Guided Tours - applyListFilter(Function filter_func)

Sets a function to retrieve filtered tour results when the `getAllTours()` method is called.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
filter_func	Function	Filter function that takes a single `tour` object from the `tours[]` array returne `getAllTours()` method.

Returns

Type	Description
None	

The following example shows basic API usage.

```
//create a filter function
var filtFunction = function(tour) {
   //only return those tours whose name starts with 'my'
   return tour.name.indexOf('my') === 0);
}

//apply the filter
top.NOW.guided_tours.api.applyListFilter (filtFunction);

//call the getAllTours method to observe the filtered tours
top.NOW.guided_tours.api.getAllTours (function(er, tours) {
  if(!er) {
    console.log('The filtered tours are: ');
    console.log(tours);
  }
});
```

The following example shows how to use the `options` field on the tour object to add JSON with custom tour identifiers for reading and filtering tours inside the `filter_func()` function.

```
top.NOW.guided_tours.api.applyListFilter(function(tour) {
       var options = (tour.options)? JSON.parse(tour.options):
 null;
```

```
      return (options && options.my_param) ? (options.my_param
 == my_value) : false;
});
```

Guided Tours - endTour()

Stops a currently playing tour. This method silently exits if no tours are playing.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Null	

```
//create a callback function to end the tour if it starts
 correctly
var cbFunction = function(err) {
 if (err) {
   console.log('Error Occurred');
}
 else {
    // tour has started so we can call endTour
    top.NOW.guided_tours.api.endTour();
}
}

//calling the startTour method so that we can end the tour as
 soon as it starts
top.NOW.guided_tours.api.startTour('a297e04b732313007077edcc5ef6
a780', 2, cbFunction);
```

Guided Tours - events.off(String event_name, Function listener_function)

Removes an existing event listener.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
event_name	String	Event name to be removed from the listener. Valid event names: • tourStarted • tourEnded • tourCompleted • tourFailed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• tourAbandoned • tourDismissed • stepStarted
listener_function	Function	Optional. If provided, specified listener function is removed from remaining eve listeners attached with that event. If not provided, all listener functions attache that event are removed.

Returns

Type	Description
None	

```
//create a callback function to handle the result of the api
 call
var eventListenerTourStarted = function() {
   console.log('The tour has started');
}
var eventListenerTourEnded = function() {
   console.log('The tour has ended');
}

//attaching event listeners for tourStarted and tourEnded Events
top.NOW.guided_tours.events.on('tourStarted',eventListenerTourSt
arted);
top.NOW.guided_tours.events.on('tourEnded',
 eventListenerTourEnded);

…
//start a tour
top.NOW.guided_tours.api.startTour
 ('a297e04b732313007077edcc5ef6a780', 2, cbFunction);
//As soon as the tour starts the eventListenerTourStarted gets
 fired
…
top.NOW.guided_tours.api.endTour();
// eventListenerTourEnded gets fired

….

//removing the event listeners
 top.NOW.guided_tours.events.off('tourStarted',eventListenerTour
Started);
top.NOW.guided_tours.events.off('tourEnded',
 eventListenerTourEnded);
```

Guided Tours - events.on(String event_name, Function listener_function)

Attaches an event listener to a guided tour event.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
event_name	String	Event name to be attached to the listener. Valid event names: • stepStarted • tourStarted • tourEnded • tourCompleted • tourFailed • tourAbandoned • tourDismissed
listener_function	Function	Listener to be added. **Note:** Clear any event listener after it solves its purpose.

listener_function.obj	Object	Passed to `listener_function()` by each event in the following format:
		
		• For stepStarted events:
		`{tour: '<tour_sys_id>', step: step_num}`
		
		• For all other events:
		`{tour: '<tour_sys_id>'}`
		
		JSON parameters:
		• tour_sys_id: String. Guided tour ID from the Guided Tours [sys_embedded_tour_guide] table
		• step_num: Number. Value between 0 (first step) and n (final step)

The following example shows basic API usage.

```
//create a callback function to handle the result of the api
 call
var eventListenerTourStarted = function() {
   console.log('The tour has started');
}
var eventListenerTourEnded = function() {
   console.log('The tour has ended');
}

//attaching event listeners for tourStarted and tourEnded Events
top.NOW.guided_tours.events.on('tourStarted',eventListenerTourSt
arted);
top.NOW.guided_tours.events.on('tourEnded',
 eventListenerTourEnded);

...
//start a tour
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
top.NOW.guided_tours.api.startTour
 ('a297e04b732313007077edcc5ef6a780', 2, cbFunction);
//As soon as the tour starts the eventListenerTourStarted gets
 fired
…
top.NOW.guided_tours.api.endTour();
// eventListenerTourEnded gets fired

….

//removing the event listeners
 top.NOW.guided_tours.events.off('tourStarted',eventListenerTour
Started);
top.NOW.guided_tours.events.off('tourEnded',
 eventListenerTourEnded);
```

The following example shows how to use the `listener_function` parameter with `obj` as an argument.

```
top.NOW.guided_tours.events.on("tourStarted", function
 (obj){console.log(obj);});
```

Guided Tours - getAllTours(Function cb_function)

Gets a list of tours on the current page from which this method is called. Because this method is asynchronous, a callback function must be passed to determine operation success and get a list of tours.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
cb_function	Function	Callback function called by `getAllTours()` after attempt to fetch all tours fo current page from which `getAllTours()` method is called.
cb_function.err	Object	Points to the error object if any occurred during the operation: `err = { success: false, message: 'string containing th error object' }` Null otherwise.
cb_function.tours	Array	List of available tours for the page. If no tours are present on the page, `cb_function.tours` returns undefined `if(!tours) console.log('No tour present')`

Returns

Type	Description
None	

```
//create a callback function to handle the result of the API
 call
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var cbFunction = function(err, tours) {
 if (err) {
   console.log('Error Occurred');
}
 else {
     if(!tours) console.log('No tour present')
   else {
      tours.forEach(function(t) {
               console.log(t);
             });
          }
}
}
//calling the getTours method
top.NOW.guided_tours.api.getAllTours(cbFunction);
```

Guided Tours - loadPlayer()

Loads the guided tours player on a page in which guided tours player is not present by default.

Complete signature:

```
NOW.guided_tours.api.loadPlayer()
```

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

Guided Tours - startTour(String tour_id, Number step_number, Function cb_function)

Starts a tour. Because this method is asynchronous, you must pass a callback function to determine operation success.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

Parameters

Name	Type	Description
tour_id	String	Sys ID of the tour from the Guided Tours [sys_embedded_tour_guide] table.
step_number	Number	Optional. Step at which to start the tour. If not provided (or step number is 0), to starts from the beginning.
cb_function	Function	Optional. Callback function called by `startTour()` method after attempt to the tour.
cb_function.err	Object	Points to the error object if any occurred during the operation: `err = { success: false, message: 'string containing t error object' }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Null otherwise.

Returns

Type	Description
None	

```
//create a callback function to handle the result of the API
 call
var cbFunction = function(err) {
 if (err) {
   console.log('Error Occurred');
}
 else {
   console.log('The tour with tourid=%s was successfully
 launched', tourId);
}
}

//calling the startTour method
top.NOW.guided_tours.api.startTour('a297e04b732313007077edcc5ef6
a780', 2, cbFunction);
```

i18N - Client

The *i18N* API provides methods to get and format translated messages.

The *i18N* methods are accessed using the `g_i18n` global object.

i18N - format(String message, Object map)

Formats a string containing named tokens with values from a map.

Parameters

Name	Type	Description
message	String	The message to have the tokens added.
map	Object	The map of name/value pairs to replace in the message.

Returns

Type	Description
String	The formatted string

```
// Returns: "The rich young ruler was very very rich"
nowapi.g_i18n.format("The {p1} {p2} {p3} was very very
 {p1}",{p1: "rich", p2: "young", p3: "ruler"});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i18N - getMessage(String msgKey, Function callback)

Retrieves a translated message.

If the specified string exists in the database for the current language, then the translated message is returned. If the specified string does not exist for the current language, then the English version of the string is returned. If the string does not exist at all in the database, then the ID itself is returned.

Parameters

Name	Type	Description
msgKey	String	The message to be retrieved.
callback	Function	The function to be called when the message has been retrieved. The callback function has one argument, a string that is the translated message.

Returns

Type	Description
void	

i18N - getMessages(Array msgKeys, Function callback)

Retrieves a set of messages.

If the specified string exists in the database for the current language, then the translated message is returned. If the specified string does not exist for the current language, then the English version of the string is returned. If the string does not exist at all in the database, then the ID itself is returned.

Parameters

Name	Type	Description
msgKeys	Array	An array of keys specifying the messages to be retrieved.
callback	Function	The function to be called when the messages have been retrieved. The callback function has one argument, an object containing key-value pairs, where key is the requested message key, and the value is the translated string.

Returns

Type	Description
void	

openFrameAPI - Client

The `openFrameAPI` provides methods that interact with OpenFrame. OpenFrame is an omni-present frame that communication partners can use to integrate their systems into the ServiceNow platform.

One of the core requirements is the ability to connect and serve code from different domains that can connect seamlessly with partner subsystems. This cross domain connection is required

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to keep connections and callbacks registered into communication systems without any cross domain issues.

OpenFrame has two significant parts. One lives in the ServiceNow application (referred to as TopFrame) and this API that is sourced from the partner application. This API has the necessary methods to communicate with TopFrame and control the visual features of the OpenFrame.

Note: To stay current with reference to the OpenFrame library, use the following resource URI: `https://[servicenow instance]/scripts/openframe/latest/openFrameAPI.min.js`.

openFrameAPI - getAWAAgentPresence(String success, String failure)

Returns the logged in agent's current presence state.

Parameters

Name	Type	Description
success	String	If the method is successful, name of the callback function to invoke.
failure	String	If the method fails, name of the callback function to invoke.

Returns

Type	Description

presence	Results passed to the success callback function by the openFrame infrastructure.
	
	Data type: Object
	
	`"presence": {`
	`  "available": Boolean,`
	`  "channels": [Array],`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

presence.available	Flag that indicates whether the associated agent is available. Valid values: • true: Agent is available. • false: Agent isn't available. Data type: Boolean

presence.channels	List of available channels of communication with the agent.
	
	Data type: Array of Objects
	
	`"channels": [`
	`  {`
	`  "available": Boolean,`
	`  "name": "String",`
	`  "restrict_update": Boolean,`
	`  "service_channel_type": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	`"sys_id": "String"`
	`}`
	`]`

presence.channels.available	Flag that indicates whether the channel is available. Valid values: • true: Channel is available. • false: Channel isn't available. Data type Boolean
presence.channels.name	Name of the channel, such as Chat or Phone. Data type: String
presence.channels.restrict_update	Flag that indicates whether the user can restrict updates to the channel. Valid values: • true: User can restrict updates to the channel. • false: User can't restrict updates to the channel. Data type Boolean
presence.channels.service_channel_type	Type of the service channel. Data type: String
presence.channels.sys_id	Sys_id of the channel record. Data type: String Table: Service Channels [awa_service_channel]
presence.name	Name of the agent's presence state. Data type: String
presence.sys_id	Sys_id of the presence state record. Data type: String Table: Presence States [awa_presence_state]

The following code example shows how to call this method.

```
function failure(data)
{
  console.log("failure: " + JSON.stringify(data));
}

function success(data)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  console.log("success: " + JSON.stringify(data));
}

openFrameAPI.getAWAAgentPresence(success, failure)
```

Response to success callback function:

```
success: {
  "presence": {
    "name": "Available",
    "sys_id": "0b10223c57a313005baaa65ef94f970",
    "available": true,
    "channels": [
      {
        "name": "Chat",
        "available": true,
        "sys_id": "27f675e3739713004a905ee515f6a7c3",
        "restrict_update": false,
        "service_channel_type": "chat"
      }
    ]
  }
}
```

openFrameAPI - hide()

Hides the OpenFrame in the TopFrame.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
openFrameAPI.hide()
```

openFrameAPI - init(Object config, function successCallback, function failureCallback)

Initializes OpenFrame. This must be the first method that you call.

This method initializes communication to TopFrame and initializes any visual elements passed in the *config* parameter.

Parameters

Name	Type	Description
config	Object	Name-value pairs to use during the initialization process. Possible keys:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• height • subTitle • title • titleIcon • width All keys are optional. Pass an empty object if you don't want to set these key-value pairs.
successCallback	function	Name of the callback function to use if the `init` method succeeds. The OpenFrame configuration stored in the system is passed as a parameter to the callback function.
failureCallback	function	Name of the callback function to use if the `init` method fails.

Returns

Type	Description
void	

```
var config = {
height: 300,
width: 200
}
function handleCommunicationEvent(context) {
console.log("Communication from Topframe", context);
}
function initSuccess(snConfig) {
console.log("openframe configuration", snConfig);
//register for communication event from TopFrame
openFrameAPI.subscribe(openFrameAPI.EVENTS.COMMUNICATION_EVENT,
handleCommunicationEvent);
}
function initFailure(error) {
console.log("OpenFrame init failed...", error);
}
openFrameAPI.init(config, initSuccess, initFailure);
```

openFrameAPI - isVisible(function callback)

Checks to see if the OpenFrame is visible in the TopFrame.

Parameters

Name	Type	Description
callback	function	The callback function receives a parameter with a value of true or false. True if OpenFrame is visible and false if not visible.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
function callback(isVisible) {
console.log(isVisible)
}
openFrameAPI.isVisible(callback)
```

openFrameAPI - openCustomURL(String details)

Opens a custom URL in the UI16 interface.

Parameters

Name	Type	Description
Url	String	Text of the custom URL. Maximum size: 2083 characters

Returns

Type	Description
void	

```
openFrameAPI.openCustomURL('10_cool_things.do');
```

openFrameAPI - openServiceNowForm(Object details)

Opens a form URL.

When an agent receives an incoming call, the OpenFrame window displays information such as the account, contact, or consumer. Clicking a link in the OpenFrame window displays the corresponding record.

- In the platform interface, this API opens a form URL in TopFrame.
- For Agent Workspace, this API supports interaction tab management. In Agent Workspace, an interaction record opens in a parent tab and the specified entity record opens in a child tab under the interaction tab.

Parameters

Name	Type	Description

details	Object	Key-value pairs that identify the form URL to open.
		`"details": {`
		`  "entity": "String";`
		`  "interaction_sys_id": "String";`
		`  "query": "String"`
		`}`

details.entity	String	Table or entity name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
details.interaction_sys_id	String	Optional. Sys_id of the interaction record to open as parent tab in Agent Workspace. **Note:** In the platform interface the *interaction_sys_id* is ignored.
details.query	String	Query to identify the record to open, such as: `query:'sys_id=<record_sys_id>'`.

Returns

Type	Description
void	

The following example shows basic usage in platform:

```
openFrameAPI.openServiceNowForm({entity:'customer_account',
query:'sys_id=447832786f0331003b3c498f5d3ee452',
 'interaction_sys_id':'3be092313b711300758ce9b534efc4dd'});
```

The following example shows how to use the *query* parameter to create a new record with data provided in the form by using sysparm_query and an encoded query to populate the first and last name fields in Workspace:

```
openFrameAPI.openServiceNowForm({ entity: 'sys_user',
query:
 'sys_id=-1&sysparm_query=first_name=Ivan^last_name=Greggor' });
```

openFrameAPI - openServiceNowFormwithChildTab()

Opens a ServiceNow form with a child tab if invoked in a workspace or opens an entity if invoked in the UI16 interface.

Parameters

Name	Type	Description
openServiceNowFormwithChildTab	Object	Defines if the API opens a ServiceNow form with a child tab if invoked in a workspace or opens an entity if invoked in the UI16 interface. `openFrameAPI.openServiceNowFormwithChildTab({ entity: "String", sys_id: String", parent_entity: "String", parent_entity_sys_id: "String" })`
openServiceNowFormwithChildTab.entity	String	Name of the table that contains the record to open.
openServiceNowFormwithChildTab.sys_id	String	Sys_id of the record to open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
openServiceNowFormwithChildTab.parent_entity	String	Name of the table to open as a parent tab.
openServiceNowFormwithChildTab.parent_entity_sys_id	String	Sys_id of the parent record to open.

Returns

Type	Description
None	

The following example opens the parent entity as a parent tab on a configured workspace, or opens just the entity if invoked in UI16.

```
openFrameAPI.openServiceNowFormwithChildTab({
  entity: "customer_account",
  sys_id: "447832786f0331003b3c498f5d3ee452",
  parent_entity: "interaction",
  parent_entity_sys_id: "3be092313b711300758ce9b534efc4dd"
});
```

openFrameAPI - openServiceNowList(Object details)

Opens a list URL in the UI16 interface.

Parameters

Name	Type	Description
details	Object	Key value pairs that describe the content to use when opening the list URL. Valid values: • entity: Table name • query: Encoded query string

Returns

Type	Description
void	

```
openFrameAPI.openServiceNowList({entity:'case',
 query:'active=true'});
```

openFrameAPI - setFrameMode(mode)

Sets the OpenFrame mode.

The mode passed in this API:

- Sets the appropriate icon in the header: collapse or expand
- Raises the relevant event for CTI:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- openFrameAPI.EVENTS.COLLAPSE
- openFrameAPI.EVENTS.EXPAND

Parameters

Name	Type	Description
Mode	String	Set OpenFrame Mode. Enumerated options: **1.** openFrameAPI.FRAME_MODE.COLLAPSE **2.** openFrameAPI.FRAME_MODE.EXPAND

Returns

Type	Description
void	

```
openFrameAPI.setFrameMode(openFrameAPI.FRAME_MODE.COLLAPSE);
```

openFrameAPI - setHeight(height)

Sets the OpenFrame height.

Parameters

Name	Type	Description
Height	Number	Height in pixels

Returns

Type	Description
void	

```
openFrameAPI.setHeight(100);
```

openFrameAPI - setICContext(String Type, Object <Context>)

Sets the context data related to the interaction controls on the client. Use this context data to determine the client UI to display in OpenFrame.

For additional information on interactive controls, see Interaction Controls Component (ICC) for voice calls.

For additional information on interaction records, see CSM voice interaction record page.

Parameters

Name	Type	Description
<Context>	Object	Context data to set. Each context data ty data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid *Context* data objects: • `activeCall` • `activeConversation` • `idleState` • `offerContext` • `searchTargetList`

activeCall	Array of Objects	Context details about an active call. Each ongoing active call.
		`"activeCall": [`
		`  {`
		`  "callbackContext": {Obj`
		`  "currentParticipant":`
		`  "customPayload: {Objec`
		`  "direction": "String",`
		`  "externalId": "String"`
		`  "nowRecordId": "String`
		`  "nowRecordTable": "Str`
		`  "participants": [Array`
		`  "type": "String"`
		`  }`
		`]`

activeCall.callbackContext	Object	Only used if the *activeCall.type* p
		Callback context information for the ong
		`"callbackContext": {`
		`  "callAttemptedByAgent":`
		`  "callbackNumbers": [Array`
		`  "closeInEndTime": "Strin`
		`  "customerName": "String"`
		`  "dialInEndTime": "String`
		`}`

activeCall.callbackContext.callAttemptedByAgent	Boolean	Flag that indicates whether callback was service agent. Valid values: • true: The callback was attempted by a true, set *closeInEndTime*. • false: The callback wasn't attempted b If false, set *dialInEndTime*. Default: False
activeCall.callbackContext.callbackNumbers	Array	List of phone numbers provided as string
activeCall.callbackContext.closeInEndTime	String	Applies only when `callAttemptedBy` callback in UTC format.

Parameters (continued)

Name	Type	Description
activeCall.callbackContext.customerName	String	Name of the customer.
activeCall.callbackContext.dialInEndTime	String	Only applies when `callAttemptedBy` type of callback is auto-dial. Dial-in end t format.

activeCall.currentParticipant	Object	Required. Details about the current parti call status.
		`"currentParticipant": {`
		`"actor": "String",`
		`"callStartTime": "String`
		`"capabilities": {Object}`
		`"connectedTime": "String`
		`"custom-capability-state`
		`"flagged": Boolean,`
		`"held": Boolean,`
		`"id": "String",`
		`"muted": Boolean,`
		`"name": "String",`
		`"paused": Boolean,`
		`"recording": "String",`
		`"state": "String",`
		`"supervisor": "Object",`
		`"wrapUP": {Object}`
		`}`

activeCall.currentParticipant.actor	String	Type of participant on the call. Valid values: • agent **Note:** Other participant types to be
activeCall.currentParticipant.callStartTime	String	Date and time that the call started. Time standard: UTC Format: RSS - "<day of week>, dd mmm y example: "Wed, 17 Dec 2024 05:23:41 GI
activeCall.currentParticipant.capabilities	Object	Details about the capabilities that the cu perform during a call. The associated ico component for the capabilities that are e

Parameters (continued)

Name	Type	Description
		• offerContext: Sets the current participa resiliency. When you pass this context the `offerContext{}` JSON as the • searchTargetList: Sets the telephone d type is set, it enables **Transfer call** on When you pass this context type, you `searchTargetList[]` JSON as th

Returns

Type	Description
None	
Error (offerContext)	Error messages associated with the *`offerContext`* object used for resiliency. To view these messages, use the subscribe() method to subscribe to *`openframe_awa_client_offer`* event. Context values are represented as follows: **1.** success **2.** error **3.** partialSuccess **AWA_EXTUSER_ROLE_CHECK_FAILED** Message: User does not have the awa_external_user role. This event indicates that the required role 'awa_external_user' or 'admin' is not present for the agent. **AWA_AGENT_NOT_AVAILABLE** Message: Agent is not available to receive work. This event indicates that the agent selected is unavailable. **AWA_OFFER_ASSIGNMENT_PAYLOAD_MISSING** Message: Assignment payload is empty or undefined in the offerContext. This event indicates that the payload is empty or undefined in the *`offerContext`* object. **AWA_OFFER_QUEUEID_MISSING** Message: Transfer Source queue ID is missing in the offerContext. This event indicates that the required transfer queue ID (*`transferContent.targetId`*) is missing from the *`offerContext`* object. **AWA_ASSIGNMENT_OFFEREDON_FUTURE**

Returns (continued)

Type	Description
	Message: OfferedOn time is in future. This event indicates that the value of the *assignment.offeredOn* property is a future date and invalid. The date must be present or earlier. **AWA_ASSIGNMENT_OFFEREDON_INVALID_FORMAT** Message: OfferedOn date format is invalid, Please send it in "Www, dd Mmm yyyy HH:mm:ss GMT" UTC format. This event indicates that the value provided for the *offerContext.assignment.offeredOn* property is not in the proper time date format. **AWA_OFFER_EXTERNALID_MISSING** Message: ExternalId is missing in the offerContext. This event indicates that the required externalId property has not been provided for the offer. This value identifies the current active call on the associated external system.

The following code example shows how to set the active state context.

```
openFrameAPI.setICContext("activeCall", {
  "activeCall": [
    {
      "nowRecordTable": "interaction",
      "nowRecordId": "12345675678903456",

Example: Agent Selects a Support Queue using the agentSettings property

The `setICContext("agentSettings")` method configures queue selection options for contact center agents in OpenFrame. The first example initializes the agent's environment by setting a default queue ("Account Support") and populating a dropdown menu with all available queue options.

As the agent's assignment changes or they manually switch queues, the second example demonstrates how to update `currentSelectedQueue` to reflect the new selection, keeping the system synchronized with the agent's active queue. This allows the OpenFrame interface to display the correct queue context and route interactions to the appropriate team.

```
// Initialize agentSettings context with available queues
openFrameAPI.setICContext("agentSettings", {
  "outboundQueue": {
    "currentSelectedQueue": {
      "label": "Account Support",
      "id": "queueId1"
    },
    "targets": [
      {
        "label": "Account Support",
        "id": "queueId1"
      },
      {
        "label": "Billing Support",
        "id": "queueId2"
      },
      {
        "label": "Hardware Support",
        "id": "queueId3"
      },
      {
        "label": "Product Support",
        "id": "queueId4"
      },
      {
        "label": "Sales Support",
        "id": "queueId5"
      }
    ]
  }
});
```

In this example, the agent switches to Billing Support as the newly selected queue:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Agent switches to Billing Support
openFrameAPI.setICContext("agentSettings", {
  "outboundQueue": {
    "currentSelectedQueue": {
      "label": "Billing Support",
      "id": "queueId2"
    },
    "targets": [
      // ... same targets array
    ]
  }
});
```

Example: Setting Active Conversation Context

Use case - When an agent receives an inbound interaction:

- The system identifies the ServiceNow interaction record and passes its record ID.
- The externalId stores any external system reference (e.g., from a third-party contact center).
- If the interaction requires post-call work, wrapUpRequired is set to true.
- The OpenFrame interface is synchronized with the active conversation context, allowing agents to access conversation history and interaction details.

```
// Initialize activeConversation context with the current
 interaction
openFrameAPI.setICContext('activeConversation', {
  'activeConversation': [
    {
      'nowRecordId': '74103990fbd98b10ff19fe5f3eefdc41',
      'nowRecordTable': 'Interaction',
      'externalId': 'externalId123',
      'wrapUpRequired': true
    }
  ]
});
```

Output:

```
{
  'activeConversation': [
    {
      'nowRecordId': '74103990fbd98b10ff19fe5f3eefdc41',
      'nowRecordTable': 'Interaction',
      'externalId': 'externalId123',
      'wrapUpRequired': true,
      'status': 'active',
      'timestamp': '2024-06-24T14:32:15Z'
    }
  ],
  'success': true
}
```

Update the interaction to a new conversation:

```
// Update to a new active conversation
openFrameAPI.setICContext('activeConversation', {
```

```
  'activeConversation': [
    {
      'nowRecordId': '85214001gce99c21gg30gf6g4ffgeeid52',
      'nowRecordTable': 'Interaction',
      'externalId': 'externalId456',
      'wrapUpRequired': true
    }
  ]
});
```

openFrameAPI - setIcons(Array icons)

Defines icons in the OpenFrame header that are placed next to the close icon.

Parameters

Name	Type	Description
icons	Array of objects	A list of icon configurations, where each icon configuration is an object with key values *imageURL*, *imageTitle*, and any other needed context. Maximum size: Icons can be a maximum of 16x16 pixels. Larger images are automatically adjusted to this maximum.

Returns

Type	Description
void	

```
openFrameAPI.setIcons([{imageURL:'https://
mydomian.com/image/mute.png',
imageTitle:'mute', id:101},
 {imageURL:'https://mydomian.com/image/hold.png',
imageTitle:'hold', id:102}]);
```

openFrameAPI - setPresenceIndicator(presence)

Sets the presence indicator to display agent availability in a workspace.

For more information on configuring OpenFrame, refer to Create an OpenFrame configuration

Parameters

Name	Type	Description
state	String	Presence state of the agent. Default states: • Available • Away • Offline You can also specify custom states.
color	String	Presence indicator color on workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Supported colors: • red • orange • grey • green

Returns

Type	Description
void	

```
openframeAPI.setPresenceIndicator('Available', 'green');
```

openFrameAPI - setSize(Number width, Number height)

Sets the OpenFrame size.

Parameters

Name	Type	Description
width	Number	Should be greater than zero.
height	Number	Should be greater than zero.

Returns

Type	Description
void	

```
openFrameAPI.setSize(300, 370);
```

openFrameAPI - setSubtitle(String subTitle)

Sets the OpenFrame subtitle.

Parameters

Name	Type	Description
subTitle	String	A string of 256 or fewer characters.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
openFrameAPI.setSubtitle('+18888888888');
```

openFrameAPI - setTitle(String title)

Sets the OpenFrame title.

Parameters

Name	Type	Description
title	String	A string of 256 or fewer characters.

Returns

Type	Description
void	

```
openFrameAPI.setTitle('Incoming Call');
```

openFrameAPI - setTitleIcon(Object icon)

Sets the OpenFrame's title icon.

Parameters

Name	Type	Description
icon	Object	Object of key value pairs. Keys include *imageURL*, *imageTitle*, and any other context needed. Maximum size: Icons can be a maximum of 16x16 pixels. Larger images are automatically adjusted to this maximum.

Returns

Type	Description
void	

```
openFrameAPI.setTitleIcon({imageURL:'/my/image/path.png',
 imageTitle:'mute', id:101});
```

```
openFrameAPI.setTitleIcon({imageURL:'https://
mydomian.com/image/path.png',
imageTitle:'mute', id:101});
```

openFrameAPI - toastMessage(String message, String type, Number duration)

Displays an alert message.

Parameters

Name	Type	Description
message	String	Message to display in the alert.
type	String	Type of message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Possible values: • info • warning • error
duration	Number	Optional. Duration to display the message before it is auto-dismissed. Units: Milliseconds Default: The message is displayed until it is manually closed.

Returns

Type	Description
None	

This example displays info, warning, and error messages.

```
openFrameAPI.toastMessage("Testing info message", "info",
 10000); //display for 10 seconds
openFrameAPI.toastMessage("Testing warning message",
 "warning"); //display until manually closed
openFrameAPI.toastMessage("Testing error message", "error");
```

openFrameAPI - setWidth(width)

Sets the OpenFrame width.

Parameters

Name	Type	Description
Width	Number	Width in pixels

Returns

Type	Description
void	

```
openFrameAPI.setWidth(100);
```

openFrameAPI - show()

Makes the OpenFrame visible in the TopFrame.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
openFrameAPI.show()
```

openFrameAPI - subscribe(openFrameAPIEVENT event, function eventCallback)

Subscribes to a specified event.

Parameters

Name	Type	Description

event	openFrameAPIEVENT	The event to subscribe to:
		• interaction_control_action: Receives the interaction lifecycle event or calls control updates from OpenFrame and updates the UI accordingly. Call control update examples include call initiated, muted, held, ended, and transfer requests. Q4 additions include callback-related sub-actions:
		  ○ callbackLeaveAndTransfer: Agent initiates callback leave and transfer.
		  ○ getSearchTarget: Transfer list search is initiated to find agents, queues, or external targets.
		  ○ getMoreInfo: Information icon clicked on a transfer target to display skills or availability details.
		  ○ callbackTransferInitiated: Callback transfer begins to an agent, queue, external user, or direct target with consult or blind subtype.
		  ○ cancelCallbackTransfer: Callback transfer is cancelled before completion.
		• openframe_agent_off_interaction: Indicates the presence of an agent on chat as off or available.
		• openframe_awa_agent_presence: In Advanced Work Assignment (AWA), this event occurs when there's any change in the agent presence state. Computer Telephony Integration (CTI) developers can subscribe

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		to this event to receive presence state changes.
		• openframe_awa_client_offer: Occurs when an offer or transfer is made on a resiliency-related offer.
		• openframe_awa_workitem_accepted: Occurs when a work item is accepted by an agent.
		• openframe_awa_workitem_offered: Occurs when a work item is offered to an agent.
		• openframe_awa_workitem_rejected: Occurs when a work item is rejected by an agent.
		• openframe_awa_workitem_cancelled:
		  ○ Occurs when a work item is cancelled by AWA.
		  ○ Occurs when a Agent 1 transfers the phone call (Blind or Consult) to Agent 2 but Agent 2 rejects the transfer.
		  ○ Occurs when an Agent 1 cancels the transfer before the Agent 2 picks up the transfer. Currently, cancellation is supported only for chats.
		• openframe_before_destroy: Occurs before the TopFrame is unloaded.
		• openframe_collapse: Occurs when the collapse icon is selected on the OpenFrame header.
		• openframe_communication: Application-specific and can be customized.
		• openframe_communication_failure: Occurs when communication to TopFrame fails.
		• openframe_expand: Occurs when the expand icon is selected on the OpenFrame header.
		• openframe_heart_beat: Occurs when the user session is extended or logged out.
		• openframe_header_icon_clicked: Deprecated. Use openframe_icon_clicked or openframe_title_icon_clicked instead.
		• openframe_hidden: Occurs when the OpenFrame is hidden.
		• openframe_icon_clicked: Occurs when any icon other than the close icon is selected on the OpenFrame footer. The callback receives the icon object as a parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• openframe_icc_record_opened: Occurs when an agent with the `awa_manager` role opens an Interaction Management System (IMS) record. Returns the interaction record table and record ID. • openframe_shown: Occurs when the OpenFrame is shown. • openframe_title_icon_clicked: Occurs when the title icon is selected on the OpenFrame. The callback receives the titleIcon object as a parameter. • openframe_wrap_up_submitted: Occurs when the wrap up periods ends on the wrap-up modeless dialog. The event is triggered only when the wrap up is external.
eventCallback	function	Function to call when the specified event occurs.

Returns

Type	Description
results	Most event subscriptions have no return values. The event subscriptions that do return values are described in the following table entries.

interaction_control_action (callback sub-actions)	The following callback-related sub-actions return specific payload objects:
	
	`callbackLeaveAndTransfer`:
	`"action": {`
	`  "name": "callbackLeaveAndTransfer",`
	`  "payload": {`
	`  "nowRecordTable": "String",`
	`  "nowRecordId": "String",`
	`  "externalId": "String",`
	`  "participantId": "String"`
	`  }`
	`}`
	
	`getSearchTarget`:
	`"action": {`
	`  "name": "getSearchTarget",`
	`  "payload": {`
	`  "nowRecordId": "String",`
	`  "externalCallId": "String",`
	`  "participantId": "String",`
	`  "searchTerm": "String",`
	`  "limit": Number,`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Currently supported for chat interactions.

openframe_awa_agent_presence	In AWA, the *`openframe_awa_agent_presence`* event returns the `presence` object:
	
	`"presence":{`
	`  "available": Boolean,`
	`  "channels":[`
	`  {`
	`  "available": Boolean,`
	`  "name": "String",`
	`  "restrict_update": Boolean,`
	`  "sys_id": "String"`
	`  }`
	`  ],`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`
	
	`presence`: Information about an agent's current presence state and channel.
	
	• *`presence.available`*: Flag that indicates whether the agent is available.
	• *`presence.channels`*: List of objects that describe the available channels of communication with the agent.
	  ○ *`presence.channels.available`*: Flag that indicates whether the channel is available.
	  ○ *`presence.channels.name`*: Channel name, such as Chat or Phone.
	  ○ *`presence.channels.restrict_update`*: Flag that indicates whether the user can restrict updates.
	  ○ *`presence.channels.sys_id`*: Channel sys_id.
	• *`presence.name`*: Name of the agent's presence state.
	• *`presence.sys_id`*: Presence state sys_id.

openframe_awa_workitem_accepted and openframe_awa_workitem_offered	In AWA, the *`openframe_awa_workitem_accepted`* and *`openframe_awa_workitem_offered`* events return the `workItem` object:
	
	`"workItem": {`
	`  "document": {`
	`  "sys_id": "String",`
	`  "table": "String"`
	`  },`
	`  "isAutoAccepted": Boolean,`
	`  "isQueueTransferred": Boolean,`
	`  "previousWorkItem": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	`"serviceChannel": { "name": "String", "sys_id": "String" }, "size": Number, "sys_id": "String" }`
	
	workItem: Information about the work item that is associated with the event.
	
	• *workItem.document*: List of documents associated with the work item task.
	  ○ *workItem.document.sys_id*: Sys_id of the document assigned to the work item task.
	  ○ *workItem.document.table*: Name of the document table assigned to the task.
	• *workItem.isAutoAccepted*: Flag that indicates whether the work item was automatically accepted by the system. Set to true if the work item was auto-accepted.
	• *workItem.isQueueTransferred*: Flag that indicates whether the work item is queue transferred. Set to true if the work item is queue transferred, false if it isn't. For more information about queue transfers, see Using Agent Chat.
	• *workItem.previousWorkItem*: Sys_id of the previous work item for the same document ID. For the non-transfer work items this value is empty.
	• *workItem.serviceChannel*: List of service channels associated with the work item task.
	  ○ *workItem.serviceChannel.name*: Name of the service channel, such as Chat or Phone.
	  ○ *workItem.serviceChannel.sys_id*: Sys_id of the service channel.
	• *workItem.size*: Agent's capacity used when this work item is assigned to the agent.
	• *workItem.sys_id*: Sys_id of the work item that was accepted or offered.

openframe_awa_workitem_rejected	In AWA, the *openframe_awa_workitem_rejected* event returns the `workItem` object: `"workItem": { "document": { "sys_id": "String", "table": "String" },`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	`"isQueueTransferred": Boolean,`
	`"previousWorkItem": "String",`
	`"rejection": {`
	`"reason": "String",`
	`"sys_id": "String"`
	`},`
	`"serviceChannel": {`
	`"name": "String",`
	`"sys_id": "String"`
	`},`
	`"size": Number,`
	`"sys_id": "String"`
	`}`
	
	workItem: Information about the work item that is associated with the event.
	
	• *workItem.document*: List of documents associated with the work item task.
	  ○ *workItem.document.sys_id*: Sys_id of the document assigned to the work item task.
	  ○ *workItem.document.table*: Name of the document table assigned to the task.
	• *workItem.isQueueTransferred*: Flag that indicates whether the work item is queue transferred. Set to true if the work item is queue transferred, false if it isn't. For more information about queue transfers, see Using Agent Chat.
	• *workItem.previousWorkItem*: Sys_id of the previous work item for the same document ID. For the non-transfer work items this value is empty.
	• *workItem.rejection*: List of reasons for the rejection of the work item.
	  ○ *workItem.rejection.reason*: Name of the reason for rejecting the work items.
	  ○ *workItem.rejection.sys_id*: Sys_id of the rejection reason.
	
	  Table: Reject Reasons [awa_reject_reason]
	
	• *workItem.serviceChannel*: List of service channels associated with the work item task.
	  ○ *workItem.serviceChannel.name*: Name of the service channel, such as Chat or Phone.
	  ○ *workItem.serviceChannel.sys_id*: Sys_id of the service channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• *workItem.size*: Agent's capacity used when this work item is assigned to the agent. • *workItem.sys_id*: Sys_id of the work item that was accepted or offered.

openframe_heart_beat	The *openframe_heart_beat* event returns the following object:
	`{ "lastUiActivity": "String", "sessionLoggedIn": Boolean }`
	• *lastUiActivity*: Optional. Time stamp of last UI activity that extended the user session.
	• *sessionLoggedIn* Flag that indicates whether the user is logged in.
	  ○ true: User is logged in.
	  ○ false: User isn't logged in.

openframe_icc_record_opened	The *openframe_icc_record_opened* event returns the following object: `{ "action": { "name": "iccRecordOpened", "payload": { "nowRecordTable": "String", "nowRecordId": "String" } } }` • *nowRecordTable*: Name of the table containing the interaction record. Valid value: `interaction` • *nowRecordId*: Sys_id of the interaction record opened by the manager.
openframe_wrap_up_submitted	The *openframe_wrap_up_submitted* event returns the following object: `{ "wrapUp": { "external": Boolean, "externalSegmentId": "String", "recordId": "String", "recordTable": "String", "wrapUpCode": "String", "wrapUpNotes": "String", "wrapUpSegmentId": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	`}`
	`}`
	
	• *external*: Flag that indicates whether the wrap up is handled internally by the ServiceNow instance or managed outside of the ServiceNow instance by some other call system.
	  ○ true: Wrap up is handled by an external call system.
	  ○ false: Wrap up is handled by the ServiceNow instance.
	• *externalSegmentId*: Unique identifier of the external data object that triggered the external wrap up.
	• *recordId*: Sys_id of the interaction record that is undergoing wrap up.
	• *recordTable*: Name of the table containing the record. Always set as "interaction".
	• *wrapUpCode*: Code selected by the user during the wrap up that indicates how the interaction was resolved.
	• *wrapUpNotes*: Free-form text entered by the user during wrap up that describes how the interaction was resolved.
	• *wrapUpSegmentId*: Sys_id of the interaction wrap up segment record associated with the interaction. Located in the Wrap Up Segment [interaction_wrap_up_segment] table. Contains the wrap up data.

The following code example shows how to call this method for an `openframe_awa_agent_presence` event.

```
function handleIconClick(context) {
console.log("Icon was clicked", context);
}
openFrameAPI.subscribe(openFrameAPI.events.openframe_awa_agent_p
resence, handleIconClick);
```

Output:

```
// Sample presence object output
// openframe_awa_agent_presence event only

{
  "result":{
    "presence":{
      "name":"Available",
      "sys_id":"27f675e3739713004a905ee515f6a7c3",
      "available":true,
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "channels":[
        {
          "name":"Chat",
          "available":true,
          "sys_id":"36f675e4239713124a905fe515f6a832",
          "restrict_update":false
        },
        {
          "name":"Phone",
          "available":true,
          "sys_id":"9378a530a1820610f809018efd9bc01e",
          "restrict_update":false
        }
      ]
    }
  }
}
```

The following code example shows how to call this method for an `openframe_awa_workitem_accepted` event.

```
function handleIconClick(context) {
console.log("Icon was clicked", context);
}
openFrameAPI.subscribe(openFrameAPI.events.openframe_awa_workite
m_accepted, handleIconClick);
```

Output:

```
// Sample workItem object output
// openframe_awa_workitem_accepted event only
{
  "result": {
    "workItem": {
      "sys_id": "14c86c40a1650610f87701807d9bc0be",
      "size": 1,
      "serviceChannel": {
        "name": "Chat",
        "sys_id": "27f675e3739713004a905ee515f6a7c3"
      },
      "document": {
        "sys_id": "aa582040a1650610f87701807d9bc076",
        "table": "interaction"
      },
      "previousWorkItem": "7c78a440a1650610f87701807d9bc02b",
      "isQueueTransferred": true,
      "isAutoAccepted": true
    }
  }
}
```

The following code example shows how to call this method for an `openframe_awa_workitem_rejected` event.

```
function handleIconClick(context) {
console.log("Icon was clicked", context);
}
```

```
openFrameAPI.subscribe(openFrameAPI.events.openframe_awa_workite
m_rejected, handleIconClick);
```

Output:

```
// Sample workItem object output
// openframe_awa_workitem_rejected event only
{
  "payload": {
    "workItem": {
      "sys_id": "2c3bdc4824250610f8775e73b116f8de",
      "size": "1",
      "serviceChannel": {
        "name": "Chat",
        "sysID": "27f675e3739713004a905ee515f6a7c3"
      },
      "document": {
        "sys_id": "cf0a180824250610f8775e73b116f80c",
        "table": "interaction"
      },
      "rejection": {
        "reason": "Busy",
        "sys_id": "4e93fa29b38023002e7b6e5f26a8dc20"
      },
      "previousWorkItem": "831b9c4824250610f8775e73b116f841",
      "isQueueTransferred": true
    }
  }
}
```

The following example shows how to subscribe to the *interaction_control_action* event, including the Q4 callback actions.

```
openFrameAPI.subscribe("interaction_control_action",
 function(action) {
    // Can perform the action based on the name
    if (action.name == "mute") {
        mute();
        openFrameAPI.setICContext("activeCall", context); //
 Update context representing the change
    } else if (action.name == "getSearchTarget") {
        action.payload.searchType == "queue" ?
 fetchQueueTransferList(action.payload.searchTerm) :
 fetchAgentTransferList(action.payload.searchTerm);
        openFrameAPI.setICContext("searchTargetList",
 context); // Call context will have the transfer list
    } else if (action.name == "callbackTransferInitiated") {
        handleCallbackTransfer(action.payload);
        openFrameAPI.setICContext("activeCall", context); //
 Update callback state
    } else if (action.name == "cancelCallbackTransfer") {
        handleCallbackCancellation(action.payload);
        openFrameAPI.setICContext("activeCall", context);
    } else if (action.name == "logout") {
        logout();
        openFrameAPI.showIframe(); // Show iframe api
```

```
    }
});
```

The following example shows how to subscribe to the *openframe_icc_record_opened* event for manager roles.

```
openFrameAPI.subscribe(openFrameAPI.events.openframe_icc_record_
opened, function(action) {
    console.log("IMS opened: " + action.payload.nowRecordId);
    // Handle manager interaction record opening
    var recordId = action.payload.nowRecordId;
    var recordTable = action.payload.nowRecordTable;
    displayManagerContext(recordId, recordTable);
});
```

Output:

```
{
  "action": {
    "name": "iccRecordOpened",
    "payload": {
      "nowRecordTable": "interaction",
      "nowRecordId": "7ef5becf4199e210f8771b3e09cfdf55"
    }
  }
}
```

openFrameAPI - version()

Returns the OpenFrame API version.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The OpenFrame API version

```
var version = openFrameAPI.version();

console.log("API version " + version);
```

NotifyClient - Client

The *NotifyClient* API provides methods that enable you to use Notify telephony functionality, such as making and receiving calls from a web browser.

Several *NotifyClient* methods take a callback function as a parameter. Because *NotifyClient* method calls are made asynchronously, these methods can't return a value directly. Use the callback function to parse the returned data, such as by assigning variables or making other API calls.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyClient - Client(Object notifyConfig, Boolean initializeVendorClientLazily)

Instantiates a new Notify WebRTC Client object.

Parameters

Name	Type	Description
initializeVendorClientLazily	Boolean	Flag that indicates whether to use the autoSelectVendorCallback function passed in the `setCallerId()` method to automatically set the caller's associated vendor (`notifyConfig.vendor` does not need to be defined in the constructor). • false: Default. Do not use the autoSelectVendorCallback function to set the caller's vendor. The vendor must be set in the constructor. • true: Use the autoSelectVendorCallback function to define the vendor when the caller ID is set.
notifyConfig	Object	JSON object that contains the configuration settings for the Notify WebRTC Client.
notifyConfig.autoLoadScriptResources	Boolean	Flag that indicates how to load the core JS library needed by the vendor client. • false: Default. Use vendor specific codes to load the required vendor JS library (enables backwards compatibility). • true: Use notifyClient.js to load the core JS library.
notifyConfig.callerId	Number	Registered Notify number to use. Do not directly set this value. Use the method `notifyClient.setCallerID()` to set this value.
notifyConfig.forceRefreshToken	Boolean	Flag that indicates whether to auto-renew expired client tokens. • false: Do not automatically renew client tokens when they expire. • true: Default. Automatically renew client tokens when they expire.
notifyConfig.skipParentId	Boolean	Flag that indicates whether to immediately invoke the onIncoming caller for incoming calls. • false: Default. Do not immediately invoke the onIncoming event handler. • true: Immediately invoke the onIncoming event handler. By setting this flag, if there is another call, where the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`<Dial><Client>` Twiml caused the incoming call, then setting this flag causes the system to auto poll the backend. This auto poll obtains the parent notify_call reference.
notifyConfig.vendor	Constant	Vendor to which the caller belongs. • SNC.Notify.Vendor.TWILIO_DIRECT • SNC.Notify.Vendor.TWILIO (older, deprecated Twilio driver)

The following example shows how to create the NotifyClient constructor, register various event listeners, and initialize the client driver.

```
jQuery(function () {

  var notifyConfig = {
    autoLoadScriptResources: true // This will take care of auto
 loading the JS resources needed by the client (if any)
  };
  var client = new SNC.Notify.Client(notifyConfig, true); // The
 second argument ensures that the proper vendor for the given
 number is auto determined
  client.setCallerId('valid_notify_long_number', function () {
    // This is called after the vendor has been determined.

    if (!notifyConfig.vendor) // Means this number has no
 compatible vendor
      return;

    client.addEventListener(SNC.Notify.STD_EVENTS.ONLINE,
 function () {
      // Ability to call is available
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.OFFLINE,
 function () {
      // Ability to call is _not_ available right now
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.ERROR,
 function (msg, code) {
      // Some error happened
    });
      //... register other event handlers here
      //Show UI elements which can be used to invoke
 client.call() and other APIs
    client.init(); // This is important to call this.
    });
});
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyClient - addEventListener(String event, Function fn)

Registers an event handler to listen for changes in a Notify client.

Using this method you can register multiple listeners. Each listener must be a separate method call.

Parameters

Name	Type	Description

event	String	Name of the event to listen for.
		
		Instead of passing strings, use the constants defined in `SNC.Notify.STD_EVENTS`.
		
		• CALL_START: call has started and is in progress.
		• CALL_CANCEL: caller canceled the call.
		• CALL_INIT: WebRTC connected to a call (incoming or outgoing).
		• CALL_DISCONNECT: current call has been disconnected.
		• ERROR: Error occurred. Parameters: `message(string), errCode(string)`
		  ○ `message`: error message to display.
		  ○ `errCode`: Optional. Associated error code.
		• INCOMING_CALL: Call is coming in. Parameters: `from(string), to(string), callId(string), parentId(string), sysId(string), isFromClient(boolean)`
		  ○ `from`: caller's phone number.
		  ○ `to`: called phone number.
		  ○ `callId`: SID of the call.
		  ○ `parentId`: parent notify_call reference. If skipParentId is set to true, this parameter should not be passed.
		  ○ `sysId`: WebRTC-to-WebRTC calls only. Unique identifier (sys_id) of the caller.
		  ○ `isFromClient`: WebRTC-to-WebRTC calls only. Flag that indicates whether the call is from another WebRTC client.
		• CALL_MUTE: client is muted.
		• CALL_UNMUTE: client is unmuted.
		• OFFLINE: WebRTC session is not active.
		• ONLINE: WebRTC session is ready. Must be set after calling the init() method.

Returns

Type	Description
Function	Function to use to de-register a listener.

This example shows how to register multiple listeners.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
jQuery(function () {

  var notifyConfig = {
    autoLoadScriptResources: true // This will take care of auto
 loading the JS resources needed by the client (if any)
  };
  var client = new SNC.Notify.Client(notifyConfig, true); // The
 second argument ensures that the proper client for the given
 number is auto determined
  client.setCallerId('valid_notify_long_number', function () {
    // This is called after the client has been determined.

    if (!notifyConfig.vendor) // Means this number has no
 compatible client
      return;

    client.addEventListener(SNC.Notify.STD_EVENTS.ONLINE,
 function () {
      // Ability to call is available
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.OFFLINE,
 function () {
      // Ability to call is _not_ available right now
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.ERROR,
 function (msg, code) {
      // Some error happened
    });
      //... register other event handlers here

    client.init(); // This is important to call this.
    });
});
```

This example shows how to de-register a listener.

```
var dereg =
 notifyClient.addEventListener(SNC.Notify.STD_EVENTS.ONLINE,
 function () {
 ...
 });
 dereg();
  // The event listener function is no longer triggered.
```

NotifyClient - call(Object identifier)

Calls the specified phone number or the phone number associated with a specified user.

Note: When checking the status of a call/connection, always compare against the constants provided by `SNC.Notify.Status`.

Parameters

Name	Type	Description
identifier	Object	JSON object that contains either a phone number to call or the sys_id of a WebRTC user. Passing a user sys_id causes the call to be made through browser-to-browser communication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		You can obtain the user sys_id from the Notify WebRTC Session table. **Note:** If you provide both a phone number and user sys_id, the method only uses the phone number.

Returns

Type	Description
void	

This example demonstrates passing a phone number as the function parameter.

```
notifyClient.call({
    phoneNumber: "+18001112223"
});
```

This example demonstrates passing a user record sys_id as the function parameter.

```
notifyClient.call({
    userId: "6816f79cc0a8016401c5a33be04be441"
});
```

This example shows a button click handler.

```
$j("#pickupCallBtn").on("click", function() {
 notifyClient.hangupCall();
});
```

This example shows an event handler.

```
onConnect: function(status) {
  // webRTC receives a call connection event (incoming or
 outgoing).
  if (status == SNC.Notify.Status.OPEN) {
    setStatus(getTimeStamp() + " -- Successfully established
 call");
    showHangupButton();
  }
},
```

NotifyClient - destroy()

Kills the current Notify client, rendering it unusable.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

NotifyClient - forwardCall(Object argument)

Forwards an ongoing incoming or outgoing phone call to either a different phone number or a different WebRTC client.

Parameters

Name	Type	Description
argument	Object	JSON object that contains the necessary information for forwarding the call to either a phone number or a WebRTC client (user sys_id). You can obtain this sys_id from the Notify WebRTC Session table.

Returns

Type	Description
void	

This example demonstrates forwarding a call to a different phone number. The dtmf attribute allows you to send DTMF dial tones to the receiving number.

```
var arg = {
    type: "number",
    id: "+17012345678",
    dtmf: "1234"
}
client.forwardCall(arg);
```

This example demonstrates forwarding a call to a different Notify client.

```
var arg = {
    type: "userId",
    id: "6816f79cc0a8016401c5a33be04be441"
}
client.forwardCall(arg);
```

NotifyClient - getAvailableClients(Function callback)

Returns a list of clients available to accept calls.

This method excludes the current client from the list. The equivalent Notify-getAvailableClients() method does not filter any user.

Parameters

Name	Type	Description
callback	Function	Function to use to parse the list of clients. This function accepts a single parameter, an array of JSON objects with the following format: `[{ sys_id: "...",  // user's sys_id`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`    name: "..." // user's name` `}]`

Returns

Type	Description
void	

NotifyClient - getParentId(String callId, Function callback)

Returns the parent call identifier for a specified call identifier, if one exists.

Depending on the telephony provider, there may be a delay before the parent call identifier is returned; therefore you must provide a callback function.

Parameters

Name	Type	Description
callId	String	Unique identifier of the call for which to return the parent call identifier.
callback	Function	Function that obtains the JSON object that contains either the parent call identifier or an error message if the identifier could not be obtained after several tries.

Returns

Type	Description
String	Parent call identifier.

This example shows how to use this method to obtain the parent call identifier.

```
notifyClient.getParentId( callId, function(jsonObj) {} );
```

This example shows the contents of the jsonObj parameter.

```
{
 parentId: "xyz",
 error: "msg"
}
```

NotifyClient - getStatus()

Returns the normalized status of the current call.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Current status of the call. The values returned by the telephony provider API are normalized by replacing the returned driver value with its equivalent value as defined in SNC.Notify.Status.

This example shows how to obtain the status of the current Notify client.

```
clientStatus = notifyClient.getStatus();
```

NotifyClient - hangupCall()

End the current call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example how to hang up a call.

```
$j("#pickupCallBtn").on("click", function() {
    notifyClient.hangupCall();
});
```

NotifyClient - init()

Initializes the client driver.

For example, when using the Twilio client, it invokes the method `Twilio.Device.setup()`. Call this method after the user has interacted with the page. This initialization process is asynchronous, therefore, you must provide an ONLINE event handler. This handler is called when the setup process is complete and the system is ready to take or make calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to initialize the Notify client.

```
$j(function() {
  notifyClient = new SNC.Notify.Client( notifyConfig );
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  notifyClient.setCallerId( '+31858889170' );
  notifyClient.init();
});
```

NotifyClient - mute(Boolean muted)

Mute or unmute the current client.

Parameters

Name	Type	Description
muted	Boolean	Mutes or unmutes the current call. • false: (or any non-true value) unmutes the current call. • true: mutes the current call.

Returns

Type	Description
void	

This example shows how to send mute the current call.

```
notifyClient.mute( "true" );
```

NotifyClient - pickupCall()

Answers and connects to an incoming call from a WebRTC client.

Call this method when there is a notification of an incoming call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to pickup a call.

```
$j("#pickupCallBtn").on("click", function() {
    notifyClient.pickupCall();
});
```

NotifyClient - sendDtmf(String digits)

Send one or more DTMF-valid digits over the current call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
digits	String	One or more DTMF-valid digits.

Returns

Type	Description
void	

This example shows how to send DTMF signals to the current call.

```
notifyClient.SendDtmf( "1246AF" ) {} );
```

NotifyClient - setCallerId(String value, Function autoSelectVendorCallback)

Sets the caller ID for the current client session.

You can change or update the caller ID at any time however, the caller ID must belong to the same vendor.

Parameters

Name	Type	Description
value	String	Phone number to use to make and receive calls.
autoSelectVendorCallback	Function	**Optional.** *initializeVendorClientLazily* must be set to "true" in the constructor to use this function, otherwise an error is thrown. Name of the callback function to call once the vendor is automatically set for the specified phone number. With this option, the vendor does not need to be specified in the constructor (*notifyConfig.vendor*). Auto vendor selection is an asynchronous operation. Therefore, this callback is required to indicate when it is safe to call *notifyConfig.init()*, as this method requires that the vendor be set before it is called. In addition, you must also check if *notifyConfig.vendor* has been set in the callback to ensure that a vendor has been specified.

Returns

Type	Description
void	

This example shows how to set the caller ID. This example assumes that the vendor is set in the constructor.

```
$j(function() {
  notifyClient = new SNC.Notify.Client( notifyConfig );
  notifyClient.setCallerId( '+31858889170' );
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  notifyClient.init();
});
```

NotifyClient - setClientAvailable(Boolean available)

Sets the availability of an active WebRTC client agent.

This type of availability is different than an agent being in a call. In this case, an active WebRTC client may be connected and not on a call, but may not want to receive calls.

Calling this method updates the **Available** field value on the Notify Client Connected Session [notify_client_session] record associated with this client session. You can get a list of available clients using the *`getAvailableClients()`* method.

Parameters

Name	Type	Description
available	boolean	Flag that indicates whether an active WebRTC client wants to receive calls. • false: client does not want to receive calls. • true: client does want to receive calls.

Returns

Type	Description
void	

NotifyOnTaskClient - Client

The *`NotifyOnTaskClient`* API provides methods for sending SMS messages or starting/managing a conference call for various telephony service providers, such as Zoom and Webex.

Any UI can consume the *`NotifyOnTaskClient`* API by explicitly including the NotifyOnTaskClient UI script.

Using the *`NotifyOnTaskClient`* API you can:

- Start a conference call
- End a conference call
- Add participants
- Perform actions that are available through the telephony driver such as:
  - mute/unmute participants
  - remove participants from a conference call
  - add participants to a conference call
  - start a conference call
  - end a conference call

The Notify (com.snc.notify) plugin requires a separate subscription. For additional information on activating the Notify plugin, see Activate Notify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyOnTaskClient - addParticipants(Object data)

Adds the specified participants to a specified conference call.

Parameters

Name	Type	Description
data	Object	Object that describes the conference call.
data.addToWorkNotes	Boolean	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record in which to add the work notes. Default: false
data.confId	String	Sys_id of the conference call. Table: Notify Conference Call [notify_conference_call]

data.items	Array	Information for each participant to include in the conference call.
		
		`"items": [`
		`  "email": "String",`
		`  "id": "String",`
		`  "notifyParticipantId": "String",`
		`  "phoneNumber": "String"`
		`]`

data.items.email	String	Email address of the participant.
data.items.id	String	User sys_id. Table: User [sys_User]
data.items.notifyParticipantId	String	Participant sys_id. Table: Notify Participant [notify_participant]
data.items.phoneNumber	String	Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId* parameter, this value supersedes the phone numbers in the user/participant record and is used to place the call.
data.message	String	Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance."
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex.
data.sysId	String	Sys_id of the source record to associate with the conference call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example, if a conference call is held to discuss a specific incident or problem, put the sys_id of the incident or problem record in this value. This sys_id is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the *`data.Table`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. You should configure this value when the conference call is initially created through a "start" action. If required, you can also set this value through this method.
data.table	String	Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *`data.sysId`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. You should configure this value when the conference call is initially created through a "start" action. If required, you can also set this value through this method.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Possible values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty.
	
	• Data type: Array of Strings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`<action>.warnMessages`: If *status* is false, any warning messages thrown during processing. • Data type: Array of Strings `<action>.errorMessages`: If *status* is false, any error messages thrown during processing. • Data type: Array of Strings

The following code example shows how to call this method.

```
function addToConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';
    data.items.push({ id: 'userSysId' });
    data.items.push({ phoneNumber: '+917799555331' });
    data.items.push({ email: 'yln99518@gmail.com' });

    NotifyOnTaskClient.addParticipants(data).then(function
 (result) {
        var joinActionResult = result[0];
        if(joinActionResult.status) {

 joinActionResult.successMessages.forEach(function(msg) {
                console.log(msg);
            });
            return;
        }

        joinActionResult.warnMessages.forEach(function(msg) {
            console.warn(msg);
        });
        joinActionResult.errorMessages.forEach(function(msg) {
            console.error(msg);
        });
    }, function (errMsg) {
        console.log(errMsg);
    });
}
```

NotifyOnTaskClient - doConferenceAction(String action, Object data)

Performs the specified conference call action, such as starting/ending a conference call or joining, removing, muting, or unmuting participants from a conference call.

You can start a new conference call and add participants within a single call to this method or call the method multiple times to start the call and then manage participants separately. In addition, through the passed in data object, you can configure the method to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Save pointers in the conference call record to the specific record (source record), such as an incident or problem, that is the topic of discussion for the conference call.
- Allow/disallow multiple conference calls for a source record.
- Automatically log the participants that were in the conference call in the **Work notes** field of the source record.
- Have a message read aloud when a participant answers an outgoing call from the conference.

Parameters

Name	Type	Description
action	String	Defines the conference call action to perform. The following are the available conference call actions: • end: Terminates the conference call identified in *data.confId*. • join: Adds the participant specified in the *data.items* array to the conference call identified in *data.confId*. • kick: Removes the participant specified in the *data.items* array from the conference call identified in *data.confId*. • multiJoin: Adds the participants specified in the *data.items* array to the conference call identified in *data.confId* • multiKick: Removes the participants specified in the *data.items* array from the conference call identified in *data.confId*. • multiMute: Mutes the participants specified in the *data.items* array on the conference call identified in *data.confId*. • multiUnmute: Unmutes the participants specified in the *data.items* array from the conference call identified in *data.confId*. • mute: Mutes the participant specified in the *data.items* array on the conference call identified in *data.confId*. • selfJoin: Adds the currently logged in user to the conference call (no entry in *data.items* required.) • start: Starts the conference call identified in *data.confId*. • unmute: Unmutes the participant specified in the *data.items* array from the conference call identified in *data.confId*.
data	Object	Object that describes the conference call.
data.addToWorkNotes	Boolean	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record in which to add the work notes. Default: false Actions for which this parameter is valid: • join • multiJoin • selfJoin • start
data.allowMulticonference	Boolean	Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false Actions for which this parameter is valid: • start
data.confId	String	Sys_id of the conference call. Table: Notify Conference Call [notify_conference_call] Actions for which this parameter is required: • end • join • multiJoin • selfJoin **Note:** Participant actions such as mute, unmute, and kick don't require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table.
data.fromNumber	String	Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Actions for which this parameter is required: • start
data.isNewConference	Boolean	Flag that indicates whether this is a new or an existing conference call. Valid values: • true: New conference call • false: Existing conference call Default: false Actions for which this parameter is valid: • start
data.message	String	Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance." Actions for which this parameter is valid: • join • multiJoin • start
data.items	Array	Information for each participant to include in the conference call. Valid array values: • id: Sys_id of user; located in the User [sys_User] table. Valid actions: join, multiJoin, start • notifyParticipantId: Sys ID of the Notify participant; located in the Notify Participant [notify_participant] table. Valid actions: join, kick, multiJoin, mute, start, unmute • phoneNumber: Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId*, this value supersedes the phone numbers in the user/participant record and is used to place the call. Valid actions: join, multiJoin, start

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• email: Email address of the participant. Valid actions: join, multiJoin, start
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex. Actions for which this parameter is required: • all
data.sysId	String	Sys_id of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the sys_id of the incident or problem record in this value. This sys_id is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the *`data.Table`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start
data.table	String	Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *`data.sysId`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start

Returns

Type	Description
Object	Results of the conference action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	`<action>.status`: Status of the conference action.
	• Data type: Boolean
	• Possible values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *status* is true, success message(s), else empty.
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *status* is false, any warning messages thrown during processing.
	• Data type: Array of Strings
	
	`<action>.errorMessages`: If *status* is false, any error messages thrown during processing.
	• Data type: Array of Strings

The following example shows how to create a function to call doConferenceAction() to manipulate the participants in a conference call by passing in the action and the participants.

```
/**
 *
 * @param {string} action - action to perform on the conference
 object or participant object
 * @param {Array} participants;
 */
function doConferenceAction(action, participants) {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';
    data.items = participants;

    NotifyOnTaskClient.doConferenceAction(action,
 data).then(function (result) {
        var kickActionResult = result[0];
        if (kickActionResult.status)
            console.log(action + ' succeeded');
        else {
            kickActionResult.warnMessages.forEach(function (msg)
 {
                console.warn(msg);
            });
            kickActionResult.errorMessages.forEach(function
 (msg) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                console.error(msg);
            });
        }
    }, function (errMsg) {
            console.log(errMsg)
    });
}

// kick participants

doConferenceAction('kick', [{notifyParticipantId:
 'notifyParticipantSysId'}]);

// kick multiple participants

doConferenceAction('multiKick',
    [{notifyParticipantId: 'notifyParticipantSysId'},
    {notifyParticipantId: 'notifyParticipantSysId'}]);

// Mute participants
doConferenceAction('mute', [{notifyParticipantId:
 'notifyParticipantSysId'}]);
doConferenceAction('mute', [{notifyParticipantId:
 'notifyParticipantSysId'}]);

doConferenceAction('multiMute',
    [{notifyParticipantId: 'notifyParticipantSysId'},
    {notifyParticipantId: 'notifyParticipantSysId'}]);

// self join to any confernece.
doConferenceAction('selfJoin', [{id: 'logged in userId'}]);
```

NotifyOnTaskClient - endConference(Object data)

Terminates the specified conference call.

Parameters

Name	Type	Description
data	Object	Object that describes the conference call.
data.confId	String	Sys_id of the conference call.
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex.

Returns

Type	Description
Object	Results of the conference action. `<action>.status`: Status of the conference action. • Data type: Boolean • Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ true: Conference action succeeded ○ false: Conference action failed `<action>.successMessages`: If *`status`* is true, success message(s), else empty. • Data type: Array of Strings `<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing. • Data type: Array of Strings `<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing. • Data type: Array of Strings

```
function endConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';

    NotifyOnTaskClient.endConference(data).then(function
 (result) {
        var endActionResult = result[0];
        if (endActionResult.status)
            console.log('Conference has been ended');
        else {
            endActionResult.warnMessages.forEach(function (msg)
 {
                console.warn(msg);
            });
            endActionResult.errorMessages.forEach(function (msg)
 {
                console.error(msg);
            });
        }
    }, function (errMsg) {
        console.log(errMsg);
    });
}
```

NotifyOnTaskClient - getNotifyActionTemplate()

Returns a JSON data template to use with the *`doConferenceAction()`* method. Using this template automatically structures the data object so that you don't have to manually create it.

Call this method prior to calling the *`doConferenceAction()`* method. For the desired conference call action, set the desired parameters within the template, and then pass the template in the *`doConferenceAction()`* call. For additional information on the valid parameters for each action, see doConferenceAction().

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This is a helper method. You can also manually construct this object and pass it into the `doConferenceAction()` method and have the same outcome.

Parameters

Name	Type	Description
None		

Returns

Type	Description
data	Object that describes the conference call.
data.addToWorkNotes	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the `data.table` and `data.sysId` parameters. These parameters identify the record in which to add the work notes. Default: false Actions for which this parameter is valid: • join • multiJoin • selfJoin • start
data.allowMultconference	Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the `data.table` and `data.sysId` parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false Actions for which this parameter is valid: • start
data.confId	Sys_id of the conference call. Table: Notify Conference Call [notify_conference_call] Actions for which this parameter is required: • end • join • multiJoin • selfJoin

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Note: Participant actions such as mute, unmute, and kick don't require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table.
data.fromNumber	Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table. Actions for which this parameter is required: • start
data.isNewConference	Flag that indicates whether this is a new or an existing conference call. Valid values: • true: New conference call • false: Existing conference call Default: false Actions for which this parameter is valid: • start
data.items	Information for each participant to include in the conference call. Valid array values: • id: Sys_id of user; located in the User [sys_User] table. Valid actions: join, multiJoin, start • notifyParticipantId: Sys ID of the Notify participant; located in the Notify Participant [notify_participant] table. Valid actions: join, kick, multiJoin, mute, start, unmute • phoneNumber: Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId*, this value supersedes the phone numbers in the user/participant record and is used to place the call. Valid actions: join, multiJoin, start • email: Email address of the participant. Valid actions: join, multiJoin, start

NotifyOnTaskClient - start(Object data)

Starts a new conference call.

Parameters

Name	Type	Description
data	Object	Object that describes the conference call.
data.addToWorkNotes	Boolean	Optional.Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values for the *data.table* and *data.sysId* parameters to identify the record in which to add the work notes. Default: false
data.allowMulticonference	Boolean	Optional. Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false
data.fromNumber	String	Required. Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table.

data.items	Array	Optional. Information for each participant to include in the conference call.
		
		`"items": [`
		`  "email": "String",`
		`  "id": "String",`
		`  "notifyParticipantId": "String",`
		`  "phoneNumber": "String"`
		`]`

data.items.email	String	Email address of the participant.
data.items.id	String	User sys_id. Table: User [sys_User]
data.items.notifyParticipantId	String	Participant sys_id. Table: Notify Participant [notify_participant]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
data.items.phoneNumber	String	Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId* parameter, this value supersedes the phone numbers in the user/participant record and is used to place the call.
data.message	String	Optional. Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance."
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex.
data.sysId	String	Optional. Sys_id of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the sys_id of the incident or problem record in this value. This sys_id is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the *data.Table*, *data.addToWorkNotes*, and *allowMulticonference* parameters.
data.table	String	Optional. Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *data.sysId*, *data.addToWorkNotes*, and *allowMulticonference* parameters.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Possible values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`<action>.successMessages`: If *status* is true, success message(s), else empty. • Data type: Array of Strings `<action>.warnMessages`: If *status* is false, any warning messages thrown during processing. • Data type: Array of Strings `<action>.errorMessages`: If *status* is false, any error messages thrown during processing. • Data type: Array of Strings

The following code example shows how to call this method.

```
function startConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.table = 'incident';
    data.sysId = '1234';
    data.serviceProvider = serviceProvider;
    data.addToWorkNotes = true;
    data.fromNumber = 'Telephony Number';
    data.items.push({ id: 'userSysId' });
    data.items.push({ phoneNumber: '+917799555332' });
    data.items.push({ email: 'yln99517@gmail.com' });

    NotifyOnTaskClient.start(data).then(function (result) {
        var startActionResult = result[0];
        if(startActionResult.status) {

 startActionResult.successMessages.forEach(function(msg) {
                console.log(msg);
            });
            return;
        }

        startActionResult.warnMessages.forEach(function(msg) {
            console.warn(msg);
        });
        startActionResult.errorMessages.forEach(function(msg) {
            console.error(msg);
        });
    }, function (errMsg) {
        console.log(errMsg);
    });
}
```

ScopedSessionDomain - Client

The *ScopedSessionDomain* script include that contains client-side methods that provide functionality related to the current session domain.

This API is only available if the Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions) plugin has been activated in the instance. In addition, the caller must have the admin role to access this API.

ScopedSessionDomain - getCurrentDomainID()

Returns the sys_id of the current domain for the logged-in user session.

The identifier that is returned depends on the domain type and the instantiation of that domain.

- If the user is configured in the global domain, and does not use the domain picker to switch domains, the method returns null.
- If the user uses the domain picker to switch to the global domain, the method returns the string "global".
- For all other domains, the method returns the sys_id of that domain.

To access this method from a client-side script, you must use GlideAjax() to invoke it. To invoke this method from a server-side script, use something similar to the following to instantiate the object and access the method.

```
var ssg = new global.ScopedSessionDomain();
domainID = ssg.getCurrentDomainID();
```

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the session domain of the current logged-in user. This is the same information that appears in the domain picker.

This example shows how to call the *getCurrentDomainID()* method from a client-side script.

```
// This example is calling the script include in a client
 script.
// This particular record is within the "Service Portal -
 Standard Ticket" scope.
// To reproduce this example:
//  1. Change application scope to "Service Portal - Standard
 Ticket"
//  2. Navigate to Client Script table and open a new form and
 name it anything
//  3. Set table=ticket_configuration (this table is within the
 same scope)
//  4. Set UI type=Desktop and Type=onLoad
//  5. Populate the script field with the script above
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//  6. Navigate to the ticket_configuration table and open any
 form.
//
// This will trigger the client script, invoke the API, and pop
 up a browser alert containing the sys_id of the user's current
 domain

function onLoad() {
  var ga = new GlideAjax("global.ScopedSessionDomain"); // Set
 the script include
  ga.addParam("sysparm_name", "getCurrentDomainID"); // Set the
 getCurrentDomainID method
  ga.getXML(getResponse);

  function getResponse(response) {
     var answer =
 response.responseXML.documentElement.getAttribute('answer');
     alert(answer); // Pops up the sys_id of the domain record
  }
}
```

ScriptLoader - Client

The *ScriptLoader* API provides methods to load scripts asynchronously.

You can use this API in client-side scripts for a platform/desktop UI using *ListV2* and *ListV3* APIs. It isn't available for Service Portal, Mobile, or Agent Workspace.

You access *ScriptLoader* methods by using the global object `ScriptLoader`.

ScriptLoader - getScripts(Array scripts, Function callback)

Loads scripts asynchronously.

Parameters

Name	Type	Description
scripts	Array	Array of scripts to load.
callback	Function	Function to call when the scripts have been loaded. The callback function must not have any arguments.

Returns

Type	Description
void	

```
var scriptFiles=[
'scripts/classes/providers/ProviderUI.js',
'scripts/classes/providers/wf_provider_client_script.js'
];

ScriptLoader.getScripts(scriptFiles, function() {
  ProviderUI.setFields(['input_transform']);
  ProviderUI.apply();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 ProviderUI.removeDisabledAttribute("sys_readonly.wf_element_act
ivity.access");
}
```

ScriptLoader - getScripts(String filePath, Function callback)

Gets scripts asynchronously.

Parameters

Name	Type	Description
filePath	String	Path, including the file name, that contains one or more scripts.
callback	Function	Function to call after the scripts have been loaded. This callback function should not have arguments.

Returns

Type	Description
void	

This example shows how load a utility script and then run the *getDepartment()* function.

```
// Client script to load a utility script and run the
 getDepartment callback function
ScriptLoader.getScripts('sn_ui_script_util.Utilities.jsdbx',
 getDepartment);

function getDepartment() {
  var req = sn_ui_script_util.Utilities.rest('json');
  req.addParam("sysparm_query", "sys_id=" + newValue);
  req.addParam("sysparm_fields", "department");
  req.addParam("sysparm_display_value", true);
  req.success(updateNotes);
  req.get("/api/now/table/sys_user");
}

function updateNotes(data) {
  g_form.setValue("work_notes",
 data.result[0].department.display_value);
}
```

SNAnalytics - Client

The *SNAnalytics* API provides methods to push custom analytics data (events, pages, and user properties) to the Usage Insights for Service Portal dashboard.

Usage Insights for Service Portal provides dashboard views for monitoring the key performance indicators (KPIs) of web applications built on Service Portal. You can use these insights to optimize your portal. For example, Usage Insights tracks when a user orders a catalog item or views a knowledge article. You can use this data to infer which items or articles are the most popular among users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this API, the Service Portal Analytics (com.glide.service-portal.analytics) plugin must be activated on the instance. In addition, within your application, you must import the snAnalytics Angular service, such as:

```
<client_script><![CDATA[function($rootScope, $scope, $window,
 $timeout, spUtil, $sce, spModal, $uibModal, $location,
 cabrillo, snAnalytics)
```

For additional information, see Usage Insights for Service Portal.

SNAnalytics - addEvent(Object payload)

Stores the specified event information in the analytics data store.

Events are actions performed by a user, such as clicking a button or submitting a form. Call this method within your web-page widget whenever you want to capture a user action. These events then automatically appear on the associated user session timeline and User Experience Analytics dashboard.

The following is an example of a payload passed in an *addEvent()* call:

```
var payload= {};
payload.name = "Manage Account";
payload.data = {};
payload.data["Function Name"] = c.data.function_name;
payload.data["User Type"] = c.data.user_type;
payload.data["Company"] = c.data.company_name;
snAnalytics.addEvent(payload);
```

The screen capture below shows the information that appears on the analytics dashboard for the event "Manage Account." The timeline at the top represents the number of times that the event occurred. The pie charts below the timeline reflect the properties that were captured in the *addEvent()* call.

If you want to capture when users access a web page, use the SNAnalytics - startPage(String name, String description) method instead of this method.

Parameters

Name	Type	Description
payload	Object	Event to store in the analytics data store. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		`"payload": {`
		`  "data": [Array],`
		`  "name": String`
		`}`

payload.data	Array Each element can be a string (case-sensitive), boolean, number, or date.	Optional. Name-value pairs of custom event properties. These properties can be any values that you want to track and see on the analytics dashboard. They appear under the associated event timeline on the analytics dashboard. The **Page Id** property always appears first on the dashboard for all base system events, and all other properties are sorted alphabetically. If no properties are required for an event, only an event timeline appears on the analytics dashboard. Properties can be added at a later time. The following values are automatically converted by this method: • String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false Default value: Null
payload.name	String	Descriptive name of the event. Special characters are not allowed. Maximum length: The length of the event name and value cannot exceed 300 bytes.

Returns

Type	Description
None	

The following example shows how to call the *addEvent()* method during initialization of a widget.

