description

account	Details of the account associated with the lead.
	
	Data type: Object
	
	`"account": {`
	`  "sys_id": "String"`
	`}`

account.sys_id	Sys_id of the associated account record. Data type: String

Request body parameters (continued)

Name	Description
	Table: Account [customer_account]
business_phone	Lead's business phone number. Data type: String
city	City in which the lead resides. Data type: String
company	Lead's company name. Data type: String

consumer	Consumer associated with the lead.
	
	Data type: Object
	
	`"consumer": {`
	`  "sys_id": "String"`
	`}`

consumer.sys_id	Sys_id of the associated consumer record. Data type: String Table: Consumer [csm_consumer]

contact	Contact associated with the lead account.
	
	Data type: Object
	
	`"contact": {`
	`  "sys_id": "String"`
	`}`

contact.sys_id	Sys_id of the associated contact record. Data type: String Table: Contact [customer_contact]
country	Country in which the lead resides. Data type: String
do_not_call	Flag that indicates whether the mode of communication is by phone. Valid values: • true: Can call contact. • false: Don't call contact. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (continued)

Name	Description
do_not_email	Flag that indicates whether the mode of communication is by email. Valid values: • true: Can email contact. • false: Don't email contact. Data type: Boolean
do_not_share	Flag that indicates whether the lead details can be shared. Valid values: • true: Lead details can be shared. • false: Lead details can't be shared. Data type: Boolean
email	Lead's email address. Data type: String
external_id	ID used by the system that generated the lead to identify the lead in the associated system. Data type: String
external_system	Name of the external system associated with the lead, such as HubSpot or pipedrive. Data type: String
first_name	First name of the contact associated with the lead. Data type: String
industry	Industry to which the lead belongs. Data type: String Table: Located in the *industry* field of the Account [customer_account] table.
last_name	Required. Last name of the contact associated with the lead. Data type: String
lead_group	Group to which the lead belongs. Data type: Object

Request body parameters (continued)

Name	Description

	`"lead_group": {`
	`  "sys_id": "String"`
	`}`

lead_group.sys_id	Sys_id of the lead group record. Data type: String Table: Group [sys_user_group]

lead_line_items	List of lead line items to associated with the lead. Group to which the lead belongs.
	
	Data type: Object
	
	`"lead_line_items": [`
	`  {`
	`  "external_id": "String",`
	`  "external_system": "String",`
	`  "product_offering": {Object},`
	`  "quantity": Number,`
	`  "work_notes": [Array],`
	`  "unit_of_measurement": {Object}`
	`  }`
	`]`
	
	Maximum line items: 100 - any over that are ignored

lead_line_items.external_id	ID used by the system that generated the lead line item to identify the line item in the associated system. Data type: String
lead_line_items.external_system	Name of the external system associated with the lead line item, such as HubSpot or pipedrive. Data type: String

lead_line_items.product_offering	Required. Information about the product offering associated with the lead line item.
	
	Data type: Object
	
	`"product_offering": {`
	`  "sys_id": "String"`
	`}`

lead_line_items.product_offering.sys_id	Required. Sys_id of the product offering record associated with the lead line item. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Table: Product Offering [sn_prd_pm_product_offering]
lead_line_items.quantity	Quantity of items the lead wants to purchase of the associated product offering. Data type: Number (Integer)

lead_line_items.unit_of_measurement	Details of the measuring unit of lead line item.
	
	Data type: Object
	
	`"unit_of_measurement": {`
	`  "sys_id": "String"`
	`}`

lead_line_items.unit_of_measurement .sys_id	Sys_id of the record that describes the measuring unit. Data type: String Table: Unit of Measure [sn_prd_pm_uom]

lead_line_items.work_notes	List that describes the work notes created for the lead line item.
	
	Data type: Array of Objects
	
	`"work_notes": [`
	`  "text": "String"`
	`  }`
	`]`

lead_line_items.work_notes.text	Text of the note made by the author. Data type: String
lead_rating	Rating for the lead such as, 100_cold, 200_warm, 300_hot, or 400_super_hot. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_rating field of the Leads table. Data type: String
lead_score	Score for the lead. Data type: Decimal Range: 1 to 100
lead_source	Originator of the lead.

Request body parameters (continued)

Name	Description
	Note: This is a choice field. It must contain one of the choice items defined in the lead_source field of the Leads table. Data type: String
lead_type	Type of lead, such as New Business or Existing Business. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_type field of the Leads table. Data type: String
middle_name	Middle name of the contact for the lead. Data type: String
mobile_phone	Phone number of the contact for the lead. Data type: String
other_reason	Additional reason for the lead disqualification. Data type: String Max length: 160 characters

owner	Details of the person associated with the lead.
	
	Data type: Object
	
	`"owner": {`
	`  "sys_id": "String"`
	`}`

owner.sys_id	Sys_id of the user record of the person that owns the lead. Data type: String Table: User [sys_user]
reason	Reason for the lead disqualification such as, Disqualify. Data type: String Max length: 40 characters
short_description	Short description of the lead. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Max length: 160 characters

similar_lead	Details on any similar lead. Use this for possible lead disqualification.
	
	Data type: Object
	
	`"similar_lead": {`
	`  "sys_id": "String"`
	`}`

similar_lead.sys_id	Sys_id of the lead record that is a possible duplicate lead. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
stage	Stage of the lead such as, 100_new. **Note:** This is a choice field. It must contain one of the choice items defined in the stage field of the Leads table. Data type: String
state	State in which the lead resides. Data type: String
street	Street on which the lead resides. Data type: String
title	Lead's title. Data type: String
website	Lead's website URL. Data type: String

work_notes	List of work notes created for the lead.
	
	Data type: Array of Objects
	
	`"work_notes": [`
	`  {`
	`  "text": "String"`
	`  }`
	`]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Note: An array of work notes in the request is inserted as a single text. This text is generated by combining the content from all work note objects in the request, with each entry separated by a comma (,).
work_notes.text	Text of the note made by the author. Data type: String
zip	Zip code of the associated lead. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. Lead and lead line items records were successfully updated.
400	Error. Possible reasons: • Invalid payload: Invalid/empty request body. • Invalid payload: Invalid field value for email/phone number fields. • Invalid payload: Mandatory field is absent, or its value is empty.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• Invalid payload: Stage is '400_closed_won'. Qualifying lead is not supported using the API. • If the stage of the lead to be updated is already in the closed state and you are trying to update it.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

account	Account linked to the lead.
	
	Data type: Object
	
	`"account": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

account.name	Name of the account. Data type: String
account.sys_id	Sys_id of the associated account record. Data type: String Table: Account [customer_account]
business_phone	Lead's business phone number. Data type: String
city	City in which the lead resides. Data type: String

closed_date	Date and time when the lead was closed.
	
	Data type: Object
	
	`"closed_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

closed_date.display_value	Date and time as displayed in the UI.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Format: User's format and time zone.
closed_date.value	Date and time that the lead closed as defined in the associated record. Data type: String Format: UTC
company	Lead's company name. Data type: String

consumer	Consumer associated with the lead.
	
	Data type: Object
	
	`"consumer": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

consumer.name	Name of the associated consumer. Data type: String
consumer.sys_id	Sys_id of the associated consumer record. Data type: String Table: Consumer [csm_consumer]

contact	Contact associated with the lead account.
	
	Data type: Object
	
	`"contact": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

contact.name	Contact's name. Data type: String
contact.sys_id	Sys_id of the associated contact record. Data type: String Table: Contact [customer_contact]
country	Country in which the lead resides. Data type: String

Name	Description

lead_line_items.sys_created_on	System-generated date and time that the lead line item was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items. sys_created_on.display_value	Date and time that the lead line item was created. Data type: String Format: Default instance format and time zone
lead_line_items. sys_created_on.value	Date and time that the lead line item was created. Data type: String Format: UTC
lead_line_items.sys_domain	Sys_id of the domain record to which the lead line item belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_domain_path	Path of the domain to which the lead line item belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_id	Sys_id of the lead line item record. Data type: String
lead_line_items.sys_mod_count	Number of times the associated lead line item record has been modified. Data type: Number (Integer)
lead_line_items.sys_tags	List of system tags associated with the lead line item. Data type: Array
lead_line_items.sys_updated_by	User name of the person that last updated the associated lead line item. Data type: String
lead_line_items.sys_updated_on	System-generated date and time when the lead line item was last updated.

Name	Description

	Data type: Object
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items.sys_updated_on.display_value	Date and time that the lead line item was last updated. Data type: String Format: Default instance format and time zone
lead_line_items.sys_updated_on.value	Date and time that the lead line item was last updated. Data type: String Format: UTC

lead_line_items.unit_of_measurement	Details of the measuring unit of lead line item.
	
	Data type: Object
	`"unit_of_measurement": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

lead_line_items.unit_of_measurement.name	Name of the measuring unit such as, each or cubic foot. Data type: String
lead_line_items.unit_of_measurement.sys_id	Sys_id of the record that describes the measuring unit. Data type: String Table: Unit of Measure [sn_prd_pm_uom]

lead_line_items.work_notes	List that describes the work notes created for the lead line item.
	
	Data type: Array of Objects
	`"work_notes": [`
	`  {`
	`  "author": "String",`
	`  "date": "String",`
	`  "text": "String"`
	`  }`
	`]`

lead_line_items.work_notes.author	User name of the person that authored the associated work note. Data type: String
lead_line_items.work_notes.date	Date that the note was created.

Name	Description
	Data type: String
lead_line_items.work_notes.text	Text of the note made by the author. Data type: String
lead_rating	Rating for the lead such as, 100_cold, 200_warm, 300_hot, or 400_super_hot. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_rating field of the Leads table. Data type: String
lead_score	Score for the lead. Data type: Decimal Range: 1 to 100
lead_source	Originator of the lead. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_source field of the Leads table. Data type: String
lead_type	Type of lead, such as New Business or Existing Business. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_type field of the Leads table. Data type: String
middle_name	Middle name of the contact for the lead. Data type: String
mobile_phone	Phone number of the contact for the lead. Data type: String
number	Unique system-generated number of the lead record. Data type: String
other_reason	Additional reason for the lead disqualification. Data type: String Max length: 160 characters
owner	Details of the person associated with the lead.

Name	Description

	Data type: Object
	`"owner": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

owner.name	Name of the person that owns the lead. Data type: String
owner.sys_id	Sys_id of the user record of the person that owns the lead. Data type: String Table: User [sys_user]
reason	Reason for the lead disqualification such as, Disqualify. Data type: String Max length: 40 characters
short_description	Short description of the lead. Data type: String Max length: 160 characters

similar_lead	Details on any similar lead. Use this for possible lead disqualification.
	
	Data type: Object
	`"similar_lead": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

similar_lead.name	Name of the duplicate lead. Data type: String
similar_lead.sys_id	Sys_id of the lead record that is a possible duplicate lead. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
stage	Stage of the lead such as, 100_new. **Note:** This is a choice field. It must contain one of the choice items defined in the stage field of the Leads table. Data type: String
state	State in which the lead resides.

Name	Description
	Data type: String
street	Street on which the lead resides. Data type: String
sys_class_name	System-generated class name of the Lead table. Data type: String
sys_created_by	User name of the person that created the lead. Data type: String

sys_created_on	System-generated date and time that the lead was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

sys_created_on.display_value	Date and time when the lead was created. Data type: String Format: Default instance format and time zone
sys_created_on.value	Date and time when the lead was created. Data type: String Format: UTC
sys_domain	Sys_id of the domain record to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
sys_domain_path	Path of the domain to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
sys_id	Sys_id of the lead record. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
sys_mod_count	Number of times the associated lead record has been modified.

Name	Description
	Data type: Number (Integer)
sys_tags	List of system tags associated with the lead. You can use these tags to categorize leads. Data type: Array
sys_updated_by	User name of the person that last updated the lead record. Data type: String

sys_updated_on	System-generated date and time when the lead was last updated.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

sys_updated_on.display_value	Date and time that the lead was last updated. Data type: String Format: Instance's default format and time zone
sys_updated_on.value	Date and time that the lead was last updated. Data type: String Format: UTC
title	Lead's title. Data type: String
website	Lead's website URL. Data type: String

work_notes	List of work notes created for the lead.
	
	Data type: Array of Objects
	
	`"work_notes": [`
	`  {`
	`  "author": "String",`
	`  "date": "String",`
	`  "text": "String"`
	`  }`
	`]`

work_notes.author	User name of the person that authored the associated work note. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
work_notes.date	Date that the note was created. Data type: String
work_notes.text	Text of the note made by the author. Data type: String
zip	Zip code of the associated lead. Data type: String

Example: cURL request

The following code example shows how to update the lead record with the sys_id 856b6a95ffde8210b85dffffffffffd7.

```
curl "
 https://instance.service-now.com/api/sn_lead_mgmt_core/v1/lead/
856b6a95ffde8210b85dffffffffffd7" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data " {
  "lead_source": "inbount_web",
  "business_phone": "+1 (555) 123-4567",
  "do_not_share": true,
  "lead_score": 40,
  "stage": "300_nurturning",
  "do_not_email": false,
  "lead_type": "new_business",
  "work_notes": [
    {
      "text": "Work notes for lead"
    }
  ],
  "lead_rating": "200_warm",
  "lead_line_items": [
    {
      "sys_id" : "013daa19ffde8210b85dffffffffff82",
      "quantity": 10
    },
    {
      "product_offering": {
        "sys_id": "0b61dd9fd0a63110f8770dbf976be171"
      }
    }
  ]
}"
```

The response contains all lead record fields.

```
{
  "short_description": "Looking for a quote on preventative
 maintenance plans for their corporate office building
 elevators.",
```

lead - POST /sn_lead_mgmt_core/lead

Creates a lead record and its associated lead line items using the specified parameters.

Once processed, records are created in the following tables:

- Lead [sn_lead_mgmt_core_lead]
- Lead Line Item [sn_lead_mgmt_core_lead_line_item]

Rules for passed-in parameters:

- Invalid parameter names are ignored.
- Invalid values for non-mandatory choice and reference fields are ignored.
- If field WRITE access is denied for one or more fields, the restricted fields are ignored.
- You can't insert system field values using this API. Any provided values are ignored. System fields are a part of the ignored fields list, which is configurable.
- The values of the parameters *account*, *contact*, and *consumer* are ignored if both the *account* and *consumer* parameters are non-empty.
- Unless otherwise specified, the default value for all non-passed parameters is 'null'.

URL format

Versioned URL: `/api/sn_lead_mgmt_core/{api_version}/lead`

Default URL: `/api/sn_lead_mgmt_core/{api_version}/lead`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description

account	Details on the account associated with the lead.
	
	Data type: Object
	
	`"account": {`
	`  "sys_id": "String"`
	`}`

account.sys_id	Sys_id of the associated account record. Data type: String Table: Account [customer_account]
business_phone	Lead's business phone number. Data type: String
city	City in which the lead resides. Data type: String
company	Lead's company name. Data type: String

consumer	Consumer associated with the lead.
	
	Data type: Object
	
	`"consumer": {`
	`  "sys_id": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
consumer.sys_id	Sys_id of the associated consumer record. Data type: String Table: Consumer [csm_consumer]

contact	Contact associated with the lead account.
	
	Data type: Object
	
	`"contact": {`
	`  "sys_id": "String"`
	`}`

contact.sys_id	Sys_id of the associated contact record. Data type: String Table: Contact [customer_contact]
country	Country in which the lead resides. Data type: String
do_not_call	Flag that indicates whether the mode of communication is by phone. Valid values: • true: Can call contact. • false: Don't call contact. Data type: Boolean Default: false
do_not_email	Flag that indicates whether the mode of communication is by email. Valid values: • true: Can email contact. • false: Don't email contact. Data type: Boolean Default: false
do_not_share	Flag that indicates whether the lead details can be shared. Valid values: • true: Lead details can be shared. • false: Lead details can't be shared.

Request body parameters (continued)

Name	Description
	Data type: Boolean Default: false
email	Lead's email address. Data type: String
external_id	ID used by the system that generated the lead to identify the lead in the associated system. Data type: String
external_system	Name of the external system associated with the lead, such as HubSpot or pipedrive. Data type: String
first_name	First name of the contact associated with the lead. Data type: String
industry	Industry to which the lead belongs. Data type: String Table: Located in the *industry* field of the Account [customer_account] table.
last_name	Required. Last name of the contact associated with the lead. Data type: String

lead_group	Group to which the lead belongs.
	
	Data type: Object
	
	`"lead_group": {`
	`  "sys_id": "String"`
	`}`

lead_group.sys_id	Sys_id of the lead group record. Data type: String Table: Group [sys_user_group]

lead_line_items	List of lead line items to associated with the lead. Group to which the lead belongs.
	
	Data type: Object
	
	`"lead_line_items": [`
	`  {`
	`  "external_id": "String",`
	`  "external_system": "String",`

Request body parameters (continued)

Name	Description

	``
	"product_offering": {Object},
	"quantity": Number,
	"work_notes": [Array],
	"unit_of_measurement": {Object}
	}
	]
	``
	
	Maximum line items: 100 - any over that are ignored

lead_line_items.external_id	ID used by the system that generated the lead line item to identify the line item in the associated system. Data type: String
lead_line_items.external_system	Name of the external system associated with the lead line item, such as HubSpot or pipedrive. Data type: String

lead_line_items.product_offering	Required. Information about the product offering associated with the lead line item.
	
	Data type: Object
	
	``
	"product_offering": {
	"sys_id": "String"
	}
	``

lead_line_items.product_offering.sys_id	Required. Sys_id of the product offering record associated with the lead line item. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
lead_line_items.quantity	Quantity of items the lead wants to purchase of the associated product offering. Data type: Number (Integer) Default: 1

lead_line_items.unit_of_measurement	Details of the measuring unit of lead line item.
	
	Data type: Object
	
	``
	"unit_of_measurement": {
	"sys_id": "String"
	}
	``

lead_line_items.unit_of_measurement.sys_id	Sys_id of the record that describes the measuring unit.

Request body parameters (continued)

Name	Description
mobile_phone	Phone number of the contact for the lead. Data type: String
other_reason	Additional reason for the lead disqualification. Data type: String Max length: 160 characters

owner	Details of the person associated with the lead.
	
	Data type: Object
	
	`"owner": {`
	`  "sys_id": "String"`
	`}`

owner.sys_id	Sys_id of the user record of the person that owns the lead. Data type: String Table: User [sys_user]
reason	Reason for the lead disqualification such as, Disqualify. Data type: String Max length: 40 characters
short_description	Short description of the lead. Data type: String Max length: 160 characters

similar_lead	Details on any similar lead. Use this for possible lead disqualification.
	
	Data type: Object
	
	`"similar_lead": {`
	`  "sys_id": "String"`
	`}`

similar_lead.sys_id	Sys_id of the lead record that is a possible duplicate lead. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
stage	Stage of the lead such as, 100_new.

Request body parameters (continued)

Name	Description
	Note: This is a choice field. It must contain one of the choice items defined in the stage field of the Leads table. Data type: String Default: 100_new
state	State in which the lead resides. Data type: String
street	Street on which the lead resides. Data type: String
title	Lead's title. Data type: String
website	Lead's website URL. Data type: String
work_notes	List of work notes created for the lead. Data type: Array of Objects `"work_notes": [ { "text": "String" } ]` **Note:** An array of work notes in the request is inserted as a single text. This text is generated by combining the content from all work note objects in the request, with each entry separated by a comma (,). Default: Empty array
work_notes.text	Text of the note made by the author. Data type: String
zip	Zip code of the associated lead. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. Lead and its associated line items are inserted successfully.
400	Error. Possible reasons: • Invalid payload: Invalid/empty request body. • Invalid payload: Invalid field value for email/phone number fields. • Invalid payload: Mandatory field is absent, or its value is empty. • Business rule/data policy violation.
403	Forbidden. The user doesn't have access rights to the specified record.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

account	Account linked to the lead.
	Data type: Object
	`"account": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

account.name	Name of the account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
account.sys_id	Sys_id of the associated account record. Data type: String Table: Account [customer_account]
business_phone	Lead's business phone number. Data type: String
city	City in which the lead resides. Data type: String

closed_date	Date and time when the lead was closed.
	
	Data type: Object
	
	`"closed_date": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

closed_date.display_value	Date and time as displayed in the UI. Data type: String Format: User's format and time zone.
closed_date.value	Date and time that the lead closed as defined in the associated record. Data type: String Format: UTC
company	Lead's company name. Data type: String

consumer	Consumer associated with the lead.
	
	Data type: Object
	
	`"consumer": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

consumer.name	Name of the associated consumer. Data type: String
consumer.sys_id	Sys_id of the associated consumer record. Data type: String

Name	Description
	Table: Consumer [csm_consumer]

contact	Contact associated with the lead account.
	
	Data type: Object
	
	`"contact": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

contact.name	Contact's name. Data type: String
contact.sys_id	Sys_id of the associated contact record. Data type: String Table: Contact [customer_contact]
country	Country in which the lead resides. Data type: String
do_not_call	Flag that indicates whether the mode of communication is by phone. Valid values: • true: Can call contact. • false: Don't call contact. Data type: Boolean
do_not_email	Flag that indicates whether the mode of communication is by email. Valid values: • true: Can email contact. • false: Don't email contact. Data type: Boolean
do_not_share	Flag that indicates whether the lead details can be shared. Valid values: • true: Lead details can be shared. • false: Lead details can't be shared. Data type: Boolean
email	Lead's email address. Data type: String

Name	Description
external_id	ID used by the system that generated the lead to identify the lead in the associated system. Data type: String
external_system	Name of the external system associated with the lead, such as HubSpot or pipedrive. Data type: String
first_name	First name of the contact associated with the lead. Data type: String
industry	Industry to which the lead belongs. Data type: String Table: Located in the *industry* field of the Account [customer_account] table.
last_name	Last name of the contact associated with the lead. Data type: String

lead_group	Group to which the lead belongs.
	
	Data type: Object
	
	`"lead_group": {`
	`  "name: "String",`
	`  "sys_id": "String"`
	`}`

lead_group.name	Lead group's name. Data type: String
lead_group.sys_id	Sys_id of the lead group record. Data type: String Table: Group [sys_user_group]

lead_line_items	Details of the lead line items associated with the lead.
	
	Data type: Array of Objects
	
	`"lead_line_items": [`
	`  {`
	`  "external_id": "String",`
	`  "external_system": "String",`
	`  "lead": {Object},`
	`  "number": "String",`
	`  "product_offering": {Object},`
	`  "quantity": Number,`
	`  "sys_created_by": "String",`
	`  "sys_created_on {Object},`

Name	Description
	"sys_domain": "String", "sys_domain_path": "String", "sys_id": "String", "sys_mod_count": Number, "sys_tags": [Array], "sys_updated_by: "String", "sys_updated_on: {Object}, "unit_of_measurement": {Object}, "work_notes": [Array] }]
lead_line_items.external_id	ID used by the system that generated the lead line item to identify the line item in the associated system. Data type: String
lead_line_items.external_system	Name of the external system associated with the lead line item, such as HubSpot or pipedrive. Data type: String

lead_line_items.lead	Details about the lead associated with the line item.
	
	Data type: Object
	"lead: {
	"name": "String",
	"sys_id": "String"
	}

lead_line_items.lead.name	Associated lead's name. Data type: String
lead_line_items.lead.sys_id	Sys_id of the associated lead record. Data type: String
lead_line_items.number	Unique system-generated number of the lead line item record. Data type: String

lead_line_items.product_offering	Information about the product offering associated with the lead line item.
	
	Data type: Object
	"product_offering": {
	"code": " String",
	"name": "String",
	"sys_id": "String"
	}

lead_line_items. product_offering.code	Code linked to the product offering.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Note: This is a system-generated alphanumeric number based on the product name. Although system generated, you can edit the code to represent a SKU or any other industry specific product codes. Data type: String
lead_line_items.product_offering.name	Product offering's name. Data type: String
lead_line_items.product_offering.sys_id	Sys_id of the product offering record associated with the lead line item. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
lead_line_items.quantity	Quantity of items the lead wants to purchase of the associated product offering. Data type: Number (Integer)
lead_line_items.sys_created_by	User name of the person that created the lead line item. Data type: String

lead_line_items.sys_created_on	System-generated date and time that the lead line item was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items.sys_created_on.display_value	Date and time that the lead line item was created. Data type: String Format: Default instance format and time zone
lead_line_items.sys_created_on.value	Date and time that the lead line item was created. Data type: String Format: UTC
lead_line_items.sys_domain	Sys_id of the domain record to which the lead line item belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_domain_path	Path of the domain to which the lead line item belongs.

Name	Description
	Note: This parameter is only returned in the response if domain separation is enabled. Data type: String
lead_line_items.sys_id	Sys_id of the lead line item record. Data type: String
lead_line_items.sys_mod_count	Number of times the associated lead line item record has been modified. Data type: Number (Integer)
lead_line_items.sys_tags	List of system tags associated with the lead line item. Data type: Array
lead_line_items.sys_updated_by	User name of the person that last updated the associated lead line item. Data type: String

lead_line_items.sys_updated_on	System-generated date and time when the lead line item was last updated.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

lead_line_items.sys_updated_on.display_value	Date and time that the lead line item was last updated. Data type: String Format: Default instance format and time zone
lead_line_items.sys_updated_on.value	Date and time that the lead line item was last updated. Data type: String Format: UTC

lead_line_items.unit_of_measurement	Details of the measuring unit of lead line item.
	
	Data type: Object
	
	`"unit_of_measurement": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

lead_line_items.unit_of_measurement.name	Name of the measuring unit such as, each or cubic foot. Data type: String

Name	Description
lead_line_items. unit_of_measurement.sys_id	Sys_id of the record that describes the measuring unit. Data type: String Table: Unit of Measure [sn_prd_pm_uom]
lead_line_items.work_notes	List that describes the work notes created for the lead line item. Data type: Array of Objects `"work_notes": [ { "author": "String", "date": "String", "text": "String" } ]`
lead_line_items.work_notes. author	User name of the person that authored the associated work note. Data type: String
lead_line_items.work_notes.date	Date that the note was created. Data type: String
lead_line_items.work_notes.text	Text of the note made by the author. Data type: String
lead_rating	Rating for the lead such as, 100_cold, 200_warm, 300_hot, or 400_super_hot. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_rating field of the Leads table. Data type: String
lead_score	Score for the lead. Data type: Decimal Range: 1 to 100
lead_source	Originator of the lead. **Note:** This is a choice field. It must contain one of the choice items defined in the lead_source field of the Leads table. Data type: String
lead_type	Type of lead, such as New Business or Existing Business.

Name	Description
	Note: This is a choice field. It must contain one of the choice items defined in the lead_type field of the Leads table. Data type: String
middle_name	Middle name of the contact for the lead. Data type: String
mobile_phone	Phone number of the contact for the lead. Data type: String
number	Unique system-generated number of the lead record. Data type: String
other_reason	Additional reason for the lead disqualification. Data type: String Max length: 160 characters

owner	Details of the person associated with the lead.
	
	Data type: Object
	
	`"owner": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

owner.name	Name of the person that owns the lead. Data type: String
owner.sys_id	Sys_id of the user record of the person that owns the lead. Data type: String Table: User [sys_user]
reason	Reason for the lead disqualification such as, Disqualify. Data type: String Max length: 40 characters
short_description	Short description of the lead. Data type: String Max length: 160 characters
similar_lead	Details on any similar lead. Use this for possible lead disqualification. Data type: Object

Name	Description

	`"similar_lead": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

similar_lead.name	Name of the duplicate lead. Data type: String
similar_lead.sys_id	Sys_id of the lead record that is a possible duplicate lead. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
stage	Stage of the lead such as, 100_new. **Note:** This is a choice field. It must contain one of the choice items defined in the stage field of the Leads table. Data type: String
state	State in which the lead resides. Data type: String
street	Street on which the lead resides. Data type: String
sys_class_name	System-generated class name of the Lead table. Data type: String
sys_created_by	User name of the person that created the lead. Data type: String

sys_created_on	System-generated date and time that the lead was created.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

sys_created_on.display_value	Date and time when the lead was created. Data type: String Format: Default instance format and time zone
sys_created_on.value	Date and time when the lead was created. Data type: String

Name	Description
	Format: UTC
sys_domain	Sys_id of the domain record to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
sys_domain_path	Path of the domain to which the lead belongs. **Note:** This parameter is only returned in the response if domain separation is enabled. Data type: String
sys_id	Sys_id of the lead record. Data type: String Table: Lead [sn_lead_mgmt_core_lead]
sys_mod_count	Number of times the associated lead record has been modified. Data type: Number (Integer)
sys_tags	List of system tags associated with the lead. You can use these tags to categorize leads. Data type: Array
sys_updated_by	User name of the person that last updated the lead record. Data type: String

sys_updated_on	System-generated date and time when the lead was last updated.
	
	Data type: Object
	
	`"sys_created_on": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

sys_updated_on.display_value	Date and time that the lead was last updated. Data type: String Format: Instance's default format and time zone
sys_updated_on.value	Date and time that the lead was last updated. Data type: String Format: UTC

Name	Description
title	Lead's title. Data type: String
website	Lead's website URL. Data type: String
work_notes	List of work notes created for the lead. Data type: Array of Objects `"work_notes": [ { "author": "String", "date": "String", "text": "String" } ]`
work_notes.author	User name of the person that authored the associated work note. Data type: String
work_notes.date	Date that the note was created. Data type: String
work_notes.text	Text of the note made by the author. Data type: String
zip	Zip code of the associated lead. Data type: String

Example: cURL request

The following code example shows how to create a new lead record with one lead line item.

```
curl "
 https://instance.service-now.com/api/sn_lead_mgmt_core/v1/lead"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data " {
    "short_description": "Looking for a quote on preventative
 maintenance plans for their corporate office building
 elevators.",
    "country": "USA",
    "city": "San Francisco",
    "lead_source": "inbound_phone",
    "industry": "manufacturing",
    "title": "Director of Building operations",
    "business_phone": "+1 (555) 123-4567",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "street": "789, Industrial drive",
    "company": "Lee Manufacturing Inc",
    "state": "CA",
    "first_name": "James",
    "email": "james.wilson@email.com",
    "consumer": {
      "sys_id": "46ce64ef99ca5210f8779c3cc41bb03c"
    },
    "zip": "94016",
    "website": "example.com",
    "last_name": "Wilson",
    "middle_name": null,
    "do_not_share": false,
    "lead_score": 92,
    "stage": "100_new",
    "do_not_email": false,
    "lead_type": "existing_business",
    "work_notes": [
      {
        "text": "Work notes for lead"
      }
    ],
    "do_not_call": true,
    "lead_rating": "200_warm",
    "lead_line_items": [
      {
        "quantity": 1,
        "product_offering": {
          "sys_id": "32619d9fd0a63110f8770dbf976be1f9"
        },
        "unit_of_measurement": {
          "sys_id": "cb2795d553020110286eddeeff7b12ff"
        }
      }
  ]
}
```

The response contains the fields in the lead and lead line items records.

MetricBase Time Series API

The *`MetricBase Time Series`* API provides endpoints to insert data into, retrieve information from, and to run transforms against a MetricBase database.

This API can only be used when the MetricBase plugin (com.snc.clotho) is installed and activated.

Role required to write to this API: clotho_rest_put.

The examples in this section were created using data in the MetricBase (com.snc.clotho) plugin.

MetricBase Time Series - GET /now/clotho/table/{table}/{subject}/{metric}

Retrieves specified time series data from the MetricBase database.

URL format

Versioned URL: `/api/now/{api_version}/clotho/table/{table}/{subject}/{metric}`

Supported request parameters

Path parameters

Name	Description
api_version	
metric	Name of the column in the table identified in the *`subject`* parameter to use as the metric. Data type: String
subject	Sys_id of the GlideRecord associated with this series. Data type: String
table	Name of the table containing the GlideRecord associated with this series. Data type: String

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to label the result data with the subject record display value if no other label is specified. Valid values: • true: Result data is labeled with the subject record display value. • false: Result data is not labeled with the subject record display value. Data type: Boolean Default: false
sysparm_end	Required. End time of the evaluation period. An empty or missing value is treated as the current time. Time values are inclusive of this end time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55`. • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
sysparm_start	Required. Start time of the evaluation period. The special value `all` can be used to set the start time as the current time minus the

Query parameters (continued)

Name	Description
	maximum retention period for the specified metrics. An empty or missing value is treated as an implicit `all`. Time values are inclusive of this start time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55` • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
label	Label used to identify this metric's result set. Data type: String
seriesRef	Data series results. Data type: Array of Objects `"seriesRef": [ { "metric": "String", "subject": "String", "table": "String" } ]`
seriesRef.metric	Name of the metric from which the data series was obtained. Only appears if the *metrics* object is passed in the request. Data type: String
seriesRef.subject	Sys_id of the data series record. Located in the table specified in *seriesRef.table*. Data type: String
seriesRef.table	Name of the table from where the data series was obtained. Data type: String
values	Transformed series values. Data type: Array of Objects `"values": [ { "timestamp": "String", "value": Number } ]`
values.timestamp	Timestamp of the value. Data type: String Format: ISO 8601
values.value	Metric values. Data type: Number

MetricBase Time Series - POST /now/clotho/accumulate

Accumulates metric values at specified timestamp and saves the result to the database rather than overwriting the value.

Use this API to handle metrics that can be summed for an accumulation, such as kilowatt-hours (kWhs) of electricity. Accumulate makes a call for each metric at the provided timestamp. For example, collected kilowatts for a heater, electric kettle, and washing machine would result in three calls to accumulate.

URL format

Versioned URL: `/api/now/{api_version}/clotho/accumulate`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
default_value	Default value for accumulation at a given timestamp. Used only during the first call to accumulate if a value is unavailable for a given timestamp. A use case could be accumulating a watts metric for a total_power. You want to accumulate watts for a router connected to an outlet without a power meter to measure it. If you know the consumption value and it is constant), you can use the constant value as a default value to accumulate total_power. For example, you would use 20 if the router is constantly plugged in and consumes 20 Watts. Data type: String Default: 0
sysparm_ignore_unknown_series	Flag that indicates whether to ignore an unknown series and continue the transaction without returning an error. Valid values: • true: Ignore unknown series. • false: Don't ignore unknown series. Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
seriesRef	List of strings representing data series information to update. Data type: Array `"seriesRef": [ { "metric": "String", "subject": "String", "table": "String" } ]`
seriesRef.metric	Required. Name of the accumulating metric to update. Data type: String
seriesRef.subject	Required. Sys_id of the record in which to update the data. Data type: String Table: Specified in *`seriesRef.table`*
seriesRef.table	Required. Name of the table in which to save the data. Data type: String
values	Required. Series values to accumulate and store. Values with the same timestamp are summed up with the *`default_value`* query parameter. Data type: Array `"values": [ { "timestamp": "String", "value": Number } ]`
values.timestamp	Required. ISO 8601 timestamp of the value. Data type: String Format: YYYY-MM-ddTHH:mm:ddZ The character represented by 'Z' denotes the UTC time zone in an ISO-formatted timestamp. This portion of the timestamp format is optional. Example: `2019-03-21T17:05:00Z`
values.value	Required. Metric value. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
message	Message indicating success (OK) or error.

Example: cURL request

This example shows how to accumulate metric values at a given timestamp.

```
curl
 "https://instance.servicenow.com/api/now/v1/clotho/accumulate"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"seriesRef\": {
    \"subject\": \"3D666b051787333200a328c5b836cb0b92\",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    \"table\": \"power_monitoring\",
    \"metric\": \"total_power\"
  },
  \"values\": [
    {
      \"timestamp\": \"2019-03-21T17:05:00Z\",
      \"value\": 0.150185
    },
    {
      \"timestamp\": \"2019-03-21T17:05:00Z \",
      \"value\": 0.46074
    },
    {
      \"timestamp\": \"2019-03-21T17:05:00Z \",
      \"value\": 0.83104
    },
    {
      \"timestamp\": \"2019-03-21T17:05:00Z \",
      \"value\": 1.260635
    },
    {
      \"timestamp\": \"2019-03-21T17:05:00Z \",
      \"value\": 1.749
    }
  ]
}" \
--user "username":"password"
```

Output provided with successful results.

```
{
    "result": {
        "message": "ok"
    }
}
```

MetricBase Time Series - POST /now/clotho/transform

Retrieves and optionally groups time series data for one or more metrics after applying a specified list of transforms that form a linear pipeline.