```
function initialize() {
  c.options.glyph = c.options.glyph || 'search';
  c.options.title = c.options.title || c.data.searchMsg;
  c.options.color = c.options.color || "default";
  c.searchTerm = c.data.q;
  c.searchQuery = "";
  c.pageID = $scope.page && $scope.page.id;
  c.showSuggestions =  c.data.searchTypeBehavior ===
 "suggestions" && c.data.isSuggestionsEnabled === "true";
  c.suggestionsLimit = c.options.limit || "";
  c.latitude = null;
  c.longitude = null;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  c.isLocationTrackerDisabled = c.data.isLocationTrackerDisabled
 === "true";
  c.isTypeAheadEnabled = c.data.isTypeAheadEnabled === "true";

  c.sendAnalytics = function(type){
    var payload= {};
    payload.name = "Initiate Search";
    payload.data = {};
    payload.data["Keyword"] = (type == 'User Entered' ?
 c.searchTerm : c.searchQuery);
    payload.data["Type"] = type;
    snAnalytics.addEvent(payload);
  };
}
```

SNAnalytics - appendToUserProperty(String name, String value)

Appends the specified string to the specified user string property in the analytics data store.

Parameters

Name	Type	Description
name	String or String[]	Name of the property to append the specified string to. Special characters are not allowed. **Note:** The associated property must be a string or string[]. Maximum length: The length of the property name and property value cannot exceed 300 bytes.
value	String	Value to append to the string property. The following values are automatically converted by this method: • String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false

Returns

Type	Description
None	

This example shows how to add `television` to the `tags` property.

```
snAnalytics.setUserProperties({
  level: 7,
  lastPurchase: new Date(),
  lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23',
  isPremium: true,
  tags: ['chair', 'table'],
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Append television to the tags property (now 'tags' will have
 'chair', 'table', and 'television')
snAnalytics.appendToUserProperty('tags', 'television');
```

SNAnalytics - incUserProperty(String name, Number value)

Increments or decrements the specified user property value with the specified number value in the analytics data store.

Parameters

Name	Type	Description
name	String	Name of the property to increment. Value is case-sensitive. **Note:** The associated property must be a number.
value	Number	Amount to increment the property by. If you enter a negative number, the value is decremented.

Returns

Type	Description
None	

The following example shows how to increment the property `Grace days` by 5.

```
snAnalytics.incUserProperty('Grace days', 5)
```

SNAnalytics - removeUserProperty(String name)

Removes the specified property for the current user from the analytics data store.

In addition, the property no longer appears on the analytics dashboard.

Parameters

Name	Type	Description
name	String	Name of the property to remove. Value is case-sensitive.

Returns

Type	Description
None	

The following example shows how to remove the IsAdmin property.

```
snAnalytics.removeUserProperty('IsAdmin');
```

SNAnalytics - setUserProperties(Object properties)

Sets the specified properties with the specified values for the current user in the analytics data store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These properties are saved in the analytics data store and appear on the user session details page as illustrated below. If a property already exists in the analytics data store, the current value is overwritten with the new value.

Parameters

Name	Type	Description
properties	Object Each element in this object can be a string, boolean, number, date, string[], or null.	Object that contains the name-value pairs of the user properties to set, such as: `{ level: 7, lastPurchase: new Date(), lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23', isPremium: true, tags: ['chair', 'table'], }` The following values are automatically converted by this method: • String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false

Returns

Type	Description
None	

The following example shows how to set multiple properties for the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
snAnalytics.setUserProperties({
  level: 7,
  lastPurchase: new Date(),
  lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23',
  isPremium: true,
  tags: ['chair', 'table'],
});
```

SNAnalytics - setUserProperty(String name, UserProperty value)

Sets the specified property with the specified value for the current user in the analytics data store.

These properties are saved in the analytics data store and appear on the user session details page as illustrated below. If a property already exists in the analytics data store, the current value is overwritten with the new value.

Parameters

Name	Type	Description
name	String	Name of the property to update. This name appears as the label for the property. For example, in the prior screenshot, Domain, Instance Name, Company, Role, and User Type are all name parameters. Special characters are not allowed. Maximum length: The length of the property name and property value cannot exceed 300 bytes.
value	UserProperty This value can be a string, boolean,	Value to set in the specified property. The following values are automatically converted by this method:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
	number, date, string[], or null.	• String value of "yes": Boolean value of "true" • String value of "no": Boolean value of "false

Returns

Type	Description
None	

The following example shows how to set the property `Company`.

```
snAnalytics.setUserProperty('Company', "ABC Company")
```

SNAnalytics - startPage(String name, String description)

Saves the name and description of a page in the analytics data store.

This information appears in the user session timeline and on the analytics dashboard. Call this method within your custom widgets to track the pages visited by a user. You can also use this method to track user navigation within an individual page. For more information, see Exploring Usage Insights.

Note: In general, portal pages are automatically tagged with this tracking capability. Use this method for custom scenarios, such as a single page custom widget in a wizard scenario.

Parameters

Name	Type	Description
name	String	Descriptive name of the page or page section. Special characters are not allowed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
description	String	Optional. Description of the page to appear in the timeline and analytics dashboard. Default: *name* parameter value

Returns

Type	Description
None	

The following example shows how to call the *startPage()* method.

```
snAnalytics.startPage('login_view', 'Login');
```

spAriaUtil - Client

The *spAriaUtil* API provides methods to show messages on a screen reader.

This API is an angular service that you can use in Service Portal widget client scripts.

spAriaUtil - sendLiveMessage(String message)

Announce a message to a screen reader.

The *sendLiveMessage()* method injects text into an aria-live region on the page. The default setting for an aria-live region is `assertive`, which means that messages are announced immediately. This can annoy and confuse users if used too frequently.

Parameters

Name	Type	Description
message	String	The message to be shown.

Returns

Type	Description
void	

```
function(spAriaUtil) {
  /* widget controller */

  spAriaUtil.sendLiveMessage('Hello world!');
}
```

spContextManager - Client

Makes data from a Service Portal widget available to other applications and services in a Service Portal page. For example, pass widget data to Agent Chat when it opens in a Service Portal page.

The *spContextManager* API is an AngularJS service that you can use in Service Portal widget client scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Keys passed to this API are unique per page. For example, if the `'agent-chat'` key is already initialized by another widget on the page through the *`addContext()`* method, you must use the *`updateContextForKey()`* method to update the key's data. Available keys include: agent-chat: Sends widget data to Agent Chat.

For more information about passing data to Agent Chat, see Configure Agent Chat in Service Portal.

spContextManager - addContext(String key, Object context)

Initializes a key and adds widget data as the value. For example, add data to the 'agent-chat' key to make it available to Agent Chat.

Use this method the first time data is added to a specific key on a Service Portal page. If the key is already used by another widget on the page, use the *`updateContextForKey()`* method instead.

Parameters

Name	Type	Description
key	String	Name of the key to send the data. Available keys include**agent-chat**: Sends widget data to Agent Chat when it opens in a Service Portal page.
context	Object	Widget data in JSON format to send to the application or service specified in the key parameter. For example, `{'approval_count': 5}`.

Returns

Type	Description
void	

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat `iframe` URL.

```
function ($scope, spContextManager) {
    spContextManager.addContext('agent-chat', {
        'approval_count': 5
    });
};
```

spContextManager - getContext()

Returns each key and associated data object defined by any widget on the page.

Using this method may affect performance. Use this method to understand which keys are initialized on the page and to get their current values. If you know which key you need to access, use the *`getContextForKey()`* method instead.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Each key and associated data object defined on the page.

```
function ($scope, spContextManager) {
  spContextManager.getContext();
}
```

spContextManager - getContextForKey(String key, Boolean returnPromise)

Returns the widget data associated with a key.

Parameters

Name	Type	Description
key	String	Name of the key to get context from. Available keys include: agent-chat: Sends widget data to Agent Chat.
returnPromise	Boolean	Flag that determines whether to return the data associated with a key as a promise or an object. Values include: • True: return the data as a promise. Use this option if another widget on the page uses the *addContext()* method to initialize the same key. Returning a promise prevents returning an undefined object when the key is not yet initialized. • False: returns an object containing the data associated with the key.

Returns

Type	Description
Promise	If returnPromise is true, returns a promise that is fulfilled when another widget on the page initializes the key.
Object	If returnPromise is false, returns an object containing the data associated with the key. For example, `{approval_count: 5}`.

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat `iframe` URL.

```
function ($scope, spContextManager) {
  spContextManager.getContextForKey('agent-chat',
 true).then(function(context) {
    context = context || {};
    context.approval_count = 5;
    spContextManager.updateContextForKey('agent-chat', context);
  });
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

spContextManager - updateContextForKey(String key, Object context)

Sends data to an existing key. For example, if another widget on the page uses the 'agent-chat' key to pass data to the Agent Chat configuration, you must update the context of the key rather than using the *addContext()* method.

Parameters

Name	Type	Description
key	String	Name of the key to send the data. Available keys include**agent-chat**: Sends widget data to Agent Chat when it opens in a Service Portal page.
context	Object	Widget data in JSON format to send to the application or service specified in the key parameter. For example, `{'approval_count': 5}`.

Returns

Type	Description
void	

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat `iframe` URL.

```
function ($scope, spContextManager) {
  spContextManager.getContextForKey('agent-chat',
 true).then(function(context) {
    context = context || {};
    context.approval_count = 5;
    spContextManager.updateContextForKey('agent-chat', context);
  });
}
```

spModal - Client

Shows alerts, prompts, and confirmation dialogs in Service Portal widgets. The *spModal* class is available in Service Portal client scripts.

The *spModal* class is a lightweight wrapper for Angular UI bootstrap's $uibModal. You can use the *spModal.open()* method to display a widget in a modal dialog.

spModal - alert(String message).then(fn)

Displays an alert.

Parameters

Name	Type	Description
message	String	The message to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	The promise contains a single argument that contains true or false.

```
// HTML template
<button ng-click="c.onAlert()" class="btn btn-default">
    Alert
  </button>

// Client script
function(spModal) {
    var c = this;
  c.onAlert = function () {
        spModal.alert('How do you feel today?').then(function
 (answer) {
            c.simple = answer;
        });
    }
 }
```

spModal - confirm(String message).then(fn)

Displays a confirmation message.

Parameters

Name	Type	Description
message	String	The message to display.

Returns

Type	Description
Boolean	The promise contains a single argument that contains true or false.

```
// HTML template
 <button ng-click="c.onConfirm()" class="btn btn-default">
 Confirm </button>
<span>{{c.confirmed}}</span>

// Client script
function(spModal) {
  var c = this;
  c.onConfirm = function() {
        c.confirmed = "asking";
        spModal.confirm("Can you confirm or deny
 this?").then(function(confirmed) {
            c.confirmed = confirmed; // true or false
        })
    }
 }
```

Confirm with HTML message:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//HTML template
<button ng-click="c.onConfirmEx()" class="btn btn-default">
    Confirm - HTML message
  </button>
  <span>{{c.confirmed}}</span>

// Client script
function(spModal) {
  var c = this;
  // more control, passing options
    c.onConfirmEx = function() {
        c.confirmed = "asking";
        var warn = '<i class="fa fa-warning"
 aria-hidden="true"></i>';
        spModal.open({
            title: 'Delete this Thing?',
            message: warn + ' Are you <b>sure</b> you want to do
 that?'
        }).then(function(confirmed) {
            c.confirmed = confirmed;
        })
    }
}
```

spModal - open(Object options).then(fn)

Opens a modal window using the specified options.

Parameters

Name	Type	Description
options	Object	An object that may have these properties. • backdrop: Boolean|String. Controls the presence of a backdrop. Valid values: ○ true: Displays backdrop. ○ false: No backdrop. ○ static: Disables modal closing by selecting the backdrop. Default: true • buttons: Array. Buttons to show on the dialog. The default is Cancel and OK. • input: Boolean. When true, shows an input field on the dialog. Default: false • keyboard: Boolean. When true, indicates that the dialog is closeable using the ESC key. Default: true • message: String. HTML that goes in the header. Default: empty

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• noDismiss: Boolean. When true, indicates that the header section containing the close icon isn't present. Default: false • shared: Client-side object. Shares data with the embedded widget client script. • size: String. Size of the window. Valid values: 'sm' or 'lg'. Default: empty • title: String. HTML that goes in the header. Default: empty • value: String. Value of the input field. Default: empty • widget: String. Widget ID or sys_id to embed in the dialog. Default: empty • widgetInput: Object. Sent to the embedded widget as input. Default: null

Returns

Type	Description
void	

The following code example shows how to create a prompt with a label.

```
//HTML template
<button ng-click="c.onOpen()" class="btn btn-default">
    Prompt with label
  </button>
  <div ng-show="c.name">
    You answered <span>{{c.name}}</span>
  </div>

//Client code
function(spModal) {
  var c = this;
  c.onOpen = function() {
        //ask the user for a string
        spModal.open({
            title: 'Give me a name',
            message: 'What would you like to name it?',
            input: true,
            value: c.name
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        }).then(function(name) {
            c.name = name;
        })
    }
}
```

The following code example shows how to use the custom buttons option.

```
//HTML template
<button ng-click="c.onAgree()" class="btn btn-default">
    Agree
  </button>
  <div ng-show="c.agree">
    You answered {{c.agree}}
  </div>

//Client script
function(spModal) {
  var c = this;
  c.onAgree = function() {
        // ask the user for a string
        // note embedded html in message
        var h = '<h4>Apple likes people to agree to lots of
 stuff</h4>'
        // Line feeds added to the following lines for
 presentation formatting.
        var m = 'Your use of Apple software or hardware products
 is based
on the software license and other terms and conditions in effect
 for the
product at the time of purchase. Your agreement to these terms
 is required
to install or use the product. '
        spModal.open({
            title: 'Do you agree?',
            message: h + m,
            buttons: [
                {label:'✘ ${No}', cancel: true},
                {label:'✔ ${Yes}', primary: true}
            ]
        }).then(function() {
            c.agree = 'yes';
        }, function() {
            c.agree = 'no';
        })
    }
}
```

The following code example shows how to use the embedded widget option.

```
//HTML template
<button ng-click="c.onWidget('widget-cool-clock')" class="btn
 btn-default">
    Cool Clock
  </button>

//Client script
function(spModal) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var c = this;
  c.onWidget = function(widgetId, widgetInput) {
        spModal.open({
            title: 'Displaying widget ' + widgetId,
            widget: widgetId,
            widgetInput: widgetInput || {}
        }).then(function(){
            console.log('widget dismissed');
        })
    }
}
```

spModal - prompt(String message, String default).then(fn)

Displays a prompt for user input.

Parameters

Name	Type	Description
message	String	The message to display.
default (optional)	String	A default value to use if the user does not provide a response.

Returns

Type	Description
String	The promise contains the user's response, or the default value if the user does not enter a response.

```
//HTML template
 <button ng-click="c.onPrompt()" class="btn btn-default">
    Prompt
  </button>
  <div ng-show="c.name">
    You answered <span>{{c.name}}</span>
  </div>

// Client script
function(spModal) {
  var c = this;
  c.onPrompt = function() {
        spModal.prompt("Your name please",
 c.name).then(function(name) {
            c.name = name;
        })
    }
}
```

spUtil - Client

The *spUtil* API provides utility methods to perform common functions in a Service Portal widget client script.

These functions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Display a notification error message. spUtil - addErrorMessage(String message)
- Display a notification info message. spUtil - addInfoMessage(String message)
- Display a trivial notification message. spUtil - addTrivialMessage(String message)
- Create a unique identifier. spUtil - createUid()
- Format a string with variables. spUtil - format(String template, Object data)
- Embed a widget model in a widget client script. spUtil - get(String widgetId Object data)
- Retrieve all headers to use for API calls. spUtil - getHeaders()
- Return the complete host domain. spUtil - getHost()
- Execute the callback with User Preference response by passing the preference name. spUtil - getPreference(String preference, Function callback)
- Return the current service portal URL information. spUtil - getURL()
- Check if the current client is a mobile device. spUtil - isMobile()
- Parse the comma-separated attributes within a specified string. spUtil - parseAttributes(String attributes)
- Watch for updates to a table or filter and returns the value from the callback function. spUtil - recordWatch(Object $scope, String table, String filter, Function callback)
- Call the server and replaces the current **options** and **data** with the server response. spUtil - refresh(Object $scope)
- Scroll to the element with the specified selector, over a specified period of time. spUtil - scrollTo(String selector, Number time)
- Update the header breadcrumbs. spUtil - setBreadCrumb(Object $scope, Array breadcrumbs)
- Set a user preference. spUtil - setPreference(String pref, String value)
- Update the search page. spUtil - setSearchPage(String searchPage)
- Update the data object on the server within a given scope. spUtil - update(Object $scope)

For additional information on widgets, see Service Portal widgets.

spUtil - addErrorMessage(String message)

Displays a notification error message.

Parameters

Name	Type	Description
message	String	Error message to display.

Returns

Type	Description
void	

```
spUtil.addErrorMessage("There has been an error processing your
 request")
```

spUtil - addInfoMessage(String message)

Displays a notification info message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
message	String	Message to display.

Returns

Type	Description
void	

```
spUtil.addInfoMessage("Your order has been placed")
```

spUtil - addTrivialMessage(String message)

Displays a trivial notification message.

Trivial messages disappear after a short period of time.

Parameters

Name	Type	Description
message	String	Message to display.

Returns

Type	Description
void	

```
spUtil.addTrivialMessage("Thanks for your order")
```

spUtil - createUid()

Create a unique identifier.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A unique 32 character ID.

spUtil - get(String widgetId Object data)

Embeds a widget model in a widget client script.

The callback function returns the full widget model. For additional information on widgets, see Service Portal widgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
widgetId	String	Widget ID or sys_id of the widget to embed.
data	Object	Optional. Name/value pairs of parameters to pass to the widget model.

Returns

Type	Description
Object	Model of the embedded widget.

Without data passed.

```
spUtil.get("widget-cool-clock").then(function(response) {
  c.coolClock = response;
});
```

With data passed.

```
spUtil.get('pps-list-modal', {title: c.data.editAllocations,
  table: 'resource_allocation',
  queryString: 'GROUPBYuser^resource_plan=' + c.data.sysId,
  view: 'resource_portal_allocations' }).then(function(response)
 {
    var formModal = response;
    c.allocationListModal = response;
  });
```

spUtil - getHeaders()

Retrieves all headers to use for API calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	All headers to use for API calls.

spUtil - getHost()

Returns the complete host domain.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The complete host domain, for example `hi.servicenow.com`

spUtil - getPreference(String preference, Function callback)

Executes the callback with User Preference response by passing the preference name.

Parameters

Name	Type	Description
preference	String	Name of the preference.
callback	Function	Define the callback function.

Returns

Type	Description
void	

spUtil - getURL()

Returns the current service portal URL information.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Current service portal URL.

spUtil - format(String template, Object data)

Formats a string that contains variables.

Use this method as an alternative to string concatenation.

Parameters

Name	Type	Description
template	String	String template that contains values for variable substitution.
data	Object	Object containing the values for the variables defined in the template string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	String containing the variable values instead of the variable nomenclature.

```
spUtil.format('An error ocurred: {error} when loading {widget}',
 {error: '404', widget: 'sp-widget'})
```

Output:

```
'An error occurred: 404 when loading sp-widget'
```

spUtil - isMobile()

Checks if the current client is a mobile device.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current client is a mobile device. Valid values: • true: Current client is a mobile device. • false: Current client is not a mobile device.

spUtil - parseAttributes(String attributes)

Parses the comma-separated attributes within a specified string.

Parameters

Name	Type	Description
attributes	String	String containing comma separated attributes, such as the Attributes field of a dictionary record.

Returns

Type	Description
Array	Array of objects containing the parsed attributes.

```
function getRefQualElements() {
  var refQualElements = [];
  if (field && field.attributes &&
 field.attributes.indexOf('ref_qual_elements') > -1) {
    var attributes = spUtil.parseAttributes(field.attributes);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    refQualElements =
 attributes['ref_qual_elements'].split(';');
  }
  return refQualElements;
}
```

spUtil - recordWatch(Object $scope, String table, String filter, Function callback)

Watches for updates to a table or filter and returns the value from the callback function.

Allows a widget developer to respond to table updates in real-time. For instance, by using *`recordWatch()`*, the Simple List widget can listen for changes to its data table. If records are added, removed, or updated, the widget updates automatically.

Note: When passing the `$scope` argument into the *`recordWatch()`* function, inject `$scope` into the parameters of your client script function.

Parameters

Name	Type	Description
$scope	Object	Scope of the data object updated by the callback function.
table	String	Watched table.
filter	String	Filter for fields to watch.
callback	Function	Optional. Parameter to define the callback function.

Returns

Type	Description
Promise	Return value of the callback function.

```
//A simple recordWatch function.
spUtil.recordWatch($scope, "live_profile", "sys_id=" +
 liveProfileId);

//In a widget client script
function(spUtil, $scope) {
  /* widget controller */
  var c =this;

  // Registers a listener on the incident table with the filter
 active=true,
  // meaning that whenever something changes on that table with
 that filter,
  // the callback function is executed.
  // The callback function takes a single parameter 'response',
 which contains
  // the property 'data'. The 'data' property contains
 information about the changed record.
  spUtil.recordWatch($scope, "incident", "active=true",
 function(response) {

    // Returns the data inserted or updated on the table
    console.log(response.data);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    });
}
```

spUtil - refresh(Object $scope)

Calls the server and replaces the current **options** and **data** with the server response.

Calling `spUtil.refresh()` is similar to calling `server.refresh()`. However, when you call `spUtil.refresh()`, you can define the $scope object.

Parameters

Name	Type	Description
$scope	Object	Scope defined for the update.

Returns

Type	Description
Object	Updated options and data objects.

spUtil - scrollTo(String selector, Number time)

Scrolls to the element with the specified selector, over a specified period of time.

Parameters

Name	Type	Description
selector	String	Selector to scroll to.
time	Number	Time taken to scroll to the specified selector. Unit: Milliseconds

Returns

Type	Description
void	

spUtil - setBreadCrumb(Object $scope, Array breadcrumbs)

Updates the header breadcrumbs.

Parameters

Name	Type	Description
$scope	Object	Scope defined for the table.
breadcrumbs	Array	Conditions used to create the breadcrumb filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

spUtil - setPreference(String pref, String value)

Sets a user preference.

Parameters

Name	Type	Description
pref	String	Preference name
value	String	Preference value

Returns

Type	Description
void	

spUtil - setSearchPage(String searchPage)

Updates the search page.

Parameters

Name	Type	Description
searchPage	String	Name of the search page.

Returns

Type	Description
void	

spUtil - update(Object $scope)

Updates the data object on the server within a given scope.

This method is similar to `server.update()`, but includes a $scope parameter that defines the scope to pass over.

Parameters

Name	Type	Description
$scope	Object	Scope defined for the update.

Returns

Type	Description
Object	Updated data object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example includes a P1 widget that watches for changes to the state field and uses a filter to watch all active P1s and let the callback function determine whether to refresh the data. The *data.changes* property contains an array of any updated fields. If the state of any fields have changed, the data is updated in the widget.

```
var q = "priority=1^active=true^EQ";
spUtil.recordWatch($scope, "incident", q, function(event, data)
 {
   if (data.changes.includes("state")) { // only update if state
 was updated.
      spUtil.update($scope);
   }
});
```

StopWatch - Client

The *StopWatch* API provides methods to measure the duration of operations.

You can use this API in client-side scripts using *ListV2* and *ListV3* APIs.

StopWatch - StopWatch()

Creates an instance of the StopWatch class.

Uses the current time as the start time.

Parameters

Name	Type	Description
None		

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");

sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

StopWatch - StopWatch(Date initialDate)

Creates an instance of the StopWatch class using the specified date as the initial value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
initialDate	Date	The initial date for the object.

StopWatch - getTime()

Returns the number of milliseconds since the timer started.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Time since the timer started. Unit: Milliseconds

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");

sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

StopWatch - restart()

Resets the timer start to the current time.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");

sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

StopWatch - toString()

Returns the elapsed time.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Elapsed time. Format: HH:MM:SS.SSS

```
var sw = new StopWatch();

// some slow code here
for(var i=0,j=1;i<100000000;i++) {
    j=Math.sqrt(i*i*j);
}

if (sw.getTime() > 500)
    console.log("Long running script. Execution time: [" +
 sw.toString() + "]");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
sw.restart();

// some faster code
for(i=0,j;i<100000;i++) {
    j= i + Math.random() * i;
}

console.log("Finished in: " + sw.getTime() + "ms");
sw.stop();
```

Client Next Experience API reference

This reference contains Glide client-side JavaScript APIs with options and compatibility in Configurable Workspace in the Next Experience UI. You can use the classes and methods along with parameters, descriptions, and examples to help control the end-user experience.

g_modal (Next Experience) - Client

The *g_modal* API enables you to display a modal window to enhance application functionality.

Use this API to display modals in workspaces.

Using this API you can:

- Display input type fields in a modal window.
- Show something in a frame such as a UI page or external link.
- Perform an action on user confirmation.
- Load a component.
- Use HTML to populate the contents of a modal.

g_modal (Next Experience) - alert(String title, String message, Function callback, style Object)

Displays an alert message relating to a UI action.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: Alert
message	String	Message to display in the modal body. **Note:** If you only pass one parameter, the method treats it as the *message* parameter.
callback	Function	Optional. Function to call after the form has been submitted and processed on the server. The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *action_verb*: Name of the UI action executed. Examples: ○ sysverb_cancel (Cancel button) ○ sysverb_insert (Submit button) ○ sysverb_save (Save button) • *sys_id*: Sys_id of the affected record. • *table*: Name of the table containing the record. • *displayValue*: Value that appears on the form. Default: No additional processing

style	Object	Optional. Style of the confirmation button to display in the modal.
		`"style": {`
		`  "buttonTitle": "String",`
		`  "buttonType": "String"`
		`}`

style.buttonTitle	String	Optional. Text to display on the confirmation button. Default: OK
style.buttonType	String	Optional. Type of confirmation button to display. Default: default

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise. If a *callback* parameter isn't passed, the method always returns success.

The following code example shows how to call this method to display an alert message 'Only the assigned to can end this action.'.

```
function onClick(g_form) {

  if (g_user.userID != g_form.getValue('assigned_to')) {
    g_modal.alert('Only the assigned to can end this action.');
    return;
  }

  var msg = getMessage("Are you sure you want to take this
 action?");
  g_modal.confirm(getMessage("Confirmation"), msg, function
 (confirmed) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    if (confirmed) {
      g_form.setValue('state', 'closed_complete');
      g_form.save();
    }
  });

  return false;
}
```

g_modal (Next Experience) - confirm(String title, String message, Function callback, style Object)

Displays a confirm message relating to a UI action.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: Confirm
message	String	Message to display in the modal body. **Note:** If you only pass one parameter, the method treats it as the *`message`* parameter.
callback	Function	Optional. Function to call after the form has been submitted and processed on the server. The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where: • *`action_verb`*: Name of the UI action executed. Examples: ○ sysverb_cancel (Cancel button) ○ sysverb_insert (Submit button) ○ sysverb_save (Save button) • *`sys_id`*: Sys_id of the affected record. • *`table`*: Name of the table containing the record. • *`displayValue`*: Value that appears on the form. Default: No additional processing

style	Object	Optional. Style of the confirm and cancel buttons to display in the modal.
		`"style": {`
		`  "cancelTitle": "String",`
		`  "cancelType": "String",`
		`  "confirmTitle": "String",`
		`  "confirmType": "String"`
		`}`

style.cancelTitle	String	Optional. Text to display on the cancel button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: Cancel
style.cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
style.confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
style.confirmType	String	Optional. Type of confirm button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: default

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise. If a *callback* parameter isn't passed, the method always returns success.

The following code example shows how to call this method to display the confirmation message "Are you sure you want to take this action?"

```
function onClick(g_form) {

  if (g_user.userID != g_form.getValue('assigned_to')) {
    g_modal.alert('Only the assigned to can end this action.');
    return;
  }

  var msg = getMessage("Are you sure you want to take this
 action?");
  g_modal.confirm(getMessage("Confirmation"), msg, function
 (confirmed) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    if (confirmed) {
      g_form.setValue('state', 'closed_complete');
      g_form.save();
    }
  });

  return false;
}
```

Output:

g_modal (Next Experience) - confirmDestroy(String title, String message, Function callback, style Object)

Displays a confirm message related to a UI action, with the confirm button displaying a destructive style.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: Confirm
message	String	Message to display in the modal body. **Note:** If you only pass one parameter, the method treats it as the *`message`* parameter.
callback	Function	Optional. Function to call after the form has been submitted and processed on the server. The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		• *action_verb*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *sys_id*: Sys_id of the affected record.
		• *table*: Name of the table containing the record.
		• *displayValue*: Value that appears on the form.
		
		Default: No additional processing

style	Object	Optional. Style of the confirm and cancel buttons to display in the modal.
		`"style": {`
		`  "cancelTitle": "String",`
		`  "cancelType": "String",`
		`  "confirmTitle": "String",`
		`  "confirmType": "String"`
		`}`

style.cancelTitle	String	Optional. Text to display on the cancel button. Default: Cancel
style.cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
style.confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
style.confirmType	String	Optional. Type of confirm button to display. Default: destructive

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	If a *callback* parameter isn't passed, the method always returns success.

This example displays a confirmation modal with a red **Cancel** button and a blue **Confirm** button.

```
function callback(value){
  value ? console.log("confirm destroy callback") :
 console.log('cancel callback');
}

function onClick(g_form) {
  g_modal.confirmDestroy("Confirm Destroy Title", "Confirm
 Destroy Message", callback, {
    cancelTitle: "Cancel",
    cancelType: "destructive",
    confirmTitle: "Confirm",
    confirmType: "confirm"
  })

  .then(

    function test() {
      g_form.setValue("state', '7");
    },

    function fail() {
      g_form.setValue("state", 2)
    }
  )
}
```

g_modal (Next Experience) - richText(String title, String richText, Function callback, String size, String cancelTitle, String confirmTitle, String cancelType, String confirmType, Object resizableConfig)

Displays a modal that uses passed HTML to generate the content within the modal.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: blank
richText	String	HTML content to display in the modal. **Note:** This method removes `<script>` tags, inline JavaScript, and other elements that might pose security exploits.
callback	Function	Optional. Function to call after the form has been submitted and processed on the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where: • *`action_verb`*: Name of the UI action executed. Examples: ○ sysverb_cancel (Cancel button) ○ sysverb_insert (Submit button) ○ sysverb_save (Save button) • *`sys_id`*: Sys_id of the affected record. • *`table`*: Name of the table containing the record. • *`displayValue`*: Value that appears on the form. Default: No additional processing
cancelTitle	String	Optional. Text to display on the cancel button. Default: Cancel
confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
confirmType	String	Optional. Type of confirm button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: default

resizableConfig	Object	Optional. Configuration parameters for resizing the associated modal. If you don't want users to be able to resize the modal, don't pass this parameter.
		`resizableConfig:`
		`  {`

Parameters (continued)

Name	Type	Description

		`enableResizable: Boolean,`
		`resizableMaxHeight: Number,`
		`resizableMaxWidth: Number,`
		`resizableMinHeight: Number,`
		`resizableMinWidth: Number`
		`}`
		
		Default: Modal is not resizable.

resizableConfig.enableResizable	Boolean	Flag that indicates whether users can resize the associated modal. Valid values: • true: Modal is resizable. Resize handles appear on the borders of the modal. • false: Modal isn't resizable. Default: false
resizableConfig.resizableMaxHeight	Number	Maximum resizable height of the modal. Data type: Number Unit: Pixels Default: Window's height.
resizableConfig.resizableMinHeight	Number	Minimum resizable height of the modal. Data type: Number Unit: Pixels Default: 600px
resizableConfig.resizableMaxWidth	Number	Maximum resizable width of the modal. Data type: Number Unit: Pixels Default: Window's width
resizableConfig.resizableMinWidth	Number	Minimum resizable width of the modal. Data type: Number Unit: Pixels Default: 380px

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise. If a *callback* parameter isn't passed, the method always returns success.

The following code example shows how to display the text "This is rich text" in bold in the associated modal.

```
function callback(value){
  value ? console.log("confirm richtext callback") :
 console.log('cancel rich text callback');
}

function onClick(g_form) {
  g_modal.richText("RichTextTitle", "<b>This is rich text</b>",
 callback, {
    cancelTitle: "Rich Cancel",
    confirmTitle: "Rich Confirm"
  })

  .then(
    function test() {
      g_form.setValue("state', '7");
    },

    function fail() {
      g_form.setValue("state", 2)
    }
  )
}
```

Output:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g_modal (Next Experience) - showFields(String title, Array fields, Function callback, String size, String cancelTitle, String confirmTitle, String cancelType, String confirmType, Object resizableConfig, String instruction)

Displays a modal window that contains the specified fields and an **OK** and **Cancel** buttons by default.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: " "

fields	Array of Objects	List of fields to display in the modal. Each field is defined in a separate object. The *`fields`* parameters that you pass are dependent on the type of field (*`fields.type`*) specified.
		
		The fields display in the modal in the same order as they appear in the array.
		
		`fields: [`
		`  {`
		`  autoFocus: Boolean,`
		`  choices: "Array",`
		`  display_value_list: "String",`
		`  enableMentions: Boolean,`
		`  label: "String",`
		`  mandatory: Boolean,`
		`  name: "String",`
		`  referringTable: "String",`
		`  referringRecordId: "String",`
		`  type: "String",`
		`  value: "String"`
		`  }`
		`]`

fields.autoFocus	Boolean	Optional. Flag that indicates whether the field should default to auto focus when the modal loads. Only one field should have this value set to true. Valid values: • true: Auto focus. • false: Don't auto focus. Default: false

fields.choices	Array of Objects	Required if the *`fields.type`* parameter is set to `choice`. List of options to display in the associated list field. Each entry in the choice list must be specified as a separate object in the `choices` array.
		
		For example:
		
		`choices: [`
		`  {`
		`  displayValue: "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		`value: "String`
		`}`
		`]`

fields.choices.displayValue	String	Optional. Value to display in the list field. Default: Blank
fields.choices.value	String	Optional. Internal value of the value displayed in the list field. Default: Null
fields.display_value_list	Array of Strings	Optional. List of strings to display. For example, `['item1', 'item2', 'item3']`.
fields.enableMentions	Boolean	Required if *`fields.type`* is `html`. Flag that indicates whether you can mention a user in the modal. Valid values: • true: Users can be mentioned in the modal. • false: Users can't be mentioned in the modal. Default: false
fields.label	String	Optional. Text to display as the label for this field in the modal. Default: Blank
fields.mandatory	Boolean	Optional. Flag that indicates whether the field is mandatory. Valid values: • true: Field is mandatory. • false: Field is optional. Default: false
fields.name	String	Internal name of the field. If the *`fields.type`* parameter is set to `reference` or `glide_list`, it is the reference field on the current record being used to search.
fields.referringTable	String	Required if the *`fields.type`* parameter is set to `reference` or `glide_list`. Name of the table that you are referencing from. For example: `incident`
fields.referringRecordId	String	Required if the *`fields.type`* parameter is set to `reference`. Sys_id of the record that you're calling in the UI action form.
fields.type	String	Type of field to display in the modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Each field type has a set of *fields.<>* elements that can be passed. The values in brackets [ ] below are the *fields* elements supported by the associated *fields* type. Valid values: • boolean [autofocus, label, mandatory, name, value] • choice [autofocus, choices, label, mandatory, name, value] • domain_id [label, referringRecordId, referringTable, value] • glide_list [autofocus, display_value_list, label, name, mandatory, referringRecordId, referringTable, value] • html [autofocus, enableMentions, label, mandatory, name, referringRecordId, referringTable, value] • reference [autofocus, label, mandatory, name, reference, referringRecordId, referringTable, value] • string [autofocus, label, mandatory, name, value] • textarea [autofocus, label, mandatory, name, value]

fields.value	String	Optional. Value to display in the field.
		
		For example, for a choice field you might display a user prompt:
		
		`value: getMessage(' -- Select -- ')`
		
		Or for a reference field you might display the value of a field on the associated form:
		
		`g_form.getValue('caller_id')`
		
		Default: Blank

callback	Function	Optional. Function to call after the form has been submitted and processed on the server.
		
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		
		• *action_verb*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *sys_id*: Sys_id of the affected record.
		• *table*: Name of the table containing the record.
		• *displayValue*: Value that appears on the form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: No additional processing
size	String	Optional. Size of the modal. Valid values: • fw: Full-width • sm: 420px by 315px • md: 600px by 450px • lg: 800px by 600px **Note:** If a pixel value is specified, the modal takes up the whole browser. For example, passing "1px" makes the modal full-width. Default: sm
cancelTitle	String	Optional. Text to display on the cancel button. Default: Cancel
confirmTitle	String	Optional. Text to display on the confirm button. Default: OK
cancelType	String	Optional. Type of cancel button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: confirm
confirmType	String	Optional. Type of confirm button to display. Valid values: • confirm (blue background) • default (white background) • destructive (red background) Default: default

resizableConfig	Object	Optional. Configuration parameters for resizing the associated modal. If you don't want users to be able to resize the modal, don't pass this parameter.
		
		`resizableConfig:`
		`  {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		`enableResizable: Boolean,`
		`resizableMaxHeight: Number,`
		`resizableMaxWidth: Number,`
		`resizableMinHeight: Number,`
		`resizableMinWidth: Number`
		`}`
		
		Default: Modal is not resizable.

resizableConfig. enableResizable	Boolean	Flag that indicates whether users can resize the associated modal. Valid values: • true: Modal is resizable. Resize handles appear on the borders of the modal. • false: Modal isn't resizable. Default: false
resizableConfig. resizableMaxHeight	Number	Maximum resizable height of the modal. Data type: Number Unit: Pixels Default: Window's height.
resizableConfig. resizableMinHeight	Number	Minimum resizable height of the modal. Data type: Number Unit: Pixels Default: 600px
resizableConfig. resizableMaxWidth	Number	Maximum resizable width of the modal. Data type: Number Unit: Pixels Default: Window's width
resizableConfig. resizableMinWidth	Number	Minimum resizable width of the modal. Data type: Number Unit: Pixels Default: 380px
instruction	String	Optional. Instructions to display in the modal. This content appears below the modal title and above the first field in the modal.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: No instructions displayed

Returns

Type	Description
Promise	If a *callback* parameter is passed, returns promise if successful, error otherwise. If a *callback* parameter isn't passed, the method always returns success.

The following example shows prompting a user for a reason using a modal window, and then passing it back to the work notes field on the record. The *then()* method returns a promise, which returns what the modal returns; *fieldValues* in this case. The work notes field on the client-side, with the field value, are in the *updatedFields* array. Since only one field is returned, the example assumes an index position of *0*.

```
function onClick(g_form) {
    g_modal.showFields({
        title: "Enter your reason",
        fields: [{
            type: 'textarea',
            name: 'work_notes',
            label: getMessage('Reason'),
            mandatory: true
        }],
        size: 'lg'
    }).then(function(fieldValues) {
        g_form.setValue('work_notes',
 fieldValues.updatedFields[0].value);
        g_form.save();
    });
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example expands on the example above, adding choice and a reference fields.

```
function onClick(g_form) {

    var fields = [{
        type: 'textarea',
        name: 'work_notes',
        label: getMessage('Reason'),
        mandatory: true
    },
    {
        type: 'choice',
        name: 'reason_code',
        label: getMessage('Reason code'),
        value: getMessage(' -- Select -- '),
        choices: [
          {
            displayValue: 'Duplicate',
            value: 'duplicate'
          },
          {
            displayValue: 'Canceled',
            value: 'canceled'
          }
        ],
        mandatory: true
    },
    {
        type: 'reference',
        name: 'caller_id',
        label: getMessage('What is your name?'),
        mandatory: true,
        reference: 'sys_user',
        referringTable: 'incident',
        referringRecordId: g_form.getUniqueValue(),
  value: g_form.getValue('caller_id'),
  displayValue: g_form.getDisplayValue('caller_id')
    }
  ];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  g_modal.showFields({
    title: "Enter your reason",
    fields: fields,
    size: 'lg'
  }).then(function(fieldValues) {
        g_form.setValue('work_notes',
 fieldValues.updatedFields[0].value);
        g_form.setValue('caller_id',
 fieldValues.updatedFields[2].value);
        g_form.save();
  });
}
```

Output:

The following example shows how to use this method to display a modal that contains textarea, choices, reference, glide_list, and domain_id field types.

```
function onClick(g_form) {
  var fields = [
    {
      type: 'textarea',
      name: 'work_notes',
      label: getMessage('Reason'),
      mandatory: true
    },
    {
      type: 'choice',
      name: 'reason_code',
      label: getMessage('Reason code'),
      value: getMessage(' -- Select -- '),
      choices: [
        {
          displayValue: 'Duplicate',
          value: 'duplicate'
        },
        {
          displayValue: 'Canceled',
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          value: 'canceled'
        }
      ],
      mandatory: true
    },
    {
      type: 'reference',
      name: 'caller_id',
      label: getMessage('What is your name?'),
      mandatory: true,
      referringTable: 'incident',
      referringRecordId: g_form.getUniqueValue(),
        value: g_form.getValue('caller_id')
    },
     {
      type: 'glide_list',
        name: 'watch_list',
        label: 'A list',
        mandatory: false,
      referringTable: 'incident',
      referringRecordId: g_form.getUniqueValue(),
        value: '628,9ee1,f298d',
        display_value_list: ['item1', 'item2', 'item3']
    },
     {
        label: 'Domain ID',
        type: 'domain_id',
        value: 'c90d4b084a362312013398f051272c0d',
        displayValue: 'TOP/ACME',
        referringRecordId: '552c48888c033300964f4932b03eb092',
        referringTable: 'incident'
     }
  ];

  g_modal.showFields({
    title: "Enter your reason",
    fields: fields,
    size: 'lg'
  }).then(function(fieldValues) {

  });
}
```

g_modal (Next Experience) - showFrame(String title, String url, Function callback, String size, String height, String modalHeight, String modalWidth, Boolean showClose, String autoCloseOn, Boolean hasLoadingMessage, Boolean closeOnEscape, Boolean hideOverlay, Object resizableConfig)

Displays a modal that uses a link to an external URL or UI page for its content.

Parameters

Name	Type	Description
title	String	Optional. Title to display in the header of the modal. Default: blank

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
url	String	URL of the information to load in the IFrame. **Note:** If only one argument is passed, it is treated as the *`url`* parameter.

callback	Function	Optional. Function to call after the form has been submitted and processed on the server.
		
		The callback function has the form `callbackFunction(String action_verb, String sys_id, String table, String displayValue)` where:
		• *`action_verb`*: Name of the UI action executed. Examples:
		  ○ sysverb_cancel (Cancel button)
		  ○ sysverb_insert (Submit button)
		  ○ sysverb_save (Save button)
		• *`sys_id`*: Sys_id of the affected record.
		• *`table`*: Name of the table containing the record.
		• *`displayValue`*: Value that appears on the form.
		
		Default: No additional processing

size	String	Optional. Size of the modal. Valid values: • fw: Full-width • sm: 420px by 253.25px • md: 600px by 253.25px • lg: 800px x 254px Default: lg
height	String	Optional. Height of the content section in the modal. This value is in the format of "<number><unit>", such as "80%" or "300px". If you only pass a number, the method assumes the unit of measure is pixels. Valid units of measure: • % • em • px • vh Default: 100% or 153.75px

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
modalHeight	String	Optional. Height of the modal. This value is in the format of "<number><unit>", such as "80%" or "300px". If you only pass a number, the method assumes the unit of measure is pixels. Valid units of measure: • % • em • px • vh Default: 254px
modalWidth	String	Optional. Width of the modal. This value is in the format of "<number><unit>", such as "80%" or "300px". If you only pass a number, the method assumes the unit of measure is pixels. Valid units of measure: • % • em • px • vh Default: 800px
showClose	Boolean	Optional. Flag that indicates whether the close icon (X) appears in the upper-right corner of the modal. Valid values: • true: Display the close icon. • false: Don't display the close icon. Default: true
autoCloseOn	String	Optional. Condition on which to automatically close the modal. Valid values: • EMPTY_BODY • URL_CHANGED Default: Don't automatically close modal.
hasLoadingMessage	Boolean	Optional. Flag that indicates whether to display the **Loading...** message in the content slot of the modal before loading the modal content. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Display loading message. • false: Don't display the loading message. The content slot of the modal is empty before content is loaded. **Note:** You can't customize the “Loading...” message; only configure whether it displays or not. Default: false
closeOnEscape	Boolean	Optional. Flag that indicates whether the user can close the modal by pressing the escape key. Valid values: • true: Modal closes when the user presses the escape key. • false: Modal doesn't close when the user presses the escape key. Default: false
hideOverlay	Boolean	Optional. Flag that indicates whether to display the transparent gray overlay over the record page. Valid values: • true: Hide the transparent gray overlay over the record page. • false: Display the transparent gray overlay over the record page. Default: false
resizableConfig	Object	Optional. Configuration parameters for resizing the associated modal. If you don't want users to be able to resize the modal, don't pass this parameter. `resizableConfig: { enableResizable: Boolean, resizableMaxHeight: Number, resizableMaxWidth: Number, resizableMinHeight: Number, resizableMinWidth: Number }` Default: Modal is not resizable.
resizableConfig.enableResizable	Boolean	Flag that indicates whether users can resize the associated modal. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Modal is resizable. Resize handles appear on the borders of the modal. • false: Modal isn't resizable. Default: false
resizableConfig.resizableMaxHeight	Number	Maximum resizable height of the modal. Data type: Number Unit: Pixels Default: Window's height.
resizableConfig.resizableMinHeight	Number	Minimum resizable height of the modal. Data type: Number Unit: Pixels Default: 600px
resizableConfig.resizableMaxWidth	Number	Maximum resizable width of the modal. Data type: Number Unit: Pixels Default: Window's width
resizableConfig.resizableMinWidth	Number	Minimum resizable width of the modal. Data type: Number Unit: Pixels Default: 380px

Returns

Type	Description
Promise	Returns promise if successful, error otherwise. This promise is resolved when the IFrame modal is closed.

The following example shows how to display a KB article in a model using the sys_id of the KB article record and a base URL.

```
function onClick(g_form) {
  var kbId = '24d9243187032100deddb882a2e3ec33'; //sysId of KB
 article
  g_modal.showFrame({
    url: '/kb_view.do?sys_kb_id=' + kbId,
    title: 'Test Knowledge Article',
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    size: 'lg',
    height: 500px
  });
}
```

Output:

This example shows how to use an embedded UI page when creating a modal. It uses *`window.parent.postMessage()`* in the UI page to pass data from the iFrame back to the workspace since the *`g_form`* API is not accessible in a UI page when it is in the iFrame.

```
function onClick(g_form) {
  function proposeMIC(data) {
    var workNotes = data.msg + "\n" + data.workNotes;
    var notes = g_form.getValue('work_notes') + ' ' + workNotes;
    var bi = g_form.getValue('business_impact') + ' ' +
 data.businessImpact;
    g_form.setValue('work_notes', notes.trim());
    g_form.setValue('business_impact', bi.trim());
    g_form.submit('sysverb_mim_propose');
  }

  function openPopup() {
    if(!g_form.getControl('work_notes')) {
      getMessage('Cannot propose major incident as "Worknotes"
 is not visible', function(msg) {
  g_form.addErrorMessage(msg);
      });
      return false;
    }

    var url =
 "/sn_major_inc_mgmt_mim_propose.do?sysparm_stack=no&sysparm_wor
kspace=" + true;
    g_modal.showFrame({
      title: getMessage("Propose Major Incident"),
      url: url,
      size: 'lg',
```

```
      autoCloseOn: 'URL_CHANGED',
      callback: function (ret, data) {
        if (ret)
          proposeMIC(data);
      }
    });
  }

  openPopup();
}
```

Output:

GlideForm (Next Experience) - Client

The `GlideForm` API provides methods to customize forms in the Next Experience UI Framework.

Only use `GlideForm` methods on the client. You can use these methods to make custom changes to the form view of records. All validation of examples was done using client scripts.

You can also use some of these methods in other client scripts (such as Catalog Client Scripts or Wizard Client Scripts), but you must first test this to determine whether they will work as expected.

Note: The methods `getControl()`, `getHelpTextControl()`, `getElement()`, and `getFormElement()` are deprecated for mobile devices. For information on using `GlideForm` for mobile, see Mobile Client GlideForm (g_form) Scripting and Migration.

There is no constructor for the `GlideForm` class. Access `GlideForm` methods using the `g_form` global object.

GlideForm (Next Experience) - addAdditionalParams(String parameterName, String value)

Adds a hidden input with given name and value parameter to the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
parameterName	String	Name of the parameter to add.
value	String	Value of the parameter to add.

Returns

Type	Description
None	

The following example customizes the behavior of the **Update** button on the **Incident** form so that users are redirected back to the list view in the default view, but remain on the record in the **Advanced View** after saving.

```
// Create an onLoad client script for the incident table with
 the following script.

function onLoad() {
   g_form.addAdditionalParam('view_name', g_form.getViewName());
}
```

Edit the global `sysverb_update` UI action and add the following script.

```
current.update();
if (RP.getParameterValue("view_name") == "advanced") {
   // Keep the record open if saving from the advanced view
   action.openGlideRecord(current);

// To test:
// Open the incident list and edit an incident. Click Update to
 be redirected to the list.
// Open /incident_list.do?sysparm_view=advanced and edit an
 incident. Click Update to be redirected back to the edited
 incident.
```

GlideForm (Next Experience) - addChoice(String fieldName, String choiceValue, String choiceLabel)

Adds a choice to the end of a specified choice list field.

Parameters

Name	Type	Description
fieldName	String	Name of the field in which to add the choice field option.
choiceValue	String	Value to store in the database.
choiceLabel	String	Value to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
g_form.addChoice('priority', '6', '6 - Really Low');
```

GlideForm (Next Experience) - addDecoration(String fieldName, String icon, String title)

Adds an icon on a field's label.

Adding the same item twice is prevented; however, you can add the same icon with a different title.

Note: This method is not supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	Field name.
icon	String	Name of the icon to show next to the specified field. Valid values: • icon-add • icon-alert • icon-book • icon-book-open • icon-calendar • icon-cards • icon-cart-full • icon-catalog • icon-check-circle • icon-cog • icon-comment • icon-console • icon-dashboard • icon-database • icon-delete • icon-drawer • icon-edit • icon-filter • icon-folder • icon-form • icon-help

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• icon-home • icon-image • icon-info • icon-label • icon-lightbulb • icon-list • icon-livefeed • icon-locked • icon-mail • icon-mobile • icon-new-ticket • icon-paperclip • icon-power • icon-script • icon-search • icon-sort-ascending • icon-star • icon-star-empty • icon-tab • icon-trash • icon-tree • icon-tree-right • icon-user • icon-user-group • icon-view
title	String	Title for the icon.

Returns

Type	Description
None	

```
g_form.addDecoration('caller_id', 'icon-star', 'preferred
 member');
```

GlideForm (Next Experience) - addDecoration(String fieldName, String icon, String title, String color)

Adds an icon on a field's label.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adding the same item twice is prevented; however, you can add the same icon with a different title.

Note: This method is not supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	Field name.
icon	String	Name of the icon to show next to the specified field. Valid values: • icon-add • icon-alert • icon-book • icon-book-open • icon-calendar • icon-cards • icon-cart-full • icon-catalog • icon-check-circle • icon-cog • icon-comment • icon-console • icon-dashboard • icon-database • icon-delete • icon-drawer • icon-edit • icon-filter • icon-folder • icon-form • icon-help • icon-home • icon-image • icon-info • icon-label • icon-lightbulb • icon-list • icon-livefeed • icon-locked

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• icon-mail • icon-mobile • icon-new-ticket • icon-paperclip • icon-power • icon-script • icon-search • icon-sort-ascending • icon-star • icon-star-empty • icon-tab • icon-trash • icon-tree • icon-tree-right • icon-user • icon-user-group • icon-view
title	String	Title for the icon.
color	String	CSS color.

Returns

Type	Description
None	

```
g_form.addDecoration('caller_id', 'icon-star', 'Mark as
 Favorite', 'color-green');
```

GlideForm (Next Experience) - addErrorMessage(String message)

Displays the specified error message at the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Message to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
g_form.addErrorMessage('This is an error');
```

GlideForm (Next Experience) - addFormMessage(String message, String type, Object options)

Displays a floating form message at the top of the form detail section. The message doesn't cover UI actions.

See also:

- clearAllFormMessages()
- clearFormMessages()

Parameters

Name	Type	Description
message	String	Message to display.
type	String	Type of message. Valid values: • error • info • warning
options	Object	Optional. Buttons to add to the form message and any metadata needed to handle a button click. `{ buttons: [Array], meta: {Object} }`
options.buttons	Array	List of buttons to add to the form message. `buttons: [ { actionName: "String", label: "String" } ]`
options.buttons.actionName	String	Name used by the `FORM_MESSAGE_BUTTON_CLICKED` event handlers to determine the button that was clicked. For example, if you add a button with the *`actionName`* `assign_to_me`, you must create an event handler in UIB on the `FORM_MESSAGE_BUTTON_CLICKED` event that only executes when the *`actionName`* is `assigned_to_me`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
options.buttons.label	String	Text to display on the button.
options.meta	Object	Map of any metadata needed to handle the button click formatted as key-value pairs. `meta: { 'key': 'value' }` For example, for an **Assign to me** button the event handler needs the sys_id of the user to assign the record to.

Returns

Type	Description
None	

The following example shows how to add form messages of each type.

```
g_form.addFormMessage('info message','info');
g_form.addFormMessage('warning message','warning');
g_form.addFormMessage('error message','error');
g_form.addFormMessage('info2 message','info');
g_form.addFormMessage('warning2 message','warning');
g_form.addFormMessage('error2 message','error');
g_form.addFormMessage('Would you like to reassign this
 to yourself?', 'info', {buttons: [{label: "Assign to
 me", actionName: "assign_to_me"}], meta: {'userId':
 '46d44a23a9fe19810012d100cca80666'}});
```

GlideForm (Next Experience) - addInfoMessage(String message)

Adds the specified informational message to the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Message to display.

Returns

Type	Description
None	

```
g_form.addInfoMessage('The top five fields in this form are
 mandatory');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm (Next Experience) - addHighMessage(String message)

Displays a high priority message at the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Message to display on the form.

Returns

Type	Description
None	

The following example shows how to display a high priority message at the top of the form.

```
g_form.addHighMessage("This is a high priority message");
```

GlideForm (Next Experience) - addLowMessage(String message)

Displays a low priority message at the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Message to display on the form.

Returns

Type	Description
None	

The following example shows how to display a low priority message at the top of the form.

```
g_form.addLowMessage("This is a low priority message ");
```

GlideForm (Next Experience) - addModerateMessage(String message)

Displays a moderate priority message at the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Message to display on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to display a moderate priority message at the top of the form.

```
g_form.addModerateMessage(“This is a moderate priority
 message");
```

GlideForm (Next Experience) - addOption(String fieldName, String choiceValue, String choiceLabel)

Adds a choice to the end of a specified choice list field.

Parameters

Name	Type	Description
fieldName	String	Name of the field in which to add the choice field option.
choiceValue	String	Value to store in the database.
choiceLabel	String	Value to display.

Returns

Type	Description
None	

```
g_form.addOption('priority', '6', '6 - Really Low');
```

GlideForm (Next Experience) - addOption(String fieldName, String choiceValue, String choiceLabel, Number choiceIndex)

Adds a choice to the list field at the position specified.

Note: Duplicate list labels are not supported in Service Portal. For example, items with label text matching another label are ignored and not added to the list.

Parameters

Name	Type	Description
fieldName	String	Name of the field in which to add the choice field option.
choiceValue	String	Value to store in the database.
choiceLabel	String	Value to display.
choiceIndex	Number	Order of the choice in the list. The index is a zero-based array.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g_form.addOption('priority', '2.5', '2.5 - Moderately High', 3);
```

GlideForm (Next Experience) - addSuccessMessage(String message)

Displays a message confirming a successful action at the top of the form.

This message appears for approximately four seconds and then disappears. This timeout is not configurable at this time.

Parameters

Name	Type	Description
message	String	Success message to display.

Returns

Type	Description
None	

The following example shows how to display a message confirming a success message at the top of the form.

```
g_form.addSuccessMessage("This is a success message");
```

GlideForm (Next Experience) - clearAllFormMessages()

Removes all form messages of any type.

See also:

- GlideForm (Next Experience) - addFormMessage(String message, String type, Object options)
- GlideForm (Next Experience) - clearMessages()
- clearFormMessages()

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to clear all messages from the form.

```
g_form.clearAllFormMessages();
```

GlideForm (Next Experience) - clearChoices(String fieldName)

Removes all choices in a specified choice list field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

fieldName	String	Name of the field for which to clear the full list of choices.

Returns

Type	Description
None	

```
g_form.clearChoices('priority');
```

GlideForm (Next Experience) - clearFormMessages(String type)

Removes all form messages of a specified type.

See also:

- GlideForm (Next Experience) - addFormMessage(String message, String type, Object options)
- GlideForm (Next Experience) - clearMessages()
- GlideForm (Next Experience) - clearAllFormMessages()

Parameters

Name	Type	Description
type	String	Type of message. Valid values: • error • info • warning

Returns

Type	Description
None	

The following example shows how to clear all error messages from the form.

```
g_form.clearFormMessages('error');
```

GlideForm (Next Experience) - clearMessages()

Removes all informational and error messages from the top of the form.

Removes informational and error messages added with `g_form.addInfoMessage()` and `g_form.addErrorMessage()`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
g_form.clearMessages();
```

GlideForm (Next Experience) - clearOptions(String fieldName)

Removes all options from the specified choice list.

Parameters

Name	Type	Description
fieldName	String	Name of the field for which to clear the choice options.

Returns

Type	Description
None	

```
g_form.clearOptions('priority');
```

GlideForm (Next Experience) - clearValue(String fieldName)

Removes any value(s) from the specified field.

Note: This method can't be used to update fields set to strict read only. If this method is called on strict read only fields, the field isn't updated and a warning is logged in the browser console. For more information, see Configuring read-only security options.

Parameters

Name	Type	Description
fieldName	String	Name of the field to clear.

Returns

Type	Description
None	

GlideForm (Next Experience) - disableAttachments()

Prevents file attachments from being added to the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

GlideForm (Next Experience) - disableChoice(String fieldName, String choiceValue)

Programmatically turns off a specific choice in the drop-down field, if the choice exists. No changes are made if the choice is already turned off.

Parameters

Name	Type	Description
fieldName	String	Field name of the choice to turn off. Data type: String
choiceValue	String	Value of the choice to turn off. Data type: String

Returns

Type	Description
Boolean	Flag that indicates whether the given choice is turned off or active in the form. Valid values: • true: Choice is turned off. • false: Option is already turned off or is not found. Data type: Boolean

The following example calls *`disableChoice()`* to turn off the loading_dock choice in the delivery_location form field.

```
if (g_form.getValue('address_type') == 'home') {
 g_form.disableChoice('delivery_location', 'loading_dock');
}

// Only itil_admin users can select the "Closed" option

function onLoad() {
 if (g_user.hasRole('itil_admin')) return;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 if (g_form.getValue('incident_state') != '7')
  g_form.disableChoice('incident_state', 7);

 if (g_form.getValue('state') != '7') {
  g_form.disableChoice('state', 7);
 }

}
```

GlideForm (Next Experience) - enableAttachments()

Allows file attachments to be added to the form. Shows the paper clip icon.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

GlideForm (Next Experience) - enableChoice(String fieldName, String choiceValue)

Programmatically enables a specific choice in the drop-down field, if the choice exists. No changes are made if the option is already enabled.

Parameters

Name	Type	Description
fieldName	String	Field name of the choice to enable.
choiceValue	String	Value of the choice to enable.

Returns

Type	Description
Boolean	Flag that indicates whether the given choice is successfully enabled. Valid values: • true: Choice is enabled. • false: Choice is already enabled or is not found. Data type: Boolean

The following example calls `enable()` to enable a new drop-down choice, `1`, in the `priority` form field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var shortDescription = g_form.getValue('shortDescription');

// Allow priority 1 selection if short description mentions
 security
if (shortDescription.includes('security')) {
 var p1Choice = g_form.getChoice('priority', '1');
 g_form.enableChoice('priority', '1');
}
```

GlideForm (Next Experience) - flash(String fieldName, String color, Number count)

Use to draw attention to a field. Flashes the specified color for a specified duration of time in the specified field.

This method is not supported by Service Catalog.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
fieldName	String	Field to highlight in the following format: `"<table-name>.<field-name>"`.
color	String	RGB color or acceptable CSS color.
count	Number	How long the label will flash. Valid values: • 2: Flashes for 1 second • 0: Flashes for 2 seconds • -2: Flashes for 3 seconds • -4: Flashes for 4 seconds

Returns

Type	Description
None	

```
g_form.flash("incident.number", "#FFFACD", 0);
```

GlideForm (Next Experience) - getActionName()

Returns the most recent action name, or, for a client script, the sys_id of the UI action clicked.

Note: Not available in Wizard client scripts.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Current action name or sys_id of the UI action clicked.

```
function onSubmit() {
   var action = g_form.getActionName();
   alert('You pressed ' + action);
}
```

GlideForm (Next Experience) - getAnnotations()

Returns a list of all annotations on a form.

Annotations are visual separators between form elements, or blocks of colored text used to highlight form elements. Use GlideForm (Next Experience) - getAnnotationByName(String name) to return a specific annotation by its name.

Parameters

Name	Type	Description
None		

Returns

Property	Description
Array of Objects	Content of the annotation. Data type: Array of Objects `[{content: "String", name: "String", visible: Boolean}]`
array.content	Text of the returned annotation. Data type: String
array.name	Name of the returned annotation. Data type: String Table location: Form Annotations [sys_ui_annotation], Field: **name**
array.visible	Flag that indicates whether the annotation is visible on the form. Valid values: • true: The annotation is visible. • false: The annotation isn't visible. Data type: Boolean

The following example first calls *getAnnotations()* to return all annotations in a form, and then calls *hideAnnotation()* to hide all annotations in the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
const annotations = getAnnotations();

/* returns:
[
    {
        "name": "test-annotation-msg-1",
        "visible": true,
        "content": "Test<input id=\"make_spacing_ok\"
 style=\"visibility:hidden; width:0px;\">"
    },
    {
        "name": "test-annotation-msg-2",
        "visible": true,
        "content": "Test 2<input id=\"make_spacing_ok\"
 style=\"visibility:hidden; width:0px;\">"
    }

]*/
annotations.forEach(function(annotation) {
 g_form.hideAnnotation(annotation.name);
});

// this script hides all annotations on the form.
```

GlideForm (Next Experience) - getAnnotationByName(String name)

Returns a form annotation of a given name.

Annotations are visual separators between form elements, or blocks of colored text used to highlight form elements. Use GlideForm (Next Experience) - getAnnotations() to return all annotations in a form.

Parameters

Name	Type	Description
name	String	The name of the annotation to return. Table: Form Annotations [sys_ui_annotation], Field: **Name**

Returns

Property	Description
Array of Objects	Content of the annotation. Data type: Array of Objects `[{content: "String", name: "String", visible: Boolean}]`
array.content	Text of the returned annotation. Data type: String
array.name	Name of the returned annotation. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Property	Description
	Table location: Form Annotations [sys_ui_annotation], Field: **name**
array.visible	Flag that indicates whether the annotation is visible on the form. Valid values: • true: The annotation is visible. • false: The annotation isn't visible. Data type: Boolean

The following example demonstrates how to use the *`getAnnotationByName()`* method to retrieve a form annotation according to its given name, test-annotation-msg-1.

```
  var sampleAnnotation =
g_form.getAnnotationByName("test-annotation-msg-1");

  /* returns:
  {
      "name": "test-annotation-msg-1",
      "visible": true,
      "content": "Test<input id=\"make_spacing_ok\"
style=\"visibility:hidden; width:0px;\">"
  }
  */
```

GlideForm (Next Experience) - getBooleanValue(String fieldName)

Returns a Boolean value for the specified field.

Parameters

Name	Type	Description
fieldName	String	Field to highlight in the following format: `"<table-name>.<field-name>"`.

Returns

Type	Description
Boolean	Returns false if the field value is false or undefined; otherwise returns true.

GlideForm (Next Experience) - getChoice(String fieldName, String choiceValue)

Returns an object with properties representing a given field and choice value.

Parameters

Name	Type	Description
fieldName	String	Field name of the choice to retrieve.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
choiceValue	String	Value of the choice to retrieve.

Returns

Property	Description
GlideFormChoice object or null	GlideFormChoice object for the specified field and choice value. Returns null if no matching choice exists. Data type: Object `("label", "value", "disabled", "index")`
GlideFormChoice.label	Read-only display text of the choice. Data type: String
GlideFormChoice.value	Read-only value of the choice. Data type: String
GlideFormChoice.disabled	Flag that indicates whether the choice is turned off in the form. Valid values: • true: Choice is turned off. • false: Choice is enabled. Data type: Boolean
GlideFormChoice.index	Indicates the position of the choice in the drop-down. Data type: Number

The following example demonstrates how to call *`g_form.getChoice()`* to return information about the `priority` field choices.

```
var priority = g_form.getValue('priority');

var priorityLabel = g_form.getChoice('priority',
 priority).label;
```

GlideForm (Next Experience) - getControl(String fieldName)

Returns the HTML element for the specified field.

Compound fields may contain several HTML elements. This method is generally not necessary as there are built-in methods that use the fields on a form.

If the field is a reference field and the control is a choice list, *`getControl()`* may not return a control as expected. In this case, use `sys_select.<table name>.<field name>`.

This method is not available in mobile scripts or Service Portal scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldName	String	Name of the field for which to return the HTML element.

Returns

Type	Description
HTMLElement	Field's HTML element.

GlideForm (Next Experience) - getDecimalValue(String fieldName)

Returns the decimal value of the specified field.

Parameters

Name	Type	Description
fieldName	String	Name of the field for which to return the decimal value.

Returns

Type	Description
String	Decimal value of the specified field.

```
function onChange(control, oldValue, newValue, isLoading) {
   alert(g_form.getDecimalValue('percent_complete'));
}
```

GlideForm (Next Experience) - getDisplayValue(String fieldName)

Returns the display value from a form in Service Portal.

See also:

- getValue()
- Get the display value of a reference variable

Note: In the core UI, calling this method as `g_form.getDisplayValue()` without an argument returns the record display value rather than the display value of an individual field.

Parameters

Name	Type	Description
fieldName	String	Name of the field from which you want to retrieve a value in the form.

Returns

Type	Description
String	Display value of the specified field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to get the display value of a reference variable in the core UI or Service Portal. The use case for this example is on the community site.

```
function onChange(control, oldValue, newValue, isLoading) {
     if (isLoading || newValue == '') {
          return;
     }
     if(window == null){
          var valuePortal = g_form.getDisplayValue('requester');
          alert('Portal->' + valuePortal);
     }
     else{
          var valueNative =
 g_form.getDisplayBox('requester').value;
          alert('CoreUI->' + valueCoreUI);
     }
     //Type appropriate comment here, and begin script below
}
```

GlideForm (Next Experience) - getElement(String id)

Returns the HTML element specified by the parameter.

Compound fields may contain several HTML elements. This method is generally not necessary as there are built-in methods that use the fields on a form.

This method is not available in mobile scripts or Service Portal scripts.

Parameters

Name	Type	Description
id	String	Field ID.

Returns

Type	Description
HTMLElement	Field's HTML element.

GlideForm (Next Experience) - getFormElement()

Returns the HTML element for the form.

This method is not available in mobile scripts or Service Portal scripts.

Parameters

Name	Type	Description
None		

Returns

Type	Description
HTMLFormElement	HTML element for the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm (Next Experience) - getIntValue(String fieldName)

Returns the integer value for the specified field.

Parameters

Name	Type	Description
fieldName	String	Field name.

Returns

Type	Description
Number	Integer value of the field.

GlideForm (Next Experience) - getLabelOf(String fieldName)

Returns the plain text value of the field label.

Parameters

Name	Type	Description
fieldName	String	Field name.

Returns

Type	Description
String	Label text.

```
if (g_user.hasRole('itil')) {
    var oldLabel = g_form.getLabelOf('comments');
    g_form.setLabelOf('comments', oldLabel + ' (Customer
 visible)');
}
```

GlideForm (Next Experience) - getOptions(String fieldName)

Returns the available and selected options for a choice or reference field on the form. This method is useful for dynamic forms, catalog variables and variable sets, and integrations needing to inspect or filter field options at runtime.

For example, you can use the `g_form.getOptions()` to:

- Get and set the name-value pairs in a watch_list field type.
- Search or filter available options by a search term.
- Enable access to the same auto-complete results via a callback.
- Get and set options on choice fields, reference fields, and advanced field types such as watch_list, glide_list, field_list, and slushbucket.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldName	String	The field name of the choice or reference field to retrieve.

Returns

Property	Description
Array of Objects or null	Read-only array of objects containing the value and label of each selected option. Returns null if the field does not support options. Data type: Array of Objects `[{value: "String", displayValue: "String"}]`
array.displayValue	The choice display value. Data type: String
array.value	The value of the option. Data type: String
getAvailable(term)	Function for returning all available options. A search term can be provided as an argument to filter the options by display value (a case-insensitive sub string match). Returns a Promise of Array of Objects with the matching choice's display value and value. Data type: Array of Objects `[{value: "String", displayValue: "String"}]`

The following example calls *g_form.getOptions()* to return all available choices for specified form fields, like state, work_notes_list, and others.

```
g_form.getOptions("state"); //table: incident, field: state,
 type: integer, choice: Dropdown without --None--
/*
returns
 [{"value":"1","displayValue":"New"},{"value":"2","displayValue"
:"In Progress"},{"value":"3","displayValue":"On
 Hold"},{"value":"6","displayValue":"Resolved"},{"value":"7","di
splayValue":"Closed"},{"value":"8","displayValue":"Canceled"}]
*/

g_form.getOptions("category"); //table: incident, field:
 category, type: string, choice: Dropdown with --None--
/*
returns [{"value":"","displayValue":"-- None
 --"},{"value":"inquiry","displayValue":"Inquiry /
 Help"},{"value":"software","displayValue":"Software"},{"value":
"hardware","displayValue":"Hardware"},{"value":"network","displa
yValue":"Network"},{"value":"database","displayValue":"Database
"}]
*/
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 body"},{"value":"article_type","displayValue":"Article
 type"},{"value":"direct","displayValue":"Attachment
 link"},{"value":"author","displayValue":"Author"},{"value":"bas
e_version","displayValue":"Base Version"},...]
*/
```

The following example script demonstrates how to call *g_form.getOptions()* with getAvailable() function.

```
const options = g_form.getOptions('priority');
if (options) {
  console.log('Selected:', options.selected);
  options.getAvailable('high').then(available => {
    console.log('Available matching "high":', available);
  });
}
```

GlideForm (Next Experience) - getReference(String fieldName, Function callBack)

Returns the GlideRecord for a specified field.

If a callback function is present, this routine runs asynchronously. The browser (and script) processing continues normally until the server returns the reference value, at which time, the callback function is invoked. If a callback function is not present, this routine runs synchronously and processing halts (causing the browser to appear to hang) while waiting on a server response.

Important: It is strongly recommended that you use a callback function.

Callback function support for ServiceCatalogForm.getReference is available.

Note: Using this method requires a call to the server which requires additional time and may introduce latency to your page. Use this method with caution. For additional information, see Client script design and processing.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
callBack	Function	Name of the call back function.

Returns

Type	Description
GlideRecord	GlideRecord object for the specified field. If the specified reference can't be found, it returns an initialized GlideRecord object where `currentRow = -1` and `rows.length = 0`.

```
function onChange(control, oldValue, newValue, isLoading) {
    g_form.getReference('caller_id', doAlert); // doAlert is our
 callback function
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function doAlert(caller) { // reference is passed into callback
 as first arguments
   if (caller.getValue('vip') == 'true') {
      alert('Caller is a VIP!');
   }
}
```

GlideForm (Next Experience) - getRelatedListNames()

Returns an array of related list names from the current form.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array of Strings	List of related list names from the current form. The related list names are listed in the order in which they appear on the form.

```
var listNames = g_form.getRelatedListNames();

for (var i = 0; i < listNames.length; i++) {
  this.showRelatedList(listNames[i]);
 }
```

GlideForm (Next Experience) - getSectionNames()

Returns all section names, whether visible or not.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array of Strings	Section names.

GlideForm (Next Experience) - getSections()

Returns an array of the form's sections.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array of HTML elements	Form's sections.

```
function onChange(control, oldValue, newValue, isLoading) {
   //this example was run on a form divided into sections
 (Change form)
   // and hid a section when the "state" field was changed
   var sections = g_form.getSections();
   if (newValue == '2') {
      g_form.setSectionDisplay(sections[1], false);
   } else {
      g_form.setSectionDisplay(sections[1], true);
   }
}
```

GlideForm (Next Experience) - getTableName()

Returns the name of the table to which this record belongs.

On the server side, the table for the current record can be retrieved with `current.sys_class_name` or `current.getTableName()`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the table.

```
function onLoad() {
    if (g_form.isNewRecord()) {
        var tableName = g_form.getTableName(); //Get the table
 name
    }
}
```

GlideForm (Next Experience) - getUniqueValue()

Returns the sys_id of the record displayed in the form.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Record's sys_id.

```
function onLoad() {
   var incSysid = g_form.getUniqueValue();
   alert(incSysid);
}
```

GlideForm (Next Experience) - getValue(String fieldName)

Returns the value of the specified form field.

This method also supports getting values from a multi-row variable set (MRVS). To obtain data from fields within an MRVS, you must first use `JSON.parse(getValue('<mrvs_field_name>') || '[]')` to obtain the MRVS array, and then use indexing to access the fields within the row objects. For more details, see the code example below.

Parameters

Name	Type	Description
fieldName	String	Name of the field whose value to return.

Returns

Type	Description
String	Value of the specified field.

The following example shows how to get the short description from the current form.

```
function onChange(control, oldValue, newValue, isLoading) {
   alert(g_form.getValue('short_description'));
}
```

The following example shows how to get values from an MRVS. In this example, salaries are being managed through the Service Catalog. The client script searches all rows within the MRVS for the value entered in the **Job title** and then updates the matching entries within the MRVS with what is entered in the **Salary** field. The MRVS is named "variable_set_1" and contains the following fields within each row object: Employee name [employee_name], Job title [employee_job_title], and Salary [employee_salary]. In addition, the Catalog Item contains: Job title [job_title] and Salary [salary].

```
function onChange(control, oldValue, newValue, isLoading) {
if (isLoading || newValue == '') {
return;
}

// Get the MRVS
var vs1 = g_form.getValue('variable_set_1') || '[]';
var multiRowVariableSet = JSON.parse(vs1);

for (var i = 0; i < multiRowVariableSet.length; i++) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Check if the entered job title matches the title in the
 current MRVS row
  if (multiRowVariableSet[i].employee_job_title ==
 g_form.getValue("job_title")){
    // Update the value of a matching field with the new salary
    multiRowVariableSet[i].employee_salary = newValue;
  }
}

// Update the MRVS
g_form.setValue('variable_set_1',
 JSON.stringify(multiRowVariableSet));
}
```

GlideForm (Next Experience) - hideAllFieldMsgs()

Hides all field messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

GlideForm (Next Experience) - hideAllFieldMsgs(String type)

Hides all field messages of the specified type.

Parameters

Name	Type	Description
type	String	>Type of message. Valid values: • error • info

Returns

Type	Description
None	

GlideForm (Next Experience) - hideAnnotation(String name)

Hides an annotation with a given name on the form UI.

Annotations are visual separators between form elements, or blocks of colored text used to highlight form elements. See also:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- GlideForm (Next Experience) - showAnnotation(String name) to display a specific annotation on the form.
- GlideForm (Next Experience) - toggleAnnotations() to toggle annotations on and off with greater flexibility.

Parameters

Name	Type	Description
name	String	Name of the annotation to hide in the form. Table: Form Annotations [sys_ui_annotation], Field: **Name**

Returns

Type	Description
None	

The following example demonstrates how to programmatically hide the annotation named test-annotation-msg-1 on the form field using the *`hideAnnotation()`* method.

```
g_form.hideAnnotation('test-annotation-msg-1');
```

GlideForm (Next Experience) - hideErrorBox(String fieldName)

Hides the error message placed by *`showErrorBox()`*.

Whenever possible, use *`hideFieldMsg()`* rather than this method whenever possible.

Parameters

Name	Type	Description
fieldName	String	Name of the field or control whose error message to hide.

Returns

Type	Description
None	

GlideForm (Next Experience) - hideFieldMsg(String fieldName, Boolean clearAll)

Hides the first message that appears in the specified field on the current form.

Use the showFieldMsg(String field, String message, String type) or showFieldMsg(String field, String message, String type, Boolean scrollForm) methods to display messages on a form.

For example, the following code snippet shows how to display two messages on the `work_notes` field of a form and then hide the first message:

```
g_form.showFieldMsg('work_notes', 'First message', "error");
g_form.showFieldMsg('work_notes', 'Second message', "error");
g_form.hideFieldMsg('work_notes', false); // This call hides the
 'First message'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldName	String	Name of the field on which to hide the message.
clearAll	Boolean	Optional. Flag that indicates whether to hide all messages for the specified field. Valid values: • true: Hide all messages. • false: Only hide the first message being displayed. Default: false

Returns

Type	Description
None	

The following example shows how to clear all messages for a specified form field and then display an encryption error message.

```
function submitEncryptedInputs() {
  return processEncryptedInputs(function(inputName, fieldName) {
    if (!checkEncryptedFieldValue(fieldName)) {
      g_form.hideFieldMsg(fieldName, true); // Hide all messages
 for the specified field
      g_form.showFieldMsg(fieldName, "Your activity requires an
 encrypted input.", "error");
      return false;
    }
    return true;
  });
}
```

GlideForm (Next Experience) - hideRelatedList(String listTableName)

Hides the specified related list on the form.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
listTableName	String	Name of the related list. Use the sys_id to hide a list through a relationship.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm (Next Experience) - hideRelatedLists()

Hides all related lists on the form.

This method is not available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

GlideForm (Next Experience) - isMandatory(String fieldName)

Returns true if the field is mandatory.

Mandatory fields are visually distinguished by an asterisk next to the field label. The asterisk is red if the field is empty, and black if the field is not empty. The system displays a validation message if a user attempts to save or submit the form without completing those fields. For more information, see Form fields.

Parameters

Name	Type	Description
fieldName	String	Name of the field.

Returns

Type	Description
Boolean	True if the field is required, false otherwise.

GlideForm (Next Experience) - isNewRecord()

Returns true if the record has never been saved.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the record has not been saved; otherwise false.

```
function onLoad() {
   if(g_form.isNewRecord()){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        alert('New Record!');
    }
}
```

GlideForm (Next Experience) - isVisible(String fieldName)

Determines whether the field associated with the passed-in field name is visible on the current form.

Parameters

Name	Type	Description
fieldName	String	Name of the field to check whether it is visible on the current form.

Returns

Type	Description
Boolean	Flag that indicates whether the specified field is visible on the current form. Possible values: • true: Field is visible on the form. • false: Field isn't visible on the form.

The following code example shows how to check if the `user_address` field is visible on the current form.

```
if(g_form.isVisible('user_address')) {
    alert('is visible');
}
else {
    alert('is hidden');
}
```

GlideForm (Next Experience) - onUserChangeValue(Function fn)

Registers a custom event listener that detects when any field in the current form is modified by a user.

When a form field is modified, the event listener calls the function that is passed in when the listener is initially registered. This listener is only triggered when a user makes a change to a field on the form. Changes from client scripts, UI policies, or any other non-user interactions, do not trigger the listener.

Note: This method does not work for journal fields or Service Catalog items in the classic environment.

Parameters

Name	Type	Description
fn	Function	Function to call when a user changes the value of a field within the current form. This is actually the function code, not just the function name. This function must accept the following three arguments:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• field name • original field value • updated field value

Returns

Type	Description
Function	Function to call to unregister the onUserChangeValue event listener.

```
var handler = function(fieldname, originalValue, newValue) {
  console.log('The field ('+ fieldname + ') has a new value of:
 ' + newValue); // function code
}

var unregister = g_form.onUserChangeValue(handler);

// To unregister the event listener
unregister();
```

GlideForm (Next Experience) - removeChoice(String fieldName, String choiceValue)

Removes the specified choice from the specified choice list field.

Parameters

fieldName	String	Name of the filed from which to remove a single choice from the choice list.
choiceValue	String	Value of the choice to remove from the choice list.

Returns

Type	Description
None	

```
g_form.removeChoice('priority', '1');
```

GlideForm (Next Experience) - removeDecoration(String fieldname, String icon, String title)

Removes the icon from the specified field that matches the specified icon and title.

Note: This method isn't supported by Service Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldName	String	Field name from which to remove the decoration.
icon	String	Name of the icon to remove.
title	String	Icon's text title (name).

Returns

Type	Description
None	

```
function onChange(control, oldValue, newValue, isLoading) {
 // if the caller_id field is not present, then we can't add an
 icon anywhere
 if (!g_form.hasField('caller_id'))
  return;

 if (!newValue)
  return;

 g_form.getReference('caller_id', function(ref) {
  g_form.removeDecoration('caller_id', 'icon-star', 'VIP');

  if (ref.getValue('vip') == 'true')
   g_form.addDecoration('caller_id', 'icon-star', 'VIP');
 });
}
```

GlideForm (Next Experience) - removeDecoration(String fieldname, String icon, String title, String color)

Removes the icon from the specified field that matches the specified icon, title, and color.

Note: This method isn't supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	Field name from which to remove the decoration.
icon	String	Name of the icon to remove.
title	String	Icon's text title (name).
color	String	CSS color to match.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
g_form.removeDecoration('caller_id', 'icon-star', 'VIP',
 'blue');
```

GlideForm (Next Experience) - removeOption(String fieldName, String choiceValue)

Removes the specified option from the specified choice list.

Parameters

Name	Type	Description
fieldName	String	Name of the field from which to remove the option from the choice list.
choiceValue	String	Value stored in the database. This is not the label.

Returns

Type	Description
None	

```
g_form.removeOption('priority', '1');
```

GlideForm (Next Experience) - save()

Saves the record without navigating away (update and stay).

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

GlideForm (Next Experience) - setChoiceLabel(String fieldName, String choiceValue, String newLabel)

Updates the label of a specific choice in the drop-down field.

When calling this method, the index position of the updated option in the drop-down remains unchanged. The enabled or turned off state of the option is preserved.

Parameters

Name	Type	Description
fieldName	String	Field name that contains the choice to update. Data type: String
choiceValue	String	Value of the choice label to update with a new label. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
newLabel	String	Label name to update the existing choice label to. Data type: String

Returns

Type	Description
Boolean	Flag that indicates whether the option label is updated successfully. Valid values: • true: Choice label is updated. • false: Choice label isn't updated because the specified choice to update may have been read-only or does not exist, or the new label exists and is already associated with another option.

The following example calls setChoiceLabel() to update the 'bonus' field choices (10, 20, and 30) to new values.

```
// Show the calculated bonus next to the percentage label
var salary = parseInt(g_form.getValue('salary'), 10);
g_form.setChoiceLabel('bonus', '10', '10% ($'+ (salary * .10)
 +')');
g_form.setChoiceLabel('bonus', '20', '20% ($'+ (salary * .20)
 +')');
g_form.setChoiceLabel('bonus', '30', '30% ($'+ (salary * .30)
 +')');
```

GlideForm (Next Experience) - setDisabled(String fieldName, Boolean disable)

Makes the specified field available or unavailable.

Parameters

Name	Type	Description
fieldName	String	Name of the field to enable or turn off.
disable	Boolean	Flag that indicates whether to turn off the specified field. Valid values: • true: Turns off the field. • false: Enables the field. Default: false

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideForm (Next Experience) - setDisplay(String fieldName, Boolean display)

Displays or hides a specified field on the form.

This method can't hide a mandatory field with no value. If the field is hidden, the space is used to display other items. Whenever possible, use a UI policy instead of this method.

Parameters

Name	Type	Description
fieldName	String	Name of the field.
display	Boolean	Flag that indicates whether to display the specified field. Valid values: • true: Display the field. • false: Hide the field.

Returns

Type	Description
None	

```
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
   //If the page isn't loading
   if (!isLoading) {
      //If the new value isn't blank
      if (newValue != '') {
         g_form.setDisplay('priority', false);
      }
      else
         g_form.setDisplay('priority', true);
      }
   }
```

GlideForm (Next Experience) - setLabelOf(String fieldName, String label)

Sets the plain text value of the specified field label.

Note: This method isn't supported by Service Catalog.

Parameters

Name	Type	Description
fieldName	String	Name of the field for which to set the label.
label	String	Plain text value to set in the label.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if (g_user.hasRole('itil')) {
    var oldLabel = g_form.getLabelOf('comments');
    g_form.setLabelOf('comments', oldLabel + ' (Customer
 visible)');
}
```

GlideForm (Next Experience) - setMandatory(String fieldName, Boolean mandatory)

Makes the specified field mandatory.

Mandatory fields are visually distinguished by an asterisk next to the field label. The asterisk is red if the field is empty, and black if the field is not empty. The system displays a validation message if a user attempts to save or submit the form without completing those fields. For more information, see Form fields.

Note: Whenever possible, use a UI policy rather than this method.

Parameters

Name	Type	Description
fieldName	String	Name of the field to make mandatory.
mandatory	Boolean	Flag that indicates whether the field is mandatory. Valid values: • true: Field is mandatory. • false: Field is optional. Default: false

Returns

Type	Description
None	

GlideForm (Next Experience) - setReadOnly(String fieldName, Boolean readOnly)

Makes the specified field read-only or editable.

Whenever possible, use a UI policy instead of this method.

To make a mandatory field read-only, you must first remove the mandatory requirement for that field by using the `setMandatory()` method.

Once you set a field to read-only, you cannot use the setValue() method to update the value of that field. If you need to set the value in this way, you must set the `readOnly` value to `false`.

Parameters

Name	Type	Description
fieldName	String	Name of the field whose access value to set.
readOnly	Boolean	Flag that determines whether the associate field is editable or read-only. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Set field to read-only. • false: Set field to be editable.

Returns

Type	Description
None	

The following example shows how set the Variable Editor to read only. To do this in Service Catalog tables, use *setVariablesReadOnly()*.

```
// Create a Client Script on a table (e.g., incident) and paste
 this script
// Uncheck (set to false) the "isolate script" checkbox (not
 available by default)
// To add the isolate script checkbox to the form, configure
 form layout to add the checkbox
function onLoad() {

 $("variable_map").querySelectorAll("item").forEach(function(it
em){
    var variable = item.getAttribute("qname");
    g_form.setReadOnly("variables."+ variable, true);
  });
}
```

GlideForm (Next Experience) - setSectionDisplay(String sectionName, Boolean display)

Shows or hides a specified section in the form.

Parameters

Name	Type	Description
sectionName	String	Section name is lower case with an underscore replacing the first space in the name, and with the remaining spaces being removed. For example, "Section Four is Here" becomes "section_fourishere". Other non-alphanumeric characters, such as ampersands (&), are removed. Section names can be found by using the *getSectionNames()* method.
display	Boolean	Flag that indicates whether to show the section. Valid values: • true: Show the section. • false: Hide the section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Returns true when successful.

GlideForm (Next Experience) - setValue(String fieldName, String value, String displayValue)

Sets the value of a specified form field to the specified value or the value of a specified display value in a reference record.

To improve performance by preventing a round trip when setting the value for a reference field, use this method, not *`setValue(fieldName, value)`*. When setting multiple reference values for a list collector field, pass arrays in the *`value`* and *`displayValue`* parameters.

This method also supports setting values in a multi-row variable set (MRVS). You must first use `JSON.parse(getValue('<mrvs_field_name>'))` to obtain the MRVS array and then use indexing to update the fields within the row objects. Once all values are updated in the MRVS, use the *`setValue()`* method to save the updated MRVS array. For more details, see the code example below.

Note: This method can't be used to update fields set to strict read only. If this method is called on strict read only fields, the field isn't updated and a warning is logged in the browser console. For more information, see Configuring read-only security options.

Note: The method *`setValue()`* can cause a stack overflow when used in an `onchange` client script. This is because every time the value is set, it will register as a change, which may re-trigger the OnChange client script. To prevent this, perform a check that will validate that the new value will be different from the old value. For example, before performing `setValue(shortDesc, newValue.toUpperCase());`, validate that the short description is not already uppercase. This will prevent the client script from applying the *`toUpperCase()`* more than once.

Parameters

Name	Type	Description
fieldName	String	Name of the form field to update.
value	String or Array	Sys_id of the reference record to use to update the field. If the specified field is a GlideList, this parameter can contain an array of sys_ids. In this case, the method performs a lookup of all records specified in the array and those values are used to update the contents of the specified field (related list). **Note:** When defining a value in a choice list, be sure to use a number value rather than the label.
displayValue	String or Array	Field within the specified reference record to use to update the specified field. For example, in the User [sys_user] table it might be userName. If the specified field is a GlideList, this parameter can contain an array of display value names. For additional information on display values, see Display value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set the short description in the current form.

```
g_form.setValue('short_description', 'replace this with
 appropriate text');
```

The following example shows how to set values in an MRVS. In this example, salaries are being managed through the Service Catalog. The client script searches all rows within the MRVS for the value entered in the **Job title** and then updates the matching entries within the MRVS with what is entered in the **Salary** field. The MRVS is named "variable_set_1" and contains the following fields within each row object: Employee name [employee_name], Job title [employee_job_title], and Salary [employee_salary]. In addition, the Catalog Item contains: Job title [job_title] and Salary [salary].

```
function onChange(control, oldValue, newValue, isLoading) {
if (isLoading || newValue == '') {
return;
}

// Get the MRVS
var multiRowVariableSet =
 JSON.parse(g_form.getValue('variable_set_1'));

for (var i = 0; i < multiRowVariableSet.length; i++) {
// Check if the entered job title matches the title in the
 current MRVS row
  if (multiRowVariableSet[i].employee_job_title ==
 g_form.getValue("job_title")){
    // Update the value of a matching field with the new salary
    multiRowVariableSet[i].employee_salary = newValue;
  }
}

// Update the MRVS
g_form.setValue('variable_set_1',
 JSON.stringify(multiRowVariableSet));
}
```

This example shows passing the sys_id of the reference record that contains the userName field to use to update the **assigned_to** form field.

```
g_form.setValue('assigned_to', userSysID, userName);
```

This example shows passing an array of reference record sys_ids and an array of corresponding display value names to use to update the form fields in the GlideList **glide-list_field_name**.

```
g_form.setValue('glide-list_field_name', sysIDArray,
 displayNameArray);
```

GlideForm (Next Experience) - setVariablesReadOnly(Boolean isReadOnly)

Makes a Service Catalog variable editor read only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This method is only applicable to Service Catalog variable editors in the core UI. This method is not supported in the Service Catalog form.

The method must be placed in the client script of the table in which the variable editor is added, such as Requested Item [sc_req_item], Incident [incident], and so on. To set variables to read only in other tables, use the setReadOnly() method.

See also: Service Catalog variable editors

Parameters

Name	Type	Description
isReadOnly	Boolean	Flag that determines whether the variable editor is read only. Valid values: • true: Sets the variable editor as read-only. • false: Sets the variable editor as editable. Default: false

Returns

Type	Description
None	

Adding the following line to a client script sets the variable editor to read only.

```
g_form.setVariablesReadOnly(true);
```

GlideForm (Next Experience) - setVisible(String fieldName, Boolean display)

Displays or hides the specified field.

On desktop UI, the space is left blank when hidden. On Mobile or Service Portal UI, the space is filled in my other fields when hidden. This method can't hide mandatory fields with no value.

Use UI Policy rather than this method whenever possible.

Parameters

Name	Type	Description
fieldName	String	Name of the field to display or hide.
display	Boolean	Flag that indicates whether to display the specified field. Valid values: • true: Display the field. • false: Hide the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
   //If the page isn't loading
   if (!isLoading) {
      //If the new value isn't blank
      if(newValue != '') {
         g_form.setVisible('priority', false);
      }
      else
         g_form.setVisible('priority', true);
      }
   }
```

GlideForm (Next Experience) - showAnnotation(String name)

Shows an annotation with a given name on the form UI.

Annotations are visual separators between form elements, or blocks of colored text used to highlight form elements. See also:

- GlideForm (Next Experience) - hideAnnotation(String name) to hide a specific annotation on the form.
- GlideForm (Next Experience) - toggleAnnotations() to toggle annotations on and off with greater flexibility.

Parameters

Name	Type	Description
name	String	Name of the annotation to show in the form. Table: Form Annotations [sys_ui_annotation], Field: **Name**

Returns

Type	Description
None	

The following example demonstrates how to programmatically show the annotation named test-annotation-msg on the form field using the *showAnnotation()* method.

```
g_form.showAnnotation('test-annotation-msg');
```

GlideForm (Next Experience) - showErrorBox(String name, String message)

Displays an error message under the specified form field (either a control object or the name of the field). If the control or field is currently off the screen, the form automatically scrolls to the control or field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field). The `showFieldMsg()` method is a similar method that requires a type parameter.

Parameters

Name	Type	Description
name	String	Name of the field or control under which to display the error message.
message	String	Error message to display.

Returns

Type	Description
None	

GlideForm (Next Experience) - showErrorBox(String name, String message, Boolean scrollForm)

Displays an error message under the specified form field (either a control object or the name of the field). If the control or field is currently off the screen and the `scrollForm` parameter is true, the form scrolls to the control or field.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field). The `showFieldMsg()` method is a similar method that requires a type parameter.

Parameters

Name	Type	Description
name	String	Name of the field or control under which to display the error message.
message	String	Error message to display.
scrollForm	Boolean	Flag that indicates whether to automatically scroll the form to the error message field. Valid values: • true: Scroll to the error message field. • false: Don't scroll to the error message field. Default: true

Returns

Type	Description
None	

GlideForm (Next Experience) - showFieldMsg(String field, String message, String type)

Displays a message under the specified form field (either a control object or the name of the field). If the control or field is off the screen, the method automatically scrolls the form to that field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field).

The *showErrorBox()* method is a shorthand method that does not require the type parameter.

Note: This method does not work with the *journal_field* type field in Core UI.

Parameters

Name	Type	Description
field	String	Name of the field or control under which to display the message.
message	String	Message to display.
type	String	Type of message. Valid values: • error • info • warning

Returns

Type	Description
None	

```
g_form.showFieldMsg('impact','Low impact response time can be
 one week','info');
```

GlideForm (Next Experience) - showFieldMsg(String field, String message, String type, Boolean scrollForm)

Displays a message under the specified form field (either a control object or the name of the field). If the control or field is currently off the screen and *scrollForm* is `true`, the method scrolls the form to that field.

A global property (glide.ui.scroll_to_message_field) is available that controls automatic message scrolling when the form field is off screen (scrolls the form to the control or field).

The *showErrorBox()* method is a shorthand method that does not require the type parameter.

Note: This method does not work with the *journal_field* type field in Core UI.

Parameters

Name	Type	Description
field	String	Name of the field or control under which to display the message.
message	String	Message to display.
type	String	Type of message. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• error • info • warning
scrollForm	Boolean	Flag that indicates whether to automatically scroll the form to the message field. Valid values: • true: Scroll to the message field. • false: Don't scroll to the message field. Default: true

Returns

Type	Description
None	

```
g_form.showFieldMsg('impact','Low impact not allowed with High
 priority','error',false);
```

GlideForm (Next Experience) - showRelatedList(String listTableName)

Displays the specified related list on the form.

This method isn't available on the mobile platform. If this method is run on a mobile platform, no action occurs.

Parameters

Name	Type	Description
listTableName	String	Name of the related list to display.

Returns

Type	Description
None	

GlideForm (Next Experience) - showRelatedLists()

Displays all the form's related lists.

This method isn't available on the mobile platform. If this method is run on a mobile platform, no action occurs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

GlideForm (Next Experience) - submit()

Saves the record.

The user is taken away from the form, returning them to where they were.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

GlideForm (Next Experience) - submit(String verb)

Performs the specified UI action.

Parameters

Name	Type	Description
verb	String	An action_name from a sys_ui_action record. The action name must be for a visible form button.

Returns

Type	Description
None	

GlideForm (Next Experience) - toggleAnnotations()

Hides or shows all annotations on the form.

Annotations are visual separators between form elements, or blocks of colored text used to highlight form elements. If annotations are visible on the form, calling `toggleAnnotations()` hides them. Similarly if annotations are hidden on the form, calling this method displays them. See also:

- GlideForm (Next Experience) - hideAnnotation(String name)
- GlideForm (Next Experience) - showAnnotation(String name)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to call *toggleAnnotations()* to show or hide form annotations. As a result, annotations are hidden or shown depending on their previous state.

```
g_form.toggleAnnotations();
```

GlideList (Next Experience) - Client

The *GlideList* API provides methods to customize lists in the Next Experience UI Framework.

This API enables adding GlideList functionality to a button in the Workspace Experience UI. Use the `g_list` variable to call each method.

To add a button, create a list action and add *GlideList* method calls into the **Client Script** field `onClick{}` method. For instructions, see Use the client GlideList API in the Workspace Experience UI.

Note: Each method must be used with the *refresh()* method, with the exceptions of *sort()* and *sortDescending()* methods.

The methods in this API are based on *GlideList2*. The following *GlideList2* methods are not supported in the Next Experience framework and cause an error in the console log:

- *isUserList()*
- *setFirstRow()*
- *showHideGroups()*
- *showHideList()*
- *toggleList()*
- *toggleListNoPref()*

GlideList (Next Experience) - addFilter(String filter)

Adds a single term to the list query filter.

See also setFilter().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
filter	String	Encoded query string in standard Glide format. See Encoded query strings.

Returns

Type	Description
None	

The following example shows how to retrieve a list of active records and refresh the page.

```
g_list.addFilter("active=true");
g_list.refresh();
```

GlideList (Next Experience) - getChecked()

Returns a comma-separated list of the sys_ids for the items that are checked in the associated list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Comma-separated list of the sys_ids for the items that are checked in the list. Does not check to determine that the items returned are allowed to be executed.

The following example shows how to get the sys_ids of each record selected in a list.

```
var myChecked = g_list.getChecked();
alert(myChecked);
g_list.refresh();
```

Output in an alert box (empty if no records are selected):

```
079893e6b733330059128ac7ee11a967,
 4fca6d45b7131010f03e9b7ade11a9d3,
 5c460fbf1bd0011079e52131604bcbd9
```

GlideList (Next Experience) - getFixedQuery()

Returns the fixed query.

A fixed query is the part of the query that cannot be removed from the breadcrumb (i.e., it is fixed for the user).

Apply this method under **Related List Actions** in the Workspace Experience UI. For instructions, see Use the client GlideList API in the Workspace Experience UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The fixed query string for the list.

The following example shows how to display a fixed query with a debug message in the browser console log.

```
console.log(g_list.getFixedQuery() + " debug message");
```

The output after clicking the button on the Child Incidents tab in an Incident record.

```
parent_incident=46f1784ba9fe19810018aa27fbb23482 debug message
```

GlideList (Next Experience) - getGroupBy()

Returns the field or comma-separated list of fields that are used to group the list.

See also:

- getQuery()
- setGroupBy()

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The field or comma-separated list of fields that are used to group the list.

The following example shows how to get field groupBy values of the current list view.

```
var grpdBy = g_list.getGroupBy();
alert("The list is grouped by " + grpdBy);
g_list.refresh();
```

Output in an alert box for a list grouped by priority:

```
The list is grouped by ^GROUPBYpriority
```

GlideList (Next Experience) - getListName()

Returns the name of the list, which is usually the table name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The list name (usually the table name).

The following example shows how to call the method.

```
g_list.getListName();
```

GlideList (Next Experience) - getOrderBy()

Returns the first field used to order the list.

See also:

- getQuery()
- setOrderBy()

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The field by which to order the list. Empty if the list is not ordered.

The following example shows how to get field orderBy values of the current list view.

```
var orderBy = g_list.getOrderBy();

alert("The list is ordered by " + orderBy);
g_list.refresh();
```

Output in an alert box for a list ordered by priority:

```
The list is ordered by ^ORDERBYDESCpriority
```

GlideList (Next Experience) - getParentTable()

Returns the name of the parent table for a related list (the table associated with the form).

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The parent table name.

The following example shows how to call the method.

```
g_list.getParentTable();
g_list.refresh();
```

GlideList (Next Experience) - getQuery(Object)

Returns the encoded query string for the list.

See also:

- getFixedQuery()
- getGroupBy()
- getOrderBy()
- setGroupBy()
- setOrderBy()

Parameters

Name	Type	Description
<object>	Object	Optional. By default, this method includes orderBy, groupBy, and fixed query in the results. You can set object properties to restrict results to one or more of the three available options.
<object>.orderBy	Boolean	Optional. Flag that indicates whether to include orderBy in results. Valid values: • true: Include orderBy in results. • false: Do not include orderBy in results. Default: false
<object>.groupBy	Boolean	Optional. Flag that indicates whether to include groupBy in results. Valid values: • true: Include groupBy in results. • false: Do not include groupBy in results. Default: false
<object>.fixed	Boolean	Optional. Flag that indicates whether to include fixed query in results. Valid values: • true: Include fixed query in results. • false: Do not include fixed query in results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: false

Returns

Type	Description
String	Encoded query string for the list.

The following example shows how to display the list encoded query with a debug message in the browser console log.

```
var myQuery = g_list.getQuery();
console.log(myQuery + " message");
```

Output:

```
active=false^EQ message
```

GlideList (Next Experience) - getRelated()

Returns the related list field that associates the related list to the parent form.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field that connects the list to the parent form.

The following example shows how to call the method.

```
g_list.getRelated();
```

GlideList (Next Experience) - getTableName()

Returns the table name for the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Returns the table name for the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to display the list name for the current view.

```
var listName = g_list.getListName();
alert("The current list name is " + listName);
g_list.refresh();
```

Output in an alert box:

```
The current list name is incident
```

GlideList (Next Experience) - getTitle()

Returns the list title.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The list title.

The following example shows how to call the method.

```
g_list.getTitle();
```

GlideList (Next Experience) - getView()

Returns the view used to display the list.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the view.

The following example shows how to call the method.

```
g_list.getView();
```

GlideList (Next Experience) - refresh(Number firstRow)

Refreshes the list. The *orderBy* part of the list filter is ignored so that the list uses its natural ordering when it is refreshed.

Parameters

Name	Type	Description
firstRow	Number	The first row to appear in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: First row of the current view.

Returns

Type	Description
None	

The following example shows how to call the method.

```
g_list.addFilter("active=true");
g_list.refresh();
```

GlideList (Next Experience) - refreshWithOrderBy(Number firstRow)

Refreshes the list. The *orderBy* part of the list filter is included if it is specified for the list.

Parameters

Name	Type	Description
firstRow	Number	The first row to appear in the list. Default: First row of the current view.

Returns

Type	Description
None	

The following example shows how to call the method.

```
g_list.refreshWithOrderBy();
```

GlideList (Next Experience) - setFilter(String filter)

Sets the encoded query string for the list, ignoring the *orderBy* and *groupBy* parts of the query string.

See also addFilter().

Parameters

Name	Type	Description
filter	String	Encoded query string in standard Glide format. See Encoded query strings.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to restrict list results to active records.

```
g_list.setFilter("active=true");
g_list.refresh();
```

GlideList (Next Experience) - setGroupBy(String groupBy)

Sets the list *groupBy* criteria for a single field.

See also:

- getGroupBy()
- getQuery()

Parameters

Name	Type	Description
groupBy	String	The *groupBy* criteria for the list.

Returns

Type	Description
None	

The following example shows how to group listed records by Caller ID.

```
g_list.setGroupBy("caller_id");
g_list.refresh();
```

GlideList (Next Experience) - setOrderBy(String orderBy)

Sets the *orderBy* criteria for the list.

For a single order by field, use *orderBy* field or *orderByDesc* field. For multiple fields, use `orderByField1^orderByField2^orderByField3`. *orderBy* specifies ascending order and orderByDesc specifies descending. These prefix strings are optional. If not specified, *orderBy* is the default order.

See also:

- getOrderBy()
- getQuery()
- sort()
- sortDescending()

Parameters

Name	Type	Description
orderBy	String	Single or multiple orderBy fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to order the list by the value of the Priority field.

```
g_list.setOrderBy("priority");
g_list.refresh();
```

GlideList (Next Experience) - setRowsPerPage(Number rows)

Sets the number of rows per page to display.

Parameters

Name	Type	Description
rows	Number	The number of rows to display.

Returns

Type	Description
None	

The following example shows how to limit results to 50 rows per page.

```
g_list.setRowsPerPage(50);
refresh();
```

GlideList (Next Experience) - sort(String field)

Sorts the list in ascending order and sets the field as an *`orderBy`* column.

See also:

- getOrderBy()
- getQuery()
- setOrderBy()
- sortDescending()

Note: This method does not require the *`refresh()`* method.

Parameters

Name	Type	Description
field	String	Field to use to sort the list.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to sort results by the **Number** field.

```
g_list.sort("number");
```

GlideList (Next Experience) - sortDescending(String field, Number amount)

Sorts a single field in the list in descending order and sets the field as an *orderByDescField* column.

See also:

- getOrderBy()
- getQuery()
- setOrderBy()
- sortDescending()

Note: This method does not require the *refresh()* method.

Parameters

Name	Type	Description
field	String	Field to use to sort the list.

Returns

Type	Description
None	

The following example shows how to sort results by the Number field in descending order.

```
g_list.sortDescending("number");
```

GlideModal (Next Experience) - Client

The *GlideModal* API provides methods for displaying a content overlay, known as a modal. Modals are interactive windows that appear above a page and close when a user takes an action. You can use a modal to display information, ask questions, or perform actions.

Use the *GlideModal* methods in scripts anywhere that you can use client-side JavaScript. These methods are most often called from a UI action with the **Client** check box selected.

Modals can contain different types of content such as:

- Static text
- Dynamic text
- Forms
- Images
- Buttons

Using this API you can:

- Get an existing modal.
- Create modal content from a UI page or from passed HTML.
- Set the title in the modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set the width of the modal.
- Get and set preferences.
- Switch modal views.

To make a modal appear in the UI you must call one of the render methods:

- GlideModal (Next Experience) - render()
- GlideModal (Next Experience) - renderWithContent(String html)

The following code example shows how to create and render a modal using the UI page "UI_dialog_name".

```
var dialog = new nowapi.GlideModal("UI_dialog_name");

//Set the dialog title
dialog.setTitle('Show title');

//Set the dialog width
dialog.setWidth(550);

//Display the modal
dialog.render();
```

GlideModal (Next Experience) - GlideModal(String id, Boolean readOnly, Number/String width)

Creates an instance of the *`GlideModal`* class.

Parameters

Name	Type	Description
id	String	Name of theUI page to load into the modal. You can also specify either the `glide_modal_confirm` or `glide_modal_info` modals that are provided in the base system. Table: UI Page [sys_ui_page]
readOnly	Boolean	Optional. Flag that indicates whether the content in the modal is read-only. Valid values: • true: Content is read only. • false: User can modify the content. Default: false
width	Number or String	Optional. Width of the modal in pixels or the modal CSS class. If a pixel width is passed, it aligns the specified width with the corresponding CSS class. Possible modal CSS classes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• modal-alert: (300 px) Assigned when the specified width is 0 to 349 pixels. • modal-sm: (400 px) Assigned when the specified width is 350 to 449 pixels. • modal-md: (600 px) Assigned when the specified width is 450 to 649 pixels. • modal-lg: (900 px) Assigned when the specified width is 650 to 900 pixels. Default: modal-md Maximum width: 900 pixels **Note:** You can also set the modal width using the *setWidth()* method.

The following code example shows how to create a GlideModal object using an existing UI page.

```
var dialog = new nowapi.GlideModal('UI_dialog_name');

//Set the dialog title
dialog.setTitle('Show title');

//Set the desired preferences
dialog.setPreference('table', 'task');
dialog.setPreference('name', 'value');

//Opens the dialog
dialog.render();
```

The following code example shows how to create a GlideModal object using the `glide_modal_confirm` file.

```
var dialog = new nowapi.GlideModal('glide_modal_confirm', true,
 300);
dialog.setTitle(new GwtMessage().getMessage('Confirmation'));
dialog.setPreference('body', new GwtMessage().format("This will
 complete all update sets in the batch. Continue changing state
 to complete?"));
dialog.setPreference('focusTrap', true);
dialog.setPreference('onPromptComplete', doComplete);
dialog.setPreference('onPromptCancel', doCancel);
dialog.render();

function doComplete() {
  callback(true);
}

function doCancel() {
  callback(false);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideModal (Next Experience) - destroy()

Closes the current modal.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to use the `destroy()` method to close a modal.

```
function cancelDialog(){

  var dialog = new nowapi.GlideModal('cancelTask');

  // Sets the dialog title
  dialog.setTitle('Cancel Task');

  // Set up valid custom HTML to display
  dialog.renderWithContent('<div style="padding:15px">
    <p>What action do you want to take?</p>
    <p><select name="cancellation" id="taskCancellation"
 class="form-control">
    <option value="cancelOnly" role="option">Cancel task but
 keep requested item open
    </option>
    <option value="cancelAll" role="option">Cancel this and all
 other tasks, closing the
    requested item</option></select></p><div
 style="padding:5px;float:right"><button
    style="padding:5px;margin-right:10px
 onclick="window.changeTaskAction(this.innerHTML,
    jQuery(\'#taskCancellation\').val())" class="btn
 btn-default">Abort</button>
    <button style="padding:5px" class="btn btn-primary"

 onclick="window.changeTaskAction(this.innerHTML,jQuery(\'#taskC
ancellation\').val())">
    Cancel Task</button></div></div>');

  // Use the windows object to ensure the code is accessible
 from the modal dialog
  window.changeTaskAction = function(thisButton, thisAction){

    // Close the GlideModal dialog window
    dialog.destroy();

    // Submit to the back-end
    if(thisButton=='Cancel Task'){
      if(thisAction=="cancelAll"){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        // Closed Incomplete -- will close the Requested Item
 and all other open tasks
        g_form.setValue('state',4);
      }else{
        // Closed Skipped -- will only close this task
        g_form.setValue('state',7);
      }
         //Regular ServiceNow form submission
         gsftSubmit(null, g_form.getFormElement(),
 'cancel_sc_task');
      }
   };

   // Prevents the form from submitting when the dialog first
 loads
   return false;
}
```

The following code example shows how to use *`GlideModal.get().destroy()`* to close a modal in a client script. The following button should be declared in the UI page HTML: `<button onclick="closeMe()">close</button>`.

```
function closeGlideModal() {
  try {
    nowapi.GlideModal.get().destroy();
  } catch (err) {
    console.warn("closeGlideModal ERROR: " + err.message);
    var x = document.getElementById('THE_NAME_OF_YOUR_UI_PAGE' +
 '_closemodal');
    if (x) {
      x.click();
    } else {
      console.warn("No 'X' close button found!");
    }
  }
}

function closeMe() {
  setTimeout(function() {
    closeGlideModal();
  }, 100);
}
```

GlideModal (Next Experience) - get(String id)

Returns the GlideModal object identified by the specified UI page name.

Use this method to obtain the GlideModal object to use in other GlideModal operations such as, `GlideModal.get().destroy()`.

Parameters

Name	Type	Description
id	String	Name of theUI page associated with the modal. You can also specify either the `glide_modal_confirm` or `glide_modal_info` modals that are provided in the base system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Table: UI Page [sys_ui_page]

Returns

Type	Description
GlideModal	Requested GlideModal object.

This example shows how to use the *get()* method to obtain the modal that you want to close using the *destroy()* method.

```
// If the modal was initially created like this:

var dialog = new nowapi.GlideModal("glide_modal_confirm");
dialog.render();

// Code using the modal
...

// Now use the get() and destroy() methods to close the modal
var glideModal = new
 nowapi.GlideModal().get("glide_modal_confirm");
glideModal.destroy();

// You could also code it like this:
// GlideModal.prototype.get('glide_modal_confirm').destroy();
```

GlideModal (Next Experience) - getID()

Returns the GlideModal ID.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	ID of the *GlideModal*.

The following example demonstrates how to get the *GlideModal* ID on the instance.

```
var id = modal.getID();
console.log('modal id', id);
```

GlideModal (Next Experience) - getPreference(String name, String value)

Returns the value of the specified preference (property).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoking actions that create the modal typically also create the necessary preferences for the modal using the GlideModal (Next Experience) - setPreference(String name, String value) method. The UI page client script can then consume these preferences using this method.

Parameters

Name	Type	Description
name	String	Name of the preference value to retrieve. This value must have previously been set on the modal using the `setPreference()` method.
value	String	Value of the preference to retrieve. This value must have previously been set on the modal using the `setPreference()` method.

Returns

Type	Description
String	Specified preference's value.

This example shows a simple case of setting a preference and then retrieving that preference from a specified modal.

```
var dialog = new nowapi.GlideModal('UI_dialog_name');
//Sets the dialog title
dialog.setTitle('Modal title');

//Sets the value of the preference table
dialog.setPreference('table', 'incident');

//Gets the value of the preference table
var title = dialog.getPreference('table');
```

GlideModal (Next Experience) - getPreferences()

Returns all preferences and values associated with the modal.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Specified preference's value.

This example shows a simple case of setting a preference and then retrieving that preference from a specified modal.

```
var dialog = new nowapi.GlideModal('UI_dialog_name');
//Sets the dialog title
dialog.setTitle('Modal title');

//Sets the value of the preference table
dialog.setPreference('table', 'incident');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Gets the value of the preference table
var title = dialog.getPreference('table');
```

GlideModal (Next Experience) - render()

Renders the UI page specified when the API was instantiated in the modal. You must call this method after you define the modal for it to appear in the UI.

Call this method when you use a UI page to generate the content in your modal. If you want to display HTML within a modal, call renderWithContent(String html) to render the modal.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to instantiate a *GlideModal* object using the UI page "UI_dialog_name", set the title and width of the modal, and then display the modal in the UI (render).

```
var dialog = new nowapi.GlideModal("UI_dialog_name");

//Set the dialog title and width
dialog.setTitle('Show title');
dialog.setWidth(550);

//Display the dialog
dialog.render();
```

GlideModal (Next Experience) - renderWithContent(String html)

Displays a modal with the specified string-based HTML content.

Use the *renderWithContent()* method in lieu of the *render()* method when deriving the modal content from HTML.

Parameters

Name	Type	Description
html	String	HTML content to display in the modal.

Returns

Type	Description
None	

This code example shows how to display a modal that is constructed using the passed HTML string which contains a list of choices that the user can select from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function cancelDialog(){

  var dialog = new nowapi.GlideModal('cancelTask');

  // Sets the dialog title
  dialog.setTitle('Cancel Task');

  // Set up valid custom HTML to display
  dialog.renderWithContent('<div style="padding:15px">
    <p>What action do you want to take?</p>
    <p><select name="cancellation" id="taskCancellation"
 class="form-control">
    <option value="cancelOnly" role="option">Cancel task but
 keep requested item open
    </option>
    <option value="cancelAll" role="option">Cancel this and all
 other tasks, closing the
    requested item</option></select></p><div
 style="padding:5px;float:right"><button
    style="padding:5px;margin-right:10px
 onclick="window.changeTaskAction(this.innerHTML,
    jQuery(\'#taskCancellation\').val())" class="btn
 btn-default">Abort</button>
    <button style="padding:5px" class="btn btn-primary"

 onclick="window.changeTaskAction(this.innerHTML,jQuery(\'#taskC
ancellation\').val())">
    Cancel Task</button></div></div>');

  // Use the windows object to ensure the code is accessible
 from the modal dialog
  window.changeTaskAction = function(thisButton, thisAction){

    // Close the GlideModal dialog window
    dialog.destroy();

    // Submit to the back-end
    if(thisButton=='Cancel Task'){
      if(thisAction=="cancelAll"){
        // Closed Incomplete -- will close the Requested Item
 and all other open tasks
        g_form.setValue('state',4);
      }else{
        // Closed Skipped -- will only close this task
        g_form.setValue('state',7);
      }
         //Regular ServiceNow form submission
         gsftSubmit(null, g_form.getFormElement(),
 'cancel_sc_task');
      }
   };

   // Prevents the form from submitting when the dialog first
 loads
   return false;
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideModal (Next Experience) - setDialog(String dialogName)

Sets the dialog name as a table preference for the GlideModal.

Parameters

Name	Type	Description
dialogName	String	The name of the modal dialog to be used as the dialog name and corresponding preference table. See also: • setPreference() • setPreferenceAndReload()

Returns

Type	Description
None	

This example shows how to set a modal dialog name as a table preference.

```
var dialog = new nowapi.GlideModal('change_confirm_reason',
 false, 648, 250);
dialog.setTitle(new GwtMessage().getMessage('Cancel Change
 Request'));
dialog.setPreference('focusTrap', true);
dialog.setDialog('onPromptComplete');
dialog.setPreference('onPromptCancel', onPromptCancel);
dialog.on('closeconfirm', onPromptCancel);
dialog.setPreference('buttonLabelComplete', new
 GwtMessage().getMessage('OK'));
dialog.setPreference('buttonLabelCancel', new
 GwtMessage().getMessage('Cancel'));
dialog.render();
```

GlideModal (Next Experience) - setPreferenceAndReload(Object properties)

Sets the specified preferences and then reloads the modal.

Parameters

Name	Type	Description
properties	Object	Name-value pairs to set as preferences in the format.

Returns

Type	Description
None	

In this example, the `setPreferenceAndReload()` function sets preferences and reloads the modal with updated preferences. The modal renders with the initial preferences, and after 5 seconds the `setPreferenceAndReload()` is called and reloads the modal with the updated preferences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// UI Page to render in the GlideModal is 'glide_modal_confirm'
var glideModal = new nowapi.GlideModal("glide_modal_confirm",
false, 600);
glideModal.setTitle(getMessage("Confirmation"));
glideModal.setPreference("body", getMessage("Are you sure you
want to reject this deal registration? This action cannot be
undone."));
glideModal.setPreference('buttonLabelComplete',
getMessage("Reject"));
glideModal.setPreference('buttonLabelCancel',
getMessage("Cancel"));
glideModal.render();

var preferences = {
    "body": "THIS IS THE UPDATED BODY PREFERENCE",
    "buttonLabelComplete": "NEW REJECT",
    "buttonLabelCancel": "NEW CANCEL"
};

setTimeout(function() {
    glideModal.setPreferenceAndReload(preferences);
}, 5000);
```

GlideModal (Next Experience) - setPreference(String name, String value)

Sets the specified field on the current form to the specified value.

Parameters

Name	Type	Description
name	String	Name of the form field to update. If this field does not exist on the current form, the request is ignored.
value	String	Value to store in the specified form field.

Returns

Type	Description
None	

The following code example shows how to set the *table* preference to 'task' and the *name* preference to 'value'.

```
var dialog = new nowapi.GlideModal('UI_dialog_name');

//Set the dialog title
dialog.setTitle('Show title');

//Set the desired preferences
dialog.setPreference('table', 'task');
dialog.setPreference('name', 'value');

//Opens the dialog
dialog.render();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideModal (Next Experience) - setTitle(String title)

Sets the title of the modal.

Parameters

Name	Type	Description
title	String	Text to display in the title of the modal.

Returns

Type	Description
None	

The following code example shows how to set the modal title to `Table to update`.

```
var dialog = new nowapi.GlideModal('UI_dialog_name');

//Sets the dialog title
dialog.setTitle('Table to update');
dialog.setPreference('table', 'task');
dialog.setWidth(550);

//Opens the dialog
dialog.render();
```

GlideModal (Next Experience) - setWidth(Number/String width)

Sets the width of the modal.

You can also set the width of a modal when you first instantiate the API using the GlideModal() constructor.

Parameters

Name	Type	Description
width	Number or String	Width of the modal in pixels or the modal CSS class. If a pixel width is passed, it aligns the specified width with the corresponding CSS class. Possible modal CSS classes: • modal-alert: (300 px) Assigned when the specified width is 0 to 349 pixels. • modal-sm: (400 px) Assigned when the specified width is 350 to 449 pixels. • modal-md: (600 px) Assigned when the specified width is 450 to 649 pixels. • modal-lg: (900 px) Assigned when the specified width is 650 to 900 pixels. Maximum width: 900 pixels

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to set the modal width to 550 pixels.

```
var dialog = new nowapi.GlideModal('UI_dialog_name');

//Sets the dialog title
dialog.setTitle('Show title');
dialog.setPreference('name', 'value');
dialog.setWidth(550);

//Opens the dialog
dialog.render();
```

GlideModal (Next Experience) - switchView(String newView)

Change the view and reload the modal.

Parameters

Name	Type	Description
newView	String	View to use.

Returns

Type	Description
None	

GlideModal (Next Experience) - type()

Returns the type as GlideModal.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Returns a string indicating that the type is GlideModal.

GlideModal (Next Experience) - updateTitle()

Updates the title specified using `GlideModal setTitle()` method.

You must always first call GlideModal (Next Experience) - setTitle(String title) to specify the Modal title using `updateTitle()` to commit the change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example demonstrates how to use set and update a modal's title by calling *setTitle()* and *updateTitle()* respectively.

```
var modal = new nowapi.GlideModal();
modal.renderWithContent('TEST CONTENT');

setTimeout(function() {
    modal.setTitle("TEST setTitle() AND updateTitle()
 METHODS"); // will only update the `title` prop, updateTitle()
 must be called to see change
    modal.updateTitle();
}, 3000);
```

GlideNavigation (Next Experience) - Client

The *GlideNavigation* API enables refreshing the navigator and main frame in the Next Experience UI Framework.

Methods for this API are called within the *nowapi* namespace using the *g_navigation* system variable.

GlideNavigation [Next Experience] - refreshNavigator()

Refreshes the navigator contents.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to trigger a menu transaction similar to Core UI.

```
// onChange() client script settings:
// Table: Incident
// UI Type: All
// Type: onChange
// Field Name: Short description
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   if (isLoading || newValue === '') {
      return;
   }

   nowapi.g_navigation.refreshNavigator();
}
```

GlideUser (Next Experience) - Client

The *GlideUser* API provides a method to access information about current user roles in the Next Experience UI Framework.

GlideUser methods are accessed through a global object (`g_user`) that is only available in client scripts.

GlideUser (Next Experience) - getRoles()

Returns all roles assigned to the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Array of roles assigned to the current user. Includes explicitly granted roles, inherited roles, and roles acquired by group membership.

This example checks if the current user has the admin role.

```
if (g_user.getRoles().indexOf('admin') !== -1) {
    console.log('User is admin');
}
```

Output:

```
User is admin
```

This example logs all roles assigned to the current user.

```
function onChange(control, oldValue, newValue, isLoading,
 isTemplate) {
   if (isLoading || newValue === '') {
      return;
   }
   console.log(g_user.getRoles());
}
```

Output:

```
['actsub_user', 'sn_publications_recipients_list_user',
 'sn_publications.author', 'interaction_agent',
 'interaction_admin', 'image_admin',
 'sn_publications_recipients_user', 'workflow_publisher',
 'knowledge']
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

StopWatch (Next Experience) - Client

The *StopWatch* API provides methods to measure durations in the Next Experience UI Framework.

Properties

Name	Type	Description
started	Date object	Start date and time for the *StopWatch*. This value is set when calling the constructor StopWatch(Object started) or the restart() method.

StopWatch (Next Experience) - StopWatch(Object started)

Constructor to initialize a new *StopWatch*.

Parameters

Name	Type	Description
started	Date object	Optional. Date and time to use as the start time for the *StopWatch*. Default: The current date and time.

This example initializes a new *StopWatch* starting at the current date and time.

```
var timer = new nowapi.StopWatch();
```

StopWatch (Next Experience) - getTime()

Returns the elapsed time in milliseconds since the *StopWatch* started.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Elapsed time since the *StopWatch* started. Unit: Milliseconds

This example returns the elapsed *StopWatch* time in milliseconds.

```
var timer = new nowapi.StopWatch();
console.log(timer.started);  //logs the StopWatch start date and
 time to the console
var millis = timer.getTime();
```

StopWatch (Next Experience) - restart()

Resets the *StopWatch* start time as the current date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example returns the elapsed milliseconds since the timer started and restarted.

```
var timer = new nowapi.StopWatch();
console.log(timer.started);  //logs the StopWatch start date and
 time to the console
timer.getTime();  //milliseconds since the timer started
timer.restart();
console.log(timer.started);  //logs the new StopWatch start date
 and time to the console
timer.getTime();  //milliseconds since the timer restarted
```

StopWatch (Next Experience) - toString()

Returns the elapsed time in ISO 8601 format (HH:mm:ss.sss) since the *StopWatch* started.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Duration in ISO 8601 format containing hours, minutes, seconds, and milliseconds (HH:mm:ss.sss).

This example returns the elapsed *StopWatch* time in the format HH:mm:ss.sss.

```
var timer = new nowapi.StopWatch();
var duration = timer.toString();
```

UIB API reference

Use UI Builder (UIB) APIs in UIB client applications.

api - UI Builder

The *api* API provides methods that you can use when developing client scripts in the UI Builder.

This API is exposed to client scripts, also known as page scripts. Client scripts are executed in response to something happening on a page, such as:

- User interaction events/actions, such as a button click.
- Lifecycle events, such as a data broker execution started.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These scripts do not have to return anything to the framework and can be written as an asynchronous function.

This API is also exposed to scripted property values. These scripts are executed whenever the framework-runtime needs to calculate a value, such as:

- Passing to a component property.
- Determining component visibility.
- Emitting an event with a payload.

These scripts cannot be written as an asynchronous function. They also cannot invoke side-effect methods on the api object, such as, `api.emit()`, `api.setState()`, and `api.data.<data_resource_id>.*()`.

The api object contains both configuration dependent and configuration independent properties that you can access within the context of the associated page or component. You cannot directly modify the properties within this object. Modification can only be made through the available methods.

api - api.context.props.<page_property_name>

Page properties can be configured within UI Builder. The configuration values depend on the context in which the page is used.

Field

Name	Type	Description

<page_property_name>	Any	Available values are dependant on the client script implementation.
		
		To access these properties, use the following: `api.context.props.<page_property_name>`.
		
		For example:
		`// A record page with property table could be accessed with`
		`function isActivityStreamVisible({api}) {`
		`  return api.context.props.table === 'incident';`
		`}`
		
		Note: These property values are read-only. Mutating nested object values from scripts is not supported.

api - api.context.session.<session_property>

Context session properties associated with the current user.

Available session properties

Name	Type	Description
isLoggedIn	Boolean	Flag that indicates whether the current user is logged in to the system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available session properties (continued)

Name	Type	Description
		Possible values: • true: Current user is logged in to • false: Current user is not logged in.
properties.awaEnabled	String	The system property glide.awa.enabled that indicates whether the auto assignment for work items for Advanced Work Assignment (AWA) is enabled for the current user. Possible values: • true: AWA is enabled for the user. • false: AWA is not enabled for the user. For additional information, see Components installed with Advanced Work Assignment.
properties.forgetMe.value	String	The property glide.ui.forgetme that indicates whether to remove the **Remember Me** check box from the login page to prevent login information from being cached. Possible values: • true: Remove the **Remember Me** check box. • false: Display the **Remember Me** check box. For additional information, see Remove remember me.
properties.sessionTimeLeft.value	String Number coerced to string	The system property glide.ui.session_timeleft that determines the mount of time left before the current session times out. Use this property to prompt the user to extent the current session before it times out. Unit: Minutes
properties.sessionTimeout.value	String Number coerced to string	The system property glide.ui.session_timeout that determines the initial session time out value. Unit: Minutes - Values greater than 1440 minutes are treated as one day. For additional information, see Session activity timeout
properties.trackingEnabled.value	String	The system property glide.uxbuilder.tracking.enabled that indicates whether to enable/disable web analytics library loading and instantiation for UI Builder based applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available session properties (continued)

Name	Type	Description
		Possible values: • true: Enabled for the user. • false: Disabled for the user.
user.avatar	String	URL of the current user's avatar.
user.dateFormat	String	Default date format.
user.domain	String	Domain path for the current user.
user.firstName	String	First name of the current user.
user.fullName	String	First and last name of the current user.
user.initials	String	Initials of the current user.
user.language	String	Primary language spoken by the current user.
user.preferences	Array of objects	Name-value pairs that describe the user preferences. These user preferences are stored as records in the User Preference [sys_user_preference] table, and are updated each time the user changes their settings. For additional information, see Exploring user administration.
user.roles	Array	Comma-separated list of roles assigned to the current user. **Note:** If the user has no roles assigned, this context session property returns null rather than an empty array.
user.sys_id	String	Sys_id of the user in the User [sys_user] table.
user.timeFormat	String	Default time format to use for the user.
user.timeZone	String	Time zone of the current user.
user.timeZoneOffset	String	Time zone offset of the current user.

api - api.data.<data_resource_id>.lifecycle.lastFetchSucceeded

Boolean flag that indicates whether the last fetch attempt for the specified data resource instance finished successfully.

If the value is true, the last fetch attempt for the data resource instance finished successfully; otherwise, false.

Field

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field (continued)

Name	Type	Description
		In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

api - api.data.<data_resource_id>.addErrorMessage(Object payload)

Displays the specified error message at the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the error message to display.
		`"payload": {`
		`  "message": "String"`
		`}`

payload.message	String	Error message to display.

Returns

Type	Description
None	

```
api.data.gform.addErrorMessage({message: 'Error message'});
```

api -api.data.<data_resource_id>.addInfoMessage(Object payload)

Displays the specified informational message at the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the informational message to display.
		`"payload": {`
		`  "message": "String"`
		`}`

payload.message	String	Informational message to display.

Returns

Type	Description
None	

```
api.data.gform.addInfoMessage({message: 'Test message'});
```

api - api.data.<data_resource_id>.addOption(Object payload)

Adds an option to the specified choice type field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the field value to update.
		`"payload": {`
		`  "choiceIndex": "String",`
		`  "choiceLabel": "String",`
		`  "choiceValue": "String",`
		`  "fieldName": "String"`
		`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
payload.choiceIndex	String	Optional. Index into the choice list at which to insert the option. Default: End of the choice list.
payload.choiceLabel	String	Label of the option to add to the specified field.
payload.choiceValue	String	Value of the option to add to the specified field.
payload.fieldName	String	Name of the choice type form field to add the specified option to.

Returns

Type	Description
None	

```
api.data.gform.addOption({fieldName: 'priority', choiceLabel:
 'Extremely High', choiceValue: '10'});
```

api - api.data.<data_resource_id>.addWarningMessage(Object payload)

Displays the specified warning message at the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the warning message to display.
		`"payload": {`
		`  "message": "String"`
		`}`

payload.message	String	Warning message to display.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
api.data.gform.addWarningMessage({message: 'Test message'});
```

api - api.data.<data_resource_id>.clearMessage()

Removes all informational and error messages from the top of the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.clearMessage();
```

api - api.data.<data_resource_id>.clearOptions(Object payload)

Clears all options from the specified choice type field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the choice type field whose options are to be cleared.
		`"payload": {`
		`  "fieldName": "String"`
		`}`

payload.fieldName	String	Name of the choice type field whose options are to be cleared.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
api.data.gform.clearOptions({fieldName: 'priority'});
```

api - api.data.<data_resource_id>.executeUiAction(Object payload)

Executes the specified UI action.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Description of the UI action to execute. `"payload": { "actionSysId": "String" }`
payload.actionSysId	String	Sys_id of the UI action to execute. Table: UI Action [sys_ui_action]

Returns

Type	Description
None	

The following code example shows how to call this method.

```
api.data.gform.executeUiAction({actionSysId:
 '60615ff90f730010ac7de6f8c4767e9a'});
```

api - api.data.<data_resource_id>.execute(Object inputValues)

Triggers an execute operation on the specified data resource.

This method is only available if the data resource is one of the following types:

- Composite
- GraphQL
- REST

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Scriptlet
- Transform

Note: This method is only exposed if the *mutates_server_data* field is set to `true` on the corresponding data resource (sys_ux_data_broker_* table) record. It is accessible under *api.data.<data_resource_Id>.refresh()*.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
inputValues	Object	Object to pass to the specified data resource. This object must conform to the data resource's input parameters.

Returns

Type	Description
None	

This code example shows a page script that is invoked when the **Submit** button on the page is clicked. The page is configured wit a Server Data Resource tat creates a new record.

```
function handler({api}) {
  if (api.state.movieYear === 2020) {
    // The data resource used in this case specifies two input
 parameters: name and year
    api.data.create_movie_record.execute({
      name: api.state.movieName,
      year: api.state.movieYear
    });
  }
}
```

api - api.data.<data_resource_id>.hideFieldMessage(Object payload)

Hides the oldest message next to the specified field or clears all messages associated with the field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field message to hide. `"payload": { "clearAll": Boolean, "fieldName": "String" }`
payload.clearAll	Boolean	Optional. Flag that indicates whether to clear all messages associated with the specified form field. Valid values: • true: Clear all messages associated with the specified field. • false: Do not clear all messages associated with the specified field. Default: false
payload.fieldName	String	Name of the form field for which to hide the oldest message or clear all associated messages.

Returns

Type	Description
None	

```
api.data.gform.hideFieldMessage({fieldName:
 'short_description'});
```

api - api.data.<data_resource_id>.hideRelatedList(Object payload)

Hides the specified related list on the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the related list to hide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`"payload": { "listTableName ": "String" }`
payload.listTableName	String	Name of the related list to hide. If the list to hide is through a relationship, provide the sys_id of the list instead of the name. Table: Related List [sys_ui_related_list]

Returns

Type	Description
None	

The following code example shows how to call this method.

```
api.data.gform.hideRelatedList({listTableName:'incident.parent_incident'});
```

api - api.data.<data_resource_id>.hideRelatedLists()

Hides all related lists on the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.hideRelatedLists();
```

api - api.data.<data_resource_id>.refresh()

Triggers a refresh operation for the specified non-mutating data resource instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Call this method if the underlying data being fetched by the data resource changes. A data resource is considered non-mutating if the *mutates_server_data* field on the record is set to false.

This method is asynchronous and emits an internal event to trigger the refresh of the specified data resource instance. The UI Builder allows you to trigger client scripts in response to data resource lifecycle events, such as DATA_FETCH_SUCCEEDED and DATA_FETCH_FAILED. For additional information on these events, see Event mapping.

This method is only available if the data resource is one of the following types:

- Composite
- GraphQL
- REST
- Scriptlet
- Transform

Note: This method is only exposed if the *mutates_server_data* field is set to `false` on the corresponding data resource (sys_ux_data_broker_* table) record.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

This code example shows a page script that is invoked when a dropdown item is selected in a page. The page is configured with two Server Data Resources that query problem and incident tables.

```
function handler({api, event}) {
  const value = event.payload.value[0];
  if (value === 'problem')
    api.data.problem_list_1.refresh();
  else if(value === 'incident')
    api.data.incident_list_1.refresh();
}
```

api - api.data.<data_resource_id>.reload()

Reloads the current form using the same table and sys_id.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.reload();
```

api - api.data.<data_resource_id>.removeOption(Object payload)

Removes an option from the specified choice type field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the choice type field to update. `"payload": { "choiceValue": "String", "fieldName": "String" }`
payload.choiceValue	String	Value of the option to remove from the specified choice type field.
payload.fieldName	String	Name of the choice type form field from which to remove the specified value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
api.data.gform.removeOption({fieldName: 'priority', choiceValue:
 '1'});
```

api - api.data.<data_resource_id>.save()

Triggers form submission using the *Save* UI action.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

Returns

Type	Description
None	

```
api.data.gform.save();
```

api - api.data.<data_resource_id>.setMandatory(Object payload)

Sets whether the specified form field is mandatory.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field whose mandatory information to update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`"payload": { "fieldName": "String", "mandatory": Boolean }`
payload.fieldName	String	Name of the form field whose mandatory value is to be set.
payload.mandatory	Boolean	Flag that indicates the specified form field is mandatory, meaning the form cannot be saved without this field containing a valid value. Valid values: • true: Field is mandatory. • false: Field is optional.

Returns

Type	Description
None	

```
api.data.gform.setMandatory({fieldName: 'short_description',
 mandatory: false});
```

api - api.data.<data_resource_id>.setReadOnly(Object payload)

Sets the read/write capabilities of the specified form field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field whose readability information to update. `"payload": { "fieldName": "String", "readonly": Boolean }`
payload.fieldName	String	Name of the form field whose readability is to be set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
payload.readonly	Boolean	Flag that indicates the read/write capabilities of the specified form field. Valid values: • true: Field is read only. • false: Field is read/write.

Returns

Type	Description
None	

```
api.data.gform.setReadOnly({fieldName: 'short_description',
 readonly: false});
```

api -api.data.<data_resource_id>.setValue(Object payload)

Updates a specified GlideForm field with the specified value. Optionally, you can also update the display value with the same specified value.

Only the value on the form is updated. The value is not saved in the database.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the field whose value to update.
		`"payload": {`
		`  "displayValue": "String",`
		`  "fieldName": "String",`
		`  "value": "String"`
		`}`

payload.displayValue	String	Optional. Name of the display value to update. If left blank, the display value is not modified.
payload.fieldName	String	Name of the form field to update.
payload.value	String	Value to update the field with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
api.data.gform.setValue({fieldName: 'short_description', value:
 'short description'});
```

api - api.data.<data_resource_id>.setVisible(Object payload)

Sets the visibility of the specified form field.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the field on which to set visibility.
		`"payload": {`
		`  "fieldName": "String",`
		`  "visibility": Boolean`
		`}`

payload.fieldName	String	Name of the form field whose visibility is to be set.
payload.visibility	Boolean	Flag that indicates whether the associated field is visible on the current form. Valid values: • true: Field will display on the form. • false: Field will not display on the form.

Returns

Type	Description
None	

```
api.data.gform.setVisible({fieldName: 'short_description',
 visibility: false});
```

api - api.data.<data_resource_id>.showFieldMessage(Object payload)

Displays the specified message next to the specified field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.
payload	Object	Object that describes the field message to display. `"payload": { "fieldName": "String", "message": "String", "type": "String"`
payload.fieldName	String	Name of the field next to which the message should appear.
payload.message	String	Message to display.
payload.type	String	Optional. Type of message to display. Valid values: • error • info • warning Default: info

Returns

Type	Description
None	

```
api.data.gform.showFieldMessage({fieldName: 'short_description',
 message: 'Error message', type: 'error'});
```

api - api.data.<data_resource_id>.showRelatedList(Object payload)

Displays the specified related list on the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the related list to display.
		`"payload": {`
		`  "listTableName ": "String"`
		`}`

payload.listTableName	String	Name of the related list to display. If the list to display is through a relationship, provide the sys_id of the list instead of the name. Table: Related List [sys_ui_related_list]

Returns

Type	Description
None	

The following code example shows how to call this method.

```
api.data.gform.showRelatedList({listTableName:'incident.parent_i
ncident'});
```

api - api.data.<data_resource_id>.showRelatedLists()

Displays all related lists associated with the current form.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
api.data.gform.showRelatedLists();
```

api - api.data.<data_resource_id>.submit()

Triggers form submission using the specified UI action.

Parameters

Name	Type	Description
data_resource_id	String	Unique identifier of the associated data resource. In most cases, you can use the Form Controller CTRL_RECORD#SAVE_FORM action. If the record page has the Record Page Tabs component, the data resource for this method must be based off of GlideForm (g_form). The available data resource instances are configuration-dependent and defined when you add the data resource to your page in UI Builder.

payload	Object	Object that describes the UI action to use to submit the current form.
		`"payload": {`
		`  "submitActionName": "String"`
		`}`

payload.submitActionName	String	Name of the UI action to execute to submit the current form.

Returns

Type	Description
None	

```
api.data.gform.submit({submitActionName:'sysverb_ws_save'});
```

api - api.emit(String eventName, Object payload)

Emits an event with the specified name and payload.

The event name being emitted must be part of the associated page definition's dispatched events list, which is stored in the UX Macroponent Definition [sys_ux_macroponent] table. Any `api.emit` call that dispatches events not declared in this table are ignored.

For additional information on events, see Work with events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
eventName	String	Name of the event to emit. This name should follow the UI Framework action naming guidelines: • Should be upper snake case, such as ITEM_CHANGED. All letters in upper case and all spaces replaced with underscores. • Should be past tense, such as BUTTON_CLICKED or USER_SELECTED. For additional information on these action naming guidelines, see https://developer.servicenow.com/dev.do#!/reference/now-experience/sandiego/ui-framework/main-concepts/dispatching-actions.
payload	Object	Optional. Object that contains the data to send with the emitted event. This object is free-form and can contain whatever data is necessary by the entity receiving the data. **Note:** Payloads of primitive type work, but could result in inconsistent behavior.

Returns

Type	Description
None	

The following code example shows emitting an event called *NOW_UXF_PAGE#ADD_NOTIFICATIONS* with an associated *items* payload.

```
function handler({api}) {
  api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
    items: [
      {
        id: 'alert1',
        status: 'positive',
        icon: 'check-circle-outline',
        content: 'Here is some information!',
        textLinkProps: {
          label: 'More info',
          href: 'https://www.servicenow.com'
        },
      action: {type: 'acknowledge'}
      }
    ]
  });
}
```

api - setState(String stateParam, Any value)

Sets the value of the specified client state parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use client state parameters to maintain a shared state on a page. The shared state can then be passed as values to properties of components used on the page. You can also access and update client states in multiple page scripts. A common use case is to keep track of values input by users in multiple form controls on a page. When the form is submitted, a client script could then use all of the values stored in client state parameters to create a new record with a data broker. A page can have one or more client state parameters, which you can declare for a page through the UI Builder. You can then bind a client state parameter to one or more components to share or act on the client state parameter.

`api.setState()` calls are executed asynchronously and do not necessarily update the UI immediately. If the value to set depends on the *`currentValue`* of the client state parameter, or any of the properties provided in the api object, you should use this variant of the *`api.setState()`* method to avoid using outdated values.

Parameters

Name	Type	Description
stateParm	String	Name of the client state parameter to update. This name must be declared in the client state parameters of the associated page. For additional information on declaring client state parameters, see Work with client state parameters.
value	Any - Must be the same as the client state parameter declaration.	Value to set the specified client state parameter to.

Returns

Type	Description
None	

This example shows a script that could be executed to update the email client state parameter when an input value is set on a now-input component.

```
function handler({api, event}) {
    api.setState('email', event.payload.value);
}
```

api - setState(String stateParam, Function callbackFn)

Sets the value of the specified client state parameter to the value returned by the specified callback function.

The callback function is invoked with an object that has two properties: *`currentValue`* and *`api`*. The function should never mutate the *`currentValue`* property or the *`api`* object directly.

Use client state parameters to maintain a shared state on a page. The shared state can then be passed as values to properties of components used on the page. You can also access and update client states in multiple page scripts. A common use case is to keep track of values input by users in multiple form controls on a page. When the form is submitted, a client script could then use all of the values stored in client state parameters to create a new record with a data

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

broker. A page can have one or more client state parameters, which you can declare for a page through the UI Builder. You can then bind a client state parameter to one or more components to share or act on the client state parameter.

`api.setState()` calls are executed asynchronously and do not necessarily update the UI immediately. If the value to set depends on the `currentValue` of the client state parameter, or any of the properties provided in the api object, you should use this variant of the `api.setState()` method to avoid using outdated values.

Parameters

Name	Type	Description
stateParm	String	Name of the client state parameter to update. This name must be declared in the client state parameters of the associated page. For additional information on declaring client state parameters, see Work with client state parameters.
callbackFn	Function	Callback function to execute to obtain the value.

Returns

Type	Description
None	

This example shows how to use `api.setState` to log users into a page.

```
function handler({api, event}) {
  const {name, value} = event.payload;
  if (name === 'username' || name === 'password') {
    // Update the loginParameters state object with the
 username/password value
    api.setState('loginParameters', ({currentValue}) => {
      return {
        ...currentValue,
        [name]: value
      };
    });
  }
}
```

api - api.state.<client_state_parameter_name>

Current value of the specified client state parameter.

Field

Name	Type	Description
<client_state_parameter_name>	Any. The available client state parameters are dependent on the page configuration.	Name of the client state parameter. Available client states are dependant on the client script implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field (continued)

Name	Type	Description
		To access the available client states, use the following: `api.state.<client_state_name>`. For example: `function showRelatedLists({api}) { return ! api.state.isCustomListSelected; }` **Note:** These property values are read-only. To update a client state parameter, use api.setState(). Mutating nested object values from scripts is not supported.

helpers - UI Builder

The *helpers* API provides general functionality that is common across page scripts, eliminating the need to write scripts for simple functionality such as opening and closing a modal.

This API is only available to page scripts, it is not available in any other UI Builder scripts including:

- component property value scripts
- component visibility scripts
- event payload scripts
- UX client script includes

helpers - helpers.modal.close(String modalId)

Closes the specified modal on the current page.

Parameters

Name	Type	Description
modalId	String	Modal component ID of the modal to close. Component IDs are auto generated when a component is dragged and dropped on the UI Builder stage. You can locate the ID on the property page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This example shows closing a modal with a component ID that ends with `alert-modal`.

```
function handler({api, event, imports, helpers}) {
  helpers.modal.close("[component-id$='alert_modal']")
}
```

helpers - helpers.modal.open(String modalId, Object options)

Opens the specified modal on the current page.

You can only display one modal at a time within a page. If a modal is currently open, and you call this method, the existing modal is hidden and the new modal appears.

Parameters

Name	Type	Description
modalId	String	Component ID of the modal to open. Component IDs are auto generated when a component is dragged and dropped on the UI Builder stage. You can locate the ID on the property page.

options	Object	Optional.
		`"options": {`
		`  "content": "String",`
		`  "contentFullWidth": Boolean,`
		`  "headerLabel": "String",`
		`  "size": "String"`
		`}`

options.content	String	Text content for the modal.
options.contentFullWidth	Boolean	Flag that indicates whether to remove the horizontal padding around the body of the modal in order to fit wider content. Valid values: • true: Remove the padding. • false: Do not remove the padding. Default: false
options.headerLabel	String	Text content for the modal header.
options.size	String	Size of the modal container. Most sizes automatically expand to fill the viewport when the screen size is small. Valid values: • sm • md • lg • fullscreen

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: sm

Returns

Type	Description
None	

This example shows opening a modal with ca omponent ID that ends with `alert-modal`.

```
function handler({api, event, imports, helpers}) {
  helpers.modal.open("[component-id$='alert_modal']")
}
```

helpers - helpers.navigate.setRouteParams(Object params)

Passes the specified parameters down to other components on the same page.

Use this method in any page component that wants to add a parameter in a URL. You may want to add a parameter to a URL when another component needs to know the current value of that parameter when it changes, so it can react to it. For example, use this method to pass the `selectedIndex` of a tab component so it reflected in the URL to give focus to that tab.

Parameters

Name	Type	Description
params	Object	Key-value pairs of optional parameters to pass to other components. This must be a plain, flat object with only primitive values. Array or object references are ignored and not added to the URL. All specified keys#must be part of#the optional parameters#n the route configuration or they are also ignored. For additional information on optional parameters, see Create a page in UI Builder.

Returns

Type	Description
None	

This code example shows how to append the URL `params/selected-tab-index/2`. Note that the parameter in the actual URL is changed from camel case to snake case, so `selectedTabIndex` becomes `selected-tab-index`.

```
function handler({api, event, helpers, imports}) {
  helpers.navigate.setRouteParams({'params':
 {'selectedTabIndex':  2}});
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

helpers - helpers.navigate.to(String route, Object fields, Object params, Boolean redirect, Boolean passiveNavigation, String targetRoute)

Navigates from one screen to another based on the specified route and field information. URL changes and the respective screen loads are observed.

Parameters

Name	Type	Description
route	String	Name of the route. Must be a valid entry from UX App Routes (sys_ux_app_route.list). This value is reflected in the URL, and the URL is created based on the *route*, *fields*, and *optionalParams* column values: `/<route>/<field1Value>/{<field2Value>/params/<optionalParamKey1>/<optionalParamValue1>/<optionalParamKey2>/<optionalParamValue2>` For example: `/record/incident/12345/params/selectedTabIndex/4`
fields	Object	Optional. Key-value pairs of required parameters. For example: `'fields' : {'table': 'incident', 'sysId': '12345'}`.
params	Object	Optional. Key-value pairs of optional parameters. For example: `'params' : {'selectedTabIndex': 4}`.
redirect	Boolean	Flag that indicates whether to remove the latest history entry from the browser history. For example, if you navigate to sites A, B and then C. If *redirect* is set to `true` while navigating to C, the history entry for B is removed. The browser history only shows only A and C. Valid values: • true: Removes the latest history entry, and redirects to the latest URL. • false: Does not remove any history entries. Default: false
passiveNavigation	Boolean	Flag that indicates whether to perform background navigation. Background navigation is when a page is opened but it is not active or shown. For example, opening an inactive tab for the page, but it is not visible but loaded in the background. Valid values: • true: Perform background navigation. • false: Do not perform background navigation. Default: false
targetRoute	String or Object	Sub navigation to a drill-down, deep-link, or sub-tab. If set to `current`, the current route does a sub-navigation under the current URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example, if `/record/incident/123` is the current URL, and the following call is made: `helper.navigate.to('record', {'table': 'problem', 'sysId': '567'}, {}, false, false, 'current');` The following URL is generated: `/record/incident/123/sub/record/problem/567` **Note:** *`targetRoute`* can be either a string such as `'current'` or an object, such as `navigation NAV_ITEM_SELECTED payload`.

Returns

Type	Description
None	

This example shows how to navigate to a page passing just the *`route`* parameter.

```
function handler({api, event, imports, helpers}) {
  helpers.navigate.to('test');
}
```

This example shows how to navigate to a page passing the *`route`* and *`fields`* parameters.

```
function handler({api, event, imports, helpers}) {
  helpers.navigate.to('test', {'key': 'value'});
}
```

This example shows how to navigate to a page passing the *`route`*, *`fields`*, and *`params`* parameters.

```
function handler({api, event, helpers, imports}) {
  helpers.navigate.to('test', {'key': 'value'}, {'first':
 'FirstName', 'last': 'Last Name'});
}
```

helpers - helpers.screen.updateStatus(Object statusObj)

Enables pages to report their status updates, such as title, icon, dirty state, message, and error changes.

Status updates are reported to WorkspaceChrome or AppShell, whichever the outer layer is, and acting as the host.

Parameters

Name	Type	Description
statusObj	Object	Payload to send to the current page to report that the content has been updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • *dirtyModalId*: (String) ID of the modal that has changed. • *hasError*: (Boolean) Flag that indicates that there are errors on the page. • *hasUpdate*: (Boolean) Flag that indicates that there were updates to the page. • *icon*: (String) Name of the updated or new icon. • *isDirty*: (Boolean) Flag that indicates whether the page is dirty (values have changed). • *message*: (String) Updated/new message. • *screenKey*: (String) ID of the screen on which the change occurred. Every screen has a *screenKey* as a property on the screen macroponent inside sn-canvas-screen. • *status*: (String) Status operation for this action. This value must be one of the following: inserted, deleted, saved, or closed. • *title*: (String) Updated/new display title. • *tooltipPreview*: (JSON) Updated or new tool tip. For example, `tooltipPreview : { primaryTitle, secondaryContent: {} }`

Returns

Type	Description
None	

```
screen.updateStatus({'dirtyModalId': 'customModalId', 'isDirty':
 true});
```

helpers - helpers.snHttp(String url, Object options)

Makes an HTTP request to the ServiceNow instance and returns a promise with the results.

Note: There is a known issue where objects named *options* are omitted from the HTTP response.