URL format

Versioned URL: `/api/now/{api_version}/clotho/transform`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to label the result data with the subject record display value if no other label is specified. Valid values: • true: Result data is labeled with the subject record display value. • false: Result data is not labeled with the subject record display value. Data type: Boolean Default: false

Request body parameters (XML or JSON)

Name	Description
end	Required. End time of the evaluation period. An empty or missing value is treated as the current time. Time values are inclusive of this end time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55`. • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
limit	Maximum number of records to return. Unusually large values can impact system performance. Data type: Number Default: 10,000
metrics	List of metrics objects to use in the transform. For more information on metrics, see Metrics. Data type: Array `"metrics": [ { "groupBy": "String" "label": "String", "metric": "String", "transforms": [Array] } ]`
metrics.groupBy	Comma-separated list of fields, contained in the table specified in the *`table`* parameter, to group the series by before collecting or applying aggregated transformations.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	The order of the items in the list is the order in which the data is grouped by. For example, if there are two items in the list, "state, zip code", then the series is first grouped by state and then by zip code within the state. Data type: String Default: Data is not grouped.
metrics.label	Label to use for this metric's result set. It replaces any labels generated by the transform chain. Data type: String Default: Generated default label.
metrics.metric	Required if *metrics* object is passed. Metric field to use in the transform. This field must be in the table specified in the *table* parameter. Data type: String
metrics.transforms	List of transforms (transform chain) to apply to the retrieved time series data. Each transform builds on the results of the previous transform. For a list of available transforms, see Supported Transforms below. Data type: Array of Objects `"transforms": [ { "arg": {Object}, "name": "String" } ]`
metrics.transforms.arg	Dependent on the transform. Parameter or parameters to pass into the transform. General guidelines: • Don't use the *arg* parameter when specifying transformations that do not take a parameter. • Use Number, String, or Boolean for transforms that take a single parameter. • Use a JSON object, with the appropriate name-value pairs, for transforms that take more than one parameter. Data type: Number, String, Boolean, or JSON object, depending on transform. (For a list of available transforms, refer to the table Supported transforms below.)
metrics.transforms.name	Required if a *transforms* object is specified. Name of the transform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	For a list of available transforms, refer to the table Supported transforms below. Data type: String
query	Encoded query to use to filter the result set. You can compose the query using the specified table's filter editor. Once created, select **Copy URL** from the filter's breadcrumbs context menu. Data type: String Default: None
start	Required. Start time of the evaluation period. The special value `all` can be used to set the start time as the current time minus the maximum retention period for the specified metrics. An empty or missing value is treated as an implicit `all`. Time values are inclusive of this start time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55` • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
table	Required. Name of the table that contains the GlideRecord associated with this series. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
results	Zero or more return result objects that satisfy the query. Contains either a *series* array or a *grouped* array. Data type: Array `"results":[ { "grouped": [Array], "marker": "String", "series": [Array] } ]`
results.grouped	List of grouped result objects where each *grouped* result object corresponds to a specific group. This format is returned when the *metrics.groupBy* parameter is passed in the request body. Data type: Array `"grouped": [ { "groupingBy": "String", "groups": [Array]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`}` `]`
results.grouped.groupingBy	Value passed in the *`metrics.groupBy`* parameter in the request. Data type: String

results.grouped.groups	List of generated groups based on the content of the *`metrics.groupBy`* parameter in the request.
	
	Data type: Array
	
	`"groups": [`
	`  {`
	`  "group": "String",`
	`  "label": "String",`
	`  "series": {Object}`
	`  }`
	`]`

results.grouped.groups.group	Name of the group. Data type: String
results.grouped.groups.label	Label of the group. Data type: String

results.grouped.groups.series	Transformed values for the group's result.
	
	Data type: Array
	
	`"series": [`
	`  {`
	`  "label": "String",`
	`  "seriesRef": {Object},`
	`  "values": [Array]`
	`  }`
	`]`

results.grouped.groups.series.label	Label of the series. Data type: String

results.grouped.groups.series.seriesRef	Results of a single data series. Does not appear if there are multiple data series in the response.
	
	Data type: Object
	
	`"seriesRef": {`
	`  "metric": "String",`
	`  "subject": "String",`
	`  "table": "String"`
	`}`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
results.grouped.groups.series.seriesRef.metric	Name of the metric from which the data series was obtained. Only appears if the *metrics* object is passed in the request. Data type: String
results.grouped.groups.series.seriesRef.subject	Sys_id of the data series record.. Data type: String Table: Table specified the in *results.series.seriesRef.table* parameter.
results.grouped.groups.series.seriesRef.table	Name of the table from where the data series was obtained. Data type: String
results.grouped.groups.series.values	List of result values for the group. Data type: Array `"values": [ { "timestamp": "String", "value": Number } ]`
results.grouped.groups.series.values.timestamp	ISO 8601 timestamp of the value. Data type: String
results.grouped.groups.series.values.value	Transformed value. Data type: Number
results.marker	Unique identifier for the corresponding results. Data type: String
results.series	List of ungrouped series of result objects. Data type: Array of Objects `"series": [ { "label": "String", "seriesRef": {Object}, "values": [Array] } ]`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
results.series.label	Data series label. This value is either generated by the endpoint or is the value passed in the *metrics.label* parameter. Data type: String

results.series.seriesRef	Results of a single data series. Does not appear if there are multiple data series in the response.
	
	Data type: Object
	
	`"seriesRef": {`
	`  "metric": "String",`
	`  "subject": "String",`
	`  "table": "String"`
	`}`

results.series.seriesRef.metric	Name of the metric from which the data series was obtained. Only appears if the *metrics* object is passed in the request. Data type: String
results.series.seriesRef.subject	Sys_id of the data series record. Data type: String Table: Secified in the *results.series.seriesRef.table* parameter.
results.series.seriesRef.table	Name of the table from where the data series was obtained. Data type: String

results.series.values	Transformed series values.
	
	Data type: Array of Objects
	
	`"values": [`
	`  {`
	`  "timestamp": "String",`
	`  "value": Number`
	`  }`
	`]`

results.series.values.timestamp	ISO 8601 timestamp of the value. Data type: String
results.series.values.value	Transformed value. Data type: Number

Supported transforms

Transform data types

Transform	Description
add	Adds the specified number to each timestamp value. Argument: arg (Decimal data type) – Number to add. For example: `"transforms": [ { "name": "add", "arg": 8 } ]`
autocorrelate	Calculates the correlation between timestamp values separated by an increasing number of periods starting at 1.
avg	Aggregates the time series into one series containing the average value for each corresponding timestamp across the input.
bottom	Returns the specified number of series that have the lowest values. Argument: `arg` (Integer) – The number of series to return. For example, the following returns the two time series that contain the lowest sets of values. `"transforms": [ { "name": "bottom", "arg": 2 } ]`
ceil	Rounds the value in each timestamp up to the specified precision: `ceil(value / <arg>) * <arg>)` Argument: arg (Decimal data type) – Decimal precision to round up to.
collect	Displays the transform results of the transform chain up to the point of the collect transform call. Collect transform results contain a unique marker, but you may want to also define a label. For example: `{ "start": "PT1H", "end": "", "table": "mb_demo_drone", "limit": 5000, "metrics": [ { "metric": "mb_demo_mt_altitude", "transforms": [ {`

Transform data types (continued)

Transform	Description

	<pre>"name": "label",
	"arg": "Series Timestamp Values"
	},
	{
	"name": "collect"
	},
	{
	"name": "avg"
	},
	{
	"name": "label",
	"arg": "Average Timestamp Values"
	}
	]
	}
	]
	}</pre>

constrainValues	Replaces any value outside the specified range with the corresponding maximum or minimum value.
	
	For example, if you specified the following, the transform replaces any value that is less than 0 with 0, and any value that is more than 100 with 100.
	
	<pre>"transforms": [
	{
	"name": "constrainValues",
	"val1": 0,
	"val2": 100
	}
	]</pre>
	Arguments:
	• val1 (Decimal data type): Minimum or maximum value.
	• val2 (Decimal data type): Minimum or maximum value.

count	Aggregates the time series into one series. The new series contains the number of values that are not NaN (Not a Number) for each corresponding timestamp across the series.
derivative	Determines the rate of change between timestamps. Divides the difference between the value in each timestamp and the value in the next timestamp by the timestamp's period. **Note:** This transform returns one less value than the number of values in the series.
div	Divides the value in each timestamp by the specified number (arg). Argument: arg (Decimal – The number by which to divide the value of each timestamp.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
envelope	Returns two time series, where, at any point in time, one contains the largest value and the other contains the smallest value. **Note:** NaNs are ignored, but are returned if there are no other return values.
exp	Raises the value of the specified base to the power of the value in each timestamp. Argument: arg (Decimal data type) – The base value.
filter	Applies an aggregator to the contents of a sliding window, such as producing a moving average. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • window (Duration data type): The duration of the sliding window.
floor	Rounds the value in each timestamp down to the specified precision: `floor(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round down to.
fractiles	Returns a time series for each fraction in the specified array. Each timestamp value is the value at which the specified fraction of values, for the corresponding timestamp across the input series, is below the specified percentage. For example, if the fraction is 0.5, then the value in the timestamp is the value where half the values in the input series are below 0.5. Argument: arg (Array of Decimal) – The fractions to use on the input series. For example: `"transforms": [ { "name": "fractiles", "arg": [0.25, 0.5, 0.75, 1] } ]`
groupBy	Groups data by the specified fields before collecting or applying aggregated transformations. Argument: arg (String) - A comma separated list of fields in the table to use to group the transform results. For example: `"transforms": [ { "name": "groupBy", "arg": "model" }, {`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description

	`"name": "avg"`
	`},`
	`{`
	`"name": "label",`
	`"arg": "Model: %g"`
	`}`
	`]`

integrate	Multiplies the value in each timestamp by its period.
interpolate	Creates a data value for a NaN data item by interpolating from adjacent data values. Argument: arg (Integer) – Number of data samples in each direction to check for a non-NaN value. If a non-NaN value is not found, then NaN is used.
inverse	Computes the inverse of each timestamp value.
iqr	Performs an interquartile range transform and creates a result set that contains four series: **1.** -IQR: The median of all entries below `Q1 - (1.5 * IQR)`. **2.** Q1: The median of the smallest half of entries. **3.** Q3: The median of the largest half of entries. **4.** +IQR: The median of all entries above `Q3 + (1.5 * IQR)`. **Note:** `IQR = Q3 - Q1`

label	Labels a transformation chain.
	
	Note: Subsequent transformations may modify or replace the label.
	
	Argument: arg (String) – Text of the label. Can contain the following formatting expressions:
	• %%: Escape a "%" literal.
	• %l: Current label that is being replaced.
	• %s: Series subject.
	• %g: Value of the group by field. If this is a referenced record, then the value of the record's name field. If multiple groups are specified in the *groupBy* transform, labels are comma separated.
	• %G: Value of the group by field. If this is a referenced record, then the record's sys_id. If multiple groups are selected, values are comma separated.
	
	For example:
	`"transforms": [`
	`{`
	`"name": "label",`
	`"arg": "Series Timestamp Values"`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description

	`},`
	`]`
	`"transforms": [`
	`  {`
	`  "name": "groupBy",`
	`  "arg": "model"`
	`  },`
	`  {`
	`  "name": "avg"`
	`  },`
	`  {`
	`  "name": "label",`
	`  "arg": "Model: %g"`
	`  }`
	`]`

limit	Returns, at most, the specified duration or number of values, starting with the most recently saved value. Arguments: • arg (Integer): Number of timestamp values to return for each time series. OR • arg (Duration data type): Duration to limit each time series to.
log	Runs a logarithm on the value in each timestamp where the result is the log of the specified base for the timestamp value. Argument: arg (Decimal data type) – Base for the logarithm calculation.

mapValues	Replaces any values within the specified range (inclusive) with the specified value. If both *`lowerBound`* and *`upperBound`* are specified as NaN, then it replaces any NaN value with the *`targetValue`*.
	
	Arguments:
	• lowerBound (Decimal data type): The lowest value in the range.
	• upperBound (Decimal data type): The highest value in the range.
	• targetValue (Decimal data type): Replacement value.
	
	For example, the following changes all values in the time series that are between .1 and .9 to 1:
	`"transforms": [`
	`  {`
	`  "name": "mapValues",`
	`  "lowerBound": .1,`
	`  "upperBound": .9,`
	`  "targetValue": 1`
	`  }`
	`]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
max	Returns a series that contains the maximum value for each corresponding timestamp across the input.
median	Creates a series that contains the median of values for each timestamp across a set of series. If there are `n` series: • If `n` is odd, the median is the `(n / 2 + 1)` value for a timestamp. • If `n` is even, the median is the average of the `(n / 2)` and `(n / 2 + 1)` values for a timestamp.
min	Returns a series that contains the minimum value for each corresponding timestamp across the input.
mul	Multiplies the value in each timestamp by the specified number. Argument: arg (Decimal data type) – Number by which to multiply the value of each timestamp.
partition	Produces a new series with values filtered by applying a specified aggregator to a non-overlapping window. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • base (DateTime data type): The zero offset to use for partitioning. For example, to partition by day (24h), set this value to Monday at midnight in your time zone. To partition by a 30-day period, set this value to the first day of the most recent month. Default: Beginning of the EPOCH. • window (Duration data type): The duration of the non-overlapping window to apply the aggregator.
pow	Raises each timestamp value to the specified power. Argument: arg (Decimal data type) – Power to which to raise each value.
product	Aggregates the selected metric series into a single series that contains the product of all values for each timestamp. NaNs are excluded. If all numbers in the series are NaN, the output is also NaN.
resample	Resamples a time series to either a fixed number of points or from one frequency to another. Use the resample transformation to reduce the number of samples in the result set to more closely match the number of samples that you want to display. Arguments: You can pass various arguments for this transform. Below is a list of each of the possible argument groups. Only one of these argument groups can be passed within a single transform. The following argument groups are delineated by AND/OR. AND meaning the argument is part of the current group; OR meaning it is the start of a new argument group.

Transform data types (continued)

Transform	Description
	• arg (Integer): Number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • arg (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • values (Integer): The number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *aggregator* to them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • period (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *aggregator* to them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND

Transform data types (continued)

Transform	Description
	• minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them.
round	Rounds the value in each timestamp up to the specified precision: `(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round up to.
root	Calculates the root of each timestamp value using the specified index. Argument: arg (Decimal data type) – The index of the root. For example, the following returns the square root of each timestamp: `"transforms": [ { "name": "root", "arg": "2" }, ]`
stddev	Creates a series that contains the standard deviation of values for each timestamp across a set of series.
sub	Subtracts the specified number from the value in each timestamp. Argument: arg (Number) – The number to subtract from the value in each timestamp.
sum	Aggregates the selected metric series into one series that contains the sum of all values for each timestamp, excluding any NaNs. If all numbers in the series are NaN, the output is NaN.
timeshift	Shifts the time range by adding the specified offset to a value's timestamp without modifying the value. Use this transform to shift timestamps to another timezone. Argument: arg (Duration data type) – The amount of time to shift by.
top	Returns the specified number of series that have the highest values. Argument: arg (Integer) – The number of series to return. For example, the following returns the two time series that contain the highest sets of values. `"transforms": [ { "name": "top", "arg": 2`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	`}` `]`

Data type	Description
Aggregator	Available aggregators to use within the transform. • AVG: Calculates the arithmetic mean of all currently selected series. • CHISQUARE: Shows how well a statistical model fits the metric dataset. • LAST: Returns the last defined value in the period window. • MAX: Shows the largest value for the metric dataset, at each point in time. • MEDIAN: Shows the median of the metric dataset. The median separates the higher values of the metric dataset from the lower values. • MIN: Shows the smallest value for the metric dataset, at each point in time. • STDDEV: Calculates the standard deviation across the underlying data. Used to quantify the variation or dispersion of a set of data values in the metric dataset. • SUM: Calculates the sum across all currently selected series.
DateTime	Absolute date/time values are specified by the ISO 8601 date and time format: `YYYY-MM-DDThh:mm:ss`. For example: 2020-02-28T13:10:42. Where: • [YYYY]: Four-digit year. • [MM]: Zero-padded month between 01 and 12. • [DD]: Zero-padded day between 01 and 31. • T: Represents time and is mandatory before any of the time components are specified. • [hh]: Zero-padded hour between 00 and 23. • [mm]: Zero-padded minutes between 00 and 59. • [ss]: Zero-padded seconds between 00 and 59. Note that leap seconds are spread out evenly across the previous 1,000 seconds. Relative date/time values are specified using a duration (Duration data type), which is subtracted from the current time. For example: P7D = seven days ago.
Decimal	Decimal value that can either be: • A signed decimal number of arbitrary precision that can use exponential notation. Such as: ○ 2 ○ 1.7

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description
	○ -3.47 ○ 1.0E+2 • A string representation of: ○ A signed decimal number that may use exponential notation and is guaranteed to be a double-precision 64-bit IEEE 754 floating-point number. ○ "NaN" ○ "-Infinity" ○ "+Infinity"
Duration	Amount of time in a time interval. Duration values are specified by the ISO 8601 duration format: `P[n]Y[n]M[n]DT[n]H[n]M[n]S` Where: • P: Duration designator, referred to as "period", and is always placed at the beginning of the duration. • [n]Y: Number of years. • [n]M: Number of months. • [n]D: Number of days. • T: Time designator and is mandatory before any of the time components are specified. • [n]H: Number of hours. • [n]M: Number of minutes. • [n]S: Number of seconds. For example: • P7D: Period of seven days. • P1M: Period of one month. • PT15M: Period of 15 minutes. • P1DT12H: Period of one day and twelve hours.

  }
]
```

MetricBase Time Series - POST /now/clotho/transform/stream

Returns a stream of transformed time series data for one or more metrics after applying the specified list of transforms.

Streaming data in this manner allows you to process the data as individual transforms are completed and returned, rather than waiting for all transform results to be completed and downloaded. If large amounts of data need to be processed by the client, this type of processing reduces the end-to-end processing time and potentially reduces the memory usage on the client.

By setting the corresponding Accept header value in your request, you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Specify the streamed data to be encoded in a binary format,
- Serialize streamed data into a JSON array, or
- Stream data back to the client in a wide or narrow CSV format.

The endpoint streams the data as transforms are completed on the MetricBase server, without groupings or a predetermined ordering. Data streamed in binary format is smaller in size than the JSON representation returned by the MetricBase Time Series - POST /now/clotho/transform endpoint.

URL format

Versioned URL: `/api/now/{api_version}/clotho/transform/stream`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to label the result data with the subject record display value if no other label is specified. Valid values: • true: Result data is labeled with the subject record display value. • false: Result data is not labeled with the subject record display value. Data type: Boolean Default: false

Request body parameters (XML or JSON)

Name	Description
end	Required. End time of the evaluation period. An empty or missing value is treated as the current time. Time values are inclusive of this end time. Data type: String Format: ISO 8601 (UTC), either:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55`. • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
limit	Maximum number of records to return. Unusually large values can impact system performance. Data type: Number Default: 10,000
metrics	List of metrics objects to use in the transform. For more information on metrics, see Metrics. Data type: Array `"metrics": [ { "label": "String", "metric": "String", "transforms": [Array] } ]`
metrics.label	Label to use for this metric's result set. It replaces any labels generated by the transform chain. Data type: String Default: Generated default label.
metrics.metric	Required if *`metrics`* object is passed. Metric field to use in the transform. This field must be in the table specified in the *`table`* parameter. Data type: String
metrics.transforms	List of transforms (transform chain) to apply to the retrieved time series data. Each transform builds on the results of the previous transform. For a list of available transforms, see Supported Transforms below. Data type: Array of Objects `"transforms": [ { "arg": {Object}, "name": "String" } ]`
metrics.transforms.arg	Dependent on the transform. Parameter or parameters to pass into the transform.

Request body parameters (XML or JSON) (continued)

Name	Description
	General guidelines: • Don't use the *arg* parameter when specifying transformations that do not take a parameter. • Use Number, String, or Boolean for transforms that take a single parameter. • Use a JSON object, with the appropriate name-value pairs, for transforms that take more than one parameter. Data type: Number, String, Boolean, or JSON object, depending on transform. (For a list of available transforms, refer to the table Supported transforms below.)
metrics.transforms.name	Required if a *transforms* object is specified. Name of the transform. For a list of available transforms, refer to the table Supported transforms below. Data type: String
query	Encoded query to use to filter the result set. You can compose the query using the specified table's filter editor. Once created, select **Copy URL** from the filter's breadcrumbs context menu. Data type: String Default: None
start	Required. Start time of the evaluation period. The special value `all` can be used to set the start time as the current time minus the maximum retention period for the specified metrics. An empty or missing value is treated as an implicit `all`. Time values are inclusive of this start time. Data type: String Format: ISO 8601 (UTC), either: • Absolute date format [YYYY-MM-DDThh:mm:ss], such as `2019-03-20T17:04:55` • Relative to current time duration format `[P(n)Y(n)M(n)DT(n)H(n)M(n)S]`, such as `P1M`.
table	Required. Name of the table that contains the GlideRecord associated with this series. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supports the following: • *application/json* • *application/octet-stream* or • *text/csv* To specify the CSV format, use `text/csv;format=narrow` or `text/csv;format=wide`.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	Data format of the response body. Based on the specified Accept values of the request, use: • *application/json* • *application/octet-stream* or • *text/csv* If multiple Accept types are specified, the first supported type is returned.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed and data will begin streaming. **Note:** A 200 response can still incur a processing error midstream as the transforms are computed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (Octet-stream or JSON)

Name	Description
Output Stream (Octet-Stream)	If the Accept request header is set to *application/octet-stream*, the matching MetricBase data is returned as a binary serialized stream. The Clotho-Util for Java applications provide a deserializer that enables you to parse this data. The stream consists of a binary serialization of each datum, preceded by an integer representing its length. The following entries describe the data within the binary representation and the order of that data.
CSV Stream (UTF-8 Stream)	If the Accept request header is set to *text/csv*, the matching MetricBase data is returned as UTF-8 encoded CSV data in wide or narrow formats. A narrow format returns subject and time stamp columns and a column for each returned metric. A wide format returns a time stamp column with a separate column for each metric-subject pair.
Subject	Source of the data. For example, if the metric for the data is drone altitudes, this value may be the ID of a specific drone. If a colon is included in the value, the parts after the subject represent the metric that the data is a part of. Null values are represented by an encoded empty string. Data type: String (Java Modified UTF) Size: 2+ bytes
Dimension	Metric that the data is from. Null values are represented by an encoded empty string. Data type: String (Java Modified UTF) Size: 2+ bytes
Label	Label of the data. Null values are represented by an encoded empty string. Data type: String (Java Modified UTF) Size: 2+ bytes
Type	Type of data encoded into a byte. Possible values: • Float Mode • Float Signal

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Double Model • Double Signal Data type: Byte Size: 1 byte
Flags	Encoded *serializeFlags* variable. If *serializeTags* is true and the data contains tags, the value is 2, otherwise it is 0. Data type: Byte Size: 1 byte
Period	Period associated with the data. Data type: Number (Integer) Size: 4 bytes
Number of Tags	If *serializeTags* is true, then this is the number of tags stored in the data. Data type: Number (Integer) Size: 4 bytes
Tags	If *serializeTags* is true, each tag is stored in the data. Data type: String (Java modified UTF) Size: Depends on number of tags (2+ bytes).
Start Epoch Second	Epoch UTC time representing the start time of this data series. Data type: Number (Long) Size: 8 bytes
Number of Values	Number of values stored in this data. Data type: Number (Integer) Size: 4 bytes
Values	If *Type* is `Float Signal`, then the remainder consists of float values. Size: *Number of Values* * 4 Data type: Number (Float)
Values	If *Type* is `Double Signal`, then the remainder consists of double values. Data type: Number (Double) Size: *Number of Values* * 4 bytes

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Model Json (Model)	If *`Type`* is `Float Model` or `Double Model`, the remainder is a Java Modified UTF String representing the model as JSON. Data type: String (Java Modified UTF) Size: 2+ bytes
Big Model Marker (Big Model)	If the length of the model's JSON is greater than 65,535 bytes, then this field is written instead of the *`Model Json`*. Data type: String (Java Modified UTF) Size: 5
Big Model Size (Big Model)	Length of the JSON representation of the big model. Data type: Number (Integer) Size: 4 bytes
Big Model Json (Big Model)	JSON representation of the model as a series of UTF characters, The size is dictated by the *`Big Model Size`* field. Data type: String (UTF chars) Size: 65535-256000 bytes
JSON Stream (JSON)	If the Accept request header is set to *`application/json`*, the matching MetricBase data is returned as a stream of new line separated JSON objects. The following entries describe the possible elements in each returned object.
label	Data's label. This value is either generated by the endpoint or is the value passed in the *`metrics.label`* parameter. Data type: String
period	Amount of time between each value. For example, a period of 60 would mean that each value is a minute apart. Data type: Number Unit: Seconds
range	Start and end times of the data Data type: Array Format: ISO 8601 (UTC)
series	Identifies the individual data. If present, is typically in the form of `[glide record id]:[metric]`. This may not be present when using transforms. Data type: String
species	Type of return data. For a series of either float or double values, this is either FLOAT_SIGNAL or DOUBLE_SIGNAL. For a model meant to analyze float or double data, this is either FLOAT_MODEL or DOUBLE_MODEL.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
tags	Tags associated with the data. Data type: Array of Strings
value	Float or Double values for the data. Data type: Array of Numbers
error	Error message if the transformation of the specified data series fails. Data type: String

Supported transforms

Transform data types

Transform	Description
add	Adds the specified number to each timestamp value. Argument: arg (Decimal data type) – Number to add. For example: `"transforms": [ { "name": "add", "arg": 8 } ]`
autocorrelate	Calculates the correlation between timestamp values separated by an increasing number of periods starting at 1.
avg	Aggregates the time series into one series containing the average value for each corresponding timestamp across the input.
bottom	Returns the specified number of series that have the lowest values. Argument: `arg` (Integer) – The number of series to return. For example, the following returns the two time series that contain the lowest sets of values. `"transforms": [ { "name": "bottom", "arg": 2 } ]`
ceil	Rounds the value in each timestamp up to the specified precision: `ceil(value / <arg>) * <arg>)` Argument: arg (Decimal data type) – Decimal precision to round up to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
collect	Displays the transform results of the transform chain up to the point of the collect transform call. Collect transform results contain a unique marker, but you may want to also define a label. For example: `{ "start": "PT1H", "end": "", "table": "mb_demo_drone", "limit": 5000, "metrics": [ { "metric": "mb_demo_mt_altitude", "transforms": [ { "name": "label", "arg": "Series Timestamp Values" }, { "name": "collect" }, { "name": "avg" }, { "name": "label", "arg": "Average Timestamp Values" } ] } ] }`
constrainValues	Replaces any value outside the specified range with the corresponding maximum or minimum value. For example, if you specified the following, the transform replaces any value that is less than 0 with 0, and any value that is more than 100 with 100. `"transforms": [ { "name": "constrainValues", "val1": 0, "val2": 100 } ]` Arguments: • val1 (Decimal data type): Minimum or maximum value. • val2 (Decimal data type): Minimum or maximum value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
count	Aggregates the time series into one series. The new series contains the number of values that are not NaN (Not a Number) for each corresponding timestamp across the series.
derivative	Determines the rate of change between timestamps. Divides the difference between the value in each timestamp and the value in the next timestamp by the timestamp's period. **Note:** This transform returns one less value than the number of values in the series.
div	Divides the value in each timestamp by the specified number (arg). Argument: arg (Decimal – The number by which to divide the value of each timestamp.
envelope	Returns two time series, where, at any point in time, one contains the largest value and the other contains the smallest value. **Note:** NaNs are ignored, but are returned if there are no other return values.
exp	Raises the value of the specified base to the power of the value in each timestamp. Argument: arg (Decimal data type) – The base value.
filter	Applies an aggregator to the contents of a sliding window, such as producing a moving average. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • window (Duration data type): The duration of the sliding window.
floor	Rounds the value in each timestamp down to the specified precision: `floor(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round down to.

fractiles	Returns a time series for each fraction in the specified array. Each timestamp value is the value at which the specified fraction of values, for the corresponding timestamp across the input series, is below the specified percentage. For example, if the fraction is 0.5, then the value in the timestamp is the value where half the values in the input series are below 0.5.
	
	Argument: arg (Array of Decimal) – The fractions to use on the input series.
	
	For example:
	`"transforms": [`
	`  {`
	`  "name": "fractiles",`
	`  "arg": [0.25, 0.5, 0.75, 1]`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	`}` `]`

groupBy	Groups data by the specified fields before collecting or applying aggregated transformations.
	
	Argument: arg (String) - A comma separated list of fields in the table to use to group the transform results.
	
	For example:
	`"transforms": [`
	`{`
	`"name": "groupBy",`
	`"arg": "model"`
	`},`
	`{`
	`"name": "avg"`
	`},`
	`{`
	`"name": "label",`
	`"arg": "Model: %g"`
	`}`
	`]`

integrate	Multiplies the value in each timestamp by its period.
interpolate	Creates a data value for a NaN data item by interpolating from adjacent data values. Argument: arg (Integer) – Number of data samples in each direction to check for a non-NaN value. If a non-NaN value is not found, then NaN is used.
inverse	Computes the inverse of each timestamp value.
iqr	Performs an interquartile range transform and creates a result set that contains four series: **1.** -IQR: The median of all entries below `Q1 - (1.5 * IQR)`. **2.** Q1: The median of the smallest half of entries. **3.** Q3: The median of the largest half of entries. **4.** +IQR: The median of all entries above `Q3 + (1.5 * IQR)`. **Note:** `IQR = Q3 - Q1`
label	Labels a transformation chain. **Note:** Subsequent transformations may modify or replace the label. Argument: arg (String) – Text of the label. Can contain the following formatting expressions: • %%: Escape a "%" literal. • %l: Current label that is being replaced.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description

	• %s: Series subject.
	• %g: Value of the group by field. If this is a referenced record, then the value of the record's name field. If multiple groups are specified in the *groupBy* transform, labels are comma separated.
	• %G: Value of the group by field. If this is a referenced record, then the record's sys_id. If multiple groups are selected, values are comma separated.
	
	For example:
	`"transforms": [ { "name": "label", "arg": "Series Timestamp Values" }, ]`
	`"transforms": [ { "name": "groupBy", "arg": "model" }, { "name": "avg" }, { "name": "label", "arg": "Model: %g" } ]`

limit	Returns, at most, the specified duration or number of values, starting with the most recently saved value. Arguments: • arg (Integer): Number of timestamp values to return for each time series. OR • arg (Duration data type): Duration to limit each time series to.
log	Runs a logarithm on the value in each timestamp where the result is the log of the specified base for the timestamp value. Argument: arg (Decimal data type) – Base for the logarithm calculation.
mapValues	Replaces any values within the specified range (inclusive) with the specified value. If both *lowerBound* and *upperBound* are specified as NaN, then it replaces any NaN value with the *targetValue*. Arguments:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	• lowerBound (Decimal data type): The lowest value in the range. • upperBound (Decimal data type): The highest value in the range. • targetValue (Decimal data type): Replacement value. For example, the following changes all values in the time series that are between .1 and .9 to 1: `"transforms": [ { "name": "mapValues", "lowerBound": .1, "upperBound": .9, "targetValue": 1 } ]`
max	Returns a series that contains the maximum value for each corresponding timestamp across the input.
median	Creates a series that contains the median of values for each timestamp across a set of series. If there are `n` series: • If `n` is odd, the median is the `(n / 2 + 1)` value for a timestamp. • If `n` is even, the median is the average of the `(n / 2)` and `(n / 2 + 1)` values for a timestamp.
min	Returns a series that contains the minimum value for each corresponding timestamp across the input.
mul	Multiplies the value in each timestamp by the specified number. Argument: arg (Decimal data type) – Number by which to multiply the value of each timestamp.
partition	Produces a new series with values filtered by applying a specified aggregator to a non-overlapping window. Arguments: • aggregator (Aggregator data type): Type of aggregation to perform. • base (DateTime data type): The zero offset to use for partitioning. For example, to partition by day (24h), set this value to Monday at midnight in your time zone. To partition by a 30-day period, set this value to the first day of the most recent month. Default: Beginning of the EPOCH. • window (Duration data type): The duration of the non-overlapping window to apply the aggregator.
pow	Raises each timestamp value to the specified power.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform data types (continued)

Transform	Description
	Argument: arg (Decimal data type) – Power to which to raise each value.
product	Aggregates the selected metric series into a single series that contains the product of all values for each timestamp. NaNs are excluded. If all numbers in the series are NaN, the output is also NaN.
resample	Resamples a time series to either a fixed number of points or from one frequency to another. Use the resample transformation to reduce the number of samples in the result set to more closely match the number of samples that you want to display. Arguments: You can pass various arguments for this transform. Below is a list of each of the possible argument groups. Only one of these argument groups can be passed within a single transform. The following argument groups are delineated by AND/OR. AND meaning the argument is part of the current group; OR meaning it is the start of a new argument group. • arg (Integer): Number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • arg (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by averaging them. OR • minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • values (Integer): The number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *aggregator* to them.

Transform data types (continued)

Transform	Description
	OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • period (Duration data type): The frequency at which to resample. If available samples are less than this number, the endpoint uses interpolation to create additional samples. If there are more samples than this number, they are reduced by applying the specified *aggregator* to them. OR • aggregator (Aggregator data type): The aggregator to use when resampling. AND • minValues (Integer): The minimum number of samples to include in the result set. If available samples are less than this number, the endpoint uses interpolation to create additional samples. AND • maxValues (Integer): The maximum number of samples to include in the result set. If there are more samples than this number, they are reduced by averaging them.
round	Rounds the value in each timestamp up to the specified precision: `(value / <arg>) * <arg>` Argument: arg (Decimal data type) – The decimal precision to round up to.
root	Calculates the root of each timestamp value using the specified index. Argument: arg (Decimal data type) – The index of the root. For example, the following returns the square root of each timestamp: `"transforms": [ { "name": "root", "arg": "2" }, ]`
stddev	Creates a series that contains the standard deviation of values for each timestamp across a set of series.
sub	Subtracts the specified number from the value in each timestamp. Argument: arg (Number) – The number to subtract from the value in each timestamp.

Transform data types (continued)

Transform	Description
sum	Aggregates the selected metric series into one series that contains the sum of all values for each timestamp, excluding any NaNs. If all numbers in the series are NaN, the output is NaN.
timeshift	Shifts the time range by adding the specified offset to a value's timestamp without modifying the value. Use this transform to shift timestamps to another timezone. Argument: arg (Duration data type) – The amount of time to shift by.
top	Returns the specified number of series that have the highest values. Argument: arg (Integer) – The number of series to return. For example, the following returns the two time series that contain the highest sets of values. `"transforms": [ { "name": "top", "arg": 2 } ]`

Data type	Description
Aggregator	Available aggregators to use within the transform. • AVG: Calculates the arithmetic mean of all currently selected series. • CHISQUARE: Shows how well a statistical model fits the metric dataset. • LAST: Returns the last defined value in the period window. • MAX: Shows the largest value for the metric dataset, at each point in time. • MEDIAN: Shows the median of the metric dataset. The median separates the higher values of the metric dataset from the lower values. • MIN: Shows the smallest value for the metric dataset, at each point in time. • STDDEV: Calculates the standard deviation across the underlying data. Used to quantify the variation or dispersion of a set of data values in the metric dataset. • SUM: Calculates the sum across all currently selected series.
DateTime	Absolute date/time values are specified by the ISO 8601 date and time format: `YYYY-MM-DDThh:mm:ss`. For example: 2020-02-28T13:10:42. Where: • [YYYY]: Four-digit year. • [MM]: Zero-padded month between 01 and 12. • [DD]: Zero-padded day between 01 and 31. • T: Represents time and is mandatory before any of the time components are specified.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description
	• [hh]: Zero-padded hour between 00 and 23. • [mm]: Zero-padded minutes between 00 and 59. • [ss]: Zero-padded seconds between 00 and 59. Note that leap seconds are spread out evenly across the previous 1,000 seconds. Relative date/time values are specified using a duration (Duration data type), which is subtracted from the current time. For example: P7D = seven days ago.

Decimal	Decimal value that can either be:
	• A signed decimal number of arbitrary precision that can use exponential notation.
	
	Such as:
	  ○ 2
	  ○ 1.7
	  ○ -3.47
	  ○ 1.0E+2
	• A string representation of:
	  ○ A signed decimal number that may use exponential notation and is guaranteed to be a double-precision 64-bit IEEE 754 floating-point number.
	  ○ "NaN"
	  ○ "-Infinity"
	  ○ "+Infinity"

Duration	Amount of time in a time interval. Duration values are specified by the ISO 8601 duration format: `P [ n ] Y [ n ] M [ n ] DT [ n ] H [ n ] M [ n ] S` Where: • P: Duration designator, referred to as "period", and is always placed at the beginning of the duration. • [n]Y: Number of years. • [n]M: Number of months. • [n]D: Number of days. • T: Time designator and is mandatory before any of the time components are specified. • [n]H: Number of hours. • [n]M: Number of minutes. • [n]S: Number of seconds. For example: • P7D: Period of seven days. • P1M: Period of one month.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description
	• PT15M: Period of 15 minutes. • P1DT12H: Period of one day and twelve hours.

Example: cURL request

The following example shows how to call this endpoint to return a JSON stream for metrics on the mb_demo_drone table. Note: While the objects in this example are expanded to multiple lines for legibility, in an actual result each returned object is on its own line. You can make the same call and return an octet stream by setting `--header "Accept:application/octet-stream" \`.

```
curl "localhost:8080/api/now/v1/clotho/transform/stream" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user "username":"password" \
-d "{\
  \"start\": \"PT5M\",\
  \"end\": \"\",\
  \"table\": \"mb_demo_drone\",\
  \"query\": \"fleet.nameSTARTSWITHB\",\
  \"limit\": 5000,\
  \"metrics\": [\
    {\
      \"metric\": \"mb_demo_mt_altitude\",\
      \"label\": \"Series - Avg\",\
      \"transforms\": [\
        {\
          \"name\": \"partition\",\
          \"arg\": {\
            \"aggregator\": \"AVG\",\
            \"window\": \"PT5M\"\
          }\
        },
        {\
          \"name\": \"avg\"\
        }\
      ]\
    },
    {\
      \"metric\": \"mb_demo_mt_altitude\",\
      \"groupBy\": \"fleet\",\
      \"label\": \"Fleet - AVG\",\
      \"transforms\": [\
        {\
          \"name\": \"partition\",\

The following cURL example uses the CSV format option to stream back the altitude values (stored in the database as "mb_demo_mt_altitude") of the last day for each drone stored in the mb_demo_drone [Drones] table of the Metricbase Demo plugin. In the example, the data is returned in a narrow table format with three columns: the Sys_id of the subject identifying the drone, the time stamp of value, and the altitude value.

```
curl
 "https://instance.servicenow.com/api/now/v1/clotho/transform/st
ream" \
--request POST \
--header "Accept:text/csv;format=narrow" \
--header "Content-Type:application/json" \
--user "user name":"password" \
-d "{\
  \"start\": \"P1D\",\
  \"end\": \"\",\
  \"table\": \"mb_demo_drone\",\
  \"metrics\": [\
    {\
      \"metric\": \"mb_demo_mt_altitude\",\
      \"transforms\": []\
    }]\
}"
```

Output:

```
Subject, Timestamp,"mb_demo_drone|mb_demo_mt_altitude"

MetricBase Time Series - POST /now/clotho/put

Adds time series data to the MetricBase database.

URL format

Versioned URL: `/api/now/{api_version}/clotho/put`

Supported request parameters

Path parameters

Name	Description
api_version	Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_ignore_unknown_series	Flag that indicates whether to ignore unknown series and continue the transaction without returning an error. Valid values: • true: Ignore unknown series. • false: Do not ignore unknown series. Default: true

Request body parameters (XML or JSON)

Name	Description
seriesRef	Required. Information to update. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"seriesRef": [ { "metric": "String", "subject": "String", "table": "String" } ]`
seriesRef.metric	Required. Name of the metric to update. Data type: String
seriesRef.subject	Required. Sys_id of the record in which to update the data. Data type: String Table: Specified in the *`seriesRef.table`* parameter.
seriesRef.table	Required. Name of the table in which to save the data. Data type: String
values	Required. Series values to store. Data type: Array `"values": [ { "timestamp": "String", "value": Number } ]`
values.timestamp	Required. ISO 8601 timestamp of the value. Data type: String Format: `YYYY-MM-ddTHH:mm:ddZ` The ending 'Z', which denotes the UTC time zone in an ISO-formatted timestamp, is optional.
values.value	Required. Metric value. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
message	Message that indicates the status of the request, such as `ok` if the request processed successfully.

Example: cURL request

```
curl "https://instance.servicenow.com/api/now/v1/clotho/put" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"seriesRef\": {
    \"subject\": \"3D666b051787333200a328c5b836cb0b92\",
    \"table\": \"mb_demo_drone\",
    \"metric\": \"mb_demo_mt_altitude\"
  },
  \"values\": [
    {
      \"timestamp\": \"2019-03-21T17:05:00Z\",
      \"value\": 0.150185
    },
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    {
      \"timestamp\": \"2019-03-21T17:06:00Z\",
      \"value\": 0.46074
    },
    {
      \"timestamp\": \"2019-03-21T17:07:00Z\",
      \"value\": 0.83104
    },
    {
      \"timestamp\": \"2019-03-21T17:08:00Z\",
      \"value\": 1.260635
    },
    {
      \"timestamp\": \"2019-03-21T17:09:00Z\",
      \"value\": 1.749
    }
  ]
}" \
--user "username":"password"
```

```
{
    "result": {
        "message": "ok"
    }
}
```

Omichannel Callback API

The *Omnichannel Callback* API provides methods for creating, updating, and initiating a callback request for live agent conversations.

The *Omnichannel Callback* API allows agents to programmatically call users back rather than waiting in the queue for an available agent. For example, agents can use the callback functionality to call users back when the agent wait time is long or when there are no agents available. You can do the following actions with this API:

- Create a new, immediate callback request or schedule a new request.
- Create an initial interaction and subsequent retry interactions.
- Update an existing callback.

This API belongs to the sn_omni_callback namespace and requires the Administrator with callback API [sn_omni_callback.callback_api] role.

For more information about the Omnichannel Callback application as an ServiceNow AI Platform capability, see Omnichannel Callback.

Omnichannel Callback - POST api/sn_omni_callback/actions

Provides actions for integrating third-party Contact Center as a Service (CCaaS) platforms with ServiceNow®'s Omnichannel Callback system. This API acts as a bridge, routing callback operations (create, update, cancel, close) to external CCaaS providers via configurable Workflow Studio subflows.

Note: This endpoint works similarly to Omnichannel Callback - POST /api/sn_omni_callback/callback/create and Omnichannel Callback - PATCH /api/sn_omni_callback/callback/update, but is used to update or create callbacks in a third-party integration with routing context.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Intelligent routing

The `/actions` endpoint intelligently routes callback requests based on the `routingContext` parameter. When a routing rule is configured, the API uses a single, unified payload structure for all actions and routes the request to a CCaaS subflow using `routingContext`. When routing is configured, the content of the request never changes. Only the top-level `action` value differs.

Note: The API checks for routing rules in the Callback Routing Configuration [sys_cs_callback_routing_config] table based on the `routingContext` parameter. If a matching rule is found, the request is forwarded to the configured custom subflow. The subflow can integrate with external CCaaS platforms or implement custom business logic. The subflow processes the request and returns the response.

If `routingContext` is omitted or no routing rule matches, the API falls back to default ServiceNow behavior and expects the standard payload format of the corresponding `POST /create`, `PATCH /update`, or `PATCH /cancel` endpoints.

URL format

Versioned URL: `/api/sn_omni_callback/v1/actions`

Default URL: `/api/sn_omni_callback/actions`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
Object	Object containing the operation and details. Data type: Object `{ "action": "String", "payload": {Object}, "routingContext": {Object} }`
action	Required. Defines the action to perform on the callback.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Accepted values: • `create`: Creates a new callback record. • `update`: Updates an existing callback record based on the callback number. • `close`: Closes a callback record because the callback request has been fulfilled. Doesn't initiate the callback. Updates the reason field in the Callback [sys_cs_callback] table. • `cancel`: Cancels a callback record because the customer cancelled the request and doesn't need to connect with an agent. Updates the reason field in the Callback [sys_cs_callback] table. Data type: String
payload	Required. Object containing specific data required for the given action when *routingContext* object is passed. For close and cancel operations, only *callbackID* is needed in the payload. **Note:** For create and update actions, if *routingContext* isn't passed, use the *payload* object structure documented in the Omnichannel Callback - POST / api/sn_omni_callback/callback/create and Omnichannel Callback - PATCH / api/sn_omni_callback/callback/update operations, respectively. The 'Examples' section demonstrates both routing and non-routing scenarios. Data type: Object *payload* structure for create and update actions. `{ "callbackContext": {Object}, "callbackDetails": {Object}, "callbackId": "String", "phoneNumber": "String", "type": "String" }` *payload* structure for close and cancel actions.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	`"payload": { "callbackId": "String" }`
payload.callbackContext	Optional. Object containing the context details about the callback request. Table: Callback Context [sys_cs_callback_context] Data type: Object `"callbackContext": { "customer_timezone": "String", "ivr_path": "String", "queue": "String" }`
payload.callbackContext.customer_timezone	Time zone of customer who requested the callback. Time zones can be provided in the following formats. • `Country/City`: For example, `America/Los_Angeles`. • `Country/Time zone`: For example, `US/Pacific`. • `Time zone abbreviation`: For example, `PST`. For a complete list of valid timezones, see the Time zone field in the User [sys_user] table. For more information about time zones, see Time zones. Data type: String
payload.callbackContext.ivr_path	The IVR (Interactive Voice Response) path that a customer follows before being transferred to a human agent. Typically contains a list of queues or menu options the customer navigated through in the IVR system. This string is passed by Contact Center as a Service (CCaaS). For example, `"ivr_path": "Technical Support > Account Management"` Data type: String
payload.callbackContext.queue	Number assignments in the queue. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
payload.callbackDetails	Optional. Object containing the details about the callback request. Table: Callback [sys_cs_callback] Data type: Object `"callbackDetails": { "description": "String", "end_time": "String", "expire_time": "String", "first_name": "String", "last_name": "String", "opened_by": "String", "phone_number": "String", "next_retry": "String", "reason": "String", "scheduled_start_time": "String", "short_description": "String", "state": "String", "type": "String" }`
payload.callbackDetails.description	Detailed explanation of the callback request. Can include specific customer concerns, context, or notes from the agent. Data type: String
payload.callbackDetails.end_time	The time window when the callback request is expected to be completed. After this timestamp, the callback is considered overdue or expired unless rescheduled. Only applicable to a `Scheduled` callback type. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
payload.callbackDetails.expire_time	The final cutoff time after which the callback request should no longer be attempted. This is often used to automatically close or cancel stale requests. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
payload.callbackDetails.first_name	First name of the customer requesting the callback.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String
payload.callbackDetails.last_name	Last name of the customer requesting the callback. Data type: String
payload.callbackDetails.opened_by	Sys_id of the user or agent who created or initiated the callback request. Table: User [sys_user]
payload.callbackDetails.phone_number	Phone number of the customer to call back. Data type: String
payload.callbackDetails.next_retry	The next scheduled attempt time if previous callback attempts were unsuccessful. Useful for automated or manual retry logic. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
payload.callbackDetails.reason	Reason for the callback request. Helps with routing, analytics, and reporting by tagging the callback with a standardized reason. Valid values: • `Other issue` • Custom values defined by your implementation. For example, `"Billing Inquiry"`, `"Technical Support"` Table: Callback [sys_cs_callback], Field: reason_type Data type: String
payload.callbackDetails.scheduled_start_time	Date and time value to when the callback window begins. Only applicable to a `Scheduled` callback type. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
payload.callbackDetails.short_description	A brief summary of the callback request, usually used in lists or dashboards. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
payload.callbackDetails.state	The current workflow status of the callback request. Valid values: • `pending approval` • `in progress` • `completed` • `canceled` Data type: String
payload.callbackDetails.type	The category of the request. Value is always `callback`.
payload.callbackId	Required. Sys_id or external_id of the callback. Table: Callback [sys_cs_callback] Data type: String
payload.phoneNumber	Required. Phone number of the user requesting the callback. Data type: String
payload.type	Required. Type of callback. Valid value: `callback_request` Data type: String

routingContext	Required for routing configuration. If not passed or the routing rule doesn't match, the actions endpoint doesn't invoke a CCaaS subflow and falls back to using default ServiceNow processing.
	
	Contextual information used to find a custom subflow or routing rule. If omitted, the API uses default callback processing.
	
	Data type: Object
	`"routingContext": {`
	`"sourceTable": "String",`
	`"sourceId": "String",`
	`"userId": "String"`
	`}`

routingContext.sourceId	Sys_id of the source record initiating the callback. Corresponds to the value of *`sourceTable`*.

Request body parameters (continued)

Name	Description
	Data type: String
routingContext.sourceTable	The table name where the request originated. Accepted values: • `sp_portal` • `sn_csm_ec_engmnt_center_module` • `sn_embeddable_core_module` Data type: String
routingContext.userId	User initiating the request (often the agent or system user). Table: User [sys_user] Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
body	Object containing success or failure information about the request. Data type: Object `{ "status": 200, "body": { "message": "String", "number": "String" } }`
body.message	Message with a brief details about the action's success or failure. Data type: String
body.number	The callback reference number. For example, `"CAL0010012"`. Table: Callback [sys_cs_callback] Data type: String
status	Corresponding status code of the request. Data type: String

Example: Create example (routing enabled)

This action creates a new callback record with routing context configured.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "action": "create",
  "routingContext": {
    "sourceTable": "sn_csm_ec_engmnt_center_module",
    "sourceId": "a1b2c3d4e5f6a7b8",
    "userId": "beth.anglin"
  },
  "payload": {
    "callbackId": "cb-98765",
    "callbackDetails": {
      "first_name": "Alice",
      "last_name": "Smith",
      "state": "Pending Approval",
      "reason": "Request updated by user",
      "end_time": "2025-12-17T23:00:00Z",
      "scheduled_start_time": "2025-12-17T22:00:00Z",
      "next_retry": "2025-12-18T10:00:00Z",
      "expiry_time": "2025-12-18T12:00:00Z",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "phone_number": "+14155552671",
      "short_description": "Callback request for customer
 support",
      "description": "Customer requested a callback regarding
 their recent order.",
      "opened_by": "user_sys_id_12345",
      "type": "callback"
    },
    "type": "callback_request",
    "phoneNumber": "+14155552671",
    "callbackContext": {
      "queue": "Customer Support",
      "ivr_path": "support/ivr-path",
      "customer_timezone": "GMT-5"
    }
  },
  "additional_parameters": {}
}
```

Example: Create (no routing context)

The following example demonstrates how to create a new callback record without routing context.

Note: Create actions without routing context follow the request structure documented in Omnichannel Callback - POST /api/sn_omni_callback/callback/create.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "action": "create",
  "payload": {
  "type": "asap",
  "callbackDetails": {
    "appointment": "68cc0a5a9314521060320dd548373cbd",
    "description": "Customer reported issue with order #12345",
    "short_description": "Order issue",
    "reason_type": "product_issue",
    "expire_time": "2025-09-01 17:00",
    "messaging_channel": "web_channel_sys_id",
    "channel_to_callback": "genesys_channel_sys_id",
    "scheduled_start_time": "2025-09-01 1:00",
    "end_time": "2025-09-01 17:00",
    "user_document": "abel.tuter",
    "user_table": "sys_user"
},
  },
  "callbackContext": {
    "queue": "sample queue",
    "ivr_path": "sample ivr path"
  },
  "inboundId": "ServiceNowVoice",
  "isExternal": true,
  "phoneNumber": "+123454768",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "externalCallbackId": "new-external-id",
  "interactionDetails": {
    "clientSessionId": "f8453abb-a33d-45b7-bf01-52b7a821e99z",
    "userId": "32423424",
    "callerPhoneNumber": "+14089178877"
  }
}
```

Example: Update action (routing enabled)

This example action updates an existing callback record with routing context. The *`callbackNumber`* value identifies the record to update:

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "action": "update",
  "payload": {
    "callbackDetails": {
      "appointment": "68cc0a5a9314521060320dd548373cbd",
      "description": "Customer reported issue with order
 #12345",
      "short_description": "Order issue",
      "reason_type": "product_issue",
      "expire_time": "2025-09-01 17:00",
      "messaging_channel": "web_channel_sys_id",
      "channel_to_callback": "genesys_channel_sys_id",
      "scheduled_start_time": "2025-09-01 1:00",
      "end_time": "2025-09-01 17:00",
      "user_document": "abel.tuter",
      "user_table": "sys_user"
    },
    "callbackContext": {
      "queue": "5 value changed via api",
      "ivr_path": "5 some-ivr-path changed via api"
    },
    "inboundId": "AmazonConnect",
    "phoneNumber": "+14089178877",
    "callbackId": "a16ead53fff0621088c6ffffffffffce"
  }
}
```

Example: Update (no routing context)

The following example demonstrates how to update a callback record without routing context:

Note: Update actions without routing context follow the request structure documented in Omnichannel Callback - PATCH /api/sn_omni_callback/callback/update.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  -d ' {
  "action": "update",
  "payload": {
    "callbackDetails": {
      "appointment": "68cc0a5a9314521060320dd548373cbd",
      "description": "Customer reported issue with order
 #12345",
      "short_description": "Order issue",
      "reason_type": "product_issue",
      "expire_time": "2025-09-01 17:00",
      "messaging_channel": "web_channel_sys_id",
      "channel_to_callback": "genesys_channel_sys_id",
      "scheduled_start_time": "2025-09-01 1:00",
      "end_time": "2025-09-01 17:00",
      "user_document": "abel.tuter",
      "user_table": "sys_user"
    },
    "callbackContext": {
      "queue": "5 value changed via api",
      "ivr_path": "5 some-ivr-path changed via api"
    },
    "inboundId": "AmazonConnect",
    "phoneNumber": "+14089178877",
    "callbackId": "a16ead53fff0621088c6ffffffffffce"
  }
}
```

Example: Cancel action

This example action cancels a given callback record with routing context and updates the reason field in the Callback [sys_cs_callback] table.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
    "action": "cancel",
    "routingContext": {
        "sourceTable": "sn_csm_ec_engmnt_center_module",
        "sourceId": "a1b2c3d4e5f6a7b8",
        "userId": "beth.anglin"
    },
     "payload": {
        "callbackId": "CAL0001234"
    }
}
```

Example: Cancel (no routing context)

The following example demonstrates how to cancel a callback record without routing context:

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  -u 'username':'password' \
  -d ' {
  "action": "cancel",
  "payload": {
    "callbackId": "cb-98765"
  }
}
```

Example: Close action (routing enabled)

This example closes a callback record with routing context and updates the reason field in the Callback [sys_cs_callback] table:

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
    "action": "close",
    "routingContext": {
        "sourceTable": "sn_csm_ec_engmnt_center_module",
        "sourceId": "a1b2c3d4e5f6a7b8",
        "userId": "beth.anglin"
    },
    "payload": {
        "callbackId": "CAL0001234"
    }
}
```

Example: Close (no routing context)

The following example demonstrates how to close a callback record without routing context:

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/actions \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "action": "close",
  "payload": {
    "callbackId": "cb-98765"
  }
}
```

Omnichannel Callback - POST /api/sn_omni_callback/callback/attempt

Initiates an interaction for an existing callback, including retry attempts.

URL format

Default URL: `/api/sn_omni_callback/callback/attempt`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
callbackId	Required. Sys_id or external_id of the callback. Table: Callback [sys_cs_callback] Data type: String

interactionDetails	Optional. Details about the interaction. Meant for 'asap' (immediate) callback types so that interaction details are routed directly to the agent without waiting.
	
	All interaction details are passed in the payload of the Voice Interaction Resource - POST /cs/voice-interactions.
	
	Data type: Object
	
	`"interactionDetails": {`
	`  "callerPhoneNumber": "String",`
	`  "clientSessionId": "String",`
	`  "userId": "String"`
	`}`

interactionDetails.callerPhoneNumber	Caller's callback phone number. This is the number the agent uses to reach the caller in case the call drops. Data type: String Format: E.164 standard compliant Default: None
interactionDetails.clientSessionId	Unique identifier of a record in an external system used to track this phone call. This information links the records between the two systems. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Format: Typically a UUID or unique session token generated by the external system Default: None
interactionDetails.userId	Sys_id of the user to call back. Table: User [sys_user] Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
errors	Message containing details about the failures of the callback creation, like missing required request IDs. Data type: Array of strings `"errors": ["String", "String"]`
messages	Message containing details about the success of the callback creation. Data type: Array of strings `"messages": ["String", "String"]`

result	Result of the request.
	
	Data type: Object
	
	`"result": {`
	`  "status": "String",`
	`  "response": {Object},`
	`  "errors": [Array],`
	`  "messages": [Array]`
	`}`

result.response	Object containing callback and interaction IDs of the callback request.
	
	Data type: Object
	
	`"response": {`
	`  "callback_created": Boolean`
	`  "callback_id": "String",`
	`  "interaction_id": "String"`
	`}`

result.response.interaction_id	Sys_id of the newly created interaction. Table: Interaction [interaction] Data type: String
result.status	Success or failure status of the request. Valid values: • success • failure Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following example demonstrates a POST attempt request with details about the initial interaction and subsequent retry interactions.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/callba
ck/attempt' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "callbackId": "<ID#>",
  "interactionDetails": {
    "clientSessionId": "<ID#>",
    "userId": "<ID#>",
    "callerPhoneNumber": "+112345678901"
  }
}
```

Response body when a valid callback_Id is provided and a new interaction was successfully created for the callback.

```
{
  "result": {
    "status": "success",
    "response": {
      "interaction_id": "<Interaction ID#>"
    }
  }
}
```

Response body when an invalid callback_Id was provided in the request.

```
{
  "result": {
    "status": "failure",
    "response": {
      "interactionId": null
    },
    "errors": [
      "Callback not found for callback ID: <ID#>"
    ]
  }
}
```

Response body when the interaction already exists for the given callback (message returns details about the existing interaction):

```
{
  "result": {
    "status": "success",
    "response": {
      "interaction_id": "<Interaction ID#>"
    },
    "messages": [
      "Active Interaction <Interaction ID#> already exists for
 callback <ID#>"
```

```
      ]
    }
}
```

Omnichannel Callback - POST /api/sn_omni_callback/callback/create

Initiates a new immediate or scheduled callback request based on details you provide in the request body. For immediate callbacks, this API creates both the callback and interaction. For scheduled callbacks, creates the callback with an appointment ID.

URL format

Versioned URL: `/api/sn_omni_callback/v1/callback/create`

Default URL: `/api/sn_omni_callback/callback/create`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
callbackContext	Object containing the context details about the callback request. Table: Callback Context [sys_cs_callback_context] Data type: Object `"callbackContext": { "customer_timezone": "String", "ivr_path": "String", "source_channel": "String", "queue": "String", "voicemail_duration": "String", "voicemail_recorded_at": "String", "voicemail_transcript": "String", "voicemail_url": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
callbackContext.customer_timezone	Time zone of customer who requested the callback. Time zones can be provided in the following formats. • `Country/City`. For example, `America/Los_Angeles`. • `Country/Time zone`. For example, `US/Pacific`. • `Time zone abbreviation`. For example, `PST`. For a complete list of valid timezones, see the Time zone field in the User [sys_user] table. For more information about time zones, see Time zones. Data type: String
callbackContext.ivr_path	The IVR (Interactive Voice Response) path that a customer follows before being transferred to a human agent. Typically contains a list of queues or menu options the customer navigated through in the IVR system. This string is passed by Contact Center as a Service (CCaaS). For example, `"ivr_path": "Technical Support > Account Management"` Data type: String
callbackContext.queue	Number assignments in the queue. Data type: String
callbackContext.source_channel	Source of the callback. For example, IVR, Web, or VA. Data type: String
callbackContext.voicemail_duration	Length of the voicemail in hours, minutes, or seconds. Field: Voicemail Duration Data type: Number
callbackContext.voicemail_recorded_at	Time stamp in which the voicemail was recorded. Field: Voicemail Recorded At Data type: String
callbackContext.voicemail_transcript	Transcribed text of the voicemail. Field: Voicemail Transcript Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
callbackContext.voicemail_url	Relative link to the callback record containing the voicemail. Field: Voicemail URL Data type: String

callbackDetails	Object containing the details about the callback request.
	
	Table: Callback [sys_cs_callback]
	
	Data type: Object
	
	`"callbackDetails": {`
	`  "appointment": "String",`
	`  "channel_to_callback": "String",`
	`  "description": "String",`
	`  "end_time": "String",`
	`  "expire_time": "String",`
	`  "messaging_channel": "String",`
	`  "reason_type": "String"`
	`  "scheduled_start_time": "String",`
	`  "short_description": "String",`
	`  "user_document": "String",`
	`  "user_table": "String"`
	`}`

callbackDetails.appointment	Sys_id of the appointment. Only applicable to a `Scheduled` callback type. Table: Appointment Booking [sn_apptmnt_booking_appointment_booking] Data type: String
callbackDetails.channel_to_callback	Target messaging channel to route the callback through. Table: Messaging Channel [sys_cs_channel], Field: sys_id Data type: String
callbackDetails.description	Full description describing the reason for the callback, if needed. Data type: String
callbackDetails.end_time	Date and time value to stop the callback attempt. Only applicable to a `Scheduled` callback type. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
callbackDetails.expire_time	Date and time to close the callback request. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
callbackDetails.messaging_channel	Source of the callback. Identifies the client interface that initiated the callback request, such as a web client, mobile app, or embedded messenger. Table: Messaging Channel [sys_cs_channel], Field: sys_id Data type: String
callbackDetails.reason_type	Reason for the callback request. Helps with routing, analytics, and reporting by tagging the callback with a standardized reason. Valid values: • `Other issue` • Custom values defined by your implementation. For example, `"Billing Inquiry"`, `"Technical Support"` Table: Callback [sys_cs_callback], Field: reason_type Data type: String
callbackDetails.scheduled_start_time	Date and time value to initiate the callback. Only applicable to a `Scheduled` callback type. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
callbackDetails.short_description	Provides a detailed explanation of the callback request. Can include specific customer concerns, context, or notes from the agent. Data type: String
callbackDetails.user_document	Sys_id of the user who requested the callback. Used with *`callbackDetails.user_table`* to identify the user requesting the callback. Table: User [sys_user], Field: sys_id Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
callbackDetails.user_table	Table where the user record resides. Used with *`callbackDetails.user_document`* to identify the user requesting the callback. Value is always `sys_user`. Data type: String
externalCallbackId	External identifier for the callback that was created in a third party vendor. Data type: String
inboundId	Sys_id of the inbound call associated with the callback. Provides traceability linking the callback request to a specific inbound call record that might originate from a third-party provider or CCaaS platform. Table: Callback [sys_cs_callback], Field: provider_application_id Data type: String

interactionDetails	Optional. Details about the interaction. Meant for 'asap' (immediate) callback types so that interaction details are routed directly to the agent without waiting.
	
	All interaction details are passed in the payload of the Voice Interaction Resource - POST /cs/voice-interactions.
	
	Data type: Object
	
	`"interactionDetails": {`
	`  "callerPhoneNumber": "String",`
	`  "clientSessionId": "String",`
	`  "userId": "String"`
	`}`

interactionDetails.callerPhoneNumber	Caller's callback phone number. This is the number the agent uses to reach the caller in case the call drops. Data type: String Format: E.164 standard compliant Default: None
interactionDetails.clientSessionId	Unique identifier of a record in an external system used to track this phone call. This information links the records between the two systems. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Format: Typically a UUID or unique session token generated by the external system Default: None
interactionDetails.userId	Sys_id of the user to call back. Table: User [sys_user] Data type: String
isExternal	Flag that indicates whether the callback is external and was requested in different third-party vendor. Valid values: • true: Callback is external. • false: Callback is not external. Default: false
type	Required. Type of callback. Valid values: • `asap`: The callback interaction is created instantly. • `scheduled`: The callback interaction is created and scheduled for a later time selected by the customer. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

Response headers (continued)

Header	Description
	Default: *application/json*

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Result of the request.
	
	Data type: Object
	
	`"result": {`
	`  "status": "String",`
	`  "response": {Object},`
	`  "errors": [Array],`
	`  "messages": [Array]`
	`}`

result.errors	Message containing details about the failures of the callback creation, like missing required request IDs. Data type: Array of strings `"errors": ["String", "String"]`
result.messages	Message containing details about the success of the callback creation. Data type: Array of strings `"messages": ["String", "String"]`
result.response	Object containing callback and interaction IDs of the callback request. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"response": { "callback_created": Boolean "callback_id": "String", "interaction_id": "String" }`
result.response.callback_created	Flag indicating whether the new callback request was created or not. Possible values: • true: Callback was created successfully. • false: Callback was not created. For example, the callback already exists with the given callback_id. Data type: Boolean
result.response.callback_id	Sys_id of the new callback, if applicable. Table: Callback [sys_cs_callback] Data type: String
result.response.interaction_id	Sys_id of the newly created interaction. Table: Interaction [interaction] Data type: String
result.status	Success or failure status of the request. Valid values: • success • failure Data type: String

Example: cURL request

The following example creates a simple callback request according to details the agent provides in the request body.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/callba
ck/create' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "type": "asap",
  "callbackDetails": {
    "appointment": "68cc0a5a9314521060320dd548373cbd",
    "description": "Customer reported issue with order #12345",
    "short_description": "Order issue",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "reason_type": "product_issue",
    "expire_time": "2025-09-01 17:00",
    "messaging_channel": "web_channel_sys_id",
    "channel_to_callback": "genesys_channel_sys_id",
    "scheduled_start_time": "2025-09-01 1:00",
    "end_time": "2025-09-01 17:00",
    "user_document": "abel.tuter",
    "user_table": "sys_user"
},
  },
  "callbackContext": {
    "queue": "sample queue",
    "ivr_path": "sample ivr path"
  },
  "inboundId": "ServiceNowVoice",
  "isExternal": true,
  "phoneNumber": "+123454768",
  "externalCallbackId": "new-external-id",
  "interactionDetails": {
    "clientSessionId": "f8453abb-a33d-45b7-bf01-52b7a821e99z",
    "userId": "32423424",
    "callerPhoneNumber": "+14089178877"
  }
}
```

The response body returns a success response with callback and interaction IDs for the newly created callback request.