```
{
  options: {},
  otherFields: {}
}

becomes

{
  otherFields: {}
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
url	String	HTTP endpoint relative to the instance URL. For example, `/api/now/table/incident` or `/api/now/table/incident/a83820b58f723300e7e16c7827bdeed`.

options	Object	Describes the contents of the HTTP request.
		`"options": {`
		`  "batch": Boolean,`
		`  "body": {Object},`
		`  "headers": {Object},`
		`  "method": "String"`
		`}`

options.batch	Boolean	Optional. Flag that indicates whether this HTTP request should be batched with other HTTP requests made to the instance. Valid values: • true: Make request as part of a batch request. • false: Make dedicated request. Default: true
options.body	Object	Optional. Data to send as the request body. Only applicable for request methods PUT, POST, and PATCH. Elements in the object depend on the type of HTTP method. For details, refer to the code examples below. Default: `{}`

options.headers	Object	Optional. Additional HTTP request headers.
		For example:
		`headers: {`
		`  "Content-Type": "application/json",`
		`  "Accept": "application/xml"`
		`}`

options.method	String	Optional. HTTP method. Valid values: • DELETE • GET • PATCH • POST • PUT Default: GET

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description

error	Object that describes any error returned by the REST API.
	
	Data type: Object
	
	`"error": {`
	`  "data": "String",`
	`  "message": "String",`
	`  "options": {Object},`
	`  "status": Number,`
	`  "statusText": "String"`
	`}`

error.data	Response returned from the HTTP API. Data type: Defined by REST API
error.message	Message describing the error encountered when trying to process the HTTP request. **Note:** This parameter is not always returned. Data type: String

error.options	Describes the original HTTP request.
	
	Data type: Object
	
	`"options": {`
	`  "headers": {Object},`
	`  "responseHeader": {Object}`
	`}`

error.options.headers	Object containing a list of all of the request headers sent in the request. Data type: Object
error.options.responseHeaders	Object containing a list of all of the response headers sent in the request. Data type: Object
error.status	Returned HTTP error status code, such as 400, 405, or 500. Data type: Number
error.statusText	Returned HTTP status message, such as `Bad Request`. Data type: String
response	Returned when HTTP request is successful. The response to the HTTP request. Data type: Any

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example show how to call *snHttp()* which returns a promise.

```
function handler({api, event, helpers, imports}) {
  helpers.snHttp('/api/now/table/u_movie', {method: 'GET'})
    .then(({response}) => {
      // do something with the table data
    })
    .catch(({error}) => {
      const message = `Error: ${error.data.error.message}`;
      console.error(message);
      api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
        id: 'alert5',
        status: 'high',
        icon: 'info-circle-outline',
        content: message,
        action: { type: 'dismiss' }
    });
  });
}
```

The following example show how to call *snHttp()* using *async* and *await*.

```
async function handler({helpers}) {
  try {
    const result = await
 helpers.snHttp('/api/now/table/u_movie', {method: 'GET'});
  } catch ({error}) {
      const message = `Error: ${error.data.error.message}`;
      console.error(message);
      api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
        id: 'alert5',
        status: 'high',
        icon: 'info-circle-outline',
        content: message,
        action: { type: 'dismiss' }
      });
  }
}
```

The following example show how to set up a POST request.

```
function handler({api, helpers, event, imports}) {
  helpers
    .snHttp("/api/now/table/incident", {
      method: "POST",
      body: {
        description: "Sample description",
        close_notes: "Sample close notes",
        order: "-1"
      }
    })
    .then({{ response }) => {
      // handle POST request response
    })
    .catch({{ error }) => {
      // handle POST request errors
    });
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example show how to set up a PUT request.

```
function handler({api, helpers, event, imports}) {
  helpers

 .snHttp("/api/now/table/incident/a83820b58f723300e7e16c7827bdee
d2", {
      method: "PUT",
      body: {
        activity_due: "1970-04-02 18:26:17"
      },
      headers: {
        "Content-Type": "application/json",
        "Accept": "application/xml"
      }
    })
    .then(({ response }) => {
      // handle PUT request response
    })
    .catch(({ error }) => {
      // handle PUT request errors
    });
}
```

helpers - helpers.timing.clearInterval(Number timeoutId)

Cancels the execution of the function that was scheduled through a prior `setInterval()` call.

Parameters

Name	Type	Description
timeoutId	Number	Unique identifier of the scheduled function to clear. This value is returned by the corresponding `setInterval()` call.

Returns

Type	Description
None	

This example shows using `clearInterval()` to cancel a timing operation that was previously set using the `setInterval()` method. This function could be invoked by a user clicking a **Disable Auto-refresh** button on a page.

```
function handler({api, helpers}) {
  api.setState('intervalId', ({currentValue}) => {
    if (currentValue > -1) {
      helpers.timing.clearInterval(currentValue);
    }
    return -1;
  });
}
```

helpers - helpers.timing.clearTimeout(Number timeoutId)

Cancels the execution of the function that was scheduled through a prior `setTimeout()` call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
timeoutId	Number	Unique identifier of the scheduled function to clear. This value is returned by the corresponding *setTimeout()* call.

Returns

Type	Description
None	

This code example shows how to terminate a timer with the specified *timeoutId*.

```
function handler({api, helpers}) {
  api.setState('timeoutId', ({currentValue}) => {
    if (currentValue > -1) {
      helpers.timing.clearTimeout(currentValue);
    }
    return -1;
  });
}
```

helpers - helpers.timing.setInterval(Function fn, Number delay)

Repeatedly executes the specified function, using the specified delay value as the interval between function calls.

Unlike the native JavaScript *setInterval()* method, this method does not support passing a code string to evaluate as the first argument. Any additional arguments are passed to the function itself.

Parameters

Name	Type	Description
fn	Function	Function to repeatedly execute.
delay	Number	Length of the time-interval between each function execution. Unit: Milliseconds

Returns

Type	Description
Number	Unique identifier of the function execution operation. Use this value in the helpers - helpers.timing.clearInterval(Number timeoutId) method if you need to cancel this operation.

This code example shows how to refresh the timestamp on a page every second. This function could be invoked by a user clicking an **Enable Auto-refresh** button on a page.

```
function handler({api, helpers}) {
  // Every one second, refresh the value of current timestamp
 client state parameter
  const intervalId = helpers.timing.setInterval(() => {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    api.setState('currentTimestamp', new Date().toString())
  }, 1000);

  // The interval ID is kept in state to use when calling the
 helpers.timing.clearInterval() method at a later point
  api.setState('intervalId', intervalId);
}
```

helpers - helpers.timing.setTimeout(Function fn, Number delay)

Executes the specified function, after the specified delay.

Unlike the native JavaScript *`setTimeout()`* method, this method does not support passing a code string to evaluate as the first argument. Any additional arguments are passed to the function itself.

Parameters

Name	Type	Description
fn	Function	Function to execute.
delay	Number	Length of the time to wait before calling the specified function. Unit: Milliseconds

Returns

Type	Description
Number	Unique identifier of the function execution operation. Use this value in the helpers - helpers.timing.clearTimeout(Number timeoutId) method if you need to cancel this operation.

This code example shows how to set a 20 minute timer. You could associate this function with a button **Remind me in 20 minutes**.

```
function handler({api, helpers}) {
  const timeoutId = helpers.timing.setTimeout(() => {
    api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
      id: 'alert5',
      status: 'high',
      icon: 'info-circle-outline',
      content: 'Try to look away at something that is 20 feet
 away from you for a total of 20 minutes.',
      action: { type: 'dismiss' }
    });
  }, 20 * 60 * 1000);

  // The timeout ID is kept in state to use when calling the
 helpers.timing.clearTimeout() method at a later point
  api.setState('timeoutId', timeoutId);
}
```

helpers - helpers.translate(String message, String tokens)

Asynchronously retrieves and translates the specified message based on the current user's session language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use this method with the api - setState(String stateParam, Any value) to bind the translated value to other fields on the page.

Note: You can call this method using a promise or `async` and `await`. The code examples below show both implementations.

Parameters

Name	Type	Description
message	String	Message to translate.
tokens	String	Optional. Comma-separated list of parameters to use for replacing string variables. For example: `helpers.translate('Text {0} {1}', 'to', 'translate');`

Returns

Type	Description
String	Translated text string.

The following example shows how to pass in table field references to embed in the corresponding variables in a string, using a promise.

```
function handler ({api, helpers}) {
  helpers.translate('Welcome {0} {1}!', user.firstName,
 user.lastName)
    .then((translatedText) => {
      api.setState('greeting', translatedText);
    });
}
```

The following example shows how to use `async` and `await` in your function instead of a promise.

```
async function handler ({api, helpers}) {
  const translatedText = await helpers.translate('Welcome to
 {0}', 'ServiceNow');
    api.setState('greeting', translatedText);
}
```

Mobile Scripting API reference

Mobile Scripts are JavaScript APIs that you write in the sn_mobile_scripting scoped namespace to evaluate conditions and read or update records for mobile app components.

Mobile scripting supports a smaller set of classes and methods than server-side scripting, because the same script must be able to run against the local database on a device. Depending on the use case and execution context, a mobile script runs on the device or on the instance.

Whether a script that uses this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The same script is used in both cases, without modification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported components

Mobile scripts are currently supported for the following components:

- **Button conditions**: Determine whether a button is shown or enabled for the current record and user.
- **Write-back actions (WBA)**: Set field values on a record when the action runs.

Available classes

- MobileGlideDate - Scoped: Work with date values.
- MobileGlideDateTime - Scoped: Work with date and time values.
- MobileGlideElement - Scoped: Read and set values on a single field.
- MobileGlideRecord - Scoped: Query, read, and update records.
- MobileGlideSystem - Scoped (mgs): Utility methods for the current user, session, and date-time values.
- MobileGlideTime - Scoped: Work with time values.
- MobileGlideUser - Scoped: Access the current user's profile, roles, and groups.
- MobileScripts - Scoped: Load and invoke custom mobile scripts.

Instantiating a class

```
var gr = new sn_mobile_scripting.MobileGlideRecord('incident');
```

`MobileGlideSystem` is available as the mgs object and doesn't require instantiation.

API access requirements

The Mobile Scripting classes are provided within the sn_mobile_scripting namespace and require the Mobile Scripting plugin (com.glide.sg.mobile_scripting).

To create or modify the scripts that call this API, you need the mobile_admin role.

MobileGlideDate - Scoped

The *`MobileGlideDate`* API provides the subset of GlideDate available to mobile scripts. It represents the date-only portion of a MobileGlideDateTime value.

`MobileGlideDate` provides the subset of GlideDate that can be evaluated against the local database on a device. It represents the date-only portion of a MobileGlideDateTime value, for scripts that need only the calendar date, such as a script that checks whether a due date falls on the current date, without accounting for the time of day.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

API access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin,

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

which is enabled by default. The class has no public constructor. Obtain an instance from the `getDate()` or `getLocalDate()` method of MobileGlideDateTime.

MobileGlideDate - getByFormat(String format)

Gets the date value in the specified format.

Parameters

Name	Type	Description
format	String	Date format string, for example, "MM/dd/yyyy".

Returns

Type	Description
String	Date value formatted per format.

This example calls getByFormat_S.

```
var dueDate = mgs.nowGlideDateTime().getDate();
mgs.info(dueDate.getByFormat('MM/dd/yyyy'));
```

Output:

```
"08/26/2026"
```

MobileGlideDate - getDayOfMonthNoTZ()

Gets the day of the month, not adjusted for time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Day of the month. Range: 1–31.

This example calls getDayOfMonthNoTZ.

```
mgs.info(mgs.nowGlideDateTime().getDate().getDayOfMonthNoTZ());
```

Output:

```
26
```

MobileGlideDate - getDisplayValue()

Gets the date value in the current user's display format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display-format date value.

This example calls getDisplayValue.

```
mgs.info(mgs.nowGlideDateTime().getDate().getDisplayValue());
```

Output:

```
"08/26/2026"
```

MobileGlideDate - getDisplayValueInternal()

Gets the display value in the internal format (yyyy-MM-dd).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display value expressed in internal format.

This example calls getDisplayValueInternal.

```
mgs.info(mgs.nowGlideDateTime().getDate().getDisplayValueInterna
l());
```

Output:

```
"2026-08-26"
```

MobileGlideDate - getMonthNoTZ()

Gets the month, not adjusted for time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Month number. Range: 1–12.

This example calls getMonthNoTZ.

```
mgs.info(mgs.nowGlideDateTime().getDate().getMonthNoTZ());
```

Output:

```
8
```

MobileGlideDate - getNumericValue()

Gets the number of milliseconds since January 1, 1970, 00:00:00 GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Milliseconds since epoch (UTC). Unit: milliseconds.

This example calls getNumericValue.

```
mgs.info(mgs.nowGlideDateTime().getDate().getNumericValue());
```

Output:

```
1787788800000
```

MobileGlideDate - getValue()

Gets the date value in the internal format and system time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Internal-format date value.

This example calls getValue.

```
mgs.info(mgs.nowGlideDateTime().getDate().getValue());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"2026-08-26"
```

MobileGlideDate - getYearNoTZ()

Gets the four-digit year, not adjusted for time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Four-digit year.

This example calls getYearNoTZ.

```
mgs.info(mgs.nowGlideDateTime().getDate().getYearNoTZ());
```

Output:

```
2026
```

MobileGlideDate - isValid()

Determines whether this value is a valid date.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the value is a valid date. Possible values: true, this is a valid date; false, this is not a valid date.

This example calls isValid.

```
mgs.info(mgs.nowGlideDateTime().getDate().isValid());
```

Output:

```
true
```

MobileGlideDateTime - Scoped

The *MobileGlideDateTime* API provides the subset of GlideDateTime available to mobile scripts. It gives a script structured access to a date and time value.

MobileGlideDateTime provides the subset of GlideDateTime that can be evaluated against the local database on a device. It gives a script structured access to the components of a date and time value, including the day, month, year, and week, in both local time and UTC, as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

well as comparison operators. A value can also be split into aMobileGlideDate - Scoped and MobileGlideTime - Scoped pair.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

API access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin, which is enabled by default. The class has no public value constructor. Obtain an instance from the `nowGlideDateTime()` method of mgs.

MobileGlideDateTime - compareTo(MobileGlideDateTime gdt)

Compares this datetime with another.

Parameters

Name	Type	Description
gdt	MobileGlideDateTime	The datetime to compare against.

Returns

Type	Description
Number	0 if equal, 1 if this datetime is after gdt, -1 if before. Range: -1 to 1.

This example calls compareTo_M.

```
mgs.info(mgs.nowGlideDateTime().compareTo(mgs.nowGlideDateTime()
));
```

Output:

```
0
```

MobileGlideDateTime - equals() / after() / before() / onOrAfter() / onOrBefore()

Compares this datetime with another MobileGlideDateTime for equality, or determines whether it occurs after, before, on-or-after, or on-or-before the specified datetime.

Parameters

Name	Type	Description
gdt	MobileGlideDateTime	The datetime to compare against.

Returns

Type	Description
Boolean	Result of the comparison named by the method called.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example calls equals_after_before_onOrAfter_onOrBefore.

```
var dueDate = current.due_date.getValue();
var now = mgs.nowGlideDateTime();
mgs.info(now.after(dueDate));
```

Output:

```
false
```

MobileGlideDateTime - getDate() / getLocalDate()

Gets the date portion, expressed in the system time zone or in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
MobileGlideDate	Date-only portion of this datetime. See MobileGlideDate for its methods.

This example calls getDate_getLocalDate.

```
var date = mgs.nowGlideDateTime().getLocalDate();
mgs.info(date.getByFormat('MM/dd/yyyy'));
```

Output:

```
"08/26/2026"
```

MobileGlideDateTime - getDayOfMonthLocalTime() / getDayOfMonthUTC()

Gets the day of the month, in the user's time zone or in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Day of the month. Range: 1–31.

This example calls getDayOfMonthLocalTime_getDayOfMonthUTC.

```
mgs.info(mgs.nowGlideDateTime().getDayOfMonthLocalTime());
```

Output:

```
26
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MobileGlideDateTime - getDayOfWeekLocalTime() / getDayOfWeekUTC()

Gets the day of the week, in the user's time zone or in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Day of the week. Range: 1–7 (Monday = 1).

This example calls getDayOfWeekLocalTime_getDayOfWeekUTC.

```
var isMonday = mgs.nowGlideDateTime().getDayOfWeekLocalTime()
 === 1;
mgs.info(isMonday);
```

Output:

```
false
```

MobileGlideDateTime - getDaysInMonthLocalTime() / getDaysInMonthUTC()

Gets the number of days in the month, in the user's time zone or in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Number of days in the month. Range: 28–31.

This example calls getDaysInMonthLocalTime_getDaysInMonthUTC.

```
mgs.info(mgs.nowGlideDateTime().getDaysInMonthLocalTime());
```

Output:

```
31
```

MobileGlideDateTime - getDSTOffset()

Gets the amount of time, in milliseconds, that daylight saving time is offset.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	DST offset. Unit: milliseconds.

This example calls getDSTOffset.

```
mgs.info(mgs.nowGlideDateTime().getDSTOffset());
```

Output:

```
0
```

MobileGlideDateTime - getErrorMsg()

Gets the current error message.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Current error message. Returns null if there is no error. The backing field is only ever assigned when a real error occurs, such as an unparseable date/time string. It is never set to an empty string.

This example calls getErrorMsg.

```
mgs.info(mgs.nowGlideDateTime().getErrorMsg());
```

MobileGlideDateTime - getMonthLocalTime() / getMonthUTC()

Gets the month, in the user's time zone or in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Month number. Range: 1–12.

This example calls getMonthLocalTime_getMonthUTC.

```
mgs.info(mgs.nowGlideDateTime().getMonthLocalTime());
```

Output:

```
8
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MobileGlideDateTime - getNumericValue()

Gets the number of milliseconds since January 1, 1970, 00:00:00 GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Milliseconds since epoch (UTC). Unit: milliseconds.

This example calls getNumericValue.

```
mgs.info(mgs.nowGlideDateTime().getNumericValue());
```

Output:

```
1787855057000
```

MobileGlideDateTime - getTime() / getLocalTime()

Gets the time portion, or the time portion expressed in the current user's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
MobileGlideTime	Time-only portion of this datetime. See MobileGlideTime for its methods.

This example calls getTime_getLocalTime.

```
var time = mgs.nowGlideDateTime().getLocalTime();
mgs.info(time.getHourOfDayLocalTime());
```

Output:

```
16
```

MobileGlideDateTime - getTZOffset()

Gets the time zone offset in milliseconds.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Time zone offset. Unit: milliseconds.

This example calls getTZOffset.

```
mgs.info(mgs.nowGlideDateTime().getTZOffset());
```

MobileGlideDateTime - getUserFormattedLocalTime() / getInternalFormattedLocalTime()

Gets the object's time in the local time zone, in the user's display format or in the internal format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Local time in the format named by the method called.

This example calls getUserFormattedLocalTime_getInternalFormattedLocalTime.

```
mgs.info(mgs.nowGlideDateTime().getUserFormattedLocalTime());
```

MobileGlideDateTime - getValue() / getDisplayValue() / getDisplayValueInternal()

Gets the date-time value in the internal format, the current user's display format, and the display value expressed in the internal format, respectively.

`getValue()` returns the internal-format value; `getDisplayValue()` returns the current user's display-format value; `getDisplayValueInternal()` returns the display value expressed in the internal format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Date-time string in the format described earlier for the method called.

This example calls getValue_getDisplayValue_getDisplayValueInternal.

```
var gdt = mgs.nowGlideDateTime();
mgs.info(gdt.getValue());
```

Output:

```
"2026-08-26 20:44:17"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MobileGlideDateTime - getWeekOfYearLocalTime() / getWeekOfYearUTC()

Gets the number of the week in the year, in the user's time zone or in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Week of the year. Range: 1–53.

This example calls getWeekOfYearLocalTime_getWeekOfYearUTC.

```
mgs.info(mgs.nowGlideDateTime().getWeekOfYearLocalTime());
```

Output:

```
35
```

MobileGlideDateTime - getYearLocalTime() / getYearUTC()

Gets the four-digit year, in the user's time zone or in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Four-digit year.

This example calls getYearLocalTime_getYearUTC.

```
mgs.info(mgs.nowGlideDateTime().getYearLocalTime());
```

Output:

```
2026
```

MobileGlideDateTime - isDST()

Determines whether this datetime uses a daylight saving offset.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether daylight saving is in effect. Possible values: true, daylight saving is in effect; false, daylight saving is not in effect.

This example calls isDST.

```
mgs.info(mgs.nowGlideDateTime().isDST());
```

Output:

```
false
```

MobileGlideDateTime - isValid()

Determines whether the value is a valid date and time.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the value is a valid date-time. Possible values: true, this is a valid date-time; false, this is not a valid date-time.

This example calls isValid.

```
mgs.info(mgs.nowGlideDateTime().isValid());
```

Output:

```
true
```

MobileGlideDateTime - toString()

Returns the string representation of the datetime value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	String representation of the datetime value.

This example calls toString.

```
mgs.info(String(mgs.nowGlideDateTime()));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MobileGlideElement - Scoped

The *MobileGlideElement* API provides the subset of GlideElement available to mobile scripts. An instance is returned when a script dot-walks into a field on a MobileGlideRecord.

MobileGlideElement provides the subset of GlideElement that can be evaluated against the local database on a device. An instance is returned when a script dot-walks into a field on a MobileGlideRecord, or accesses `current.<field>` in a condition script. The element carries both the raw value and the display value of a single field, and can report whether the field has been changed. A script can therefore compare the stored value of a field with the value shown to the user, or detect an edit that hasn't been saved to the record yet.

MobileGlideElement also supports field access with the dot operator, which is what enables a chained dot-walk through reference fields. For example, `current.caller_id.name` first resolves `caller_id` to a *MobileGlideElement*, and then dot-walks `.name` from that element into the referenced record.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

API access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin, which is enabled by default. The class has no public constructor. Obtain an instance from the `getElement(field)` method of MobileGlideRecord, or through dot-walk field access, which resolves to the same element.

MobileGlideElement - changes()

Determines whether the field value has changed since the record was loaded.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the value has changed since load. Possible values: true, the value changed; false, the value did not change.

This example calls changes.

```
if (current.priority.changes()) {
  mgs.info('Priority was changed');
}
```

Output:

```
"Priority was changed"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MobileGlideElement - getDisplayValue()

Gets the display value of the field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display value of the field.

This example calls getDisplayValue.

```
mgs.info(current.state.getDisplayValue());
```

Output:

```
"In Progress"
```

MobileGlideElement - getName()

Gets the name of the field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Field name. Maximum length: 40.

This example calls getName.

```
mgs.info(current.priority.getName());
```

Output:

```
"priority"
```

MobileGlideElement - getValue()

Gets the internal string value of the field.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Internal value of the field.

This example calls getValue.

```
mgs.info(current.state.getValue());
```

Output:

```
"2"
```

MobileGlideElement - nil()

Determines whether the field value is null or empty.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the field is null or empty. Possible values: true, the field is null or empty; false, the field has a value.

This example calls nil.

```
if (current.assigned_to.nil()) {
  mgs.info('Unassigned');
}
```

Output:

```
"Unassigned"
```

MobileGlideElement - setDisplayValue(String value)

Sets the display value of the field.

Parameters

Name	Type	Description
value	String	New display value for the field.

Returns

Type	Description
void	

This example calls setDisplayValue_S.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
current.state.setDisplayValue('In Progress');
```

MobileGlideElement - setValue(Object value)

Sets the internal value of the field.

Parameters

Name	Type	Description
value	Object	New internal value for the field.

Returns

Type	Description
void	

This example calls setValue_O.

```
current.priority.setValue('1');
```

MobileGlideElement - toString()

Returns the string representation of the field value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	String representation of the field value.

This example calls toString.

```
mgs.info(String(current.priority));
```

Output:

```
"1"
```

MobileGlideRecord - Scoped

The *MobileGlideRecord* API provides the subset of GlideRecord available to mobile scripts, for querying and updating records through the mobile scripting environment..

Unlike a server-side GlideRecord, which doesn't enforce access controls, this class enforces read, write, and execute access checks on every field access. A field that the current user doesn't have permission to read returns an empty value. This behavior matches the data synced to the device, which is filtered by access controls before it reaches the user, so a script returns the same result wherever it's evaluated.

Unlike a server-side GlideRecord, which doesn't enforce access controls, this class enforces read, write, and execute access checks on every field access. A field that the current user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

doesn't have permission to read returns an empty value. This behavior matches the data synced to the device, which is filtered by access controls before it reaches the user, so a script returns the same result wherever it's evaluated. Records can be filtered with an encoded query, which supports a subset of the available operators. For the supported operators, see documentation for the *addEncodedQuery()* method.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

API access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin, which is enabled by default. The class has a public constructor. For more information, see *MobileGlideRecord(String tableName)*.

MobileGlideRecord - addEncodedQuery(String query)

Adds an encoded query string to filter records.

Adds an encoded query to filter the records. See the supported operators in the relevant documentation. See supported operatorshere Delegates to the underlying GlideRecordSecure's user-encoded-query method, not the unsafe encoded-query method. Field-level access controls are enforced on the query conditions themselves.

Encoded query operators supported for MobileGlideRecord in mobile scripts

Operator	Description	Incident encoded query example
`^`	(AND) Combines multiple conditions so that all conditions must be true for an incident to be returned. This is the default logical operator between conditions in an encoded query. Conditions are evaluated together as a logical AND.	`state=1^priority=2`
`^OR`	(OR) Combines conditions so that at least one of the conditions must be true. Useful when matching alternative states or fields. OR conditions are evaluated at the same query level unless they're grouped explicitly.	`state=1^ORstate=2`
`!=`	Returns incidents where the field value is different from the provided value. Records with empty values are also returned unless they're explicitly filtered.	`state!=7`
`<`	Returns incidents where the numeric or date field value is less than the specified value.	`priority<3`
`<=`	Returns incidents where the numeric or date field value is less than or equal to the specified value.	`priority<=2`
`>`	Returns incidents where the numeric or date field value is greater than the specified value.	`priority>2`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Encoded query operators supported for MobileGlideRecord in mobile scripts (continued)

Operator	Description	Incident encoded query example
`>=`	Returns incidents where the numeric or date field value is greater than or equal to the specified value.	`priority>=4`
`LT_FIELD`	Compares two fields on the same incident record and returns records where the first field is earlier or smaller than the second field.	`resolved_atLT_FIELDopened_at`
`LT_OR_EQUALS_FIELD`	Same as `LT_FIELD`, but also includes records where both field values are equal.	`closed_atLT_OR_EQUALS_FIELDresol`
`GT_FIELD`	Returns incidents where the first field value is greater or later than the second field value.	`resolved_atGT_FIELDopened_at`
`GT_OR_EQUALS_FIELD`	Returns incidents where the first field value is greater than or equal to the second field value.	`sys_updated_onGT_OR_EQUALS_FIELD`
`BETWEEN`	Returns incidents where the field value falls within the specified inclusive range. Commonly used for numeric priority ranges or date ranges.	`priorityBETWEEN2@4`
`ISEMPTY`	Returns incidents where the field has no value at all, including null references.	`assigned_toISEMPTY`
`ISNOTEMPTY`	Returns incidents where the field contains any value.	`assigned_toISNOTEMPTY`
`ISEMPTYSTRING`	Returns incidents where the field value is an empty string rather than null. Applies mainly to string fields.	`short_descriptionISEMPTYSTRING`
`LIKE`	Performs a case-insensitive partial match using wildcard logic. Returns incidents where the field contains the specified pattern.	`short_descriptionLIKEemail`
`NOT LIKE`	Excludes incidents where the field matches the provided pattern.	`short_descriptionNOT LIKEtest`
`CONTAINS`	Similar to `LIKE`, but explicitly expresses substring containment for readability.	`descriptionCONTAINSnetwork`
`DOES NOT CONTAIN`	Returns incidents where the field doesn't include the specified substring.	`descriptionDOES NOT CONTAINwifi`
`STARTSWITH`	Returns incidents where the field value begins with the specified string. Often used with incident numbers.	`numberSTARTSWITHINC`
`ENDSWITH`	Returns incidents where the field value ends with the specified string.	`caller_id.emailENDSWITH@company.`
`IN_FIELD`	Compares two fields and returns incidents where the value of the first field exists within the value set of the second field.	`assigned_toIN_FIELDwatch_list`
`IN`	Returns incidents where the field value matches one of the provided values in a comma-separated list.	`stateIN1,2,3`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Encoded query operators supported for MobileGlideRecord in mobile scripts (continued)

Operator	Description	Incident encoded query example
NOT IN	Returns incidents where the field value doesn't match any value in the provided list.	priorityNOT IN1,5
ON	Returns incidents where a date or date-time field falls on a specific calendar day.	sys_created_onON2025-01-10
NOTON	Excludes incidents created or updated on a specific calendar day.	sys_created_onNOTON2025-01-10
SAMEAS	Returns incidents where the values of two fields are identical. Often used for reference comparisons.	assigned_toSAMEASopened_by
NSAMEAS	Returns incidents where the values of two fields are different.	assigned_toNSAMEASopened_by
MORETHAN	Compares duration or numeric fields and returns incidents where the first field is greater than the second field.	calendar_durationMORETHANbusines
LESSTHAN	Compares duration or numeric fields and returns incidents where the first field is less than the second field.	calendar_durationLESSTHANbusines
RELATIVEGT	Returns incidents where the date field is later than a relative time expression, such as greater than one day ago.	sys_created_onRELATIVEGT@day@ago
RELATIVEGE	Same as RELATIVEGT, but also includes values equal to the relative time threshold.	sys_updated_onRELATIVEGE@hour@ag
RELATIVELT	Returns incidents where the date field is earlier than a relative time expression.	sys_created_onRELATIVELT@day@ago
RELATIVELE	Returns incidents where the date field is earlier than or equal to the relative time expression.	sys_updated_onRELATIVELE@minute@
RELATIVEEE	Returns incidents where the date field exactly matches the relative time expression.	sys_created_onRELATIVEEE@day@ago
MATCH_RGX_FIELD	Matches the target field against a regular expression stored in another field.	short_descriptionMATCH_RGX_FIELD
MATCH_RGX	Applies a regular expression directly to the field value.	short_descriptionMATCH_RGX^INC[0
VALCHANGES	Returns incidents where the specified field has changed at any point in its update history.	stateVALCHANGES
DYNAMIC	Uses a ServiceNow dynamic filter that resolves at run time, such as the current user.	assigned_toDYNAMICme

Parameters

Name	Type	Description
query	String	Encoded query string. For example, "active=true^priority<=2". Only the listed operators are supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		See the previous table for supported encoded query operators for *MobileGlideRecord*.

Returns

Type	Description
void	

This example calls addEncodedQuery_S.

```
var gr = new MobileGlideRecord('wm_task');
gr.addEncodedQuery('active=true^priority<=2');
gr.query();
```

MobileGlideRecord - deleteRecord()

Deletes the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the record was deleted successfully. Possible values: • true: The record was deleted. • false: The record was not deleted.

This example calls deleteRecord.

```
var deleted = gr.deleteRecord();
mgs.info(deleted);
```

Output:

```
true
```

MobileGlideRecord - get(String sysId)

Retrieves a single record by its sys_id.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to load. Maximum length: 32.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the record was found and loaded. Possible values: true, the record was found and loaded; false, the record was not found.

This example calls get_S.

```
var gr = new MobileGlideRecord('wm_task');
if (gr.get(current.getValue('sys_id'))) {
  mgs.info('loaded');
}
```

Output:

```
"loaded"
```

MobileGlideRecord - getElement(String field)

Retrieves the MobileGlideElement for a specified field, enabling dot-walk method calls.

Dot operator field access is equivalent to this method — `gr.priority` resolves to the exact same MobileGlideElement as `gr.getElement('priority')`, including chaining through reference fields (for example, `current.caller_id.name`). Every example in this document that writes `current.<field>` is using this mechanism rather than calling `getElement()` explicitly.

Parameters

Name	Type	Description
field	String	Name of the field to access.

Returns

Type	Description
MobileGlideElement	Element wrapper for the field. See MobileGlideElement for its methods.

This example calls getElement_S.

```
var el = gr.getElement('state');
mgs.info(el.getDisplayValue());
```

Output:

```
"In Progress"
```

MobileGlideRecord - getValue(String field)

Gets the value of a field from the current record.

Parameters

Name	Type	Description
field	String	Name of the field to read.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Internal value of the field. Returns null if field does not resolve to a real field on the table, or if the current user lacks read access to it. Returns an empty string if the field exists, is readable, and is simply empty.

This example calls getValue_S.

```
mgs.info(gr.getValue('short_description'));
```

MobileGlideRecord - insert()

Inserts the new record into the database.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the newly created record. Returns null on any insert failure — access-control denial, a read-only table, being blocked by an access handler, or a table-level validation error. Never throws. The underlying platform records a failure reason internally, but MobileGlideRecord does not expose a method to read it — a script can detect that insert() failed but not why.

This example calls insert.

```
var gr = new MobileGlideRecord('wm_task');
gr.initialize();
gr.setValue('parent', current.getValue('sys_id'));
gr.setValue('short_description', 'Follow-up required');
var newSysId = gr.insert();
mgs.info(newSysId);
```

Output:

```
"9c0c1f2a3b4c5d6e7f8091a2b3c4d5e6"
```

MobileGlideRecord - initialize()

Creates an empty record suitable for population before an insert.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	Populates the record with table defaults, ready for setValue()/insert().

This example calls initialize.

```
var gr = new MobileGlideRecord('wm_task');
gr.initialize();
```

MobileGlideRecord - MobileGlideRecord(String tableName)

Creates an instance of the MobileGlideRecord class for the specified table.

Parameters

Name	Type	Description
tableName	String	Name of the table to query or update.

This example creates a MobileGlideRecord for the wm_task table.

```
var gr = new MobileGlideRecord('wm_task');
```

MobileGlideRecord - next()

Moves to the next record in the result set.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether another record is available and was advanced to. Possible values: true, another record was advanced to; false, the result set is exhausted.

This example calls next.

```
var gr = new MobileGlideRecord('wm_task');
gr.addEncodedQuery('active=true');
gr.query();
while (gr.next()) {
  mgs.info(gr.getValue('number'));
}
```

Output:

```
"WM0001001"
"WM0001002"
```

MobileGlideRecord - query()

Executes the query built with addEncodedQuery() against the on-device database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example calls query.

```
var gr = new MobileGlideRecord('wm_task');
gr.addEncodedQuery('active=true');
gr.query();
```

MobileGlideRecord - setValue(String field, String value)

Sets the value of a field on the current record.

Parameters

Name	Type	Description
field	String	Name of the field to set.
value	String	New internal value for the field.

Returns

Type	Description
void	

This example calls setValue_S_S.

```
gr.setValue('priority', '1');
```

MobileGlideRecord - update()

Updates the current record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the updated record.

This example calls update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gr.setValue('priority', '1');
gr.update();
```

MobileGlideSystem - Scoped

The *MobileGlideSystem* API provides utility methods for the current session, including user information, date and time values, and script logging.

MobileGlideSystem methods provide the subset of GlideSystem behavior that can be evaluated against the local database on a device: identity and role checks for the current user, and logging and messaging. Most of the class consists of date-range helpers that mirror the GlideSystem date-range shortcuts used in filters and reports, such as the beginning of the previous quarter. These helpers let a script express a relative time window without calculating dates directly.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

API Access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin, which is enabled by default. The class can't be instantiated. All members are static delegates, and the class is accessed through the variable `mgs`, which the mobile scripting preamble declares as `var mgs = sn_mobile_scripting.MobileGlideSystem;`.

MobileGlideSystem - addErrorMessage(String error)

Adds an error message for the current session, surfaced to the user in the mobile client.

Parameters

Name	Type	Description
error	String	Error text to display to the user.

Returns

Type	Description
void	

This example calls addErrorMessage_S.

```
mgs.addErrorMessage('This field cannot be edited while the
 record is closed.');
```

MobileGlideSystem - addInfoMessage(String message)

Adds an info message for the current session, surfaced to the user in the mobile client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
message	String	Text to display to the user.

Returns

Type	Description
void	

This example calls addInfoMessage_S.

```
mgs.addInfoMessage('Saved locally — will sync when back
 online.');
```

MobileGlideSystem - beginningOfDay(MobileGlideDateTime dateTime) / endOfDay(MobileGlideDateTime dateTime)

Gets the UTC start or end date-time of the day containing the given MobileGlideDateTime.

Unlike the fixed named-range methods, this method takes a MobileGlideDateTime parameter rather than being parameterless.

Parameters

Name	Type	Description
dateTime	MobileGlideDateTime	The date-time whose containing day's start/end is returned.

Returns

Type	Description
String	UTC date-time at the start/end of the day containing dateTime.

This example calls beginningOfDay_M_endOfDay_M.

```
var dayStart = mgs.beginningOfDay(mgs.nowGlideDateTime());
mgs.info(dayStart);
```

Output:

```
"2026-08-26 00:00:00"
```

MobileGlideSystem - beginningOfX() / endOfX() — relative date-range shortcuts (35 pairs, 70 methods)

Gets the UTC start or end date-time of a fixed named relative range (a relative month, quarter, year, day, hour, or minute window).

One full worked example is given following this note; the remaining 34 pairs (68 methods) differ only in the named range, not in shape or behavior. Every pair is still listed by name so none is dropped from this documentation set.

Scope decision (see source-mapping.md): this single reference topic documents the entire 35-pair/70-method family the source attachment (DOC1138071-mgs.docx) consolidated under one heading. This deviates from the real GlideSystem corpus convention. That convention gives

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

beginningOfThisMonth() and endOfThisMonth() their own separate reference topic files, for example r_GS-beginningOfThisMonth.dita and r_GS-endOfThisMonth.dita. This is flagged for the writer to decide whether MobileGlideSystem should also get one-file-per-method splitting before real promotion.

All 35 beginningOfX()/endOfX() pairs in this family:

- beginningOfLast3Months() / endOfLast3Months()
- beginningOfLast6Months() / endOfLast6Months()
- beginningOfLast9Months() / endOfLast9Months()
- beginningOfLast12Months() / endOfLast12Months()
- beginningOfLastQuarter() / endOfLastQuarter()
- beginningOfLast2Quarters() / endOfLast2Quarters()
- beginningOfNextQuarter() / endOfNextQuarter()
- beginningOfNext2Quarters() / endOfNext2Quarters()
- beginningOfLast2Years() / endOfLast2Years()
- beginningOfLast7Days() / endOfLast7Days()
- beginningOfLast30Days() / endOfLast30Days()
- beginningOfLast60Days() / endOfLast60Days()
- beginningOfLast90Days() / endOfLast90Days()
- beginningOfLast120Days() / endOfLast120Days()
- beginningOfCurrentHour() / endOfCurrentHour()
- beginningOfLastHour() / endOfLastHour()
- beginningOfLast2Hours() / endOfLast2Hours()
- beginningOfCurrentMinute() / endOfCurrentMinute()
- beginningOfLastMinute() / endOfLastMinute()
- beginningOfLast15Minutes() / endOfLast15Minutes()
- beginningOfLast30Minutes() / endOfLast30Minutes()
- beginningOfLast45Minutes() / endOfLast45Minutes()
- beginningOfOneYearAgo() / endOfOneYearAgo()
- beginningOfToday() / endOfToday()
- beginningOfYesterday() / endOfYesterday()
- beginningOfTomorrow() / endOfTomorrow()
- beginningOfThisWeek() / endOfThisWeek()
- beginningOfLastWeek() / endOfLastWeek()
- beginningOfNextWeek() / endOfNextWeek()
- beginningOfThisMonth() / endOfThisMonth()
- beginningOfLastMonth() / endOfLastMonth()
- beginningOfNextMonth() / endOfNextMonth()
- beginningOfThisQuarter() / endOfThisQuarter()
- beginningOfThisYear() / endOfThisYear()

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- beginningOfLastYear() / endOfLastYear()
- beginningOfNextYear() / endOfNextYear()

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	UTC date-time at the start/end of the named range.

This example shows the worked pair, beginningOfThisMonth()/endOfThisMonth(); every other pair in this family behaves identically.

```
var start = mgs.beginningOfThisMonth();
var end = mgs.endOfThisMonth();
mgs.info(start + ' to ' + end);
```

Output:

```
"2026-08-01 00:00:00 to 2026-08-31 23:59:59"
```

MobileGlideSystem - dateGenerate(String date, String range)

Generates a date-time string for the given date and range.

Parameters

Name	Type	Description
date	String	Date in yyyymmdd format, for example, "20260215".
range	String	Either 'start' (00:00:00), 'end' (23:59:59), or a specific hh:mm:ss (24hr) time.

Returns

Type	Description
String	Date-time string in the instance's date format.

This example calls dateGenerate_S_S.

```
var rangeStart = mgs.dateGenerate('20260215', 'start');
mgs.info(rangeStart);
```

Output:

```
"2026-02-15 00:00:00"
```

MobileGlideSystem - getMessage(String messageId, Object args)

Gets the translated message for the given message ID, substituting positional placeholders in the message text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
messageId	String	Key of a sys_ui_message record. If no record matches, the platform falls back to returning messageId itself as the message text.
args	Object	Optional. A single value, or an array of values, substituted positionally for {0}, {1}, and so on, placeholders in the message text.

Returns

Type	Description
String	Translated message text with substitutions applied.

This example calls getMessage_S_O.

```
mgs.info(mgs.getMessage('This {0} record is currently locked.',
 ['incident']));
```

Output:

```
"This incident record is currently locked."
```

MobileGlideSystem - getUser()

Gets the MobileGlideUser object for the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
MobileGlideUser	The current user. For the available methods, see MobileGlideUser.

This example gets the display name of the current user and writes it to the log.

```
var displayName = mgs.getUser().getDisplayName();
        mgs.info(displayName);
```

Output:

```
Jordan Alvarez
```

MobileGlideSystem - getUserDisplayName()

Gets the display name of the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user's display name.

This example calls getUserDisplayName.

```
mgs.info(mgs.getUserDisplayName());
```

Output:

```
"Jordan Alvarez"
```

MobileGlideSystem - getUserID()

Gets the sys_id of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the current user. Maximum length: 32.

This example calls getUserID.

```
mgs.info(mgs.getUserID());
```

Output:

```
"62826bf03710200044e0bfc8bcbe5dec"
```

MobileGlideSystem - getUserName()

Gets the username of the current user.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The user's login name.

This example calls getUserName.

```
mgs.info(mgs.getUserName());
```

Output:

```
"employee.smith"
```

MobileGlideSystem - hasRole(String role)

Determines whether the current user has the specified role.

Parameters

Name	Type	Description
role	String	Name of the role to check, for example, 'itil'.

Returns

Type	Description
Boolean	Flag that indicates whether the current user has the specified role. Possible values: true, user has the role; false, user does not have the role.

This example calls hasRole_S.

```
if (mgs.hasRole('itil')) {
  mgs.info('User is ITIL');
}
```

Output:

```
"User is ITIL"
```

MobileGlideSystem - info(String message)

Logs an informational message for debugging.

Parameters

Name	Type	Description
message	String	Text to write to the system log.

Returns

Type	Description
void	

This example writes the sys_id of the current record to the log as part of a condition script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
mgs.info('Condition evaluated for record ' +
 current.getValue('sys_id'));
```

MobileGlideSystem - minutesAgo(n) / hoursAgo(n) / daysAgo(n) / monthsAgo(n) / quartersAgo(n) / yearsAgo(n) — N-units-ago shortcuts (6 families, 18 methods)

Gets a date-time N units in the past — either the exact moment (unitAgo(n)), or the start (unitAgoStart(n)) or end (unitAgoEnd(n)) of that unit's containing period.

One full worked example is given following this note; the other families differ only in the unit (minutes, hours, days, months, quarters, years), not in shape or behavior. Every family is confirmed exposed on mgs by its own static function bindings in the runtime implementation.

Scope decision (see source-mapping.md): this single reference topic documents the entire 6-family/18-method group the source attachment consolidated under one heading. This is the same documented deviation from the strict one-file-per-method corpus convention as the beginningOfX()/endOfX() family earlier in this class. yearsAgo(n) is the one family confirmed with no Start/End variant.

All 6 families in this group:

- minutesAgo(n) / minutesAgoStart(n) / minutesAgoEnd(n)
- hoursAgo(n) / hoursAgoStart(n) / hoursAgoEnd(n)
- daysAgo(n) / daysAgoStart(n) / daysAgoEnd(n)
- monthsAgo(n) / monthsAgoStart(n) / monthsAgoEnd(n)
- quartersAgo(n) / quartersAgoStart(n) / quartersAgoEnd(n)
- yearsAgo(n)

Parameters

Name	Type	Description
n	Number	How many units in the past. Integer. Minimum value: 0.

Returns

Type	Description
String	Date-time string per the method's semantics (exact / period start / period end).

This example shows the worked family, daysAgo(n)/daysAgoStart(n)/daysAgoEnd(n); every other family in this group behaves identically, parameterized by its own unit.

```
var threeDaysAgo = mgs.daysAgo(3);
var thatDayStart = mgs.daysAgoStart(3);
var thatDayEnd = mgs.daysAgoEnd(3);
mgs.info(threeDaysAgo);
```

Output:

```
"2026-08-23 16:44:17"
```

MobileGlideSystem - nil(Object value)

Determines whether the value is null, undefined, or an empty string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
value	Object	Value to test.

Returns

Type	Description
Boolean	true if value is null, undefined, or an empty string; false otherwise.

This example calls nil_O.

```
mgs.info(mgs.nil(current.getValue('short_description')));
```

Output:

```
false
```

MobileGlideSystem - now()

Gets the current date. Despite the generic name, this returns a date only, with no time-of-day component, unlike nowDateTime().

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Current date only (no time-of-day), in the user's preferred date pattern (for example, MM/dd/yyyy) computed in the platform's internal time zone.

This example calls now.

```
mgs.info(mgs.now());
```

Output:

```
"08/26/2026"
```

MobileGlideSystem - nowDateTime()

Gets the current date and time.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Current date and time, in the current user's display format and actual session time zone. Falls back to the literal string "NULL" if the underlying value is somehow null. This is distinct from now(), which returns a date only, computed in the platform's internal/UTC time zone rather than the user's. It is also distinct from nowNoTZ(), which returns date and time in the fixed internal format and that same internal/UTC time zone.

This example calls nowDateTime.

```
mgs.info(mgs.nowDateTime());
```

Output:

```
"2026-08-26 16:44:17"
```

MobileGlideSystem - nowGlideDateTime()

Gets a MobileGlideDateTime object with the current date and time.

Parameters

Name	Type	Description
None		

Returns

Type	Description
MobileGlideDateTime	Current date-time object. See MobileGlideDateTime for its methods.

This example calls nowGlideDateTime.

```
var gdt = mgs.nowGlideDateTime();
mgs.info(gdt.getValue());
```

Output:

```
"2026-08-26 20:44:17"
```

MobileGlideSystem - nowNoTZ()

Gets the current date and time in UTC, without time zone conversion.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Current UTC date-time, format yyyy-mm-dd hh:mm:ss.

This example calls nowNoTZ.

```
mgs.info(mgs.nowNoTZ());
```

Output:

```
"2026-08-26 20:44:17"
```

MobileGlideSystem - yesterday() / lastWeek()

Gets the date and time 24 hours ago, or 7 days ago.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Date-time in the fixed internal format (yyyy-MM-dd HH:mm:ss) and the platform's internal/UTC time zone.

This example calls yesterday_lastWeek.

```
mgs.info(mgs.yesterday());
mgs.info(mgs.lastWeek());
```

Output:

```
"2026-08-25 16:44:17"
"2026-08-19 16:44:17"
```

MobileGlideTime - Scoped

The *`MobileGlideTime`* API provides the subset of GlideTime available to mobile scripts. It represents the time-of-day portion of a MobileGlideDateTime value.

`MobileGlideTime` provides the subset of GlideTime that can be evaluated against the local database on a device. It represents the time-of-day portion of a MobileGlideDateTime value, for scripts that control behavior based on the time of day and not the calendar date, such as a script that checks whether the current time falls within business hours.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin, which is enabled by default. The class has no public constructor. Obtain an instance from the `getTime()` or `getLocalTime()` method of MobileGlideDateTime.

MobileGlideTime - getByFormat(String format)

Gets the time value in the specified format.

Parameters

Name	Type	Description
format	String	Time format string, for example, "HH:mm".

Returns

Type	Description
String	Time value formatted per format.

This example calls getByFormat_S.

```
var time = mgs.nowGlideDateTime().getLocalTime();
mgs.info(time.getByFormat('HH:mm'));
```

Output:

```
"16:44"
```

MobileGlideTime - getDisplayValue()

Gets the time value in the current user's display format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display-format time value.

This example calls getDisplayValue.

```
mgs.info(mgs.nowGlideDateTime().getLocalTime().getDisplayValue(
));
```

Output:

```
"4:44:17 PM"
```

MobileGlideTime - getDisplayValueInternal()

Gets the display value in the internal format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Display value expressed in internal format.

This example calls getDisplayValueInternal.

```
mgs.info(mgs.nowGlideDateTime().getLocalTime().getDisplayValueIn
ternal());
```

Output:

```
"16:44:17"
```

MobileGlideTime - getHourLocalTime() / getHourUTC()

Gets the hour part of the time on a 12-hour clock, in the user's time zone or in UTC.

`getHourLocalTime()` returns the hour in the user's local time zone; `getHourUTC()` returns the equivalent hour in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Hour on a 12-hour clock. Range: 0–11 (0 represents both noon and midnight).

This example calls getHourLocalTime_getHourUTC.

```
mgs.info(mgs.nowGlideDateTime().getLocalTime().getHourLocalTime(
));
```

Output:

```
4
```

MobileGlideTime - getHourOfDayLocalTime() / getHourOfDayUTC()

Gets the hour part of the time on a 24-hour clock, in the user's time zone or in UTC.

`getHourOfDayLocalTime()` returns the hour in the user's local time zone; `getHourOfDayUTC()` returns the equivalent hour in UTC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Hour on a 24-hour clock. Range: 0–23.

This example calls getHourOfDayLocalTime_getHourOfDayUTC.

```
mgs.info(mgs.nowGlideDateTime().getLocalTime().getHourOfDayLocal
Time());
```

Output:

```
16
```

MobileGlideTime - getMinutesLocalTime() / getMinutesUTC()

Gets the minutes, in the user's time zone or in UTC.

`getMinutesLocalTime()` returns the minutes in the user's local time zone; `getMinutesUTC()` returns the equivalent minutes in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Minutes. Range: 0–59.

This example calls getMinutesLocalTime_getMinutesUTC.

```
mgs.info(mgs.nowGlideDateTime().getLocalTime().getMinutesLocalTi
me());
```

Output:

```
44
```

MobileGlideTime - getSeconds()

Gets the seconds.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Seconds. Range: 0–59.

This example calls getSeconds.

```
mgs.info(mgs.nowGlideDateTime().getLocalTime().getSeconds());
```

Output:

```
17
```

MobileGlideTime - getValue()

Gets the time value in the internal format and system time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Internal-format time value.

This example calls getValue.

```
mgs.info(mgs.nowGlideDateTime().getLocalTime().getValue());
```

Output:

```
"16:44:17"
```

MobileGlideUser - Scoped

The `MobileGlideUser` API provides a read-only view of the currently logged-in user. An instance is returned by the getUser() method of MobileGlideSystem.

`MobileGlideUser` provides a read-only view of the currently logged-in user, returned by the `getUser()` method of mgs. It provides access to identity fields such as the sys_id, user name, and email address, to display information, and to role and group membership checks. It provides a subset of the methods available in the GlideUser API.

A button condition or a write-back action script can use these methods to control behavior based on who the user is. For example, a script can allow an action only for members of a specific group, or hide a field from users who don't have a required role.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin, which is enabled by default. The class has no public constructor. Obtain an instance from the `getUser()` method of mgs.

MobileGlideUser - getCompanyId()

Gets the sys_id of the user's company.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the user's company, referencing the core_company table. Maximum length: 32.

This example calls getCompanyId.

```
var companyId = mgs.getUser().getCompanyId();
mgs.info(companyId);
```

Output:

```
"31bea3d53790200044e0bfc8bcbe5c3"
```

MobileGlideUser - getDisplayName()

Gets the user's display name, as shown throughout the UI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user's display name, sourced from the sys_user table's user_display_name field. Maximum length: 255.

This example calls getDisplayName.

```
var displayName = mgs.getUser().getDisplayName();
mgs.info(displayName);
```

Output:

```
"Jordan Alvarez"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MobileGlideUser - getEmail()

Gets the user's email address.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user's email address, sourced from the sys_user table's email field (maximum length 100).

This example calls getEmail.

```
var email = mgs.getUser().getEmail();
mgs.info(email);
```

Output:

```
"jordan.alvarez@example.com"
```

MobileGlideUser - getFirstName()

Gets the user's first name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user's first name, sourced from the sys_user table's first_name field. Maximum length: 50.

This example calls getFirstName.

```
var firstName = mgs.getUser().getFirstName();
mgs.info(firstName);
```

Output:

```
"Jordan"
```

MobileGlideUser - getID()

Gets the sys_id of the currently logged-in user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the current user. Maximum length: 32.

This example calls getID.

```
var userId = mgs.getUser().getID();
mgs.info(userId);
```

Output:

```
"62826bf03710200044e0bfc8bcbe5dec"
```

MobileGlideUser - getLastName()

Gets the user's last name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user's last name, sourced from the sys_user table's last_name field. Maximum length: 50.

This example calls getLastName.

```
var lastName = mgs.getUser().getLastName();
mgs.info(lastName);
```

Output:

```
"Alvarez"
```

MobileGlideUser - getMyGroups()

Gets the sys_ids of the groups the user is a member of.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array of String	List of sys_user_group sys_ids the user belongs to.

This example calls getMyGroups.

```
var groups = mgs.getUser().getMyGroups();
var inTargetGroup = groups.indexOf('a1b2c3d4e5f6') !== -1;
mgs.info(inTargetGroup);
```

Output:

```
false
```

MobileGlideUser - getName()

Gets the user's login name (username).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user's login name, sourced from the sys_user table's user_name field. Maximum length: 40.

This example calls getName.

```
var loginName = mgs.getUser().getName();
mgs.info(loginName);
```

Output:

```
"employee.smith"
```

MobileGlideUser - getRoles()

Gets the roles the user has been explicitly assigned, not including inherited roles.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array of String	List of role names explicitly assigned to the user. Does not include roles inherited through group membership or role hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example calls getRoles.

```
var roles = mgs.getUser().getRoles();
mgs.info(roles.join(', '));
```

Output:

```
"itil, catalog_admin"
```

MobileGlideUser - getUserRoles()

Gets all roles the user has, including inherited roles.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array of String	List of all effective role names for the user, including roles inherited through group membership or role hierarchy.

This example calls getUserRoles.

```
var allRoles = mgs.getUser().getUserRoles();
var isItil = allRoles.includes('itil');
mgs.info(isItil);
```

Output:

```
true
```

MobileGlideUser - hasRole(String role)

Determines whether the current user has the specified role.

Parameters

Name	Type	Description
role	String	Name of the role to check, for example, 'itil'.

Returns

Type	Description
Boolean	Flag that indicates whether the current user has the specified role. Possible values: true, user has the role; false, user does not have the role.

This example calls hasRole_S.

```
var isItil = mgs.getUser().hasRole('itil');
mgs.info(isItil);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
true
```

MobileGlideUser - isMemberOf(String group)

Determines whether the current user is a member of the specified group.

Parameters

Name	Type	Description
group	String	Identifier of the group to check membership against — accepts either the group's sys_id or its unique name.

Returns

Type	Description
Boolean	Flag that indicates whether the current user is a member of the specified group. Possible values: true, user is a member of the group; false, user is not a member of the group.

This example calls isMemberOf_S.

```
var inServiceDesk = mgs.getUser().isMemberOf('service_desk');
if (inServiceDesk) {
  mgs.info('User belongs to the Service Desk group');
}
```

Output:

```
"User belongs to the Service Desk group"
```

MobileScripts - Scoped

The *`MobileScripts`* API is the entry point for loading and calling custom mobile scripts stored in the Mobile Script [sys_sg_mobile_script] table.

It works like a script include, and can be resolved both on the device and on the instance.

Use this API to move reusable logic, such as a validator or a formatter, out of the inline expression on a button condition or a write-back action step. The script can then be called by name instead of being duplicated in each expression. A mobile script can also call another mobile script: the body of every mobile script runs with *`MobileScripts`*, mgs, and MobileGlideRecord already in scope, so a script can call `MobileScripts.get('ScriptA')` from within its own source.

When the script is evaluated on the instance, the results of `get()` are cached for the duration of the transaction, so repeated calls that use the same script name within a transaction don't run the script again. Resolving a script that depends on other scripts is limited by a configurable call depth, which is 25 by default. If resolution exceeds that depth, an error is thrown. This limit prevents mobile scripts from depending on each other in a loop.

Whether a script that calls this API is evaluated on the instance or on the device depends on how the component that runs the script is configured. The methods in this class are available in both cases: the mobile client provides its own implementation of the same API surface, so the same script returns the same result in either context. Typical calling contexts include a condition script on a mobile button (`sys_sg_button`) and an execution script on a write-back action item or step.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

API access

This API is registered in the `sn_mobile_scripting` application scope and requires the `mobile_admin` role. It requires the `com.glide.sg.mobile_scripting` plugin, which is enabled by default. The class has no constructor. Access it with the static `MobileScripts.get(apiName)` method.

MobileScripts - get(String apiName)

Loads a mobile script by its API name and returns its exported value (typically a class or function) for immediate invocation.

Parameters

Name	Type	Description
apiName	String	Dot-walked name in scope.name format (for example, "global.ValidationHelper"), matching a record in the sys_sg_mobile_script table.

Returns

Type	Description
Object	The script's exported class, function, or object. Resolved exports are cached for the rest of the transaction, so repeated calls with the same apiName are cheap. If apiName does not resolve to a record in sys_sg_mobile_script, throws IllegalArgumentException.

This example calls a static method exported by a mobile script named global.TaskValidator.

```
var canComplete =
 MobileScripts.get('global.TaskValidator').canComplete(current.g
etValue('sys_id'));
mgs.info(canComplete);
```

Output:

```
true
```

Client mobile API reference

Use Cabrillo JS to build custom mobile experiences inside of ServiceNow AI Platform native mobile apps.

Cabrillo JS constants

These are the constants used by Cabrillo JS.

Cabrillo JS constants - button styles

Constants to use when setting the style of a button.

Properties

Name	Type	Description
cabrillo.viewLayout.MORE_MENU_BUTTON_STYLE	String	Indicates that the button appears in the navigation bar's overflow button menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
cabrillo.viewLayout.REPLACE_BACK_BUTTON_STYLE	String	Replaces the native back button with a Cabrillo button. **Note:** Use this style with caution. If the webpage does not restore the native back button after using the Cabrillo replacement, the user may not be able to navigate back.

Cabrillo JS constants - close button styles

Constants to use when setting the close button style of modal interfaces.

Properties

Name	Type	Description
cabrillo.modal.CLOSE_BUTTON_STYLE_CANCEL	String	The modal has a localized cancel button to close the modal.
cabrillo.modal.CLOSE_BUTTON_STYLE_CLOSE	String	The modal has a localized close button to close the modal.
cabrillo.modal.CLOSE_BUTTON_STYLE_DONE	String	The modal has a localized done button to close the modal.

Cabrillo JS constants - message styles

Constants to use when setting the style of a message.

The appearance of each message style can be customized using theme colors. For more information, see Next Experience theming for mobile.

Properties

Name	Type	Description
cabrillo.message.ERROR_MESSAGE_STYLE	String	The message is styled to indicate an error.
cabrillo.message.INFO_MESSAGE_STYLE	String	The message is styled to indicate non-critical information.
cabrillo.message.SUCCESS_MESSAGE_STYLE	String	The message is styled to indicate a success.
cabrillo.message.WARNING_MESSAGE_STYLE	String	The message is styled to indicate a warning.

Cabrillo JS constants - modal presentation styles

Constants to use when setting the presentation style of modal interfaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
cabrillo.modal.MODAL_PRESENTATION_STYLE_FULL_SCREEN	String	The modal is presented full screen.
cabrillo.modal.MODAL_PRESENTATION_STYLE_FORM_SHEET	String	The modal is presented as a form sheet, but may adapt to full screen on small devices.

Cabrillo JS data types

These are common data types used by Cabrillo JS APIs.

Cabrillo.Attachment

Defines an attachment.

Properties

Name	Type	Description
content_type	String	The attachment content type.
ext	String	The attachment file extension.
file_name	String	The full file name of the attachment including the extension.
sys_created_by	String	The user name of the user that created the attachment.
sys_id	String	The attachment record sys_id.
sys_updated_on	String	The date the attachment record was updated.
table_name	String	Name of the table containing the record to which the attachment is attached.
table_sys_id	String	The sys_id of the record that to which the attachment is attached.
thumbnail	String	The URL for the image thumbnail of the attachment. Only applies to image attachments.

Cabrillo.AttachmentOptions

Defines attachment options.

Properties

Name	Type	Description
isSingleSelection	Boolean	Optional. Flag that indicates whether the document picker for uploading files allows multi-selection. Valid values: • true: Only one file to upload can be selected at a time. • false: Multiple files to upload can be selected at a time. Default: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cabrillo.Button

Defines a button. Different interface contexts may support a subset of a button's properties.

Properties

Name	Type	Description
backgroundColor	String	Background color of the button or badge. A string containing hex, RGB, HSL, or an x11-named color. **Note:** The color can't be set for buttons in the navigation bar. The color can be set for bottom buttons.
badgeCount	Number	Number value to display on the button's badge.
buttonId	String	Required. Unique id for the button. This value is returned in the button action payload to indicate which button the user tapped.
buttonStyle	String	Used to customize the style of the button.
enabled	Boolean	Indicates whether the button is enabled.
imageName	String	Specifies an image. Possible values are: • add: Displays an add button. • back: Displays a back arrow image to navigate back. • cart: Displays a shopping cart. • close: Displays an X image to navigate back. • edit: Displays an edit button. • filter: Displays a filter button. • menu: Displays a menu button. • search: Displays a search button.
textColor	String	The text color of the badge or button. A string containing hex, RGB, HSL, or an x11-named color. **Note:** The color can't be set for buttons in the navigation bar. The color can be set for bottom buttons.
title	String	Title of the button. The string should be localized.

Cabrillo.ModalResponse

Contains the result passed from a modal window that was dismissed.

Properties

Name	Type	Description
results	Object	The result from the dismissed modal window.

Cabrillo.NavigationRequest

Specifies a request to navigate to a list or record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
table	String	The table to navigate to. Required for both list and record navigation.
sysId	String	The sys_id of the record to navigate to. Required for record navigation.
query	String	An encoded query for the requested list. Can be used to seed values for record navigation requests.
view	String	The list or record view.

Cabrillo.Rect

Contains the location and dimensions of a rectangle.

Properties

Name	Type	Description
x	Number	The x origin of the rectangle.
y	Number	The y origin of the rectangle.
width	Number	The width in points.
height	Number	The height in points.

Cabrillo.Spinner

Defines a spinner.

Properties

Name	Type	Description
mask	Boolean	Optional. Determines whether to display a mask behind the spinner. Valid values: • true: Displays a mask behind the spinner. • false: Does not display a mask behind the spinner. Default: false
maskColor	String	Color of the mask, if enabled.

cabrillo - Client

Cabrillo JS is a client side JavaScript API for accessing capabilities inside ServiceNow native mobile applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use Cabrillo JS to build a custom mobile experience in ServiceNow native mobile applications. Cabrillo JS provides APIs to use native device capabilities, native mobile UI, and other ServiceNow mobile functionality.

Cabrillo JS is available in AngularJS as an injectable parameter. For example, you can inject Cabrillo JS in a Service Portal widget client script.

```
function(cabrillo) {
    var c = this;

    // Used to determine if Cabrillo is executing in
 ServiceNow's native mobile apps.
    c.isNative = cabrillo.isNative();
}
```

Cabrillo JS APIs are only supported when executing in ServiceNow native mobile applications. Use the `cabrillo.isNative()` API to determine if the script is executing in a native context.

Note: Cabrillo JS APIs are unavailable in GlideForm client scripts.

cabrillo - isNative()

Boolean value indicating if Cabrillo JS is executing a ServiceNow native mobile application.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if Cabrillo JS is running in a native context; otherwise, false.

```
var isNative = cabrillo.isNative();
```

cabrillo.attachments - Client

The name space for Cabrillo JS attachment functions. This enables adding and viewing attachments.

cabrillo.attachments - addFile(String tableName, String sysId, Object params, String options)

Presents a document picker and uploads the selected file.

Important: This method is deprecated. Use the addFiles() method instead.

Parameters

Name	Type	Description
tableName	String	Table name of the record to which to attach the attachment.
sysID	String	The sys_id of the record to which to attach the attachment.
params	Object	Unused. Set to null.
options	String	Unused. Set to null.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
promise	If successful a Cabrillo.Attachment object. If the operation fails, an error.

```
var table = 'incident';
var sysID = 'a9e30c7dc61122760116894de7bcc7bd';

cabrillo.attachments.addFile(table,
    sysID,
    null,
    null
).then(function(attachment) {
    if (attachment) {
        console.log('Added a new file.', attachment);
    } else {
        console.log('User cancelled adding an attachment.');
    }
}, function(error) {
    console.log('Failed to attach new file.', error);
});
```

cabrillo.attachments - addFiles(String tableName, String sysId, Object params, Object options)

Presents a document picker to select and upload files.

Parameters

Name	Type	Description
tableName	String	Name of the table that contains the record to attach the file to.
sysID	String	Sys_id of the record to attach the file to.
params	Object	Optional. Reserved for future use. Set to null.
options	Object	Optional. Additional settings for uploading files. `{ "isSingleSelection": Boolean }`
options.isSingleSelection	Boolean	Optional. Flag that indicates whether the document picker for uploading files allows multi-selection. Valid values: • true: Only one file to upload can be selected at a time. • false: Multiple files to upload can be selected at a time. Default: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Promise	Contains any successfully created attachments and any errors. If multiple files were selected, a Cabrillo.Attachment is created for each successfully uploaded file while an error message is generated for each unsuccessful upload. Data type: Object `{ "attachments": [Array], "errors": [Array] }`
Promise.attachments	Contains any successfully created attachments. Data type: Array `"attachments": [Cabrillo.Attachment]`
Promise.errors	Contains any errors. Data type: Array `"errors": ["String"]`

This example creates a button for adding multiple attachments to an incident record and checks for any upload errors.

```
this.attachMultipleFilesButton = function() {
   c.log("Attempting to add multiple attachments to
 INC0010453");
   var table = 'incident';
   var sysID = 'fc74aefa1bfb2c10181499f1b24bcb3c';

   cabrillo.attachments.addFiles(table,
 sysID).then(function(result) {
      if (result) {
         handleMultipleResult(result)
      } else {
         c.log('User cancelled adding an attachment.');
      }
   }, function(error) {
      c.log('Failed to attach new files.', error);
   });
}

// A helper function to handle addFiles results
function handleMultipleResult(result) {
   c.log('Added multiple attachments.', result);
   if (result.attachments) {
      c.log('Number of new attachments',
 result.attachments.length);
   }
   if (result.errors) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      c.log('Number of errors during upload',
 result.errors.length);
   }
}
```

cabrillo.attachments -viewFile(Cabrillo.Attachment attachment, Cabrillo.Rect sourceRect, String sourceBase64Image)

Presents a document picker and uploads the selected file.

Note: Scaling using a sourceRect parameter with a sourceBase64 image is only supported on iOS. Android ignores these parameters and opens the image without a scaling animation.

Parameters

Name	Type	Description
attachment	Cabrillo.Attachment	Describes the attachment to view.
sourceRect	Cabrillo.Rect	Optional. Describes the source rectangle of the image to scale up.
sourceBase64Image	String	Optional. A base64 representation of the source image to scale up.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

```
// A Cabrillo.Attachment dictionary to view
var attachment = {
    sys_id: '8e99daa3ff133100ba13ffffffffff2d',
    content_type: 'image/jpeg',
    path: '8e99daa3ff133100ba13ffffffffff2d.iix'
};

cabrillo.attachments.viewFile(attachment,
    null,
    null
).then(function() {
    // It worked. Nothing to do here.
}, function(error) {
    console.log('Failed to view file.', error);
});
```

To scale an image that was tapped into a native image viewer, the `viewFile()` method accepts optional arguments for the image's rectangle on the page as well as a base64 encoded thumbnail of the image. The thumbnail is scaled into the full size image with an animation.

```
// Grab image metadata from an image that was tapped
var imageMetadata = imageMetadataFromEvent(event);

// Optional rect of image on page
var imageRect = imageMetadata.rect;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Optional base64 encoded image to scale up into native viewer
var base64EncodedImage = imageMetadata.base64;

// A Cabrillo.Attachment dictionary to view
var attachment = {
    sys_id: '8e99daa3ff133100ba13ffffffffff2d',
    content_type: 'image/jpeg',
    path: '8e99daa3ff133100ba13ffffffffff2d.iix'
}

cabrillo.attachments.viewFile(attachment,
    imageRect,
    base64EncodedImage
).then(function() {
    // It worked. Nothing to do here.
}, function(error) {
    console.log('Failed to view file.', error);
});
```

cabrillo.camera - Client

Cabrillo JS camera functions to provide camera access for bar code scanning.

cabrillo.camera - getBarcode()

Provides a standard interface for scanning bar codes. Use this to present a bar code scanner and capture scanned result.

Supported bar code types.

- 1D bar codes: EAN-13, EAN-8, UPC-A, UPC-E, Code-39, Code-93, Code-128, ITF
- 2D bar codes: QR Code, Data Matrix, PDF-417, AZTEC

Parameters

Name	Type	Description
None		

Returns

Type	Description
promise	Resolves to a bar code string, or if the operation fails, an error.

```
cabrillo.camera.getBarcode().then(function(barcode) {
    if (barcode) {
        console.log('Scanned barcode.', barcode);
    } else {
        console.log('User cancelled scanning barcode.');
    }
}, function(error) {
    console.log('Failed to scan barcode.', error);
});
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

cabrillo.flowControl - Client

Cabrillo JS functions for managing the flow of a web view.

cabrillo.flowControl - flowEnded(String flowName)

Indicates to the client that the web flow is complete.

The mobile client can then take appropriate action, which typically is to close the web view.

Parameters

Name	Type	Description
flowName	String	Optional. The name of the web flow to close.

Returns

Type	Description
None	

```
var flowName = 'Open Incident Flow';
cabrillo.flowControl.flowEnded(flowName);
```

cabrillo.flowControl - flowEndedWithUpdate(String flowName, boolean clientRefreshNeeded)

Indicates to the client that the web flow is complete and the client should update the native screens.

The mobile client can then take appropriate action, which typically is to close the web view.

Parameters

Name	Type	Description
flowName	String	Optional. The name of the web flow to close.
clientRefreshNeeded	Boolean	Optional. Flag that indicates whether the client needs to refresh the displayed data. Valid values: • true: The client needs to refresh the displayed data. • false: The client doesn't need to refresh the displayed data. Default: false

Returns

Type	Description
None	

```
var flowName = 'Open Incident Flow';
var clientRefreshNeeded = true;
cabrillo.flowControl.flowEnded(flowName, clientRefreshNeeded);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

cabrillo.message - Client

Cabrillo JS functions to display messages in the native UI.

cabrillo.message - showMessage(String style, String title)

Displays a message in the native UI.

Parameters

Name	Type	Description
style	String	Style of the banner. Possible values: • cabrillo.message.ERROR_MESSAGE_STYLE • cabrillo.message.INFO_MESSAGE_STYLE • cabrillo.message.SUCCESS_MESSAGE_STYLE • cabrillo.message.WARNING_MESSAGE_STYLE For more information, see Cabrillo JS constants - message styles.
title	String	Text to display in the banner.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

```
var style = cabrillo.message.SUCCESS_MESSAGE_STYLE;
var title = "You did it!";

cabrillo.message.showMessage(
   style,
   title
).then(function(response) {
   console.log('success');
}, function(error) {
   console.log(error);
});
```

cabrillo.modal - Client

Cabrillo JS functions for presenting web content inside of native modals.

cabrillo.modal - dismissModal(Object data)

Use to dismiss a modal that has been presented with the *presentModal()* function.

A presented modal is responsible for dismissing itself and passing any results back to the presenting context. The *dismissModal()* function must be called from the presented context not from the presenting context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
data	Object	Optional. An object to pass back to the presenting context when the presented context dismisses itself.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

```
// Any object can be passed back to the presenting context when
 the presented context dismisses itself.
var results = {
    team: 'Mobile'
    company: 'ServiceNow'
}

cabrillo.modal.dismissModal(results).then(function() {
    console.log('Modal was dismissed and results were passed to
 presenting context.');
}, function(error) {
    console.log(error);
});
```

cabrillo.modal - presentModal(String title, String url, String closeButtonStyle, String modalPresentationStyle)

Presents content in a native modal interface.

Parameters

Name	Type	Description
title	String	Title of the modal interface.
url	String	The URL to open the modal. This must be an internal instance URL (fully qualified or relative; a relative URL is preferred).
closeButtonStyle	String	Close button style of the modal interface. Possible values: • cabrillo.modal.CLOSE_BUTTON_STYLE_CANCEL • cabrillo.modal.CLOSE_BUTTON_STYLE_CLOSE • cabrillo.modal.CLOSE_BUTTON_STYLE_DONE For more information, see Cabrillo JS constants - close button styles.
modalPresentationStyle	String	Presentation style of the modal interface. Possible values: • cabrillo.modal.MODAL_PRESENTATION_STYLE_FULL_SCREEN • cabrillo.modal.MODAL_PRESENTATION_STYLE_FORM_SHEET

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For more information, see Cabrillo JS constants - modal presentation styles. **Note:** This parameter is only supported on Apple iOS.

Returns

Type	Description
promise	If successful, a Cabrillo.ModalResponse object, otherwise an error.

Present a native modal that loads a custom URL. This presents a custom Service Portal page in a form sheet style modal. The promise is fulfilled when the modal is dismissed. See the *`dismissModal()`* function for custom dismissal capabilities.

```
cabrillo.modal.presentModal('Portal Page',
    '/$sp.do?id=my_modal_page',
    cabrillo.modal.CLOSE_BUTTON_STYLE_CLOSE,
    cabrillo.modal.MODAL_PRESENTATION_STYLE_FORM_SHEET
).then(function(response) {
    // The results from the modal are in a results key on the
 response object.
    var results = response && response.results ?
 response.results : null;

    if (results) {
        console.log('Modal dismissed with results.', results);
    } else {
        console.log('Modal dismissed without results.');
    }
}, function(error) {
    console.log(error);
});
```

cabrillo.navigation - Client

Cabrillo JS functions for forward and backward navigation.

cabrillo.navigation - goBack()

Enables backward navigation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if Cabrillo JS will navigate backward; otherwise false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
cabrillo.navigation.goBack();
```

cabrillo.navigation - goto(String url, Cabrillo.NavigationRequest request)

Enables forward navigation.

Use the request parameter not the url parameter for list or record navigation.

Parameters

Name	Type	Description
url	String	An URL to navigate to. This should be used for custom URL navigation. Optional.
request	Cabrillo.NavigationRequest	Describes the list or record to navigate to. Optional.

Returns

Type	Description
Boolean	Returns true if Cabrillo JS will navigate; otherwise returns false.

Navigate to a URL.

```
cabrillo.navigation["goto"]('/$sp.do?id=my_custom_page');
```

Navigate to a list. The request parameter is preferred over the url parameter for list navigation.

```
// A Cabrillo.NavigationRequest dictionary that specifies a list
 of active incidents.
var request = {
    table: 'incident',
    query: 'active=true',
};
cabrillo.navigation["goto"](null, request);
```

Navigate to a record. The request parameter is preferred over the url parameter for record navigation.

```
// A Cabrillo.NavigationRequest dictionary that specifies an
 incident record.
var request = {
    table: 'incident',
    sysId: 'a9e30c7dc61122760116894de7bcc7bd'
};
cabrillo.navigation["goto"](null, request);
```

Navigate to a new record.

```
// A Cabrillo.NavigationRequest dictionary that specifies a new
 incident record.
// The new record will be seeded with the encoded query.
var request = {
    table: 'incident',
    sysId: '-1',
    query: 'short_description=This is a new incident.'
};
cabrillo.navigation["goto"](null, request);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

cabrillo.nowapp - Client

The name space for Cabrillo Now App functions. This enables you to interact with screens inside of ServiceNow AI Platform® native mobile apps.

cabrillo.nowapp - openLauncherScreen(String launcherScreenId)

Opens a mobile launcher native screen.

Parameters

Name	Type	Description
launcherScreenId	String	Sys_id of the launcher screen from the Applet launcher [sys_sg_applet_launcher] table.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const launcherScreenId = 'a9e30c7dc61122760116894de7bcc7bd';
const result =
 cabrillo.nowapp.openLauncherScreen(launcherScreenId);
If (result === false) {
    console.log("method is not available")
}
```

Output:

```
true
```

cabrillo.nowapp - openScreen(String screenId)

Opens a mobile native screen.

Parameters

Name	Type	Description
screenId	String	The sys_id of the screen record to open from the Screen [sys_sg_screen] table.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: the method is available on the native side • false: the method is not available on the native side.

```
const screenId = 'a9e30c7dc61122760116894de7bcc7bd';
cabrillo.nowapp.openScreen(screenId);
If (result === false) {
    console.log("method is not available")
}
```

Output:

```
true
```

cabrillo.nowapp - openScreenWithRecordContext(String screenId, String table, String recordId)

Opens a mobile native screen with a record context.

Parameters

Name	Type	Description
ScreenId	string	Sys_id of the screen record to open from the Screen [sys_sg_screen] table.
table	string	The record table.
record	string	The record sys_id.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const screenId = 'a9e30c7dc61122760116894de7bcc7bd';
const recordId= '8e99daa3ff133100ba13757574847f2d';
const table= 'sys_users';
const result =
 cabrillo.nowapp.openScreenWithRecordContext(screenId, table,
 recordId);
If (result === false) {
    console.log("method is not available")
}
```

Output:

```
true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

cabrillo.nowapp - performFunction(String functionId, String table, String recordId)

Executes a native mobile function.

Note: Only Action functions are supported for the Vancouver release. For more information, see Action functions.

Parameters

Name	Type	Description
functionId	string	Sys_id of the target function from the Button [sys_sg_button] table.
table	string	The record table. Optional for Global Action items. For more information about mobile function, see Action functions. **Note:** Differences between Global and Record actions: • Record: Applies an action at the record level. For example, use this option to create a button that changes the state of a record. You can set the context to Record for actions on a particular field, a particular record, or swipe actions. If the action function includes a UI parameter with the Input source field set to Auto fill, you must specify the table in the Table field. • Global: Applies an action at the global, or list level. For example, use this option to add a button that creates a record. Do not use the Global setting for actions that are in the context of a record, or actions that include a UI parameter with the Input source field set to Auto fill.
recordId	string	The record sys_id. Optional for Global Action Items. For more information about mobile function, see Action functions. **Note:** Differences between Global and Record action items: • Record: Applies an action at the record level. For example, use this option to create a button that changes the state of a record. You can set the context to Record for actions on a particular field, a particular record, or swipe actions. If the action function includes a UI parameter with the Input source field set to Auto fill, you must specify the table in the Table field. • Global: Applies an action at the global, or list level. For example, use this option to add a button that creates a record. Do not use the Global setting for actions that are in the context of a record, or actions that include a UI parameter with the Input source field set to Auto fill.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const functionId= 'a9e30c7dc61122760116894de7bcc7bd';
const recordId= '8e99daa3ff133100ba13757574847f2d';
const table= 'sys_users';
const result = cabrillo.nowapp.performFunction(functionId,
 table, recordId);
If (result === false) {
    console.log("method is not available")
}
```

Output:

```
true
```

cabrillo.nowapp - refresh()

Refresh the UI stack in the event a table update is made in the web view that may affect a previous screen.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the method is available on the native side. Valid values: • true: the method is available on the native side • false: the method is not available on the native side.

```
const result = cabrillo.nowapp.refresh();
If (result === false) {
    console.log("method is not available")
```

Output:

```
true
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

cabrillo.viewLayout - Client

Cabrillo JS functions to provide access to native UI elements like buttons and spinners.

cabrillo.viewLayout - getTitle()

Gets the current native view's title.

Parameters

Name	Type	Description
None		

Returns

Type	Description
promise	If successful, resolves to the title text, otherwise an error.

```
cabrillo.viewLayout.getTitle()
.then(function(title) {
   console.log(title);
}, function(error) {
   console.log(error);
});
```

cabrillo.viewLayout - hideBackButton()

Hides the back button on the client interface.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
cabrillo.viewLayout.hideBackButton();
```

cabrillo.viewLayout - hideSpinner()

Hides a native spinner in the current interface.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
cabrillo.viewLayout.hideSpinner();
```

cabrillo.viewLayout - setBottomButtons(Array buttons, Function execute)

Set buttons at the bottom of the current interface.

Images and badges are not supported in bottom buttons.

Parameters

Name	Type	Description
buttons	Array of Cabrillo.Button objects	Describes the buttons to set. A maximum of one button is currently supported.
execute	Function	The function to call when a button is tapped. The function has no return value and takes the selected button index as its only parameter. The function must have a single parameter that is a Number.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

Set bottom buttons.

```
var buttons = [
    {
        title: 'Add to Cart',
        buttonId: 'btnAddCart',
        enabled: true,
        backgroundColor: '#3091F9',
        textColor: '#FFFFFF'
    }
];

cabrillo.viewLayout.setBottomButtons(buttons, (buttonIndex) => {
    console.log('Success. Received an event from the button.');
}).catch((err) => {
    console.log('Failed to register buttons.');
    console.error(err);
});
```

Clear bottom buttons.

```
cabrillo.viewLayout.setBottomButtons();
```

cabrillo.viewLayout - setNavigationBarButtons(Array buttons, Function execute)

Set buttons in the navigation bar of the current interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Images and badges for buttons that appear in the overflow button menu are omitted. For this reason, it's best to provide a title and an image name when setting an image button in the navigation bar.

Parameters

Name	Type	Description
buttons	Array of Cabrillo.Button objects.	Describes the buttons to set. Buttons may overflow into an additional menu as needed.
execute	Function	The function to call when a button is tapped. The function has no return value and takes the selected button index as its only parameter. The function must have a single parameter that is a Number.

Returns

Type	Description
promise	If successful, an unresolved object, otherwise an error.

Set navigation bar buttons.

```
var buttons = [
   {
      title: "Save",
      enabled: true,
      buttonId: "btnSave",
   },
];

cabrillo.viewLayout
   .setBottomButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
      console.error(err);
   });
```

Handle multiple buttons.

```
var buttons = [
   {
      title: "Save",
      enabled: true,
      buttonId: "btnSave",
   },
   {
      title: "Delete",
      enabled: true,
      buttonId: "btnDelete",
   },
];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      switch (buttonIndex) {
         case 0:
            console.log("Received an event from the Save
 button.");
            break;
         case 1:
            console.log("Received an event from the Delete
 button.");
            break;
      }
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
      console.error(err);
   });
```

Buttons placed in the navigation bar can be represented by an image.

```
var buttons = [
   {
      title: "Compose",
      buttonId: "btnCompose",
      imageName: "compose",
      enabled: true,
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
      console.error(err);
   });
```

A native back button is shown in the native app by default, but you can replace the back button with a Cabrillo button by setting a button's `buttonStyle` property.

```
var buttons = [
   {
      title: "Cancel",
      buttonId: "btnCancel",
      imageName: "close",
      buttonStyle:
 cabrillo.viewLayout.REPLACE_BACK_BUTTON_STYLE,
      enabled: true,
   },
   {
      title: "Done",
      enabled: true,
   },
];

cabrillo.viewLayout
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      switch (buttonIndex) {
         case 0:
            c.log("Cancel button was clicked.");
            break;
         case 1:
            c.log("Done button was clicked.");
            break;
      }
   })
   .catch((err) => {
      c.log("Failed to register buttons.");
      c.error(err);
   });
```

Buttons are placed in the overflow button menu as needed. To force a button into the overflow button menu, set the button's buttonStyle property.

```
var buttons = [
   {
      title: "Save",
      buttonId: "btnSave",
      buttonStyle: cabrillo.viewLayout.MORE_MENU_BUTTON_STYLE,
      enabled: true,
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
   .catch((err) => {
      console.log("Failed to register buttons.");
      console.error(err);
   });
```

Buttons may have a badge when placed in the navigation bar. This example sets a button with a shopping cart icon and a badge count of 3. The badge has a blue background with white text.

```
var buttons = [
   {
      title: "Cart",
      buttonId: "btnCart",
      imageName: "cart",
      badgeCount: 3,
      backgroundColor: "#3091F9",
      textColor: "#FFFFFF",
      enabled: true,
   },
];

cabrillo.viewLayout
   .setNavigationBarButtons(buttons, (buttonIndex) => {
      console.log("Success. Received an event from the
 button.");
   })
   .catch((err) => {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        console.log("Failed to register buttons.");
        console.error(err);
    });
```

Clear navigation bar buttons.

```
cabrillo.viewLayout.setNavigationBarButtons();
```

cabrillo.viewLayout - setTitle(String title)

Sets the current native view's title.

Parameters

Name	Type	Description
title	String	The title of the interface.

Returns

Type	Description
void	

```
cabrillo.viewLayout.setTitle('My Title');
```

cabrillo.viewLayout - showBackButton()

Shows the back button on the client interface.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
cabrillo.viewLayout.showBackButton();
```

cabrillo.viewLayout - showSpinner(Object options)

Shows a native spinner in the current interface.

Parameters

Name	Type	Description
options	Object	Optional. Additional settings to modify the appearance of the spinner. `{ "mask": Boolean,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`"maskColor": "String"` `}`
options.mask	Boolean	Optional. Determines whether to display a mask behind the spinner. Valid values: • true: Displays a mask behind the spinner. • false: Does not display a mask behind the spinner. Default: false
options.maskColor	String	Color of the mask, if enabled.

Returns

Type	Description
None	

```
var options = { mask: true, maskColor: '#ffffff' };
cabrillo.viewLayout.showSpinner(options);
```

m_form - Client

Provides methods to get and set input values on input form screens, as well as display messages.

This API supports the following input types:

- Boolean
- Choice
- Date/time
- Number
- Reference
- String

This API can be used with the MobileScriptIncludeCaller - Client API to auto-fill inputs on input form screens. For more information about input form screens, see Input form screen.

Use this API in the **Client script** field of a Mobile UI Rule Action. For instructions on configuring a Mobile UI Rule Action with the correct settings for this API, see Configure auto-fill inputs on input form screens.

m_form - addErrorMessage(String message)

Displays an error message at the top of the input form screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
message	String	The message to display.

Returns

Type	Description
None	

In this example, an informational or error message is displayed on the form depending on the value entered for the priority.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var priority = newValue;
   if (priority > 0 && priority < 3) {
      getMessage("This incident should be handled ASAP",
 function(response){
         m_form.addInfoMessage(response);
      });
   } else {
      getMessage("The selected priority is invalid",
 function(response){
         m_form.addErrorMessage(response);
      });
   }
}
```

m_form - addInfoMessage(String message)

Displays an informational message at the top of the input form screen.

Parameters

Name	Type	Description
message	String	The message to display.

Returns

Type	Description
None	

In this example, an informational or error message is displayed on the form depending on the value entered for the priority.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var priority = newValue;
   if (priority > 0 && priority < 3) {
      getMessage("This incident should be handled ASAP",
 function(response){
         m_form.addInfoMessage(response);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      });
   } else {
      getMessage("The selected priority is invalid",
 function(response){
         m_form.addErrorMessage(response);
      });
   }
}
```

m_form - getValue(String inputName)

Returns the value of a specified input on an input form screen.

Parameters

Name	Type	Description
inputName	String	Name of the input to return the value of.

Returns

Type	Description
String	The value of the specified input. **Note:** If the input is a choice list with multi-select, the return type is an array of strings containing the selected values.

This client script passes the employee_id input value to the script include, which uses the ID to look up the employee's title. The title is provided to the callback function, which it uses to auto-fill the business_title input on the input form screen.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var employeeId = m_form.getValue("employee_id");
   var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
   caller.addParam("employeeId", employeeId);
   caller.call(function(response) {
      m_form.setValue("business_title", response);
   });
}
```

Script include.

```
// Mobile callable script include
var UserUtilsTest = Class.create();
UserUtilsTest.prototype =
 Object.extendsObject(global.AbstractMobileCallableInclude, {
   getBusinessTitle: function() {
      var employeeId = this.getParameter("employeeId");
      var gr = new GlideRecord("sys_user");
      gr.get(employeeId);
      return gr.getValue("title");
   },
   type: 'UserUtilsTest'
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

m_form - setAffectedInputs(Array inputNames)

Adds a shimmering effect to specified inputs indicating that the value is being set by a script.

The shimmering effect ends once the value for the input is set.

Parameters

Name	Type	Description
inputNames	Array	Array of strings containing the names of inputs to apply the shimmer effect to.

Returns

Type	Description
None	

This client script adds a shimmer effect to the caller input to indicate that it's auto-filled.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var affectedInputs = [];
   affectedInputs.push("Caller");
   m_form.setAffectedInputs(affectedInputs);
   m_form.setValue("Caller",
 ["800b174138d089c868d09de320f9833b",
 "46d44a23a9fe19810012d100cca80666"]);
   var result = m_form.getValue("Caller");
   console.log(`Ref test: ${result[0]}`);
}
```

m_form - setValue(String inputName, Object value, String displayValue)

Sets the value of a specified input on an input form screen.

Parameters

Name	Type	Description
inputName	String	Name of the input to set the value of.
value	Object	Value to set the input to. The data type of the value varies based on the input being set.
displayValue	String	Optional. Use this parameter when setting the value of Reference type inputs.

Returns

Type	Description
None	

This example sets an integer value for the order input.

```
m_form.setValue("order", 5);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example sets a string value for the description input.

```
m_form.setValue("description", "This is the description
 content");
```

This example uses an object containing the value and display value to set a reference type input.

```
m_form.setValue("Caller",
 [{"value":"800b174138d089c868d09de320f9833b",
 "displayValue":"Abel Tuter"}]);
```

MobileScriptIncludeCaller - Client

Provides methods to call script includes from Mobile UI Rule Actions.

This API can be used with the m_form - Client API to auto-fill inputs on input form screens. For more information about input form screens, see Input form screen.

Use this API in the **Client script** field of a Mobile UI Rule Action. For instructions on configuring a Mobile UI Rule Action with the correct settings for this API, see Configure auto-fill inputs on input form screens.

The script include must have the **Mobile callable** field selected to be called by this API.

MobileScriptIncludeCaller - MobileScriptIncludeCaller(String scriptName, String functionName)

Creates an instance of the *`MobileScriptIncludeCaller`* class with the script include and function to call.

Parameters

Name	Type	Description
scriptName	String	Name of the mobile-callable script include to call. If the script include supports cross-scope access and it's in a different scope than the client script, the name of the script include must be prefixed with the scope.
functionName	String	The public function to call in the script include.

This example shows how to create an instance of the *`MobileScriptIncludeCaller`* class that can be used to call the `getBusinessTitle()` function in the UserUtilsTest script include.

```
var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
```

MobileScriptIncludeCaller - addParam(String key, Object value)

Adds a parameter to pass when calling the script include.

This method enables you to pass values from the input form to the script include.

Parameters

Name	Type	Description
key	String	Key to use for the parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
value	Object	Value of the parameter.

Returns

Type	Description
None	

This example shows how to add the value of the employee_id input from the input form to the *`MobileScriptIncludeCaller`* object.

```
var employeeId = m_form.getValue("employee_id");
var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
caller.addParam("employeeId", employeeId);
```

MobileScriptIncludeCaller - call(Function successCallback, Function errorCallback)

Calls the script include specified by the constructor.

The server call executes asynchronously and the script include's response is passed to the callback function. If the response from the server fails, for example if the script include isn't found, the response argument passed to the callback is empty or null.

The script include must have the **Mobile callable** field selected to be called by this method.

Parameters

Name	Type	Description
successCallback	Function	Optional. The name of the callback function to process the results returned by the server. If a callback function isn't provided, this method returns a promise, which can be consumed using the Promise API.
errorCallback	Function	Optional. The name of the callback function to call if an error occurs.

Returns

Type	Description
None	

This client script passes the employee_id input value to the script include, which uses the ID to look up the employee's title. The title is provided to the callback function, which it uses to auto-fill the business_title input on the input form screen.

```
// Client script in a Mobile UI Rule Action
function onChange(inputName, newValue) {
   var employeeId = m_form.getValue("employee_id");
   var caller = new MobileScriptIncludeCaller("UserUtilsTest",
 "getBusinessTitle");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   caller.addParam("employeeId", employeeId);
   caller.call(function(response) {
      m_form.setValue("business_title", response);
   });
}
```

Script include.

```
// Mobile callable script include
var UserUtilsTest = Class.create();
UserUtilsTest.prototype =
 Object.extendsObject(global.AbstractMobileCallableInclude, {
   getBusinessTitle: function() {
      var employeeId = this.getParameter("employeeId");
      var gr = new GlideRecord("sys_user");
      gr.get(employeeId);
      return gr.getValue("title");
   },
   type: 'UserUtilsTest'
});
```

Mobile SDK API reference

Use the ServiceNow Mobile SDK to leverage the functionality and resources of the ServiceNow platform within your standalone mobile Android and iOS applications.

Mobile SDK - Android

The Mobile SDK for Android provides the classes necessary to interface Android devices with the ServiceNow platform.

AuthorizationToken class - Android

The *`AuthorizationToken`* class provides the authorization token provided by the host application. Used by the NowSDK to authorize access to a specified ServiceNow instance for the currently logged in user.

Properties

Name	Type	Description
token	String	Value of the authorization token.
type	String	Type of authorization token. Valid values (case-sensitive): • JWT • OAuthAccess • OAuthRefresh

AuthorizatonToken - AuthorizationToken(type: AuthorizationTokenType, token: String)

Returns the authorization token provided by the host application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
type	String	Type of authorization token. Valid values (case-sensitive): • JWT • OAuthAccess • OAuthRefresh
token	String	Value of the authorization token.

Returns

Type	Description
None	

```
class SDKManager @Inject constructor(
  private val settings: Provider<NowSDKSettings>,
  private val jwtService: JWTService
) : NowSDKAuthorizationProviding,
  DevicePermissionDelegate {

  override fun requestAuthorization(
    instanceURL: URL,
    callback: Consumer<List<AuthorizationToken>?>
  ) {
      GlobalScope.launch(Dispatchers.IO) {
        try {
          val token = jwtService.getJWT(settings.get().user,
 settings.get().clientId).token
          callback.accept(
            listOf(
              AuthorizationToken(
                AuthorizationTokenType.JWT,
                token
              )
            )
          )
        } catch (ex : Exception) {
           Log.e("JWT", "Failed to get jwt", ex)
           return@launch callback.accept(null)
        }
      }
    }
```

Call interface - Android

The `Call` interface represents a request that is prepared for processing.

Possible processing options include:

- cancel
- enqueue

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- execute
- map

A call object cannot be processed twice.

Properties

Name	Type	Description
request	Request	Original request that initiated this call.

Call - cancel()

Cancels the associated call, if possible (best effort.)

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
private var inFlightDataRequestCall: Call<*>? = null
fun cancelTransfer() = inFlightDataRequestCall?.cancel()
```

Call - enqueue(onSuccess: Consumer<Response<T>>, onError: Consumer<NowDataError>)

Schedules the request to be executed as soon as the system\thread is available to execute this request.

Parameters

Name	Type	Description
onSuccess	Consumer <Response<T>>	Callback to execute if the call is successful. HTTP response with the body parsed to the data type specified by the *T* parameter. **Note:** Consumer is a OOB Java type for asynchronous consumption of an object. In this case, the call uses generic to return a type `Response<T>` where `T` is the object type.
onError	Consumer <NowDataError>	Callback to execute if the call fails. NowDataError

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
fun makeGraphQLRequest(query: String) {
  val call = graphQLService.graphQLRequest(query)
  call.enqueue(
    { response -> handleResponse(response) },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

Call - execute()

Invokes the request immediately. Blocks until the response is processed or is in error.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Response<T>	Response data in the format defined in the *T* parameter.

The following code example shows how to call this function.

```
val response = apiService.data(NowAPIService.Endpoint(
  relativePath = CASES_API,
  requestMethod = HttpMethod.GET,
  requireAuth = true)
).execute()
```

FetchConfiguration class - Android

The `FetchConfiguration` class provides the ability to define the configuration for fetching records from the associatedServiceNow table.

This class only contains a single function (constructor), FetchConfiguration().

Properties

Name	Type	Description
filter	Filter	Query to use to filter the return results.
limit	Integer	Number of records per page/response to return.
queryParams	QueryParams	Iterable structure that contains name-value pairs of request query parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
readConfiguration	FieldReadConfiguration	Configuration for the fields to return in the response.

FetchConfiguration - FetchConfiguration(filter: Filter? = null, limit: Int? = null, readConfiguration: FieldReadConfiguration? = null)

Enables you to define the records and fields to return from the associated ServiceNow table.

Parameters

Name	Type	Description
filter	Filter	Optional. Query to use to filter the records that are returned from the table. For example: `active=true^short_descriptionLIKEbroken` Default: null - Return all records.
limit	Integer	Optional. Number of records to return per page/ response. Default: null - Return the maximum allowed by the ServiceNow REST API.
readConfiguration	FieldReadConfiguration	Optional. Configuration of the fields returned in the response. Default: null - Return all fields.

The following code example shows how to call this function.

```
nowTableService.records("incident", FetchConfiguration(
  filter = Filter("active=true"),
  limit = 10,
  readConfiguration = FieldReadConfiguration(
    includeFields = listOf("sys_id", "short_description")
  )
))
```

FieldReadConfiguration class - Android

The *`FieldReadConfiguration`* class provides the ability to define what fields to return or not return in a response record.

Properties

Name	Type	Description
includeFields	Collection <String>	Fields to return in the response.
queryItems	Map <String, String>	Read-only. Collection of query items representing the read configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
queryParams	QueryParams	Iterable structure that contains name-value pairs of request query parameters. Use these parameters to build a request.

FieldReadConfiguration - FieldReadConfiguration(includeFields: Collection<String> = listOf(), vararg options: FieldReadConfiguration.Options)

Defines the fields to include in the return response from the associated ServiceNow table.

Parameters

Name	Type	Description
includeFields	Collection<String>	List of comma-separated fields to return in the response. If the list is empty, all fields are returned.
vararg options	FieldReadConfiguration.Options	Optional. Array of zero or more options that define the type of field information to return. Possible values: • ACTUAL_VALUES: Include the field's actual value in the response. • DISPLAY_VALUES: Include the field's display value in the response. • EXCLUDE_REFERENCE_LINK: Exclude the *Table* API links for the reference fields.

The following code example shows how to call this function.

```
val readConfiguration = FieldReadConfiguration(
  includeFields = listOf("sys_id", "sys_created_on",
 "short_description"),
  options =
 arrayOf(FieldReadConfiguration.Options.DISPLAY_VALUES)
)
val fetchConfiguration = FetchConfiguration(
  filter = Filter("active=true"),
  readConfiguration = readConfiguration
)
val response = nowTableService.records("incident",
 fetchConfiguration).execute()
handleResponse(response)
```

FieldWriteOptions structure - Android

The *FieldWriteOptions* class provides functions that set the options for updating or creating fields in a record on a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
queryItems	Map <String, String>	Collection of request query items that represent the write options.

FieldWriteOptions - FieldWriteOptions(vararg options: FieldWriteOptions.Options)

Sets the options for writing or creating fields in a record on your ServiceNow instance.

Parameters

Name	Type	Description
vararg options	FieldWriteOptions.Options	Options to set when creating or writing to fields. Valid values: • TREAT_INPUT_VALUES_AS_DISPLAY_VALUES: Specified field values should be saved as the display values. If this value isn't set to `true`, the passed values are assumed to be the actual field values. • SUPPRESS_AUTO_SYS_FIELD: Suppress auto-generation of system fields.

The following code example shows how to call this function.

```
// Update assigned_to field using actual value (syd_id of user)
val response = runCatching {
    getNowTableService()?.updateRecord("sys_id_of_record",
 "sn_customerservice_case", mapOf("assigned_to" to
 "<sys_id_of_user>"))?.execute()
}

// Update assigned_to field using display value
val fieldWriteOptions =
 FieldWriteOptions(FieldWriteOptions.Options.TREAT_INPUT_VALUES_
AS_DISPLAY_VALUES)
val response = runCatching {
    getNowTableService()?.updateRecord("sys_id_of_user",
 "sn_customerservice_case", mapOf("assigned_to" to "John
 Doe"))?.execute()
}
```

Filter class - Android

The *`Filter`* class provides the ability to configure filters that define the data to return in the return results of a REST endpoint query.

Properties

Name	Type	Description
queryItems	Map<String, String>	Collection of query items representing the filter.

Filter - Filter(conditions: List<Condition>, keywords: String? = null, sortBy: List<Sort>? = null)

Creates a filter based on specific keywords and conditions that can be OR'd or AND'd together.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
conditions	List<Condition>	Simple or compound conditions to add to the query. Possible conditions: • BooleanSimpleCondition: Conditions available for boolean record fields. • DateSimpleTimeCondition: Conditions available for date-time record fields. • EmailSimpleCondition: Conditions available for email fields. • IntegerChoiceSimpleCondition: Conditions available for integer choice fields. • NumericSimpleCondition: Conditions available for various numeric fields. • ReferenceSimpleCondition: Condition operators available for reference record fields. • StringChoiceSimpleCondition: Condition operators available for choice record fields containing strings. • StringSimpleCondition: Condition operators available for string record fields. • CompoundCondition: Allows you to group SimpleConditions into a compound condition using ConditionUtils.CompoundOperator connectors.
keywords	String	Optional. Any specific word or phrase to search for. Default: nil - No specific word search.
sortBy	List<Sort>	Optional. List of record field names and the associated sort order constant to sort the returned records by. For example: `val sortBy = listOf("zipcode", ORDER_DESC)` If you include multiple sort fields, each subsequent field is a further sort of the prior field(s). Valid sort values: • ORDER_ASC: Sort ascending • ORDER_DESC: Sort descending Default: ORDER_ASC

Returns

Type	Description
None	

```
// Where the record is active
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
val condition1 = BooleanSimpleCondition.conditionIs("active",
 true)

// AND the date value of the SLA due field is on "today" or any
 date after today.

val condition2 = DateSimpleTimeCondition.atOrAfter("sla_due", 0,
 ConditionUtils.DateTimeValueOperator.daysAgoStart)

val filter = Filter(conditions = listOf(condition1, condition2))
```

Filter - Filter(criteriaList: List<Criteria>, sortBy: List<Sort>? = null)

Creates a filter based on one or more filter criteria that are OR'd together.

Parameters

Name	Type	Description
criteriaList	List<Criteria>	Top level criteria conditions to group with OR connectors.
sortBy	List<Sort>	Optional. List of record field names and the associated sort order constant to sort the returned records by. For example: `val sortBy = listOf("zipcode", ORDER_DESC)` If you include multiple sort fields, each subsequent field is a further sort of the prior field(s). Valid sort values: • ORDER_ASC: Sort ascending • ORDER_DESC: Sort descending Default: ORDER_ASC

Returns

Type	Description
None	

```
val activeIncidents =
 BooleanSimpleCondition.conditionIs("active", true)
val assignedToEmpty =
 StringSimpleCondition.isEmpty("assigned_to")
val assignedToAbel =
 StringSimpleCondition.conditionIs("assigned_to", "Abel Tuter")
val assignedToAbelOrEmpty =
 CompoundCondition(ConditionUtils.CompoundOperator.OR,
 listOf(assignedToEmpty, assignedToAbel))
val needToReassign =
 Criteria().addConditions(listOf(activeIncidents,
 assignedToAbelOrEmpty))
val highEscelations =
 StringSimpleCondition.conditionIs("escalation", "2")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
val overdueEscelations =
 StringSimpleCondition.conditionIs("escalation", "3")
val highOrOverdueEscelations =
 CompoundCondition(ConditionUtils.CompoundOperator.OR,
 listOf(highEscelations, overdueEscelations))
val needToHandleEscalation =
 Criteria().addCondition(highOrOverdueEscelations)
val myPrioritiesForTodayFilter = Filter(listOf(needToReassign,
 needToHandleEscalation))
```

NotSupportedPushError class - Android

A function from the *NotSupportedPushError* class is thrown when the NowPushSDK cannot process the push notification request. When this type of error is thrown, you must parse and handle the push notification outside of the MobileSDK framework.

Properties

Name	Type	Description
cause	Throwable	Cause of the error.
message	String	Message that contains the error details to display to the user.

NowAPIService interface - Android

The *NowAPIService* interface provides the ability to perform requests on a specified ServiceNow REST API.

Note: Guest users only work for the *NowAPIService* interface if the REST API being accessed is configured for guest users.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Service configuration to associate with the protocol.

NowAPIService - data(endpoint: NowAPIService.Endpoint, queryParams: QueryParams, headers: Headers, body: String)

Calls the specified REST API on the specified ServiceNow instance.

Parameters

Name	Type	Description
endpoint	NowAPIService.Endpoint	REST endpoint to call.
queryParams	QueryParams	Optional. Query parameter object that contains the query parameters to pass in the REST call. Default: null
headers	Headers	Optional. Headers object that contains the headers to pass in the REST call. Default: null

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
body	String	Optional. Object that contains the request body and content type to pass into the REST call. Default: null

Returns

Type	Description
Call<ByteArray>	Return results from the called REST endpoint.

```
suspend fun loadCases(): List<CaseItem> =
 withContext(Dispatchers.IO) {
  val apiService = nowServiceManager.getNowAPIService()

  val result = runCatching {
    val response = apiService.data(NowAPIService.Endpoint(
      relativePath = CASES_API,
      requestMethod = HttpMethod.GET,
      requireAuth = true)
    ).execute()

    val byteArray = response.body ?: throw Exception("Null
 Result")
    val buffer = Buffer()
    val reader = JsonReader.of(buffer.write(byteArray))
    val listType = Types.newParameterizedType(
      List::class.java,
      CaseItem::class.java
    )

    val resultType = Types.newParameterizedType(
      ResultResponse::class.java,
      listType
    )
    val adapter =
 moshi.adapter<ResultResponse<List<CaseItem>>>(resultType)
    adapter.fromJson(reader)
  }

  if (result.isSuccess) {
      result.getOrNull()?.result ?: throw Exception("Cases not
 in response")
  } else {
      throw result.exceptionOrNull() ?: Exception("Error Cases")
  }
}
```

NowAttachment class - Android

The *NowAttachment* class provides an object that contains an attachment and its associated metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
data	Data	Attachment data/file.
metadata	NowAttachmentMetadata	Metadata associated with the attachment.

NowAttachmentMetadata class - Android

The `NowAttachmentMetadata` class provides functions that enable you to encode and manage attachment metadata.

NowAttachmentMetadata Properties

Name	Type	Description
averageImageColor	String	Most dominant color in the associated image.
chunkSizeInBytes	Integer	If the attachment is too large to be transferred in a single packet, the maximum of bytes (chunk) of the attachment file to send in an individual packet. Unit: Bytes
compressedSize InBytes	Integer	Compressed size of the attachment. Unit: Bytes
created	Date	Date on which the attachment was created.
createdBy	String	Entity that created the attachment.
download	URL	Full download URL of the attachment associated with the metadata.
fileName	String	Name of the attachment file.
hash	String	Expected SHA256 digest for the attachment. A downloaded attachment is validated by comparing its computed digest to this SHA256 digest.
imageHeight	Integer	Height of image. Unit: Pixels
imageWidth	Integer	Width of image. Unit: Pixels
isCompressed	Boolean	Flag that indicates whether the attachment file is compressed. Possible values: • true: Attachment is compressed. • false: Attachment in not compressed.
mimeType	String	Attachment MIME type.
modificationCount	Integer	Number of times that the attachment was modified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAttachmentMetadata Properties (continued)

Name	Type	Description
sizeInBytes	Integer	Size of the attachment. Unit: Bytes
sourceSysId	String	Sys_id of the attachment record to which the metadata is associated.
sourceTableName	String	Name of the source table in which the attachment resides.
state		Availability state. Valid values: • AVAILABLE • CONDITIONALLY • PENDING • UNAVAILABLE
sysId	String	Unique 32-character Globally Unique ID (GUID), that identifies each record in a ServiceNow instance.
tags	String	List of tags associated with the attachment.
updated	Date	Date on which the attachment was last modified.
updatedBy	String	Entity that updated the attachment.

NowAttachmentMetadata - NowAttachmentMetadata(sysId: String, fileName: String, mimeType: String, _isCompressed: String, _sizeInBytes: String, _compressedSizeInBytes: String, _chunkSizeInBytes: String, _modificationCount: String, created: Date, createdBy: String, updated: Date, updatedBy: String, download: String?, hash: String, state: NowAttachmentMetadata.State, averageImageColor: String, _imageWidth: String, _imageHeight: String, sourceTableName: String, sourceSysId: String, tags: String)

Class returned by `NowAttachment` class. This object is Parcelable.

Parameters

Name	Type	Description
sysId	String	Unique 32-character Globally Unique ID (GUID), that identifies each record in a ServiceNow instance.
fileName	String	Name of the attachment file.
mimeType	String	Attachment MIME type.
isCompressed	Boolean	Flag that indicates whether the attachment file is compressed. Possible values: • true: Attachment is compressed. • false: Attachment in not compressed.
sizeInBytes	Integer	Size of the attachment. Unit: Bytes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
compressedSizeInBytes	Integer	Compressed size of the attachment. Unit: Bytes
chunkSizeInBytes	Integer	If the attachment is too large to be transferred in a single packet, the maximum of bytes (chunk) of the attachment file to send in an individual packet. Unit: Bytes
modificationCount	Integer	Number of times that the attachment was modified.
created	Date	Date on which the attachment was created.
createdBy	String	Entity that created the attachment.
updated	Date	Date on which the attachment was last modified.
updatedBy	String	Entity that updated the attachment.
download	URL	Full download URL of the attachment associated with the metadata.
hash	String	Expected SHA256 digest for the attachment. A downloaded attachment is validated by comparing its computed digest to this SHA256 digest.
state		Availability state. Valid values: • AVAILABLE • CONDITIONALLY • PENDING • UNAVAILABLE
averageImageColor	String	Most dominant color in the associated image.
imageWidth	Integer	Width of image. Unit: Pixels
imageHeight	Integer	Height of image. Unit: Pixels
sourceTableName	String	Name of the source table in which the attachment resides.
sourceSysId	String	Sys_id of the attachment record to which the metadata is associated.
tags	String	List of tags associated with the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
sysId (SysIdentifiable)	Unique 32-character GUID of the associated metadata record.

NowAttachmentService interface - Android

The *NowAttachmentService* interface provides functions that enable the manipulation of file attachments and their associated metadata.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration to associate with the service.

NowAttachmentService - attachment(sysId: String, validateAttachment: Boolean = true)

Retrieves the attachment with the specified sys_id and optionally validates the attachment by comparing the computed hash of the attachment to the expected hash.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to retrieve. This is the sys_id for the attachment on your ServiceNow instance.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Do not validate the attachment. Default: true

Returns

Type	Description
Call<NowAttachment>	NowAttachment object that contains the requested attachment.

```
fun getAttachment(sysId: String, isValidateAttachment: Boolean)
 {
  val call = attachmentService.attachment(sysId,
 isValidateAttachment)
  call.enqueue(
    { response ->
      val attachment: NowAttachment? = response.body
    },
      { nowDataError -> handleError(nowDataError) }
  )
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowAttachmentService - attachmentMetadata(sysId: String)

Retrieves the metadata for the attachment associated with the specified sys_id.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment whose metadata you want to retrieve.

Returns

Type	Description
Call <NowAttachmentMetadata>	Object that contains the metadata for the specified attachment.

```
fun fetchMetadata(sysId: String) {
  val call = attachmentService.attachmentMetadata(sysId)
  call.enqueue(
    { response ->
      val metadata: NowAttachmentMetadata? = response.body
    },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowAttachmentService - attachmentMetadata(filter: Filter? = null, limit: Int? = null)

Retrieves the metadata for all the attachments that meet the specified criteria.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: null - Returns metadata for all available attachments. Takes into consideration the *limit* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: null - Returns all metadata that meets the *filter* parameter specifications.

Returns

Type	Description
Call<List <NowAttachmentMetadata>>	List of objects that contain the metadata for the matching attachments.

```
fun fetchMultipleMetadata(filterQuery: String, limit: Int) {
  val call =
 attachmentService.attachmentMetadata(Filter(filterQuery),
 limit)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  call.enqueue(
    { response ->
      val metadataList: List<NowAttachmentMetadata>? =
 response.body
    },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowAttachmentService - attachmentMetadataPaginator(filter: Filter? = null, limit: Int? = null)

Retrieves the metadata for all the attachments that meet the specified criteria and creates a paginator for iterating through the pages of the returned metadata.

You can use this paginator to navigate through the returned metadata, performing navigation operations such as fetching the first, last, previous, or next page, or checking whether there is next or previous page.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: null - Returns metadata for all available attachments. Takes into consideration the *limit* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: null - Returns all metadata that meets the *filter* parameter specifications.

Returns

Type	Description
Paginator <NowAttachmentMetadata>	Success: Paginator object along with the specified pages of metadata. Failure: NowDataError object.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val filterQuery: String = "content_type=text/plain"
  val filter = filterQuery.let(::Filter)
  val limit = 10
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(filter, limit)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")
}
```

NowAttachmentService - delete(sysId: String)

Deletes the attachment with the specified sys_id.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.

Returns

Type	Description
Call<ByteArray>	Success: Nothing is returned. Failure: NowDataError returned.

```
fun deleteAttachment(sysId: String) {
  val call = attachmentService.delete(sysId)
  call.enqueue(
    { response -> handleResponse(response) },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowAttachmentService - upload(data: ByteArray, configuration: NowAttachmentUploadConfiguration)

Retrieves the metadata for all the attachments that meet the specified criteria and creates a paginator for iterating through pages of the returned metadata.

Parameters

Name	Type	Description
data	ByteArray	Metadata to upload and associate with the attachment specified in the configuration object.
configuration	NowAttachmentUploadConfiguration	Upload configuration parameters.

Returns

Type	Description
NowAttachmentMetadata	Uploaded metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
fun uploadAttachment(tableName: String, recordSysId: String,
 fileName: String) {
  val bitmap = BitmapFactory.decodeResource(resources,
 R.drawable.test_image)
  val data = bitmap.compress(ImageType.JPEG)
  val contentType = "image/jpg"
  val config = NowAttachmentUploadConfiguration(tableName,
 recordSysId, fileName, contentType)
  val call = attachmentService.upload(data, config)

  call.enqueue(
    { response ->
      val uploadedAttachmentMetadata: NowAttachmentMetadata? =
 response.body
    },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowChatConfiguration class - Android

The *NowChatConfiguration* class enables you to configure options on a chat session, such as showing a prompt before closing a chat window, disabling features while using chat, applying different conversation options when using chat, and configuring UI components in NowChat.

NowChatConfiguration - NowChatConfiguration(closePrompt: ClosePrompt? = null, disabledFeatures: List<Feature>? = null, conversationOptions: List<ConversationOption>? = null, uiConfiguration: UIConfiguration? = null)

Configures options for the current chat session. This method enables you to show a prompt before closing a chat window, disable features while using chat, apply different conversation options when using chat, and configure UI components in NowChat.

Parameters

Name	Type	Description
closePrompt	ClosePrompt object	Prompt to display before closing the associated chat window. Call the *NowChatConfiguration.ClosePrompt()* subclass to define the value of this parameter. For example: `closePrompt = NowChatConfiguration.ClosePrompt( header = null, message = "Are you sure you want to leave?", acceptButtonTitle = "Yes", declineButtonTitle = "No" )` If you don't want to display a close prompt, pass null.
disabledFeatures	List<NowChatConfiguration.	List of chat features to disable within the current chat session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
	Feature>	Valid value: START_NEW_CONVERSATION: Hide/disable the **StartNew Conversation** button that appears in a chat window. The available chat features are defined in the *`NowChatConfiguration.Feature`* enum class. For example: `disabledFeatures = listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION)` If you don't want to disable any features, pass null.
conversationOptions	List<Conversation Option>?	List of conversation options to apply to NowChat. Valid values: • END_CONVERSATION_ON_EXIT: Ongoing conversation is terminated when exiting the NowChat window. • FORCE_NEW_CONVERSATION: Forces a new chat conversation when NowChat starts. The available conversation options are defined in the *`NowChatConfiguration.ConversationOption`* enum class. For example: `conversationOptions = listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVERSATION),` If you don't want to apply any options, pass null.
uiConfiguration	UIConfiguration?	UIConfiguration values to use to configure UI components in NowChat. Valid values: • *`attachmentUploadButton`*: Configuration for the `AttachmentUploadButton` that is shown next to the text input while talking with a live agent. • *`closeButton`*: Configuration for the `CloseButton` used for back navigation on the NowChat toolbar. For example: `uiConfiguration = NowChatConfiguration.UIConfiguration(`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`closeButton = NowChatConfiguration.CloseButton( icon = myDrawable ), attachmentUploadButton = NowChatConfiguration.AttachmentUploadButton(isVisible = false) )` To use the default configuration, pass null.

Returns

Type	Description
NowChatConfiguration	Returns a NowChatConfiguration object that you can pass when calling the NowChatService - start(activity: Activity, themeColors: NowChatTheme = object: NowChatTheme{}, contextData: Map<String, Any> = mapOf(), chatConfiguration: NowChatConfiguration? = null) method.

The following code example shows how to call this method.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  //Drawable to use instead of the default NowChat back button.
  val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

  val chatConfiguration = NowChatConfiguration(
    closePrompt = NowChatConfiguration.ClosePrompt(
      header = null,
      message = "Are you sure you want to leave?",
      acceptButtonTitle = "Yes",
      declineButtonTitle = "No"
    ),
    disabledFeatures =
 listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION),
    conversationOptions =
 listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVER
SATION),
    uiConfiguration = NowChatConfiguration.UIConfiguration(
      closeButton = NowChatConfiguration.CloseButton(
        icon = myDrawable
      ),
      attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
    )
  )
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  chatService?.start(activity, chatConfiguration)
}
```

NowChatConfiguration - AttachmentUploadButton(isVisible: Boolean = true)

Defines the UI configurations to apply to the upload attachment button that appears next to the text input while talking with a live agent.

AttachmentUploadButton is a subclass of the *NowChatConfiguration* class.

Parameters

Name	Type	Description
isVisible	Boolean	Flag that indicates the visibility of the upload attachment button. Valid values: • true: Upload attachment button is visible. • false: Upload attachment button is hidden. Default: true

Returns

Type	Description
Object	UI configuration object.

The following code example shows how to hide the AttachmentUploadButton.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  val chatConfiguration = NowChatConfiguration(
    uiConfiguration = NowChatConfiguration.UIConfiguration(
      attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
    )
  )

  chatService?.start(activity, chatConfiguration)
}
```

NowChatConfiguration - CloseButton(icon: Drawable?)

Defines the configuration of the close button used for back navigation on the NowChat toolbar. You then pass this object into the *NowChatConfiguration()* method to configure the close button to use within the chat session.

CloseButton() is a subclass of the *NowChatConfiguration* class.

Parameters

Name	Type	Description
icon	Drawable?	Drawable object to use for the close (back) button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		You can use the *ContextCompat.getDrawable()* method to obtain this drawable object. For example: `val myDrawable = ContextCompat.getDrawable(activity, R.drawable.my_drawable)` To use the default drawable, pass null. Default: NowChat back button

Returns

Type	Description
Object	Close button configuration object.

The following code example shows how to set a custom icon for the close button on the NowChat toolbar.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  //Drawable to use instead of the default NowChat back button.
  val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

  val chatConfiguration = NowChatConfiguration(
    uiConfiguration = NowChatConfiguration.UIConfiguration(
      closeButton = NowChatConfiguration.CloseButton(
        icon = myDrawable
      )
    )
  )

  chatService?.start(activity, chatConfiguration)
}
```

NowChatConfiguration - ClosePrompt(header: String, message: String, acceptButtonTitle: String, declineButtonTitle: String)

Creates and returns a ClosePrompt object based on the passed parameters. You then pass this object into the *NowChatConfiguration()* method to configure the close prompt options within the chat session.

Parameters

Name	Type	Description
header	String	Text to display on the prompt's header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		If you don't want to display a prompt header, pass null.
message	String	Text to display as the prompt's main text.
acceptButtonTitle	String	Text to display on the prompt's primary button for closing the chat window.
declineButtonTitle	String	Text to display on the prompt's secondary button that dismisses the prompt. If you don't want to display a secondary button, pass null.

Returns

Type	Description
Object	Prompt to display before closing the associated chat window.

The following code example shows how to call this method to configure the close prompt.

```
suspend fun launchChat() {
  val chatService = getNowChatService()

  val chatConfiguration = NowChatConfiguration(
    closePrompt = NowChatConfiguration.ClosePrompt(
      header = null,
      message = "Are you sure you want to leave?",
      acceptButtonTitle = "Yes",
      declineButtonTitle = "No"
    )
  )
  chatService?.start(activity, chatConfiguration)
}
```

NowChatConfiguration - UIConfiguration(closeButton: CloseButton? = null, attachmentUploadButton: AttachmentUploadButton? = null, hideServiceNowInProductBranding: Boolean = false, voiceInputButton: VoiceInputButton? = null)

Creates and returns a UIConfiguration object based on the passed parameters. You then pass this object into the *`NowChatConfiguration()`* constructor to configure UI components in NowChat.

`UIConfiguration` is a subclass of the *`NowChatConfiguration`* class.

Parameters

Name	Type	Description
closeButton	CloseButton?	UI configuration for the `CloseButton` that appears on the NowChat toolbar and is used for back navigation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Call the NowChatConfiguration - CloseButton(icon: Drawable?) subclass to define the value of this parameter. For example: `val chatConfiguration = NowChatConfiguration( uiConfiguration = NowChatConfiguration.UIConfiguration( closeButton = NowChatConfiguration.CloseButton( icon = myDrawable ) )`
attachmentUploadButton	AttachmentUploadButton?	UI configuration for the `AttachmentUploadButton` that is shown next to the text input while talking with a live agent. Call the NowChatConfiguration - AttachmentUploadButton(isVisible: Boolean = true) subclass to define the value of this parameter. For example: `val chatConfiguration = NowChatConfiguration( uiConfiguration = NowChatConfiguration.UIConfiguration( attachmentUploadButton = NowChatConfiguration.AttachmentUploadButton(isVisible = false) ) )`
hideServiceNowInProductBranding	Boolean	Optional. Flag that indicates whether to hide the ServiceNow branding in Virtual Agent. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: ServiceNow branding is hidden. • false: ServiceNow branding is shown. Default: false
voiceInputButton	VoiceInputButton?	Optional. UI configuration for the speech-to-text microphone button shown in the text input bar. Default: null (the button is visible)

Returns

Type	Description
UIConfiguration	Object containing the UI configurations defined in the provided parameters.

The following code example calls the *UIConfiguration* subclass. It sets the icon for the closeButton, hides the attachment upload button, hides ServiceNow branding, and hides the speech-to-text microphone button.

```
suspend fun launchChat() {
    val chatService = getNowChatService()

    // Drawable to use instead of the default NowChat back
 button
    val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

    val uiConfiguration = NowChatConfiguration.UIConfiguration(
        closeButton = NowChatConfiguration.CloseButton(icon =
 myDrawable),
        attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false),
        hideServiceNowInProductBranding = true,
        voiceInputButton =
 NowChatConfiguration.VoiceInputButton(isVisible = false)
    )

    val chatConfiguration = NowChatConfiguration(
        uiConfiguration = uiConfiguration
    )

    chatService?.start(activity, chatConfiguration)
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowChatConfiguration - VoiceInputButton(isVisible: Boolean = true)

Defines the UI configurations to apply to the speech-to-text microphone button that appears in the text input bar.

VoiceInputButton is a subclass of the *NowChatConfiguration* class.

Parameters

Name	Type	Description
isVisible	Boolean	Optional. Flag that sets the visibility of the speech-to-text microphone button in the text input bar. Valid values: • true: The button is visible. • false: The button is hidden. Default: true

Returns

Type	Description
VoiceInputButton	Object containing the UI configuration for the speech-to-text microphone button.

The following code example hides the speech-to-text microphone button.

```
suspend fun launchChat() {
    val chatService = getNowChatService()

    val voiceInputButton =
 NowChatConfiguration.VoiceInputButton(isVisible = false)

    val uiConfiguration = NowChatConfiguration.UIConfiguration(
        voiceInputButton = voiceInputButton
    )

    val chatConfiguration = NowChatConfiguration(
        uiConfiguration = uiConfiguration
    )

    chatService?.start(activity, chatConfiguration)
}
```

NowChatSDK class - Android

The *NowChatService* class provides the function necessary to create a NowChatService that interacts with NowChat. NowChat provides the ability to embed Live Agent and Virtual Agent within your application.

For additional information on Live Agent and Virtual Agent, see Virtual Agent.

NowChatSDK - makeChatService(instanceURL: URL, nowChatSdkCallbacks)

Creates a NowChat service. This is a suspend function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance that the NowChatService should interact with.
nowChatSdkCallbacks	NowChatSdkCallbacks	Callbacks for the host application to use to configure the NowChatService.

Returns

Type	Description
None	

```
@Inject lateinit var sdkSettingsProvider:
 Provider<NowSDKSettings>
@Inject lateinit var chatCallbacks: SampleAppNowChatSDKCallbacks

private fun launchChat() {
  binding.progressBar.visibility = View.VISIBLE

  NowChatSDK.makeChatService(
    URL(sdkSettingsProvider.get().instanceBaseURL),
    chatCallbacks
  ) .onSuccess {
    it.start(this, chatCallbacks.nowChatThemeColors) }
  } .onFailure {
     Log.e("NowChat", "Unable to launch chat: $it")
  }
}
```

NowChatSdkCallbacks interface - Android

The *NowChatSdkCallbacks* interface provides functions that enable callbacks for host applications to configure or handle actions from the NowChatSDK.

Properties

Name	Type	Description
isFileCollectionBlocked	Boolean	Flag that indicates whether the host application should prevent NowChat from opening the file picker. Valid values: • true: Prevent the file picker from opening. • false: Allow the file picker to open.
isGalleryCollectionBlocked	Boolean	Flag that indicates whether the host application should prevent NowChat from opening the photo gallery. Valid values: • true: Prevent the photo gallery from opening. • false: Allow the photo gallery to open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
isLocationCollectionBlocked	Boolean	Flag that indicates whether the host application should prevent NowChat from accessing geolocation positioning. Valid values: • true: Prevent access to geolocation positioning. • false: Do not prevent access to geolocation positioning.
isPhotoCollection Blocked	Boolean	Flag that indicates whether the host application should prevent NowChat from accessing the camera. Valid values: • true: Prevent access to the camera. • false: Do not prevent access to the camera.

NowChatSdkCallbacks - didEndSessionWithId(sessionId: String)

Called when the chat screen is closed and the chat session ends.

Note: You must define the desired functionality for this callback by overriding the function as the default implementation simply writes the message "Chat session $sessionId ended." in the log.

Parameters

Name	Type	Description
sessionId	String	Sys_id of the session that ended. Table: Conversation Session [sys_cs_session]

Returns

Type	Description
None	

The following code example shows where to place your code to override the default functionality.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {
  override fun didEndSessionWithId(sessionId: String) {
    Log.i("NowChat", "Chat session $sessionId ended.")
  }

//override other methods

}
```

NowChatSdkCallbacks - loadUri(uri: Uri, context: Context)

Handles the specified URI, such as opening it in a webview, custom tab, or external browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
uri	Uri	URI to open.
context	Context	Application context.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {
  override fun loadUri(uri: Uri, context: Context) {

    // Open the uri in a webview
    val webview = WebView(context)
    webview.loadUrl(uri.toString())
  }

  // Override other methods
}
```

NowChatSdkCallbacks - onExit(exitCode: NowChatExitCode)

Sets the result code to return when NowChat is exited.

This callback gets called when that full screen chat is closed and the user is returned back to the host application.

Parameters

Name	Type	Description
exitCode	NowChatExitCode	Reason for exiting NowChat. Valid values: • ChatPluginNotInstalledError: Chat plugin not installed on instance. • SessionInitializationError: Unable to initialize session with instance. • UserExit: User exited using the up button or back button • Unknown: Any unknown reason.

Returns

Type	Description
None	

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {

  override fun onExit(exitCode: NowChatExitCode) {
    when (exitCode) {
      NowChatExitCode.UserExit -> Log.i("NowChat", "User exited
 using the up button or back button")
      NowChatExitCode.SessionInitializationError ->
 Log.i("NowChat", "Unable to initialize session with instance")
      NowChatExitCode.ChatPluginNotInstalledError ->
 Log.i("NowChat", " Chat plugin not installed on instance.")
      NowChatExitCode.Unknown -> Log.i("NowChat", "User exited
 for Unknown reason")
    }
  }

  // Override other methods
}
```

NowChatSdkCallbacks - provideProgressView(context: Context)

Returns the view to display when the NowChat UI data is loading; typically a configured indeterminate progress bar.

Parameters

Name	Type	Description
context	Context	Application context to use to create the view.

Returns

Type	Description
View	View that the NowChat service uses when loading.

The following code example shows how to call this function.

```
class SampleNowChatSDKCallbacks : NowChatSdkCallbacks {
  override fun provideProgressView(context: Context): View? {
    return ProgressBar(context).apply {
      indeterminateTintList = ColorStateList.valueOf(
        MaterialColors.getColor(
          context,
          android.R.attr.colorPrimary,
          Color.BLACK)
      )
    }

    // Override other methods
  }
}
```

NowChatService class - Android

The *NowChatService* class provides functions that enable you to launch the NowChat activity and set error configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowChatService - launchIntent(context:Context, nowChatTheme:NowChatTheme):Intent

Launches the intent used to open the NowChat activity. Typically used for creating a `[android.app.PendingIntent]`.

Parameters

Name	Type	Description
context	Context	Context used to build the intent.
nowChatTheme	NowChatTheme	Optional. Theme object to use in the NowChat UI. Default: Default colors

Returns

Type	Description
Intent	Intent and theme colors used to launch the associated NowChat activity.

This example shows how to call the *`launchIntent()`* method and process the return activity.

```
val intent = nowChatService.launchIntent(this)
val pendingIntent = PendingIntent.getActivity(
    this,
    REQUEST_CODE,
    intent,
    PendingIntent.FLAG_IMMUTABLE
)

val notification = createNotification(title, message,
 pendingIntent)
notificationManager.notify(push.notificationId, notification)
```

NowChatService - start(activity: Activity, themeColors: NowChatTheme = object: NowChatTheme{}, contextData: Map<String, Any> = mapOf(), chatConfiguration: NowChatConfiguration? = null)

Launches the specified NowChat activity.

Parameters

Name	Type	Description
activity	Activity	Activity context to use to launch the NowChat activity and to receive the `NowChatExitCode` as a resultCode through the *`onActivityResult`*.
nowChatTheme	NowChatTheme	Optional. Theme object to use in the NowChat UI. Default: Default colors
contextData	Map<String, Any>	Optional. Additional chat context variables to pass into the chat session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For additional information on chat context variables, see Live agent chat context variables.
chatConfiguration	NowChatConfiguration	Optional. ChatConfiguration to apply while using NowChat.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun launchChat() {
    val chatService = getNowChatService()

    val chatTheme = object : NowChatTheme {
        override val brand: Int
            get() = Color.BLUE

        override val textPrimary: Int
            get() = Color.BLACK

        // Override remaining theme colors

    }
    val contextData = mapOf("sys_id" to "123456789", "table" to
 "wm_task")

    //drawable to be used instead of the default NowChat back
 button.
    val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

    val chatConfiguration = NowChatConfiguration(
        closePrompt = NowChatConfiguration.ClosePrompt(
            header = null,
            message = "Are you sure you want to leave?",
            acceptButtonTitle = "Yes",
            declineButtonTitle = "No"
        ),
        disabledFeatures =
 listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION),
        conversationOptions =
 listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVER
SATION),
        uiConfiguration = NowChatConfiguration.UIConfiguration(
            closeButton = NowChatConfiguration.CloseButton(
                icon = myDrawable
            ),
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
        )
    )

    chatService?.start(activity, chatTheme, contextData,
 chatConfiguration)
}
```

NowChatService - subscribeToUnreadMessageCount(pollingInterval: Long, listener: NowChatUnreadMessagesCountListener)

Subscribes to the unread chat message count listener.

Parameters

Name	Type	Description
pollingInterval	Long	Frequency at which to poll the web service for the unread chat message count. Unit: Milliseconds
listener	NowChatUnreadMessagesCountListener	Listener that you implement to obtain the number of unread chat messages. You must also unsubscribe to this listener when you no longer want to obtain the unread message count using the NowChatService - unsubscribeFromUnreadMessageCount(listener: NowChatUnreadMessagesCountListener) method.

Returns

Type	Description
None	

The following example shows how to subscribe to and unsubscribe from a chat unread message count listener.

```
private val unreadMessageCountListener = object:
 NowChatUnreadMessagesCountListener {
  override fun unreadMessagesCountDidChange(unreadMessageCount:
 Int) {
  }
}

fun setup() {

 nowChatService.subscribeToUnreadMessageCount(pollingInterval:10
00, unreadMessageCountListener)
}

fun teardown() {

 nowChatService.unsubscribeFromUnreadMessageCount(unreadMessageC
ountListener)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}
```

NowChatService - unsubscribeFromUnreadMessageCount(listener: NowChatUnreadMessagesCountListener)

Unsubscribes from receiving the unread message count.

Parameters

Name	Type	Description
listener	NowChatUnreadMessagesCountListener	Listener that you implement to unsubscribe from the chat unread message count listener.

Returns

Type	Description
None	

The following example shows how to subscribe to and unsubscribe from a chat unread message count listener.

```
private val unreadMessageCountListener = object:
 NowChatUnreadMessagesCountListener {
  override fun unreadMessagesCountDidChange(unreadMessageCount:
 Int) {
  }
}

fun setup() {

 nowChatService.subscribeToUnreadMessageCount(pollingInterval:10
00, unreadMessageCountListener)
}

fun teardown() {

 nowChatService.unsubscribeFromUnreadMessageCount(unreadMessageC
ountListener)
}
```

NowChatService – updateTheme(nowChatTheme: NowChatTheme)

Updates the NowChat UI theme with the specified UI theme. Use this function to update the chat UI theme after it has been initially set using the *start()* function, such as when changing the theme from light to dark.

Parameters

Name	Type	Description
nowChatTheme	NowChatTheme	Theme object to use in the NowChat UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to update a light UI theme implemented using the *start()* function to the dark UI theme using the *updateTheme()* function.

```
val chatService = serviceManager.getNowChatService()

val chatThemeLight = object : NowChatTheme {
    override val backgroundPrimary: Int
        get() = Color.WHITE

    override val textPrimary: Int
        get() = Color.BLACK

    // Override remaining theme colors
}

val chatThemeDark = object : NowChatTheme {
    override val backgroundPrimary: Int
        get() = Color.BLACK

    override val textPrimary: Int
        get() = Color.WHITE

    // Override remaining theme colors
}

//start NowChat with light theme
chatService?.start(activity, chatThemeLight)

//update NowChat theme to dark theme
chatService?.updateTheme(chatThemeDark)
```

NowChatTheme interface - Android

The *NowChatTheme* interface defines default colors for the elements in the Live Agent and Virtual Agent chat UI.

The *NowChatTheme* interface extends the *NowUITheme* interface and inherits the property *nowUIColoring*.

```
val nowUIColoring: NowUIColoring?
```

You can modify these default colors and create your own themes for your specific chat implementation. The default colors use the Coral theme.

Properties

Name	Description
actionableIconPrimaryAI	AI assistant icon tint in output cards. Default value: #004F65

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
actionablePrimaryAIBackgroundColorGradientEnd	End color of the AI actionable background gradient in voice chat. Default value: #71D5FE
actionablePrimaryAIBackgroundColorGradientStart	Start color of the AI actionable background gradient in voice chat. Default value: #86F673
alertCritical0	Alert text background. Default value: #F9C8CE
alertCritical2	Alert text icon color. Default value: #EC596B
alertCritical3	Alert text icon and bar. Default value: #E52239
alertCritical4	New message divider. Default value: #B31B2C
alertHigh3	High level alert. Default value: #C25600
alertInfo0	Highlight conversation items. Default value: #BDDCF1
alertInfo2	Highlight conversation items. Default value: #409BD7
alertInfo3	Alert level three (informational). Default value: #007AC9
alertLow2	Alert level two (low). Used in voice chat. Default value: #96979F
alertModerate3	Alert, search result, and AI icons. Default value: #7B56FF
alertPositive0	Positive alert background. Default value: #C7DCB5
alertPositive2	Positive alert accent and icon (mid-tone).

Properties (continued)

Name	Description
screenHeaderText	Text and icon elements with fixed color that appear on top of brand color (screen header). Default value: #FFFFFF
secondary	User's swiping motion. Default value: #002832
separatorSecondary	Dividers. Default value: #AAB2B6
separatorTertiary	Divider lines. Default value: #CFD5D7.
shadow	Card shadow (15%). Default value: #10171A
textActionable	Text on buttons or highlighted background. Default value: #FFFFFF
textPrimary	Chat bubble text, card header. Default value: #10171A
textSecondary	Card content, search bar icon, and text. Default value: #232E33
textTertiary	Weekday for calendar, placeholder. Default value: #37444A

NowDataSDK class - Android

The *NowDataSDK* class provides functions that enable the creation and initialization of various features services such as NowGraphQLService, NowAttachmentService, NowTableService, and NowAPIService.

NowDataSDK - makeGraphQLService(instanceURL: URL)

Creates and initializes an instance of the NowGraphQLService feature. This service enables access to the *GraphQL* API on your ServiceNow instance.

For additional information on the ServiceNow GraphQL API, see Query record data using the GraphQL API framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowGraphQLService>	NowGraphQLService object wrapped in a Kotlin Result object.

The following code example shows how to call this function.

```
private var nowGraphQLService: NowGraphQLService? = null

/**
  * Create the NowGraphQLService once in the lifetime of the
 application, inside the Application class
  * or another manager class that will be injected into other
 classes via dagger/hilt.
  * NowGraphQLService should be created after initializing the
 NowSDK.
  */
suspend fun getNowGraphQLService(): NowGraphQLService? {
  if (nowGraphQLService != null) return nowGraphQLService

  return
 NowDataSDK.makeGraphQLService(URL("https://
instance-name.service-now.com")).getOrThrow()
    .also { this.nowGraphQLService = it }
}
```

NowDataSDK - makeNowAPIService(instanceURL: URL)

Creates and initializes an instance of the NowAPIService service. This service allows you to access the public REST APIs exposed by your ServiceNow instance.

In addition, you can develop custom scripted REST APIs within your ServiceNow instance and access them within your Android application using the NowAPIService API. For additional information on ServiceNow REST APIs, see Scripted REST APIs.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowAPIService>	NowAPIService wrapped in a Kotlin Result object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function.

```
private var nowApiService: NowAPIService? = null

/**
  * Create the NowAPIService once in the lifetime of the
 application inside the Application class
  * or another manager class that will be injected into other
 classes via dagger/hilt.
  * NowAPIService should be created after initializing the
 NowSDK
  */
suspend fun getNowApiService(): NowAPIService? {
  if (nowApiService != null) return nowApiService

  return
 NowDataSDK.makeAPIService(URL("https://
instance-name.service-now.com")).getOrThrow()
    .also { this.nowApiService = it }
}
```

NowDataSDK - makeNowAttachmentService(instanceURL: URL)

Creates and initializes an instance of the NowAttachmentService feature.

This service enables you to upload, download, and delete attachment files from your ServiceNow instance. After you upload an attachment to your instance, it generates metadata for the attachment that you can then download into your Android application.

For additional information on ServiceNow attachments, see Attachment API.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowAttachmentService>	NowAttachmentService object wrapped in a Kotlin Result object.

The following code example shows how to call this method.

```
private var nowAttachmentService: NowAttachmentService? = null

/**
  * Create the NowAttachmentService once in the lifetime of the
 application inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowAttachmentService should be created after initializing
 the NowSDK.
  */
suspend fun getNowAttachmentService(): NowAttachmentService? {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  if (nowAttachmentService != null) return nowAttachmentService

  return
 NowDataSDK.makeAttachmentService(URL("https://
instance-name.service-now.com"))
    .getOrThrow()
    .also { this.nowAttachmentService = it }
}
```

NowDataSDK - makeTableService(instanceURL: URL)

Creates and initializes an instance of the NowTableService feature.

This service enables you to access to the REST *Table* API on a ServiceNow instance. For additional information on the REST *Table* API, see Table API.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`

Returns

Type	Description
Result<NowTableService>	NowTableService object wrapped in a Kotlin Result object.

The following code example shows how to call this function.

```
private var nowTableService: NowTableService? = null

/**
  * Create the NowTableService once in the lifetime of the
 application inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowTableService should be created after initializing the
 NowSDK.
  */
suspend fun getNowTableService(): NowTableService? {
  if (nowTableService != null) return nowTableService

  return
 NowDataSDK.makeTableService(URL("https://
instance-name.service-now.com")).getOrThrow()
    .also { this.nowTableService = it }
}
```

NowGraphQLService interface - Android

The *NowGraphQLService* interface provides functions that allow you to make GraphQL requests to your ServiceNow through its *GraphQL* API.

Note: The *GraphQL* API works for guest users in the base ServiceNow system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more details on the ServiceNow *GraphQL* API, see Query record data using the GraphQL API framework.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration to associate with the service.

NowGraphQLService - graphQLRequest(String query)

Passes the specified GraphQL query to the associated ServiceNow instance and returns the query results.

Parameters

Name	Type	Description
query	String	GraphQL query to pass.

Returns

Type	Description
Call<Byte Array>	Query response.

```
fun makeGraphQLRequest(query: String) {
  val call = graphQLService.graphQLRequest(query)
  call.enqueue(
    { response -> handleResponse(response) },
    { nowDataError -> handleError(nowDataError) }
  )
}
```

NowPushPayload interface - Android

The *NowPushPayload* interface defines the push notification payload that the NowSDK implements.

NowPushPayload structure

Name	Description
instanceId	ServiceNow instance identifier as provided by the push notification system. Data type: String
instanceName	ServiceNow instance name. Data type: String
message	Body of the push notification. Data type: String
notificationId	Unique identifier for this push notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowPushPayload structure (continued)

Name	Description
	Data type: Integer
threadId	ID to use to group notifications. User the same ID in different payloads to indicate a group. Data type: String
title	Title of the push notification. Data type: String

NowPushSDK class - Android

The *NowPushSDK* class provides the function necessary to create a `NowPushService` that enables the sending of unsolicited (push) notifications to Android devices.

NowPushSDK - makePushService(instanceURL: URL)

Creates a NowPush service.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance that the NowPushService should interact with.

Returns

Type	Description
Result<NowPushService>	NowPushService object wrapped in a Kotlin Result object.

This example shows how to setup to *`makePushService()`* method to create the Push Service.

```
private var nowPushService: NowPushService? = null

/**
  * Create the NowPushService once in the lifetime of the
 application inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowPushService should be created after initializing the
 NowSDK.
  */
suspend fun getNowPushService(): NowPushService? {
  if (nowPushService != null) return nowPushService

  return
 NowPushSDK.makePushService(URL("https://
instance-name.service-now.com")).getOrThrow()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .also { this.nowPushService = it }
}
```

NowPushService class - Android

The *NowPushService* class provides functions that enable interaction with the Push Notification service.

Properties

Name	Description
configuration	Service configuration to associate with the service. Data type: NowServiceConfiguration

NowPushService - handlePush(remoteMessage: RemoteMessage, successCallback: Consumer<NowPushPayload>, errorCallback: Consumer<Throwable>)

Processes a push notification request.

Note: Currently the only implemented push notification type is `NowPushVirtualAgent`. Any other passed push notification type returns a NotSupportedPushError object.

Parameters

Name	Type	Description
remote Message	Remote Message	Notification as received by `com.google.firebase.messaging.FirebaseMessagingService.c` For additional information, see Receive messages in an Android app.
success Callback	Consumer <NowPushPayload>	Callback to return the processed *NowPushPayload* to.
error Callback	Consumer <Throwable>	Callback to return the thrown error to. If the error NotSupportedPushError is thrown not supported by the mobile SDK, and must be processed outside of the mobile S

Returns

Type	Description
None	

This example shows how to override *onMessageReceived()* and pass the *RemoteMessage* through to the NowPushService. If the NowPushService recognizes the notification type, it processes the request and returns the notification object for the application to handle. Otherwise it throws the NotSupportedPushError.

```
override fun onMessageReceived(remodeeMessage: RemoteMessage){
  pushService.handlePush(remoteMessage, { push ->
    when (push) {
      is NowPushVirtualAgent → handleVirtualAgentPush(push)
    }, { error ->
        Log.e(TAG, "Unknown push", error)
        handleAppPushNotification(remoteMessage)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    })
}
```

NowPushService - registerPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>)

Registers a unique Firebase token with the ServiceNow instance used to identify the push notifications for the current Android device and specified application.

In order for the ServiceNow instance to generate notifications Android device to receive notifications from the application, this token must be registered.

Parameters

Name	Type	Description
pushToken	String	Firebase token retrieved by either *com.google.firebase.messaging.FirebaseMessaging.getToken* *com.google.firebase.messaging.FirebaseMessagingService.onl*
pushApp	String	Name of the push application as specified in the Push Application table on the assoc ServiceNow instance.
success Callback	Runnable	Callback executed when the token registration is successful.
errorCallback	Consumer <Throwable>	Callback executed when the token registration fails.

Returns

Type	Description
None	

This example registers a push token for the current Android device and the application "PushAppName".

```
FirebaseMessaging.getInstance().token.addOnCompleteListener
 { task ->
  val token = task.result

  if (!task.isSuccessful || token == null) {
    throw Exception("Unable to fetch token"))
  }

  pushService.registerPushToken(token, "PushAppName", {
    Log.v(TAG, "Successfully registered push token")
  }, { e ->
    Log.e(TAG, "Error registering push", e)
  })
}
```

NowPushService - unregisterPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>)

Unregisters the specified Firebase push token with the associated ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
pushToken	String	Firebase token to unregister. Retrieved by either `com.google.firebase.messaging.FirebaseMessaging.getToken` o `com.google.firebase.messaging.FirebaseMessagingService.onNe`
pushApp	String	Name of the push application associated with the token to unregister. This information is in the Push Application table on the associated ServiceNow instance.
success Callback	Runnable	Callback executed when the token unregistration is successful.
erro rCallback	Consumer <Throwable>	Callback executed when the token unregistration fails.

Returns

Type	Description
None	

This code example shows how to unregister a push token such as when the user logs out of the application.

```
pushService.unregisterPushtoken(token, "PushAppName", {
  Log.v(TAG, "Successfully unregistered push token")
},  { e ->
  Log.e(TAG, "Error unregistering push", e)
})
```

NowSDK - Android

The *NowSDK* class is a singleton that provides the public API for the NowSDK. This class is the gateway to all Android SDK feature services.

Before initializing a feature service, you must initialize the SDK itself by calling NowSDK.configure(). For additional information on getting started with the Android NowSDK, refer to the ServiceNow Mobile SDK Developers Guide - Android.

NowSDK - configure(application: Application, configuration: NowSDKConfiguration)

Configures the NowSDK for use.

You must call this function before attempting to use any of the feature services provided by the SDK.

Parameters

Name	Type	Description
application	Application	Reference to the hosting application object.
configuration	NowServiceConfiguration	Object containing the information necessary to initialize the NowSDK.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	NowSDKError is thrown if the provided configuration is invalid.

The following code example shows how to call this function.

```
class SampleApplication : Application(),
 NowSDKAuthorizationProviding, DevicePermissionDelegate {

    private val nowSdkSettings = NowSDKSettings(
        instanceBaseURL =
 "https://instance-name.service-now.com",
        clientId = "client_id",
        user = "user"
    )

    private val coroutineScope = CoroutineScope(Dispatchers.IO)

    private val nowSDKConfiguration = NowSDKConfiguration(this,
 this, NowLogLevel.Debug)
    override fun onCreate() {
        super.onCreate()

        NowSDK.configure(this, nowSDKConfiguration)
    }

    override fun requestAuthorization(
        instanceURL: URL,
        callback: Consumer<List<AuthorizationToken>?>
    ) {
        coroutineScope.launch {
            when {
                nowSdkSettings.user.isNullOrBlank().not() ->
 authorizeWithJWT(
                    callback = callback,
                    user = nowSdkSettings.user,
                    clientId = nowSdkSettings.clientId
                )

                else -> authorizeWithGuest(callback = callback)
            }
        }
    }

    override fun canRequestPermission(permission:
 DevicePermission): Boolean {
        return true
    }
}
```

NowSDK - logout()

Clears all user sessions persisted in memory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
class SampleApplication : Application() {

    private val nowSDKConfiguration =
 NowSDKConfiguration(authorizationProvider, permissionDelegate,
 NowLogLevel.Debug)

    override fun onCreate() {
        super.onCreate()
        NowSDK.configure(this, nowSDKConfiguration)
    }

    fun logout() {
        // Clear all user session when an application resets the
 user session
        NowSDK.logout()
    }
}
```

NowSDKAuthorizationProviding interface - Android

The *NowSDKAuthorizationProviding* interface provides a function that configures the link to the ServiceNow instance for which authorization is needed and any associated callbacks.

NowSDKAuthorizationProviding - requestAuthorization(instanceURL: URL, callback: Consumer<List<AuthorizationToken>?>)

Authorizes the currently logged-in user on the specified ServiceNow instance using the specified AuthorizationToken objects.

Parameters

Name	Type	Description
instanceURL	URL	ServiceNow instance for which the authorization is being requested.
callback	Consumer <List <AuthorizationToken>?>	Array of logged-in user specific Authorization Token objects.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
class NowSDKAuthorizationManager: NowSDKAuthorizationProviding {
  override fun requestAuthorization(
    instanceURL: URL,
    callback: Consumer<List<AuthorizationToken>?>
  ){
    val token = JWTService.fetchJwt()
    val authorizationToken =
 AuthorizationToken(AuthorizationTokenType.JWT, token)
    val result = listOf(authorizationToken)
    callback.accept(result)
  }
}
```

NowSDKConfiguration class - Android

The *NowSDKConfiguration* class contains configuration information needed to initialize the NowSDK.

Properties

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK upon request.
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values (case-sensitive): • Debug • Error • Fatal • Info • None
permissionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show system dialog for requesting the indicated device permission. For example: `override fun canRequestPermission(permission: DevicePermission): Boolean = when (permission) { DevicePermission.Camera -> true`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description

		`DevicePermission.Microphone -> false`
		`}`
		`}`

NowSDKConfiguration - NowSDKConfiguration(authorizationProvider: NowSDKAuthorizationProviding, permissionDelegate: DevicePermissionDelegate, logLevel: NowLogLevel)

Creates a new NowSDKConfiguration object.

Parameters

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK upon request.

permissionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show system dialog for requesting the indicated device permission.
		
		For example:
		
		`override fun canRequestPermission(permission: DevicePermission): Boolean = when (permission) {`
		
		`DevicePermission.Camera -> true`
		
		`DevicePermission.Microphone -> false`
		`}`
		`}`

logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values (case-sensitive): • Debug • Error • Fatal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Info • None

Returns

Type	Description
None	

The following code example shows how to call this function.

```
class SampleApplication : Application(),
 NowSDKAuthorizationProviding, DevicePermissionDelegate {

    private val nowSdkSettings = NowSDKSettings(
        instanceBaseURL =
 "https://instance-name.service-now.com",
        clientId = "client_id",
        user = "user"
    )

    private val coroutineScope = CoroutineScope(Dispatchers.IO)

    private val nowSDKConfiguration = NowSDKConfiguration(this,
 this, NowLogLevel.Debug)
    override fun onCreate() {
        super.onCreate()

        NowSDK.configure(this, nowSDKConfiguration)
    }

    override fun requestAuthorization(
        instanceURL: URL,
        callback: Consumer<List<AuthorizationToken>?>
    ) {
        coroutineScope.launch {
            when {
                nowSdkSettings.user.isNullOrBlank().not() ->
 authorizeWithJWT(
                    callback = callback,
                    user = nowSdkSettings.user,
                    clientId = nowSdkSettings.clientId
                )

                else -> authorizeWithGuest(callback = callback)
            }
        }
    }

    override fun canRequestPermission(permission:
 DevicePermission): Boolean {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        return true
    }
}
```

NowServiceConfiguration class - Android

The *`NowServiceConfiguration`* class enables you to configure the ServiceNow instance URL and package name for a feature service.