```
{
  "status": "success",
  "response": {
    "callback_id": "a16ead53fff0621088c6ffffffffffce",
    "interaction_id": "696e6d57fff0621088c6ffffffffff7d"
  }
}
```

Response body when interaction details were not provided:

```
{
  "status": "success",
  "response": {
    "callback_created": true,
    "callback_id": "7df2059ffffc221088c6ffffffffff0c"
  }
}
```

Response body when the callback ID already exists but new interaction details were provided:

```
{
  "result": {
    "status": "success",
    "response": {
      "interaction_id": "84054fff53786210011eddeeff7b12d6",
      "callback_id": "8b43c3fb53786210011eddeeff7b12a6",
      “callback_created”: false
    },
    "messages": [
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "Successfully updated the callback
 8b43c3fb53786210011eddeeff7b12a6",
      "Successfully created the interaction
 84054fff53786210011eddeeff7b12d6"
    ]
  }
}
```

Response body when the callback ID already exists but new interaction details were not provided:

```
{
  "result": {
    "status": "success",
    "response": {
      "callback_id": "8b43c3fb53786210011eddeeff7b12a6"
    },
    "messages": [
      "Successfully updated the callback
 8b43c3fb53786210011eddeeff7b12a6"
    ]
  }
}
```

Response body when mandatory fields are missing in the request:

```
{
  "result": {
    "status": "failure",
    "response": {
      "callbackId": null
    },
    "errors": [
      "Parameter 'type' is required in request"
    ]
  }
}
```

Omnichannel Callback - POST api/sn_omni_callback/callback/get

Fetches callback information based on query parameters.

URL format

Versioned URL: `/api/sn_omni_callback/v1/callback/get`

Default URL: `/api/sn_omni_callback/callback/get`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
queryParameters	Object containing the key-value pair of the query parameters to filter results on. Data type: Object `"queryParameters": { "number": "String", "state": "String", "opened_by": "String", "sys_id", "String", "callback_type": "String", "external_callback_id": "String", "callback_number": "String" }`
queryParameters.number	The callback reference number to look up. For example, `"CAL0010012"`. Table: Callback [sys_cs_callback] Data type: String
queryParameters.state	Number representing the current state of the callback. Possible values: • `1`: Open • `2`: Work in Progress • `3`: Closed Complete • `4`: Closed Abandoned • `7`: Cancelled Data type: Number
queryParameters.opened_by	User ID of the user requesting the callback. Table: User [sys_user] Data type: String
queryParameters.sys_id	Sys_id of the callback record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Callback [sys_cs_callback] Data type: String
queryParameters.callback_type	Type of callback. Valid values: • `asap`: The callback interaction is created instantly. • `scheduled`: The callback interaction is created and scheduled for a later time selected by the customer. Data type: String
queryParameters.external_callback_id	External identifier for the callback created in a third-party system. Data type: String
queryParameters.callback_number	Phone number of the caller to call back. Data type: String

responseParameters	Optional. Specifies which fields to return in the response. If omitted, the endpoint returns default fields.
	
	Data type: Object
	
	`"responseParameters": {`
	`  "callback": [Array],`
	`  "context": [Array]`
	`}`

responseParameters.callback	Optional. Returns fields from the callback record (for example, `number`, `phone_number`). Table: Callback [sys_cs_callback] Data type: Object `"callback": [String, String]` Valid values: • `number`: Unique reference number for that callback (for example, `"CAL0010012"`). • `phone_number`: Phone number of the caller.

Request body parameters (XML or JSON) (continued)

Name	Description
responseParameters.context	Optional. Returns contextual information of the callback, such as queue, assignment, or related metadata in the form of key:value pairs. Table: Callback Context [sys_cs_callback_context] Data type: Array of Strings `"callbackContext": { "customer_timezone": "String", "ivr_path": "String", "source_channel": "String", "queue": "String", "voicemail_duration": "String", "voicemail_recorded_at": "String", "voicemail_transcript": "String", "voicemail_url": "String" }`
responseParameters.context.customer_timezone	Time zone of the user requesting the callback. String
responseParameters.context.ivr_path	The IVR (Interactive Voice Response) path that a customer follows before being transferred to a human agent. Typically contains a list of queues or menu options the customer navigated through in the IVR system. This string is passed by Contact Center as a Service (CCaaS). For example, `"ivr_path": "Technical Support > Account Management"` Data type: String
responseParameters.context.source_channel	Source of the callback. For example, IVR, Web, or VA. String
responseParameters.context.queue	Name or ID of the queue where the callback is assigned.

Request body parameters (XML or JSON) (continued)

Name	Description
	String
responseParameters.context.voicemail_duration	Length of the voicemail in hours, minutes, or seconds. Table: Callback Context [sys_cs_callback_context], Field: Voicemail Duration String
responseParameters.context.voicemail_recorded_at	Time stamp in which the voicemail was recorded. Table: Callback Context [sys_cs_callback_context], Field: Voicemail Recorded At Data type: String
responseParameters.context.voicemail_transcript	Transcribed text of the voicemail. Table: Callback Context [sys_cs_callback_context], Field: Voicemail Transcript Data type: String
responseParameters.context.voicemail_url	Relative link to the callback record containing the voicemail. Table: Callback Context [sys_cs_callback_context], Field: Voicemail URL Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the callback record or callback information that matched the specified search criteria.
	
	Date type: Object
	
	`"result": {`
	`  "response": {Object},`
	`  "status": "String"`
	`}`

result.response	Callback information.
	
	Data type: Object
	
	`"response": {`
	`  "callbacks": [Array],`
	`  "count": "Number"`
	`}`

result.response.callbacks	Object containing details about the callback record in the form of key:value pairs.
	
	Note: Displays all default fields if *responseParameters* wasn't specified in the request.
	
	Data type: Array of Strings
	
	`"callbacks": [`
	`  {`
	`  "number": "String",`
	`  "state": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"first_name": "Virtual", "last_name": "Agent", "user_table": "sys_user", "opened_by": "Virtual Agent", "assigned_to": "" }]
result.response.callbacks.assigned_to	ID of the agent assigned to the request. Data type: String
result.response.callbacks.context	Contextual information of the callback record. Varies based on the request input. Table: Callback Context [sys_cs_callback_context] Data type: Array of Strings "callbackContext": { "customer_timezone": "String", "ivr_path": "String", "source_channel": "String", "queue": "String", "voicemail_duration": "String", "voicemail_recorded_at": "String", "voicemail_transcript": "String", "voicemail_url": "String" }
result.response.callbacks.context.customer_timezone	Time zone of user requesting the callback. String
result.response.callbacks.context.ivr_path	The IVR (Interactive Voice Response) path that a customer follows before being transferred to a human agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Typically contains a list of queues or menu options the customer navigated through in the IVR system. This string is passed by Contact Center as a Service (CCaaS). For example, `"ivr_path": "Technical Support > Account Management"` Data type: String
result.response.callbacks.context.source_channel	Source of the callback. For example, IVR, Web, or VA. String
result.response.callbacks.context.queue	Name or ID of the queue where the callback is assigned. String
result.response.callbacks.context.voicemail_duration	Length of the voicemail in hours, minutes, or seconds. String
result.response.callbacks.context.voicemail_recorded_at	Time stamp in which the voicemail was recorded. Data type: String
result.response.callbacks.context.voicemail_transcript	Transcribed text of the voicemail. Data type: String
result.response.callbacks.context.voicemail_url	Relative link to the callback record containing the voicemail. Data type: String
result.response.callbacks.created_on	Time stamp when callback was created. Data type: String
result.response.callbacks.first_name	First name of the user who initiated or is associated with the callback. Data type: String
result.response.callbacks.last_name	Last name of the associated user. Completes the user's full name for logging, routing, and display. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.response.callbacks.number	Unique callback reference number. For example, `"CAL0010012"`. Data type: String
result.response.callbacks.opened_by	User ID of the user requesting the callback. Table: User [sys_user] Data type: String
result.response.callbacks.phone_number	Phone number of the caller. Data type: String
result.response.callbacks.status	Current status of the callback. Possible values: • `1`: Open • `2`: Work in Progress • `3`: Closed Complete • `4`: Closed Abandoned • `7`: Cancelled Data type: String
result.response.callbacks.user_table	Table to reference when looking up callback user details. For example, sys_user. Data type: String
result.response.count	Number of matching records according to search criteria. Data type: Number
result.status	Success or error status of the request. Possible values: • error: Internal or unexpected failure, such as a database connection failure, server exception, or uncaught runtime error. • failed: Operation couldn't be completed. For example: No record found, validation failed, or unsupported parameter. • not_found: Queried entity doesn’t exist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• unauthorized: Caller lacks permissions, credentials, or access. • invalid_request: For malformed parameters, wrong types, or missing required fields. • timeout: Upstream system or database didn't return on time. • partial_success: Some records processed successfully or some failed. Data type: String

Example: cURL request

The following POST example queries callback records specifically opened by a Virtual Agent (`"opened_by": "virtual.agent"`) and is in a closed state (4), and directs the API to return only the callback record's reference number and phone number (`"callback": ["number", "callback_number"]`) within a queue context (`"context": ["queue"]`).

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/callba
ck/get' \
  -H "Content-Type: application/json" \
  -H "Accept: application/json" \
  -u 'username':'password' \
  -d {
  "queryParameters": {
    "opened_by": "virtual.agent",
    "state": 4,
  },
  "responseParameters": {
    "callback": ["number", "callback_number"],
    "context": ["queue"]
  }
}
```

Response body.

```
{
  "result": {
    "status": "success",
    "response": {
      "callbacks": [
        {
          "number": "CAL0010036",
          "callback_number": "+14089178878",
          "context": {
            "queue": "21 value changed via api"
          }
        },
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        {
          "number": "CAL0010037",
          "callback_number": "+14089178878",
          "context": {
            "queue": "21 value changed via api"
          }
        },
        {
          "number": "CAL0010001",
          "callback_number": "+918008509174",
          "context": {
            "queue": "queue"
          }
        },
        {
          "number": "CAL0010033",
          "callback_number": "+14089178878",
          "context": {
            "queue": "21 value changed via api"
          }
        },
        {
          "number": "CAL0010003",
          "callback_number": "+918008509174",
          "context": {
            "queue": "Soumya queue"
          }
        },
        {
          "number": "CAL0010035",
          "callback_number": "+14089178878",
          "context": {
            "queue": "21 value changed via api"
          }
        },
        {
          "number": "CAL0010038",
          "callback_number": "+14089178878",
          "context": {
            "queue": "21 value changed via api"
          }
        },
        {
          "number": "CAL0010034",
          "callback_number": "+14089178878",
          "context": {
            "queue": "21 value changed via api"
          }
        }
      ],
      "count": 8
    }
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example retrieves callback information based on a matching external ID, `new-external-2325`. Because the call doesn't provide *`responseParameters`* in the request, the response returns the full default record.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/callba
ck/get' \
  -H "Content-Type: application/json" \
  -H "Accept: application/json" \
  -u 'username':'password' \
  -d {
  "queryParameters": {
    "external_callback_id": "new-external-2325"
  }
}
```

Response body:

```
{
  "result": {
    "status": "success",
    "response": {
      "callbacks": [
        {
          "number": "CAL0010038",
          "state": "Closed Abandoned",
          "first_name": "Virtual",
          "last_name": "Agent",
          "user_table": "sys_user",
          "opened_by": "Virtual Agent",
          "assigned_to": ""
        }
      ]
    }
  }
}
```

Omnichannel Callback - PATCH /api/sn_omni_callback/callback/update

Updates an existing callback according to details provided in the request.

Only provide request parameters in the request body that you want to update.

URL format

Default URL: `/api/sn_omni_callback/callback/update`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
callbackContext	Object containing the context details about the callback request. Table: Callback Context [sys_cs_callback_context] Data type: Object `"callbackContext": { "customer_timezone": "String", "ivr_path": "String", "source_channel": "String", "queue": "String", "voicemail_duration": "String", "voicemail_recorded_at": "String", "voicemail_transcript": "String", "voicemail_url": "String" }`
callbackContext.customer_timezone	Time zone of customer who requested the callback. Time zones can be provided in the following formats. • `Country/City`. For example, `America/Los_Angeles`. • `Country/Time zone`. For example, `US/Pacific`. • `Time zone abbreviation`. For example, `PST`. For a complete list of valid timezones, see the Time zone field in the User [sys_user] table. For more information about time zones, see Time zones. Data type: String
callbackContext.ivr_path	The IVR (Interactive Voice Response) path that a customer follows before being transferred to a human agent. Typically contains a list of queues or menu options the customer navigated through in the IVR system. This string is passed by Contact Center as a Service (CCaaS). For example, `"ivr_path": "Technical Support > Account Management"` Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
callbackContext.queue	Number assignments in the queue. Data type: String
callbackContext.source_channel	Source of the callback. For example, IVR, Web, or VA. Data type: String
callbackContext.voicemail_duration	Length of the voicemail in hours, minutes, or seconds. Field: Voicemail Duration Data type: Number
callbackContext.voicemail_recorded_at	Time stamp in which the voicemail was recorded. Field: Voicemail Recorded At Data type: String
callbackContext.voicemail_transcript	Transcribed text of the voicemail. Field: Voicemail Transcript Data type: String
callbackContext.voicemail_url	Relative link to the callback record containing the voicemail. Field: Voicemail URL Data type: String

callbackDetails	Object containing the details about the callback request.
	
	Table: Callback [sys_cs_callback]
	
	Data type: Object
	
	`"callbackDetails": {`
	`  "appointment": "String",`
	`  "channel_to_callback": "String",`
	`  "description": "String",`
	`  "end_time": "String",`
	`  "expire_time": "String",`
	`  "messaging_channel": "String",`
	`  "reason_type": "String"`
	`  "scheduled_start_time": "String",`
	`  "short_description": "String",`
	`  "user_document": "String",`
	`  "user_table": "String"`
	`}`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
callbackDetails.appointment	Sys_id of the appointment. Only applicable to a `Scheduled` callback type. Table: Appointment Booking [sn_apptmnt_booking_appointment_booking] Data type: String
callbackDetails.channel_to_callback	Target messaging channel to route the callback through. Table: Messaging Channel [sys_cs_channel], Field: sys_id Data type: String
callbackDetails.description	Full description describing the reason for the callback, if needed. Data type: String
callbackDetails.end_time	Date and time value to stop the callback attempt. Only applicable to a `Scheduled` callback type. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
callbackDetails.expire_time	Date and time to close the callback request. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
callbackDetails.messaging_channel	Source of the callback. Identifies the client interface that initiated the callback request, such as a web client, mobile app, or embedded messenger. Table: Messaging Channel [sys_cs_channel], Field: sys_id Data type: String
callbackDetails.reason_type	Reason for the callback request. Helps with routing, analytics, and reporting by tagging the callback with a standardized reason. Valid values: • `Other issue` • Custom values defined by your implementation. For example, `"Billing Inquiry"`, `"Technical Support"`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Callback [sys_cs_callback], Field: reason_type Data type: String
callbackDetails.scheduled_start_time	Date and time value to initiate the callback. Only applicable to a `Scheduled` callback type. Format: glide_date_time value, such as `yyyy-MM-dd HH:mm:ss` Data type: String
callbackDetails.short_description	Provides a detailed explanation of the callback request. Can include specific customer concerns, context, or notes from the agent. Data type: String
callbackDetails.user_document	Sys_id of the user who requested the callback. Used with *`callbackDetails.user_table`* to identify the user requesting the callback. Table: User [sys_user], Field: sys_id Data type: String
callbackDetails.user_table	Table where the user record resides. Used with *`callbackDetails.user_document`* to identify the user requesting the callback. Value is always `sys_user`. Data type: String
callbackId	Required. Sys_id or external_id of the callback. Table: Callback [sys_cs_callback] Data type: String
inboundId	Sys_id of the inbound call associated with the callback. Provides traceability linking the callback request to a specific inbound call record that might originate from a third-party provider or CCaaS platform. Table: Callback [sys_cs_callback], Field: provider_application_id Data type: String
phoneNumber	Phone number of the caller. Data type: String of numbers Format: E.164 standard compliant

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
errors	Message containing details about the failures of the callback creation, like missing required request IDs. Data type: Array of strings `"errors": ["String", "String"]`
messages	Message containing details about the success of the callback creation. Data type: Array of strings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"messages": ["String", "String"]`

result	Result of the request.
	
	Data type: Object
	
	`"result": {`
	`  "status": "String",`
	`  "response": {Object},`
	`  "errors": [Array],`
	`  "messages": [Array]`
	`}`

result.response	Object containing callback and interaction IDs of the callback request.
	
	Data type: Object
	
	`"response": {`
	`  "callback_created": Boolean`
	`  "callback_id": "String",`
	`  "interaction_id": "String"`
	`}`

result.response.callback_created	Flag indicating whether the new callback request was created or not. Possible values: • true: Callback was created successfully. • false: Callback was not created. For example, the callback already exists with the given callback_id. Data type: Boolean
result.response.callback_id	Sys_id of the new callback, if applicable. Table: Callback [sys_cs_callback] Data type: String
result.response.interaction_id	Sys_id of the newly created interaction. Table: Interaction [interaction] Data type: String
result.status	Success or failure status of the request. Valid values: • success • failure Data type: String

Example: cURL request

The following example updates some callback details in the associated callback request.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_omni_callback/callba
ck/update' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "callbackDetails": {
    "appointment": "68cc0a5a9314521060320dd548373cbd",
    "description": "Customer reported issue with order #12345",
    "short_description": "Order issue",
    "reason_type": "product_issue",
    "expire_time": "2025-09-01 17:00",
    "messaging_channel": "web_channel_sys_id",
    "channel_to_callback": "genesys_channel_sys_id",
    "scheduled_start_time": "2025-09-01 1:00",
    "end_time": "2025-09-01 17:00",
    "user_document": "abel.tuter",
    "user_table": "sys_user"
},
  "callbackContext": {
    "queue": "5 value changed via api",
    "ivr_path": "5 some-ivr-path changed via api"
  },
  "inboundId": "AmazonConnect",
  "phoneNumber": "+14089178877",
  "callbackId": "a16ead53fff0621088c6ffffffffffce"
}
```

Response of a successful update to the valid, existing callback ID.

```
{
  "result": {
    "status": "success",
    "response": {
      "callback_id": "952f763b53786210011eddeeff7b1297"
    },
    "messages": [
      "Successfully updated the callback
 952f763b53786210011eddeeff7b1297"
    ]
  }
}
```

Response when an invalid callback ID is provided in the request:

```
  "result": {
    "status": "failure",
    "response": {
      "callbackId": null
    },
    "errors": [
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "Callback not found for callback ID:
 952f763b53786210011eddeef7b1297"
    ]
  }
}
```

Response when a callback ID is missing in the request:

```
  "result": {
    "status": "failure",
    "response": {
      "callbackId": null
    },
    "errors": [
      "Parameter 'callbackId' is required in request"
    ]
  }
}
```

Omnichannel Callback - PATCH /api/sn_omni_callback/callback/close/{callback_number}

Cancels a given callback request.

URL format

Versioned URL: `/api/{api_version}/sn_omni_callback/callback/close/{callback_number}`

Default URL: `/api/sn_omni_callback/callback/close/{callback_number}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
callback_number	Sys_id or external_id of the callback to cancel. Table: Callback [sys_cs_callback] Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
reason	Optional. Specifies to cancel the given callback. Value is always `Cancelled`. If *`reason`* isn't passed, the request is closed rather than cancelled. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters

Name	Description
reason	Reason for updating the callback request. Value is always `Cancelled` or `Closed`. Table: Callback [sys_cs_callback], Field: Reason Data type: String `{ "reason": "Cancelled" }`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following request cancels the callback request with callback ID CAL0001234.

```
curl -X POST
 "https://instance.servicenow.com/api/sn_omni_callback/callba
ck/close/CAL0001234" \
  -H "Accept: application/json" \
  -H "Content-Type: application/json" \
  -u "username:password" \
  -d '{
    "reason": "Cancelled"
  }'
```

The response body confirms the cancellation.

```
{
"reason":"Cancelled"
}
```

openframe API

The *openframe* API provides endpoints that provide Contact Center as a Service (CCaaS) the ability to create and update interaction records without using the Operation Handler.

Use this API to create interaction records to track agent phone calls. Once an interaction record is created, the interaction can automatically display in the CSM Configurable Workspace when an agent receives a phone call.

To access this API, the com.sn_openframe_store plugin must be installed on the instance and the calling user must have either the sn_openframe_api_user or sn_openframe_user role. The *openframe* API runs in the `sn_openframe` namespace.

For additional information on CSM voice interaction records, see CSM voice interaction record page.

openframe - PATCH /openframe/voice-interaction/{interactionSysId}

Updates the specified interaction record in the Interaction [interaction] table. Contact Center as a Service (CCaaS) providers can then use these records to track phone calls.

URL format

Versioned URL: `/api/now/openframe/{api_version}/voice-interaction/{interactionSysId}`

Default URL: `/api/now/openframe/voice-interaction/{interactionSysId}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
interactionSysId	Sys_id of the interaction record to update. This value is returned by the Create Voice Interaction/POST endpoint. Data type: String Table: Interaction [interaction]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

interaction	Required. Details of the voice interaction. At least one parameter must be passed.
	
	Data type: Object
	
	`"interaction": {`
	`  "additionalParams": {Object},`
	`  "callbackPhoneNumber": "String",`
	`  "clientSessionId": "String",`
	`  "inboundId": "String",`
	`  "userPhoneNumber": "String"`
	`}`

interaction.additionalParams	Name-value pairs of the associated interaction record fields and their respective values.
	
	For example:
	
	`"additionalParams": {`
	`  "direction": "inbound",`
	`  "short_description": "New outbound call",`
	`  "assigned_to": "a8f98bb0eb32010045e1a5115206fe3a"`
	`}`
	
	Data type: Object
	
	Default: None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
interaction.callbackPhoneNumber	Caller's callback phone number. This is the number the agent uses to reach the caller in case the call drops. This value maps to the caller_phone_number field in the Interaction [interaction] table. See also the *callerPhoneNumber* property description for Create Voice Interaction/POST. Data type: String Format: E.164 Default: None
interaction.clientSessionId	Unique identifier of the record in an external system used to track this phone call. This information links the records between the two systems. Data type: String Default: None
interaction.inboundId	Unique identifier of the application provider for the voice service. Table: Inbound ID field in the Provider Channel Application [sys_cs_provider_application] table. Default: None
interaction.userPhoneNumber	Phone number of the user that made the call associated with the voice interaction. Data type: String Format: E.164
interactionContext	Interaction context variables to set. Name-value pairs of the interaction context variables to save in the interaction record. These values are determined by CCaaS. For example: `"interactionContext":{ "devicetype": "genesys", "requester_session_language": "en-US" }` Data type: Object Default: None
phoneLogs	Name-value pairs of the phone logs to create and associate with a call. You can specify any field in the Phone Log [sn_open_frame_phone_log] table.

Request body parameters (XML or JSON) (continued)

Name	Description
	For example: `"phoneLogs":[ { "agent": "String", "call_id": "String", "start_time": "String" } ]` Data type: Array of Objects Default: None
relatedRecords	Records related to the call. Data type: Array of Objects `"relatedRecords":[ { "documentId": "String", "documentTable": "String" } ]` Default: None
relatedRecords.documentId	Sys_id of the related record. Data type: String Table: Specified in the *`relatedRecords.documentTable`* parameter.
relatedRecords.documentTable	Name of the table that contains the related record. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
status	Status of the record update. Possible values: • SUCCESS: The interaction record was successfully updated. • FAILURE: The interaction record was not updated.

Example: cURL request

The following code example shows how to update the interaction record with the sys_id 12961fff7fb2d2102d0cd3cf8c86652b.

```
curl
 "http://instance.service-now.com/api/now/openframe/voice-intera
ction/12961fff7fb2d2102d0cd3cf8c86652b" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"interaction\":{
```

```

Response:

```
{
  "result": {
    "status": "SUCCESS"
  }
}
```

openframe - POST /openframe/voice-interaction

Creates an interaction record in the Interaction [interaction] table when an agent accepts a call. Contact Center as a Service (CCaaS) providers can then use these records to track phone calls.

Use this endpoint to provide a consistent experience for agents, similar to other native channels such as chat and case, when accepting phone calls.

Order API

The *Order* API provides endpoints for retrieving and creating orders with order line items for the Customer Service Management application.

This API requires the Order Management (app-csm-order-mgmt) store application and is provided within the `sn_ind_tmt_orm` namespace. For information, see Sales and Order Management.

This API requires sn_csm_om.order_integrator for access, and one of the following:

- sn_csm_om.consumer_agent – API write access restricted to B2C orders.
- sn_csm_om.customer_agent – API write access restricted to B2B orders.
- sn_csm_om.order_admin – API write access for B2B or B2C orders.

For information on B2B and B2C orders, see Customer Data Models for B2B2C.

Order API – GET /sn_ind_tmt_orm/order/{id}

Retrieves complete order details by specifying the sys_id or order number.

URL format

Versioned URL: `/api/sn_ind_tmt_orm/{api_version}/order/{id}`

Default URL: `/api/sn_ind_tmt_orm/order/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or order number (order_id) of the record to retrieve. Data type: String Table: Orders [sn_csm_om_order]

Query parameters

Name	Description
sysparm_display_value	Flag that indicates whether to show the display value of the reference fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • true: Show the display value of the reference fields, choice fields, and date field in the response. • false: Show the actual value of the reference fields, choice fields, and date field in the response. Default: false

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	The user is not authenticated.
403	The user is not authorized.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• The user does not have required roles to access the API. • The user does not have authorization to read the order. This API requires sn_csm_om.order_integrator for access, and one of the following: • sn_csm_om.consumer_agent – API write access restricted to B2C orders. • sn_csm_om.customer_agent – API write access restricted to B2B orders. • sn_csm_om.order_admin – API write access for B2B or B2C orders.

Response body parameters (JSON or XML)

Name	Description
account	Sys_id of a record located in the Accounts [customer_account] table. Identifies the account for B2B orders. Data type: String
actual_end_date	End date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
actual_start_date	Start date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
billing_city	Name of the billing city. Data type: String
billing_country	Abbreviation of the billing country. Data type: String
billing_state	Abbreviation of the billing state or province. Data type: String
billing_street	Billing street address. Data type: String
billing_zip	Billing ZIP or postal code. Data type: String
comments	Additional information for the order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
consumer	Sys_id of a consumer record. Identifies the consumer for B2C orders. Data type: String
contact	Sys_id of the customer contact related to the account. Data type: String Table: Contacts [customer_contact]
contract	Sys_id of the Customer Service contract record. Data type: String Table: Contracts [ast_contract]

error	Details describing an error encountered during the request process.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. Each error message has a corresponding description in the *`detail`* property. Data type: String
expected_end_date	Expected end date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
expected_start_date	Expected start date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
external_id	External ID representing a related record on a third party's system.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
external_system	Name of the customer's system. Data type: String
order_category	Customer order type. Possible values: • product • service Data type: String
order_currency	Currency code representing the currency in which the order was purchased. For example, USD for United States Dollars. This currency is used for all amount fields in the order and line orders. Currency codes are listed in the Currencies [fx_currency] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_date	Date and time of order creation. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
order_id	Order number of the order. Data type: String Table: Orders [sn_csm_om_order]

order_line_items	Required. List of objects that define each order line item in the order.
	
	Data type: Array
	
	Required properties in each order line item object:
	• *account* for B2B orders or *consumer* for B2C orders.
	• *product_offering-*
	• *quantity*
	• *unit_of_measurements*
	• *order_line_characteristics*
	
	`"order_line_items": [`
	`{`

Name	Description
	Format: yyyy-MM-dd HH:mm:ss in UTC time zone Data type: String
order_line_items.external_id	External ID of the order line item. Data type: String
order_line_items.external_system	External sys_id of the order line item. Data type: String
order_line_items.list_price	List price of the product offering per unit. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.location	Sys_id of a shipping location record. Data type: String Table: Locations [cmn_location]
order_line_items.order	This line item's order number as listed in the Orders [sn_csm_om_order] table. Data type: String
order_line_items. order_line_characteristics	List of objects defining associated order line characteristics. Order line characteristics are located in the Order Line Characteristics [sn_csm_om_order_characteristic_value] table. Data type: Array of Objects `"order_line_characteristics": [ { "characteristic": "String", "characteristic_option": "String" } ]`
order_line_items. order_line_characteristics. characteristic_option	Product characteristic unique option that triggers the exclusion rule. For example, product size or color. Data type: String
order_line_items. order_line_characteristics. characteristic_option_value	Value of a characteristic option. Data type: String
order_line_items. order_line_characteristics. external_id	External ID of the order line characteristic.

Name	Description
order_line_items.product_offering	Sys_id of the product listed in the Product Offerings [sn_prd_pm_product_offering] table. Data type: String
order_line_items.product	Sys_id of the product model listed in the Product Models [cmdb_model] table. Must be provided with matching order line item Data type: String
order_line_items.product_specification	Sys_id of the product specification associated with the order line item. Listed in the Product Specifications [sn_prd_pm_product_specification] table. Data type: String
order_line_items.quantity	Number of product models ordered. Data type: String
order_line_items.shipping_city	Name of the destination city. Data type: String
order_line_items.shipping_country	Abbreviation of the destination country. Data type: String
order_line_items.shipping_state	Abbreviation of the destination state or province. Data type: String
order_line_items.shipping_street	Destination street address. Data type: String
order_line_items.shipping_zip	Destination ZIP or postal code. Data type: String
order_line_items.short_description	Short description of the order line item. Data type: String
order_line_items.sku	Number that is generated by a supplier that uniquely identifies a product that is sold by that supplier. Data type: String
order_line_items.sold_product	Sys_id of an install base sold product record. Data type: String

Name	Description
	Data type: String
order_line_items.sys_updated_by	System name of the user who most recently updated this record. Data type: String
order_line_items.sys_updated_on	Date and time at which the record was most recently updated. Data type: String
order_line_items.top_line_item	Total price of all order line items accumulated in this order. Data type: String
order_line_items.total_price	Total price of order line. The API does not calculate the total based on net price and quantity. Data type: String
order_line_items.unit_of_measurement	Sys_id for the ordered unit of measure listed in the Unit of Measures [sn_prd_pm_uom] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.unit_of_measurement	Required. Sys_id for the ordered unit of measure listed in the Unit of Measures [sn_prd_pm_uom] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.unit_price	Net price of the product offering per unit. Data type: String Table: Currency Instances [fx_currency_instance]
order_line_items.work_notes	Free-form internal work notes for the order line item. Data type: String
order_type	Order action that determines how the order is added. Possible values: • add • change

Name	Description
	Data type: String
partner	For B2B orders, sys_id of the associated partner record for an account. Data type: String Table: Accounts [customer_account]
partner_contact	For B2B orders, sys_id of the primary contact of the partner for the partner account. Data type: String Table: Contacts [customer_contact]
payment_ref_id	Unique identifier of the payment. For example, check number. Data type: String
price_list	Sys_id of the associated price list record. The price is not calculated based on net price and quantity by this API. **Note:** This property might not be available in earlier versions of Order Management. Data type: String Table: Price Lists [sn_csm_pricing_price_list]
quote_id	Unique ID for the order price quote. Data type: String
same_as_shipping_address	Flag that indicates whether the address of the purchaser is the same as the shipping address. Valid values: • true: Address of the purchaser is the same as the shipping address. • false: Address of the purchaser is different from the shipping address. Data type: Boolean
shipping_city	Name of the destination city. Data type: String
shipping_country	Abbreviation of the destination country. Data type: String
shipping_location	Sys_id of a shipping location record.

Name	Description
sys_domain_path	Domain path for the record. Data type: String Default: / (global)
sys_id	Sys_id of the order record. Data type: String Table: Orders [sn_csm_om_order]
sys_mod_count	Number of times this record has been modified. Data type: String
sys_tags	System tags for the content. Data type: String
sys_updated_by	System name of the user who most recently updated this record. Data type: String
sys_updated_on	Date and time at which the record was most recently updated. Data type: String
total_amount	Total cost for the entire order. Data type: String

Example: cURL request

The following example shows how to get an order by its order number.

```
curl
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/ORD0
001034" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```

Order API – POST /sn_ind_tmt_orm/order

Creates a new order with line items and characteristics.

Orders with line items are defined using request body parameters. The following properties are required in most versions of Order Management:

- *account* for B2B orders or *consumer* for B2C orders.
  - *account* – Sys_id of a record located in the Accounts [customer_account] table.
  - *consumer* – Sys_id of a consumer record.
- *order_currency* – Currency code representing the currency in which the order was purchased. For example, USD for United States Dollars. This currency is used for all amount fields in the order and line orders. Currency codes are listed in the Currencies [fx_currency] table.
- *order_line_items* – List of objects that define each order line item in the order. Required properties in each order line item object:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *account* for B2B orders or *consumer* for B2C orders.
  - *account* – Sys_id of the business account assigned to this order line item. Located in the Accounts [customer_account] table.
  - *consumer* – Sys_id of the consumer assigned to this order line item. Located in the Consumers [csm_consumer] table.
- *order_line_characteristics* – List of objects defining associated order line characteristics. Order line characteristics are located in the Order Line Characteristics [sn_csm_om_order_characteristic_value] table.
- *product_offering* – Sys_id of the product listed in the Product Offerings [sn_prd_pm_product_offering] table.
- *quantity* – Number of product models ordered.
- *unit_of_measurements* – Sys_id for the ordered unit of measure listed in the Unit of Measures [sn_prd_pm_uom] table.

The Request body parameters table contains more details.

URL format

Versioned URL: `/api/sn_ind_tmt_orm/{api_version}/order`

Default URL: `/api/sn_ind_tmt_orm/order`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
account	Required for B2B orders. Sys_id of a record located in the Accounts [customer_account] table. The consumer property is required for B2C orders. Data type: String
actual_end_date	End date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
actual_start_date	Start date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
billing_city	Name of the billing city. Data type: String
billing_country	Abbreviation of the billing country. Data type: String
billing_state	Abbreviation of the billing state or province. Data type: String
billing_street	Billing street address. Data type: String
billing_zip	Billing ZIP or postal code. Data type: String
comments	Additional information for the order. Data type: String
consumer	Required for B2C orders. Sys_id of a consumer record. The account property is required for B2B orders. Data type: String Table: Consumers [csm_consumer]
contact	Sys_id of the customer contact related to the account. Data type: String Table: Contacts [customer_contact]
contract	Sys_id of the Customer Service contract record. Data type: String Table: Contracts [ast_contract]
expected_end_date	Expected end date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
expected_start_date	Expected start date of order. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
external_id	External ID representing a related record on a third party's system. Data type: String
external_system	Name of the customer's system. Data type: String
order_category	Customer order type. Possible values: • product • service Data type: String
order_currency	Required. Currency code representing the currency in which the order was purchased. For example, USD for United States Dollars. This currency is used for all amount fields in the order and line orders. Currency codes are listed in the Currencies [fx_currency] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_date	Date and time of order creation. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
order_line_items	Required. List of objects that define each order line item in the order. Data type: Array Required properties in each order line item object: • *account* for B2B orders or *consumer* for B2C orders. • *product_offering-* • *quantity* • *unit_of_measurements* • *order_line_characteristics*

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
order_line_items.list_price	List price of the product offering per unit. **Note:** This property might not be available in earlier versions of Order Management. Data type: String

order_line_items.
order_line_characteristics
	Required. List of objects defining associated order line characteristics. Order line characteristics are located in the Order Line Characteristics [sn_csm_om_order_characteristic_value] table.
	
	In the most recent release, if the offering is associated with product specification, then order characteristics must be included to determine the product model.
	
	In earlier releases, this property was only required for simple orders with the *order_line_items.product_specification* property set.
	
	Data type: Array of Objects
	
	`"order_line_characteristics": [`
	`{`
	`"characteristic": "String",`
	`"characteristic_option": "String"`
	`}`
	`]`

order_line_items. order_line_characteristics. characteristic	Name of the characteristic associated with the product model. For example, Dishwasher Size. Data type: String
order_line_items. order_line_characteristics. characteristic_option	Product characteristic unique option that triggers the exclusion rule. For example, product size or color. Data type: String
order_line_items.price_list	Sys_id of a price list record in the Price Lists [sn_csm_pricing_price_list] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.product	Sys_id of the product model listed in the Product Models [cmdb_model] table. If included in the request body, the associated order line characteristics must match.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
order_line_items.product_offering	Required. Sys_id of the product listed in the Product Offerings [sn_prd_pm_product_offering] table. If the offering is associated with the product model, the product model is determined by the order. If the offering is associated with product specification, then order characteristics must be included to determine the product model. Data type: String
order_line_items. product_specification	Required. Sys_id of the product specification associated with the order line item. Listed in the Product Specifications [sn_prd_pm_product_specification] table. **Note:** This property was not required in earlier versions of Order Management. Data type: String
order_line_items.quantity	Required. Number of product models ordered. **Note:** This property was required in earlier versions of Order Management. Data type: String
order_line_items.shipping_city	Name of the destination city. Data type: String
order_line_items.shipping_country	Abbreviation of the destination country. Data type: String
order_line_items.shipping_state	Abbreviation of the destination state or province. Data type: String
order_line_items.shipping_street	Destination street address. Data type: String
order_line_items.shipping_zip	Destination ZIP or postal code. Data type: String
order_line_items.short_description	Short description of the order line item. Data type: String
order_line_items.sku	Number that is generated by a supplier that uniquely identifies a product that is sold by that supplier.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
order_line_items.sold_product	Sys_id of an install base sold product record. Data type: String Table: Sold Products [sn_install_base_sold_product]
order_line_items.specification	Specification of order line item. Data type: String
order_line_items.state	State of order line. For example, draft, new, in_progress, or completed. Data type: String
order_line_items.total_price	Total price of order line. The total price is not calculated based on net price and quantity by this API. Data type: String
order_line_items. unit_of_measurement	Required. Sys_id for the ordered unit of measure listed in the Unit of Measures [sn_prd_pm_uom] table. **Note:** This property might not be available in earlier versions of Order Management. Data type: String
order_line_items.unit_price	Net price of the product offering per unit. Data type: String Table: Currency Instances [fx_currency_instance]
order_line_items.work_notes	Free-form internal work notes for the order line item. Data type: String
order_type	Order action that determines how the order is added. Possible values: • add • change Data type: String
partner	For B2B orders, sys_id of the associated partner record for an account. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Accounts [customer_account]
partner_contact	For B2B orders, sys_id of the primary contact of the partner for the partner account. Data type: String Table: Contacts [customer_contact]
price_list	Sys_id of the associated price list record. The price is not calculated based on net price and quantity by this API. **Note:** This property might not be available in earlier versions of Order Management. Data type: String Table: Price Lists [sn_csm_pricing_price_list]
quote_id	Unique ID for the order price quote. Data type: String
shipping_city	Name of the destination city. Data type: String
shipping_country	Abbreviation of the destination country. Data type: String
shipping_state	Abbreviation of the destination state or province. Data type: String
shipping_street	Destination street address. Data type: String
shipping_zip	Destination ZIP or postal code. Data type: String
short_description	Short description of the order. Data type: String
special_instructions	Special instructions for the order. Data type: String
state	State of the order. For example, new, in_progress, or completed. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
total_amount	Total cost for the entire order. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Payload is not in the expected format.
401	The user is not authenticated.
403	The user is not authorized. • The user does not have required roles to access the API. • The user does not have authorization to read the order. This API requires sn_csm_om.order_integrator for access, and one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• sn_csm_om.consumer_agent – API write access restricted to B2C orders. • sn_csm_om.customer_agent – API write access restricted to B2B orders. • sn_csm_om.order_admin – API write access for B2B or B2C orders.
500	Internal server error. One or more validations have failed. Possible issues: • *Account* or *consumer* parameter is missing. These fields are mandatory on header and item. • *Account*/*contact* and *consumer* parameters have been passed. These parameters cannot be passed together. • Choice parameters: Invalid choice values passed. • Quantity parameter: Invalid value. • Invalid reference field. • Missing mandatory fields. • Invalid date and time format. • Start date is greater than end date. • Invalid characteristic. • Invalid characteristic option. • More than one product model was found for provided characteristics. • Product model not found for the provided characteristics. • User does not have access to create an order. • B2B order contains consumer order lines. • B2C order contains account, contact, partner, or partner contact parameters. • Amount fields currency does not match the order currency. • *Order_line_characteristics* were passed for an order line with *product_offering* associated with product model. • The unit of measurement specified for an offer type=configuration does not belong to the allowed units of measure defined on the product offering. • No characteristics were passed for an offer type of configuration when the product offering is expecting configuration. • Unable to create orders that have a bundle item plus simple configurations on the order line. • Passed parameters contain characteristics for a bundle offering. • Unable to create parent order line and/or child order line. Only parent bundle items are valid in bundle offering calls. • The specified unit_of_measurement record for a bundle offering contains a value other than "EACH".

Response body parameters (JSON or XML)

Name	Description

error	Details describing an error encountered during the request process.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. Each error message has a corresponding description in the *detail* property. Data type: String
order_id	Order number of the order. Data type: String Table: Orders [sn_csm_om_order]
status	Failure message included in addition to the error object. Data type: String
sys_id	Sys_id of the order record. Data type: String Table: Orders [sn_csm_om_order]

Example: cURL request

The following example shows how to create a single-item order for a stainless steel microwave.