Properties

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance that the feature service will leverage. For example: https://my_domain.hr_instance.com
packageName	String	Name of the package to associate with the feature service.

NowServiceError class - Android

The *`NowServiceError`* sealed class that returns NowSDK errors.

Properties

Name	Type	Description
cause	Throwable	Cause of the error.
message	String	Message that contains the error details to display to the user.

Errors returned by NowSDK feature services

Type	Description
SDKNotConfigured	The NowSDK was not configured. `NowSDK.configure()` was not called before creating the service.
ServiceConfigurationInvalid	The NowSDK was configured with invalid setting, such as a malformed instance URL.
ServiceDisabled	The associated service is turned off. If returned by NowVoiceSDK - makeVoiceService(instanceURL: URL), voice is turned off on the instance. To use NowVoice, `sdk.voice.enabled` must be `true`.
ServiceSettingsInvalid	Unable to process the service settings. If returned by NowVoiceSDK - makeVoiceService(instanceURL: URL), the `sdk.voice.enabled` key is missing from the instance settings.
ServiceSettingsNotFound	The instance doesn't have `sdk.voice` settings configured.
ServiceSettingsRetrievalFailed	A network or authentication error occurred. Unable to retrieve the NowSDK service settings from the ServiceNow instance.

NowTableService interface - Android

The *NowTableService* interface provides functions that enable you to create, read, delete, and update records within a table on a ServiceNow instance.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration to associate with the service.

NowTableService - createRecord(tableName: String, fields: Map<String, String>, writeOptions: FieldWriteOptions?, configuration: FieldReadConfiguration?)

Inserts the specified record in the specified table.

Parameters

Name	Type	Description
tableName	String	Name of the table in which to save the record.
fields	Map<String, String>	Key-value pairs for all fields to create in the record. **Note:** All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.
writeOptions	FieldWriteOptions	Optional. Write options to set on the fields, such as whether the value should be stored as display values or whether to suppress auto generation of system fields. Default: null - No options selected
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to return for the created record and what to include in the fields.

Returns

Type	Description
Call<ByteArray>	Success: ByteArray that contains the created record. You can convert this information into any data model that you need. Failure: NowDataError

```
fun createTableRecord( tableName: String, fields: KeyValues,
 includeFields: String,
  readOptions: ReadOptions?, writeOptions: WriteOptions?){

  val readOptionsArray = readOptions?.asArray() ?: arrayOf()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)

  var body:ByteArray?

  val call = tableService.createRecord(tableName,
 fields.toMap(),
    writeOptions?.asFieldWriteOptions(),
    readConfig)
  call.enqueue({ body = it.body },{ Log.d("Records", "failed to
 create record") })
}
```

NowTableService - deleteRecord(sysId: String, tableName: String)

Deletes the specified record in the specified table.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
tableName	String	Name of the table in which the specified record is located, such as *incident* or *asset*.

Returns

Type	Description
Call<ByteArray>	Success: Nothing is returned. Failure: NowDataError

```
fun deleteTableRecord( recordSysId: String, tableName: String,
 callType: CallTestType){
  val tableService = serviceProvider.tableService()
  var body:ByteArray?
  val call = tableService.deleteRecord(recordSysId, tableName)
  call.enqueue({ body = it.body },{ Log.d("Records", "failed to
 create record") })
}
```

NowTableService - paginator(tableName: String, configuration: FetchConfiguration)

Creates a paginator that allows iteration of pages of records within a table.

You can use this paginator to navigate through the returned records, performing navigation operations such as fetching the first, last, previous, or next page, or checking whether there is next or previous page.

Parameters

Name	Type	Description
tableName	String	Name of the table for which to create the paginator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
configuration	FetchConfiguration	Configuration that specified the filters to use, pagination page size limit, which fields to retrieve, and what to include in the fields.

Returns

Type	Description
Paginator <ByteArray>	Success: Paginator with ByteArray output of the requested records. You can use the functions within the Paginator object to navigate the returned records. Failure: NowDataError

```
private fun initTablePaginator() {
  paginator = service?.paginator(tableName,
 FetchConfiguration(null, 3))
    ?.observe(object: PaginatorCallBack<ByteArray> {
      override fun onSuccess(response:
 Response<List<ByteArray>>) {
      }
      override fun onFailure(e: NowDataError) {
        Log.e("NowDataError", "", e)
      }
    })
}
```

NowTableService - record(sysId: String, tableName: String, configuration: FieldReadConfiguration?)

Retrieves the specified record from the specified table.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to retrieve.
tableName	String	Name of the table in which the specified record is located, such as *incident* or *asset*.
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to retrieve and what to include in the fields.

Returns

Type	Description
Call <ByteArray>	Success: ByteArray that contains the retrieved record. You can convert this information into any data model that you need. Failure: NowDataError

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```
fun fetchTableRecord( sysId: String, tableName: String,
 includeFields: String,
  readOptions: ReadOptions?){

  val readOptionsArray = readOptions?.asArray() ?: arrayOf()
  val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)

  var body:ByteArray?

  val call = tableService.record(sysId, tableName, readConfig)
  call.enqueue({ body = it.body },{ Log.d("Record", "failed
 fetching record") })
}
```

NowTableService - records(tableName: String, configuration: FieldReadConfiguration?)

Retrieves sll records record from the specified table.

Parameters

Name	Type	Description
tableName	String	Name of the table from which to retrieve the records, such as *incident* or *asset*.
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to retrieve and what to include in the fields.

Returns

Type	Description
Call <ByteArray>	Success: ByteArray that contains the retrieved records. You can convert this information into any data model that you need. Failure: NowDataError

```
fun fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: String,
  readOptions: ReadOptions?, limit: Int?){

  val readOptionsArray = readOptions?.asArray() ?: arrayOf()
  val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)
  val config = FetchConfiguration(Filter(filterQuery), limit,
 readConfig)

  var body:ByteArray?

  val call = tableService.records(tableName, config)
  call.enqueue({ body = it.body },{ Log.d("Records", "failed
 fetching records") })
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - updateRecord(sysId: String, tableName: String, fields: Map<String, String>, writeOptions: FieldWriteOptions?, configuration: FieldReadConfiguration?)

Updates the specified record in the specified table with the specified fields.

Parameters

Name	Type	Description
tableName	String	Name of the table in which to update the record.
fields	Map<String, String>	Key-value pairs for all fields to update in the record. **Note:** All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.
writeOptions	FieldWriteOptions	Optional. Write options to set on the fields, such as whether the value should be stored as display values or whether to suppress auto generation of system fields. Default: null - No options selected
configuration	FieldReadConfiguration	Optional. Configuration that specifies which fields to update and what to include in the fields. Default: null

Returns

Type	Description
Call<ByteArray>	Success: ByteArray that contains the updated record. You can convert this information into any data model that you need. Failure: NowDataError

```
fun updateTableRecord( sysId: String, tableName: String, fields:
 KeyValues, includeFields: String,
   readOptions: ReadOptions?, writeOptions: WriteOptions?){

   val readOptionsArray = readOptions?.asArray() ?: arrayOf()
   val readConfig =
 FieldReadConfiguration(includeFields.split(","),
 *readOptionsArray)

   var body:ByteArray?

   val call = tableService.updateRecord(recordSysId, tableName,
 fields.toMap(),
     writeOptions?.asFieldWriteOptions(),
     readConfig)
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    call.enqueue({ body = it.body },{ Log.d("Records", "failed to
 update record") })
}
```

NowVoiceCallbacks interface - Android

Provides callback functions for voice session lifecycle and content events.

Implement this interface and pass it when calling `NowVoiceService.start()`.

A `NowVoiceError` is delivered as the second parameter of the `onCallEnd()` callback.

NowVoiceError

Type	Description
ConnectionTimeout	The connection to the voice agent timed out.
CallInitializationFailed(message)	The voice session could not be initialized. The *`message`* field contains additional detail.
ConnectionLost	The network connection dropped during an active session.
ServerErrorNow(message)	A server error occurred over the data channel.
ServerEndedCall	The server terminated the session normally, such as when a session limit is reached.
UnexpectedServiceTermination	The system destroyed the voice service unexpectedly.

Functions

Name	Description
`onCallEnd(conversationId: String?, error: NowVoiceError? = null)`	Called once when the voice session ends. *`conversationId`* identifies the completed session and may be `null` if a session was never fully established. *`error`* is a `NowVoiceError`, or `null` for normal termination.
`onMuteStateChanged(isMuted: Boolean)`	Called each time the user mutes or unmutes the microphone. *`isMuted`* is `true` when the microphone is muted.
`onMessageReceived(message: TranscriptMessage)`	Called each time a new transcript message arrives during the session. For more information, see `Transcript Message`.
`onCallMinimized()`	Called when the voice session UI is minimized by the user.

The following code example shows how to implement *`NowVoiceCallbacks`*. In each callback function, implement the desired functionality for handling the event.

```
val callbacks = object : NowVoiceCallbacks {
    override fun onCallEnd(conversationId: String?, error:
 NowVoiceError?) {
        if (error != null) {
            Log.e("NowVoice", "Session ended with error:
 $error")
        } else {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            Log.d("NowVoice", "Session complete. ID:
 $conversationId")
        }
    }

    override fun onMuteStateChanged(isMuted: Boolean) {
        // Update your UI to reflect the current mute state
        Log.d("NowVoice", "Microphone muted: $isMuted")
    }

    override fun onMessageReceived(message: TranscriptMessage) {
        // Receive real-time transcript messages
        Log.d("NowVoice", "${message.role}: ${message.content}")
    }

    override fun onCallMinimized() {
        Log.e("NowVoice", "Voice chat is minimized")
    }
}
```

NowVoiceEndpoint class - Android

Describes a voice agent endpoint.

A voice endpoint identifies the specific voice agent channel to connect to. Use `NowVoiceService.nowVoiceEndpoints` to obtain available *`NowVoiceEndpoints`*. Endpoints are retrieved from your ServiceNow instance's Mobile SDK settings. In most apps, there is a single endpoint.

Properties

Name	Type	Description
voiceServiceId	String	The unique identifier of the voice service.
voiceWebhookURL	String	The WebSocket webhook URL for the voice agent.
mobileChannelType	String	The mobile channel type for the endpoint.
mobileChannelId	String	The mobile channel identifier.

The following code example shows how to retrieve an instance of *`NowVoiceEndpoint`* from `NowVoiceService.nowVoiceEndpoints`.

```
import com.servicenow.nowsdk.voice.NowVoiceSDK
import kotlinx.coroutines.launch
import java.net.URL

lifecycleScope.launch {
    val result = NowVoiceSDK.makeVoiceService(
        instanceURL =
 URL("https://your-instance.service-now.com")
    )

    result
        .onSuccess { voiceService ->
            // Service is ready; proceed to select an endpoint
        }
        .onFailure { error ->
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            // Handle NowServiceError
            Log.e("NowVoice", "Service creation failed: $error")
        }
}

val endpoint = voiceService.nowVoiceEndpoints.firstOrNull() ?:
 return
```

NowVoiceSDK object - Android

The *NowVoiceSDK* factory object creates *NowVoiceService* instances.

Use NowVoiceService to start and manage voice agent sessions.

For more information about configuring NowVoice, including prerequisites and call order, see Embed an AI voice agent with NowVoice.

NowVoiceSDK - makeVoiceService(instanceURL: URL)

Creates a *NowVoiceService* instance for the specified ServiceNow instance. This is a suspend function.

Call from a coroutine after *NowSDK.configure()* has been called. This function fetches instance settings over the network, validates that voice is enabled on the instance, and retrieves available voice endpoint configurations.

Throws *NowServiceError* on failure.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance, for example URL(`"https://instancename.service-now.com"`).

Returns

Type	Description
Result<NowVoiceS	`Result.success(NowVoiceService)` if initialization succeeds, or `Result.failure(NowServiceError)` if setup fails.

The following code example creates an instance of *NowVoiceService*.

```
import com.servicenow.nowsdk.voice.NowVoiceSDK
import kotlinx.coroutines.launch
import java.net.URL

lifecycleScope.launch {
    val result = NowVoiceSDK.makeVoiceService(
        instanceURL =
 URL("https://your-instance.service-now.com")
    )

    result
        .onSuccess { voiceService ->
            // Service is ready; proceed to select an endpoint
        }
        .onFailure { error ->
```

```
            // Handle NowServiceError
            Log.e("NowVoice", "Service creation failed: $error")
        }
}
```

NowVoiceService class - Android

Manages voice agent sessions for a single ServiceNow instance.

Note: Initialize a *NowVoiceService* by calling NowVoiceSDK - makeVoiceService(instanceURL: URL).

Properties

Name	Type	Description
configuration	NowServiceConfiguration	The service configuration for the ServiceNow instance.
isMuted	Boolean	Flag that indicates the microphone mute state for the current call. Setting this property has no effect if no call is currently active. Valid values: • true: The microphone is muted. • false: The microphone is unmuted or no call is active.
nowVoiceEndpoints	List<NowVoiceEndpoint>	Read-only. The list of available voice endpoint configurations retrieved from the instance.

NowVoiceService - endCall()

Ends the current voice call.

Has no effect if no call is active.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example ends the active voice call.

```
val voiceService =
 NowVoiceSDK.makeVoiceService(instanceUrl).getOrNull()

val endpoint = voiceService?.nowVoiceEndpoints?.first()
voiceService?.start(activity, endpoint = endpoint, theme =
 theme)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// End a call on timeout, navigation, or from a custom hang-up
 button
voiceService?.endCall()
```

NowVoiceService - hasActiveCall()

Checks whether there is a currently active voice call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there is an active voice call. Valid values: • true: There is an active voice call. • false: There isn't an active voice call.

The following code example checks if a voice call is in progress.

```
val voiceService =
 NowVoiceSDK.makeVoiceService(instanceUrl).getOrNull()

val endpoint = voiceService?.nowVoiceEndpoints?.first()
voiceService?.start(activity, endpoint = endpoint, theme =
 theme)

// Guard UI state or prevent starting a second call
if (voiceService?.hasActiveCall() == true) {
    // A voice call is currently in progress
}
```

NowVoiceService - start(context: Context, endpoint: NowVoiceEndpoint, uiConfiguration: NowVoiceUiConfiguration, callbacks: NowVoiceCallbacks?, theme: NowVoiceTheme)

Launches the full-screen voice agent Activity. This is a suspend function that returns after the session ends.

Parameters

Name	Type	Description
context	Context	An Android `Context` used to launch the voice Activity. Typically your current `Activity`.
endpoint	NowVoiceEndpoint	The voice agent endpoint to connect to. Obtain from `NowVoiceService.nowVoiceEndpoints`.
uiConfiguration	NowVoiceUiConfiguration	Optional. Presentation options for the voice agent UI. If omitted, uses the default values for *`NowVoiceUiConfiguration`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
callbacks	NowVoiceCallbacks?	Optional. Callbacks for voice session events. If `null`, events are silently ignored.
theme	NowVoiceTheme	Optional. The visual theme applied to the voice UI. Default: The prebuilt light theme.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
//voiceService is an initialized NowVoiceService
val endpoint = voiceService.nowVoiceEndpoints.firstOrNull() ?:
 return

voiceService.start(
    context = this@MainActivity,
    endpoint = endpoint,
    uiConfiguration = NowVoiceUiConfiguration(
        hidePostCallTranscript = false,
        shouldBlockAttachmentSharing = false
    ),
    callbacks = object : NowVoiceCallbacks {
        override fun onCallEnd(conversationId: String?, error:
 NowVoiceError?) {
            if (error != null) {
                Log.e("NowVoice", "Session ended with error:
 $error")
            } else {
                Log.d("NowVoice", "Session complete. ID:
 $conversationId")
            }
        }

        override fun onMuteStateChanged(isMuted: Boolean) {
            // Update your UI to reflect the current mute state
            Log.d("NowVoice", "Microphone muted: $isMuted")
        }

        override fun onMessageReceived(message:
 TranscriptMessage) {
            // Receive real-time transcript messages
            Log.d("NowVoice", "${message.role}:
 ${message.content}")
        }
    },
    theme = object : NowVoiceTheme {}  // Uses default light
 theme
)
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowVoiceService - toggleMute()

Toggles the microphone mute state of the current call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates the new microphone mute state for the current call. Valid values: • true: The microphone is now muted. • false: The microphone is now unmuted or no call is active.

The following code example toggles and reads the microphone mute state.

```
val voiceService =
 NowVoiceSDK.makeVoiceService(instanceUrl).getOrNull()

val endpoint = voiceService?.nowVoiceEndpoints?.first()
voiceService?.start(activity, endpoint = endpoint, theme =
 theme)

// Wire to a custom mute button or auto-mute on backgrounding
voiceService?.toggleMute()

// Check mute state to update a custom mute button icon
val muted = voiceService?.isMuted ?: false
```

NowVoiceService - updateTheme(theme: NowVoiceTheme)

Updates the visual theme of the currently active voice UI.

This function has no effect if no voice session is currently active. To apply a visual theme at voice session launch, provide a theme when calling start(context:endpoint:uiConfiguration:callbacks:theme:).

Parameters

Name	Type	Description
theme	NowVoiceTheme	The theme to apply to the active voice UI.

Returns

Type	Description
None	

The following code example updates the visual theme of the currently active voice UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
val voiceService =
 NowVoiceSDK.makeVoiceService(instanceUrl).getOrNull()

val endpoint = voiceService?.nowVoiceEndpoints?.first()
voiceService?.start(activity, endpoint = endpoint, theme =
 theme)

// React to dark mode changes or apply brand colors at runtime
voiceService?.updateTheme(NowVoiceThemeDark())
```

NowVoiceTheme interface - Android

Customizes the visual appearance of the voice agent UI.

Implement *NowVoiceTheme* to customize the voice agent UI colors. All properties have default light theme implementations; override only what you need. NowVoiceThemeDark can be used as a prebuilt dark theme implementation.

This interface extends *NowUITheme*.

Properties

Name	Default	Description
actionablePrimaryAIBackgroundColorGradientEnd	#71D5FE	AI gradient background end color.
actionablePrimaryAIBackgroundColorGradientStart	#86F673	AI gradient background start color.
alertCritical0	#F9C8CE	Error and critical alert background (close button).
alertCritical4	#B31B2C	Error and critical alert icon color.
alertInfo0	#BDDCF1	Info alerts background.
alertInfo3	#007AC9	Info alerts level 3.
alertLow2	#96979F	Low priority alerts.
backgroundPrimary	#FFFFFF	Neutral background and dialog background.
backgroundSecondary	#F5F6F7	Secondary background and user message bubbles.
brandBackground	#BDDEE7	Transcript button background when selected.
destructive	#E52239	Destructive actions and error states.
highlightGreen	#BFE1D4	Green highlight in voice chat.
highlightYellow	#F0E2BF	Yellow highlight in voice chat.
presenceAvailable	#4EA800	Presence available indicator in voice chat.
primary	#00566E	Primary action color, transcript icon when selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Default	Description
secondary	#002832	Animated background gradient shown during a voice interaction.
textActionable	#FFFFFF	Text on action buttons or highlighted background.
textPrimary	#10171A	Primary text color for UI elements.
textSecondary	#232E33	Secondary text color.
textTertiary	#37444A	Tertiary text color, connection state text.

NowVoiceTheme color palette

Default colors used in the prebuilt light theme.

The following code example shows a custom implementation of *NowVoiceTheme*.

```
val myTheme = object : NowVoiceTheme {
    override val primary: Int = Color.parseColor("#0072C6")
    override val backgroundPrimary: Int = Color.WHITE
}

//voiceService is an initialized NowVoiceService
voiceService.start(context, endpoint, theme = myTheme)
```

NowVoiceThemeDark class - Android

A prebuilt dark theme implementation of *NowVoiceTheme*.

Apply the dark theme to the voice agent UI by passing it to NowVoiceService - start() or NowVoiceService - updateTheme().

The following code example shows how to use *`NowVoiceThemeDark`*.

```
//voiceService is an initialized NowVoiceService

// Apply theme at voice session launch
voiceService.start(context, endpoint, theme =
 NowVoiceThemeDark())

// Or update theme while a voice session is active
voiceService.updateTheme(NowVoiceThemeDark())
```

Related topics

NowVoiceTheme interface - Android

NowVoiceUiConfiguration class - Android

Specifies presentation options for the voice agent UI.

NowVoiceUiConfiguration - NowVoiceUiConfiguration(hidePostCallTranscript: Boolean = false, shouldBlockAttachmentSharing: Boolean = false)

Creates a *`NowVoiceUiConfiguration`* instance with the specified presentation options.

Parameters

Name	Type	Description
hidePostCallTranscript	Boolean	Optional. Flag that indicates whether the post-call transcript summary screen is displayed or hidden when the session ends. Valid values: • true: The post-call transcript summary screen is hidden. • false: The post-call transcript summary screen is displayed. Default: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
shouldBlockAttachmentSharing	Boolean	Optional. Flag that indicates whether the share button is displayed or hidden on the transcript screen. Valid values: • true: The share button is hidden. • false: The share button is displayed. Default: False

The following code example shows how to create an instance of *NowVoiceUiConfiguration*.

```
val uiConfiguration = NowVoiceUiConfiguration(
    hidePostCallTranscript = true,
    shouldBlockAttachmentSharing = true
)
```

NowWebTheme interface - Android

The *NowWebTheme* interface provides properties that enable you to override the colors used within web pages hosted on your ServiceNow instance in a native web view.

The *NowWebTheme* interface extends the *NowUITheme* interface and inherits the property *nowUIColoring*.

```
val nowUIColoring: NowUIColoring?
```

This property is used to reference color variables that *NowWebTheme* can use. For additional information on how to theme the UI, see Use NowUIColoring to theme NowWebTheme and NowChatTheme in the Mobile SDK Developer Guide - Android.

The default colors use the Coral theme.

Properties

Name	Description
alertCritical0	Use for: • error messages • snackbar background Default value: #F9C8CE
alertCritical3	Use for: • error messages • snackbar border Default value: #E52239
alertPositive0	Use for:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	• success messages • snackbar background Default value: #C7DCB5
alertPositive3	Use for: • success messages • snackbar border Default value: #3E8600
alertWarning0	Use for: • warning messages • snackbar background Default value: #ECE5BF
alertWarning3	Use for: • warning messages • snackbar border Default value: #B29800
backgroundPrimary	Use for: • card background • choice picker • input background • neutral background Default value: #FFFFFF
backgroundSecondary	Use for overflow menu background. Default value: #F5F6F7
backgroundTertiaryActionable	Use for the background color for the topic dialog search and edit text. Default value: #37444A
brand	Use for the header background in the toolbar and tables. Default value: #032D42
notification	Use for new message indicator. Default value: #E52239

Properties (continued)

Name	Description
primary	Use for: • actionable text • button backgrounds Default value: #00566E
screenHeaderText	Use for text and icon elements with a fixed color that appear on top of the brand color (screen header/toolbar). Default value: #FFFFFF
textActionable	Use for: • highlighted background • text on action buttons Default value: #FFFFFF
textPrimary	Use for: • alert dialog messages • card header text • chat bubble text • picture title and description • topic text Default value: #10171A
webPageThemeId	Sys_id of the theme to apply to the ServiceNow web pages loaded by *NowWeb*. Default value: Configured default theme Table: UX Theme [sys_ux_theme] table.
webPageThemeVariantId	Sys_id of the theme variant to apply to the ServiceNow web pages loaded by *NowWeb*. Default value: Configured default theme variant Table: UX Style [sys_ux_style] table.

NowWebSDK class - Android

The *NowWebSDK* class provides a single function that enables you to load web pages hosted on your ServiceNow instance in a native web view and Cabrillo. It automatically handles user authentication and session management instead of forcing users to log into the instance through a login web page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowWebSDK - makeWebService(instanceURL: URL, nowWebSdkCallbacks: NowWebViewServiceDelegate? = null)

Creates a NowWeb service.

Parameters

Name	Type	Description
instanceURL	URL	URL of the ServiceNow instance to access. For example, `"https://instance.servicenow.com"`
nowWebSdkCallbacks	NowWebViewServiceDelegate	Callbacks for the host application to configure *`NowWebService`*.

Returns

Type	Description
Result<NowWebService>	NowWebService object wrapped in a Kotlin Result object.

The following code example shows how to call this function.

```
 private var nowWebService: NowWebService? = null

/**
  * Create the NowWebService once in the lifetime of the
 application, inside the Application
  * class or another manager class that will be injected into
 other classes via dagger/hilt.
  * NowWebService should be created after initializing the
 NowSDK.
  */
suspend fun getNowWebService(): NowWebService? {
  if (nowWebService != null) return nowWebService

  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
    NowWebViewServiceDelegate {
    override fun flowEnded(activity: Activity, flowName:
 String?) {
      Log.i("NowWebSdk", "flow ended")
    }

    override fun requestedDismissal(activity: Activity) {
      Log.i("NebWebSdk", "screen should be dismissed")
    }

    override fun navigationFailed(activity: Activity, error:
 String) {
      Log.i("NebWebSdk", "navigation failed")
    }

    override fun unsupportedUrl(activity: Activity, uri: Uri) {
      Log.i("NebWebSdk", "URL is unsupported")
    }
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }).getOrThrow()
      .also { this.nowWebService = it }
}
```

NowWebService class - Android

The *NowWebService* class provides a function that launches a *NowWebActivity* that hosts a web view.

Properties

Name	Type	Description
configuration	NowServiceConfiguration class - Android	Configuration information for the associated service, such as the ServiceNow instance URL and the name of the package.

NowWebService - launch(context: Context, url: URL, nowWebTheme: NowWebTheme)

Creates a NowWebActivity that hosts the web view.

Parameters

Name	Type	Description
context	Context	Context to use for launching the associated activity.
url	URL	URL of the web page to load. This web page must be on the target ServiceNow instance that the service was initialized with.
nowWebTheme	NowWebTheme	Optional. *NowWebTheme* object to apply to the UI elements of the view controller. Default: Default theme

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun launchNowWeb() {
    val webService = getNowWebService()

    val webTheme = object : NowWebTheme {
        override val brand: Int
            get() = Color.BLUE

        override val textPrimary: Int
            get() = Color.BLACK

        //Override remaining theme colors
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    webService?.launch(activity,
 URL("https://instance-name.service-now.com"), webTheme)
}
```

NowWebService – preloadWebCache(preloadUris: List<URI>)

Preloads a list of specified java.net.URIs in a headless webview to pre-populate the webview cache with cacheable resources on the page.

Note: Completion of this function call is based on *`onPageFinished()`* being called in the webview, which does not take into account redirections or resources on the page. Because of this, preload may not be fully complete when this method returns.

Parameters

Name	Type	Description
preloadUris	List	List of java.net.URIs to pre-load. All java.net.URIs must be relative or match the current host configured in the NowSDK.

Returns

Type	Description
None	

The following example shows how to use the *`webService.preloadWebCache()`* function to pre-load the `mesp` page.

```
suspend fun preloadNowWeb() {
  val webService = serviceProvider.webService()
  webService.preloadWebCache(
    listOf(
      URI("mesp")
    )
  )
}
```

NowWebService – updateTheme(nowWebTheme: NowWebTheme)

Updates the NowWeb UI theme with the specified UI theme. Use this function to update the web UI theme after it has been initially set using the *`launch()`* function, such as when changing the theme from light to dark.

Parameters

Name	Type	Description
nowWebTheme	NowWebTheme	*`NowWebTheme`* object to apply to the UI elements of the view controller.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to update a light UI theme implemented using the *launch()* function to the dark UI theme using the *updateTheme()* function.

```
val webService = getNowWebService()

val lightTheme = object : NowWebTheme {
    override val brand: Int
        get() = Color.BLUE

    override val textPrimary: Int
        get() = Color.BLACK

    override val backgroundPrimary: Int
        get() = Color.WHITE

    // Override remaining theme colors
}

val darkTheme = object : NowWebTheme {
    override val brand: Int
        get() = Color.BLUE

    override val textPrimary: Int
        get() = Color.WHITE

    override val backgroundPrimary: Int
        get() = Color.BLACK

    // Override remaining theme colors
}

//launch NowWeb with light theme
webService?.launch(activity,
 URL("https://instance-name.service-now.com"), lightTheme)

//update NowWeb with dark theme
webService?.updateTheme(darkTheme)
```

NowWebViewServiceDelegate interface - Android

The *NowWebViewServiceDelegate* API provides callbacks for notification of issues within the *NowWebService* processing such as when a flow ends or a navigation fails.

NowWebViewServiceDelegate - flowEnded(flowName: String?)

Callback that notifies the host application that the specified flow has ended.

Parameters

Name	Type	Description
flowName	String	Name of the flow that ended.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun flowEnded(activity: Activity, flowName:
 String?) {
      Log.i("NowWebSdk", "flow ended")
    }
  }).getOrThrow()
}
```

NowWebViewServiceDelegate - navigationFailed(error : String)

Callback that notifies the host application that navigation has failed with the specified error reason.

Parameters

Name	Type	Description
error	String	Error that describes why the navigation failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun navigationFailed(activity: Activity, error:
 String) {
      Log.i("NebWebSdk", "navigation failed")
    }
  }).getOrThrow()
}
```

NowWebViewServiceDelegate - requestedDismissal()

Callback that notifies the host application that the screen should be dismissed.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun requestedDismissal(activity: Activity) {
      Log.i("NebWebSdk", "screen should be dismissed")
    }
  }).getOrThrow()
}
```

NowWebViewServiceDelegate - unsupportedUrl(uri: Uri)

Callback that notifies the host application that the provided URL is unsupported.

Parameters

Name	Type	Description
uri	Uri	URL that is unsupported.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun getNowWebService(): NowWebService {
  return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com"), object :
 NowWebViewServiceDelegate {
    override fun unsupportedUrl(activity: Activity, uri: Uri) {
      Log.i("NebWebSdk", "URL is unsupported")
    }
  }).getOrThrow()
}
```

Paginator class - Android

The *`Paginator`* class provides functions for paging through the return results passed back by a REST endpoint call, such as those returned by the *`NowTableService`* class.

You must first call the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) or NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function to retrieve paginate return results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Paginator - first()

Fetches the first page of the return results.

The method throws a `PaginationError` if it cannot fetch the first page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  paginator.first()
}
```

Paginator - hasNext()

Checks whether there is a next page in the return results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there's a next page in the return results. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Next page available. • false: No next page available.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

Paginator - hasPrevious()

Checks whether there in a previous page in the return results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there is a previous page in the return results. Possible values: • true: Previous page available. • false: No previous page available.

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasPrevious() && !paginator.isBusy()) {
    paginator.previous()
  }
}
```

Paginator - isBusy()

Checks whether the Paginator is busy fetching data.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	Flag that indicates whether the Paginator is busy fetching data. Possible values: • true: Busy fetching data. • false: Not busy.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

Paginator - last()

Fetches the last page of the return results.

The method throws a `PaginationError` if it cannot fetch the last page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if !paginator.isBusy()) {
    paginator.last()
  }
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Paginator - next()

Fetches the next page of the return results.

The method throws a `PaginationError` if there are no more pages to fetch.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

Paginator - observe(callback: PaginatorCallBack<T>)

Sets the Paginator object's callbacks. You must call this method before calling any other Paginator functions.

Parameters

Name	Type	Description
callback	PaginatorCallBack	Callbacks to call based on the success or failure of the Paginator creation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Success: `abstract fun onSuccess(response: Response<List<T>>)` • Failure: `abstract fun onFailure(e: NowDataError)`

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginationCallBack = object :
 PaginatorCallBack<NowAttachmentMetadata> {
    override fun onFailure(e: NowDataError) {
      handleError(e)
    }

    override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
      handleResponse(response)
    }

  }

  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(paginationCallBack)
    ?: throw Exception("Response is null")
}
```

Paginator - previous()

Fetches the previous page of the return results.

The method throws a `PaginationError` if it cannot fetch the previous page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }

    })
    ?: throw Exception("Response is null")

  if (paginator.hasPrevious() && !paginator.isBusy()) {
    paginator.previous()
  }
}
```

Paginator - reset()

Resets the Paginator back to the first page but doesn't return the first page of the return results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
suspend fun createAttachmentMetadataPaginator() {
  val paginator =
 nowServiceManager.getNowAttachmentService()?.attachmentMetadata
Paginator(null, 10)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onFailure(e: NowDataError) {
        handleError(e)
      }

      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        handleResponse(response)
      }
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    })
    ?: throw Exception("Response is null")

  paginator.reset()
}
```

TranscriptMessage class - Android

Represents a single message in the voice session transcript.

`TranscriptMessages` are passed to NowVoiceCallbacks - onMessageReceived().

Properties

Name	Type	Description
role	*`Role`*	The *`Role`* object identifies the originator of the message. Possible values: • `Role.Assistant`: The message originated from the voice agent. • `Role.User`: The message originated from the app user.
content	String	The text content of the message.

The following code example shows *`TranscriptMessage`* used with *`NowVoiceCallbacks`*.

```
override fun onMessageReceived(message: TranscriptMessage) {
    runOnUiThread { appendTranscript(message) }
}
```

Mobile SDK - iOS

The Mobile SDK for iOS provides the classes necessary to interface iOS-based devices with the ServiceNow platform.

FetchConfiguration structure - iOS

The *`FetchConfiguration`* structure provides the ability to define the configuration for fetching records from your ServiceNow instance.

Properties

Name	Type	Description
filter	Filter	Optional. Query to apply to the return results. For example, to return only active records with a short description that contains the word "broken", pass the following query: `active=true^short_descriptionLIKEbroken` Default: nil - No filter applied, all records returned (any system or table limits are honored.)
limit	Integer	Optional. Number of records to return per page/response. Default: nil - All records returned (any system or table limits are honored.)

Properties (continued)

Name	Type	Description
readConfiguration	FieldReadConfiguration	Optional. Configuration of the fields returned in the response. Default: nil - All fields are returned.

FetchConfiguration - init(filter: Filter? = nil, limit: Int? = nil, readConfiguration: FieldReadConfiguration? = nil)

Defines the criteria for what records, and associated fields within those records, to return when fetching data from a ServiceNow instance through a REST endpoint.

Parameters

Name	Type	Description
filter	Filter	Optional. Query to apply to the return results. For example, to return only active records with a short description that contains the word "broken", pass the following query: `active=true^short_descriptionLIKEbroken` Default: nil - No filter applied, all records returned (any system or table limits are honored.)
limit	Integer	Optional. Number of records to return per page/response. Default: nil - All records returned (any system or table limits are honored.)
readConfiguration	FieldReadConfiguration	Optional. Configuration of the fields returned in the response. Default: nil - All fields are returned.

Returns

Type	Description
None	

Shows how to configure the data to fetch from the Table API.

```
/// The configuration for what to fetch from the Table API.
lazy var fetchConfiguration: FetchConfiguration = {
  let includeFields = [
    // Case details
    "number",
    "short_description",
    "priority",
    "state",
    "opened_at",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // Account details
    "account.name",
    "account.number",
    "contact.name",
    "contact.email",
    "contact_type",

    // Assignment
    "assignment_group.name",
    "assigned_to.name"
  ]
  let readConfiguration = FieldReadConfiguration(includeFields:
 includeFields, options: .actualValues)
  let filter = Filter(criteria: [], sortBy: [.desc("number")],
 queryCategory: nil)
  return FetchConfiguration(filter: filter, limit: 10,
 readConfiguration: readConfiguration)
}()
```

FieldReadConfiguration structure - iOS

The *FieldReadConfiguration* structure enables you to configure which fields to fetch from a ServiceNow instance table and in which format.

Properties

Name	Type	Description
includeFields	Array	List of fields to pass back in the return results.
options	Array	List of the types of fields to return. Possible values: • actualValues: Returns the values actually stored in each of the fields, including the sys_ids for referenced records. Use this setting if dates need to be decoded in Codable models using Date. • description: Returns the description of the parameter. • displayValues: Returns the display values, if available, for the selected fields. For example, user names typically contain a reference link (sys_id) to the user record. If you request the display value, the person's name is returned instead of the sys_id that is stored in the associated field. **Note:** Display values returned by a ServiceNow instance are formatted and internationalized based on the user profile configuration of the authenticated user. This may differ from the device language and locale settings on the device. • excludeReferenceLink: Does not return any data that is defined as reference links within the table. • rawValue: Returns the raw value of the parameter.

FieldReadConfiguration - init(includeFields: [FieldName] = [], options: Options = [])

Configures the fields within a record in a ServiceNow table to pass back in the return results of a REST endpoint call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
includeFields	Array	List of fields to pass back in the return results.
options	Array	List of the types of fields to return. Possible values: • actualValues: Returns the values actually stored in each of the fields, including the sys_ids for referenced records. Use this setting if dates need to be decoded in Codable models using Date. • description: Returns the description of the parameter. • displayValues: Returns the display values, if available, for the selected fields. For example, user names typically contain a reference link (sys_id) to the user record. If you request the display value, the person's name is returned instead of the sys_id that is stored in the associated field. **Note:** Display values returned by a ServiceNow instance are formatted and internationalized based on the user profile configuration of the authenticated user. This may differ from the device language and locale settings on the device. • excludeReferenceLink: Does not return any data that is defined as reference links within the table. • rawValue: Returns the raw value of the parameter.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
/// The configuration for what to fetch from the Table API.
lazy var fetchConfiguration: FetchConfiguration = {
  let includeFields = [
    // Case details
    "number",
    "short_description",
    "priority",
    "state",
    "opened_at",

    // Account details
    "account.name",
    "account.number",
    "contact.name",
    "contact.email",
    "contact_type",

    // Assignment
    "assignment_group.name",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "assigned_to.name"
  ]
  let readConfiguration = FieldReadConfiguration(includeFields:
 includeFields, options: .actualValues)
  let filter = Filter(criteria: [], sortBy:
 [.desc("opened_at")], queryCategory: nil)
  return FetchConfiguration(filter: filter, limit: 10,
 readConfiguration: readConfiguration)
}()
```

FieldWriteOptions class - iOS

The *`FieldWriteOptions`* class provides functions that set the options for updating or creating fields in a record on a ServiceNow instance.

Properties

Name	Type	Description
rawValue	Integer	Result of the bitwise operation of the `suppressAutoSysField` and the `treatInputValuesAsDisplayValues` properties.
suppressAutoSysField	Boolean	Flag that indicates whether to suppress the automatic generation of system fields. Possible values: • true: Suppress automatic generation of system fields. • false: Allow automatic generation of system fields. Default: false
treatInputValuesAsDisplayValues	Boolean	Flag that indicates whether to set field values using their display value rather than the actual value. Possible values: • true: Use display value. • false: Use actual value. Default: false

Filter structure - iOS

The *`Filter`* structure provides the ability to configure filters that define the data to return in the return results of a REST endpoint query.

Filter - init(criteria criteriaList: [Criteria], sortBy: [Sort]? = nil, queryCategory: String? = nil)

Creates a filter based on one or more filter criteria that are OR'd together.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
criteria	Array	Top level criteria conditions to group with OR connectors.
sortBy	String	Optional. Sort order of the return results. Possible values: • asc: Ascending • desc: Desending Default: asc
queryCategory	String	Optional. Name of the query category. Default: None

Returns

Type	Description
None	

The following example shows creating three separate criteria and when passed in, if any of those criteria are met, the record is passed back in the return results.

```
// All of criteria1 conditions must be met
let criteria1 = Criteria(conditions: …)

// OR all of criteria2 conditions must be met
let criteria2 = Criteria(conditions: …)

// OR all of criteria3 conditions must be met
let criteria3 = Criteria(conditions: …)

let filter = Filter(criterias: [criteria1, criteria2,
 criteria3])
```

Filter - init(conditions: [QueryProviding], sorts: [Sort]? = nil)

Creates a filter based on all specified conditions (AND'd together)

Parameters

Name	Type	Description
conditions	QueryProviding	Conditions to group with an AND connector. Possible values: • boolean • dateTime • email • integerChoice • numeric

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• reference • string • stringChoice
sorts	String	Optional. Sort order of the return results. Possible values: • asc: Ascending • desc: Desending Default: asc

Returns

Type	Description
None	

The following code example shows how to call this function.

```
// Where the record is active
let condition1 = Condition.boolean(field: "active", .is(true))

// AND the date value of the SLA due field is on "today" or any
 date after today.
let condition2 = Condition.dateTime(field:
 "sla_due", .atOrAfter(0, .daysAgoStart))

let filter = Filter(conditions: [condition1, condition2])
```

Filter - init(query: String, queryCategory: String? = nil)

Creates a filter using a specified encoded query.

Parameters

Name	Type	Description
query	String	Encoded query Encoded query to use to filter the records to return from the table.
queryCategory	String	Optional. Name of the query category to use for the query.

Returns

Type	Description
None	

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
let query = "active=true^short_descriptionLIKEbroken"
let filter = Filter(query: query)
```

Filter - init(keywords: String? = nil, conditions: [Condition], sortBy: [Sort]? = nil)

Creates a filter based on specific keywords and conditions that are AND'd together.

Parameters

Name	Type	Description
keywords	String	Optional. Any specific word or phrase to search for. Default: nil - No specific word search.
conditions	String	Conditions to group with an AND connector. Possible values: • boolean • dateTime • email • integerChoice • numeric • reference • string • stringChoice
sortBy	String	Optional. Sort order of the return results. Possible values: • asc: Ascending • desc: Desending Default: asc

Returns

Type	Description
None	

```
// Keyword that must be found in the record
let searchTerm = "…"

// AND the specified condition must be met
let condition1 = Condition.email(field:
 "state", .changesFrom("4"))

let filter = Filter(keywords: searchTerm, condition: condition1)
```

NowAPIEndpoint protocol - iOS

The *`NowAPIEndpoint`* protocol provides an interface for accessing any publicly exposed ServiceNow REST APIs.

Requirements

Name	Type	Description
httpMethod	String	HTTP method that the associate endpoint implements, such as get, delete, post, put, and patch.
relativePath	String	Path of the associated endpoint relative to the `/api` path. For example: `/api/now/account`
requiresAuthentication	Boolean	Flag that indicates whether the endpoint requires authentication. Default: true

NowAPIService class - iOS

The *`NowAPIService`* class provides functions that enable you to perform requests to a specified ServiceNow REST API.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Service configuration to associate with the protocol.

NowAPIService - data(for endpoint: NowAPIEndpoint, queryItems: [String: String], httpHeaders: [String: String], body: Data, completion: @escaping (Result<DataResponse, NowDataError>)

Requests data from the specified ServiceNow REST API and then executes the completion handler.

Parameters

Name	Type	Description
for endpoint	NowAPIEndpoint	Object containing the ServiceNow REST API endpoint to access, including the HTTP method, relative path to the endpoint, path parameters, and whether authentication is required.
queryItems	Array	Optional. Query parameters for the endpoint as key/value pairs. Default: nil
httpHeaders	Array	Optional. Request HTTP headers required by the endpoint as key/value pairs. Default: nil
body	String	Optional. Request body parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: nil
completion	@escaping (Result<DataResponse, NowDataError>)	Completion handler to execute after the REST API call completes. Return values for the completion handler: • Success: DataResponse that contains the returned data from the REST API call. • Failure: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
struct Endpoint: NowAPIEndpoint {
  let httpMethod: HTTPMethod
  let relativePath: String
  let requiresAuthentication: Bool
}

/// HTTP request method
public enum HTTPMethod: CaseIterable {
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    case options, get, head, post, put, patch, delete, trace,
 connect
}
let relativePath = "/api/now/account"
let endPoint = Endpoint(httpMethod: HTTPMethod.get,
 relativePath: relativePath, requiresAuthentication: true)

apiService.data(for: endPoint, queryItems: ["name": "abel"],
 httpHeaders: httpHeaders, body: body.data(using: .utf8))
 { [weak self] (result) in
  switch result {
    case .success(let response):
    // Data request successful
    case .failure(let error):
    // Data request failed, return NowDataError
    // .failure(error)
  }
}
```

NowAPIService - data(for endpoint: NowAPIEndpoint, queryItems: [String: String], httpHeaders: [String: String], body: Data) async throws

Requests data from the specified ServiceNow REST API.

Parameters

Name	Type	Description
for endpoint	NowAPIEndpoint	Object containing the ServiceNow REST API endpoint to access, including the HTTP method, relative path to the endpoint, path parameters, and whether authentication is required.
queryItems	Array	Optional. Query parameters for the endpoint as key/value pairs. Default: nil
httpHeaders	Array	Optional. Request HTTP headers required by the endpoint as key/value pairs. Default: nil
body	String	Optional. Request body parameters. Default: nil

Returns

Type	Description
DataResponse	Returned when the method is successful. Data from the REST API call.
NowDataError	Thrown when the method fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let dataResponse = try await apiService.data(for: endpoint,
 queryItems: queryItems, httpHeaders: httpHeaders, body: body)
    // Data request successful
} catch {
    // Data request failed, NowDataError thrown
}
```

NowAPIService - data(for endpoint: NowAPIEndpoint, queryItems: [String: String]? = nil, httpHeaders: [String: String]? = nil, body: Data? = nil)

Requests data from the specified ServiceNow REST API.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for endpoint	NowAPIEndpoint	Object containing the ServiceNow REST API endpoint to access, including the HTTP method, relative path to the endpoint, path parameters, and whether authentication is required.
queryItems	Array	Optional. Query parameters for the endpoint as key/value pairs. Default: nil
httpHeaders	Array	Optional. Request HTTP headers required by the endpoint as key/value pairs. Default: nil
body	Data	Optional. Request body parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: nil

Returns

Type	Description

AnyPublisher<DataResponse, NowDataError>	Success: Data returned by the REST API.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
struct Endpoint: NowAPIEndpoint {
    let httpMethod: HTTPMethod
    let relativePath: String
    let requiresAuthentication: Bool
}

/// HTTP request method
public enum HTTPMethod: CaseIterable {
    case options, get, head, post, put, patch, delete, trace,
 connect
}
let relativePath = "/api/now/account"
let endPoint = Endpoint(httpMethod: HTTPMethod.get,
 relativePath: relativePath, requiresAuthentication: true)

// Using Combine
apiService.data(for: Endpoint(httpMethod: httpMethod,
 relativePath: endpointPath, requiresAuthentication:
 requiresAuthentication), queryItems: queryItems, httpHeaders:
 httpHeaders, body: body.data(using: .utf8))
```

```
  .receive(on: DispatchQueue.main)
  .sink { [weak self] (comp) in
    if case let .failure(error) = comp {
      // Data request failed, return NowDataError
    }
  } receiveValue: { [weak self] (response) in
    // Data request successful
    self?.publish(data: response.data)
  }
  .store(in: &self.subscriptions)
}
```

NowAttachment structure - iOS

The *NowAttachment* structure provides functions that enable you to validate attachments by comparing their computed hash.

Properties

Name	Type	Description
data	Data	Attachment data.
hash	String	Computed digest for the attachment data. This computed digest is used to validate the attachment by comparing it to the known digest stored in the attachment metadata. Calculating the computed digest is expensive; avoid using it in the UI. Instead, consider using the hash property in the NowAttachmentMetadata class. If you must use the computed hash, use it sparingly, and consider caching it.
metadata	NowAttachmentMetadata	Metadata associated with the attachment.

NowAttachment - validate()

Validates the attachment by comparing the computed hash for the attachment data to the digest stored in the attachment metadata.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the attachment is valid. Possible values: • true: Attachment is valid. • false: Attachment is invalid.

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
guard
  let metadataHeader =
 response.httpResponse?.value(forHTTPHeaderField:
 NowAttachment.attachmentMetadataHeaderKey),
  let metadataHeaderData = metadataHeader.data(using: .utf8)
 else {
    throw NowDataError.missingAttachmentMetadata
  }

let metadata = try coder.decode(NowAttachmentMetadata.self,
 from: metadataHeaderData)
let attachment = NowAttachment(metadata: metadata, data:
 response.data)

if !attachment.validate() {
  throw NowDataError.attachmentValidation
}
// Attachment is valid
return attachment
```

NowAttachmentMetadata structure - iOS

The `NowAttachmentMetadata` structure provides functions that enable you to encode and manage attachment metadata.

Properties

Name	Type	Description
averageImageColor	String	Most dominant color in the associated image.
chunkSizeInBytes	Integer	Size of the chunk. Unit: Bytes
compressedSize InBytes	Integer	Compressed size of the attachment. Unit: Bytes
created	Date	Date on which the attachment was created.
createdBy	String	Entity that created the attachment.
download	URL	URL of the attachment on the ServiceNow instance.
fileName	String	Name of the attachment file.
hash	String	Expected SHA256 digest for the attachment. A downloaded attachment is validated by comparing its computed digest to this SHA256 digest.
imageHeight	Integer	Height of image. Unit: Pixels
imageWidth	Integer	Width of image. Unit: Pixels

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
isCompressed	Boolean	Flag that indicates whether the attachment file is compressed. Possible values: • true: Attachment is compressed. • false: Attachment in not compressed.
mimeType	String	Attachment MIME type.
modificationCount	Integer	Number of times that the attachment was modified.
sizeInBytes	Integer	Size of the attachment. Unit: Bytes
sourceSysId	String	Sys_id of the attachment file.
sourceTableName	String	Name of the source table in which the attachment resides.
state		Availability state, such as conditionally, unavailable, available, and pending.
sysId	String	Unique 32-character Globally Unique ID (GUID), that identifies each record in a ServiceNow instance.
tags	String	List of tags associated with the attachment.
updated	Date	Date on which the attachment was last modified.
updatedBy	String	Entity that updated the attachment.

NowAttachmentMetadata - encode(to encoder: Encoder)

Encodes the current object value into data using the specified encoder.

If the object fails to be encoded into data, the encoder encodes an empty keyed container in its place. This function also throws an error if any values are invalid for the specified encoder's format.

Parameters

Name	Type	Description
to encoder	Encoder	Encoder that defines the structure of the encoded output.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let query = "active=true^short_descriptionLIKEbroken"
let filter = Filter(query: query)
metadataPublisher(filter: filter, limit: 1)
private func metadataPublisher(filter: Filter?, limit: Int?) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let publisher = attachmentService.attachmentMetadata(filter:
 filter, limit: limit)
  publisher
  .receive(on: DispatchQueue.main)
  .encode(encoder: JSONEncoder())
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // attachment published failed, return NowDataError
    }
  } receiveValue: { [weak self] (data) in
    // Attachment published successful, return data
  }
  .store(in: &subscriptions)
}
```

NowAttachmentMetadata - init(from decoder: Decoder)

Creates a new NowAttachmentMetadata instance by decoding data into an object from the specified decoder.

This method throws an error if reading from the decoder fails or if the data read is corrupt or otherwise invalid.

Parameters

Name	Type	Description
decoder	Decoder	Decoder to read data from.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
guard
  let metadataHeader =
 response.httpResponse?.value(forHTTPHeaderField:
 NowAttachment.attachmentMetadataHeaderKey),
  let metadataHeaderData = metadataHeader.data(using: .utf8)
 else {
    throw NowDataError.missingAttachmentMetadata
  }

let metadata = try coder.decode(NowAttachmentMetadata.self,
 from: metadataHeaderData)
let attachment = NowAttachment(metadata: metadata, data:
 response.data)
```

NowAttachmentService class - iOS

The *NowAttachmentService* class provides functions that enable you to upload and query attachments that are associated with records within a table on a ServiceNow instance.

You can upload or retrieve a single file with each request. *NowAttachmentService* respects any system limitations on uploaded files, such as maximum file size and

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

allowed attachment types. You can control these settings using the instance properties com.glide.attachment.max_size, 1024MB by default, and glide.attachment.extensions.

Note: *`NowAttachmentService`* accepts all Content-Type values (/). Specify the file content type when uploading an attachment. The content type is stored with the file metadata, enabling other tools to correctly identify and parse the file.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration settings provided when the service was initialized.

NowAttachmentService - attachment(for sysId: String, validateAttachment: Boolean) async throws

Retrieves the attachment with the specified sys_id and validates the attachment by comparing the computed hash of the attachment to the expected SHA256 checksum.

Note: Validation of an attachment can cause a performance impact. You can skip the validation step by setting the *`validateAttachment`* parameter to `false`. You can validate the attachment at a later stage if needed by calling the *`Attachment.validate()`* function.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment to retrieve.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Do not validate the attachment. Default: true

Returns

Type	Description
NowAttachment	Returned when the method is successful. Specified attachment.
NowDataError	Thrown when the method fails. • `accessToken(AccessTokenProviderError)` ○ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ○ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response • `cannotDecodeModel(DecodingError)` ○ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. • `cannotDecodeProperty(type: Any, from: String)` ○ *`type`*: Wrapped type to decode from a string. ○ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled

Returns (continued)

Type	Description
	○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
func downloadAttachment(sysId: String) async throws ->
 NowAttachment {
    do {
        let nowAttachment = try await
 attachmentService.attachment(for: sysId, validateAttachment:
 false)
        return nowAttachment
    } catch {
        // Handle NowDataError
        throw error
    }
}
```

NowAttachmentService - attachment(for sysId: String, validateAttachment: Boolean, completion: @escaping (Result<NowAttachment, NowDataError>))

Retrieves the attachment with the specified sys_id and validates the attachment by comparing the computed hash of the attachment to the expected SHA256 checksum. Once finished, it executes the passed completion handler.

Note: Validation of an attachment can cause a performance impact. You can skip the validation step by setting the *`validateAttachment`* parameter to `false`. You can validate the attachment at a later stage if needed by calling the *`Attachment.validate()`* function.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment to retrieve.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Do not validate the attachment. Default: true
completion	@escaping (Result <NowAttachment, NowDataError>)	Completion handler to execute after the attachment is retrieved. Return values for the completion handler: • Success: NowAttachment - Requested attachment • Failure: NowDataError

Parameters (continued)

Name	Type	Description
		○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.

Parameters (continued)

Name	Type	Description
		○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
private func downloadAttachment(sysId: String) {
  attachmentService.attachment(for: sysId, validateAttachment:
 false) { (result) in
    switch result {
      case .success(let attachment):
        // Attachment retrieved successful, return attachment
      case .failure(let error):
        // Attachment retrieved failed, return NowDataError
    }
  }
}
```

NowAttachmentService - attachment(for sysId: String, validateAttachment: Boolean)

Retrieves the attachment with the specified sys_id and validates the attachment by comparing the computed hash of the attachment to the expected hash.

Note: Validation of an attachment can cause a performance impact. You can skip the validation step by setting the *`validateAttachment`* parameter to `false`. If needed, you can validate the attachment at a later stage by calling the *`Attachment.validate()`* function.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment to retrieve.
validateAttachment	Boolean	Flag that indicates whether to validate the attachment. Valid values: • true: Validate the attachment. • false: Don't validate the attachment. Default: true

Returns

Type	Description
AnyPublisher <NowAttachment, NowDataError>	Success: NowAttachment - Contains the specified attachment. Failure: NowDataError • `accessToken(AccessTokenProviderError)` ○ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. • `attachmentValidation` Thrown when an attachment fails validation. • `badResponse(statusCode: HTTPStatusCode)` ○ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response • `cannotDecodeModel(DecodingError)` ○ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. • `cannotDecodeProperty(type: Any, from: String)`

```
        // Attachment retrieved failed, return NowDataError
      }
    } receiveValue: { [weak self] (attachment) in
      // Attachment retrieved successful, return attachment
    }
    .store(in: &subscriptions)
}
```

NowAttachmentService - attachmentMetadata(filter: Filter, limit: Int) async throws

Retrieves the metadata for all the attachments that meet the specified criteria.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: nil - Returns metadata for all available attachments. Takes into consideration the *`limit`* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: nil - Returns all metadata that meets the *`filter`* parameter specifications.

Returns

Type	Description
[NowAttachmentMetadata]	Returned when the method is successful. Array that contains the metadata for the matching attachments.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.

Parameters (continued)

Name	Type	Description
		▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let query = "active=true^short_descriptionLIKEbroken"
let filter = Filter(query: query)
attachmentService.attachmentMetadata(filter: filter, limit:
 limit) { (result) in
  DispatchQueue.main.async { [weak self] in
    switch result {
    case .success(let response):
      do {
        let data = try JSONEncoder().encode(response)
        // Retrieve metadata successfully, return data
      } catch {
        // Retrieve metadata failed, return error
      }
    case .failure(let error):
      // Retrieve metadata failed, return NowDataError
    }
  }
}
```

NowAttachmentService - attachmentMetadata(filter: Filter, limit: Int)

Retrieves the metadata for all the attachments that meet the specified criteria.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: nil - Returns metadata for all available attachments. Takes into consideration the *limit* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: nil - Returns all metadata that meets the *filter* parameter specifications.

let filter = Filter(query: query)
let publisher =
 self.attachmentService.attachmentMetadata(filter: filter)
publisher
  .receive(on: DispatchQueue.main)
  .encode(encoder: JSONEncoder())
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // Retrieve metadata failed, return NowDataError
  } receiveValue: { [weak self] (data) in
     // Retrieve metadata successfully, return data
  }
.store(in: &subscriptions
```

NowAttachmentService - attachmentMetadata(for sysId: String) async throws

Retrieves the metadata for the attachment associated with the specified sys_id.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment whose metadata to retrieve.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
NowAttachmentMetadata	Returned when the method is successful. Metadata for the requested attachment.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.

Returns (continued)

Type	Description
	Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let metadata = try await
 attachmentService.attachmentMetadata(for: sysId)
    // Metadata retrieval successful
} catch {
    // Metadata retrieval failed, NowDataError thrown
}
```

NowAttachmentService - attachmentMetadata(for sysId: String, completion: @escaping (Result<NowAttachmentMetadata, NowDataError>))

Retrieves the metadata for the attachment associated with the specified sys_id and then executes the completion handler after the metadata is retrieved.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment whose metadata to retrieve.
completion	@escaping (Result <NowAttachmentMetadata, NowDataError>)	Completion handler to execute after the metadata is retrieved. Return values for the completion handler: • Success: NowAttachmentMetadata - Requested metadata • Failure: NowDataError

Parameters (continued)

Name	Type	Description
		○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
attachmentService.attachmentMetadata(for: sysId) { (result) in
  DispatchQueue.main.async { [weak self] in
    switch result {
      case .success(let response):
        do {
          let data = try JSONEncoder().encode(response)
          // Retrieve metadata successfully, return data
        } catch {
          // Retrieve metadata failed, return error
        }
      case .failure(let error):
        // Retrieve metadata failed, return NowDataError
    }
  }
}
```

NowAttachmentService - attachmentMetadata(for sysId: String)

Retrieves the metadata for the attachment associated with the specified sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for sysId	String	Sys_id of the attachment whose metadata to retrieve.

Returns

Type	Description

AnyPublisher <[NowAttachmentMetadata], NowDataError>	Success: NowAttachmentMetadata - Object that contains the metadata for the requested attachment.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	Thrown when the attachment metadata header is missing.
	
	• `missingServiceConfiguration`
	
	Thrown when an expected service configuration is missing.
	
	• `missingSysID`
	
	Thrown when an expected sys_id parameter is missing.
	
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	
	Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
let publisher = self.attachmentService.attachmentMetadata(for:
 sysId)
publisher
  .receive(on: DispatchQueue.main)
  .encode(encoder: JSONEncoder())
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // Retrieve metadata failed, return NowDataError
    }
  } receiveValue: { [weak self] (data) in
     // Retrieve metadata successfully, return data
  }
.store(in: &subscriptions)
```

NowAttachmentService - attachmentMetadataPaginator(filter: Filter, limit: Int)

Retrieves the metadata for all the attachments that meet the specified criteria and returns a Paginator object for iterating through the pages of the returned metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
filter	Filter	Optional. Query string to use to filter the attachments whose metadata to return. Default: nil - Returns metadata for all available attachments. Takes into consideration the *`limit`* parameter.
limit	Integer	Optional. Maximum number of attachment file's metadata to return. Default: nil - Returns all metadata that meets the *`filter`* parameter specifications.

Returns

Type	Description

Paginator <[NowAttachmentMetadata]>
Failure: NowDataError object.
	Success: Array of NowAttachmentMetadata objects.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let paginator: Paginator<T> = makePaginator(query: query,
 fetchLimit: 1)

func makePaginator(query: String, fetchLimit: Int?) ->
 Paginator<[NowAttachmentMetadata]> {
  attachmentsService.attachmentMetadataPaginator(filter:
 Filter(query: query), limit: fetchLimit)
}
```

NowAttachmentService - delete(sysId: String) async throws

Deletes the attachment with the specified sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.

Returns

Type	Description
None	Nothing is returned if the method was successful.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	  Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`

Returns (continued)

Type	Description
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    try await attachmentService.delete(sysId: sysId)
    // Deletion successful
} catch {
    // Deletion failed, NowDataError thrown
}
```

NowAttachmentService - delete(sysId: String, completion: @escaping (Result<Void, NowDataError>))

Deletes the attachment with the specified sys_id and then executes the passed completion handler after the attachment is deleted.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.
completion	@escaping (Result<Void, NowDataError>)	Completion handler to execute after the attachment is deleted. Return values for the completion handler: • Success: Void • Error: NowDataError

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let sysId = UUID().uuidString  // UUID for the attachment
attachmentService.delete(sysId: sysId) { (result) in
  DispatchQueue.main.async { [weak self] in
    switch result {
      case .success:
        // Attachment with sysId is deleted
      case .failure(let error):
        // Failed to delete, with NowDataError
    }
  }
}
```

NowAttachmentService - delete(sysId: String)

Deletes the attachment with the specified sys_id.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
sysId	String	Sys_id of the attachment to delete.

Returns

Type	Description

AnyPublisher<Void, NowDataError>	Success: Nothing returned
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	  Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`

Returns (continued)

Type	Description
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
let publisher = attachmentService.delete(sysId: sysId)
publisher
  .receive(on: DispatchQueue.main)
  .sink { [weak self] completion in
    switch completion {
      case .finished:
        // Attachment with sysId is deleted
      case .failure(let error):
       // Failed to delete, with NowDataError
    }
 } receiveValue: {
 }
 .store(in: &subscriptions)
```

NowAttachmentService - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding)

Initializes a new NowAttachmentService instance.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration information needed to properly initialize the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
coreServiceProvider	NowCoreServiceProviding	Optional. Object implementing the NowCoreServiceProviding protocol. Default: nil

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}
guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com"),
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
}
let attachmentService = NowAttachmentService(configuration:
 serviceConfig, coreServiceProvider: coreService)
```

NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate) async throws

Uploads the attachment data and attaches it to a record in a table as specified in the upload configuration.

The *`ProgressUpdate`* callback provides upload progress information that you can then use to provide UI feedback.

Parameters

Name	Type	Description
data	Data	Attachment to upload.
configuration	NowAttachmentUpload Configuration	Configuration information that defines the upload parameters for the attachment, such as: • Table and record to attach the file to • Attachment file name • Type of attachment • Whether the file is encrypted
progressUpdate	@escaping ProgressUpdate	Completion handler to execute after the attachment is retrieved. This is called multiple times until the upload process is complete. Return values for the completion handler:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		ProgressUpdate - Returns the current progress of the upload. `ProgressUpdate = (_bytesWritten: Int64, _totalBytesWritten: Int64, _totalBytesExpectedToWrite: Int64) -> Void`

Returns

Type	Description
NowAttachmentMetadata	Returned when the method is successful. Object that contains the uploaded metadata.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	Thrown when the attachment metadata header is missing.
	
	• `missingServiceConfiguration`
	
	Thrown when an expected service configuration is missing.
	
	• `missingSysID`
	
	Thrown when an expected sys_id parameter is missing.
	
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	
	Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
func uploadFile(for tableName: String, sysId: String, mimeType:
 String, encryptionContext: String?, data: Data, filename:
 String) async throws -> NowAttachmentMetadata {

    let mimeType = MediaUtilities.mimeType(forFileName:
 filename)
    let uploadConfig =
 NowAttachmentUploadConfiguration(tableName: tableName,

 recordSysId: sysId,

 fileName: filename,

 contentType: mimeType,

 encryptionContext: encryptionContext)

    do {
```

```
        let attachmentMetadata = try await
 attachmentService.upload(data: data, configuration:
 uploadConfig) { (_, _, _) in }
        return attachmentMetadata
    } catch {
        // Handle NowDataError
        throw error
    }
}
```

NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate, completion: @escaping (Result<NowAttachmentMetadata, NowDataError>))

Uploads the attachment data and attaches it to a record in a table as specified in the upload configuration.

The `ProgressUpdate` callback provides upload progress information that you can then use to provide UI feedback.

Parameters

Name	Type	Description
data	Data	Attachment to upload.
configuration	NowAttachmentUpload Configuration	Configuration information that defines the upload parameters for the attachment, such as: • Table and record to attach the file to • Attachment file name • Type of attachment • Whether the file is encrypted
progressUpdate	@escaping ProgressUpdate	Completion handler to execute after the attachment is retrieved. This is called multiple times until the upload process is complete. Return values for the completion handler: ProgressUpdate - Returns the current progress of the upload. `ProgressUpdate = (_bytesWritten: Int64, _totalBytesWritten: Int64, _totalBytesExpectedToWrite: Int64) -> Void`
completion	@escaping (Result<NowAttachmentMetadata, NowDataError>)	Completion handler to execute after the metadata is uploaded. Return values for the completion handler: • Success: NowAttachmentMetadata - Object containing the metadata for the uploaded attachment. • Error: NowDataError

Parameters (continued)

Name	Type	Description
		○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
typealias ProgressUpdate = (_ bytesWritten: Int64, _
 totalBytesWritten: Int64, _ totalBytesExpectedToWrite: Int64)
 -> Void

let image = UIImage(named: "photo.png")
let data = image.pngData()
let recordSysId = "" // Sys_id of the record on the SN instance

let config = NowAttachmentUploadConfiguration(
  tableName: "tableName",
  recordSysId: recordSysId,
  fileName: "photo.png",
  contentType: "image/png",
  encryptionContext: nil)

private func uploadFile(
  data: Data,
  config: NowAttachmentUploadConfiguration,
  progress: @escaping ProgressUpdate) {
```

```
    attachmentService.upload(data: data, configuration: config,
progressUpdate: progress) { (result) in
      DispatchQueue.main.async { [weak self] in
        switch result {
          case .success(let response)
            do {
              let data = try JSONEncoder().encode(response)
                // Upload file successfully, return data
            } catch
                // Upload file decode failed, return error
            }
          case .failure(let error):
                // Upload file failed, return NowDataError
      }
    }
  }
```

NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate)

Uploads the attachment data and attaches it to a record in a table as specified in the upload configuration.

The *`ProgressUpdate`* callback provides upload progress information that you can then use to provide UI feedback.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
data	Data	Attachment to upload. The data size and type of attachment that you can upload are controlled by your ServiceNow instance.
configuration	NowAttachmentUploadConfiguration	Configuration information that defines the upload parameters for the attachment, such as: • Table and record to attach the file to • Attachment file name • Type of attachment • Whether the file is encrypted
progressUpdate	@escaping ProgressUpdate	Completion handler to execute after the attachment is retrieved. Return values for the completion handler: ProgressUpdate - Returns the current progress of the upload. This is called multiple times until the upload process is complete.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`ProgressUpdate = (_bytesWritten: Int64, _totalBytesWritten: Int64, _totalBytesExpectedToWrite: Int64) -> Void`

Returns

Type	Description

AnyPublisher <NowAttachmentMetadata, NowDataError>	Success: NowAttachmentMetadata - Object that contains the metadata for the requested attachment.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `cannotParseResponse`
	
	Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	Thrown when the attachment metadata header is missing.
	
	• `missingServiceConfiguration`
	
	Thrown when an expected service configuration is missing.
	
	• `missingSysID`
	
	Thrown when an expected sys_id parameter is missing.
	
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	
	Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
typealias ProgressUpdate = (_ bytesWritten: Int64, _
 totalBytesWritten: Int64, _ totalBytesExpectedToWrite: Int64)
 -> Void

let image = UIImage(named: "photo.png")
let data = image.pngData()
let recordSysId = "" // Sys_id of the record on the SN instance
let config = NowAttachmentUploadConfiguration(
  tableName: "tableName",
  recordSysId: recordSysId,
  fileName: "photo.png",
  contentType: "image/png",
  encryptionContext: nil)

private func uploadFile(data: Data,
  config: NowAttachmentUploadConfiguration,
  progress: @escaping ProgressUpdate) {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    let publisher = attachmentService.upload(data: data,
configuration: config, progressUpdate: progress)

    publisher
      .receive(on: DispatchQueue.main)
      .encode(encoder: JSONEncoder())
      .sink { [weak self] completion in
        if case let .failure(error) = completion {
          // Upload file failed, return NowDataError
        }
      } receiveValue: { [weak self] (data) in
        // Upload file successfully, return data
      }
      .store(in: &subscriptions)
  }
```

NowAttachmentUploadConfiguration structure - iOS

The *NowAttachmentUploadConfiguration* structure enables you to define the configuration information for an attachment that you are uploading to your ServiceNow instance.

Properties

Name	Type	Description
contentType	String	HTTP data content type.
encryptionContext	String	Optional. Sys_id of an encryption context record. Specify this parameter to allow only users with the specified encryption context to access the attachment. Default: Attached file is not encrypted with any encryption context.
fileName	String	Name of the attachment file.
recordSysId	String	Sys_id of the record on the ServiceNow instance to associate the attachment with.
tableName	String	Name of the table on the ServiceNow instance that contains the record specified in the *recordSysid* parameter.

NowAttachmentUploadConfiguration - init(tableName: String, recordSysId: SysID, fileName: String, contentType: String, encryptionContext: String?)

Sets the upload configuration values for the specified attachment.

Parameters

Name	Type	Description
tableName	String	Name of the table on the ServiceNow instance that contains the record specified in the *recordSysid* parameter.
recordSysId	String	Sys_id of the record on the ServiceNow instance to associate the attachment with.
fileName	String	Name of the attachment file.
contentType	String	HTTP data content type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
encryptionContext	String	Optional. Sys_id of an encryption context record. Specify this parameter to allow only users with the specified encryption context to access the attachment. Default: Attached file is not encrypted with any encryption context.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let recordSysId = "" // Sys_id of the record on the SN instance

let config = NowAttachmentUploadConfiguration(
  tableName: "tableName",
  recordSysId: recordSysId,
  fileName: "photo.png",
  contentType: "image/png",
  encryptionContext: nil)
```

NowChat API - iOS

The *NowChat* API is a top-level global API that enables users to instantiate a NowChat service instance.

NowChat - makeChatService(instanceUrl: URL, delegate: NowChatServiceDelegate?)

Creates an instance of NowChatService with the specified configuration.

Note: You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call the `NowSDK.configure()` method with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing chat services.
delegate	NowChatServiceDelegate	Optional. Delegate object that implements the NowChatServiceDelegate protocol.

Returns

Type	Description
AnyPublisher<NowChatService, NowServiceError>	If successful, returns an initialized NowChatService object. If it fails, returns a NowServiceError object.

The following code example shows how to call this function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
….
guard
  let jwtUrl = URL(string: "http://xx.xx.xx.xxx:8080"),
  let instanceUrl = URL(string:
 "https://instance.service-now.com") else {
    return
  }
// AuthorizationProvider - struct conforming to
 NowSDKAuthorizationProviding protocol
let authorizationProvider = AuthorizationProvider(userEmail:
 "sdk@servicenow.com", jwtProviderUrl: jwtUrl, clientId:
 "deb8756b452d201039231ca568f26511")

// PermissionProvider - class conforming to
 DevicePermissionDelegate protocol
let permissionProvider = PermissionProvider()
let config = NowSDKConfiguration(authorizationProvider:
 authorizationProvider, permissionDelegate: permissionProvider,
 logLevel: .debug)

do {
  try NowSDK.configure(with: config)
  let chat = setup(with: instanceUrl)
} catch {
  // Return ConfigurationError.sdkError(error)
}
…..

func initializeChatService(with instanceURL: URL) ->
 AnyPublisher<NowService, ConfigurationError> {
  NowChat.makeChatService(instanceUrl: instanceURL, delegate:
 nil)
  .mapError { .sdkError($0) }
  .map { $0 as NowService }
  .eraseToAnyPublisher()
}
```

NowChat - makeChatService(instanceUrl: URL, delegate: NowChatServiceDelegate?, completion: @escaping ((Result<NowChatService, NowServiceError>) -> Void))

Creates an instance of `NowChatService` with the specified configuration, and once complete, calls the specified completion handler.

Note: You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call the `NowSDK.configure()` method with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing chat services.
delegate	NowChatServiceDelegate	Optional. Delegate object that implements the NowChatServiceDelegate protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
completion	@escaping ((Result<NowChatService, NowServiceError>) -> Void)	Completion handler that is called containing either an initialized `NowChatService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func initializeChatService() {
  NowChat.makeChatService(instanceUrl: instanceUrl, delegate:
 self) { [weak self] result in
    guard let self = self else { return }

    switch result {
    case .success(let service):
      self.chatService = service
    case .failure(let error):
      debugPrint("Creating the chat service failed with error:
 \(error)")
    }
    self.viewState = self.makeViewState()
  }
}
```

NowChatColoring protocol - iOS

The *`NowChatColoring`* protocol defines default colors for the elements in the Live Agent and Virtual Agent chat UI.

You can modify these default colors and create your own themes for your specific chat implementation.

Properties

Name	Description
alertCritical0	Color applied to the alert pop-up background. Default dark color: #7B1E28 Default light color: #F8C8CD
alertCritical2	Alert text icon color. Default value: #B61C2D
backgroundPrimary	Background color applied to the chat view background, choice picker, input background, and the card background.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default dark color: #07080B Default light color: #FFFFFF
backgroundPrimaryActionable	Background color applied to the pagination selected and pop-up backgrounds. Default dark color: #FFFFFF Default light color: #151920
backgroundSecondary	Background color applied to the bottom bar, columns in cards, and the search background in a choice picker. Default dark color: #151920 Default light color: #F6F6F8
backgroundSecondaryActionable	Background color applied to selectable inputs such as the search background and the date/time background. Default dark color: #C1C5CD Default light color: #2C323F
backgroundTertiary	Background color applied to the agent and bot chat bubbles. Default dark color: #252A35 Default light color: #E4E6EA
borderTertiary	Color applied to chat input borders. Default dark color: #454D5B Default light color: #D3D6DC
brand	Color applied to the activity indicator shown while loading pages. Default dark color: #302F4B Default light color: #302F4B
brandBackground	Background color applied to the user bubble background. Default dark color: #28284D Default light color: #D1D2EE
destructive	Color applied to UI elements that trigger destructive actions (e.g.: Delete) Default dark color: #E46876

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default light color: #B61C2D
linkPrimaryText	Color applied to links and UI elements that behave like links. Default dark color: #647BFD Default light color: #3C59E7
linkSecondary	Color applied to links on non-neutral (non-white) backgrounds. Default dark color: #93A3FE Default light color: #293D9E
notification	Color applied to the new message indicator. Default dark color: #E46876 Default light color:#B61C2D
nowUIColor	Foundation UI color theme used for all NowSDK UI elements.
primary	Color applied to buttons or actionable text. Default dark color: #8486FF Default light color: #4F52BD
screenHeaderText	Color applied to text in the chat screen header. Default dark color: #FFFFFF Default light color: #FFFFFF
secondary	Color applied to swipe action. Default dark color: #CECFFF Default light color: #1C1D42
separatorPrimary	Color applied to the chat input borders. Default dark color: #8F95A1 Default light color: #8F95A1
separatorTertiary	Color applied to dividers. Default dark color: #353B49 Default light color: #D3D6DC
shadow	Color applied to card shadow.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default dark color: #151920 Default light color: #151920
textActionable	Color applied to button text or highlighted backgrounds. Default dark color: #07080B Default light color: #FFFFFF
textSecondary	Color applied to card content and search bar icon and text. Default dark color: #C1C5CD Default light color: #2C323F
textTertiary	Color applied to weekdays in a calendar and as a placeholder. Default dark color: ##8F95A1 Default light color: #454D5B

The following shows the default colors used for *`NowChatColoring`*. You can override any or all of these colors.