```
curl "https://instance.service-now.com/api/sn_ind_tmt_orm/order"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"account\": \"c480021553ab70101aaeddeeff7b120f\",
\"contact\":\"96d0461553ab70101aaeddeeff7b120b\",
\"order_currency\": \"USD\",
\"order_line_items\": [
{
\"account\": \"c480021553ab70101aaeddeeff7b120f\",
\"action\": \"add\",
\"contact\": \"96d0461553ab70101aaeddeeff7b120b\",
\"list_price\": \"2000\",
\"order_line_characteristics\": [
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
\"characteristic\" : \"Solana color\",
\"characteristic_option\" : \"Stainless steel\"
},
{
\"characteristic\" :\"Microvawe Capacity\",
\"characteristic_option\" : \"1.2 cu\"
}
],
\"product_offering\": \"2d4376760f740110603bf634a7767e46\",
\"quantity\": \"1\",
\"shipping_city\": \"Santa Clara\",
\"shipping_country\": \"USA\",
\"shipping_state\": \"CA\",
\"shipping_street\": \"222 Star St\",
\"shipping_zip\": \"94560\",
\"state\": \"draft\",
\"status\": \"new\",
\"total_price\": \"2000\",
\"unit_of_measurement\": \"cb2795d553020110286eddeeff7b12ff\",
\"unit_price\": \"2000\"
}
]
}" \
--user 'user':'password'
```

Response:

```
{
  "result": {
    "sys_id": "24fdf5bd75eec510f877f30c01a15aa0",
    "order_id": "ORD0001034"
  }
}
```

Party Management Open API

The *Party Management Open* API provides endpoints for managing parties with a relationship to the enterprise, like a consumer, account, or contact. Use this API to create, update, and retrieve data from the Consumer [csm_consumer], Account [customer_account], and Contact [customer_contact] tables.

The *Party Management Open* API is a ServiceNow® implementation of the TM Forum Party Management API REST specification. This implementation is based on the TMF632 Party Management API Conformance Profile v5.0.0 – TM Forum, June 2025. The *Party Management Open* API is conformance certified by TM Forum.

This API is provided within the sn_tmf_api namespace. The calling user must have the sn_tmf_api.party_integrator role. The Customer Service Base Entities (com.snc.cs_base) plugin is required, particularly for all GET operations.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. Sensitive fields like phone numbers may require special ACL permissions for update or retrieval.

Party Management – DELETE /api/sn_tmf_api/v1/party/individual/{id}

Inactivates a specified record from the Consumer [csm_consumer] and Contact [customer_contact] tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_tmf_api/{api_version}/party/individual/{id}`

Default URL: `/api/sn_tmf_api/v1/party/individual/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or external_id of the Consumer or Contact record to set to an inactive state. Table: Consumer [csm_consumer] and Contact [customer_contact]. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

The following example deletes the given record.

```
curl
 "http://instance.service-now.com/api/sn_tmf_api/v1/party/indivi
dual/dca96eaa11f43110f877366201dea6c1" \
--request DELETE \
--header "Accept:application/json" \
--user 'user':'password' \
```

Doesn't return a response body. Reference status codes for a success or failure indicator.

Party Management – GET /api/sn_tmf_api/v1/party/individual

Retrieves a list of all individual (party) records with a relationship to the enterprise. You can filter results by specific fields or IDs.

URL format

Versioned URL: `/api/sn_tmf_api/v1/party/individual`

Default URL: `/api/sn_tmf_api/v1/party/individual`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • @type • familyName • gender • givenName • href • id • middleName • name • nationality • status • title Data type: String Default: Returns all fields.
id	Filter party management by sys_id. Specified sys_ids are returned in the response. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. Data type: Number Default: 0

Request body parameters (XML or JSON)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if offset=2 and limit=3, the value of the Content-Range header is items 3-5.
Content-Type	Data format of the response body. Only supports application/json.
Link	Contains the following links to navigate through query results: • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON or XML)

Name	Description
contactMedium	List of means for contacting the party. Data type: Array of Objects `"contactMedium": [ { "@type": "String", "city": "String", "country": "String", "emailAddress": "String", "locationId": "String", "mediumType": "String", "phoneNumber": "String", "postCode": "String", "preferred": "Boolean", "stateOrProvince": "String", "street1": "String", "street2": "String" } ]`
contactMedium.@type	Type of contacting party. Indicates the specific schema or subclass type of the object. Possible values: • BusinessPhoneContactMedium: Business phone number • EmailContactMedium: Email address • FaxPhoneContactMedium: Fax number • GeographicAddressContactMedium: Physical address (street, city, state, postal code) • HomePhoneContactMedium: Home phone number • MobilePhoneContactMedium: Mobile number Data type: String
contactMedium.city	City of the individual.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
contactMedium.country	Country of the individual. Data type: String
contactMedium.emailAddress	Email address of the contact. Data type: String
contactMedium.locationId	Sys_id of the party location. Table: Location [cmn_location] Data type: String
contactMedium.mediumType	The type of contact medium. Indicates the business-level attribute that specifies the kind of contact channel being used. Possible values: • email • businessPhone • homePhone • mobilePhone • postalAddress Data type: String
contactMedium.phoneNumber	Phone number of the individual. Data type: String
contactMedium.postCode	Postcode of the individual. Data type: String
contactMedium.preferred	This value is always false. Data type: Boolean
contactMedium.stateOrProvince	Indicates whether the location is from a state or province. Possible values: • state • province Data type: String
contactMedium.street1	Describes the street. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
contactMedium.street2	Complementary street description. Data type: String
familyName	Last name of the individual. Data type: String
gender	Gender of the individual. Data type: String
givenName	First name of the individual. Data type: String
href	Relative link to the user or consumer or contact record. Data type: String
id	Sys_id of the user or consumer or contact record to retrieve. Tables: Consumer [csm_consumer] or Contact [customer_contact] Data type: String
middleName	Middle name of the individual. Data type: String
name	User name of the user or contact individual. Data type: String
nationality	Nationality of the individual. Data type: String
partyCharacteristics	List of characteristics associated with the party. Data type: Array of Objects `"partyCharacteristics": [ { "@type": "String", "name": " String", "value": "String", "valueType": "String" } ]`
partyCharacteristics.@type	When subclassing, this defines the subclass extensible name. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• StringCharacteristic • StringArrayCharacteristic • IntegerCharacteristic • BooleanCharacteristic Data type: String
partyCharacteristics.name	Name of the party characteristic. Data type: String
partyCharacteristics.value	Value of the party characteristic. Data type: String
partyCharacteristics.valueType	Data type of the characteristic's value. Data type: String
partyOrPartyRole	Roles related to this party are defined where the party is created in table. For example, `User`, `Consumer`, `Customer Contact`. *`partyOrPartyRole`* indicates which type of record is retrieved in the operation. If the provided sys_id belongs to the Consumer [csm_consumer] table, then *`partyOrPartyRole.role`* is set to `Consumer`. Likewise, if the sys_id belongs to the Contact [customer_contact] table, then *`partyOrPartyRole.role`* is set to `Contact`. Data type: Object `"partyOrPartyRole": { "@type": "String", "role":"String" }`
partyOrPartyRole.@type	This value is always `Party`. Data type: String
partyOrPartyRole.role	Type of party role. Possible values: • Consumer • Contact Data type: String
relatedParty	List of parties or party roles related to this party. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"relatedParty": [ { "role": "String", "partyOrPartyRole": {Object} } ]`
relatedParty.partyOrPartyRole	Represents information about the related party and the role it plays in the context of the record. For example, if the role is `Company`, then *`partyOrPartyRole.id`* contains the sys_id of the Company [core_company] record, and *`partyOrPartyRole.name`* contains the company's name. This structure ensures that both the party reference and its role are explicitly defined and easily identifiable. Data type: Object `"partyOrPartyRole": { "@type": "String", "id": "String", "name": "String" }`
relatedParty.partyOrPartyRole.@type	Type of the related party. Possible value for user: • Organization • Individual Data type: String

relatedParty.partyOrPartyRole.id	Sys_id of the related party.
	
	• Possible value for `user`:
	  ○ Company
	  ○ Department
	• Possible value for `customer`: Account
	• Possible value for `consumer`: User
	
	Data type: String

relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String
relatedParty.role	Business role that the related party plays in the context of the current entity. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Company (if related party is User) • Department (if related party is User) • Account (if related party is Customer) • User (if related party is Consumer) Data type: String
status	Flag that indicates the status of the individual. Valid values: • active: Individual is in an active status. • inactive: Individual is in an inactive status. Data type: Boolean
title	Prefix or title of the individual. For example, `Dr.`, `Mr.`, `Ms.`). Data type: String

Example: cURL request

Retrieves a list of all party management records in the instance.

```
curl"http://
instance.servicenow.com/api/v1/sn_tmf_api/party/individual" \
--request GET \
--header "Accept:application/json" \
--user 'user:password'
```

Response body for a Individual Contact party.

Party Management - GET /api/sn_tmf_api/v1/party/individual/{id}

Retrieves a specified record from the Consumer [csm_consumer] or Contact [customer_contact] tables. You can filter results by specific fields.

URL format

Versioned URL: `/api/sn_tmf_api/{api_version}/party/individual`

Default URL: `/api/sn_tmf_api/v1/party/individual`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or external_id of the consumer or contact record to retrieve. Table: Consumer [csm_consumer] or Contact [customer_contact] Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • @type • familyName • gender • givenName • href • id • middleName • name • nationality • status • title Data type: String Default: Returns all fields

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
contactMedium	List of means for contacting the party. Data type: Array of Objects `"contactMedium": [ { "@type": "String", "city": "String", "country": "String", "emailAddress": "String", "locationId": "String", "mediumType": "String", "phoneNumber": "String", "postCode": "String", "preferred": "Boolean", "stateOrProvince": "String", "street1": "String", "street2": "String" } ]`
contactMedium.@type	Type of contacting party. Indicates the specific schema or subclass type of the object. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• BusinessPhoneContactMedium: Business phone number • EmailContactMedium: Email address • FaxPhoneContactMedium: Fax number • GeographicAddressContactMedium: Physical address (street, city, state, postal code) • HomePhoneContactMedium: Home phone number • MobilePhoneContactMedium: Mobile number Data type: String
contactMedium.city	City of the individual. Data type: String
contactMedium.country	Country of the individual. Data type: String
contactMedium.emailAddress	Email address of the contact. Data type: String
contactMedium.locationId	Sys_id of the party location. Table: Location [cmn_location] Data type: String
contactMedium.mediumType	The type of contact medium. Indicates the business-level attribute that specifies the kind of contact channel being used. Possible values: • email • businessPhone • homePhone • mobilePhone • postalAddress Data type: String
contactMedium.phoneNumber	Phone number of the individual. Data type: String
contactMedium.postCode	Postcode of the individual. Data type: String
contactMedium.preferred	This value is always false.

Name	Description

	• Possible value for `user`:
	  ○ Company
	  ○ Department
	• Possible value for `customer`: Account
	• Possible value for `consumer`: User
	
	Data type: String

relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String
relatedParty.role	Business role that the related party plays in the context of the current entity. Possible values: • Company (if related party is User) • Department (if related party is User) • Account (if related party is Customer) • User (if related party is Consumer) Data type: String
status	Flag that indicates the status of the individual. Valid values: • active: Individual is in an active status. • inactive: Individual is in an inactive status. Data type: Boolean
title	Prefix or title of the individual. For example, `Dr.`, `Mr.`, `Ms.`). Data type: String

Example: cURL request

Retrieves a specified record, `12345`, from the table.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/v1/party/individ
ual/12345" \
--request GET \
--header "Accept:application/json" \
--user 'user':'password' \
```

Response body.

Party Management – GET/api/ sn_tmf_api/v1/party/organization/{id}

Retrieves a specified record from the Account [customer_account] tables. You can filter results by specific fields or IDs.

URL format

Versioned URL: `/api/sn_tmf_api/v1/party/organization/{id}`

Default URL: `/api/sn_tmf_api/v1/party/organization/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the company or account record to retrieve. Table: Account [customer_account] or Company [csm_company] Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • @type • href • id • legalName • name • status • tradingName Data type: String Default: Returns all fields
id	Filter party management by sys_id. Specified sys_ids are returned in the response. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Response body parameters (JSON or XML)

Name	Description
@type	This value is always `Organization`. Data type: String
contactMedium	List of means for contacting the party. A contact medium represents the way you communicate with or reach a party like an individual or organization. For example, a channel or method of contact associated with that party. Data type: Array of Objects `"contactMedium": [ { "@type": "String", "city": "String", "country": "String", "emailAddress": "String", "locationId": "String", "mediumType": "String", "phoneNumber": "String", "postCode": "String", "preferred": "Boolean", "stateOrProvince": "String", "street1": "String", "street2": "String" } ]`
contactMedium.@type	Type of contact medium. Type of contacting party. Indicates the specific schema or subclass type of the object. Possible values: • BusinessPhoneContactMedium: Business phone number • EmailContactMedium: Email address • FaxPhoneContactMedium: Fax number • GeographicAddressContactMedium: Physical address (street, city, state, postal code)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• HomePhoneContactMedium: Home phone number • MobilePhoneContactMedium: Mobile number Data type: String
contactMedium.city	City of the organization. Data type: String
contactMedium.country	Country of the organization. Data type: String
contactMedium.emailAdress	Email address of the organization contact. Data type: String
contactMedium.locationId	Sys_id of the location. Table: Location [cmn_location] Data type: String
contactMedium.mediumType	The type of contact medium. Possible values: • businessPhone • email • faxPhone • homePhone • mobilePhone • postalAddress Data type: String
contactMedium.phoneNumber	Phone number of the organization contact. Data type: String
contactMedium.postCode	Postcode of the organization. Data type: String
contactMedium.preferred	This value is always `false`. Data type: Boolean
contactMedium.stateOrProvince	Indicates whether the location is from a state or province. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• state • province Data type: String
contactMedium.street1	Describes the street. Data type: String
contactMedium.street2	Complementary street description. Data type: String
externalReference	List of identifiers of the party in an external system. Data type: Array of Objects `"externalReference": [ { "externalIdentifierType": "String", "name": "String" } ]`
externalReference.externalIdentifierType	Type of entity within the external system. Data type: String
externalReference.name	Human-readable name of the external system or reference. Data type: String
href	Relative link to the account record (URI). Table: Account [customer_account] Data type: String
id	Sys_id of the external entity account record. Table: Account [customer_account] Data type: String
legalName	Legal name of the organization. Data type: String
name	Name of the organization. Data type: String
partyCharacteristics	List of characteristics that a party can take on. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"partyCharacteristics": [ { "@type": "String" "name": "String", "value": "String", "valueType": "String" } ]`
partyCharacteristics.@type	When subclassing, *`@type`* defines the subclass extensible name. Possible value: • BooleanCharacteristic • IntegerCharacteristic • StringArrayCharacteristic • StringCharacteristic Data type: String
partyCharacteristics.name	Name of the party characteristic. Data type: String
partyCharacteristics.value	Value of the party characteristic. Data type: String
partyCharacteristics.valueType	Data type of the characteristic's value. Data type: String
partyOrPartyRole	Roles related to this party are defined where the party is created in the table. For example, `Company` or `Account`. *`partyOrPartyRole`* indicates which type of record is retrieved in the operation. If the provided sys_id belongs to the Account [customer_account] table, then *`partyOrPartyRole.role`* is set to `Account`. Likewise, if the sys_id belongs to the Company [core_company] table, then *`partyOrPartyRole.role`* is set to `Company`. Data type: Object `"partyOrPartyRole": { "@type": "String", "name":"String", "role":"String", }`
PartyOrPartyRole.@type	This value is always `party`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
PartyOrPartyRole.name	Defines the type of the account or company. Data type: String
PartyOrPartyRole.role	Type of the role. Possible value: • Account • Company Data type: String
relatedParty	List of parties or party roles related to this party. Data type: Array of Objects `"relatedParty": [ { "partyOrPartyRole": {Object}, "role": "String" } ]`
relatedParty.partyOrPartyRole	Roles related to this party. Data type: Array of Objects `"partyOrPartyRole": [ { "@type": "String", "id": "String", "name": "String", } ]`
relatedParty.partyOrPartyRole.@type	Type of the related party. Value is always `Organization`. Data type: String
relatedParty.partyOrPartyRole.id	Sys_id of the related party. Possible value: • Contact • Other Data type: String
relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedParty.role	Role played by the related party or party role in the context of the specific entity it's linked to. Possible values: • Contact • Other Data type: String
status	Flag that indicates the status of organization. Valid values: • active: Organization is active. • inactive: Organization is inactive. Data type: Boolean
tradingName	Name that the organization trades under. Data type: String

Example: cURL request

The following GET call returns fields for the specified party management organization record with sys_id, 12345.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/v1/party/organiz
ation/12345" \
--request GET \
--header "Accept:application/json" \
--user 'user':'password' \
```

Response body.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
contactMedium.postCode	Postcode of the individual. Data type: String
contactMedium.preferred	This value is always false. Data type: Boolean
contactMedium.stateOrProvince	Indicates whether the location is in a state or province. Possible values: • state • province Data type: String
contactMedium.street1	Describes the street. Data type: String
contactMedium.street2	Complementary street description. Data type: String
familyName	Last name of the individual. Data type: String
gender	Gender of the individual. Data type: String
givenName	First name of the individual. Data type: String
href	Relative link to the user or consumer or contact record. Data type: String
middleName	Middle name of the individual. Data type: String
name	User name of the user or contact individual. Data type: String
nationality	Nationality of the individual. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
partyCharacteristics	List of characteristics associated with the party. Data type: Array of Objects `"partyCharacteristics": [ { "@type": "String", "name": " String", "value": "String", "valueType": "String" } ]`
partyCharacteristics.@type	When subclassing, this parameter defines the subclass extensible name. Possible values: • StringCharacteristic • StringArrayCharacteristic • IntegerCharacteristic • BooleanCharacteristic Data type: String
partyCharacteristics.name	Name of the party characteristic. Data type: String
partyCharacteristics.value	Value of the party characteristic. Data type: String
partyCharacteristics.valueType	Data type of the characteristic's value. Data type: String
partyOrPartyRole	Roles related to this party are defined where the party is created in table. For example, `User`, `Consumer`, `Customer Contact`. *`partyOrPartyRole`* indicates which type of record is retrieved in the operation. If the provided sys_id belongs to the Consumer [csm_consumer] table, then *`partyOrPartyRole.role`* is set to `Consumer`. Likewise, if the sys_id belongs to the Contact [customer_contact] table, then *`partyOrPartyRole.role`* is set to `Contact`. Data type: Object `"partyOrPartyRole": { "@type": "String",`

Request body parameters (XML or JSON) (continued)

Name	Description
	`"role":"String"` `}`
partyOrPartyRole.@type	This value is always `Party`. Data type: String
partyOrPartyRole.role	Type of the role. Possible values: • Consumer • Contact Data type: String

relatedParty	List of parties and party roles related to this party.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`{`
	`"role": "String",`
	`"partyOrPartyRole": {Object}`
	`}`
	`]`

relatedParty.partyOrPartyRole.@type	Type of the related party. Possible value for user: • Organization • Individual Data type: String

relatedParty.partyOrPartyRole.id	ID for the linked entity in the Party Management or Party Role Management system.
	• Possible value for user:
	  ○ `Company`
	  ○ `Department`
	• Possible value for customer: `Account`
	• Possible value for consumer: `User`
	
	Data type: String

relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
relatedParty.role	Business role that the related party plays in the context of the current entity. Possible values: • Company (if related party is User) • Department (if related party is User) • Account (if related party is Customer) • User (if related party is Consumer) Data type: String
status	Flag that indicates the status of the individual. Valid values: • active: Individual is in an active status. • inactive: Individual isn't in an active status. Data type: Boolean
title	Prefix or title of the individual. For example, `Dr.`, `Mr.`, `Ms.`). Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

This returns all organization records related to the enterprise.

```
curl"http://
instance.servicenow.com/api/sn_tmf_api/v1/party/organization" \
--request GET \
--header "Accept:application/json" \
--user 'user':'password'
```

Response body.

Party Management – PATCH/api/sn_tmf_api/v1/party/individual/{id}

Updates an existing individual party record in the Consumer [csm_consumer] or Contact [customer_contact] table without replacing the entire resource.

URL format

Versioned URL: `/api/sn_tmf_api/v1/party/individual`

Default URL: `/api/sn_tmf_api/v1/party/individual`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the consumer or contact. Tables: Consumer [csm_consumer] or Contact [customer_contact] Data type: String

Query parameters

Name	Description
None

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String

relatedParty.partyOrPartyRole.id	ID for the linked entity in the Party Management or Party Role Management system.
	• Possible value for user:
	  ○ `Company`
	  ○ `Department`
	• Possible value for customer: `Account`
	• Possible value for consumer: `User`
	
	Data type: String

relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String
relatedParty.role	Business role that the related party plays in the context of the current entity. Possible values: • Company (if related party is User) • Department (if related party is User) • Account (if related party is Customer) • User (if related party is Consumer) Data type: String
status	Flag that indicates the status of the individual. Valid values: • active: Individual is in an active status. • inactive: Individual isn't in an active status. Data type: Boolean
title	Prefix or title of the individual. For example, `Dr.`, `Mr.`, `Ms.`). Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Name	Description
	Data type: Boolean
contactMedium.stateOrProvince	Indicates whether the location is from a state or province. Possible values: • state • province Data type: String
contactMedium.street1	Describes the street. Data type: String
contactMedium.street2	Complementary street description. Data type: String
familyName	Last name of the individual. Data type: String
gender	Gender of the individual. Data type: String
givenName	First name of the individual. Data type: String
href	Relative link to the user or consumer or contact record. Data type: String
id	Sys_id of the user or consumer or contact record to retrieve. Tables: Consumer [csm_consumer] or Contact [customer_contact] Data type: String
middleName	Middle name of the individual. Data type: String
name	User name of the user or contact individual. Data type: String
nationality	Nationality of the individual. Data type: String
partyCharacteristics	List of characteristics associated with the party.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array of Objects `"partyCharacteristics": [ { "@type": "String", "name": " String", "value": "String", "valueType": "String" } ]`
partyCharacteristics.@type	When subclassing, this defines the subclass extensible name. Possible values: • StringCharacteristic • StringArrayCharacteristic • IntegerCharacteristic • BooleanCharacteristic Data type: String
partyCharacteristics.name	Name of the party characteristic. Data type: String
partyCharacteristics.value	Value of the party characteristic. Data type: String
partyCharacteristics.valueType	Data type of the characteristic's value. Data type: String
partyOrPartyRole	Roles related to this party are defined where the party is created in table. For example, `User`, `Consumer`, `Customer Contact`. *`partyOrPartyRole`* indicates which type of record is retrieved in the operation. If the provided sys_id belongs to the Consumer [csm_consumer] table, then *`partyOrPartyRole.role`* is set to `Consumer`. Likewise, if the sys_id belongs to the Contact [customer_contact] table, then *`partyOrPartyRole.role`* is set to `Contact`. Data type: Object `"partyOrPartyRole": { "@type": "String", "role":"String" }`

Name	Description

	• Possible value for `user`:
	  ○ Company
	  ○ Department
	• Possible value for `customer`: Account
	• Possible value for `consumer`: User
	
	Data type: String

relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String
relatedParty.role	Business role that the related party plays in the context of the current entity. Possible values: • Company (if related party is User) • Department (if related party is User) • Account (if related party is Customer) • User (if related party is Consumer) Data type: String
status	Flag that indicates the status of the individual. Valid values: • active: Individual is in an active status. • inactive: Individual is in an inactive status. Data type: Boolean
title	Prefix or title of the individual. For example, `Dr.`, `Mr.`, `Ms.`). Data type: String

Example: cURL request

Updates an existing individual party record with sys_id, 12345, in the Consumer [csm_consumer] or Contact [customer_contact] table without replacing the entire resource.

```
curl
 "http://localhost:8080/api/sn_tmf_api/v1/party/Individual/123
45" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'user':'password'
--data "{
  \"name\": \"John.Doe\",
```

Party Management - PATCH /api/sn_tmf_api/v1/party/organization/{id}

Updates an existing individual party record in the Account [customer_account] tables without replacing the entire resource.

URL format

Versioned URL: `/api/sn_tmf_api/v1/party/organization/{id}`

Default URL: `/api/sn_tmf_api/v1/party/organization/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
@type	This value is always `Organization`. Data type: String

contactMedium	List of means for contacting the party. A contact medium represents the way you communicate with or reach a party like an individual or organization. For example, a channel or method of contact associated with that party.
	
	Data type: Array of Objects
	
	`"contactMedium": [`
	`{`
	`"@type": "String",`

Party Management - POST /api/sn_tmf_api/v1/party/individual

Creates a new individual party management record in the Consumer [csm_consumer] or Contact [customer_contact] tables.

URL format

Versioned URL: `/api/sn_tmf_api/v1/party/individual`

Default URL: `/api/sn_tmf_api/v1/party/individual`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
contactMedium	List of means for contacting the party. Data type: Array of Objects `"contactMedium": [ { "@type": "String", "city": "String", "country": "String", "emailAddress": "String", "locationId": "String", "mediumType": "String", "phoneNumber": "String", "postCode": "String", "preferred": "Boolean", "stateOrProvince": "String", "street1": "String", "street2": "String" } ]`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
contactMedium.@type	Type of contacting party. Indicates the specific schema or subclass type of the object. Possible values: • BusinessPhoneContactMedium: Business phone number • EmailContactMedium: Email address • FaxPhoneContactMedium: Fax number • GeographicAddressContactMedium: Physical address (street, city, state, postal code) • HomePhoneContactMedium: Home phone number • MobilePhoneContactMedium: Mobile number Data type: String
contactMedium.city	City of the individual. Data type: String
contactMedium.country	Country of the individual. Data type: String
contactMedium.emailAddress	Email address of the contact. Data type: String
contactMedium.locationId	Sys_id of the party location. Table: Location [cmn_location] Data type: String
contactMedium.mediumType	The type of contact medium. Indicates the business-level attribute that specifies the kind of contact channel being used. Possible values: • email • businessPhone • homePhone • mobilePhone • postalAddress Data type: String
contactMedium.phoneNumber	Phone number of the individual.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
contactMedium.postCode	Postcode of the individual. Data type: String
contactMedium.preferred	This value is always false. Data type: Boolean
contactMedium.stateOrProvince	Indicates whether the location is in a state or province. Possible values: • state • province Data type: String
contactMedium.street1	Describes the street. Data type: String
contactMedium.street2	Complementary street description. Data type: String
familyName	Last name of the individual. Data type: String
gender	Gender of the individual. Data type: String
givenName	First name of the individual. Data type: String
href	Relative link to the user or consumer or contact record. Data type: String
middleName	Middle name of the individual. Data type: String
name	User name of the user or contact individual. Data type: String
nationality	Nationality of the individual. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
partyCharacteristics	List of characteristics associated with the party. Data type: Array of Objects `"partyCharacteristics": [ { "@type": "String", "name": " String", "value": "String", "valueType": "String" } ]`
partyCharacteristics.@type	When subclassing, this parameter defines the subclass extensible name. Possible values: • StringCharacteristic • StringArrayCharacteristic • IntegerCharacteristic • BooleanCharacteristic Data type: String
partyCharacteristics.name	Name of the party characteristic. Data type: String
partyCharacteristics.value	Value of the party characteristic. Data type: String
partyCharacteristics.valueType	Data type of the characteristic's value. Data type: String
partyOrPartyRole	Roles related to this party are defined where the party is created in table. For example, `User`, `Consumer`, `Customer Contact`. *`partyOrPartyRole`* indicates which type of record is retrieved in the operation. If the provided sys_id belongs to the Consumer [csm_consumer] table, then *`partyOrPartyRole.role`* is set to `Consumer`. Likewise, if the sys_id belongs to the Contact [customer_contact] table, then *`partyOrPartyRole.role`* is set to `Contact`. Data type: Object `"partyOrPartyRole": { "@type": "String",`

Request body parameters (XML or JSON) (continued)

Name	Description
	`"role":"String"` `}`
partyOrPartyRole.@type	This value is always `Party`. Data type: String
partyOrPartyRole.role	Type of the role. Possible values: • Consumer • Contact Data type: String

relatedParty	List of parties and party roles related to this party.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`{`
	`"role": "String",`
	`"partyOrPartyRole": {Object}`
	`}`
	`]`

relatedParty.partyOrPartyRole.@type	Type of the related party. Possible value for user: • Organization • Individual Data type: String

relatedParty.partyOrPartyRole.id	ID for the linked entity in the Party Management or Party Role Management system.
	• Possible value for user:
	  ○ `Company`
	  ○ `Department`
	• Possible value for customer: `Account`
	• Possible value for consumer: `User`
	
	Data type: String

relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
relatedParty.role	Business role that the related party plays in the context of the current entity. Possible values: • Company (if related party is User) • Department (if related party is User) • Account (if related party is Customer) • User (if related party is Consumer) Data type: String
status	Flag that indicates the status of the individual. Valid values: • active: Individual is in an active status. • inactive: Individual isn't in an active status. Data type: Boolean
title	Prefix or title of the individual. For example, `Dr.`, `Mr.`, `Ms.`). Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Name	Description
	Data type: String
gender	Gender of the individual. Data type: String
givenName	First name of the individual. Data type: String
href	Relative link to the user or consumer or contact record. Data type: String
id	Sys_id of the user or consumer or contact record to retrieve. Tables: Consumer [csm_consumer] or Contact [customer_contact] Data type: String
middleName	Middle name of the individual. Data type: String
name	User name of the user or contact individual. Data type: String
nationality	Nationality of the individual. Data type: String
partyCharacteristics	List of characteristics associated with the party. Data type: Array of Objects `"partyCharacteristics": [ { "@type": "String", "name": " String", "value": "String", "valueType": "String" } ]`
partyCharacteristics.@type	When subclassing, this defines the subclass extensible name. Possible values: • StringCharacteristic • StringArrayCharacteristic • IntegerCharacteristic • BooleanCharacteristic

Name	Description
	Data type: String
partyCharacteristics.name	Name of the party characteristic. Data type: String
partyCharacteristics.value	Value of the party characteristic. Data type: String
partyCharacteristics.valueType	Data type of the characteristic's value. Data type: String
partyOrPartyRole	Roles related to this party are defined where the party is created in table. For example, `User`, `Consumer`, `Customer Contact`. *`partyOrPartyRole`* indicates which type of record is retrieved in the operation. If the provided sys_id belongs to the Consumer [csm_consumer] table, then *`partyOrPartyRole.role`* is set to `Consumer`. Likewise, if the sys_id belongs to the Contact [customer_contact] table, then *`partyOrPartyRole.role`* is set to `Contact`. Data type: Object `"partyOrPartyRole": { "@type": "String", "role":"String" }`
partyOrPartyRole.@type	This value is always `Party`. Data type: String
partyOrPartyRole.role	Type of party role. Possible values: • Consumer • Contact Data type: String
relatedParty	List of parties or party roles related to this party. Data type: Array of Objects `"relatedParty": [ { "role": "String", "partyOrPartyRole": {Object} } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedParty.partyOrPartyRole	Represents information about the related party and the role it plays in the context of the record. For example, if the role is `Company`, then *`partyOrPartyRole.id`* contains the sys_id of the Company [core_company] record, and *`partyOrPartyRole.name`* contains the company's name. This structure ensures that both the party reference and its role are explicitly defined and easily identifiable. Data type: Object `"partyOrPartyRole": { "@type": "String", "id": "String", "name": "String" }`
relatedParty.partyOrPartyRole.@type	Type of the related party. Possible value for user: • Organization • Individual Data type: String

relatedParty.partyOrPartyRole.id	Sys_id of the related party.
	
	• Possible value for `user`:
	  ○ Company
	  ○ Department
	• Possible value for `customer`: Account
	• Possible value for `consumer`: User
	
	Data type: String

relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String
relatedParty.role	Business role that the related party plays in the context of the current entity. Possible values: • Company (if related party is User) • Department (if related party is User) • Account (if related party is Customer) • User (if related party is Consumer)

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
status	Flag that indicates the status of the individual. Valid values: • active: Individual is in an active status. • inactive: Individual is in an inactive status. Data type: Boolean
title	Prefix or title of the individual. For example, `Dr.`, `Mr.`, `Ms.`). Data type: String

Example: cURL request

This returns specified fields for the party management individual records.

URL format

Versioned URL: `/api/sn_tmf_api/v1/party/organization`

Default URL: `/api/sn_tmf_api/v1/party/organization`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
@type	This value is always `Organization`. Data type: String
contactMedium	List of means for contacting the party. A contact medium represents the way you communicate with or reach a party like an individual or organization. For example, a channel or method of contact associated with that party. Data type: Array of Objects `"contactMedium": [ { "@type": "String", "city": "String", "country": "String", "emailAddress": "String", "locationId": "String", "mediumType": "String", "phoneNumber": "String", "postCode": "String", "preferred": "Boolean", "stateOrProvince": "String", "street1": "String", "street2": "String" } ]`

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
contactMedium.postCode	Postcode of the organization. Data type: String
contactMedium.preferred	This value is always `false`. Data type: Boolean
contactMedium.stateOrProvince	Indicates whether the location is from a state or province. Possible values: • state • province Data type: String
contactMedium.street1	Describes the street. Data type: String
contactMedium.street2	Complementary street description. Data type: String
externalReference	List of identifiers of the party in an external system. Data type: Array of Objects `"externalReference": [ { "externalIdentifierType": "String", "name": "String" } ]`
externalReference.externalIdentifierType	Type of entity within the external system. Data type: String
externalReference.name	Human-readable name of the external system or reference. Data type: String
href	Relative link to the account record (URI). Table: Account [customer_account] Data type: String

	Data type: String
id	Sys_id of the external entity account record. Table: Account [customer_account] Data type: String
legalName	Legal name of the organization. Data type: String
name	Name of the organization. Data type: String
partyCharacteristics	List of characteristics that a party can take on. Data type: Array of Objects `"partyCharacteristics": [ { "@type": "String" "name": "String", "value": "String", "valueType": "String" } ]`
partyCharacteristics.@type	When subclassing, *@type* defines the subclass extensible name. Possible value: • BooleanCharacteristic • IntegerCharacteristic • StringArrayCharacteristic • StringCharacteristic Data type: String
partyCharacteristics.name	Name of the party characteristic. Data type: String
partyCharacteristics.value	Value of the party characteristic. Data type: String
partyCharacteristics.valueType	Data type of the characteristic's value. Data type: String
partyOrPartyRole	Roles related to this party are defined where the party is created in the table. For example, `Company` or `Account`.

Name	Description

	partyOrPartyRole indicates which type of record is retrieved in the operation. If the provided sys_id belongs to the Account [customer_account] table, then *partyOrPartyRole.role* is set to `Account`. Likewise, if the sys_id belongs to the Company [core_company] table, then *partyOrPartyRole.role* is set to `Company`.
	
	Data type: Object
	
	`"partyOrPartyRole": {`
	`  "@type": "String",`
	`  "name":"String",`
	`  "role":"String",`
	`}`

PartyOrPartyRole.@type	This value is always `party`. Data type: String
PartyOrPartyRole.name	Defines the type of the account or company. Data type: String
PartyOrPartyRole.role	Type of the role. Possible value: • Account • Company Data type: String

relatedParty	List of parties or party roles related to this party.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "partyOrPartyRole": {Object},`
	`  "role": "String"`
	`  }`
	`]`

relatedParty.partyOrPartyRole	Roles related to this party.
	
	Data type: Array of Objects
	
	`"partyOrPartyRole": [`
	`  {`
	`  "@type": "String",`
	`  "id": "String",`
	`  "name": "String",`
	`  }`
	`]`

Name	Description
relatedParty.partyOrPartyRole.@type	Type of the related party. Value is always `Organization`. Data type: String
relatedParty.partyOrPartyRole.id	Sys_id of the related party. Possible value: • Contact • Other Data type: String
relatedParty.partyOrPartyRole.name	Name of the related party. Data type: String
relatedParty.role	Role played by the related party or party role in the context of the specific entity it's linked to. Possible values: • Contact • Other Data type: String
status	Flag that indicates the status of organization. Valid values: • active: Organization is active. • inactive: Organization is inactive. Data type: Boolean
tradingName	Name that the organization trades under. Data type: String

Example: cURL request

This returns specified fields for the party management organization records.

```
curl
 "http://instance.service-now.com/api/sn_tmf_api/v1/party/organi
zation" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'user':'password'
--data "{

Predictive Intelligence API

The *`Predictive Intelligence`* API provides endpoints that predict a field value based on one or more input fields and a trained solution.

You can only use this API when the Predictive Intelligence (com.glide.platform_ml) plugin is activated.

Predictive Intelligence - GET /agent_intelligence/solution/{solution_name}/prediction

Predicts an output field value using a specific solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/now/agent_intelligence/solution/{solution_name}/prediction`

Supported request parameters

Path parameters

Name	Description
solution_name	Name of solution to use for predictions. For example, `ml_incident_categorization`. Data type: String

Query parameters

Name	Description
Solution definition input field key-value pair	Name-value pair of the solution input field. For example, enter the name: `short_description` and the value: `Unable to connect to` VPN. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
input	Name-value pairs that were specified as input to the call. Data type: Object

output	Predicted outcome values based on the specified solution.
	
	Data type: Object
	
	`"output": {`
	`  "confidence": Number",`
	`  "outcome": "String",`
	`  "threshold": Number"`
	`}`

output.confidence	Estimated precision of the prediction as a percentage. For example, **53.84615375762915**. Data type: Number
output.outcome	Prediction output field value. For example, an incident categorization solution would return an incident category such as **inquiry**. Data type: String
output.threshold	Value of the configured threshold associated with the prediction. Data type: Number

Example: Sample cURL request

```
curl
 "https://instance.service-now.com/api/now/predictive_intelligen
ce/solution/ml_incident_categorization/prediction?short_descript
ion=unable%20to%20connect%20to%20VPN" \
--request GET \
--header "Accept:application/json" \
```

```
--user "username":"password"
```

```
{
  "result": {
    "input": {
      "short_description": "unable to connect to VPN",
      "api": "api"
    },
    "output": {
      "outcome": "inquiry",
      "confidence": 53.84615375762915,
      "threshold": 5
    }
  }
}
```

Predictive Intelligence - GET /agent_intelligence/solution/prediction

Returns predictions for multiple solutions.

Note: Outcome result objects are grouped by solution name and sys_id in the format `result.<solutionname>.<sys_id>.[{ <result1> },{ <result2>}]`.

For customization information, see MLSolutionFactory scriptable objects.

URL format

Versioned URL: `/now/{api_version}/agent_intelligence/solution/prediction`

Default URL: `/now/agent_intelligence/solution/prediction`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Parameter	Description
input_filter	Required parameter if *`input_table`* is used, don't use this parameter with *`input_maps`* parameter. Filter to select records on which to run predictions. For example: `sys_id 0ef47232db801300864adfea5e961912` Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Parameter	Description
input_maps	Required unless using *input_table* parameter. Array of input name-value pairs. For example: `[{"short_description":"my email is not working"}, {"short_description":"need help with password"}]` Data type: Array of Objects
input_table	Required unless using *input_maps* parameter. Table name on which you want to run predictions. For example: `incident` Data type: String
options	JSON object with optional arguments. For example: `{"top_n" : 5, "apply_threshold":false}` Valid options: • top_n: Number. If provided, returns the top results, up to the specified number of predictions. • apply_threshold: Boolean. Checks the threshold value for the solution and applies it to the result set. The threshold value is solution threshold for similarity or class-level threshold for classification. Default value is true. • custom_results_filter: String. Similarity solutions only. Specifies the allowed set from which results are returned using an encoded query. Data type: Object
solution_names	Required. Comma-separated list of solution names for which you want to run predictions. For example: `ml_incident_categorization,ml_incident_assignment` Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
confidence	Value of the confidence associated with the prediction. For example, 53.84. Data type: Number
predictedSysId	The sys_id of the predicted value. Results can be from any table on which information is being predicted. Data type: String
predictedValue	Value representing the prediction result. Data type: String
threshold	Value of the configured threshold associated with the prediction. Data type: Number

          "predictedValue": "NY DB",
          "predictedSysId": "5f74727dc0a8010e01efe33a251993f9"
        }
      ]
    }
  }
}
```

Proactive Engagement API

The *`Proactive Engagement`* API provides an endpoint for creating digital experience issues.

This API is available as a custom scripted REST API. It requires the Proactive Engagement (proactive-engagement) plugin and sn_pren.experience_issue_create role. This API belongs to the `sn_pren` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the *Proactive Engagement* API to create an experience issue when an issue is detected on a user's instance. The created experience issue drives engagement with the user and helps them self-resolve the issue.

To use this API, ensure the following tables are populated with records:

- Issue Registry Template [sn_pren_issue_registry_template]
- Issue Registry [sn_pren_issue_registry]
- Resolution [sn_pren_resolution]
- Notification Content [sn_pren_notification_content]
- Provider [sn_pren_provider]

For more information, see Proactive Engagement

Proactive Engagement - CREATE /api/sn_pren/self_remediation/experience_issue/create

Creates an experience issue when an issue is detected on the user's endpoint. Updates the Experience Issues [sn_pren_experience_issue] table.

URL format

Default URL: `/api/sn_pren/self_remediation/experience_issue/create`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

endpoint	Required. Configuration item (CI) and user information used to detect issue details.
	
	Note: All parameters within this object are optional. You must pass at least one parameter within the object to identify the user or device."
	
	Data type: Object
	
	`"endpoint": {`
	`"CI": "String",`
	`"email": "String",`
	`"user_id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"user_name": "String"` `}`
endpoint.CI	Sys_id of the CI device on which the issue was detected. Data type: String Table: Computer [cmdb_ci_computer]
endpoint.email	Email address of the user for whom the issue was detected. Data type: String
endpoint.user_id	Sys_id of the user for whom the issue was detected. Data type: String Table: User [sys_user]
endpoint.user_name	User name of the user for whom the issue was detected. Data type: String Table: User [sys_user]
experience_id	User-defined ID to assign to the created issue. Data type: Number Default: An ID is automatically generated.

input_parameters	Parameters to pass to the action that will be executed on the device. The input parameters sent are passed to the configured resolution-remedial action such as a sub flow, flow action, or CI action.
	
	Data type: Object
	`"input_parameters": {`
	`"process_id": "String"`
	`}`

input_parameters.process_id	Sys_id of the process to terminate or restart. Data type: String
investigative_details	Details that could be useful for a manual investigation if the Power Usage Effectiveness (PUE) resolution fails. The investigative details are copied over to the incident which is created as a fallback when the PUE resolution fails. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	`"investigative_details": {`
	`"cpu_usage": "String",`
	`"processes_running": "String",`
	`"available_memory": "String"`
	`}`

investigative_details.cpu_usage	CPU usage on the device. Data type: Number (parsed as a string)
investigative_details.processes_running	Number of processes running on the device. Data type: Number (parsed as a string)
investigative_details.available_memory	Available memory on the device. Data type: Number (parsed as a string)
issue_code	Required. Issue code to associate with the problem. The issue code must be available and deployed in the instance. The API returns an error if an empty or invalid issue is provided. Data type: String Table: Issue Registry [sn_pren_issue_registry]
provider	Required. Unique code for the provider. This code must match the *provider_code* field in the sn_pren_provider table on the instance. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status code	Description
200	An experience issue was created successfully.
400	Invalid request. Provide endpoint details. An empty *endpoint* object was sent in the request.
400	Invalid issue code, please provide a valid issue code. An empty *issue_code* was sent in the request.
400	Invalid provider, please provide a valid provider. An empty provider was sent in the request.
400	Invalid issue code or provider, please provide valid details. Issue can't be detected in the instance. Verify *issue_code* and *provider* details.
400	Issue code does not have a proper resolution. A valid resolution is not configured in the PUE framework for the issue identified.
400	Could not resolve user from endpoint details, please provide valid details. This error is returned if the PUE framework ID is unable to identify the user from the given endpoint details.
400	An experience issue is being resolved with given issue code for specified user. The specified experience issue is currently in an in-progress or open state.
400	Existing experience issue with given *experience_id* is still under execution or is closed. This error occurs when an experience issue is in a chaining scenario. For instance, if a new *issue_code* key is sent with an existing *experience_id*, and the earlier experience issue is running or is in closed state. The experience issue with this experience_id must be in action_wait state to send a new issue_code with the previous experience_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status code	Description
400	Error occurred while creating experience issue. This indicates a technical error.

Response body parameters (JSON or XML)

Name	Description
experienceId	Experience ID of the created experience issue. Generated from the *experience_id* request parameter. If the *experience_id* parameter is not passed, the resultant ID is always the sys_id of the created record. Table: Experience Issues [sn_pren_experience_issue]

Example: cURL request

The following example creates an experience issue for user Abel Tuter. The issue code in the body allows Proactive Engagement to identify the resolution from the Issue Registry Template and engage with the end-user via Virtual Agent to help them self-solve the issue.

```
curl
 "http://instance.servicenow.com//
api/sn_srf/self_remediation/experience_issue/create" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
--data “{
  "endpoint": {
    "CI": "d049b28e936aa1106f98f6db5cba10d5",
    "user_id": "62826bf03710200044e0bfc8bcbe5df1",
    "user_name": "abel.tuter",
    "email": ""
  },
  "issue_code": "100",
  "provider": "sn",
  "experience_id": "09ed4830f393739df33",
  "input_parameters": {
    "process_id": "10644"
  },
  "investigative_details": {
    "cpu usage": "78%",
    "processes running": "35",
    "available memory": "23%"
  }
}”\
```

The response body returns the experience ID, indicating that the issue creation was successful.

```
{
  "result": {
    "experience_id": “09ed4830f393739df33”
```

```
    }
}
```

Product Catalog Open API

The *Product Catalog Open* API provides endpoints to create and retrieve product catalogs, product offerings, and product specifications.

Use this API to manage product catalog information between external systems and the ServiceNow AI Platform. The *Product Catalog Open* API is a ServiceNow® implementation of the TM Forum Product Catalog Management API REST specification. This implementation is based on the TMF620 Product Catalog Management API User Guide v5.0.0, September 2024.

This API is included in the Product Catalog Advanced application, which is available on the ServiceNow Store.

This API is provided within the `sn_tmf_api` namespace.

The calling user must have the sn_prd_pm_adv.catalog_integrator role.

This API creates and updates data in the following tables.

- Characteristic [sn_prd_pm_characteristic]
- Characteristic Option [sn_prd_pm_characteristic_option]
- Product Offering [sn_prd_pm_product_offering]
- Product Offering Catalog [sn_prd_pm_product_offering_catalog]
- Product Offering Characteristic [sn_prd_pm_product_offering_characteristic]
- Product Specification [sn_prd_pm_product_specification]
- Specification Relationship [sn_prd_pm_specification_relationship]

Product Catalog Open API - DELETE /sn_tmf_api/catalogmanagement/productOffering/{id}

Deletes the specified product offering.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product offering to delete. Data type: String Table: Product Offering [sn_prd_pm_product_offering]

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON or XML)

Name	Description
message	A failure or success message about the deletion or archival of the product specification.

Example: cURL request

The following example deletes the product offering with an ID of d6f8d9995b020210235d85cced81c7eb.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/productOffering/d6f8d9995b020210235d85cced81c7eb" \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--request DELETE\
--header "Accept:application/json" \
--user 'username':'password'
```

The response body returns a successful deletion message:

```
"The product offering (d6f8d9995b020210235d85cced81c7eb) is
 successfully deleted"
```

Product Catalog Open API - DELETE /sn_tmf_api/catalogmanagement/productOfferingPrice/{id}

Inactivates, but doesn't delete, a price list line with a specific sys_id.

To set a price list line to an inactive state, this DELETE method updates the end date of the price list line to today's date. A price list line with an end date prior to today's date is also considered inactive. Inactive price list lines are not retrievable in related GET methods.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOfferingPrice/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the price list line to delete. Table: Price list line [sn_csm_pricing_price_list_line] Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
message	Status code with a message about the successful or failed inactivation of the price list line.

Example: cURL request

The following example demonstrates how to successfully inactivate or delete a price list of the given sys_id, 994d...

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/productOfferingPrice/994d5d364f8b5210f899f61d20ce0b7c" \
--request DELETE\
--user 'username':'password'
```

Response. The response returns a 200 status code with details about the successful inactivation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Status: 200 OK
"The price list line (994d5d364f8b5210f899f61d20ce0b7c) is
 inactive successfully"
```

Product Catalog Open API - DELETE /sn_tmf_api/catalogmanagement/productSpecification/{id}

Deletes or archives the specified product specification.

When calling this DELETE method, a product specification may either be deleted or archived depending on the state it is in:

- A product specification in the draft state is successfully deleted. The response returns a success message.
- A product specification in the archived state can't be deleted. The response returns a message that the specification is already archived.
- A product specification not in the draft state and associated with other product specifications or offerings is archived but not deleted. The response returns a message that the specification is moved from an active state to an archived state.
- A product specification associated with an active product specification or offering cannot be deleted. The response returns an error message.

URL format

Default URL: `/sn_tmf_api/catalogmanagement/productSpecification/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product specification to delete. Data type: String Table: Product Specification [sn_prd_pm_product_specification]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON or XML)

Name	Description
message	A failure or success message about the deletion or archival of the product specification.

Example: cURL request

The following example deletes the product specification with an ID of 8ef57fa05b308210235d85cced81c7d8.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/productSpecification/8ef57fa05b308210235d85cced81c7d8" \
--request DELETE\
--header "Accept:application/json" \
--user 'username':'password'
```

The response body returns a success or failure message:

```
"The product specification (8ef57fa05b308210235d85cced81c7d8) is
 successfully deleted"
```

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/catalog

Retrieves a list of all product offering catalogs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/catalog`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Only returned if the field contains a value. Data type: String
externalSystem	External system of the product offering catalog, appended with `TMF620`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	For example, if the external system is ABC then the value is `ABC - TMF620`. Data Type: String
id	Sys_id of the product offering catalog. Data type: String Table: Product Offering Catalog [sn_prd_pm_product_offering_catalog]
lifecycleStatus	Current life cycle status of the price list line. Valid values: • Active • Draft • Inactive Data type: String
name	Name of the product offering catalog. Data type: String
status	Status of the product offering catalog. Possible value: published Data type: String

Example: cURL request

This example retrieves all product offering catalogs.

```
curl --location --request GET
 "https://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/catalog" \
--user 'username':'password'
```

Response body.

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/catalog/{id}

Retrieves a product offering catalog.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/catalog/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product offering catalog to retrieve. Data type: String Table: Product Offering Catalog [sn_prd_pm_product_offering_catalog]

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Data type: String
externalSystem	External system of the product offering catalog, appended with `TMF620`. For example, if the external system is ABC then the value is `ABC - TMF620`. Data Type: String
id	Sys_id of the product offering catalog. Data type: String Table: Product Offering Catalog [sn_prd_pm_product_offering_catalog]
lifecycleStatus	Current life cycle status of the price list line. Valid values: • Active • Draft • Inactive Data type: String
name	Name of the product offering catalog. Data type: String

Example: cURL request

This example retrieves a product offering catalog for an enterprise mobile plan.

```
curl --location --request GET
 "https://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/catalog/69f494792b11525047f3f3e30391bf66" \
--user 'username':'password'
```

Response body.

```
{
  "id": "69f494792b11525047f3f3e30391bf66",
  "name": "Chemical Processing",
  "lifecycleStatus": "Active",
  "description": " Catalog for Chemical Processing Industry",
  "externalSystem": "Salesforce-TMF620"
}
```

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productOffering

Retrieves all product offerings or a subset of product offerings, based on specified filter settings.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • category • channel • description • externalId • id • internalId • internalVersion • lastUpdate • name • productCharacteristic • productOfferingPrice • productOfferingTerm • productSpecification

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• prodSpecCharValueUse • validFor • version Data type: String Default: All fields are returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0
specification	Filter product offerings by product specification sys_id. Only product offerings with the specified product specification sys_id are returned in the response. Data type: String Table: Product Specification [sn_prd_pm_product_specification]
state	Filter product offerings by state. Only product offerings in the specified state are returned in the response. Valid values: • archived • draft • published • retired Data type: String

Request body parameters (JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *Content-Range* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *application/json*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productOffering/{id}

Retrieves a specific product offering.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering/{id}`

Supported request parameters

Path parameters

Name	Description
id	Initial version of the product offering to retrieve. Data type: String Table: In the initial_version field of the Product Offering [sn_prd_pm_product_offering] table.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • category • channel • description • externalId • id • internalId • internalVersion • lastUpdate • name • productCharacteristic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• productOfferingPrice • productOfferingTerm • productSpecification • prodSpecCharValueUse • validFor • version Data type: String Default: All fields are returned.
specification	Filter product offerings by product specification sys_id. Only product offerings with the specified product specification sys_id are returned in the response. Data type: String Table: Product Specification [sn_prd_pm_product_specification]
state	Filter product offerings by state. Only product offerings in the specified state are returned in the response. Valid values: • archived • draft • published • retired Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters

Name	Description

bundledGroupProductOffering	Child groups of product offerings. These show hierarchical sub-groupin
	
	Data type: Array of Objects
	
	`"bundledGroupProductOffering": [`
	`  {`
	`  "bundledGroupProductOfferingOption": {Object`
	`  "bundledProductOffering": [Array],`
	`  "id": "String",`
	`  "name": "String"`
	`  }`
	`]`

bundledGroupProductOffering.
bundledGroupProductOfferingOption
	A range of numbers that specifies the lower and upper limits of the numb associated product offering that can be procured as part of the related b product offering.
	
	Data type: Object
	
	`"bundledGroupProductOfferingOption": {`
	`  "numberRelOfferLowerLimit": "String",`
	`  "numberRelOfferUpperLimit": "String"`
	`}`

bundledGroupProductOffering. bundledGroupProductOfferingOption. numberRelOfferLowerLimit	Lower limit for a product offering that can be procured as part of the rela bundled product offering. Data type: String

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productOfferingPrice

Retrieves all price list line records in the instance.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOfferingPrice`

Supported request parameters

Path parameters

Name	Description
none	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
lastUpdate	Filter results by the date that the price line was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
name	Filter price list lines that belong to the name of a given price list. Table: Price Lists [sn_csm_pricing_price_list] Data type: String
price.value	Filter results by a specific list price value. Data type: String
priceList.id	Filter results to return only a price list with a given sys_id. Table: Price Lists [sn_csm_pricing_price_list] Data type: String
priceType	Filter results by the pricing method of the product offering. Valid values: • recurring: Lets businesses charge recurring pricing amounts with a specified frequency. • one_time: Supports one-time or recurring add-on charges and fees for a product offering. Data type: String
productOffering.id	Filter the price list line by the product offering's sys_id. Table: Product offering [sn_prd_pm_product_offering] Data type: String
unitOfMeasure.id	Filter the price list line by sys_id of the unit of measure. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
validFor.endDateTime	Filter the price list line by a given end date and time. Format: YYYY-MM-DD HH:mm:ss Data type: String
validFor.startDateTime	Filter price list line by a given start date and time. Format: YYYY-MM-DD HH:mm:ss

Query parameters (continued)

Name	Description
	Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
@type	Type of price list line. Always a value of `ProductOfferingPrice`. Data type: String
href	URL to the price list line record in the instance. Data type: String
id	Sys_id of the price list line. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
isBundle	Flag that indicates whether the price list line is part of a single product or a bundle of products. Valid values: • true: Price list line is part of a bundle. • false: Price list line isn't part of a bundle. Data type: Boolean
lastUpdate	Date and time that the price list line was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
lifecycleStatus	Current life cycle status of the price list line. Valid values: • Active • Draft • Inactive Data type: String

price	List price details of the price list line.
	
	Data type: Object
	`"price": {`
	`  "units": "String",`
	`  "value": "String"`
	`}`

price.units	Currency code of the price. For example, `USD` or `EUR`. Table: Currency [fx_currency]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
price.value	Value of the price. Data type: String (represented with a number)

priceList	Price list information associated with the price list line.
	
	Data type: Object
	
	`"priceList": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`

priceList.id	Sys_id of the price list in the Price List [sn_csm_pricing_price_list] table. Data type: String
priceList.name	Name of the price list. Data type: String
priceList.@type	The type of price list. When sub-classing, this defines the sub-class extensible name. Always has a value of `priceList`. Data type: String
priceType	The pricing method of the product offering which is associated with this price list line. Possible values: • recurring: Charge recurring pricing amounts with a specified frequency. The value of *`recurringChargePeriodType`* indicates the frequency of the charge. • one_time: One-time or recurring add-on charges and fees for a product offering. Data type: String

productOffering	Product offering that is associated with the price list line.
	
	Data type: Object
	
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "internalVersion": "String"`
	`}`

productOffering.id	Sys_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productOffering.internalVersion	Internal version number of the product offering. For example, `PRD0F01024`. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
recurringChargePeriodType	The periodicity or frequency of the product offering associated with this price list line. Returns a frequency type if *`priceType`* was set to `recurring`, otherwise returns an empty string. Possible values: • annually • monthly Data type: String

unitOfMeasure	Details about the unit of measure associated with the price list line.
	
	Data type: Object
	`"unitOfMeasure": {`
	`  "id": "String",`
	`  "amount": Number,`
	`  "units": "String"`
	`}`

unitOfMeasure.amount	Amount of the unit of measure. Data type: Number
unitOfMeasure.id	Sys_id of the unit of measure. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
unitOfMeasure.units	Type of the unit of measure associated with the price list line. For example, `year` or `bundle`. Data type: String

validFor	The duration of time that the price list line is valid for.
	
	Data type: Object
	`"validFor": {`
	`  "endDate": "String",`
	`  "startDate": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
validFor.endDate	End date and time that the price list line is valid for. Data type: String (glide_date_time)
validFor.startDate	Start date and time that the price list line is valid for. Data type: String (glide_date_time)

Example: cURL request

The following example returns all two price list lines that exist on the instance.

```
curl "http://instance.servicenow.com/api/sn_tmf_api/
 catalogmanagement/productOfferingPrice " \
--request GET\
--user 'username':'password'
```

Response body.

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productSpecification

Retrieves all product specification records.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productSpecification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • description • externalId • id • internalId • internalVersion • lastUpdate • name • productSpecCharacteristic • productSpecificationRelationship • resourceSpecification • serviceSpecification • validFor • version Data type: String Default: All fields are returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0
state	Filter product specifications by state. Only product specifications in the specified state are returned in the response. Accepted values: • archived • draft • published • retired Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
	For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
description	Description of the specification. Data type: String
displayName	Display name for the product specification. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
externalId	External ID of the product specification. If multiple versions are published, returns the highest published version among them. If no versions are published, returns the highest version regardless of state. Data type: String Table: In the external_id field of the Product Specification [sn_prd_pm_product_specification] table.
href	Relative link to the resource record. Data type: String Default: Blank string
externalSystem	External system of the product specification, appended with `TMF620`. For example, if the external system is ABC then the value is ABC - `TMF620`. Data Type: String
id	Sys_id or external ID of the product specification. Data type: String Table: In the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table.
internalId	Sys_id or internal ID of the product specification. Data type: String Table: In the initial_version field of the Product Specification [sn_prd_pm_product_specification] table.
internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Specification [sn_prd_pm_product_specification] table.
isBundle	Flag that indicates whether *`productSpecification`* represents a single product or a bundle of products. Possible values: • true: The product specification is a product bundle and contains multiple products. • false: The product specification contains a single product. Data type: Boolean
lastUpdate	Date the specification was last updated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
lifecycleStatus	Current life cycle status of the product specification. Possible values: • Active • Inactive • Draft Data type: String
name	Name of the specification. Data type: String
productSpecCharacteristic	Product specification characteristic. Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array], "validFor": {Object}, "valueType": "String" } ]`
productSpecCharacteristic. description	Description of the characteristic. Data type: String
productSpecCharacteristic.name	Name of the characteristic. Data type: String
productSpecCharacteristic. productSpecCharacteristicValue	List of the possible values of the characteristic. Data type: Array of Objects `"productSpecCharacteristicValue": [ { "isDefault": Boolean, "isMandatory": Boolean, "validFor": {Object}, "value": "String" } ]`
productSpecCharacteristic. productSpecCharacteristicValue. isDefault	Flag that indicates whether the associated characteristic value is the default value for the characteristic. Possible values:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Default value. • false: Not the default value. Default: false
productSpecCharacteristic. productSpecCharacteristicValue. isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false

productSpecCharacteristic.
productSpecCharacteristicValue.
validFor
	Date and time of when the characteristic is valid.
	
	Data type: Object
	`"validFor": {`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic. productSpecCharacteristicValue. validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic. productSpecCharacteristicValue. value	Value of the characteristic. Data type: String

productSpecCharacteristic.
validFor
	Date range the characteristic is valid for.
	
	Data type: Object
	`"validFor": {`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic. validFor.startDateTime	Start date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic. valueType	Value type of the characteristic, such as choice or email. Can be of complex or non-complex type. Data type: String Accepted values: • Date,Address • Integer,Date/Time • Array.Integer

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Array.Single Line Test • Single Line Test • Array.Object • Array.Date • Array.Decimal • Yes/No • Object • Array.Datetime • Checkbox • Email • Choice
productSpecificationRelationship	This specification's relationships to other product specifications. Data type: Array of Objects `"productSpecificationRelationship": [ { "compatibilityRelationshipType": "String", "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "prodSpecRelationshipOption": {Object}, "type": "String", "validFor": {Object}, "version": "String" ]`
productSpecificationRelationship.compatibilityRelationshipType	Compatibility relationship type in the product specification expected values. For additional information on compatibility relationships, see Configuring compatibility rules for horizontal relationships. Table: Compatibles [sn_compt_mgmt_compatibles]
productSpecificationRelationship.id	Sys_id of the related specification. Data type: String
productSpecificationRelationship.internalId	Sys_id (internal ID) of the product specification relationship. Data type: String
productSpecificationRelationship.internalVersion	Version of the product specification relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productSpecificationRelationship.name	Name of the product specification relationship. Data type: String

productSpecificationRelationship.prodSpecRelationshipOption	Cardinality of the product specification relationship.
	
	Data type: Object
	
	`"prodSpecRelationshipOption": {`
	`  "numberSpecRelDefault": "String",`
	`  "numberSpecRelLowerLimit": "String",`
	`  "numberSpecRelUpperLimit": "String"`
	`}`

productSpecificationRelationship.prodSpecRelationshipOption.numberSpecRelDefault	Default value of the product specification. Data type: String
productSpecificationRelationship.prodSpecRelationshipOption.numberSpecRelLowerLimit	Minimum number of orders that can be purchased. Data type: String
productSpecificationRelationship.prodSpecRelationshipOption.numberSpecRelUpperLimit	Maximum number of orders that can be purchased. Data type: String
productSpecificationRelationship.type	Type of product specification relationship. Data type: String

productSpecificationRelationship.validFor	Date range the product specification relationship is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

productSpecificationRelationship.validFor.endDateTime	End date of the relationship. Data type: String
productSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Data type: String
productSpecificationRelationship.version	Version of the product specification relationship. Data type: String
resourceSpecification	List of resource specifications related to this product specification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array of Objects `"resourceSpecification": [ { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String" } ]`
resourceSpecification.id	Sys_id or external ID of the resource specification. Data type: String Table: In the sys_id or external_id field of the Resource Specification [sn_prd_pm_resource_specification] table.
resourceSpecification.internalId	Initial version (sys_id) of the resource specification record. Data type: String Table: In the initial_version field of the Resource Specification [sn_prd_pm_resource_specification] table.
resourceSpecification.internalVersion	Version of the resource specification. Data type: String Table: In the version field of the Resource Specification [sn_prd_pm_resource_specification] table.
resourceSpecification.name	Name of the resource specification. Data type: String Table: Resource Specification [sn_prd_pm_resource_specification]
resourceSpecification.version	External version of the resource specification. Data type: String Table: In the external_version field of the Resource Specification [sn_prd_pm_resource_specification] table.
serviceSpecification	List of service specifications related to this product specification. Data type: Array of Objects `"serviceSpecification": [ { "id": "String", "internalId": "String", "internalVersion": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"name": "String", "version": "String" }]
serviceSpecification.id	Initial version or external ID of the service specification. Data type: String Table: In the sys_id or external_id field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalId	Initial version of the service specification. Data type: String Table: In the initial_version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalVersion	Version of the service specification. Data type: String Table: In the version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.name	Name of the service specification. Data type: String Table: Service Specification [sn_prd_pm_service_specification]
serviceSpecification.version	External version of the service specification. Data type: String Table: In the external_version field of the Service Specification [sn_prd_pm_service_specification] table.
status	Status of the product specification. Possible values: • draft • published Data type: String

validFor	Date range the specification is valid for.
	
	Data type: Object
	"validFor": {
	"endDateTime": "String",
	"startDateTime": "String"
	}

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
validFor.endDateTime	End date of the specification. Data type: String Format: YYYY-MM-DD
validFor.startDateTime	Start date of the specification. Data type: String Format: YYYY-MM-DD
version	External version of the product specification. Data type: String Table: In the external_version field of the Product Specification [sn_prd_pm_product_specification] table.

Example: cURL request

This example retrieves the first two product specification records.

```
curl --location --request GET
 "https://instance.service-now.com/api/sn_tmf_api/catalogmanagem
ent/productSpecification?limit=2" \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body:

Product Catalog Open API - GET /sn_tmf_api/catalogmanagement/productSpecification/{id}

Retrieves a specified product specification record.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productSpecification/{id}`

Supported request parameters

Path parameters

Name	Description
Id	Sys_id or Initial version of the product specification to retrieve. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Table: In the sys_id or initial_version field of the Product Specification [sn_prd_pm_product_specification] table.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • description • externalId • id • internalId • internalVersion • lastUpdate • name • productSpecCharacteristic • productSpecificationRelationship • resourceSpecification • serviceSpecification • validFor • version Data type: String Default: All fields are returned.
state	Filter product specifications by state. Only product specifications in the specified state are returned in the response. Accepted values: • archived • draft • published • retired Data type: String

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
description	Description of the specification. Data type: String
displayName	Display name for the product specification. Data type: String
externalId	External ID of the product specification. If multiple versions are published, returns the highest published version among them. If no versions are published, returns the highest version regardless of state. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Default: false
productSpecCharacteristic.productSpecCharacteristicValue.isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false
productSpecCharacteristic.productSpecCharacteristicValue.validFor	Date and time of when the characteristic is valid. Data type: Object `"validFor": { "startDateTime": "String" }`
productSpecCharacteristic.productSpecCharacteristicValue.validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String
productSpecCharacteristic.validFor	Date range the characteristic is valid for. Data type: Object `"validFor": { "startDateTime": "String" }`
productSpecCharacteristic.validFor.startDateTime	Start date of the characteristic. Data type: String
productSpecCharacteristic.valueType	Value type of the characteristic. Can be of complex or non-complex type, such as choice or email. Accepted values: • Date,Address • Integer,Date/Time • Array.Integer • Array.Single Line Test • Single Line Test • Array.Object • Array.Date • Array.Decimal

Name	Description
	• Yes/No • Object • Array.Datetime • Checkbox • Email • Choice Data type: String
productSpecificationRelationship	This specification's relationships to other product specifications. Data type: Array of Objects `"productSpecificationRelationship": [ { "compatibilityRelationshipType": "String", "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "prodSpecRelationshipOption": {Object}, "type": "String", "validFor": {Object}, "version": "String" ]`
productSpecificationRelationship.compatibilityRelationshipType	Compatibility relationship type in the product specification expected values. For additional information on compatibility relationships, see Configuring compatibility rules for horizontal relationships. Table: Compatibles [sn_compt_mgmt_compatibles]
productSpecificationRelationship.id	Sys_id of the related specification. Data type: String
productSpecificationRelationship.internalId	Sys_id (internal ID) of the product specification relationship. Data type: String
productSpecificationRelationship.internalVersion	Version of the product specification relationship. Data type: String
productSpecificationRelationship.name	Name of the product specification relationship. Data type: String

Name	Description

productSpecificationRelationship.prodSpecRelationshipOption	Cardinality of the product specification relationship.
	
	Data type: Object
	
	`"prodSpecRelationshipOption": {`
	`  "numberSpecRelDefault": "String",`
	`  "numberSpecRelLowerLimit": "String",`
	`  "numberSpecRelUpperLimit": "String"`
	`}`

productSpecificationRelationship.prodSpecRelationshipOption.numberSpecRelDefault	Default value of the product specification. Data type: String
productSpecificationRelationship.prodSpecRelationshipOption.numberSpecRelLowerLimit	Minimum number of orders that can be purchased. Data type: String
productSpecificationRelationship.prodSpecRelationshipOption.numberSpecRelUpperLimit	Maximum number of orders that can be purchased. Data type: String
productSpecificationRelationship.type	Type of product specification relationship. Data type: String

productSpecificationRelationship.validFor	Date range the product specification relationship is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

productSpecificationRelationship.validFor.endDateTime	End date of the relationship. Data type: String
productSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Data type: String
productSpecificationRelationship.version	Version of the product specification relationship. Data type: String

resourceSpecification	List of resource specifications related to this product specification.
	
	Data type: Array of Objects
	
	`"resourceSpecification": [`
	`  {`
	`  "id": "String",`
	`  "internalId": "String",`
	`  "internalVersion": "String",`

Name	Description
	Table: In the sys_id or external_id field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalId	Initial version of the service specification. Data type: String Table: In the initial_version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalVersion	Version of the service specification. Data type: String Table: In the version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.name	Name of the service specification. Data type: String Table: Service Specification [sn_prd_pm_service_specification]
serviceSpecification.version	External version of the service specification. Data type: String Table: In the external_version field of the Service Specification [sn_prd_pm_service_specification] table.
status	Status of the product specification. Possible values: • draft • published Data type: String

validFor	Date range that the specification is valid for.
	
	Data type: Object
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

validFor.endDateTime	End date of the specification. Data type: String
validFor.startDateTime	Start date of the specification. Data type: String
version	External version of the product specification.

Response body parameters (JSON)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
bundledGroupProductOffering	Child groups of product offerings. These show hierarchical sub-grouping Data type: Array of Objects

Name	Description
	Table: In the version field of the Product Offering [sn_prd_pm_product_o table.
productSpecification.status	Status of the product specification, such as published or draft. Data type: String
productSpecification.sys_id	Sys_id of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification]
productSpecification.version	External version of the product specification. Data type: String Table: In the external_version field of the Product Offering [sn_prd_pm_product_offering] table.
status	Status of the product offering. Possible values: • draft • published Data type: String

validFor	Date range the product offering is valid for.
	
	Data type: Object
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

validFor.endDateTime	End date of the product offering. Data type: String
validFor.startDateTime	Start date of the product offering. Data type: String
version	External version of the product offering. Data type: String Table: In the external_version field of the Product Offering [sn_prd_pm_product_offering] table.

The following example updates the product offering with the sys_id 313b917843235210a82ed6085bb8f2c7 with information provided in the request body.

Product Catalog Open API - PATCH /sn_tmf_api/catalogmanagement/productOfferingPrice/{id}

Updates a price list line record with a given sys_id in the Price list line [sn_csm_pricing_price_list_line] table.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOfferingPrice/{id}`

Supported request parameters

Path parameters

Name	Description
id	Required. Sys_id of the price list line to retrieve. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
@type	Required. Type of price list line. Always a value of `ProductOfferingPrice`. Data type: String
externalId	The external ID of the price list line. Data type: String
isBundle	Flag that indicates whether the price list line is part of a single product or a bundle of products. Valid values: • true: Price list line is part of a bundle. • false: Price list line isn't part of a bundle. Data type: Boolean Default: false
lastUpdate	Required. Date that the price line was last updated. Format: YYYY-MM-DD Data type: String
lifeCycleStatus	Required. Current life cycle status of the product list line. Valid values: • active • draft • inactive Data type: String Default: draft
name	Required. Name to give the price list line. Data type: String

price	Required. List price details of the price list line.
	