```
public extension NowChatColoring {
    var brand: UIColor {  nowUIColor.brand }
    var primary: UIColor {  nowUIColor.primary }
    var textActionable: UIColor { nowUIColor.textActionable }
    var screenHeaderText: UIColor
 { nowUIColor.screenHeaderText }
    var backgroundPrimary: UIColor
 { nowUIColor.backgroundPrimary }
    var backgroundSecondary: UIColor {
        nowUIColor.backgroundSecondary }
    var backgroundTertiary: UIColor {
        nowUIColor.backgroundTertiary }
    var backgroundPrimaryActionable: UIColor
 { nowUIColor.backgroundPrimaryActionable }
    var backgroundSecondaryActionable: UIColor
 { nowUIColor.backgroundSecondaryActionable }
    var brandBackground: UIColor { nowUIColor.brandBackground }
    var separatorPrimary: UIColor
 { nowUIColor.separatorPrimary }
    var separatorTertiary: UIColor
 { nowUIColor.separatorTertiary }
    var borderTertiary: UIColor { nowUIColor.borderTertiary }
    var shadow: UIColor { nowUIColor.shadow }
    var linkSecondary: UIColor { nowUIColor.linkSecondary }
    var notification: UIColor { nowUIColor.notification }
    var alertCritical0: UIColor { nowUIColor.alertCritical0 }
```

```
    var alertCritical3: UIColor { nowUIColor.alertCritical3 }
}
```

NowChatConfiguration class - iOS

Configures options on a chat session.

Use cases:

- Showing a prompt before closing a chat window.
- Turning off features while using chat.
- Applying conversation options when using chat.
- Configuring UI components in NowChat.

Use *`NowChatConfiguration`* properties to integrate NowVoice with NowChat.

Properties

Name	Type	Description
voiceConfiguration	NowVoiceEndpoint?	The voice endpoint for the in-chat voice button. When `nil`, uses the first endpoint in your ServiceNow instance's Mobile SDK settings.
voiceUIConfiguration	NowVoiceUIConfiguration?	Presentation options to apply to the voice UI launched from within chat.
voiceCallbacks	NowVoiceCallbacks?	Callbacks for voice sessions launched from within chat.

When these properties are set, a voice button appears in the NowChat UI. Tapping it launches the voice agent UI as a full-screen overlay within the chat flow. The onCallEnded callback is invoked when the voice session ends, returning the user to the chat.

NowChatConfiguration - NowChatConfiguration(closePrompt: ClosePrompt?, disabledFeatures: [Feature]? = nil, conversationOptions: [ConversationOption]? = nil, uiConfiguration: UIConfiguration? = nil)

Configures options for the current chat session. This method enables you to show a prompt before closing a chat window, disable features while using chat, apply different conversation options when using chat, and configure UI components in NowChat.

Parameters

Name	Type	Description
closePrompt	ClosePrompt?	Prompt to display before closing the associated chat window. Call the *`NowChatConfiguration.ClosePrompt()`* struct to define the value of this parameter. For example: `closePrompt = NowChatConfiguration.ClosePrompt( header = nil, message = "Are you sure you want to leave?",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		`acceptButtonTitle = "Yes",`
		`declineButtonTitle = "No"`
		`)`
		
		If you don't want to display a close prompt, omit the *`closePrompt`* argument in the *`NowChatConfiguration()`* call.

disabledFeatures	[NowChatConfiguration.Feature]?	List of chat features to disable within the current chat session. Valid value: startNewConversation - Hide/disable the **StartNew Conversation** button that appears in a chat window. The available chat features are defined in the *`NowChatOptions.Feature`* enum class. For example: `let disabledFeatures: [NowChatConfiguration.Feature]? = [.startNewConversation]` If you don't want to disable any features, omit the *`disabledFeatures`* argument in the *`NowChatConfiguration()`* call.
conversationOptions	[NowChatConfiguration.ConversationOption]?	List of conversation options to apply to NowChat. Valid values: • endConversationOnExit: Ongoing conversation is terminated when exiting the NowChat window. • forceNewConversation: Forces a new chat conversation when NowChat starts. The available conversation options are defined in the *`NowChatConfiguration.ConversationOption`* enum class. For example: `let conversationOptions: [NowChatConfiguration.ConversationOption]? = [.endConversationOnExit, .forceNewConversation]` If you don't want to disable any features, omit the *`conversationOptions`* argument in the *`NowChatConfiguration()`* call.
uiConfiguration	UIConfiguration?	UIConfiguration values to use to configure UI components in NowChat. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		• attachmentUploadButton: Configuration for the `AttachmentUploadButton` that is shown next to the text input while talking with a live agent.
		• closeButton: Configuration for the `CloseButton` used for back navigation on the NowChat toolbar.
		
		For example:
		`let attachmentUploadButton = NowChatConfiguration.AttachmentUploadButton(isVisible: false) // Default isVisible = true`
		
		`// Configure close button as Text`
		`let closeButtonText: NowChatConfiguration.CloseButtonType = .text("Exit")`
		`let uiConfigurationWithText = NowChatConfiguration.UIConfiguration(closeButton: closeButtonText)`
		
		`// Configure close button as image`
		`let buttonImage = UIImage(systemName: "arrow.left.circle") ?? nil`
		`var closeButtonImage: NowChatConfiguration.CloseButtonType?`
		`if let buttonImage { closeButtonImage = .image(buttonImage) }`
		`let uiConfigurationWithImage = NowChatConfiguration.UIConfiguration(closeButton: closeButtonImage)`
		
		If you want to use custom images instead of the provided system images, the images should be between 22 to 44 pixels in width and 30 pixels in height, for optimal resolution.
		
		To use the default for either *`AttachmentUploadButton`* or *`CloseButtonType`*, omit the associated button from the *`UIConfiguration`* argument.
		
		To use the default for both buttons, omit the *`UIConfiguration`* parameter in the *`NowChatConfiguration()`* call.

Returns

Type	Description
NowChatConfiguration	Returns a NowChatConfiguration object that you can pass when calling the NowChatConfiguration() method.

The following code example shows how to call this method to configure the chat UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
func makeChatScreen() -> UIViewController? {
  let closePrompt = NowChatConfiguration.ClosePrompt(
    header: nil,
    message: "Are you sure you want to leave?",
    acceptButtonTitle: "Yes",
    declineButtonTitle: "No"
  )

  let disabledFeatures: [NowChatConfiguration.Feature]? =
 [.startNewConversation]

  let conversationOptions:
 [NowChatConfiguration.ConversationOption]? =
 [.endConversationOnExit, .forceNewConversation]

  let attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible: false)

  // Configure close button as Text
  let closeButtonText: NowChatConfiguration.CloseButtonType
 = .text("Exit")
  let uiConfigurationWithText =
 NowChatConfiguration.UIConfiguration(closeButton:
 closeButtonText, attachmentUploadButton:
 attachmentUploadButton)

  // Configure close button as image
  let buttonImage = UIImage(systemName: "arrow.left.circle") ??
 nil

  var closeButtonImage: NowChatConfiguration.CloseButtonType?
  if let buttonImage {
    closeButtonImage = .image(buttonImage)
  }
  let uiConfigurationWithImage =
 NowChatConfiguration.UIConfiguration(closeButton:
 closeButtonImage, attachmentUploadButton:
 attachmentUploadButton)

  let chatConfiguration = NowChatConfiguration(closePrompt:
 closePrompt,
    disabledFeatures: disabledFeatures,
    conversationOptions: conversationOptions,
    uiConfiguration: uiConfigurationWithImage)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatConfiguration:
 chatConfiguration)

  switch result {
    case .success(let chatViewController):
      return chatViewController
    case .failure(let error):
      debugPrint("Chat screen creation failed with error:
 \(error)")
      return nil
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
```

NowChatConfiguration - AttachmentUploadButton(isVisible: Boolean = true)

Defines the UI configurations to apply to the upload attachment button that appears next to the text input while talking with a live agent.

AttachmentUploadButton is a struct of the *NowChatConfiguration* class.

Parameters

Name	Type	Description
isVisible	Boolean	Flag that indicates the visibility of the upload attachment button. Valid values: • true: Upload attachment button is visible. • false: Upload attachment button is hidden. Default: true

Returns

Type	Description
None	

The following code example shows how to hide the AttachmentUploadButton.

```
func makeChatScreen() -> UIViewController? {
  let attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible: false)
  let uiConfigurationWithAttachmentButton =
 NowChatConfiguration.UIConfiguration(attachmentUploadButton:
 attachmentUploadButton)

  let chatConfiguration = NowChatConfiguration(uiConfiguration:
 uiConfigurationWithAttachmentButton)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatConfiguration:
 chatConfiguration)

  switch result {
    case .success(let chatViewController):
      return chatViewController
    case .failure(let error):
      debugPrint("Chat screen creation failed with error:
 \(error)")
      return nil
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowChatConfiguration - ClosePrompt(header: String?, message: String, acceptButtonTitle: String, declineButtonTitle: String)

Creates and returns a ClosePrompt object based on the passed parameters. You then pass this object into the *NowChatConfiguration()* constructor to configure the close prompt options within a chat session.

Parameters

Name	Type	Description
header	String	Text to display on the prompt's header. If you don't want to display a prompt header, pass "nil".
message	String	Text to display as the prompt's main text.
acceptButtonTitle	String	Text to display on the prompt's primary button for closing the chat window.
declineButtonTitle	String	Text to display on the prompt's secondary button that dismisses the prompt.

The following code example shows how to call this function.

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let closePrompt = NowChatOptions.ClosePrompt(
    header: "Close Window",
    message: "Are you sure you want to close the chat window?",
    acceptButtonTitle: "Yes",
    declineButtonTitle: "No")

  let disabledFeatures = [.startNewConversation]

  let chatOptions = NowChatOptions(closePrompt: closePrompt,
    disabledFeatures: disabledFeatures,
    forceNewConversation: true)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatOptions:
 chatOptions)

  switch result {
  case .success(let chatViewController):
    return chatViewController
  case .failure(let error):
    return nil
  }
}
```

NowChatConfiguration - UIConfiguration(closeButton: CloseButtonType? = nil, attachmentUploadButton: AttachmentUploadButton? = nil, voiceInputButton: VoiceInputButton? = nil, hideBranding: Bool = false)

Creates and returns a UIConfiguration object based on the passed parameters. You then pass this object into the *NowChatConfiguration()* constructor to configure UI components in NowChat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`UIConfiguration()` is a struct of the *`NowChatConfiguration`* class.

Parameters

Name	Type	Description
closeButton	CloseButtonType?	UI configuration for the `CloseButtonType` that appears on the NowChat toolbar and is used for back navigation. Valid values: • image (UIImage): Create a close button with an image. • text (String): Create a close button as text. Use this to pass a custom name for the back button. The available `CloseButtonType` options are defined in the *`NowChatConfiguration.CloseButtonType`* enum class. For example: `func makeChatScreen() -> UIViewController? { // Configure close button as Text let closeButtonText: NowChatConfiguration.CloseButtonType = .text("Exit") let uiConfigurationWithText = NowChatConfiguration.UIConfiguration(closeButton: closeButtonText) // Configure close button as image let buttonImage = UIImage(systemName: "arrow.left.circle") ?? nil var closeButtonImage: NowChatConfiguration.CloseButtonType? if let buttonImage { closeButtonImage = .image(buttonImage) } let uiConfigurationWithImage = NowChatConfiguration.UIConfiguration(closeButton: closeButtonImage) let chatConfiguration = NowChatConfiguration(uiConfiguration: uiConfigurationWithImage) // or // let chatConfiguration = NowChatConfiguration(uiConfiguration: uiConfigurationWithText)`
attachmentUploadButton	AttachmentUploadButton?	UI configuration for the `AttachmentUploadButton` that is shown next to the text input while talking with a live agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		Call the NowChatConfiguration - AttachmentUploadButton(isVisible: Boolean = true) method to define the value of this parameter.
		
		For example:
		
		`let attachmentUploadButton = NowChatConfiguration.AttachmentUploadButton(isVisible: false)`
		`let uiConfigurationWithAttachmentButton = NowChatConfiguration.UIConfiguration(attachmentUploadButton: attachmentUploadButton)`
		
		`let chatConfiguration = NowChatConfiguration(uiConfiguration: uiConfigurationWithAttachmentButton)`

voiceInputButton	VoiceInputButton?	Optional. UI configuration for the speech-to-text microphone button shown in the text input bar. Default: nil (the button is visible)
hideBranding	Boolean	Optional. Flag that indicates whether to hide the ServiceNow branding. Valid values: • true: ServiceNow branding is hidden. • false: ServiceNow branding is shown. Default: false

Returns

Type	Description
UIConfiguration	Object containing the UI configurations defined in the provided parameters.

The following code example calls the *`UIConfiguration()`* subclass to set the chat UI configuration.

```
func makeChatScreen() -> UIViewController? {

  let attachmentUploadButton = NowChatConfiguration.AttachmentUploadButton(isVisible: false)

  // Configure close button as image
  let buttonImage = UIImage(systemName: "arrow.left.circle") ?? nil

  var closeButtonImage: NowChatConfiguration.CloseButtonType?
  if let buttonImage {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    closeButtonImage = .image(buttonImage)
  }
  let uiConfigurationWithImage =
 NowChatConfiguration.UIConfiguration(closeButton:
 closeButtonImage, attachmentUploadButton:
 attachmentUploadButton)

  let chatConfiguration = NowChatConfiguration(uiConfiguration:
 uiConfigurationWithImage)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatConfiguration:
 chatConfiguration)

  switch result {
    case .success(let chatViewController):
      return chatViewController
    case .failure(let error):
      debugPrint("Chat screen creation failed with error:
 \(error)")
      return nil
  }
}
```

NowChatConfiguration - VoiceInputButton(isVisible: Bool)

Defines the UI configurations to apply to the speech-to-text microphone button that appears in the text input bar.

VoiceInputButton is a struct of the *NowChatConfiguration* class.

Parameters

Name	Type	Description
isVisible	Boolean	Flag that sets the visibility of the speech-to-text microphone button in the text input bar. Valid values: • true: The button is visible. • false: The button is hidden.

Returns

Type	Description
VoiceInputButton	Object containing the UI configuration for the speech-to-text microphone button.

The following code example hides the speech-to-text microphone button.

```
func makeChatScreen() -> UIViewController? {
  let voiceInputButton =
 NowChatConfiguration.VoiceInputButton(isVisible: false)
  let uiConfigurationWithVoiceInputButton =
 NowChatConfiguration.UIConfiguration(voiceInputButton:
 voiceInputButton)
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let chatConfiguration = NowChatConfiguration(uiConfiguration:
 uiConfigurationWithVoiceInputButton)

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatConfiguration:
 chatConfiguration)

  switch result {
    case .success(let chatViewController):
      return chatViewController
    case .failure(let error):
      debugPrint("Chat screen creation failed with error:
 \(error)")
      return nil
  }
}
```

NowChatService class - iOS

The *NowChatService* class provides Virtual and Live Agent chat capabilities.

Using this class you can start and stop chat services, start chat sessions, create a chat user interface, and subscribe/unsubscribe to unread messages.

Properties

Name	Description
configuration	Configuration settings provided when the service was initialized. Data type: NowServiceConfiguration
instanceVersion	Version of the associated ServiceNow instance, such as vancouver or xanadu. Data type: String
networkService	Network service associated with this chat service. Data type: NetworkService
sessionType	Type of session. Possible values: • authenticated • guest • impersonated • unknown Data type: SessionType

NowChatService - init(configuration: NowServiceConfiguration, delegate: NowChatServiceDelegate?, coreServiceProvider: NowCoreServiceProviding? = nil)

Initializes a new NowChatService instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration information needed to properly initialize the service.
delegate	NowChatServiceDelegate	Optional. NowChat callback delegate object implementing the NowChatServiceDelegate protocol. Default: nil
coreServiceProvider	NowCoreServiceProviding	Optional. Object implementing the NowCoreServiceProviding protocol. Provides access to NowChat services. Default: nil

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}

guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com"),
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
  }

let chatService = NowChatService(configuration: serviceConfig,
 delegate: delegate, coreServiceProvider: coreService)
```

NowChatService - makeChatUI(theme: NowChatThemeable, chatConfiguration: NowChatConfiguration? = nil) -> Result<UIViewController, NowChatServiceError>)

Creates a `UIViewController` that hosts the chat user interface.

Although this function creates the chat UI, you must still initiate the chat session by calling the *`startChat()`* function. You should make this call as the chat UI becomes visible. For more details, see the associated sample application and the Mobile SDK Developer Guide - iOS.

Parameters

Name	Type	Description
theme	NowChatThemeable protocol - iOS	Theme information for the chat UI to create.
chatConfiguration	NowChatConfiguration?	Optional. Options to apply to the chat session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Success: UIViewController object that contains the UI view controller configuration information. Failure: NowChatServiceError object. Possible errors: • chatServiceInvalid • coreServiceInvalid • guestUserNotAllowed • invalidCredentials • noSession • unknown • unsupportedServer

The following code example shows how to call this function to create the chat UI.

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }

  let closePrompt = NowChatConfiguration.ClosePrompt(header:
 "Close Window",
    message: "Are you sure you want to close the chat window?",
    acceptButtonTitle: "Yes",
    declineButtonTitle: "No")

  let attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible:
 false) // default isVisible = true

  let chatConfiguration = NowChatConfiguration(closePrompt:
 closePrompt,
    disabledFeatures: [.startNewConversation],
    conversationOptions:
 [.forceNewConversation, .endConversationOnExit],
    uiConfiguration:
 NowChatConfiguration.UIConfiguration(closeButton:
 closeButtonImage(name: "arrow.left"), attachmentUploadButton:
 attachmentUploadButton))

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatConfiguration:
 chatConfiguration)

  switch result {
    case .success(let chatViewController):
      return chatViewController
    case .failure(let error):
      debugPrint("Chat screen creation failed with error:
 \(error)")
      return nil
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
```

NowChatService - shutdown()

Shuts down the chat service, including any active chat sessions.

After calling this function, the associated `NowChatService` is inactive and cannot be reused. To establish another chat session, create a new `NowChatService` instance by calling the *`NowChat.makeChatService()`* function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
private func resetChat() {
  chatService?.shutdown()
  chatService = nil
  initializeChatService()
  viewState = makeViewState()
}

func initializeChatService() {
  NowChat.makeChatService(instanceUrl: instanceUrl, delegate:
 self) { [weak self] result in
    guard let self = self else { return }

    switch result {
    case .success(let service):
      self.chatService = service
    case .failure(let error):
      debugPrint("Creating the chat service failed with error:
 \(error)")
    }
    self.viewState = self.makeViewState()
}

func makeViewState() -> ViewState {
  ViewState(chatEnabled: chatService != nil,
    menuItems: menuItems)
}
```

NowChatService - startChat(contextData: [String: Any]? = nil, _ completion: @escaping (Result<Void, NowChatServiceError>) -> Void)

Starts a chat session and executes a completion block after chat session has started.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
contextData	[String: Any]?	Optional. Dictionary containing chat context variables that are passed into the chat session. For additional information on chat context variables, see Live agent chat context variables.
completion	Object	Completion block to execute after the chat session has started.

Returns

Type	Description
void or String	Return values for the completion block: • Success: void • Error: NowChatServiceError Possible errors: • chatServiceInvalid • coreServiceInvalid • guestUserNotAllowed • invalidCredentials • noSession • unknown • unsupportedServer

The following code example shows how to call this function without context data.

```
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }
  chatService.startChat { [weak self] result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
}

func makeViewState() -> ViewState {
  ViewState(chatEnabled: chatService != nil,
    menuItems: menuItems)
}
```

The following code example shows how to call this function with context data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }

  let contextData = ["sys_id": "123456789", "table_name":
 "wm_task", "active": true] as [String: Any]
  chatService.startChat(contextData: contextData) { [weak self]
 result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
}

func makeViewState() -> ViewState {
  ViewState(chatEnabled: chatService != nil,
    menuItems: menuItems)
}
```

NowChatService - subscribeToUnreadMessageCount(pollingInterval: TimeInterval, completion: @escaping (Int) -> Void)

Subscribes to the unread message count listener.

Parameters

Name	Type	Description
pollingInterval	TimeInterval	Frequency at which to poll the web service for the unread chat message count. Unit: Seconds
completion	@escaping (Int) -> Void)	Completion handler to call to report the unread chat message count. *Int*: Number of unread chat messages.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
...
if viewModel.isPolling {
  viewModel.unsubscribeFromUnreadMessageCount()
  viewState.pollingInterval = ""
} else {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  viewModel.subscribeToUnreadMessageCount(pollingInterval:
 timeInterval)
}
…

func subscribeToUnreadMessageCount(pollingInterval:
 TimeInterval) {
  chatService.subscribeToUnreadMessageCount(pollingInterval:
 pollingInterval) { [weak self] count in
    self?.unreadMessageCount = count
  }
  isPolling = true
}
```

NowChatService - unsubscribeFromUnreadMessageCount()

Unsubscribes from receiving the unread message count listener.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
…
if viewModel.isPolling {
  viewModel.unsubscribeFromUnreadMessageCount()
  viewState.pollingInterval = ""
} else {
  viewModel.subscribeToUnreadMessageCount(pollingInterval:
 timeInterval)
}
…
func unsubscribeFromUnreadMessageCount() {
  chatService.unsubscribeFromUnreadMessageCount()
  isPolling = false
  unreadMessageCount = 0
}
```

NowChatService - updateTheme(theme: NowChatThemeable)

Updates the NowChat UI theme with the specified UI theme. Use this function to update the chat UI theme after it has been initially set using the `makeChatUI()` function such as when changing the theme from light to dark.

Parameters

Name	Type	Description
theme	NowChatThemeable	Theme to update the chat UI with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to update a light UI theme to the dark UI theme using the *updateTheme()* function.

```
struct LightNowChatColoring: NowChatColoring {
  let nowUIColor: NowUIColoring = LightNowUIColor()
  let brand = UIColor.now_color(withHexString: "#032D42")
  let primary = UIColor.now_color(withHexString: "#00566E")
  let secondary = UIColor.now_color(withHexString: "#002832")
  let destructive = UIColor.now_color(withHexString: "#E52239")
  let textPrimary = UIColor.now_color(withHexString: "#10171A")
  let textSecondary = UIColor.now_color(withHexString:
 "#232E33")
  let textTertiary = UIColor.now_color(withHexString: "#37444A")
  let textActionable = UIColor.now_color(withHexString:
 "#ffffff")
  let screenHeaderText = UIColor.now_color(withHexString:
 "#ffffff")
  let backgroundPrimary = UIColor.now_color(withHexString:
 "#ffffff")
  let backgroundSecondary = UIColor.now_color(withHexString:
 "#F5F6F7")
  let backgroundTertiary = UIColor.now_color(withHexString:
 "#E2E5E7")
  let backgroundPrimaryActionable =
 UIColor.now_color(withHexString: "#10171A")
  let backgroundSecondaryActionable =
 UIColor.now_color(withHexString: "#232E33")
  let brandBackground = UIColor.now_color(withHexString:
 "#BDDEE7")
  let borderTertiary = UIColor.now_color(withHexString:
 "#d3d6dc")
  let separatorPrimary = UIColor.now_color(withHexString:
 "#859095")
  let separatorTertiary = UIColor.now_color(withHexString:
 "#CFD5D7")
  let alertCritical0 = UIColor.now_color(withHexString:
 "#F9C8CE")
  let alertCritical3 = UIColor.now_color(withHexString:
 "#E52239")
  let shadow = UIColor.now_color(withHexString: "#10171A")
  let linkPrimary = UIColor.now_color(withHexString: "#1955BE")
  let linkSecondary = UIColor.now_color(withHexString:
 "#113A82")
  let notification = UIColor.now_color(withHexString: "#E52239")
  let highlightBlue = UIColor.now_color(withHexString:
 "#C4DBFE")
  let highlightGray = UIColor.now_color(withHexString:
 "#DCDDDE")
}

struct DarkNowChatColoring: NowChatColoring {

```
  // The systemThemeDidChange delegate method can be used to
 call updateTheme() to apply theme changes when the system theme
 changes.
  debugPrint("System Theme did change")
  chatService.updateTheme(theme:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowChatTheme() : LightNowChatTheme())
}
```

NowChatServiceDelegate protocol - iOS

The *NowChatServiceDelegate* protocol provides callbacks for notification of actions within the *NowChatService* such as a request to open a URL or dismiss the chat view controller.

NowChatServiceDelegate - chatService(_chatService: NowChatService, didRequestOpenUrlurl: URL)

Callback that notifies the host application that the specified chat service received a request to open a URL. This callback is usually triggered by a user tapping on a link in the chat UI. It is the host application's responsibility to handle opening the URL or ignore the request.

Parameters

Name	Type	Description
chatService	NowChatService	NowChatService object making the request.
didRequestOpenUrl url	URL	URL that the service has requested to open.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func chatService(_ chatService: NowChatService,
 didRequestOpenUrl url: URL) {
  var updatedViewState = makeViewState()
  updatedViewState.urlToOpen = url
  viewState = updatedViewState
}
```

NowChatServiceDelegate - chatService(_ chatService: NowChatService, systemThemeDidChange traitCollection: UITraitCollection)

Callback that notifies the host application that the system chat theme changed.

Parameters

Name	Type	Description
chatService	NowChatService	NowChatService object making the request.
traitCollection	UITraitCollection	UITraitCollection that contains the new theme.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to override the *systemThemeDidChange()* delegate function to call the *updateTheme()* function to apply theme changes when the system theme changes.

```
func chatService(_ chatService: any
 SnowChat.ChatServiceProvider, systemThemeDidChange
 traitCollection: UITraitCollection) {

  /// The corresponding updateTheme() method can be called here
 to change the UI theme based on System Theme
  chatService.updateTheme(theme:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowChatTheme() : LightNowChatTheme())
  print("System Theme Did Change)
}
```

NowChatServiceDelegate - chatServiceViewControllerWasDismissed(_chatService: NowChatService)

Callback that notifies the host application that the chat view controller was dismissed.

Parameters

Name	Type	Description
chatService	NowChatService	NowChatService object whose view controller was dismissed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func chatServiceViewControllerWasDismissed(_ chatService:
 NowChatService) {
  resetChat()
}
```

NowChatServiceDelegate - didEndSessionWithId(sessionId: String)

Called when the chat screen is closed and the chat session ends.

Note: You can define the desired functionality for this callback by overriding the function.

Parameters

Name	Type	Description
sessionId	String	Sys_id of the session that ended.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Table: Conversation Session [sys_cs_session]

Returns

Type	Description
None	

The following code example shows where to place your code to override the default functionality.

```
func chatService(_ chatService: NowChatService,
 didEndSessionWithId sessionId: String) {
  print("Chat Session ended with ID: \(sessionId)")
}
```

NowChatThemeable protocol - iOS

The *NowChatThemeable* protocol provides properties that enable you to override the colors used within chat pages hosted on your ServiceNow instance.

```
public protocol NowChatThemeable {
    var color: NowChatColoring { get }
}
```

The NowChatColoring protocol contains *NowUIColoring*. This property is used to reference default color variables that *NowWebThemeable* can use.

For additional information on how to theme the UI, see Use NowUIColoring to theme NowWebTheme and NowChatTheme in the Mobile SDK Developer Guide - iOS.

Define ChatColors using default colors

```
/// Sample structure for using default colors that comes with
 Mobile SDK.
struct ChatColors: NowUIColoring {
}
```

Define ChatColors using custom colors

```
/// Use Custom Colors with light theme
struct ChatColors: NowUIColoring {
    private var defaultTheme: NowChatDefaultTheme {
        NowChatDefaultTheme(nowUITheme: NowUIDefaultTheme())
    }

    var brand: UIColor {
        lightBrand
    }
    var primary: UIColor {
        lightPrimary
    }
    var secondary: UIColor {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        lightSecondary
    }
    var textTertiary: UIColor {
        lightTextTertiary
    }
    var destructive: UIColor {
        lightDestructive
    }
    var textPrimary: UIColor {
        lightTextPrimary
    }
    var textSecondary: UIColor {
        lightTextSecondary
    }
    var textActionable: UIColor {
        lightTextActionable
    }
    var screenHeaderText: UIColor {
        lightScreenHeaderText
    }
    var backgroundPrimary: UIColor {
        lightBackgroundPrimary
    }
    var backgroundSecondary: UIColor {
        lightBackgroundSecondary
    }
    var backgroundTertiary: UIColor {
        lightBackgroundTertiary
    }
    var backgroundPrimaryActionable: UIColor {
        lightBackgroundPrimaryActionable
    }
    var backgroundSecondaryActionable: UIColor {
        lightBackgroundSecondaryActionable
    }
    var brandBackground: UIColor {
        lightBrandBackground
    }
    var linkPrimaryText: UIColor {
        lightLinkPrimary
    }
    var linkSecondary: UIColor {
        lightLinkSecondary
    }
    var separatorPrimary: UIColor {
        lightSeparatorPrimary
    }
    var separatorTertiary: UIColor {
        lightSeparatorTertiary
    }
    var borderTertiary: UIColor {
        lightBorderTertiary
    }
    var shadow: UIColor {
        lightShadow
    }
    var notification: UIColor {

```
    var lightAlertCritical0: UIColor
 { defaultTheme.color.nowUIColor.alertCritical0 }
    var lightAlertCritical3: UIColor
 { defaultTheme.color.nowUIColor.alertCritical3 }
}
```

Define ChatTheme structure with NowChatThemeable protocol

```
struct CarrascoChatTheme: NowChatThemeable {
    var color: NowChatColoring

    struct Color: NowChatColoring {
        var nowUIColor: NowUIColoring

        var backgroundPrimary: UIColor
        var backgroundSecondary: UIColor
        var backgroundPrimaryActionable: UIColor
        var backgroundSecondaryActionable: UIColor
        var brandBackground: UIColor
        var backgroundTertiary: UIColor
        var separatorPrimary: UIColor
        var separatorTertiary: UIColor
        var borderTertiary: UIColor
        var shadow: UIColor
        var linkSecondary: UIColor

        init(inputs: ChatColors) {
            nowUIColor = ThemeColor(inputs)

            backgroundPrimary = inputs.backgroundPrimary
            backgroundSecondary = inputs.backgroundSecondary
            backgroundTertiary = inputs.backgroundTertiary
            backgroundPrimaryActionable =
 inputs.backgroundPrimaryActionable
            backgroundSecondaryActionable =
 inputs.backgroundSecondaryActionable
            brandBackground = inputs.brandBackground
            separatorPrimary = inputs.separatorPrimary
            separatorTertiary = inputs.separatorTertiary
            borderTertiary = inputs.borderTertiary
            shadow = inputs.shadow
            linkSecondary = inputs.linkSecondary
        }
    }

    init(chatColors: ChatColors) {
        color = Color(inputs: chatColors)
    }
}
```

Instantiate ChatTheme object by passing ChatColor as input

```
let chatTheme = CarrascoChatTheme(chatColors: ChatColors())
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pass ChatTheme object to NowChatService.makeChatUI ()

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()))

  switch result {
  case .success(let chatViewController):
    return chatViewController
  case .failure(let error):
    debugPrint("Chat screen creation failed with error:
 \(error)")
    return nil
  }
}
```

NowCoreService class - iOS

The *NowCoreService* class provides fundamental services to the various SDK feature services. This class should only be instantiated by NowSDK.

Feature services, such as Now Analytics and NowChat, can access a shared core instance through the NowSDK.core property.

NowCoreService - accessTokenDidFail(for service: NowService)

Notifies the SDK core that the access token used to authorize the API requests to the ServiceNow instance for the specified service is no longer valid.

The SDK core returns a valid access token if it is able to generate one or returns an error.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
AnyPublisher<NowSDK.AccessToken, AccessTokenProviderError>	Success: Valid access token. Failure: AccessTokenProviderError Possible values: • userSessionError • accessTokenRetrievalFailed • hostReturnedNoTokens - Indicates a guest user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
NowSDK.core()?.accessTokenDidFail(for: someService)
  .mapError { YourCustomError.accessTokenFailed($0) }

.flatMap(self.handleFailedAccessToken())
  .eraseToAnyPublisher()
```

NowCoreService - accessTokenDidFail(for service: NowService) async throws

Notifies the SDK core that the access token used to authorize the API requests to the ServiceNow instance for the specified service is no longer valid.

The SDK core returns a valid access token if it is able to generate one or returns an error.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
NowSDK.AccessToken	Returned when the method is successful. Valid access token.
AccessTokenProviderError	Thrown when the method fails. Indicates an error retrieving an access token. Possible values: • userSessionError • accessTokenRetrievalFailed • hostReturnedNoTokens - Indicates a guest user

The following code examples shows how to call this method.

```
do {
    let accessToken = try await
 NowSDK.core()?.accessTokenDidFail(for: someService)
} catch {
    self.handleFailedAccessToken(error)
}
```

NowCoreService - canRequestPermission(_ permission: DevicePermission)

Queries the host application as to whether the service is allowed to request the device permission.

This function does not request the permission, only whether it is allowed to query the device permission. Feature services should call this function to determine if they are allowed to request a desired device permission.

Parameters

Name	Type	Description
permission	DevicePermission	Device for which the request is being made. Possible values (case-sensitive):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• camera • location • microphone • photoLibrary • speachRecognition

Returns

Type	Description
Boolean	Flag that indicates whether the host application allows the SDK to request the specified device permission. Possible values: • true: Device permission can be requested. • false: Device permission cannot be requested.

```
extension AppDelegate: DevicePermissionDelegate {
  func canRequestPermission(_ permission: DevicePermission) ->
 Bool {
    return true
  }
}
```

NowCoreService - isGuestUser(for service: NowService) async

Checks whether the current user is a guest user.

Parameters

Name	Type	Description
for service	NowService	Feature service for which to perform the guest user check.

Returns

Type	Description
Boolean	Flag that indicates whether the current user is a guest user. Possible values: • true: Current user of the specified service is a guest user. • false: Current user of the specified service is not a guest user.

The following code example shows how to call this method.

```
let isGuestUser = await NowSDK.core()?.isGuestUser(for:
 someService)
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowCoreService - refreshAllSettings()

Refreshes all SDK settings for all services by re-fetching them from the active servers.

To receive updated SDK settings values whenever they're refreshed, subscribe to the publisher provided by the NowCoreService - settingsPublisher(for service: NowService) function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

```
NowSDK.core()?.refreshAllSettings()
```

NowCoreService - refreshSettings(for service: NowService)

Refreshes the SDK settings for the specified service by re-fetching them from the server.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for service	NowService	Feature service, such as NowChat, requesting the settings refresh.

Returns

Type	Description
AnyPublisher<Settings, SettingsError>	Success: Dictionary of refreshed SDK settings. Feature services need to examine the returned data for the settings relevant to their specific features. Failure: SettingsError - Type and description of error encountered. Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider • notAuthorized • sdkNotLicensed • settingNotFound • unknown

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var subscriptions = Set<AnyCancellable>()
NowSDK.core?.refreshSettings(for: someService)
  .sink(receiveCompletion: { completion in
    if case .failure(let error) = completion {
      print("Refresh failed with error:\ (error)")
    }
  }, receiveValue: { settings in
    print("Received refreshed settings:\ (settings)")
  })
  .store(in: &subscriptions)
```

NowCoreService - refreshSettings(for service: NowService) async throws

Refreshes the SDK settings for the specified service by re-fetching them from the server.

Parameters

Name	Type	Description
for service	NowService	Feature service, such as NowChat, requesting the settings refresh.

Returns

Type	Description
Settings	Returned when the method is successful. Dictionary of refreshed SDK settings. Feature services need to examine the returned data for the settings relevant to their specific features.
SettingsError	Thrown when the method fails. Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider • notAuthorized • sdkNotLicensed • settingNotFound • unknown

The following code examples shows how to call this method.

```
do {
    let settings = try await NowSDK.core()?.refreshSettings(for:
 someService)
    print("Received refreshed settings: \(settings)")
} catch {
    print("Refresh failed with Settings error: \(error)")
}
```

NowCoreService - requestAccessToken(for service: NowService)

Acquires an access token for the specified service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
AnyPublisher<NowSDK.AccessToken, AccessTokenProviderError>	Success: NowSDK.AccessToken - Access token to use to authorize API requests made to a ServiceNow instance. Failure: AccessTokenProviderError - Type and description of error encountered. Possible values: • `accessTokenRetrievalFailed` • `hostReturnedNoTokens` - Indicates a guest user • `userSessionError`

```
NowSDK.core()?.requestAccessToken(for: someService)
```

NowCoreService - requestAccessToken(for service: NowService) async throws

Acquires an access token for the specified service.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the access token.

Returns

Type	Description
NowSDK.AccessToken	Returned when the method is successful. Access token to use to authorize API requests made to a ServiceNow instance.
AccessTokenProviderError	Thrown when the method fails. Indicates an error retrieving an access token. Possible values: • `accessTokenRetrievalFailed` • `hostReturnedNoTokens` - Indicates a guest user • `userSessionError`

The following code examples shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
do {
    let accessToken = try await
 NowSDK.core()?.requestAccessToken(for: someService)
} catch {
    self.handleFailedAccessToken(error)
}
```

NowCoreService - requestNetworkService(for service: NowService)

Returns a reference to a shared network service that you can use to make API requests.

Note: This is a shared service. Altering settings or ending the session can cause issues for other feature services that share this session.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the network service.

Returns

Type	Description
NetworkService	Shared network service that you can use to make API calls.

The following code example shows how to call this function.

```
NowSDK.core()?.settingsPublisher(for: chatService)
.sink(receiveCompletion: { completion in
  if case .failure(let error) = completion {
    // Setting publisher failed with error
  }
}, receiveValue: { updatedSettings in
  // Receive array of SDK settings for chatService
})
.store(in: &subscriptions)
```

NowCoreService - requestSettings(forservice: NowService)

Returns the SDK settings for the specified feature service.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
forservice	NowService	Feature service requesting the settings.

Returns

Type	Description
AnyPublisher<Settings, SettingsError>	Success: Settings - Array of SDK settings for the specified feature service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Failure: SettingsError - Type and description of associated error. Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider • notAuthorized • sdkNotLicensed • settingNotFound • unknown

```
NowSDK.core()?.requestSettings(for: someService)
```

NowCoreService - requestSettings(for service: NowService) async throws

Returns the SDK settings for the specified feature service.

Parameters

Name	Type	Description
for service	NowService	Feature service requesting the settings.

Returns

Type	Description
Settings	Returned when the method is successful. Array of SDK settings for the specified feature service.
SettingsError	Thrown when the method fails. Type and description of associated error. Possible values: • fetchError • fetchFailed • invalidJSON • invalidProvider • notAuthorized • sdkNotLicensed • settingNotFound • unknown

The following code examples shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
do {
    let settings = try await NowSDK.core()?.requestSettings(for:
 someService)
    print("Received settings: \(settings)")
} catch {
    print("Refresh saved with Settings error: \(error)")
}
```

NowCoreService - settingsPublisher(for service: NowService)

Retrieves the settings for the publisher of the specified service.

Parameters

Name	Type	Description
for service	NowService protocol - iOS	Feature service requesting the publisher subscription.

Returns

Type	Description
AnyPublisher<Settings, Never>	Success: Settings - Array of SDK settings for the specified feature service.

The following code example shows how to call this function.

```
NowSDK.core()?.settingsPublisher(for: chatService)
.sink(receiveCompletion: { completion in
  if case .failure(let error) = completion {
    // Setting publisher failed with error
  }
}, receiveValue: { updatedSettings in
  // Receive array of SDK settings for chatService
})
.store(in: &subscriptions)
```

NowData framework - iOS

The *NowData* framework contains methods that enable the instantiation of NowData services, such as *NowGraphQLService*, *NowTableService*, *NowAPIService* (for custom APIs), and *NowAttachmentService*.

NowData - makeApiService(instanceUrl: URL, path: String, completion: @escaping ((Result<NowApiService, NowServiceError>) -> Void))

Creates an instance of NowApiService, and once complete, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose REST APIs are to be accessed by the service.
path	String	API path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example, if the API call is `https://xxx.service-now.com/api/now/sg/incident`, the path is `/api/now/sg/incident`.
completion	@escaping ((Result <NowApiService, NowService Error>) -> Void)	Completion handler that is called with a `Result<NowApiService, NowServiceError>` containing either an initialized `NowApiService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let path = "api/now/sg"
let apiPublisher = apiService(for: path)

func apiService(for path: String) -> AnyPublisher<NowAPIService,
 ConfigurationError> {
  guard let instanceURL else {
    return Fail(error: ConfigurationError.invalidInstanceURL)
    .eraseToAnyPublisher()
  }
  return Future { promise in
    NowData.makeApiService(instanceUrl: instanceURL, path: path)
 { (result) in
      promise(result.mapError { .sdkError($0) })
    }
  }
  .eraseToAnyPublisher()
}
```

NowData - makeAttachmentService(instanceUrl: URL, completion: @escaping ((Result<NowAttachmentService, NowServiceError>) -> Void))

Creates an instance of NowAttachmentService, and after completion, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose attachments are to be accessed by the service.
completion	@escaping ((Result <NowAttachmentService, NowServiceError>) -> Void)	Completion handler that is called with a `Result<NowAttachmentService, NowServiceError>` containing either an initialized `NowAttachmentService` instance or a

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		NowServiceError indicating why the initialization failed.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
….
guard
  let jwtUrl = URL(string: "http://13.57.38.237:8080"),
  let instanceUrl = URL(string:
 "https://mobilecoresdk.service-now.com") else {
    return
  }

// AuthorizationProvider - struct conforming to
 NowSDKAuthorizationProviding protocol
let authorizationProvider = AuthorizationProvider(userEmail:
 "sdk@servicenow.com", jwtProviderUrl: jwtUrl, clientId:
 "deb8756b452d201039231ca568f26511")

// PermissionProvider - class conforming to
 DevicePermissionDelegate protocol
let permissionProvider = PermissionProvider()
let config = NowSDKConfiguration(authorizationProvider:
 authorizationProvider, permissionDelegate: permissionProvider,
 logLevel: .debug)

do {
  try NowSDK.configure(with: config)
  initializeAttachmentService (with: instanceURL)
} catch {
  // Return ConfigurationError.sdkError(error)
}
…..

func initializeAttachmentService(instanceUrl: instanceURL)
 { result in
  switch result {
    case .success(let service)
      self?.attachmentService = service
    case .failure(let error)
      debug.print("Creating Attachment service failed with
 error: \(error.localizedDescription)")
      self?.attachmentService = nil
  }
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowData - makeGraphQLService(instanceUrl: URL, completion: @escaping ((Result<NowGraphQLService, NowServiceError>) -> Void))

Creates an instance of NowGraphQLService, and once complete, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing GraphQL services.
completion	@escaping ((Result <NowGraphQLService, NowServiceError>) -> Void)	Completion handler that is called with a `Result<NowGraphQLService, NowServiceError>` containing either an initialized `NowGraphQLService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

```
func initializeGraphQLService(instanceUrl: URL) {
  makeGraphQLService(instanceUrl: instanceUrl) { [weak self]
 result in
    switch result {
    case .success(let service):
      self?.graphQLService = service
    case .failure(let error):
      debugPrint("Creating GraphQL service failed with error:
 \(error.localizedDescription)")
      self?.graphQLService = nil
    }
  }
}
```

NowData - makeTableService(instanceUrl: URL, completion: @escaping ((Result<NowTableService, NowServiceError>) -> Void))

Creates an instance of NowTableService, and after it completes, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose tables are to be accessed by the service.
completion	@escaping ((Result <NowTableService, NowService Error>) -> Void)	Completion handler that is called with a `Result<NowTableService, NowServiceError>` containing either an initialized `NowTableService` instance or a `NowServiceError` indicating why the initialization failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
func initializeTableService(for instanceUrl: URL) {
  makeTableService(instanceUrl: instanceUrl) { [weak self]
 result in
    guard let self = self else { return }

    switch result {
      case .success(let tableService):
        self.tableService = tableService
        // Create a Paginator that will iterate over pages of
 customer support cases. The Paginator's response type will be
        // inferred from the Paginator's type definition (e.g.
 `Paginator<[CustomerServiceCase]>`).
        self.paginator = tableService.paginator(from:
 Self.tableName, configuration: self.fetchConfiguration)
        // Subscribe to the Paginator's publisher so we will be
 able to receive paged results.
        self.subscribeToPaginatorPublisher()
        // As we are now ready to start fetching data, inform
 the view controller.
        self.onReady(self)
      case .failure(let error):
        debugPrint("Creating table service failed with error:
 \(error.localizedDescription)")
        self.tableService = nil
        self.paginator = nil
    }
  }
}
```

NowGraphQLService class - iOS

The *NowGraphQLService* class provides functions that enable you to make requests using GraphQL queries against data on your ServiceNow instance through its *GraphQL* REST API.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration settings provided when the service was initialized.

NowGraphQLService - execute(query: GraphQLQuery) async throws

Executes the specified GraphQL query.

Parameters

Name	Type	Description
query	String	GraphQL query to execute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Data	Returned when the method is successful. Query data generated from the specified query.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	  Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	  Thrown when the attachment metadata header is missing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this method.

```
private func fetchArticles() async throws -> [Article] {
    guard let graphQLService = graphQLService else {
        throw ArticleListError.invalidGraphQLService
    }

    do {
        let data = try await
 graphQLService.execute(GraphQLQuery(query:
 recently PublishedQuery))
        let articles = try dataToArticleList(data)
    } catch let error as NowDataError {
        throw ArticleListError.fetchError(error)
    } catch {
        throw error
    }
}
private let recently PublishedQuery =
"""

{
  GlideRecord_Query {
    kb_knowledge(queryConditions:
 "active=true^ORDERBYpublishedDESC" pagination: { limit: 10,
 offset: 0 }) {
      _results {
        sys_id {
          value
        },
        number {
          displayValue
        },
        short_description {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          displayValue
        },
        author {
          displayValue
        }
        published {
          displayValue
        }
      }
    }
  }
}
"""
```

NowGraphQLService - execute(query: GraphQLQuery, completion: @escaping (Result<Data, NowDataError>))

Executes the specified GraphQL query.

Parameters

Name	Type	Description
query	String	GraphQL query to execute.
completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the query is complete. Return values: • Success: Returns query data. • Error: NowDataError

Returns

Type	Description
None	

```
gqlService.execute(GraphQLQuery(query: myQuery)) { result in
  switch result {
  case .success(let data):
    // use data
  case .failure(let error):
    // handle error
  }
}
```

NowGraphQLService - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding)

Creates a NowGraphQLService based on the specified parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when initializing the service, such as the bundle ID of the application integrating with the service and the URL of the ServiceNow instance that the NowGraphQLService wants to access.
coreServiceProvider	NowCoreServiceProviding	Optional. Core service provider. **Note:** Currently this parameter is required even though it is shown as optional. Default: nil

---

NowGraphQLService - publisher(for query: GraphQLQuery)

Creates a publisher to request GraphQL data.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
for query	GraphQLQuery	GraphQL query string to execute.

Returns

Type	Description
AnyPublisher<Data, NowDataError>	Success: GraphQL data set. Failure: NowDataError

The following code example shows how to call this function.

```
private func fetchArticles() -> AnyPublisher<[Article],
 ArticleListError> {
  guard let graphQLService = graphQLService else {
    return
 Fail(error: .invalidGraphQLService).eraseToAnyPublisher()
  }

  return graphQLService.publisher(for: GraphQLQuery(query:
 recentlyPublishedQuery))
    .mapError({ dataError -> ArticleListError in
      .fetchError(dataError)
    })
    .flatMap(dataToArticleList)
    .eraseToAnyPublisher()
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowLoggingService class - iOS

The *NowLoggingService* class provides functions that provide logging capabilities to feature services with the NowSDK.

Properties

Name	Type	Description
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values: • debug • error • fatal • log • info • none

NowLoggingService - logger(for category: NowLogCategory)

Returns a logger for the specified feature service.

Parameters

Name	Type	Description
for category	NowLogCategory	Feature service whose logger you want returned. Valid values: • analytics • chat • coresdk • data • sdk • web

Returns

Type	Description
NowLogging	Logger to use to save all log messages for the associated service.

The following code example shows how to call this function.

```
let logging = NowLoggingService.logger(for: .chat)
…
logger.error(message: "Could not create service - service
 configuration invalid")
…
logger.debug(message: "Verifying settings…")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowLoggingService - setLogLevel(_ logLevel: NowLogLevel)

Sets the desired logging level.

Note: Incoming log messages with types that don't meet the set log level threshold are discarded.

Parameters

Name	Type	Description
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values: • debug • error • fatal • info • none

Returns

Type	Description
None	

The following code example shows how to call this function.

```
NowLoggingService.setLogLevel(.info)
```

NowPush API - iOS

The *NowPush* API is a top-level global API that enables users to instantiate a NowPush service instance.

NowPush - makePushService(instanceUrl: URL)

Creates an instance of `NowChatService` with the specified configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing push notification services.

Returns

Type	Description
AnyPublisher<NowPush Service, NowServiceError>	If successful, returns an initialized NowPushService object. If it fails, returns a NowServiceError object.

This example shows how to create an instance of `NowChatService`.

```
func setup(with instanceURL: URL) -> AnyPublisher<NowService,
 ConfigurationError> {
  NowPush.makePushService(instanceUrl: instanceURL)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .mapError { .sdkError($0) }
    .map { $0 as NowService }
    .eraseToAnyPublisher()
}
```

NowPush - makePushService(instanceUrl: URL, completion: @escaping ((Result<NowPushService, NowServiceError>) -> Void))

Creates an instance of `NowPushService` with the specified configuration, and once complete, calls the specified completion handler.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance providing push notification services.
completion	@escaping ((Result<NowPush Service, NowService Error>) -> Void)	Completion handler that is called containing either an initialized `NowPushService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

This example shows how to create an instance of `NowPushService`.

```
static func setup(with instanceURL: URL,completion: @escaping
  (Result<NowPushService, NowServiceError>) → Void) {
    NowPush.makePushService(instanceUrl: instanceURL} {result in
      switch result {
      case .success(letpushService):
        completion(.success(pushService))
      case .failure(let error):
        completion(.failure(eror))
      }
    }
  }
```

NowPushPayload protocol

`NowPushPayload` is a generic protocol you can use to define a push notification protocol within the NowSDK framework.

Requirements

Name	Type	Description
message	String	Message displayed to the user in the push notification, located in the *`body`* field of the push notification.
type	`NowPushType: String, Codable`	Type of push notification. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements (continued)

Name	Type	Description
		• launchVirtualAgent

NowPushService class - iOS

The `NowPushService` class provides functions that enable interaction with the Push Notification service.

Properties

Name	Description
configuration	Configuration settings provided when the service was initialized. Data type: NowServiceConfiguration

NowPushService - registerPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void)

Registers a unique token with the ServiceNow instance used to identify the push notifications for the current iOS device and specified application.

Parameters

Name	Type	Description
_token	Data	Data object of the push token to register. This is the token obtained from the Apple Developer site. For more information, see the Mobile SDK Developer Guide - iOS.
pushAppName	String	Name of the push application for which this token is being registered.
environment	NowPushEnvironment	Environment for which the token is being registered. Valid values: • production • sandbox
completion	@escaping (Result<Data, NowPushError>) → Void	Completion handler to execute after the token has been attempted to be registered. • Success: iOS push notification certificate. • Error: NowPushError - Information about the error that occurred when trying to register the token. Possible values: ○ decoding: Decoding error occurred. ○ httpRequestFailure: Generic error that is returned whenever the http call is not a success (2xx).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		○ notAuthorized: Requestor is not authorized to perform the specified push notification operation. ○ unsupportedData: Push payload is invalid.

Returns

Type	Description
None	

This example shows how to register a push notification token for the TestPushApp application.

```
func registerForPushNotifications(deviceToken: Data) {
  pushService.registerPushToken(deviceToken,
      pushAppName: "TestPushApp",
      environment: environment) { [weak self] result in
    guard let self = self else { return }
    switch result {
      case .success:
        UserDefaults.standard.set(true, forKey:
 "pushNotificationsRegistered")
        self.pushRegistrationState = .registrationSuccess
      case .failure:
        UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
        self.pushRegistrationState = .registrationFailed
    }
  }
}
```

NowPushService - unregisterPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void)

Unregisters a previously registered push token.

Parameters

Name	Type	Description
_token	Data	Data object of the push token to unregister.
pushAppName	String	Name of the push application for which this token is being unregistered.
environment	NowPushEnvironment	Environment for which the token is being registered. Valid values: • production • sandbox
completion	@escaping (Result <Data, NowPushError>) → Void	Completion handler to execute after the token has been attempted to be unregistered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Success: API response data. • Error: `NowPushError` - Information about the error that occurred when trying to unregister the token. Possible values: ○ decoding: Decoding error occurred. ○ httpRequestFailure: Generic error that is returned whenever the http call is not a success (2xx). ○ notAuthorized: Requestor is not authorized to perform the specified push notification operation. ○ unsupportedData: Push payload is invalid.

Returns

Type	Description
None	

This example shows how to unregister the push notification token associated with the TestPushApp application.

```
func unregisterFromPushNotifications(deviceToken: Data) {
  pushService.unregisterPushToken(deviceToken, pushAppName:
 "TestPushApp", environment: environment) { [weak self] result
 in
    guard let self = self else { return }
    switch result {
      case .success:
        UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
        self.pushRegistrationState = .unregisterSuccess
      case .failure:
        self.pushRegistrationState = .unregisterFailed
    }
  }
}
```

NowPushService - payloadFromUserInfo(_userInfo: [AnyHashable: Any])

Parses the `userInfo` key-value pairs into a `NowPushPayload` object.

Parameters

Name	Type	Description
_userInfo	[AnyHashable: Any]	Push payload content received as part of the push notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Result<NowPushPayload, NowPushError>	Returns the results of the payload parsing. • Success: Parsed `NowPushPayload` object. • Failure: `NowPushError` - Information about the error that was encountered while parsing the specified user payload. Possible values: ○ decoding: Decoding error occurred. ○ httpRequestFailure: Generic error that is returned whenever the http call is not a success (2xx). ○ notAuthorized: Requestor is not authorized to perform the specified push notification operation. ○ unsupportedData: Push payload is invalid.

This example shows how to parser a user payload.

```
func userNotificationCenter(_ center: UNUserNotificationCenter,
    didReceive response: UNNotificationResponse,
    withCompletionHandler completionHandler: @escaping () ->
 Void) {
  guard let pushService = pushService else {
    completionHandler()
    return
  }
  let userInfo = response.notification.request.content.userInfo
  _ = pushService.payloadFromUserInfo(userInfo)
    .flatMap(handleNowPushPayload)
}

func handleNowPushPayload(_ payload: NowPushPayload) ->
 Result<Void, NowPushError> {
  guard payload is NowPushVirtualAgent else {
    return .failure(NowPushError.unsupportedData)
  }
  launchVirtualAgent()
  return .success(())
}
```

NowRecord class - iOS

The *`NowRecord`* class defines a model that represents a record in a table on a ServiceNow instance.

Properties

Name	Type	Description
sysId	String	Unique 32-character Globally Unique ID (GUID) that identifies each record in a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
fields	Set	Fields within the associated record.
id	String	Sys_id of the record.

NowSDK framework - iOS

The *NowSDK* framework contains methods that enable the instantiation of various feature services.

NowSDK - configure(with configuration: NowSDKConfiguration) throws

Configures *NowSDK* for use. You must call this function before calling any of the feature services within the Mobile SDK.

Note: If the configuration that you pass is invalid, a `NowSDKError` is thrown.

Parameters

Name	Type	Description
with configuration	NowSDKConfiguration	NowSDKConfiguration that contains the information necessary to initialize the service.

Returns

Type	Description
None, NowSDKError	NowSDKError is thrown if the configuration that you pass is invalid.

The following code example shows how to call this function.

```
guard
  let jwtUrl = URL(string: "http://13.57.38.237:8080"),
  let instanceUrl = URL(string:
 "https://mobilecoresdk.service-now.com") else {
    return
  }

// AuthorizationProvider - struct conforming to
 NowSDKAuthorizationProviding protocol
let authorizationProvider = AuthorizationProvider(userEmail:
 "sdk@servicenow.com", jwtProviderUrl: jwtUrl, clientId:
 "deb8756b452d201039231ca568f26511")

// PermissionProvider - class conforming to
 DevicePermissionDelegate protocol
let permissionProvider = PermissionProvider()
let config = NowSDKConfiguration(authorizationProvider:
 authorizationProvider, permissionDelegate: permissionProvider,
 logLevel: .debug)

do {
  try NowSDK.configure(with: config)
            ...
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
} catch {
   print("error is \(error.localizedDescription)")
}
```

NowSDK - core()

Returns a reference to the SDK core service.

Note: Host applications don't need to call this function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object conforming to the *NowCoreServiceProviding* protocol is returned if the SDK has been initialized by calling the NowSDK - configure(with configuration: NowSDKConfiguration) throws method; otherwise `nil`.

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}
```

NowSDK - makeServiceConfiguration(for instanceUrl: URL)

Convenience function that feature services can use to construct n NowServiceConfiguration object.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance that the service will access.

Returns

Type	Description
NowServiceConfiguration	If the specified URL passes basic validity checks, and the service configuration can be properly constructed, returns the NowServiceConfiguration object; otherwise `nil`.

The following code example shows how to call this function.

```
guard
  let instanceUrl = URL(string:
 "https://mobilecoresdk.service-now.com"),
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    logger.error(message: "Could not create service - service
configuration invalid")
    return
  }
```

NowSDKConfiguration class - iOS

The *NowSDKConfiguration* class contains configuration information needed to initialize the NowSDK.

Properties

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK upon request.
logLevel	NowLogLevel	Level of log messages for the associated logger to store. Valid values: • debug • error • fatal • info • none
permisionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show system dialog requesting the indicated device permission.

NowSDKConfiguration - init(authorizationProvider: NowSDKAuthorizationProviding, permissionDelegate: DevicePermissionDelegate, logLevel: NowLogLevel)

Creates a NowSDKConfiguration object.

Parameters

Name	Type	Description
authorizationProvider	NowSDKAuthorizationProviding	Delegate object that is responsible for providing authorization tokens to the NowSDK on request.
permissionDelegate	DevicePermissionDelegate	Delegate object called by the NowSDK to request permission from the host application to show the system dialog for requesting the indicated device permission. For example: `class PermissionProvider: DevicePermissionDelegate {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`func canRequestPermission(_ permission: DevicePermission) → Bool { return true } }`
logLevel	NowLogLevel	Level of log messages for the associated logger to store. This sets the logging level for the core services logger. You can also use the *NowLoggingService* API to set service log levels. Valid values: • debug • error • fatal • info • none

Returns

Type	Description
None	

The following code example shows how to call this function.

```
guard
  let instanceUrl = URL(string:
 "https://sn-instance.service-now.com") else {
  return
}

NowServiceConfiguration(instanceUrl: instanceUrl, appBundleId:
 "com.servicenow.appBundle")
```

NowService protocol - iOS

The *NowService* protocol provides a single interface to the NowSDK for all feature services. It defines the configuration parameters needed to access your ServiceNow instance.

All SDK feature services must implement this protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements

Name	Type	Description
configuration	NowServiceConfiguration	Service configuration to associate with the protocol.

NowServiceConfiguration structure - iOS

The *`NowServiceConfiguration`* structure defines configuration information for a feature service.

Properties

Name	Type	Description
appBundleId	String	Bundle ID of the application integrating with the NowSDK.
instanceUrl	String	URL of the ServiceNow instance that the feature service will access. For example: `https://instance.servicenow.com`.

NowServiceConfiguration - init(instanceUrl: URL, appBundleId: String)

Configures the calling feature service with the specified configuration information.

Parameters

Name	Type	Description
instanceUrl	String	URL of the ServiceNow instance that the feature service will access. For example: `https://instance.servicenow.com`.
appBundleId	String	Bundle ID of the application integrating with the NowSDK.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
guard
  let instanceUrl = URL(string:
 "https://instance.service-now.com") else {
    return
  }

NowServiceConfiguration(instanceUrl: instanceUrl, appBundleId:
 "com.servicenow.appBundle")
```

NowTableService class - iOS

The *`NowTableService`* class provides functions that enable you to perform create, read, update, and delete operations on records of existing ServiceNow tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration settings provided when the service was initialized.

NowTableService - create<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder, writeOptions: FieldWriteOptions, configuration: FetchConfiguration) async throws

Inserts the specified Codable model into the specified table.

In order to create a new record by model, the model must conform to the `SysIdentifiableModel` protocol. Each table will typically have its own model.

The model's *`sys_Id`* parameter is ignored during creation as the *`sysId`* is generated by the ServiceNow platform. The ServiceNow platform generated *`sys_Id`* is returned in the *`completion`* handler's `Result` model.

Parameters

Name	Type	Description
model	SysIdentifiableModel	Model definition of the fields to insert into the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder`
		`= .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Model	Returned when the method is successful. Codable model that was inserted in the specified table, including the sys_Id. Use this sys_id to reference this record in future method calls.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this method.

```
struct User: SysIdentifiableModel {
    var sysId: String = ""
    var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
do {
    let result = try await service.create(user, in: “sys_user”)
} catch {
    ...
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - create<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder, writeOptions: FieldWriteOptions, configuration: FetchConfiguration, completion: @escaping (Result<Model, NowDataError>))

Inserts the specified Codable model into the specified table and then executes the *completion* handler.

In order to create a new record by model, the model must conform to the `SysIdentifiableModel` protocol. Each table will typically have its own model. For example:

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id', use
 in subsequent 'update' or 'delete' calls.
  case .failure(let error):
      ...
  }
}
```

The model's *sys_Id* parameter is ignored during creation as the *sysId* is generated by the ServiceNow platform. The ServiceNow platform generated *sys_Id* is returned in the *completion* handler's `Result` model.

Parameters

Name	Type	Description
model	SysIdentifiableModel	Model definition of the fields to insert into the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.
coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance. Possible values: • default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`. • custom(JSONEncoder, JSONDecoder): Use `custom` coders to have more fine-grained control on JSON decoding/encoding. Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Model, NowDataError>)	Completion handler to execute after creating the specified decodable model(s). Return values for the completion handler: • Success: Model - Data for the created model type. • Failure: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *type*: Wrapped type to decode from a string. ▪ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id' to use
 in subsequent update or delete calls.
  case .failure(let error):
   ...
  }
}
```

NowTableService - create<Model: SysIdentifiableModel>(model: Model, in tableName: String, path: String = Constants.resultPath, coder: Coder = .default, writeOptions: FieldWriteOptions? = nil, configuration: FetchConfiguration = nil)

Inserts one Codable model into the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

In order to create a new record by model, the model must conform to the `SysIdentifiableModel` protocol. Each table will typically have its own model. For example:

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id', use
 in subsequent 'update' or 'delete' calls.
  case .failure(let error):
      ...
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The model's *sys_Id* parameter is ignored during creation. The *sysId* is assigned by the ServiceNow platform. The ServiceNow platform generated *sys_Id* is returned in the publisher's `receiveValue` callback model.

Parameters

Name	Type	Description
model	SysIdentifiableModel	`SysIdentifiableModel` model to insert into the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.
path	String	Optional. Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `Constants.resultPath`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder`
		`= .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
AnyPublisher<Model,NowDataError>	Success: Codable model that was inserted in the specified table, including *sys_Id*. Use this sys_id to reference this record in future method calls. Failure: NowDataError @escaping (Result<Model, NowDataError>)

Shows how to insert a single record into the User [sys_user] table.

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let service: NowTableService = ...
let user = User(name: "Ash Williams")
let publisher: AnyPublisher<User, NowDataError> =
 service.create(user, in: "sys_user")
publisher
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { [weak self] completion in
    ...
  } receiveValue: { [weak self] newUser in
      /// 'newUser' contains the ServiceNow platform assigned
 'sys_id' to use in subsequent update and delete calls.
     ...
  }
  .store(in: &subscriptions)
```

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil) async throws

Inserts a record in the specified table that contains the specified fields.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *convertToRecords()* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the new record.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *type*: Wrapped type to decode from a string. ○ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let dataResult: Data = try await
 tableService.createRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: configuration)
    let recordResult: NowRecord = dataResult.convertToRecord()
} catch {
    print("Record creation failed with NowDataError: \(error)")
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions, configuration: FieldReadConfiguration, completion: @escaping (Result<Data, NowDataError>)

Inserts the specified record in the specified table and then executes the *completion* handler after the record is saved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function *convertToRecords()* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myResult.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Parameters

Name	Type	Description
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FieldReadConfiguration	Optional. Configuration options that specify which fields to return and what to include in the fields. Default: nil

completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the records are retrieved.
		
		Return values:
		• Success: Data - Requested records
		• Error: NowDataError
		  ○ `accessToken(AccessTokenProviderError)`
		  ▪ *AccessTokenProviderError*: The access token provider's error code or message.
		  ▪ accessTokenRetrievalFailed
		  ▪ userSessionError(_ error: Error)
		
		Thrown when there is an error in the access token.

Parameters (continued)

Name	Type	Description
		○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let fields = ["short_description" : "test description"]
let writeOptions: FieldWriteOptions =
 [.suppressAutoSysField, .treatInputValuesAsDisplayValues]
let readConfiguration = FieldReadConfiguration(includeFields:
 ["number", "short_description"])

tableService.createRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: readConfiguration)
 { [weak self] result in
  switch result {
    case .success(let dataResult):
      let recordResult: NowRecord = dataResult.convertToRecord()
    case .failure(let error):
       print("Record creation failed with NowDataError:
 \(error)")
  }
}
```

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil)

Inserts a record in the specified table that contains the specified fields.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, you can use the convenience function `convertToRecords()` to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Parameters

Name	Type	Description
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Data, NowDataError>	Success: Data object containing the updated record.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.

© 2026 ServiceNow, Inc. All rights reserved.

Returns (continued)

Type	Description

	Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	Thrown when a network service encountered an error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to create a function that inserts a record in the specified table, with the specified fields. The output of the call is a ByteArray which allows you to convert the data into any model that you want.

```
tableService.createRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: readConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecord()
    .sink { completion in
        if case let .failure(error) = completion {
            print("Record creation failed with NowDataError:
 \(error)")
        }
    } receiveValue: { record in
        print("Created NowRecord: \(record)")
    }
    .store(in: &subscriptions)
```

NowTableService - delete(_ model: Model, from tableName: String) async throws

Deletes the specified Codable model from the specified table.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` to delete from the table. It should contain the sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description
None	Nothing returned when the method is successful.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response

```
    print("Deletion successful.")
} catch {
    print("Deletion failed with NowDataError: \(error)")
}
```

NowTableService - delete(_ model: Model, from tableName: String, completion: @escaping (Result<Void, NowDataError>))

Deletes the specified Codable model from the specified table and then executes the appropriate *`completion`* handler.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` to delete from the table. It should contain the sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.
completion	@escaping (Result<Void, NowDataError>)	Completion handler to execute after deleting the specified codable model(s). Return values: • Success: Nothing returned • Failure: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this function.

```
tableService.delete(Incident(sysId: sysId), from: tableName)
 { [weak self] result in
  switch result {
    case .success:
      // Delete successfully
    case .failure(let error):
      // Failed to delete with NowDataError
  }
}
```

NowTableService - delete(_ model: Model, from tableName: String)

Deletes the specified Codable model from the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` to delete from the table. It should contain the sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description

AnyPublisher<Void, NowDataError>	Success: Nothing returned
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a Codable model cannot be decoded from JSON. • `cannotDecodeProperty(type: Any, from: String)` ○ *type*: Wrapped type to decode from a string. ○ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this function.

```
tableService.delete(Incident(sysId: sysId), from: tableName)
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { [weak self] completion in
    switch completion {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      case .finished:
        // Delete successfully
      case .failure(let error):
        // Failed to delete with NowDataError
    }
  } receiveValue: { _ in
  }
  .store(in: &subscriptions)
```

NowTableService - deleteRecord(sysId: SysID, from tableName: String) async throws

Deletes the specified record from the specified table.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description
None	Nothing returned when the method is successful.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    try await tableService.deleteRecord(sysId: sysId, from:
 tableName)
    print("Deletion successful.")
} catch {
    print("Deletion failed with NowDataError: \(error)")
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - deleteRecord(sysId: SysID, from tableName: String, completion: @escaping (Result<Void, NowDataError>))

Deletes the specified record from the specified table and then executes the *`completion`* object after the record is deleted.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

completion	@escaping (Result<Void, NowDataError>)	Success: Nothing is returned.
		
		Failure: NowDataError
		
		• `accessToken(AccessTokenProviderError)`
		  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
		  ▪ accessTokenRetrievalFailed
		  ▪ userSessionError(_ error: Error)
		
		  Thrown when there is an error in the access token.
		
		• `attachmentValidation`
		
		  Thrown when an attachment fails validation.
		
		• `badResponse(statusCode: HTTPStatusCode)`
		  ○ *`HTTPStatusCode`*: Status code received from the instance.
		
		  Thrown when a request returns an unexpected response
		
		• `cannotDecodeModel(DecodingError)`
		  ○ *`DecodingError`*: Decoding error detected.
		
		  Thrown when a Codable model cannot be decoded from JSON.
		
		• `cannotDecodeProperty(type: Any, from: String)`
		  ○ *`type`*: Wrapped type to decode from a string.
		  ○ *`from`*: String to decode to the specified type.
		
		  Thrown when a string-wrapped value cannot be decoded from JSON.
		
		• `cannotEncodeModel(EncodingError)`
		  ○ *`EncodingError`*: Encoding error detected.
		
		  Thrown when a Codable model cannot be encoded to JSON.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this function.

```
tableService.deleteRecord(sysId: sysId, from: tableName) { [weak
 self] result in
  switch result {
    case .success:
      // Delete successfully
    case .failure(let error):
      // Failed to delete with NowDataError
  }
}
```

NowTableService - deleteRecord(sysId: SysID, from tableName: String)

Deletes the specified record from the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to delete.
from tableName	String	Name of the table from which to delete the information, such as *incident*.

Returns

Type	Description

AnyPublisher<Void, NowDataError>	Success: Nothing returned
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to create a function that deletes a record in a specified table.

```
tableService.deleteRecord(sysId: sysId, from: tableName)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .sink { completion in
        switch completion {
        case .finished:
            print("Record deleted.")
        case .failure(let error):
            print("Deletion failed with NowDataError: \(error)")
        }
    } receiveValue: { _ in }
    .store(in: &subscriptions)
```

NowServiceTable - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding? = nil)

Creates a NowTableService object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when creating the service.
coreServiceProvider	NowCoreServiceProviding	Optional. Service provider to associate with the NowTableService. Default: nil

The following code example shows how to call this function.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}

guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com") ,
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
  }
let tableService = NowTableService (configuration:
 serviceConfig, coreServiceProvider: coreService)
```

NowTableService - model<Model: Decodable>(with sysId: SysID? = nil, from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) async throws

Enables the retrieval of decodable model(s) from a specified table.

Table API responses are nested inside a *result* parameter similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
  ]
}
```

For large result sets, use one of the paginator functions, NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) or NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) to fetch paginated models.

Parameters

Name	Type	Description
with sysId	SysID	Optional. Sys_id of the record to return. Provide the sys_id if you want to retrieve a specific record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: nil
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `result`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Model	Returned when the method is successful. Decodable model(s).
NowDataError	Thrown when the method fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this method.

```
struct User: Codable {
    var name: String
}

let service: NowTableService = ...
do {
    let result = try await service.model([User].self, from:
 "sys_user", path: "result")
    print("Fetched \(users.count) users")
} catch {
    dump(error)
}
```

The following code example shows how to fetch a single Decodable model by sys_id. Use a single model type, such as `User.self`, rather than `[User].self`.

```
let result = try await service.model(User.self, with:
 "5137153cc611227c000bbd1bd8cd2005", from: "sys_user", path:
 "result")
```

NowTableService - model<Model: Decodable>(_ type: Model.Type, with sysId: SysID? = nil, from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil, completion: @escaping (Result<Model, NowDataError>))

Retrieves decodable model(s) from a specified table.

`Table` API responses are nested inside a *`result`* parameter similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
  ]
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this function to obtain decodable models instead of nested output.

Parameters

Name	Type	Description
type	Model.Type	Type of value to decode.
with sysId	String	Optional. Sys_id of the record to return. Default: All records returned per the *`configuration`* settings.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Optional. Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `Constants.resultPath`
coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance. Default: `.default`
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Model, NowDataError>)	Completion handler to execute after retrieving the specified decodable model(s). Return values for the completion handler: • Success: Data for the requested model type. • Failure: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)` ▪ *`HTTPStatusCode`*: Status code received from the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

To retrieve a collection of decoded *User* models.

```
struct User: SysIdentifiableModel {
    var sysId: String = ""
    var name: String
}
let service: NowTableService = ...
let user = User(name: "Ash Williams")
service.create(Incident(fields: fields), in: tableName,
 writeOptions: writeOptions, configuration: fetchConfiguration)
 { [weak self] result in
  switch result {
  case .success(let newUser):
    /// 'newUser' contains the platform assigned 'sys_id', use
 in subsequent 'update' or 'delete' calls.
  case .failure(let error):
    ...
 }
}
```

To fetch a single decodable model by sys_id, use a single model type, such as `User.self`, rather than `[User].self`.

```
service.model(User.self, with:
 "5137153cc611227c000bbd1bd8cd2005", from: "sys_user", path:
 "result") { resultin ... }
```

NowTableService - model<Model: Decodable>(with sysId: SysID? = nil, from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil)

Creates a publisher that enables the retrieval of decodable model(s) from a specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Table API responses are nested inside a *result* parameter similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  ]
}
```

For large result sets, use one of the paginator functions, NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) or NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) to fetch paginated models.

Parameters

Name	Type	Description
with sysId	SysID	Optional. Sys_id of the record to return. Provide the sys_id if you want to retrieve a specific record. Default: nil
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Dot separated path for the nested type. For example, `result` or `foo.bar.baz` for deeper nesting. Default: `result`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description

AnyPublisher<Model, NowDataError>	Success: Publisher returning a decodable model(s).
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	  Thrown when a response from the instance cannot be parsed into its expected format.
	
	• `invalidURL`
	
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	  Thrown when the attachment metadata header is missing.
	
	• `missingServiceConfiguration`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

To obtain a publisher that provides decoded User models by type, such as `[Users].self`, fetch the models by specifying a dot-separated path.

```
struct User: Codable {
  varname: String
}

let service: NowTableService = ...
let publisher: AnyPublisher<[User], NowDataError>
 = service.model(from: "sys_user", path:
 "user.photos.gps_location")
```

To fetch a single decodable model by sys_id, use a single `User.self` model type, rather than `[User].self`.

```
let publisher: AnyPublisher<User, NowDataError> =
 service.model(with: "5137153cc611227c000bbd1bd8cd2005", from:
 "sys_user", path: "result")
```

NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil)

Creates a paginator that enables iterating through pages of records.

The paginator's publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Unless overridden in the *configuration* parameter, a paginator returns 20 items per page. Depending on ACL evaluation, the actual number of fetched items for a page might be less than the default or configured value.

Parameters

Name	Type	Description
tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

Paginator<Data>	Success: Paginator object containing the specified records.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

```
private var tableService: NowTableService?
// Paginator creation uses type inference to determine the
 response type.
private var paginator: Paginator<[CustomerServiceCase]>?

func initializeTableService(for instanceUrl: URL) {
  makeTableService(instanceUrl: instanceUrl) { [weak self]
 result in
    guard let self = self else { return }

    switch result {
    case .success(let tableService):
      self.tableService = tableService
      // Create a paginator that iterates over pages of customer
 support cases. The paginator's response type is
      // inferred from the paginator's type definition (e.g.
 `Paginator<[CustomerServiceCase]>`).
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      self.paginator = tableService.paginator(from:
 Self.tableName, configuration: self.fetchConfiguration)
      // Subscribe to the paginator's publisher so you are able
 to receive paged results.
      self.subscribeToPaginatorPublisher()
      // Ready to start fetching data, inform the view
 controller.
      self.onReady(self)
    case .failure(let error):
      debugPrint("Creating table service failed with error:
 \(error.localizedDescription)")
      self.tableService = nil
      self.paginator = nil
    }
  }
}
```

NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil)

Creates a paginator that enables the iteration of pages of decoded model(s) that handle nesting.

The ServiceNow REST *Table* API responses are nested inside a result property similar to the following:

```
{
  "result": [
    { "name": "Ash Williams" },
    { "name": "Lionel Cosgrove" },
    { "name": "Laurie Strode" }
  ]
}
```

To obtain a paginator that provides decoded User models, fetch the paginator by specifying a dot-separated path; in this case, *result*.