	Data type: Object
	`"price": {`
	`  "unit": "String",`
	`  "value": "String"`
	`}`

price.unit	Required. Currency code of the price list line. For example, `USD` or `EUR`.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Currency [fx_currency] table. Data type: String
price.value	Required. Value of the price. Data type: String (represented with a number. For example, `"800"`.)

priceList	Required. Price list information associated with the price list line.
	
	Data type: Object
	
	`"priceList": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`

priceList.id	Required. Sys_id of the price list line. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
priceList.name	Name of the price list line. Data type: String
priceList.@type	The type of price list line. When sub-classing, this defines the sub-class extensible name. Value is always `priceList`. Data type: String
priceType	Required. Filter the price list line by the pricing method of the product offering. Valid values: • recurring: Charge recurring pricing amounts with a specified frequency. Frequency is set in the *`recurringChargePeriodType`* parameter. • one_time: Supports one-time or recurring add-on charges and fees for a product offering. Data type: String Default: recurring

productOffering	Required. Product offering of the price list line.
	
	Data type: Object
	
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"internalVersion": "String"` `}`
productOffering.id	Required. Sys_id of the product offering. Table: Product offering [sn_prd_pm_product_offering] Data type: String
productOffering.internalVersion	Internal version number of the product offering. Data type: String (represented with a number. For example, `"1"`.)
productOffering.name	Name of the product offering. Data type: String
recurringChargePeriodType	Required if *`priceType`* is recurring. Commitment terms that are selected when the product offering was created. Valid values: • annually • monthly Data type: String

unitOfMeasure	Required. Details about the unit of measure associated with the price list line.
	
	Data type: Object
	`"unitOfMeasure": {`
	`"id": "String",`
	`"amount": Number,`
	`"units": "String"`
	`}`

unitOfMeasure.amount	Amount of the unit of measure. Data type: Number
unitOfMeasure.id	Required. Sys_id of the unit of measure in the Price Line List table. Table: Price List Line [sn_csm_pricing_price_list_line] Data type: String
unitOfMeasure.units	Type of the unit of measure associated with the price list line. For example, `each` or `bundle`. Data type: String
validFor	Required. The duration of time that the price list line is valid for.

Request body parameters (XML or JSON) (continued)

Name	Description

	Data type: Object
	`"validFor": {`
	`  "endDate": "String",`
	`  "startDate": "String"`
	`}`

validFor.endDate	End date that the price list line is valid for. Data type: String (glide_date_time)
validFor.endDateTime	End date and time that the price list line is valid for. Format: YYYY-MM-DD HH:mm:ss Data type: String (glide_date)
validFor.startDate	Start date that the price list line is valid for. Data type: String (glide_date_time)
validFor.startDateTime	Start date and time that the price list line is valid for. Format: YYYY-MM-DD HH:mm:ss Data type: String (glide_date)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
id	Sys_id of the price list line. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
href	URL to the price list line record in the instance. Data type: String
lastUpdate	Date and time that the price list line was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String

validFor	The duration of time that the price list line is valid for.
	Data type: Object
	`"validFor": {`
	`  "endDate": "String",`
	`  "startDate": "String"`
	`}`

validFor.endDate	End date and time that the price list line is valid for. Data type: String (glide_date_time)
validFor.startDate	Start date and time that the price list line is valid for. Data type: String (glide_date_time)
isBundle	Flag that indicates whether the price list line is part of a single product or a bundle of products. Valid values: • true: Price list line is part of a bundle. • false: Price list line isn't part of a bundle.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
lifecycleStatus	Current life cycle status of the price list line. Valid values: • Active • Draft • Inactive Data type: String

productOffering	Product offering that is associated with the price list line.
	
	Data type: Object
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "internalVersion": "String"`
	`}`

productOffering.id	Sys_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalVersion	Internal version number of the product offering. For example, `PRD0F01024`. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
priceType	The pricing method of the product offering which is associated with this price list line. Possible values: • recurring: Charge recurring pricing amounts with a specified frequency. The value of *`recurringChargePeriodType`* indicates the frequency of the charge. • one_time: One-time or recurring add-on charges and fees for a product offering. Data type: String
recurringChargePeriodType	The periodicity or frequency of the product offering associated with this price list line. Returns a frequency type if *`priceType`* was set to `recurring`, otherwise returns an empty string. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• annually • monthly Data type: String

unitOfMeasure	Details about the unit of measure associated with the price list line.
	
	Data type: Object
	
	`"unitOfMeasure": {`
	`  "id": "String",`
	`  "amount": Number,`
	`  "units": "String"`
	`}`

unitOfMeasure.amount	Amount of the unit of measure. Data type: Number
unitOfMeasure.id	Sys_id of the unit of measure. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
unitOfMeasure.units	Type of the unit of measure associated with the price list line. For example, `year` or `bundle`. Data type: String

price	List price details of the price list line.
	
	Data type: Object
	
	`"price": {`
	`  "units": "String",`
	`  "value": "String"`
	`}`

price.units	Currency code of the price. For example, `USD` or `EUR`. Table: Currency [fx_currency] Data type: String
price.value	Value of the price. Data type: String (represented with a number)

priceList	Price list information associated with the price list line.
	
	Data type: Object
	
	`"priceList": {`
	`  "id": "String",`
	`  "name": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"@type": "String"` `}`
priceList.id	Sys_id of the price list in the Price List [sn_csm_pricing_price_list] table. Data type: String
priceList.name	Name of the price list. Data type: String
priceList.@type	The type of price list. When sub-classing, this defines the sub-class extensible name. Always has a value of `priceList`. Data type: String
@type	Always a value of `ProductOfferingPrice`. When sub-classing, this defines the sub-class extensible name. Data type: String
state	The state of the price list which is associated with this price list line. Data type: String
externalId	The external ID of this price list line. Data type: String

Example: cURL request

The following example updates the dates of when the product offering price with ID 3ddd0... is valid for.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/productOfferingPrice/994d5d364f8b5210f899f61d20ce0b7c" \
--request patch\
--user 'username':'password'
--data {
  "validFor": {
    "endDateTime": "2024-06-25 15:15:58"
  }
}
```

Response body:

```
{
  "validFor": {
    "endDateTime": "2024-06-25 15:15:58"
  },
  "id": "994d5d364f8b5210f899f61d20ce0b7c",
  "name": "new Price list",
  "lastUpdate": "2025-01-16 00:15:32",
```

```
  "href":
 "/api/sn_tmf_api/catalogmanagement/productOfferingPrice/994d5d3
64f8b5210f899f61d20ce0b7c",
  "lifecycleStatus": "Draft"
}
```

Product Catalog Open API - PATCH /sn_tmf_api/catalogmanagement/productSpecification/{id}

Updates the specified product specification.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productSpecification/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product offering to update. Data type: String Table: Product Specification [sn_prd_pm_product_specification]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Required. Description of the specification. Data type: String
externalId	Required. External ID of the product specification. If multiple versions are published, returns the highest published version among them. If no versions are published, returns the highest version regardless of state. Data type: String Table: In the external_id field of the Product Specification [sn_prd_pm_product_specification] table.
id	Sys_id or external ID of the product specification. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Table: In the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table.
internalId	Required. Sys_id or internal ID of the product specification. Data type: String Table: In the initial_version field of the Product Specification [sn_prd_pm_product_specification] table.
internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Specification [sn_prd_pm_product_specification] table.
isBundle	Flag that indicates whether *productSpecification* represents a single product or a bundle of products. Valid values: • true: The product specification is a product bundle and contains multiple products. • false: The product specification contains a single product. Data type: Boolean Default: false
lastUpdate	Date the specification was last updated. Data type: String Default: Blank string
name	Required. Name of the specification. Data type: String
productSpecCharacteristic	Specification characteristic. Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array], "validFor": {Object}, "valueType": "String"`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	`}` `]`
productSpecCharacteristic.description	Description of the characteristic. Data type: String
productSpecCharacteristic.name	Required. Name of the characteristic. Data type: String

productSpecCharacteristic.productSpecCharacteristicValue	List of the possible values of the characteristic.
	
	Data type: Array of Objects
	
	`"productSpecCharacteristicValue": [`
	`{`
	`"isDefault": Boolean,`
	`"isMandatory": Boolean,`
	`"validFor": {Object},`
	`"value": "String"`
	`}`
	`]`

productSpecCharacteristic.productSpecCharacteristicValue.isDefault	Flag that indicates whether the associated characteristic value is the default value for the characteristic. Possible values: • true: Default value. • false: Not the default value. Default: false
productSpecCharacteristic.productSpecCharacteristicValue.isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false

productSpecCharacteristic.productSpecCharacteristicValue.validFor	Date and time of when the characteristic is valid.
	
	Data type: Object
	
	`"validFor": {`
	`"startDateTime": "String"`
	`}`

productSpecCharacteristic.productSpecCharacteristicValue.validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String

productSpecCharacteristic.validFor	Date range the characteristic is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`"endDateTime": "String",`
	`"startDateTime": "String"`
	`}`

productSpecCharacteristic.validFor.endDateTime	End date and time of the characteristic. Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Data type: String
productSpecCharacteristic.validFor.startDateTime	Start date and time of the characteristic. Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Data type: String
productSpecCharacteristic.valueType	Value type of the characteristic, such as choice or email. Can be of complex or non-complex type. Data type: String Accepted values: • Date,Address • Integer,Date/Time • Array.Integer • Array.Single Line Test • Single Line Test • Array.Object • Array.Date • Array.Decimal • Yes/No • Object • Array.Datetime • Checkbox • Email • Choice

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Default value: empty string
productSpecificationRelationship	Details of the specification's relationships to other product specifications. Data type: Array of Objects `"productSpecificationRelationship": [ { "id": "String", "type": "String", "validFor": {Object} } ]`
productSpecificationRelationship.id	ID of the related specification. Data type: String
productSpecificationRelationship.type	Required if using the *productSpecificationRelationship* parameter. Type of relationship. Valid values: • bundles • composed_of Data type: String
productSpecificationRelationship.validFor	Date range the relationship is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
productSpecificationRelationship.validFor.endDateTime	End date of the relationship. Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Data type: String
productSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:35:43`. Data type: String
resourceSpecification	Required. Details of the resource specifications related to this product specification.

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/catalog

Creates a product offering catalog.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/catalog`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Description of the product offering catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String Default: Blank string
externalId	Unique identifier for the product offering catalog from the external system. Data type: String Default: Blank string
name	Required. Name of the product offering catalog. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
description	Description of the product offering catalog. Data type: String
id	Sys_id of the product offering catalog Data type: String Table: Product Offering Catalog [sn_prd_pm_product_offering_catalog]
name	Name of the product offering catalog. Data type: String

Example: cURL request

This example creates a product offering catalog.

```
curl --location --request POST
 "https://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/catalog" \
--header "Content-Type: application/json" \
--data-raw '{
    "id": "testId",
    "name": "Catalog",
    "description": "Description"
}'
--user 'username':'password'
```

Response body:

```
{
   "id": "45715d02c3510110bc0526083c40dd6b",
   "description": "Description",
   "name": "Catalog1"
}
```

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/productOffering

Creates a product offering and associated product offering bundles.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productOffering`

Name	Description
	`}` `]`
channel.description	Description of the channel. Data type: String
channel.id	Sys_id of the channel. Data type: String Table: Distribution Channel [sn_prd_pm_distribution_channel]
channel.name	Name of the channel. Data type: String
description	Description of the product offering. Data type: String
externalId	External ID of the product offering. If multiple versions are published, ret highest published version among them. If no versions are published, ret highest version regardless of state. Data type: String Table: Product Offering [sn_prd_pm_product_offering] table, external_id
externalSystem	External system of the product offering, appended with `TMF620`. For example, if the external system is ABC then the value is `ABC - TMF62` Data Type: String
href	Relative link to the resource record. Data type: String Default: Blank string
id	Required. Initial version or external ID of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] table, initial_versi external_id field
internalId	Sys_id or internal ID of the product offering record. Data type: String Table: Product Offering [sn_prd_pm_product_offering] table, initial_versi
internalVersion	Version of the product offering. Data type: String

Name	Description
	`}` `]`
prodSpecCharValueUse.description	Description of the characteristic. Data type: String
prodSpecCharValueUse.name	Name of the characteristic. Data type: String

prodSpecCharValueUse.
productSpecCharacteristicValue
	List of the possible values of the characteristic.
	
	Data type: Array of Objects
	
	`"productSpecCharacteristicValue": [`
	`{`
	`"isDefault": Boolean,`
	`"isMandatory": Boolean,`
	`"validFor": {Object},`
	`"value": "String"`
	`}`
	`]`

prodSpecCharValueUse. productSpecCharacteristicValue. isDefault	Flag that indicates whether the associated characteristic value is the de for the characteristic. Possible values: • true: Default value. • false: Not the default value. Default: false
prodSpecCharValueUse. productSpecCharacteristicValue. isMandatory	Flag that indicates whether the associated characteristic value is a man for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false

prodSpecCharValueUse.
productSpecCharacteristicValue.
validFor
	Date and time of when the characteristic is valid.
	
	Data type: Object
	
	`"validFor": {`
	`"startDateTime": "String"`
	`}`

prodSpecCharValueUse. productSpecCharacteristicValue. validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
prodSpecCharValueUse.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String

prodSpecCharValueUse.validFor	Date range the characteristic is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`  "startDateTime": "String"`
	`}`

prodSpecCharValueUse.validFor.startDateTime	Start date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS
prodSpecCharValueUse.valueType	Data type of the *prodSpecCharValueUse.productSpecCharacteristicVal* parameter. Possible values: • Array.Date • Array.Datetime • Array.Decimal • Array.Integer • Array.Object • Array.Single Line Test • Checkbox • Choice • Date,Address • Email • Integer,Date/Time • Object • Single Line Text • Yes/No Data type: String

productCharacteristic	List of product characteristics.
	
	Data type: Array of Objects
	
	`"productCharacteristic": [`
	`  {`
	`  "name": "String",`
	`  "value": "String"`
	`  }`
	`]`

Name	Description
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String

productOfferingCharacteristic	Characteristic quality or distinctive feature of a product offering. Charact can take on a discrete value that is fixed at design time (catalog authorin Mobile Plan Rank. These characteristics are not generally modifiable at i level.
	
	For additional information on product offering characteristics, see Create characteristics and characteristic options.
	
	Data type: Array of Objects
	
	`productOfferingCharacteristic": [`
	`  {`
	`  "characteristicValueSpecification": [Array],`
	`  "name": "String",`
	`  "valueType": "String"`
	`  }`
	`]`

productOfferingCharacteristic.
characteristicValueSpecification
	List of characteristic values associated with the product offering charact
	
	Data type: Array of Objects
	
	`"characteristicValueSpecification": [`
	`  {`
	`  "isDefault": Boolean,`
	`  "isMandatory": Boolean,`
	`  "value": "String"`
	`  }`
	`]`

productOfferingCharacteristic. characteristicValueSpecification. isDefault	Flag that indicates whether the associated characteristic value is the de for the associated characteristic. Possible values: • true: Is default value. • false: Isn't the default value. Data type: Boolean Default: false
productOfferingCharacteristic. characteristicValueSpecification. isMandatory	Flag that indicates whether the associated characteristic value is manda associated characteristic. Possible values: • true: Is mandatory. • false: Isn't mandatory.

Name	Description
	"priceType": "String" }]

productOfferingPrice.price	Price information for the product offering.
	
	Data type: Object
	
	"price": {
	"taxIncludedAmount": {Object}
	}

productOfferingPrice.price.taxIncludedAmount	Price information for the product offering.
	
	Data type: Object
	
	"taxIncludedAmount": {
	"unit": "String",
	"value": "String"
	}

productOfferingPrice.price.taxIncludedAmount.unit	Currency code for the product offering price. Data type: String
productOfferingPrice.price.taxIncludedAmount.value	Price of the product offering including tax. Data type: String
productOfferingPrice.priceType	Product offering price type, one-time or recurring payment. Possible values: • nonRecurring (one-time) • recurring Data type: String
productOfferingTerm	Valid contract term length for the product offering. Data type: String

productSpecification	Product specification for the product.
	
	Data type: Object
	
	"productSpecification": {
	"id": "String",
	"internalId": "String",
	"internalVersion": "String",
	"name": "String",
	"version": "String"
	}

productSpecification.id	Sys_id of the product specification record. Data type: String

Name	Description
	Table: In the initial_version field of the Product Offering [sn_prd_pm_product_offering] table.
productSpecification.internalId	Sys_id or internal ID of the product specification record. Data type: String Table: In the initial_version field of the Product Offering [sn_prd_pm_product_offering] table.
productSpecification.internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Offering [sn_prd_pm_product_o table.
productSpecification.version	External version of the product specification. Data type: String Table: In the external_version field of the Product Offering [sn_prd_pm_product_offering] table.
status	Status of the product offering. Possible values: • draft • published Data type: String

validFor	Date range the product offering is valid for.
	
	Data type: Object
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

validFor.endDateTime	End date of the product offering. Data type: String
validFor.startDateTime	Start date of the product offering. Data type: String
version	External version of the product offering. Data type: String Table: In the external_version field of the Product Offering [sn_prd_pm_product_offering] table.

This example creates a product offering.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
@type	Required. Type of price list line. Always a value of `ProductOfferingPrice`. Data type: String
externalId	The external ID of the price list line. Data type: String
isBundle	Flag that indicates whether the price list line is part of a single product or a bundle of products. Valid values: • true: Price list line is part of a bundle. • false: Price list line isn't part of a bundle. Data type: Boolean Default: false
lastUpdate	Required. Date that the price line was last updated. Format: YYYY-MM-DD Data type: String
lifeCycleStatus	Required. Current life cycle status of the product list line. Valid values: • active • draft • inactive Data type: String Default: draft
name	Required. Name to give the price list line. Data type: String
price	Required. List price details of the price list line. Data type: Object

Request body parameters (XML or JSON) (continued)

Name	Description

	`"price": {`
	`  "unit": "String",`
	`  "value": "String"`
	`}`

price.unit	Required. Currency code of the price list line. For example, USD or EUR. Table: Currency [fx_currency] table. Data type: String
price.value	Required. Value of the price. Data type: String (represented with a number. For example, `"800"`.)

priceList	Required. Price list information associated with the price list line.
	
	Data type: Object
	
	`"priceList": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`

priceList.id	Required. Sys_id of the price list line. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
priceList.name	Name of the price list line. Data type: String
priceList.@type	The type of price list line. When sub-classing, this defines the sub-class extensible name. Value is always `priceList`. Data type: String
priceType	Required. Filter the price list line by the pricing method of the product offering. Valid values: • recurring: Charge recurring pricing amounts with a specified frequency. Frequency is set in the *`recurringChargePeriodType`* parameter. • one_time: Supports one-time or recurring add-on charges and fees for a product offering. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: recurring

productOffering	Required. Product offering of the price list line.
	
	Data type: Object
	
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "internalVersion": "String"`
	`}`

productOffering.id	Required. Sys_id of the product offering. Table: Product offering [sn_prd_pm_product_offering] Data type: String
productOffering.internalVersion	Internal version number of the product offering. Data type: String (represented with a number. For example, `"1"`.)
productOffering.name	Name of the product offering. Data type: String
recurringChargePeriodType	Required if *`priceType`* is recurring. Commitment terms that are selected when the product offering was created. Valid values: • annually • monthly Data type: String

unitOfMeasure	Required. Details about the unit of measure associated with the price list line.
	
	Data type: Object
	
	`"unitOfMeasure": {`
	`  "id": "String",`
	`  "amount": Number,`
	`  "units": "String"`
	`}`

unitOfMeasure.amount	Amount of the unit of measure. Data type: Number
unitOfMeasure.id	Required. Sys_id of the unit of measure in the Price Line List table. Table: Price List Line [sn_csm_pricing_price_list_line]

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
unitOfMeasure.units	Type of the unit of measure associated with the price list line. For example, `each` or `bundle`. Data type: String

validFor	Required. The duration of time that the price list line is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`  "endDate": "String",`
	`  "startDate": "String"`
	`}`

validFor.endDate	End date that the price list line is valid for. Data type: String (glide_date_time)
validFor.endDateTime	End date and time that the price list line is valid for. Format: YYYY-MM-DD HH:mm:ss Data type: String (glide_date)
validFor.startDate	Start date that the price list line is valid for. Data type: String (glide_date_time)
validFor.startDateTime	Start date and time that the price list line is valid for. Format: YYYY-MM-DD HH:mm:ss Data type: String (glide_date)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
id	Sys_id of the price list line. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
href	URL to the price list line record in the instance. Data type: String
lastUpdate	Date and time that the price list line was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String

validFor	The duration of time that the price list line is valid for.
	Data type: Object
	`"validFor": {`
	`  "endDate": "String",`
	`  "startDate": "String"`
	`}`

validFor.endDate	End date and time that the price list line is valid for. Data type: String (glide_date_time)
validFor.startDate	Start date and time that the price list line is valid for. Data type: String (glide_date_time)
isBundle	Flag that indicates whether the price list line is part of a single product or a bundle of products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Valid values: • true: Price list line is part of a bundle. • false: Price list line isn't part of a bundle. Data type: Boolean
lifecycleStatus	Current life cycle status of the price list line. Valid values: • Active • Draft • Inactive Data type: String

productOffering	Product offering that is associated with the price list line.
	
	Data type: Object
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "internalVersion": "String"`
	`}`

productOffering.id	Sys_id of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.internalVersion	Internal version number of the product offering. For example, `PRD0F01024`. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
priceType	The pricing method of the product offering which is associated with this price list line. Possible values: • recurring: Charge recurring pricing amounts with a specified frequency. The value of *`recurringChargePeriodType`* indicates the frequency of the charge. • one_time: One-time or recurring add-on charges and fees for a product offering. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
recurringChargePeriodType	The periodicity or frequency of the product offering associated with this price list line. Returns a frequency type if *priceType* was set to `recurring`, otherwise returns an empty string. Possible values: • annually • monthly Data type: String

unitOfMeasure	Details about the unit of measure associated with the price list line.
	
	Data type: Object
	`"unitOfMeasure": {`
	`"id": "String",`
	`"amount": Number,`
	`"units": "String"`
	`}`

unitOfMeasure.amount	Amount of the unit of measure. Data type: Number
unitOfMeasure.id	Sys_id of the unit of measure. Table: Price List Lines [sn_csm_pricing_price_list_line] Data type: String
unitOfMeasure.units	Type of the unit of measure associated with the price list line. For example, `year` or `bundle`. Data type: String

price	List price details of the price list line.
	
	Data type: Object
	`"price": {`
	`"units": "String",`
	`"value": "String"`
	`}`

price.units	Currency code of the price. For example, USD or EUR. Table: Currency [fx_currency] Data type: String
price.value	Value of the price. Data type: String (represented with a number)
priceList	Price list information associated with the price list line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Object
	`"priceList": {`
	`  "id": "String",`
	`  "name": "String",`
	`  "@type": "String"`
	`}`

priceList.id	Sys_id of the price list in the Price List [sn_csm_pricing_price_list] table. Data type: String
priceList.name	Name of the price list. Data type: String
priceList.@type	The type of price list. When sub-classing, this defines the sub-class extensible name. Always has a value of `priceList`. Data type: String
@type	Always a value of `ProductOfferingPrice`. When sub-classing, this defines the sub-class extensible name. Data type: String
state	The state of the price list which is associated with this price list line. Data type: String
externalId	The external ID of this price list line. Data type: String

Example: cURL request

The following example creates a new price list line record according to data specified in the request body, and inserts it in the Price list line [sn_csm_pricing_price_list_line] table.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/catalogmanageme
nt/productOfferingPrice " \
--request POST\
--user 'username':'password'
--data {
  "name": "new Price list",
  "validFor": {
    "startDateTime": "2024-05-28 15:15:58",
    "endDateTime": "2025-06-28 15:15:58"
  },
  "priceType": "recurring",
  "recurringChargePeriodType": "monthly",
  "lastUpdate": "2023-09-23 00:00:00",
  "isBundle": false,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "lifecycleStatus": "Draft",
  "unitOfMeasure": {
    "id": "1eaa559953020110286eddeeff7b12c7",
    "amount": 1,
    "units": "Year"
  },
  "price": {
    "unit": "USD",
    "value": "800"
  },
  "productOffering": {
    "id": "9e3dd57a4fcb5210f899f61d20ce0bf2",
    "name": "Maintenance Fee",
    "internalVersion": "1"
  },
  "priceList": {
    "name": "new price list",
    "@type": "priceList"
  },
  "externalId": "test123",
  "@type": "ProductOfferingPrice"
}
```

Response body. This new price list line record is assigned a unique ID; the response body returns this information along with a URL to the new record using the *href* response parameter.

```
{
  "name": "new Price list",
  "validFor": {
    "startDateTime": "2024-05-28 15:15:58",
    "endDateTime": "2025-06-28 15:15:58"

Product Catalog Open API - POST /sn_tmf_api/catalogmanagement/productSpecification

Creates a product specification record with the specified values.

URL format

Default URL: `/api/sn_tmf_api/catalogmanagement/productSpecification`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
description	Required. Description of the specification. Data type: String
externalId	Unique identifier for the product specification from the external system. Data type: String Default: Blank string
externalSystem	External system of the product specification, appended with `TMF620`. For example, if the external system is ABC then the value is ABC - `TMF620`. Data Type: String
id	Required. Sys_id or external ID of the product specification. Data type: String

Request body parameters (JSON) (continued)

Name	Description
	Table: In the initial_version or external_id of the Product Specification [sn_prd_pm_product_specification] table.
internalId	Required. Sys_id or internal ID of the product specification. Data type: String Table: In the initial_version field of the Product Specification [sn_prd_pm_product_specification] table.
internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Specification [sn_prd_pm_product_specification] table.
lastUpdate	Date the specification was last updated. Data type: String Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Default: Blank string
name	Required. Name of the specification. Data type: String
productSpecCharacteristic	Specification characteristic. Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array], "validFor": {Object}, "valueType": "String" } ]`
productSpecCharacteristic.description	Description of the characteristic. Data type: String Default: Blank string
productSpecCharacteristic.name	Required. Name of the characteristic.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
productSpecCharacteristic. productSpecCharacteristicValue	Required. List of the possible values of the characteristic. Data type: Array of Objects `"productSpecCharacteristicValue": [ { "isDefault": Boolean, "isMandatory": Boolean, "validFor": {Object}, "value": "String" } ]`
productSpecCharacteristic. productSpecCharacteristicValue. isDefault	Flag that indicates whether the associated characteristic value is the default value for the characteristic. Possible values: • true: Default value. • false: Not the default value. Default: false
productSpecCharacteristic. productSpecCharacteristicValue. isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values: • true: Mandatory value. • false: Not a mandatory value. Default: false
productSpecCharacteristic. productSpecCharacteristicValue. validFor	Date and time of when the characteristic is valid. Data type: Object `"validFor": { "startDateTime": "String" }`
productSpecCharacteristic. productSpecCharacteristicValue. validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS

Request body parameters (JSON) (continued)

Name	Description
productSpecCharacteristic.productSpecCharacteristicValue.value	Value of the characteristic. Data type: String
productSpecCharacteristic.productSpecCharacteristicValue.value	Required. Value of the characteristic. Data type: String

productSpecCharacteristic.validFor	Date range the characteristic is valid for.
	
	Data type: Object
	
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic.validFor.endDateTime	End date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Default: Blank string
productSpecCharacteristic.validFor.startDateTime	Start date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS. For example, `2025-01-31 09:35:43`. Default: Blank string
productSpecCharacteristic.valueType	Value type of the characteristic, such as choice or email. Can be of complex or non-complex type. Data type: String Accepted values: • Date,Address • Integer,Date/Time • Array.Integer • Array.Single Line Test • Single Line Test • Array.Object • Array.Date • Array.Decimal • Yes/No

Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad request. Possible reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

Response body parameters

Name	Description
description	Description of the specification. Data type: String
externalSystem	External system of the product specification, appended with `TMF620`. For example, if the external system is ABC then the value is `ABC - TMF620`. Data Type: String
href	Relative link to the resource record. Data type: String Default: Blank string
id	Sys_id or external ID of the product specification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: In the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table.
internalId	Required. Sys_id or internal ID of the product specification. Data type: String Table: In the initial_version field of the Product Specification [sn_prd_pm_product_specification] table.
internalVersion	Version of the product specification. Data type: String Table: In the version field of the Product Specification [sn_prd_pm_product_specification] table.
isBundle	Flag that indicates whether *`productSpecification`* represents a single product or a bundle of products. Valid values: • true: The product specification is a product bundle and contains multiple products. • false: The product specification contains a single product. Data type: Boolean Default: false
lastUpdate	Date the specification was last updated. Data type: String Format: YYYY-MM-DD HH:mm:SS
lifecycleStatus	Current lifecycle status of the product specification. Possible values: • Active • Draft • Inactive Data type: String Default: Blank string
name	Name of the specification.

Name	Description
	Data type: String
productSpecCharacteristic	Specification characteristic. Data type: Array of Objects `"productSpecCharacteristic": [ { "description": "String", "name": "String", "productSpecCharacteristicValue": [Array], "validFor": {Object}, "valueType": "String" } ]`
productSpecCharacteristic.description	Description of the characteristic. Data type: String
productSpecCharacteristic.name	Name of the characteristic. Data type: String
productSpecCharacteristic. productSpecCharacteristicValue	List of the possible values of the characteristic. Data type: Array of Objects `"productSpecCharacteristicValue": [ { "isDefault": Boolean, "isMandatory": Boolean, "validFor": {Object}, "value": "String" } ]`
productSpecCharacteristic. productSpecCharacteristicValue. isDefault	Flag that indicates whether the associated characteristic value is the default value for the characteristic. Possible values: • true: Default value. • false: Not the default value. Default: false
productSpecCharacteristic. productSpecCharacteristicValue. isMandatory	Flag that indicates whether the associated characteristic value is a mandatory value for the characteristic. Possible values:

Name	Description
	• true: Mandatory value. • false: Not a mandatory value. Default: false

productSpecCharacteristic.
productSpecCharacteristicValue.
validFor
	Date and time of when the characteristic is valid.
	
	Data type: Object
	
	`"validFor": {`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic. productSpecCharacteristicValue. validFor.startDateTime	Start date and time of when the characteristic value is valid. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic. productSpecCharacteristicValue.value	Value of the characteristic. Data type: String

productSpecCharacteristic.validFor	Date range for which the characteristic is valid.
	
	Data type: Object
	
	`"validFor": {`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

productSpecCharacteristic.validFor. endDateTime	End date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic.validFor. startDateTime	Start date of the characteristic. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecCharacteristic.valueType	Value type of the characteristic, such as choice or email. Can be of complex or non-complex type. Data type: String Accepted values: • Date,Address • Integer,Date/Time • Array.Integer • Array.Single Line Test

Name	Description
	• Single Line Test • Array.Object • Array.Date • Array.Decimal • Yes/No • Object • Array.Datetime • Checkbox • Email • Choice
productSpecificationRelationship	This specification's relationships to other product specifications. Data type: Array of Objects `"productSpecificationRelationship": [ { "id": "String", "type": "String", "validFor": Object } ]`
productSpecificationRelationship.id	Sys_id of the related specification. Data type: String
productSpecificationRelationship.type	Type of relationship. Data type: String
productSpecificationRelationship.validFor	Date range the relationship is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }`
productSpecificationRelationship.validFor.endDateTime	End date of the relationship. Data type: String Format: YYYY-MM-DD HH:mm:SS
productSpecificationRelationship.validFor.startDateTime	Start date of the relationship. Data type: String Format: YYYY-MM-DD HH:mm:SS

Name	Description
resourceSpecification	List of resource specifications related to this product specification. Data type: Array of Objects `"resourceSpecification": [ { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String" } ]`
resourceSpecification.id	Sys_id or external ID of the resource specification. Data type: String Table: In the sys_id or external_id field of the Resource Specification [sn_prd_pm_resource_specification] table.
resourceSpecification.internalId	Initial version (sys_id) of the resource specification record. Data type: String Table: In the initial_version field of the Resource Specification [sn_prd_pm_resource_specification] table.
resourceSpecification.internalVersion	Version of the resource specification. Data type: String Table: In the version field of the Resource Specification [sn_prd_pm_resource_specification] table.
resourceSpecification.name	Name of the resource specification. Data type: String Table: Resource Specification [sn_prd_pm_resource_specification]
resourceSpecification.version	External version of the resource specification. Data type: String Table: In the external_version field of the Resource Specification [sn_prd_pm_resource_specification] table.
serviceSpecification	List of service specifications related to this product specification.

Name	Description
	Data type: Array of Objects `"serviceSpecification": [ { "id": "String", "internalId": "String", "internalVersion": "String", "name": "String", "version": "String" } ]`
serviceSpecification.id	Initial version or external ID of the service specification. Data type: String Table: In the sys_id or external_id field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalId	Initial version of the service specification. Data type: String Table: In the initial_version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.internalVersion	Version of the service specification. Data type: String Table: In the version field of the Service Specification [sn_prd_pm_service_specification] table.
serviceSpecification.name	Name of the service specification. Data type: String Table: Service Specification [sn_prd_pm_service_specification]
serviceSpecification.version	External version of the service specification. Data type: String Table: In the external_version field of the Service Specification [sn_prd_pm_service_specification] table.
validFor	Date range the specification is valid for. Data type: Object `"validFor": { "endDateTime": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"startDateTime": "String"` `}`
validFor.endDateTime	End date of the specification. Data type: String Format: YYYY-MM-DD HH:mm:SS
validFor.startDateTime	Start date of the specification. Data type: String Format: YYYY-MM-DD HH:mm:SS
version	External version of the product specification. Data type: String Table: In the external_version field of the Product Specification [sn_prd_pm_product_specification] table.

This example creates a product specification record with the specified values.

Product Inventory Open API

The *`Product Inventory Open`* API provides endpoints to create and retrieve product inventories.

Use this API to manage product inventory information between external systems and the ServiceNow AI Platform.

This API is included in the Product Inventory Advanced application, which is available on the ServiceNow Store.

This API is provided within the `sn_prd_invt` namespace.

The calling user must have the sn_prd_invt.product_inventory_integrator role.

This API creates and updates data in the following tables.

- Product Characteristics [sn_prd_invt_product_characteristics]
- Product Inventory [sn_prd_invt_product_inventory]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Product Model [cmdb_model]
- Product Model Characteristic [sn_prd_pm_product_model_characteristic]

The `Product Inventory Open` API is a ServiceNow® implementation of the TM Forum Product Inventory Management API REST specification. This implementation is based on the TMF637 Product Inventory Management API User Guide v5.0.0, September 2024. The `Product Inventory Open` API is conformance certified by TM Forum.

Product Inventory Open API – DELETE /sn_prd_invt/order/product/{id}

Deletes a specified product inventory record.

URL format

Default URL: `/api/sn_prd_invt/order/product/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product inventory to delete. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	No Content. Record successfully deleted.
400	Bad Request. A bad request type or malformed request was detected.

Response body parameters (JSON)

Name	Description
None	

Example: cURL request

This example deletes a product inventory record.

```
curl
 "https://instance.service-now.com/api/sn_prd_invt/product/01b2f
9972b8c72d07a83f395f291bf53" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

No response body is returned when a product inventory record is successfully deleted.

Product Inventory Open API - GET /sn_prd_invt/product

Retrieves a list of all product inventories.

URL format

Default URL: `api/sn_prd_invt/product`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by customer.
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: Return all fields.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by status.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
name	Name of the product inventory. Data type: String
place	Location of the product. Data type: Array `"place": [ { "id": "String", "name": "String" } ]`
place.id	Location sys_id or external id. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
place.name	Name of the location.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Location [cmn_location] Field: name
productCharacteristic	List of product characteristics. For additional information on product characteristics, see Create a product offering category. Data type: Array of Objects `"productCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productCharacteristic.valueType	Type of characteristic value. Accepted values: • address • array.date • array.datetime • array.decimal • array.integer • array.object • array.single_line_text • attachment • checkbox • choice • date • date_time • decimal • duration • email • integer

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• object • single_line_text • yes_no Data type: String
productId	Sys_id of the product model for the product inventory. Data type: String Table: Product Model [cmdb_model]

productOffering	Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`"id": "String",`
	`"internalId": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

productOffering.id	Initial version or external ID of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: initial_version or external_id
productOffering.internalId	Internal version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: internal_version
productOffering.internalVersion	Version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: version
productOffering.name	Name of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.version	External version of the product offering.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: external_version
productPrice	Returns an empty array. Data type: Array
productRelationship	List of related products. Data type: Array of Objects `"productRelationship": [ { "productId": "String", "relationshipType": "String" } ]`
productRelationship.productId	Sys_id of the related product. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
productRelationship.relationshipType	Type of relationship. Data type: String
productSpecification	Product specification for the product. Data type: Object `"productSpecification": { "id": "String", "internalId": "String", "internalVersion": "String", "version": "String" }`
productSpecification.id	Initial version or external ID of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: internal_version or external_id
productSpecification.internalId	Initial version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification]

Name	Description
	Field: initial_version
productSpecification.internalVersion	Version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: version
productSpecification.version	External version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: external_version

realizingResource	Resource that realizes the product. The realizing resource is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. Valid value: child Data type: String

realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Sys_id of the realizing service. Data type: String

Name	Description
	Table: Product Inventory [sn_prd_invt_product_inventory]
realizingService.type	Type of the realizing service. Valid value: child Data type: String
relatedParty	List of parties associated with the ticket. Data type: Array of Objects `"relatedParty": [ { "id": "String", "@referredType": "String" } ]`
relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]
relatedParty.@referredType	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
state	Current state of the product. Data type: String

Example: cURL request

This example retrieves all product inventories.

```
curl --location --request GET
 "https://instance.service-now.com/api/sn_prd_invt/product" \
--user 'username':'password'
```

Response body.

```

URL format

Default URL: `/api/sn_prd_invt/product/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the product inventory to retrieve. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

Query parameters

Name	Description
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String Default: Don't filer y customer.
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by status.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Record not found. Record associated with the ID is not found in the table.

Response body parameters (JSON)

Name	Description
billingAccount	Billing account of the product inventory record. Data type: String
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
name	Name of the product inventory. Data type: String
place	Location of the product. Data type: Array `"place": [ { "id": "String", "name": "String" } ]`
place.id	Location sys_id or external id. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
place.name	Name of the location. Data type: String Table: Location [cmn_location] Field: name
productCharacteristic	List of product characteristics. For additional information on product characteristics, see Create a product offering category. Data type: Array of Objects `"productCharacteristic": [ { "name": "String", "value": "String", "valueType": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productCharacteristic.valueType	Type of characteristic value. Accepted values: • address • array.date • array.datetime • array.decimal • array.integer • array.object • array.single_line_text • attachment • checkbox • choice • date • date_time • decimal • duration • email • integer • object • single_line_text • yes_no Data type: String
productId	Sys_id of the product model for the product inventory. Data type: String Table: Product Model [cmdb_model]

productOffering	Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`"id": "String",`
	`"internalId": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

productOffering.id	Initial version or external ID of the product offering.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: initial_version or external_id
productOffering.internalId	Internal version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: internal_version
productOffering.internalVersion	Version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: version
productOffering.name	Name of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.version	External version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: external_version
productPrice	Returns an empty array. Data type: Array
productRelationship	List of related products. Data type: Array of Objects `"productRelationship": [ { "productId": "String", "relationshipType": "String" } ]`
productRelationship.productId	Sys_id of the related product. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productRelationship.relationshipType	Type of relationship. Data type: String

productSpecification	Product specification for the product.
	
	Data type: Object
	
	`"productSpecification": {`
	`  "id": "String",`
	`  "internalId": "String",`
	`  "internalVersion": "String",`
	`  "version": "String"`
	`}`

productSpecification.id	Initial version or external ID of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: internal_version or external_id
productSpecification.internalId	Initial version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: initial_version
productSpecification.internalVersion	Version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: version
productSpecification.version	External version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: external_version

realizingResource	Resource that realizes the product. The realizing resource is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"type": "String"` `}`
realizingResource.id	Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. Valid value: child Data type: String

realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory.
	
	Data type: Object
	
	`"realizingService": {`
	`"id": "String",`
	`"type": "String"`
	`}`

realizingService.id	Sys_id of the realizing service. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingService.type	Type of the realizing service. Valid value: child Data type: String

relatedParty	List of parties associated with the ticket.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`{`
	`"id": "String",`
	`"@referredType": "String"`
	`}`
	`]`

relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedParty.type	Type of related party. Value is always `Related Party`. Data type: String
relatedParty.@referredType	Type of customer, such as a customer or customer contact. Data type: String
status	Current state of the product. Data type: String

Example: cURL request

This example retrieves a specified product inventory.

```
curl -X GET
 'https://instance.service-now.com/api/sn_prd_invt/product/037fd
87ec3603010abc8b5183c40ddf2' \
--user 'username':'password'
```

Output:

```
{
   "id": "037fd87ec3603010abc8b5183c40ddf2",
   "relatedParty": [
      {
         "id": "ffc68911c35420105252716b7d40dd55",

```

Product Inventory Open API - GET /sn_prd_invt/productinventory

Retrieves a list of all product inventories.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Inventory Open API - GET /sn_prd_invt/product.

URL format

Default URL: `api/sn_prd_invt/productinventory`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by customer.
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: All fields are returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String Default: Don't filter by inventory status.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Product Inventory Open API - GET /sn_prd_invt/productinventory/{inventoryId}

Retrieves a product inventory.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Inventory Open API - GET /sn_prd_invt/product/{id}.

URL format

Default URL: `/api/sn_prd_invt/productinventory/{inventoryId}`

Supported request parameters

Path parameters

Name	Description
inventoryId	Sys_id of the product inventory to retrieve. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
customer	Filter product inventories by customer. Only product offerings with a customer sys_id or external ID matching the value of this parameter are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.

place	Filter product inventories by location.
	
	Data type: Object
	
	`"place": {`
	`  "id": "String"`
	`}`

place.id	Sys_id or external id of the location associated with the product inventory record. Data type: String Table: Location [cmn_location] Field: sys_id or sn_tmt_core_external_id
status	Filter product inventories by status. Only product inventories with a status matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Invalid path parameter • Invalid URI
404	Record not found. Record associated with the ID is not found in the table.

Response body parameters (JSON)

Name	Description
id	Sys_id of the product inventory Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
name	Name of the product inventory. Data type: String

place	Place associated with the product.
	
	Data type: Object
	`"place": {`
	`  "id": "String",`
	`  "name": "String"`
	`}`

place.id	Location sys_id or external_id of the product inventory. Table: Location [cmn_location] Data: String
place.name	Name of the location associated with the product inventory.

Name	Description
	• single_line_text • yes_no Data type: String

productOffering	Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`  "id": "String",`
	`  "name": "String"`
	`}`

productOffering.id	Sys_id of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.name	Name of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]

productRelationship	List of related products.
	
	Data type: Array of Objects
	
	`"productRelationship": [`
	`  {`
	`  "productId": "String",`
	`  "relationshipType": "String"`
	`  }`
	`]`

productRelationship.productId	Sys_id of the related product. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
productRelationship.relationshipType	Type of relationship. Data type: String

productSpecification	Product specification for the product.
	
	Data type: Object
	
	`"productSpecification": {`
	`  "id": "String"`
	`}`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productSpecification.id	Sys_id of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification]

realizingResource	Realizing resource.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. Data type: String

realizingService	Realizing service.
	
	Data type: Object
	
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Sys_id of the realizing service. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingService.type	Type of the realizing service. Data type: String

relatedParty	List of parties associated with the ticket.
	
	Data type: Array of Objects
	
	`"relatedParty": [`
	`  {`
	`  "id": "String",`
	`  "@referredType": "String"`
	`  }`
	`]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
relatedParty.id	Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]
relatedParty.@referredType	Type of related party. Value is always `Related Party`. Data type: String
relatedParty.type	Type of customer. Possible values: • consumer • customer • customerContact Data type: String
status	Current state of the product. Data type: String

Example: cURL request

This example retrieves a product inventory for an SD-WAN service package.

```
curl --location --request GET 'https://
 instance.servicenow.com/api/sn_prd_invt/productinventory/074450
fc74918d10f877ca57242ff9e3' \
--user 'username':'password'
```

Output:

```
{
   "id": "074450fc74918d10f877ca57242ff9e3",
   "relatedParty": [
      {
         "id": "ffc68911c35420105252716b7d40dd55",
         "name": "Funco Intl",
         "@type": "RelatedParty",
         "@referredType": "Customer"
      },
      {
         "id": "eaf68911c35420105252716b7d40ddde",
         "name": "Sally Thomas",
         "@type": "RelatedParty",
         "@referredType": "CustomerContact"
      }
   ],
   "name": "SD-WAN Service Package PI0001576",
   "productSpecification": {
```

Request body parameters (JSON) (continued)

Name	Description
	Data type: String

productOffering	Required. Product offering that the product inventory is associated with.
	
	Data type: Object
	
	`"productOffering": {`
	`  "id": "String",`
	`  "internalVersion": "String",`
	`  "name": "String",`
	`  "version": "String"`
	`}`

productOffering.id	Required. Initial_version or external_id of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.internalVersion	Version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: version
productOffering.name	Name of the product offering. Data type: String Default: Blank string Table: Product Offering [sn_prd_pm_product_offering]
productOffering.version	External version of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering] Field: external_version

productRelationship	List of related products.
	
	Data type: Array of Objects
	
	`"productRelationship": [`
	`  {`
	`  "productId": "String",`
	`  "relationshipType": "String"`
	`  }`
	`]`

Request body parameters (JSON) (continued)

Name	Description
productRelationship.productId	Required if using the *productRelationship* parameter. Sys_id of the related product. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
productRelationship.relationshipType	Type of relationship. The only valid value is `child`. Data type: String Default: Blank string

productSpecification	Required. Product specification for the product.
	
	Data type: Object
	
	`"productSpecification": {`
	`  "id": "String",`
	`  "internalVersion": "String",`
	`  "version": "String"`
	`}`

productSpecification.id	Required. Initial_version or external_id of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification]
productSpecification.internalVersion	Version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: version
productSpecification.version	External version of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification] Field: external_version
realizingResource	Resource that realizes the product. The realizing resource is a child product inventory of this product inventory.

Request body parameters (JSON) (continued)

Name	Description

	Data type: Object
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Required if using the *`realizingResource`* parameter. Sys_id of the realizing resource. Data type: String
realizingResource.type	Type of the realizing resource. Valid value: child Data type: String

realizingService	Service that realizes the product. The realizing service is a child product inventory of this product inventory.
	
	Data type: Object
	`"realizingService": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingService.id	Required if using the *`realizingService`* parameter. Sys_id of the realizing service. Data type: String
realizingService.type	Type of the realizing service. Valid value: child Data type: String

relatedParty	List of parties associated with the ticket.
	
	Data type: Array of Objects
	`"relatedParty": [`
	`  {`
	`  "id": "String",`
	`  "@referredType": "String"`
	`  }`
	`]`

relatedParty.@referredType	Type of customer. Possible values:

Request body parameters (JSON) (continued)

Name	Description
	• consumer • customer • customer_contact Data type: String Default: Blank string
relatedParty.id	Required if using the *relatedParty* parameter. Sys_id of the account or customer contact associated with the ticket. Data type: String Table: Account [customer_account], Contact [customer_contact], or Consumer [csm_consumer]
state	Current state of the product. Possible values: • active • change_pending • inactivation_pending • inactive • installation_pending Data type: String Default: installation_pending

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Request successfully processed.
400	Bad Request. Could be any of the following reasons: • Empty payload. • Invalid payload. Mandatory field missing: <field name>

Response body parameters (JSON)

Name	Description
bundle	Flag that indicates whether the product inventory record is part of a bundled product. Valid values: • true: Is part of a bundle. • false: Isn't part of a bundle. Data type: Boolean
href	Relative link to the product inventory record. Data type: String
id	Sys_id of the product inventory. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
isBundle	Flag that indicates whether the product inventory record is part of a bundled product. Valid values: • true: Is part of a bundle. • false: Isn't part of a bundle.

	`}`

productOffering.id	Required. Sys_id of the product offering. Data type: String Table: Product Offering [sn_prd_pm_product_offering]
productOffering.name	Name of the product offering. Data type: String Default: Blank string Table: Product Offering [sn_prd_pm_product_offering]

productRelationship	List of related products.
	
	Data type: Array of Objects
	
	`"productRelationship": [`
	`  {`
	`  "productId": "String",`
	`  "relationshipType": "String"`
	`  }`
	`]`

productRelationship.productId	Required if using the *productRelationship* parameter. Sys_id of the related product.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
productRelationship.relationshipType	Type of relationship. The only valid value is `child`. Data type: String Default: Blank string

productSpecification	Required. Product specification for the product.
	
	Data type: Object
	
	`"productSpecification": {`
	`  "id": "String"`
	`}`

productSpecification.id	Required. Sys_id of the product specification. Data type: String Table: Product Specification [sn_prd_pm_product_specification]

realizingResource	Realizing resource.
	
	Data type: Object
	
	`"realizingResource": {`
	`  "id": "String",`
	`  "type": "String"`
	`}`

realizingResource.id	Required if using the *`realizingResource`* parameter. Sys_id of the realizing resource. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
realizingResource.type	Type of the realizing resource. The only valid value is `child`. Data type: String Default: Blank string
realizingService	Realizing service. Data type: Object

Response body parameters (JSON)

Name	Description
id	Sys_id of the product inventory. Data type: String Table: Product Inventory [sn_prd_invt_product_inventory]
isBundle	Flag that indicates whether the product inventory record is part of a bundled product. Valid values: • true: Is part of a bundle. • false: Isn't part of a bundle. Data type: Boolean
name	Name of the product inventory. Data type: String
pid	Unique identifier for the product inventory from the external system. Data type: String
productCharacteristic	List of product characteristics. Data type: Array of Objects `"productCharacteristic": [ { "name": "String", "value": "String" } ]`
productCharacteristic.name	Name of the characteristic. Data type: String
productCharacteristic.value	Value of the characteristic. Data type: String
productOffering	Product offering that the product inventory is associated with. Data type: Object `"productOffering": { "id": "String", "name": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.

Product Order Open API

The *Product Order Open* API provides endpoints that enable a standardized mechanism for placing product orders.

A product order is created based on a product offering that is defined and published in a product catalog. The product offering identifies the product or set of products that are available to a customer and includes the relevant product characteristics that capture the unique options of a product, and other relevant attributes such as pricing, contract terms, and availability.

To access this API, the Order Management for Telecommunications (sn_ind_tmt_orm) plugin must be activated. For more information, see Install Order Management. For information about Order Management tables and roles, see Components installed with Order Management.

This API is provided within the `sn_ind_tmt_orm` namespace.

The calling user must have the sn_ind_tmt_orm.order_integrator role.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Product Order Open API Developer Guide.

The *Product Order Open* API is a ServiceNow® implementation of the TM Forum Product Ordering Management API Specification. This implementation is based on the TMF622 Product Ordering Management API User Guide v5.0.0, September 2024. The *Product Order Open* API is conformance certified by TM Forum.

Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder

Retrieves all product orders.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]
- Order Line Related Items [sn_ind_tmt_orm_order_line_related_items]

URL format

Default URL: `/api/sn_ind_tmt_orm/order/productOrder`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String Default: Don't order by state.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Name	Description

	`"price": {Object},`
	`"priceType": "String"`
	
	`"recurringChargePeriod": "String"`
	`}`
	`]`

productOrderItem.itemPrice.price	Description of the price of the associat product.
	
	Data type: Object
	
	`"price": {`
	`"taxIncludedAmount": {Object}`
	`}`

productOrderItem.itemPrice.price.taxIncludedAmount	Description of the price of the associat product, including the tax.
	
	Data type: Object
	
	`"taxIncludedAmount": {`
	`"unit": "String",`
	`"value": Number`
	`}`

productOrderItem.itemPrice.price.taxIncludedAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludedAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String
productOrderItem.ponr	Flag that indicates whether the point o return for the order has been reached. Possible values: • true: The point of no return for the or has been reached. • false: The point of no return for the o hasn't been reached.

Name	Description
	Data type: Boolean

productOrderItem.product	Description of the instance details of th product purchased by the customer.
	
	Data type: Object
	
	`"product:" {`
	`"place": {Object},`
	`"productCharacteristic"`
	`[Array],`
	`"productRelationship":`
	`[Array],`
	`"productSpecification":`
	`{Object},`
	`"relatedParty": {Object`
	`"@type": "String"`
	`}`

productOrderItem.product.place	Maps of the locations on which to insta the product.
	
	Data type: Object
	
	`"place": {`
	`"id": "String",`
	`"@type": "String"`
	`}`

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. When employing the change action on a product order item (via the *`productOrderItem.action`* parameter), updating the request with a new place sys_id creates a move order where the order is not changed but is fulfilled in a new location. Data type: String
productOrderItem.product.place.@type	Part of TMF Open API standard. Annotation for order line item contact. T value is always `Place`. This informatio not stored. Data type: String
productOrderItem.product.productCharacteristic	List of characteristics of the associated product. Only product characteristics whose *`value`* are different than the *`previousValue`* are returned. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	`"productCharacteristic": { "name": "String", "previousValue": "String", "value": "String", "valueType": "String" }]`
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in Characteristic [sn_prd_pm_characteris table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *`productOrderItem.action`* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associate with the product. For additional information on characteristic option values, see Create product characteris and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.valueType	Type of characteristic value. Possible values: • Array.Date • Array.Datetime • Array.Decimal • Array.Integer • Array.Object • Array.Single Line Test • Checkbox • Choice • Date,Address • Email • Integer,Date/time

Name	Description
	`}` `]`
productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_con table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. T value is always `RelatedParty`. This information is not stored. Data type: String

productOrderItem.productOffering	Description of the product offering associated with the product.
	
	Data type: Object
	
	`"productOffering:" {`
	`"id": "String",`
	`"internalId": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version

Example: cURL request

This example retrieves all product orders.

```
curl --location --request GET
 'https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder' \
--user 'username':'password'
```

Response body.

```

Product Order Open API - GET /sn_ind_tmt_orm/productorder

Retrieves all product orders.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - GET /sn_ind_tmt_orm/order/productOrder.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Data type: String Default: All fields returned.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Data type: Number Default: 20 Maximum: 100
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0
state	Filter orders by state. Only orders with a state matching the value of this parameter are returned in the response. Data type: String Default: All states returned.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
	Range of content returned in a paginated call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
Content-Range	For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description

channel	List of channels to use for selling the products.
	
	Data type: Array of Objects
	
	`"channel": [`
	`  {`
	`  "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"name": "String"`
	`}`
	`]`

channel.id	Unique identifier of the channel to use to sell the associated products. Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
expectedCompletionDate	Date on which the order will be completed. Data type: String

note	List of additional notes made by the customer when ordering.
	
	Data type: Array of Objects
	
	`"note": {`
	`"author": "String",`
	`"date": "String",`
	`"text": "String"`
	`}`

note.author	User name of the person that authored the associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Additional notes/comments made by the customer while ordering. Data type: String
ponr	Flag that indicates whether the point of no return for the order has been reached. Possible values: • true: The point of no return for the order has been reached. • false: The point of no return for the order hasn't been reached. Data type: Boolean

Name	Description
productOrderItem	List that describes items associated with the product order and their associated action. Data type: Array of Objects `"productOrderItem:" [ { "action": "String", "actionReason": "String", "id": "String", "itemPrice": [Array], "product": {Object}, "productOffering": {Object}, "productOrderItemReleationship": [Array], "quantity": Number, "state": "String", "@type": "String" } ]`
productOrderItem.action	Action to carry out on the product. Possible actions are defined on the Choice List tab in the Action Dictionary Entry of the sn_ind_tmt_orm_order_line_item table. Data type: String
productOrderItem.actionReason	Reason for adding the order line item. Data type: String Stored in: The action_reason field of the sn_ind_tmt_orm_order_line_item table.
productOrderItem.id	Unique identifier of the line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.itemPrice	List that describes the price associated with the product. Data type: Array of Objects `"itemPrice": [ { "price": {Object}, "priceType": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	``
	"recurringChargePeriod": "String"
	}
	]
	``

productOrderItem.itemPrice.price	Description of the price of the associated product.
	
	Data type: Object
	
	``
	"price": {
	"taxIncludedAmount": {Object}
	}
	``

productOrderItem.itemPrice.price.taxIncludedAmount	Description of the price of the associated product, including the tax.
	
	Data type: Object
	
	``
	"taxIncludedAmount": {
	"unit": "String",
	"value": Number
	}
	``

productOrderItem.itemPrice.price.taxIncludedAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludedAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String
productOrderItem.ponr	Flag that indicates whether the point of no return for the order has been reached. Possible values: • true: The point of no return for the order has been reached. • false: The point of no return for the order hasn't been reached. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

productOrderItem.product	Description of the instance details of the product purchased by the customer.
	
	Data type: Object
	
	`"product:" {`
	`"place": {Object},`
	`"productCharacteristic": [Array],`
	`"productSpecification": {Object},`
	`"relatedParty": {Object},`
	`"@type": "String"`
	`}`

productOrderItem.product.place	Maps of the locations on which to install the product.
	
	Data type: Object
	
	`"place": {`
	`"id": "String",`
	`"@type": "String"`
	`}`

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. When employing the change action on a product order item (via the *`productOrderItem.action`* parameter), updating the request with a new place sys_id creates a move order, where the order is not changed but is fulfilled in a new location. Data type: String
productOrderItem.product.place.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `Place`. This information is not stored. Data type: String

productOrderItem.product.productCharacteristic	List of characteristics of the associated product.
	
	Only product characteristics whose *`value`* are different than the *`previousValue`* are returned.
	
	Data type: Array of Objects
	
	`"productCharacteristic": [`
	`{`
	`"name": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"previousValue": "String", "value": "String", "valueType": "String" }]
productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *productOrderItem.action* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.valueType	Type of characteristic value. Possible values: • Array.Date • Array.Datetime • Array.Decimal • Array.Integer • Array.Object • Array.Single Line Test • Checkbox • Choice • Date,Address • Email • Integer,Date/time • Object

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Single Line Text • Yes/No Data type: String
productOrderItem.product.productSpecification	Description of the product specification associated with the product. Data type: Object `"productSpecification:" { "id": "String", "name": "String", "@type": "String" }`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String
productOrderItem.product.relatedParty	List of contacts for line items. Data type: Array of Objects `"relatedParty:" { "email": "String", "firstName": "String", "id": "String", "lastName": "String", "phone": "String", "@referredType": "String", "@type": "String" }`
productOrderItem.product.relatedParty.email	Email address of the contact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact] table. Data type: String
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String

productOrderItem.productOffering	Description of the product offering associated with the product.
	
	Data type: Object
	
	`"productOffering": {`
	`"id": "String",`
	`"internalVersion": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.quantity	Number of product items purchased. Data type: Number
productOrderItem.productOrderItemRelationship	List of the relationships between order line items. Data type: Array of Objects `"productOrderItemRelationship": [ { "id": "String", "relationshipType": "String" } ]`
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requires` is used for horizontal relationships (a line item requires another line item). Data type: String
productOrderItem.state	State of the order of the associated product item. Data type: String
productOrderItem.version	Order version.

Name	Description
	Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Must list at least one item which contains customer account or consumer account information. Data type: Array of Objects `"relatedParty:" [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in the Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
relatedParty.@type	Part of TMF Open API standard. Annotation for the product. This value is always `RelatedParty`. This information is not stored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
requestedCompletionDate	Delivery date requested by the customer. Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order. Data type: String
version	Order version. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String

Example: cURL request

This example retrieves all product orders.

```
curl --location --request GET
 'https://instance.servicenow.com/api/sn_ind_tmt_orm/productord
er' \
--user 'username':'password'
```

Response body.

Product Order Open API - GET /sn_ind_tmt_orm/productorder/{id}

Retrieves the specified product order.

Important: Starting with the Tokyo release, this endpoint is deprecated. The new version of this endpoint is Product Order Open API - GET /sn_ind_tmt_orm/productorder/{id}.

This endpoint retrieves order information from the following tables:

- Customer Order [sn_ind_tmt_orm_order]
- Order Characteristic [sn_ind_tmt_orm_order_characteristic_value]
- Order Line Item [sn_ind_tmt_orm_order_line_item]
- Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact]

URL format

Default URL: `/api/sn_ind_tmt_orm/productorder/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id or external_id of the customer order to retrieve. Data type: String Table: Customer Order [sn_ind_tmt_orm_order]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. Can be for any of the following reasons: • Missing query parameter • Invalid URI
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
channel	List of channels to use for selling the products. Data type: Array of Objects `"channel": [ { "id": "String", "name": "String" } ]`
channel.id	Unique identifier of the channel to use to sell the associated products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
channel.name	Name of the channel to use to sell the associated products. Data type: String
expectedCompletionDate	Date on which the order will be completed. Data type: String

note	List of additional notes made by the customer when ordering.
	
	Data type: Object
	
	`"note": {`
	`  "author": "String",`
	`  "date": "String",`
	`  "text": "String"`
	`}`

note.author	User name of the person that authored the associated note. Data type: String
note.date	Date that the note was created. Data type: String
note.text	Additional notes/comments made by the customer while ordering. Data type: String
ponr	Flag that indicates whether the point of no return for the order has been reached. Possible values: • true: The point of no return for the order has been reached. • false: The point of no return for the order hasn't been reached. Data type: Boolean

productOrderItem	List that describes items associated with the product order and their associated action.
	
	Data type: Array of Objects
	
	`"productOrderItem:" [`
	`  {`
	`  "action": "String",`

Name	Description
	"actionReason": "String", "id": "String", "itemPrice": [Array], "product": {Object}, "productOffering": {Object}, "productOrderItemReleationship": [Array], "quantity": Number, "state": "String", "@type": "String" }]
productOrderItem.action	Action to carry out on the product. Possible actions are defined on the Choice List tab in the Action Dictionary Entry of the sn_ind_tmt_orm_order_line_item table. Data type: String
productOrderItem.actionReason	Reason for adding the order line item. Data type: String Stored in: The action_reason field of the sn_ind_tmt_orm_order_line_item table.
productOrderItem.id	Unique identifier of the line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.itemPrice	List that describes the price associated with the product. Data type: Array of Objects "itemPrice": [{ "price": {Object}, "priceType": "String", "recurringChargePeriod": "String" }]
productOrderItem.itemPrice.price	Description of the price of the associated product. Data type: Object

Name	Description
	`"price": { "taxIncludedAmount": {Object} }`
productOrderItem.itemPrice.price.taxIncludedAmount	Description of the price of the associated product, including the tax. Data type: Object `"taxIncludedAmount": { "unit": "String", "value": Number }`
productOrderItem.itemPrice.price.taxIncludedAmount.unit	Currency code in which the price is depicted. Data type: String
productOrderItem.itemPrice.price.taxIncludedAmount.value	Price of product, including any tax. Data type: Number
productOrderItem.itemPrice.priceType	Type of item price, recurring or non-recurring. Data type: String
productOrderItem.itemPrice.recurringChargePeriod	If the price is recurring, the recurring period, such as `month`. Data type: String
productOrderItem.ponr	Flag that indicates whether the point of no return for the order has been reached. Possible values: • true: The point of no return for the order has been reached. • false: The point of no return for the order hasn't been reached. Data type: Boolean
productOrderItem.product	Description of the instance details of the product purchased by the customer. Data type: Object `"product:" { "place": {Object}, "productCharacteristic": [Array], "productSpecification": {Object},`

Name	Description

	`"relatedParty": {Object},`
	`"@type": "String"`
	`}`

productOrderItem.product.place	Maps of the locations on which to install the product.
	
	Data type: Object
	
	`"place": {`
	`"id": "String",`
	`"@type": "String"`
	`}`

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. When employing the change action on a product order item (via the *`productOrderItem.action`* parameter), updating the request with a new place sys_id creates a move order, where the order is not changed but is fulfilled in a new location. Data type: String
productOrderItem.product.place.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `Place`. This information is not stored. Data type: String

productOrderItem.product.productCharacteristic	List of characteristics of the associated product.
	
	Only product characteristics whose *`value`* are different than the *`previousValue`* are returned.
	
	Data type: Array of Objects
	
	`"productCharacteristic": [`
	`{`
	`"name": "String",`
	`"previousValue":`
	`"String",`
	`"value": "String",`
	`"valueType": "String"`
	`}`
	`]`

productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in the Characteristic [sn_prd_pm_characteristic] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *productOrderItem.action* parameter is other than `add`. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.value	Characteristic option values associated with the product. For additional information on characteristic option values, see Create product characteristics and characteristic options. Data type: String
productOrderItem.product.productCharacteristic.valueType	Type of characteristic value. Possible values: • Array.Date • Array.Datetime • Array.Decimal • Array.Integer • Array.Object • Array.Single Line Test • Checkbox • Choice • Date,Address • Email • Integer,Date/time • Object • Single Line Text • Yes/No Data type: String

productOrderItem.product.productSpecification	Description of the product specification associated with the product.
	
	Data type: Object
	`"productSpecification:" {`
	`"id": "String",`
	`"name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"@type": "String"` `}`
productOrderItem.product.productSpecification.id	Initial_version or external_id of the product specification. The initial_version is the sys_id of the first version of the specification. Located in the sys_id or external_id field of the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.name	Name of the product specification. Located in the Product Specification [sn_prd_pm_product_specification] table. Data type: String
productOrderItem.product.productSpecification.@type	Part of the TMF Open API standard. This value is always `ProductSpecificationRef`. This information is not stored. Data type: String

productOrderItem.product.relatedParty	List of contacts for line items.
	
	Data type: Object
	
	`"relatedParty:" {`
	`"email": "String",`
	`"firstName": "String",`
	`"id": "String",`
	`"lastName": "String",`
	`"phone": "String",`
	`"@referredType": "String",`
	`"@type": "String"`
	`}`

productOrderItem.product.relatedParty.email	Email address of the contact. Data type: String
productOrderItem.product.relatedParty.firstName	First name of the contact. Data type: String
productOrderItem.product.relatedParty.id	Sys_id of the line item contact associated with the order line item. Located in the Order Line Item Contact [sn_ind_tmt_orm_order_line_item_contact] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
productOrderItem.product.relatedParty.lastName	Last name of the contact. Data type: String
productOrderItem.product.relatedParty.phone	Business phone number of the contact. Data type: String
productOrderItem.product.relatedParty.@referredType	Type of customer. Possible value: OrderLineItemContact Data type: String
productOrderItem.product.relatedParty.@type	Part of TMF Open API standard. Annotation for order line item contact. This value is always `RelatedParty`. This information is not stored. Data type: String
productOrderItem.productOffering	Description of the product offering associated with the product. Data type: Object `"productOffering": { "id": "String", "internalVersion": "String", "name": "String", "version": "String" }`
productOrderItem.productOffering.id	Initial_version or external_id of the product offering. The initial_version is the sys_id of the first version of the offering. Located in the sys_id or external_id field of the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.productOffering.name	Name of the product offering. Located in the Product Offering [sn_prd_pm_product_offering] table. Data type: String
productOrderItem.quantity	Number of product items purchased. Data type: Number
productOrderItem.productOrderItemRelationship	List of the relationships between order line items. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"productOrderItemRelationship": [ { "id": "String", "relationshipType": "String" } ]`
productOrderItem.productOrderItemRelationship.id	Unique identifier of the related line item. Located in the sn_ind_tmt_orm_external_id field of the Order Line Item [sn_ind_tmt_orm_order_line_item] table. Data type: String
productOrderItem.productOrderItemRelationship.relationshipType	Type of relationship between the two line items. This information is used to identify the relationship hierarchy. Possible values: • HasChild • HasParent • Requires `HasChild` and `HasParent` are used for parent/child relationships. `Requires` is used for horizontal relationships (a line item requires another line item). Data type: String
productOrderItem.state	State of the order of the associated product item. Data type: String
productOrderItem.version	Order version. Data type: String
productOrderItem.@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrderItem`. This information is not stored. Data type: String
relatedParty	List of contacts for the order. Each contact is an object in the array. Must list at least one item which contains customer account or consumer account information. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"relatedParty:" [ { "id": "String", "name": "String", "@referredType": "String", "@type": "String" } ]`
relatedParty.id	Sys_id or external_id of the account, customer contact, or consumer associated with the order. Located in the Account [customer_account], Contact [customer_contact] table, or Consumer [csm_consumer] table. Data type: String
relatedParty.name	Name of the account, customer, or consumer. Data type: String
relatedParty.@referredType	Type of customer. Possible values: • Consumer • Customer • CustomerContact Data type: String
relatedParty.@type	Part of TMF Open API standard. Annotation for the product. This value is always `RelatedParty`. This information is not stored. Data type: String
requestedCompletionDate	Delivery date requested by the customer. Data type: String
requestedStartDate	Order start date requested by the customer. Data type: String
state	Current state of the order. Data type: String
version	Order version.

Name	Description
	Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value is always `ProductOrder`. This information is not stored. Data type: String

Example: cURL request

The following code example requests an existing customer order.

```
curl -X GET
 "https://servicenow-instance/api/sn_ind_tmt_orm/productorder/8d
75939453126010a795ddeeff7b126a" \
-u "username":"password"
```

Response body.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. If there are any issues with the characteristics or characteristics option information, the endpoint stores the following comments in the work notes fields of the associated Customer Order Line Item record: • `The following Order Item characteristics does not exist: Review specification <characteristic.name> and correct the characteristic and characteristic option in the order line item prior to approving the order.` • `Order Item characteristic: <characteristic.name> with characteristic value: <characteristic.value>is invalid. Correct the characteristic values before approving the order.`
400	Bad Request. Could be any of the following reasons: • `Invalid payload: Request body missing` - Payload was not passed in the request body. • `Invalid payload: productOrderItem is missing` - Product order line item object or JSON is missing. • `Invalid payload: productOrderItem id is missing` - The *id* parameter is missing in the product order line item of the payload. • `Invalid payload: productOrderItem action is missing` - The *action* parameter is missing in the product order line item of the payload.

	`}`

productOrderItem.product.place.id	Sys_id of the associated location record in the Location [cmn_location] table. When employing the change action on a product order item (via the *productOrderItem.action* parameter), updating the request with a new place sys_id creates a move order where the order is not changed but is fulfilled in a new location. Data type: String

productOrderItem.product.productCharacteristic	List of characteristics of the associated product.
	
	Data type: Array of Objects
	
	`"productCharacteristic":`
	`{`
	`"name": "String",`
	`"previousValue":`
	`"String",`
	`"value": "String",`
	`"valueType": "String"`
	`}`
	`]`

productOrderItem.product.productCharacteristic.name	Name of the characteristic record to associate with the product. Located in Characteristic [sn_prd_pm_characteris table. Data type: String
productOrderItem.product.productCharacteristic.previousValue	Previous characteristic option values if the update is for a change order. The request is a change order if the *productOrderItem.action* parameter is other than `add`. For additional information on characteristic

Name	Description
state	Current state of the order. Data type: String
@type	Part of TMF Open API standard. Annotation for the product. This value i always `ProductOrder`. This informa is not stored. Data type: String

Example: cURL request

This example retrieves the given product order associated with the ID 8d75939453126010a795ddeeff7b126a.

```
curl -X GET
 "https://instance.service-now.com/api/sn_ind_tmt_orm/order/prod
uctOrder/8d75939453126010a795ddeeff7b126a" \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-d {
  "channel": [
    {
      "id": "1",
      "name": "Agent Assist"
    }
  ]
}
```

Response body.