```
struct User: Codable {
  varname: String
}

let service: NowTableService = ...
let paginator: Paginator<[User]> = service.paginator(from:
 "sys_user", path: "result")
```

Note: Unless overridden in the *configuration* parameter, a paginator returns 20 items per page. Depending on the ACL evaluations, the actual number of fetched items for a page might be less than the default or configured value.

After obtaining a Paginator object, subscribe to its Combine Publisher to start receiving data:

```
paginator.publisher
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { … }
  .store(in: &subscriptions)
```

Note: As with all Combine subscriptions, ensure that you retain the subscription to avoid unexpected results.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
path	String	Dot separated path for the nested type. For example, `result` or `result.user.photos` for deeper nesting. Specifying a custom path allows fetching or iterating over nested data. Default: `result`

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Paginator<Data>	Success: Paginator object containing paged `Decodable` model(s). Failure: NowDataError

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	  Thrown when there is an error in the access token.
	• `attachmentValidation`
	  Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	  Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	  Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	  Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	  Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	  Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	  Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	  Thrown when an expected service configuration is missing.
	• `missingSysID`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to obtain a Paginator object that provides decoded User models. You can fetch the desired Paginator object by hinting the compiler to return a collection of User models ([User]) and informing the Paginator object that the users are nested beneath the result path.

```
struct User: Codable {
  var name: String
}

let service: NowTableService = ...
let paginator: Paginator<[User]> = service.paginator(from:
 "sys_user", path: "result")
```

Note: The *Table* API always returns results nested beneath a result path, so you can safely eliminate the *path* parameter.

NowTableService - record(with sysId: SysID, from tableName: String, configuration: FieldReadConfiguration? = nil) async throws

Retrieves a specified record from the specified table on a ServiceNow instance.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *convertToRecords()* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the specified record.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
func fetchTableRecord(sysId: String, tableName: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = []) async throws -> NowRecord
 {
    let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
    do {
        let dataResult: Data = try await
 tableService.record(with: sysId, from: tableName,
 configuration: configuration)
        let recordResult: NowRecord =
 dataResult.convertToRecord()
        return recordResult
    } catch {
        print("Fetch failed with NowDataError: \(error)")
        throw error
    }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowTableService - record(with sysId: SysID, from tableName: String, configuration: FieldReadConfiguration, completion: @escaping (Result<Data, NowDataError>)

Retrieves the specified record from the specified table and then executes a completion handler after the record is retrieved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myResult.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the records are retrieved. Return values: • Success: Data - Requested records • Error: NowDataError ○ `accessToken(AccessTokenProviderError)` ▪ *`AccessTokenProviderError`*: The access token provider's error code or message. ▪ accessTokenRetrievalFailed ▪ userSessionError(_ error: Error) Thrown when there is an error in the access token. ○ `attachmentValidation` Thrown when an attachment fails validation. ○ `badResponse(statusCode: HTTPStatusCode)`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		▪ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response ○ `cannotDecodeModel(DecodingError)` ▪ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. ○ `cannotDecodeProperty(type: Any, from: String)` ▪ *`type`*: Wrapped type to decode from a string. ▪ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. ○ `cannotEncodeModel(EncodingError)` ▪ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. ○ `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. ○ `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = [], limit: Int?) {
  let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
  let config = FetchConfiguration(Filter(query: filterQuery),
 limit, readConfig)
  tableService.records (from: tableName, configuration:
 fetchConfiguration) { [weak self] result in
    switch result {
      case .success(let dataResult):
        let recordResult: [NowRecord] =
 dataResult.convertToRecords()
        // Return recordResult

      case .failure(let error):
        // Failed to fetch record with NowDataError
    }
  }
}
```

NowTableService - record(with sysId: SysID, from tableName: String, configuration: FieldReadConfiguration? = nil)

Creates a publisher to retrieve a specified record from the specified table on a ServiceNow instance.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function `convertToRecords()` to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Data, NowDataError>	Success: Data object containing the specified records.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to create a function that retrieves the specified record from the specified table, with the specified fields. The output of the call is a ByteArray which allows you to convert the data into any model that you want.

```
tableService.record(with: sysId, from: tableName, configuration:
 fetchConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecord()
    .sink { completion in
        if case let .failure(error) = completion {
            print("Record retrieval failed with NowDataError:
 \(error)")
        }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    } receiveValue: { record in
        print("Successfully retrieved record: \(record)")
    }
    .store(in: &subscriptions)
```

NowTableService - records(from tableName: String, configuration: FetchConfiguration? = nil) async throws

Retrieves records from the specified table.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the specified records.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	Thrown when an attachment fails validation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `badResponse(statusCode: HTTPStatusCode)` ○ *`HTTPStatusCode`*: Status code received from the instance. Thrown when a request returns an unexpected response • `cannotDecodeModel(DecodingError)` ○ *`DecodingError`*: Decoding error detected. Thrown when a Codable model cannot be decoded from JSON. • `cannotDecodeProperty(type: Any, from: String)` ○ *`type`*: Wrapped type to decode from a string. ○ *`from`*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *`EncodingError`*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this method.

```
func fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = [], limit: Int?) {
    let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
    let config = FetchConfiguration(Filter(query: filterQuery),
 limit, readConfig)
    do {
      let dataResult: Data = try await
 tableService.records(from: tableName, configuration: config)
      let recordResult: [NowRecord] =
 dataResult.convertToRecords()
      // return recordResult
    } catch {
      print("Fetch failed with NowDataError: \(error)")
      throw error
  }
}
```

NowTableService - records(from tableName: String, configuration: FetchConfiguration? = nil, completion: @escaping (Result<Data, NowDataError>))

Retrieves records from a specified table and then executes the *`completion`* handler after the records are retrieved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myResult.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
in tableName	String	Name of the table in which to write the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.
completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the records are retrieved. Return values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. ○ `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. ○ `missingServiceConfiguration` Thrown when an expected service configuration is missing. ○ `missingSysID` Thrown when an expected sys_id parameter is missing. ○ `network(NetworkServiceError)` ▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func fetchTableRecords( tableName: String, filterQuery: String,
 includeFields: [FieldName] = [FieldName](), readOptions:
 FieldReadConfiguration.Options = [], limit: Int?) {
  let readConfig = FieldReadConfiguration(includeFields:
 includeFields, options: readOptions)
  let config = FetchConfiguration(Filter(query: filterQuery),
 limit, readConfig)
  tableService.records (from: tableName, configuration:
 fetchConfiguration) { [weak self] result in
    switch result {
      case .success(let dataResult):
        let recordResult: [NowRecord] =
 dataResult.convertToRecords()
        // return recordResult

      case .failure(let error):
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        // Failed to fetch record with NowDataError
    }
  }
}
```

NowTableService - records(from tableName: String, configuration: FetchConfiguration? = nil)

Creates a publisher that enable you to retrieve records from the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

For large result sets, use the NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil) function to fetch paginated results.

Parameters

Name	Type	Description
from tableName	String	Name of the table from which to retrieve the records, such as *incident*.
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Data, NowDataError>	Success: Data object containing the specified records.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	Thrown when there is an error in the access token.
	
	• `attachmentValidation`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	Thrown when an attachment fails validation.
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	Thrown when a request returns an unexpected response
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	Thrown when a Codable model cannot be decoded from JSON.
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	Thrown when a string-wrapped value cannot be decoded from JSON.
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	Thrown when a Codable model cannot be encoded to JSON.
	• `cannotParseResponse`
	Thrown when a response from the instance cannot be parsed into its expected format.
	• `invalidURL`
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	• `missingAttachmentMetadata`
	Thrown when the attachment metadata header is missing.
	• `missingServiceConfiguration`
	Thrown when an expected service configuration is missing.
	• `missingSysID`
	Thrown when an expected sys_id parameter is missing.
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to create a function that fetches multiple records from a specified table. It creates an object which will schedule the request to be executed at some point in the future and return a ByteArray response.

```
tableService.records(from: tableName, configuration:
 fetchConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecords()
    .sink { completion in
        if case let .failure(error) = completion {
            print("Record retrieval failed with NowDataError:
 \(error)")
        }
    } receiveValue: { records in
        print("Successfully retrieved records: \(records)")
    }
    .store(in: &subscriptions)
```

NowTableService - update<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder = .default, writeOptions: FieldWriteOptions? = nil, configuration: FetchConfiguration? = nil) async throws

Updates the specified Codable model in the specified table.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` model to update in the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.
coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance. Possible values: • default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`. • custom(JSONEncoder, JSONDecoder): Use `custom` coders to have more fine-grained control on JSON decoding/encoding.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Model	Returned when the method is successful. Decodable model that was updated in the specified table.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response

```
    var name: String}

func updateUser(user: User) async throws -> User {
    do {
        let result = try await tableService.update(user, in:
 “sys_user”)
        return result
    } catch {
        print("Update failed with NowDataError: \(error)")
        throw error
    }
}
```

NowTableService - update<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder = .default, writeOptions: FieldWriteOptions? = nil, configuration: FetchConfiguration? = nil, completion: @escaping (Result<Model, NowDataError>))

Updates the specified Codable model in the specified table and then executes the *`completion`* handler.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` model to update in the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`
		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}

let user = User(sysId: "12345", name: "abel")
let coder: Coder = .default

tableService.update(user, in: "sys_user") { [weak self] result
 in
  switch result {
    case .success(let model):
      do {
        let data = try coder.jsonEncoder.encode(model)
        self?.publish(data: data)
      } catch {
        self?.publish(result: .failure(error))
      }
    case .failure(let error):
      // Failed to update with NowDataError
      self?.publish(result: .failure(error))
  }
}
```

NowTableService - update<Model: SysIdentifiableModel>(_ model: Model, in tableName: String, coder: Coder = .default, writeOptions: FieldWriteOptions? = nil, configuration: FetchConfiguration? = nil)

Updates the specified codable model in the specified table.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

Parameters

Name	Type	Description
model	Model	`SysIdentifiableModel` model to update in the table.
in tableName	String	Name of the table in which to write the records, such as *incident*.

coder	Coder	Optional. `Coder` to use to encode or decode data sent to and received from the ServiceNow instance.
		
		Possible values:
		• default: The default encoders format dates using the `yyy-MM-dd HH:mm:ss` format by using the device `Locale` and `TimeZone`.
		• custom(JSONEncoder, JSONDecoder):
		
		Use `custom` coders to have more fine-grained control on JSON decoding/encoding.
		
		Only use this enumeration to supply your own `JSONEncoder` and `JSONDecoder`, for example when using special date formats, time zones, or locales.
		`let myEncoder = JSONEncoder()`
		`myEncoder.dateFormat = …`
		`let myDecoder = JSONDecoder()`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		`myDecoder.dateFormat = …`
		`let coder: Coder = .custom(myEncoder, myDecoder)`
		
		Default: .default

writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Model, NowDataError>	Success: Decodable models that were updated in the specified table.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *type*: Wrapped type to decode from a string. ○ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

The following code example shows how to call this method.

```
struct User: SysIdentifiableModel {
  var sysId: String = ""
  var name: String
}

let user = User(sysId: "12345", name: "abel")
let coder: Coder = .default

tableService.update(user, in: "sys_user")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { [weak self] completion in
    if case let .failure(error) = completion {
      // Failed to update with NowDataError
      self?.publish(result: .failure(error))
    }
  } receiveValue: { [weak self] updatedModel in
    do {
      let data = try coder.jsonEncoder.encode(updatedModel)
      self?.publish(data: data)
    } catch {
      // Failed to update with NowDataError
      self?.publish(result: .failure(error))
    }
  }
  .store(in: &subscriptions)
```

NowTableService - updateRecord(sysId: SysID, in tableName: String, withfields: [FieldName: FieldValue], writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil) async throws

Updates the specified record with the specified fields.

You can decode the data into a custom Codable model, or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description
Data	Returned when the method is successful. Data object containing the updated record.

NowDataError	Thrown when the method fails.
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`
	  ○ *`type`*: Wrapped type to decode from a string.
	  ○ *`from`*: String to decode to the specified type.
	
	  Thrown when a string-wrapped value cannot be decoded from JSON.
	
	• `cannotEncodeModel(EncodingError)`
	  ○ *`EncodingError`*: Encoding error detected.
	
	  Thrown when a Codable model cannot be encoded to JSON.
	
	• `cannotParseResponse`
	
	  Thrown when a response from the instance cannot be parsed into its expected format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	• `invalidURL`
	
	Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string.
	
	• `missingAttachmentMetadata`
	
	Thrown when the attachment metadata header is missing.
	
	• `missingServiceConfiguration`
	
	Thrown when an expected service configuration is missing.
	
	• `missingSysID`
	
	Thrown when an expected sys_id parameter is missing.
	
	• `network(NetworkServiceError)`
	  ○ genericError(String)
	  ○ operationCanceled
	  ○ serviceDisabled
	  ○ serverError(Error)
	  ○ systemError(Error)
	
	Thrown when a network service encountered an error.

The following code examples shows how to call this method.

```
do {
    let dataResult: Data = try await
 tableService.updateRecord(with: fields, in: tableName,
 writeOptions: writeOptions, configuration: configuration)
    let recordResult: NowRecord = dataResult.convertToRecord()
} catch {
    print("Record update failed with NowDataError: \(error)")
}
```

NowTableService - updateRecord(sysId: SysID, in tableName: String, with fields: [FieldName: FieldValue], writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil, completion: @escaping (Result<Data, NowDataError>)

Updates the specified record with the specified fields then executes the *`completion`* handler once the record is saved.

If needed, you can decode the return results into a custom Codable model or you can use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function instead. Alternatively, you can use the convenience function *`convertToRecords()`* to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myResult.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

completion	@escaping (Result<Data, NowDataError>)	Completion handler to execute after the records are retrieved.
		
		Return values:
		• Success: Data - Requested records
		• Error: NowDataError
		  ○ `accessToken(AccessTokenProviderError)`
		  ▪ *`AccessTokenProviderError`*: The access token provider's error code or message.
		  ▪ accessTokenRetrievalFailed
		  ▪ userSessionError(_ error: Error)
		  Thrown when there is an error in the access token.
		  ○ `attachmentValidation`
		  Thrown when an attachment fails validation.
		  ○ `badResponse(statusCode: HTTPStatusCode)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		▪ genericError(String) ▪ operationCanceled ▪ serviceDisabled ▪ serverError(Error) ▪ systemError(Error) Thrown when a network service encountered an error.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
tableService.updateRecord(sysId: sysId, in: tableName,
 with: fields, writeOptions: writeOptions, configuration:
 readConfiguration) { [weak self] result in
  switch result {
    case .success(let data):
      self?.publish(data: data)
    case .failure(let error):
       // Failed to update with NowDataError
  }
}
```

NowTableService - updateRecord(sysId: SysID, in tableName: String, withfields: [FieldName: FieldValue], writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil)

Updates the specified record with the specified fields.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

The publisher emits data that you can decode into a custom Codable model, or you can also use the NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil) function. Alternatively, you can use the convenience function `convertToRecords()` to transform data into a NowRecord object. The following shows how to convert a publisher to emit NowRecords:

```
let dataPublisher: AnyPublisher<Data, NowDataError> = ...
let recordsPublisher: AnyPublisher<[NowRecord], NowDataError> =
 myPublisher.convertToRecords()
```

Note: All fields within a record may not be available for update. For example, fields that have a prefix of `sys_` are typically system parameters that are automatically generated and cannot be updated. Fields that are not specified and not auto-generated by the system are set to the associated data type's null value.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysId	String	Sys_id of the record to return from the ServiceNow instance.
with fields	[FieldName: FieldValue]	Name-value pairs of the fields to include in the record.
in tableName	String	Name of the table in which to write the records, such as *incident*.
writeOptions	FieldWriteOptions	Optional. Configuration options to apply to the data being written to the record. Default: nil
configuration	FetchConfiguration	Optional. Configuration to apply to the retrieved records, including filters that define the records to return, pagination page size limit, which fields to retrieve, and what to include in the fields. Default: nil - All records returned.

Returns

Type	Description

AnyPublisher<Data, NowDataError>	Success: Data object containing the updated record.
	
	Failure: NowDataError
	
	• `accessToken(AccessTokenProviderError)`
	  ○ *`AccessTokenProviderError`*: The access token provider's error code or message.
	  ▪ accessTokenRetrievalFailed
	  ▪ userSessionError(_ error: Error)
	
	  Thrown when there is an error in the access token.
	
	• `attachmentValidation`
	
	  Thrown when an attachment fails validation.
	
	• `badResponse(statusCode: HTTPStatusCode)`
	  ○ *`HTTPStatusCode`*: Status code received from the instance.
	
	  Thrown when a request returns an unexpected response
	
	• `cannotDecodeModel(DecodingError)`
	  ○ *`DecodingError`*: Decoding error detected.
	
	  Thrown when a Codable model cannot be decoded from JSON.
	
	• `cannotDecodeProperty(type: Any, from: String)`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	○ *type*: Wrapped type to decode from a string. ○ *from*: String to decode to the specified type. Thrown when a string-wrapped value cannot be decoded from JSON. • `cannotEncodeModel(EncodingError)` ○ *EncodingError*: Encoding error detected. Thrown when a Codable model cannot be encoded to JSON. • `cannotParseResponse` Thrown when a response from the instance cannot be parsed into its expected format. • `invalidURL` Thrown when a URL cannot be formed. For example, if the string contains characters that are illegal in a URL or is an empty string. • `missingAttachmentMetadata` Thrown when the attachment metadata header is missing. • `missingServiceConfiguration` Thrown when an expected service configuration is missing. • `missingSysID` Thrown when an expected sys_id parameter is missing. • `network(NetworkServiceError)` ○ genericError(String) ○ operationCanceled ○ serviceDisabled ○ serverError(Error) ○ systemError(Error) Thrown when a network service encountered an error.

This example shows how to create a function that updates a record in the specified table, with the specified fields. The output of the call is a ByteArray which allows you to convert the data into any model that you want.

```
tableService.updateRecord(sysId: sysId, in: tableName,
 with: fields, writeOptions: writeOptions, configuration:
 readConfiguration)
    .subscribe(on: DispatchQueue.global())
    .receive(on: DispatchQueue.main)
    .convertToRecord()
    .sink { completion in
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        if case let .failure(error) = completion {
            print("Update failed with NowDataError: \(error)")
        }
    } receiveValue: { record in
        print("Record updated: \(record)")
    }
    .store(in: &subscriptions)
```

NowVoice API - iOS

`NowVoice` is a top-level global API for embedding voice agent sessions in iOS applications.

Use *`NowVoice`* to create a NowVoiceService for a given ServiceNow instance, then use that service to start and manage voice agent sessions.

For more information about configuring NowVoice, including prerequisites and call order, see Embed an AI voice agent with NowVoice.

NowVoice - makeVoiceService(instanceUrl: URL) async throws

Creates an instance of *`NowVoiceService`* for the specified ServiceNow instance.

Note: Call this function from an async context, after calling NowSDK.configure(with:). This function fetches instance settings over the network; call it when launching a voice session, not at app startup.

This function validates that voice is enabled on the ServiceNow instance and retrieves available endpoint configurations. It throws a `NowServiceError` if setup fails.

NowServiceError

Case	Description
`.sdkNotConfigured`	*`NowSDK.configure(with:)`* was not called before creating the service.
`.serviceConfigurationInvalid`	The provided *`instanceUrl`* is malformed or can't be used to build a service configuration.
`.serviceSettingsRetrievalFailed(SettingsError)`	A network or authentication error occurred while fetching instance settings.
`.serviceSettingsNotFound`	The instance does not have `sdk.voice` settings configured.
`.serviceSettingsInvalid`	The `sdk.voice.enabled` key is missing from the instance settings.
`.serviceDisabled`	Voice is turned off on the instance (`sdk.voice.enabled` is `false`).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance, such as `https://instancename.service-now.com`.

Returns

Type	Description
NowVoiceService	An initialized NowVoiceService ready to start voice sessions.

The following code example shows how to create an instance of NowVoiceService.

```
import NowVoice

let instanceUrl = URL(string:
 "https://your-instance.service-now.com")!

do {
    let voiceService = try await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)
} catch {
    // Handle NowServiceError
    print("Failed to create voice service: \(error)")
}
```

NowVoiceCallbacks structure - iOS

Specifies callbacks for voice session lifecycle and content events.

NowVoiceCallbacks - init(onMuteStateChanged: ((Bool) -> Void)?, onMessageReceived: ((NowVoiceTranscriptMessage) -> Void)?, onCallEnded: NowVoiceDismissHandler?, onCallMinimized: (() -> Void)?)

Creates a *`NowVoiceCallbacks`* instance with the specified voice session event handlers.

A `VoiceAgentError` is delivered as the second parameter of the *`onCallEnded`* callback.

VoiceAgentError

Case	Description
`.connectionTimeout`	The connection to the voice agent timed out.
`.connectionFailed`	A connection to the voice agent could not be established.
`.disconnectedUnexpectedly`	The connection dropped during an active session.
`.serverEnded`	The server terminated the session.

Parameters

Name	Type	Description
onMuteStateChanged	((Bool) -> Void)?	Called each time the user mutes or unmutes the microphone. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Bool parameter is `true` when the microphone is muted.
onMessageReceived	((NowVoiceTranscriptMessage) -> Void)?	Called each time a new transcript message arrives during the session.
onCallEnded	NowVoiceDismissHandler?	Called when the voice UI is dismissed. `public typealias NowVoiceDismissHandler = ( _ conversationId: String?, _ error: VoiceAgentError?, _ endedFromCallKitUI: Bool ) -> Void` • *conversationId*: Conversation ID. • *error*: Optional error containing the reason the call ended. • *endedFromCallKitUI*: `true` when the call was ended by the user from the iOS CallKit UI (lock screen or Dynamic Island). `false` for all in-app dismissals.
onCallMinimized	(() -> Void)?	Called when the voice session UI is minimized by the user (the call remains active in the background). Providing this callback is what surfaces the minimize button in the voice UI.

The following code example shows how to initialize a *NowVoiceCallbacks*. In each callback function, implement the desired functionality for handling the event.

```
let callbacks = NowVoiceCallbacks(
    onMuteStateChanged: { isMuted in
        // Update your UI to reflect the current mute state.
        print("Microphone muted: \(isMuted)")
    },
    onMessageReceived: { message in
        // Receive real-time transcript messages during the
 session.
        print("[\(message.role)]: \(message.content)")
    },
    onCallEnded: { conversationId, error, endedFromCallKitUI in
        // Called when the voice session ends.
        if let error {
            print("Session ended with error: \(error)")
        } else {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            print("Session complete. Conversation ID:
 \(conversationId ?? "unknown")")
        }
    },
    onCallMinimized: {
        // Called when the voice UI is minimized.
        print("Voice chat is minimized")
    }
)
```

NowVoiceDefaultTheme structure - iOS

The default implementation of *`NowVoiceThemeable`*.

Related topics

NowVoiceThemeable protocol - iOS

NowVoiceDefaultTheme - init(nowUITheme: NowUIThemeable)

Creates an instance of *`NowVoiceDefaultTheme`* using the specified *`NowUIThemeable`* as the source for voice UI colors.

Parameters

Name	Type	Description
nowUITheme	NowUIThemeable	Optional. Theme to use as the source for voice UI colors. Default: `NowUIDefaultTheme`

The following code example shows how to call this function.

```
// Use the default NowUI theme
let theme = NowVoiceDefaultTheme()

// Or derive voice UI colors from a custom NowUI theme
let customTheme = NowVoiceDefaultTheme(nowUITheme:
 MyNowUITheme())
```

NowVoiceEndpoint structure - iOS

Describes a voice agent endpoint.

A voice endpoint identifies the specific voice agent channel to connect to. Use *`NowVoiceService.configurations`* to obtain available *`NowVoiceEndpoints`*. Endpoints are retrieved from your ServiceNow instance's Mobile SDK settings. In most apps, there is a single endpoint.

Properties

Name	Type	Description
mobileChannelType	String	The mobile channel type for the endpoint.
mobileChannelId	String	The mobile channel identifier.
voiceServiceId	String	The unique identifier of the voice service.
voiceWebHookURL	String	The WebSocket webhook URL for the voice agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to retrieve an instance of *NowVoiceEndpoint* from *NowVoiceService.configurations*.

```
import NowVoice

let instanceUrl = URL(string:
 "https://your-instance.service-now.com")!

do {
    let voiceService = try await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl) //creates a
 NowVoiceService
} catch {
    // Handle NowServiceError
    print("Failed to create voice service: \(error)")
}

guard let endpoint = voiceService.configurations.first else {
    // No voice endpoints configured on this instance.
    return
}
```

NowVoiceService class - iOS

The *NowVoiceService* class manages voice agent sessions for a single ServiceNow instance.

Note: Initialize a *NowVoiceService* by calling NowVoice - makeVoiceService(instanceUrl: URL) async throws.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	The service configuration for the ServiceNow instance.
configurations	Array of NowVoiceEndpoints	List of available voice endpoint configurations retrieved from the instance.
isMuted	Bool	Flag that indicates the microphone mute state for the current call. Setting this property has no effect if no call is currently active. Valid values: • true: The microphone is muted. • false: The microphone is unmuted or no call is active.
voiceEnabled	Bool	Flag that indicates whether voice is enabled on the instance. Valid values: • true: Voice is enabled. • false: Voice is turned off.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
		Always `true` after a *`NowVoiceService`* is successfully initialized with makeVoiceService(instanceUrl:).

NowVoiceService - endCall()

Ends the current voice call.

Has no effect if no call is active.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
let voiceService = try? await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)
let endpoint = voiceService?.configurations.first

if let voiceService, let endpoint {
    if let vc = try? await voiceService.startVoice(endpoint:
 endpoint, theme: theme) {
        vc.modalPresentationStyle = .fullScreen
        present(vc, animated: true)
    }
}

// End a call on timeout, navigation, or from a custom hang-up
 button
voiceService?.endCall()
```

NowVoiceService - hasActiveCall()

Checks whether there is a currently active voice call.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether there is an active voice call. Valid values: • true: There is an active voice call. • false: There isn't an active voice call.

The following code example shows how to call this function.

```
let voiceService = try? await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)
let endpoint = voiceService?.configurations.first

if let voiceService, let endpoint {
    if let vc = try? await voiceService.startVoice(endpoint:
 endpoint, theme: theme) {
        vc.modalPresentationStyle = .fullScreen
        present(vc, animated: true)
    }
}

// Guard UI state or prevent starting a second call
if voiceService?.hasActiveCall() == true {
    // A voice call is currently in progress
}
```

NowVoiceService - startVoice(endpoint: NowVoiceEndpoint, uiConfiguration: NowVoiceUIConfiguration, callbacks: NowVoiceCallbacks, theme: NowVoiceThemeable) async throws

Creates a *`UIViewController`* containing the voice agent UI, ready to be presented in a modal.

The *`UIViewController`* manages the full voice session lifecycle, including teardown on dismissal.

This function fetches an OAuth access token automatically before launching the voice UI.

Parameters

Name	Type	Description
endpoint	NowVoiceEndpoint	The voice agent channel to connect to. Obtain from `NowVoiceService.configurations`. Endpoints are retrieved from your ServiceNow instance's Mobile SDK settings.
uiConfiguration	NowVoiceUIConfiguration	Optional. Presentation options for the voice agent UI. If omitted, uses the default values for *`NowVoiceUIConfiguration`*.
callbacks	NowVoiceCallbacks	Optional. Callbacks for voice session events. If omitted, events are silently ignored.
theme	NowVoiceThemeable	Optional. The visual theme applied to the voice UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: `NowVoiceDefaultTheme`

Returns

Type	Description
UIViewController	A UIViewController containing the full-screen voice agent interface. Present it in a modal. Set `modalPresentationStyle = .fullScreen` for the intended experience.

The following code example shows how to call this function.

```
import NowVoice

let instanceUrl = URL(string:
 "https://your-instance.service-now.com")!

let voiceService = try? await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)

guard let voiceService, let endpoint =
 voiceService.configurations.first else {
    // Either the service failed to initialize, or no voice
 endpoints are configured.
    return
}

// Launch the voice agent UI
let vc = try await voiceService.startVoice(
    endpoint: endpoint,
    uiConfiguration: NowVoiceUIConfiguration(
        hidesPostCallTranscript: false,
        shouldBlockTranscriptSharing: false
    ),
    callbacks: NowVoiceCallbacks(
        onMuteStateChanged: { isMuted in
            // Update your UI to reflect the current mute state.
            print("Microphone muted: \(isMuted)")
        },
        onMessageReceived: { message in
            // Receive real-time transcript messages during the
 session.
            print("[\(message.role)]: \(message.content)")
        },
        onCallEnded: { conversationId, error, endedFromCallKitUI
 in
            // Called when the voice session ends.
            if let error {
                print("Session ended with error: \(error)")
            } else {
                print("Session complete. Conversation ID:
 \(conversationId ?? "unknown")")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            }
        },
        onCallMinimized: {
            // Called when the voice UI is minimized.
            print("Voice chat is minimized")
        }
    ),
    theme: NowVoiceDefaultTheme()
)

//Present the voice agent UI in a full-screen modal
vc.modalPresentationStyle = .fullScreen
present(vc, animated: true)
```

NowVoiceService - toggleMute()

Toggles the microphone mute state of the current call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Bool	Flag that indicates the new microphone mute state for the current call. Valid values: • true: The microphone is now muted. • false: The microphone is now unmuted or no call is active.

The following code example shows how to call this function.

```
let voiceService = try? await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)

let endpoint = voiceService?.configurations.first

if let voiceService, let endpoint {
    if let vc = try? await voiceService.startVoice(endpoint:
 endpoint, theme: theme) {
        vc.modalPresentationStyle = .fullScreen
        present(vc, animated: true)
    }
}

// Wire to a custom mute button or auto-mute on backgrounding
voiceService?.toggleMute()

// Check mute state to update a custom mute button icon
let muted = voiceService?.isMuted ?? false
```

NowVoiceService - updateTheme(theme: NowVoiceThemeable)

Updates the visual theme of the currently active voice UI.

This function has no effect if no voice session is currently active. To apply a visual theme at voice session launch, provide a theme when calling startVoice(endpoint:uiConfiguration:callbacks:theme:).

Parameters

Name	Type	Description
theme	NowVoiceThemeable	The theme to apply to the active voice UI.

Returns

Type	Description
None	

The following code example updates the visual theme of the currently active voice UI.

```
import NowVoice

let instanceUrl = URL(string:
 "https://your-instance.service-now.com")!
let voiceService = try? await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)

struct MyVoiceTheme: NowVoiceThemeable { var color:
 NowUIColoring = MyAppColors()}

// Update the theme while a voice session is active
voiceService?.updateTheme(theme: MyVoiceTheme())
```

NowVoiceThemeable protocol - iOS

Sets the colors to apply to NowVoice UI elements.

To match the voice UI to your app's visual identity, create a type conforming to *NowVoiceThemeable* and pass it to NowVoiceService - startVoice(endpoint:uiConfiguration:callbacks:theme:) or NowVoiceService - updateTheme(theme:).

Properties

Name	Type	Description
color	NowUIColoring	Colors to apply to NowVoice UI elements.

This example shows how to apply custom app colors to the voice UI.

```
import NowVoice

let instanceUrl = URL(string:
 "https://your-instance.service-now.com")!

do {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    let voiceService = try await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)
} catch {
    // Handle NowServiceError (see Error reference below)
    print("Failed to create voice service: \(error)")
}

struct MyVoiceTheme: NowVoiceThemeable {
    var color: NowUIColoring = MyAppColors()
}

// Apply at voice session launch
let vc = try await voiceService.startVoice(endpoint: endpoint,
 theme: MyVoiceTheme())

// Or update while a voice session is active
voiceService.updateTheme(theme: MyVoiceTheme())
```

NowVoiceDefaultTheme structure - iOS

NowVoiceTranscriptMessage typealias - iOS

Represents a single message in the voice session transcript.

`NowVoiceTranscriptMessage` is a type alias for `TranscriptMessage`.

Properties

Name	Type	Description
role	String	The originator of the message. Typical values are `"user"` and `"assistant"`.
content	String	The text content of the message.

The following code example shows *`NowVoiceTranscriptMessage`* used with NowVoiceCallbacks.

```
onMessageReceived: { message in
    print("[\(message.role)]: \(message.content)")
}
```

NowVoiceUIConfiguration structure - iOS

Specifies presentation options for the voice agent UI.

NowVoiceUIConfiguration - init(hidesPostCallTranscript: Bool, shouldBlockTranscriptSharing: Bool)

Creates a *`NowVoiceUIConfiguration`* instance with the specified presentation options.

Parameters

Name	Type	Description
hidesPostCallTranscript	Boolean	Optional. Flag that indicates whether the post-call transcript summary screen is displayed or hidden when the session ends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: The post-call transcript summary screen is hidden. • false: The post-call transcript summary screen is displayed. Default: False
shouldBlockTranscriptSharing	Boolean	Optional. Flag that indicates whether the **Share** button is displayed or hidden on the transcript screen. Valid values: • true: The share button is hidden. • false: The share button is displayed. Default: False

The following code example shows how to create an instance of *`NowVoiceUIConfiguration`*.

```
let uiConfiguration = NowVoiceUIConfiguration(
    hidesPostCallTranscript: true,
    shouldBlockTranscriptSharing: true
)
```

NowWeb API - iOS

The *`NowWeb`* API is a top-level global API that enables uses to instantiate a NowWeb service instance.

NowWeb - makeWebService(instanceUrl: URL) async throws

Creates an instance of NowWebService using the previously specified configuration.

You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call *`NowSDK.configure()`* with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose web services are to be accessed by the service.

Returns

Type	Description
NowWebService	If successful, returns an initialized NowWebService object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
NowServiceError	Throws one of the following errors if the method fails. Possible values: • sdkNotConfigured • serviceConfigurationInvalid • serviceDisabled • serviceSettingsInvalid • serviceSettingsNotFound • serviceSettingsRetrievalFailed

The following code example shows how to call this method.

```
do {
    let service = try await NowWeb.makeWebService(instanceUrl:
 instanceUrl)
    self.webService = service
} catch {
    debugPrint("Web Service creation failed with error:
 \(error.localizedDescription)")
}
```

NowWeb - makeWebService(instanceUrl: URL, completion: @escaping ((Result<NowWebService, NowServiceError>) -> Void))

Creates an instance of NowWebService using the previously specified configuration. When finished, calls the specified completion handler.

You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call *`NowSDK.configure()`* with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose web services are to be accessed by the service.
completion	@escaping ((Result<NowWebS NowService Error>) -> Void)	Completion handler that is called with a `Result<NowWebService, NowServiceError>` containing either an initialized `NowWebService` instance or a `NowServiceError` indicating why the initialization failed.

Returns

Type	Description
None	

```
func initializeNowSDK(userEmail: String) {
  currentUser = userEmail
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let sdkConfig = NowSDKConfiguration(authorizationProvider:
 self, permissionDelegate: self, logLevel: .debug)

  do {
      try NowSDK.configure(with: sdkConfig)
      configureAnalytics()
  } catch {
      debugPrint("Could not initialize NowSDK. Error:
 \(error.localizedDescription)")
  }
}
```

NowWeb - makeWebService(instanceUrl: URL)

Creates an instance of NowWebService using the previously specified configuration.

Note: This method has been deprecated. You should use the async/await implementation of the method instead.

You must initialize the SDK prior to calling this function or the completion block is called with a `sdkNotConfigured` error. To initialize the SDK, call *`NowSDK.configure()`* with the desired configuration.

Parameters

Name	Type	Description
instanceUrl	URL	URL of the ServiceNow instance whose web services are to be accessed by the service.

Returns

Type	Description
AnyPublisher<NowWebService, NowServiceError>	If successful, returns an initialized NowWebService object. If it fails, returns a NowServiceError object.

```
func initializeWebService() {
  NowWeb.makeWebService(instanceUrl: instanceUrl)
    .sink { completion in
      if case .failure(let error) = completion {
        debugPrint("Web Service creation failed with error:
 \(error.localizedDescription)")
      }
    } receiveValue: { [weak self] service in
        self?.webService = service
    }
    .store(in: &subscriptions)
  }
```

NowWebColoring protocol - iOS

The *`NowWebColoring`* protocol provides default values for the colors used within web pages hosted on your ServiceNow instance in a native web view.

The colors specified in the table below define the default web interface colors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Name	Description
alertCritical0	Background color applied to the error banner. Default dark color: #7B1E28 Default light color: #F8C8CD
alertCritical3	Text color applied to the error text banner. Default dark color: #E46876 Default light color: #B61C2D
alertLow0	Background color applied to the info banner. Default dark color: #DBDBDE Default light color: #DBDBDE
alertPositive0	Background color of the banner that displays success messages. Default dark color: #CADFC0 Default light color: #CADFC0
alertPositive3	Text color of the banner that displays success messages. Default dark color: #3B7F00 Default light color: #3B7F00
alertWarning0	Background color applied to the warning banner. Default dark color: #FBF7BF Default light color: #FBF7BF
backgroundPrimary	Background color applied to the view containing the web view. Default dark color: #07080B Default light color: #FFFFFF
brand	Color applied to the activity indicator shown while loading pages. Default dark color: #302F4B Default light color: #302F4B
primary	Tint color applied to action sheet on the web screen. Default dark color: #8486FF Default light color: #4F52BD
screenHeaderBackground	Text color applied to button badges. This color is also applied to a thin border around the badge.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description
	Default dark color: #CADFC0 Default light color: #CADFC0
screenHeaderText	• Text color applied to button badges • Tint color applied to disabled navigation bar buttons, banner text, and banner icon tint on the web screen. Default dark color: #FFFFFF Default light color: #FFFFFF
textActionble	Text color for action button. Default dark color: #07080B Default light color: #FFFFFF
textPrimary	Text color applied to font. Default dark color: #FFFFFF Default light color: #151920
webPageThemeId	Sys_id of the theme to apply to the ServiceNow web pages loaded by *`NowWeb`*. Default: Configured default theme Table: Located in the UX Theme [sys_ux_theme] table.
webPageThemeVariantId	Sys_id of the theme variant to apply to the ServiceNow web pages loaded by *`NowWeb`*. Default: Configured default theme variant Table: Located in the UX Style [sys_ux_style] table.

The following shows the default colors used for *`NowWebColoring`*. You can override any or all of these colors.

```
public extension NowWebColoring {
    var brand: UIColor { nowUIColor.brand }
    var primary: UIColor { nowUIColor.primary }
    var textPrimary: UIColor {
        nowUIColor.textPrimary.withAlphaComponent(0.25)
    }
    var screenHeaderText: UIColor
 { nowUIColor.screenHeaderText }
    var screenHeaderBackground: UIColor
 { nowUIColor.screenHeaderBackground }
    var textActionble: UIColor {
        nowUIColor.textActionable
```

```
    }
    var alertCritical0: UIColor { nowUIColor.alertCritical0 }
    var alertCritical3: UIColor { nowUIColor.alertCritical3 }
    var alertPositive0: UIColor { nowUIColor.alertPositive0 }
    var alertPositive3: UIColor { nowUIColor.alertPositive3 }
    var alertLow0: UIColor { nowUIColor.alertLow0 }
    var alertWarning0: UIColor { nowUIColor.alertWarning0 }
    var backgroundPrimary: UIColor
 { nowUIColor.backgroundPrimary }
}
```

NowWebService class - iOS

The *`NowWebService`* class provides functions that enable the browsing of web pages on a ServiceNow instance.

Properties

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when initializing the NowWebService instance.

NowWebService - init(configuration: NowServiceConfiguration, coreServiceProvider: NowCoreServiceProviding? = nil)

Initializes a NowWebService instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
configuration	NowServiceConfiguration	Configuration parameters to use when initializing the NowWebService instance.
coreServiceProvider	NowCoreServiceProviding	Optional. Service provider to associate with the NowWebService instance. Default: nil

The following code example shows how to call this method.

```
guard let coreService = NowSDK.core() else {
  // Error with NowServiceError.sdkNotConfigured
  return
}
guard
  let instanceUrl = URL(string:
 "http://sample.service-now.com") ,
  let serviceConfig = NowSDK.makeServiceConfiguration(for:
 instanceUrl) else {
    // Could not create service -
    // NowServiceError.serviceConfigurationInvalid
    return
}

let webService = NowWebService(configuration: serviceConfig,
 coreServiceProvider: coreService)
```

NowWebService - makeWebViewController(for url: URL, delegate: NowWebViewControllerDelegate, theme: NowWebThemeable)

Creates a UIViewController object that hosts the web view.

Parameters

Name	Type	Description
for url	URL	URL of the web page to load. This web page must be on the target ServiceNow instance that the service was initialized with.
delegate	NowWebViewControllerDelegate	Optional. Object that receives callback events from the WebViewController into the native application.
theme	NowWebThemeable protocol - iOS	Optional. NowUIThemeable protocol to apply to the UI elements of the view controller, such as color. Default: NowWebDefaultTheme(nowUITheme: NowUIDefaultTheme())

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Result<NowWebViewController, NowWebServiceError>	Success: NowWebViewController object Failure: NowWebServiceError object

```
private func webViewController(for url: URL) ->
 NowWebViewController? {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
    return nil
  }

  let result = webService.makeWebViewController(for:
 url, delegate: self, theme: CarrascoWebTheme(nowUITheme:
 CarrascoTheme()))
  switch result {
    case .success(let viewController):
      return viewController
    case .failure(let error):
      debugPrint("Web view creation failed with error:
 \(error.localizedDescription)")
  }
  return nil
}
```

NowWebService - preloadWebCache(urls: [URL], completion: PreloadWebCacheCompletion? = nil) throws

Preloads a list of specified pages with cacheable resources in the background (by NowWeb) to improve initial load times.

Parameters

Name	Type	Description
urls	Array of URL objects	URLs of the pages to preload.
completion	PreloadWebCacheCompletion	Optional closure to inform the caller that the web pages have completed loading.

Returns

Type	Description
None	

The following example shows how to use the *`webService.preloadWebCache()`* function to pre-load specified pages.

```
private func preloadURLs(urls: [URL]) {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    return
  }
  do {
       try webService.preloadWebCache(urls: urls) {
         debugPrint("URLs did complete preloading")
       }

  } catch {
      debugPrint(error.localizedDescription)
  }
}
```

NowWebThemeable protocol - iOS

The *NowWebThemeable* protocol provides properties that enable you to override the colors used within web pages hosted on your ServiceNow instance in a native web view.

```
public protocol NowWebThemeable {
    var color: NowWebColoring { get }
}
```

The NowWebColoring protocol contains *NowUIColoring*. This property is used to reference default color variables that *NowWebThemeable* can use.

For additional information on how to theme the UI, see Use NowUIColoring to theme NowWebTheme and NowChatTheme in the Mobile SDK Developer Guide - iOS.

Define WebColors using default colors

```
/// Sample structure for using default colors that come with
 Mobile SDK.
struct WebColors: NowUIColoring {
}
```

Define WebColors using custom colors

```
/// Use custom colors with light theme
struct WebColors: NowUIColoring {
    private var defaultTheme: NowWebDefaultTheme
 { NowWebDefaultTheme(nowUITheme: NowUIDefaultTheme())
    }

    var brand: UIColor { lightBrand }
    var primary: UIColor { lightPrimary }
    var textPrimary: UIColor { lightTextPrimary }
    var screenHeaderText: UIColor { lightScreenHeaderText }
    var screenHeaderBackground: UIColor
 { lightScreenHeaderBackground }
    var textActionable: UIColor { lightTextActionable }
    var alertCritical0: UIColor { lightAlertCritical0 }
    var alertCritical3: UIColor { lightAlertCritical3 }
    var alertPositive0: UIColor { lightAlertPositive0 }
    var alertPositive3: UIColor { lightAlertPositive3 }
    var alertLow0: UIColor { lightAlertLow0 }
    var alertWarning0: UIColor { lightAlertWarning0 }
    var backgroundPrimary: UIColor { lightBackgroundPrimary }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // Light Colors
    var lightBrand: UIColor { defaultTheme.color.brand }
    var lightPrimary: UIColor { defaultTheme.color.primary }
    var lightTextPrimary: UIColor
 { defaultTheme.color.textPrimary }
    var lightScreenHeaderText: UIColor
 { defaultTheme.color.screenHeaderText }
    var lightScreenHeaderBackground: UIColor
 { defaultTheme.color.screenHeaderBackground }
    var lightTextActionable: UIColor
 { defaultTheme.color.textActionble }
    var lightAlertCritical0: UIColor
 { defaultTheme.color.alertCritical0 }
    var lightAlertCritical3: UIColor
 { defaultTheme.color.alertCritical3 }
    var lightAlertPositive0: UIColor
 { defaultTheme.color.alertPositive0 }
    var lightAlertPositive3: UIColor
 { defaultTheme.color.alertPositive3 }
    var lightAlertLow0: UIColor { defaultTheme.color.alertLow0 }
    var lightAlertWarning0: UIColor
 { defaultTheme.color.alertWarning0 }
    var lightBackgroundPrimary: UIColor
 { defaultTheme.color.backgroundPrimary }
}
```

Define WebTheme structure with NowWebThemeable protocol

```
struct CarrascoWebTheme: NowWebThemeable {
    var color: NowWebColoring

    struct Color: NowWebColoring {
        var nowUIColor: NowUIColoring

        var alertPositive0: UIColor
        var alertPositive3: UIColor
        var alertLow0: UIColor
        var alertWarning0: UIColor
        var backgroundPrimary: UIColor

        init(inputs: WebColors) {
            nowUIColor = ThemeColor(inputs)

            alertPositive0 = inputs.alertPositive0
            alertPositive3 = inputs.alertPositive3
            alertLow0 = inputs.alertLow0
            alertWarning0 = inputs.alertWarning0
            backgroundPrimary = inputs.backgroundPrimary
        }
    }

    public init(webColors: WebColors) {
        color = Color(inputs: webColors)
    }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instantiate a WebTheme object by passing WebColor as input

```
let webTheme = CarrascoWebTheme(webColors: WebColors())
```

Pass a WebTheme object to NowWebService.makeWebViewController

```
func webViewController(for url: URL, delegate:
 NowWebViewControllerDelegate) -> NowWebViewController? {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
    return nil
  }
  let result = webService.makeWebViewController(for: url,
 delegate: delegate, theme: CarrascoWebTheme(webColors:
 WebColors()) )

  switch result {
  case .success(let viewController):
    return viewController
  case .failure(let error):
    debugPrint("Web view creation failed with error:
 \(error.localizedDescription)")
  }
  return nil
}
```

NowWebViewController class - iOS

The *NowWebViewController* class provides functions that enable you to manage a web viewer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowWebViewController - loadPage()

If the request is authenticated, starts loading the initial URL provided during instantiation using the `makeWebViewController()` method.

If the request fails authentication, the method `nowWebViewController(_:didFailNavigationWith:)` is called on the delegate that was passed when instantiating the object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this function.

```
private func openScreen(_ screen: ArticleListViewModel.Screen) {
  switch screen {
  case .articleDetail(let sysId):
    guard let url = URL(string:
 "/mesp?id=me_kb_view&sys_kb_id=\(sysId)"), let
 webViewController = webViewController(for: url) else {
      debugPrint("Could not create web view")
      return
    }
    webViewController.loadPage()
    navigationController?.pushViewController(webViewController,
 animated: true)
  }
}
```

NowWebViewController - updateTheme(themeColors: NowWebThemeable)

Updates the NowWebView theme with the specified UI theme. Use this function to update the web UI theme after it has been initially set using the `makeWebViewController()` function, such as when changing the theme from light to dark.

Parameters

Name	Type	Description
themeColors	NowWebThemeable	Theme to update the web UI with.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to update a light UI theme implemented using the *makeWebViewController()* function to the dark UI theme using the *updateTheme()* function.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, systemThemeDidChange traitCollection:
 UITraitCollection) {
  // The systemThemeDidChange delegate method can be used to
 call updateTheme() to apply theme changes when the system theme
 changes.
  nowWebViewController.updateTheme(themeColors:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowWebTheme() : LightNowWebTheme())
}
```

NowWebViewControllerDelegate protocol - iOS

The *NowWebViewControllerDelegate* protocol provides callbacks for notification of issues within the *NowWebViewController* processing such as when a flow ends or a navigation fails.

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, didEndFlow flowName: String)

Callback that notifies the host application that the specified Cabrillo (mobile web) flow has ended.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController where the flow ended.
didEndFlow flowName	String	Name of the Cabrillo flow that ended

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, didEndFlow flowName: String) {
  debugPrint("ended flow named: \(flowName)")
}
```

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, didFailNavigationWith error: Swift.Error)

Callback that notifies the host application that the web view navigation has failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController in which the navigation failed.
didFailNavigationWith error	Swift.Error	Error raised from the navigation failure.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, didFailNavigationWith error: Error) {
  debugPrint("NowWebViewController encountered a navigation
 error: \(error.localizedDescription)")
}
```

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, didReceive unsupportedUrl: URL)

Callback that notifies the host application that the web view attempted to load an unsupported URL.

An unsupported URL could be one for a different ServiceNow instance or an absolute URL with an invalid scheme.

Note: Valid schemes are http and https.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController used when attempting to load the unsupported URL.
didReceive unsupportedUrl	URL	Invalid URL trying to be loaded.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, didReceive unsupportedUrl: URL) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  debugPrint("nowWebViewController:receivedUnsupportedUrl:
 \(unsupportedUrl.absoluteString)")
}
```

NowWebViewControllerDelegate - nowWebViewControllerDidRequestDismissal(_ nowWebViewController: NowWebViewController)

Callback that notifies the host application that during a back navigation attempt, the stack was exhausted. The host application can then decide whether to dismiss the NowWebViewController instance.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController in which the back navigation was attempted.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
func nowWebViewControllerDidRequestDismissal(_
 nowWebViewController: NowWebViewController) {
  navigationController?.popViewController(animated: true)
}
```

NowWebViewControllerDelegate - nowWebViewController(_ nowWebViewController: NowWebViewController, systemThemeDidChange traitCollection: UITraitCollection)

Callback that notifies the host application that the system web UI theme changed.

Parameters

Name	Type	Description
nowWebViewController	NowWebViewController	Instance of NowWebViewController in which the web UI theme changed.
traitCollection	UITraitCollection	UITraitCollection object that contains the new theme.

Returns

Type	Description
None	

The following code example shows how to override the *systemThemeDidChange()* delegate function to call the *updateTheme()* function to apply theme changes when the system theme changes.

```
func nowWebViewController(_ nowWebViewController:
 NowWebViewController, systemThemeDidChange traitCollection:
 UITraitCollection) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  /// Called when the system changes between dark and light mode

    /// You can call the corresponding updateTheme() method here
 to change the UI theme based on System Theme
    nowWebViewController.updateTheme(themeColors:
 traitCollection.userInterfaceStyle == .dark ?
 DarkNowWebTheme() : LightNowWebTheme())
      print("System Theme Did Change)
}
```

Paginator API - iOS

The *Paginator* class provides methods for iterating through a record set returned by a call to the ServiceNow *Table* API through the NowTableService. It is the object that is returned by the NowTableService *paginator()* methods. Do not call this method outside of that environment.

Properties

Name	Type	Description
hasNext	Boolean	Flag that indicates whether there is a next page to fetch. Valid values: • true: Next page is available. • false: Next page is not available.
hasPrevious	Boolean	Flag that indicates whether there is a previous page to fetch. Valid values: • true: Previous page is available. • false: Previous page is not available.
isBusy	Boolean	Flag that indicates whether the Paginator object is busy fetching data. Valid values: • true: Publisher is busy. • false: Publisher is not busy.
isFinished	Boolean	Flag that indicates whether the Paginator object is finished. When the paginator is configured to finish, the Paginator object's publisher finishes when the last page has been fetched. A Paginator object cannot fetch any pages after it finishes. For additional information, see the description of the *publisherShouldFinish* parameter. Valid values: • true: Publisher is finished. • false: Publisher is not finished.
itemsPerPage	Integer	Number of items to fetch per page. Default: 20
numberOfPages	Integer	Total number of pages within the record set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Type	Description
		When the Paginator object has not yet fetched any pages, this parameter is set to `Int.max`. After an initial request has been made to the ServiceNow instance, the number of pages is updated to the actual number of pages received from the ServiceNow instance.
page	Integer	Current page within the paginated record set.
publisher	String	Publisher that supplies the stream of paginated data to the subscribers. **Note:** By default, the publisher does not finish. To change this behaviour, set the *`publisherShouldFinish`* property to `true`.
publisherShouldFinish	Boolean	Flag that indicates whether to stop the Paginator object's publisher when the last page has been fetched. A Paginator object cannot fetch any pages after it finishes. Valid values: • true: Once the last page is fetched, the publisher is released from providing additional data. The *`reset()`* method is no longer functional. • false: The publisher is never finished and all methods are fully operational regardless of navigation. Default: false

Paginator - first() throws

Fetches the first page of the return results.

If this method can't fetch the first page, it throws a `PaginationError`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
class PaginatorTestViewModel<T: JSONRepresentable>:
 ObservableObject {
  @Published var result: Result<String, Error>?
  private let paginator: Paginator<T>
  private var subscriptions = Set<AnyCancellable>()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  init(paginator: Paginator<T>) {
    self.paginator = paginator
    subscribeToPaginator()
  }

  private func subscribeToPaginator() {
    paginator.publisher
      .receive(on: DispatchQueue.main)
      .sink { [weak self] comp in
        if case .failure(let error) = comp {
          self?.result = .failure(error)
        }
      } receiveValue: { [weak self] jsonRepresentable in
        self?.result
 = .success(jsonRepresentable.jsonDescription)
      }
      .store(in: &subscriptions)
  }

  func first() {
    result = nil
    do {
      try paginator.first()
    } catch {
      self.result = .failure(error)
    }
  }
}
```

Paginator - last() throws

Fetches the last page of the return results.

If this method can't fetch the last page, it throws a `PaginationError`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
…
func last() {
  result = nil
  do {
    try paginator.last()
  } catch {
    self.result = .failure(error)
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}
...
```

Paginator - next() throws

Fetches the next page of the return results.

If there are no more pages to fetch, the method throws a `PaginationError`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
...
func next() {
  result = nil
  do {
    try paginator.next()
  } catch {
    self.result = .failure(error)
  }
}
...
```

Paginator - previous() throws

Fetches the previous page of the return results.

If the method can't fetch the previous page, it throws a `PaginationError`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
...
func previous() {
  result = nil
  do {
    try paginator.previous()
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  } catch {
    self.result = .failure(error)
  }
}
...
```

Paginator - reset()

Resets the Paginator back to the first page but doesn't return the first page of the return results.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following code example shows how to call this method.

```
...
func reset() {
  result = nil
  paginator.reset()
}
...
```

REST API reference

Use REST interfaces to access data on your instance.

Account API

The *Account* API provides endpoints to retrieve Customer Service Management (CSM) account records.

This API requires the Case Management Core plugin (com.sn_customerservice) and is provided within the now namespace.

Users require the csm_ws_integration role for full API access.

Account - GET /now/account

Retrieves a specified set of Customer Service Management (CSM) accounts.

URL format

Versioned URL: `/api/now/{api_version}/account`

Default URL: `/api/now/account`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the *`sysparm_offset`* parameter to paginate record retrieval. In the response, the boolean parameter *`hasMore`* is returned. It indicates whether there are more records to return that meet the filter criteria. Data type: Number Default: 10
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. For example: `sysparm_query=caller_id=javascript:gs.getUserID()^active=true` The encoded query supports *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in *`sysparm_query`*. For example, `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory` filters all active records and orders the results in ascending order by number first, and then in descending order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores the invalid part. It then returns rows using only the valid portion of the query. You can control this behavior using the property *`glide.invalid_query.returns_no_rows`*. Set this property to true to return no rows on an invalid query.

Query parameters (continued)

Name	Description
	Note: The *glide.invalid_query.returns_no_rows* property controls the behavior of all queries across the instance, such as in lists, scripts (*GlideRecord.query()*), and web service APIs. Data type: String

Request body parameters (XML or JSON)

Element	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description
account_code	Unique combination of values that an application uses to identify budget forecasts and budget plans. Data type: String Maximum length: 255
account_parent	Sys_id of the parent account of this account. Located in the Account [customer_account] table. Data type: String
account_path	Path from the parent to the child accounts in the account hierarchy. Data type: String Maximum length: 255
active_escalation	Sys_id of the active escalation associated with the account. Data type: String Table: Escalation [sn_customerservice_escalation]
apple_icon	Icon for iPhone home page bookmarks. Data type: Image
banner_image	Banner image that appears on the customer portal. Data type: Image
banner_image_light	Small banner image. Data type: Image
banner_text	Banner text that appears on the customer portal. Data type: String Maximum length: 4,000
city	City in which the company that is associated with this account resides. Data type: String

Parameter	Description
	Maximum length: 50
contact	Sys_id of a contact record associated with this account. Data type: String Table: User [sys_user]
country	Country in which the company that is associated with this account resides. Data type: String Maximum length: 40 Default: USA
customer	Flag that indicates whether the account is a customer account, as opposed to a partner account. Possible values: • true: Customer account • false: Partner account Data type: Boolean Default: false
discount	Discount given to the account on purchases. Data type: Number Maximum length: 15
fax_phone	Primary fax phone number for the company associated with this account. Data type: String Maximum length: 40
fiscal_year	Fiscal year for the company associated with the account. Data type: String
lat_long_error	Difference in the actual location as compared to latitude and longitude information. Data type: String Maximum length: 1,000
latitude	Latitude of the company associated with this account.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: Number (floating point number) Maximum length: 40
longitude	Longitude of the company associated with this account. Data type: Number (floating point number) Maximum length: 40
manufacturer	Flag that indicates whether the company associated with this account manufactures goods. Possible values: • true: Manufactures goods • false: Does not manufacture goods Data type: Boolean Default: false
market_cap	Market value of the associated company's publicly traded stock shares. Data type: Number (currency) Maximum length: 20
name	Name of the company associated with this account. Data type: String Maximum length: 80
notes	Additional information about the company. Data type: String Maximum length: 4,000
num_employees	Number of people employed by the company. Data type: Number (Integer) Maximum length: 40
number	Number that identifies this account. Data type: String Maximum length: 40
parent	Sys_id of the parent account of this account.

Parameter	Description
	Data type: String Table: Company [core_company]
partner	Flag that indicates whether the account is a partner account or a customer account. Possible values: • true: Partner account • false: Customer account Data type: Boolean Default: false
phone	Primary phone number for the company. Data type: String
primary	Flag that indicates whether this is a primary account. Possible values: • true: Primary account • false: Secondary account Data type: Boolean Default: false
primary_contact	Sys_id of the primary contact for the account. Data type: String Table: Contact [customer_contact]
profits	Profit information entered for this account. Data type: Number (Currency) Maximum length: 40
publicly_traded	Flag that indicates whether the company associated with this account is publicly traded on the stock exchange. Possible values: • true: Publicly traded • false: Private company Data type: Boolean
rank_tier	Type of account.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Possible values: • blacklist • other • strategic • tactical • valued Data type: String Maximum length: 40
registration_code	Unique code that customers use when requesting a login on the customer portal. This code provides a method for validating the customer on the company before granting access. Data type: String Maximum length: 40
revenue_per_year	Revenue produced by the company associated with this account. Data type: Number (Currency) Maximum length: 20
state	State in which the company resides. Data type: String Maximum length: 40
stock_price	Price of the company stock. Data type: String Maximum length: 40
stock_symbol	Stock symbol of the company. Data type: String Maximum length: 40
street	Street address of the company. Data type: String Maximum length: 255
sys_class_name	Table that contains the associated account record.

Parameter	Description
	Data type: String
sys_created_by	User that originally created the account. Data type: String Maximum length: 40
sys_created_on	Date and time that the account was originally created. Data type: String
sys_id	Sys_id for the account record. Data type: String
sys_mod_count	Number of times the account information has been updated. Data type: Number (Integer)
sys_updated_by	User that last modified the account information. Data type: String Maximum length: 40
sys_updated_on	Date and time the account information was last updated. Data type: String
theme	Sys_id of the customer portal theme used by this account. Data type: String Table: Theme [sys_ui_theme]
vendor	Flag that indicates whether the company associated with this account is a vendor. Possible values: • true: Vendor • false: Not a vendor Data type: Boolean Default: false
vendor_manager	List of sys_ids of the vendor managers for the account. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Table: User [sys_user]
vendor_type	List of sys_ids of the type of vendor such as, applications, hardware, services, or software. Data type: String Table: Vendor Type [vendor_type]
website	URL of the website for the company. Data type: String Maximum length: 1,024
zip	Zip code of the company. Data type: String Maximum length: 40

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/account?sysparm_limit=
2&sysparm_offset=2>;rel="next" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Parameter	Description
	Data type: Number (floating point number) Maximum length: 40
longitude	Longitude of the company associated with this account. Data type: Number (floating point number) Maximum length: 40
manufacturer	Flag that indicates whether the company associated with this account manufactures goods. Possible values: • true: Manufactures goods • false: Does not manufacture goods Data type: Boolean Default: false
market_cap	Market value of the associated company's publicly traded stock shares. Data type: Number (currency) Maximum length: 20
name	Name of the company associated with this account. Data type: String Maximum length: 80
notes	Additional information about the company. Data type: String Maximum length: 4,000
num_employees	Number of people employed by the company. Data type: Number (Integer) Maximum length: 40
number	Number that identifies this account. Data type: String Maximum length: 40
parent	Sys_id of the parent account of this account.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: String Table: Company [core_company]
partner	Flag that indicates whether the account is a partner account or a customer account. Possible values: • true: Partner account • false: Customer account Data type: Boolean Default: false
phone	Primary phone number for the company. Data type: String
primary	Flag that indicates whether this is a primary account. Possible values: • true: Primary account • false: Secondary account Data type: Boolean Default: false
primary_contact	Sys_id of the primary contact for the account. Data type: String Table: Contact [customer_contact]
profits	Profit information entered for this account. Data type: Number (Currency) Maximum length: 40
publicly_traded	Flag that indicates whether the company associated with this account is publicly traded on the stock exchange. Possible values: • true: Publicly traded • false: Private company Data type: Boolean
rank_tier	Type of account.

Parameter	Description
	Possible values: • blacklist • other • strategic • tactical • valued Data type: String Maximum length: 40
registration_code	Unique code that customers use when requesting a login on the customer portal. This code provides a method for validating the customer on the company before granting access. Data type: String Maximum length: 40
revenue_per_year	Revenue produced by the company associated with this account. Data type: Number (Currency) Maximum length: 20
state	State in which the company resides. Data type: String Maximum length: 40
stock_price	Price of the company stock. Data type: String Maximum length: 40
stock_symbol	Stock symbol of the company. Data type: String Maximum length: 40
street	Street address of the company. Data type: String Maximum length: 255
sys_class_name	Table that contains the associated account record.

Parameter	Description
	Data type: String
sys_created_by	User that originally created the account. Data type: String Maximum length: 40
sys_created_on	Date and time that the account was originally created. Data type: String
sys_id	Sys_id for the account record. Data type: String
sys_mod_count	Number of times the account information has been updated. Data type: Number (Integer)
sys_updated_by	User that last modified the account information. Data type: String Maximum length: 40
sys_updated_on	Date and time the account information was last updated. Data type: String
theme	Sys_id of the customer portal theme used by this account. Data type: String Table: Theme [sys_ui_theme]
vendor	Flag that indicates whether the company associated with this account is a vendor. Possible values: • true: Vendor • false: Not a vendor Data type: Boolean Default: false
vendor_manager	List of sys_ids of the vendor managers for the account. Data type: String

Parameter	Description
	Table: User [sys_user]
vendor_type	List of sys_ids of the type of vendor such as, applications, hardware, services, or software. Data type: String Table: Vendor Type [vendor_type]
website	URL of the website for the company. Data type: String Maximum length: 1,024
zip	Zip code of the company. Data type: String Maximum length: 40

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/account/bf60bef46f0331
003b3c498f5d3ee41a" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"

ActivitySubscriptions API

The *`ActivitySubscriptions`* API provides endpoints to retrieve Activity entities from the Subscriptions and Activity Feed Framework.

This API requires activation of the Subscriptions and Activity Feed Framework (com.snc.activity_subscriptions) plugin. Activate the Customer Central (com.sn_csm_customer_central) plugin to seed configuration in all required tables. For more information on customer central configuration settings, see Configure customer central.

ActivitySubscriptions - GET /now/actsub/activities

Retrieves activity records from the Subscriptions and Activity Feed Framework.

No role is required to access this endpoint, but data returned is limited by user access settings.

URL format

Versioned URL: `/api/now/{api_version}/actsub/activities`

Default URL: `/api/now/actsub/activities`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
before	Date/time value. The request returns only records created prior to this date and time. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD
context	Required. Sys_id of an activity context. Predefined activity contexts include Consumer and Contact. Data type: String Table: Activity Context [sn_actsub_activity_context]
context_instance	Required. Sys_id of an instance of the specified activity context, representing the initiator of the activities you want to retrieve. Located in the appropriate table for the activity context. As an example, if you set *`context`* to the sys_id of the Consumer activity context, set this parameter to the sys_id of the Consumer [csm_consumer] table record for the consumer whose activities you want to retrieve. Data type: String
end_date	Date/time value. The request returns only records created during the time period defined by *`start_date`* and this parameter. Must be set along with *`start_date`*. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD
facets	Comma-separated list of sys_ids of activity facet types to retrieve for the specified activity context. For more details on activity facets, see Create facets for activity contexts. Data type: String Default: Return all activity facet types configured for the activity context. Table: Activity Facet [sn_actsub_facet]

Query parameters (continued)

Name	Description
last	Index value of the first result row omitted from the response body. The result row index starts at 0, so the last row included in the response body is the one with the index *last*-1. For example, setting `last=5` omits rows with index 5 and above and returns at most only the first five result rows (with index values 0 through 4). Setting `stFrom=1` and `last=5` skips the first result row and returns the second through fifth result rows (with index values 1 through 4). Data type: Number (integer) Default: The value of the **com.snc.actsub.activities.api.fetch.limit** system property (10 by default).
record_id	Sys_id of a record to use when rendering dynamic facets. Located in the appropriate table for the activity type you want to retrieve. For example, if you want to fetch activities for a Case record, set this parameter to the sys_id of the Case record in question. For more details on dynamic facets, see Create facets for activity contexts. Data type: String
start_date	Date/time value. The request returns only records created during the time period defined by this parameter and *end_date*. Must be set along with *end_date*. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD
stFrom	Index value of the first result row to include in the response body. The result row index starts at 0. For example, `stFrom=2` skips the first two result rows and returns results from the third row onward. Data type: Number (integer) Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. The response body *result.message* parameter describes the nature of the error. Example error messages: • `Make sure a valid context and context_instance are passed` or `Make sure a valid stream and user are passed` indicates that the request lacks one or both of the *context* and *context_instance* query parameters. These parameters are required. • `stFrom can not be greater than last` indicates that the *stFrom* query parameter value exceeds the *last* query parameter value. • `Please provide start_date and end_date` indicates that the request includes only one of the *start_date* and *end_date* query parameters, which cannot be used separately. • `start_date can not be ahead of end_date` indicates that the specified *start_date* query parameter value occurs after the specified *end_date* query parameter value. • `Provided context is not configured in the system` indicates that the *context* query parameter value does not represent a valid activity context. • `Make sure a valid context_instance is passed` indicates that the *context_instance* query parameter value does not represent a valid instance of the specified activity context.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Result object.
	
	Data type: Object
	
	`"result": {`
	`  "activities": [Array],`
	`  "message": "String",`
	`  "status": Number,`
	`  "stream": "String",`
	`  "user": "String"`
	`}`

result.activities	Array of objects in which each object represents an activity record from the specified activity context and context instance.
	
	Data type: Array of Objects
	
	`"activities": [`
	`  {`
	`  "activity_type_id": "String",`
	`  "content_fields": [Array],`
	`  "created": "String",`
	`  "icon": "String",`
	`  "source_table_name": "String",`
	`  "subheader_fields": [Array],`
	`  "subobject_sys_id": "String",`
	`  "subobject_table_name": "String",`
	`  "sys_id": "String",`
	`  "title": "String"`
	`  }`
	`]`

result.activities.activity_type_id	Sys_id of the record from the Activity Types [sn_actsub_activity_type] table that corresponds to the type of this activity record. Data type: String
result.activities.content_fields	Array of objects in which each object represents a field to display as content in the tile for the activity record.

Name	Description
	"display_as_timeago": "String", "label": "String", "show_label": "String", "type": "String", "value": "String" }]
result.activities.subheader_fields.deeplink_to_subobject	Flag indicating whether or not the subheader field displays as a hyperlink to the record for the object on which this activity was performed. Valid values: • true: The subheader field displays as a hyperlink to the record for the object on which this activity was performed. • false: The subheader field doesn't display as a hyperlink to the record for the object on which this activity was performed. Data type: String
result.activities.subheader_fields.display_as_timeago	Flag indicating whether or not the subheader field displays in time ago format. Valid values: • true: The subheader field displays in time ago format. • false: The subheader field doesn't display in time ago format. Data type: String
result.activities.subheader_fields.label	Label for the subheader field. Data type: String
result.activities.subheader_fields.show_label	Flag indicating whether or not the subheader field label displays for subheader field values in the tile for this activity record. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: The subheader field label displays for subheader field values in the tile for this activity record. • false: The subheader field label doesn't display for subheader field values in the tile for this activity record. Data type: String
result.activities.subheader_fields.type	Type of the subheader field. Data type: String
result.activities.subheader_fields.value	Value of the subheader field. Data type: String
result.activities.subobject_sys_id	Sys_id of the record for the object on which this activity was performed. Located in the table specified in the *subobject_table_name* parameter value. Data type: String
result.activities.subobject_table_name	Name of the table containing the record for the object on which this activity was performed. Determined by the Table Name defined in the Activity Group [sn_actsub_subscribable_object] table for the group containing the activity type associated with this activity record. Data type: String
result.activities.sys_id	Sys_id of this activity record. Located in the table specified as the *source_table_name* response body parameter value. Data type: String
result.activities.title	Title that displays on the tile for this activity record. Data type: String
result.hasMoreRecords	Flag indicating whether or not the list of activities in the response body is truncated by the *last* query parameter value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Valid values: • true: The list of activities in the response body is truncated by the *last* query parameter value. Repeating the request with a higher *last* query parameter value will return additional activities for this context and context instance. • false: The list of activities in the response body isn't truncated by the *last* query parameter value. No further activities are available for this context and context instance. Data type: String
result.message	Error message describing the problem encountered during request processing. Data type: String
result.status	HTTP status code returned for request. Valid values: Refer to Status Codes. Data type: Number
result.stream	Sys_id specified in request *context* query parameter. Data type: String Table: Activity Context [sn_actsub_activity_context]
result.user	Sys_id specified in request *context_instance* query parameter. Located in the appropriate table for the activity context. Data type: String

Example: cURL request

Request the second and third activity records for a specific Contact, limiting to data from 2020:

```
curl "https://instance.servicenow.com/api/now/actsub/activities\
?context=4a6a035a73d30010e37d71ef64f6a714\
&context_instance=ddce70866f9331003b3c498f5d3ee417\
&stFrom=1&last=3\
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
&start_date=2020-01-01%2000:00:00&end_date=2020-12-31%2023:59:
59" \
--request GET \
--header "Accept: application/json" \
--user "username:password"
```

The response body includes the two requested activity records for the specified Contact:

```
{
  "result": {
    "hasMoreRecords": true,
    "activities": [
      {
        "subobject_table_name": "sn_customerservice_case",
        "source_table_name": "sn_customerservice_case",
        "content_fields": [
          {
            "value": "Test",
            "show_label": "false",

```

ActivitySubscriptions - GET /now/actsub/facets/{activity_context}/{context_instance}

Retrieves facets configured for an activity context from the Subscriptions and Activity Feed Framework. Displays activity counts and data for each facet as determined by activity type, group, and context settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users must have the actsub_user or admin role to access this endpoint. Data returned is limited by user access settings.

For more details on activity context facets, see Create facets for activity contexts.

URL format

Versioned URL: `/api/now/{api_version}/actsub/facets/{activity_context}/{context_instance}`

Default URL: `/api/now/actsub/facets/{activity_context}/{context_instance}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
activity_context	Sys_id of an activity context. Predefined activity contexts include Consumer and Contact. Navigate to **Customer Central** > **Customer Activity** > **Activity Contexts** to view the full list of activity contexts defined for your instance. Data type: String Table: Activity Contexts [sn_actsub_activity_context]
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
context_instance	Sys_id of an instance of the specified activity context, representing the initiator of the activities you want to retrieve facets for. As an example, if you set *`activity_context`* to the sys_id of the Contact activity context, you should set this parameter to the sys_id of the Contact [customer_contact] record for the contact whose activity facets you want to retrieve. Data type: String Table: In the context table specified for the activity context record in the Activity Contexts [sn_actsub_activity_context] table.

Query parameters

Name	Description
end_date	Date/time value. The request returns only records created during the time period defined by *`start_date`* and this parameter. Must be set along with *`start_date`*.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD
facets	Comma-separated list of sys_ids of activity facets to retrieve for the specified activity context. To see the activity facet types defined for an activity context, navigate to **Customer Central** > **Customer Activity** > **Activity Contexts** and examine the **Facets** related list. Data type: String Default: Return all activity facets configured for the activity context.
get_activity_count	Flag indicating whether or not to include activity counts for each facet in the response body. Valid values: • true: Include facet activity counts. • false: Omit facet activity counts. Data type: Boolean Default: false
lazy_load	Flag indicating whether or not to improve performance by omitting facet activity data and activity counts from the response body. This parameter takes precedence over *`get_activity_count`*. Valid values: • true: Omit facet activity data and activity counts. • false: Retrieve facet activity data and activity counts. Data type: Boolean Default: false
start_date	Date/time value. The request returns only records created during the time period defined by this parameter and *`end_date`*. Must be set along with *`end_date`*. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD

Request body parameters (XML or JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. The response body *result.message* parameter describes the nature of the error. Example error messages: • `Make sure a valid activity context details are passed` indicates that the *activity_context* path parameter value does not represent a valid activity context, the *context_instance* path parameter value does not represent a valid instance of the specified activity context, or both. • `Please provide start_date and end_date` indicates that the request includes only one of the *start_date* and *end_date* query parameters, which cannot be used separately. • `start_date can not be ahead of end_date` indicates that the specified *start_date* query parameter value occurs after the specified *end_date* query parameter value.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
result	List of activity facets. Data type: Array of Objects `"result": [ { "activity_count": Number, "children": [Array], "facets": [Array], "icon": "String", "is_dynamic": "String", "message": "String", "name": "String", "status": Number } ]`
result.activity_count	Number of activity records included in this facet (and its children, if any. Only displayed when *lazy_load* query parameter is false and *get_activity_count* query parameter is true. Data type: Number
result.children	Array of objects in which each object represents an activity record (if this is a dynamic facet) or a child facet (if this is a static facet). Data type: Array of Objects `"children": [ { "activity_count": Number "facet": "String", "icon": "String", "title": "String" } ]`
result.children.activity_count	Number of activity records included in this child facet (and its children, if any). Only displayed when the *lazy_load* query parameter is false and the *get_activity_count* query parameter is true. Data type: Number
result.children.created	Creation date/time for this activity record. Data type: String Format: YYYY-MM-DD hh:mm:ss
result.children.facet	Sys_id of this child facet record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Activity Facet [sn_actsub_facet]
result.children.icon	Name of the icon associated with this child facet. Data type: String
result.children.sys_id	Sys_id of this activity record. Located in the appropriate table for the parent facet type. As an example, an activity record included in the Cases facet has a sys_id located in the Case [sn_customerservice_case] table. Data type: String
result.children.metadata	Array of objects in which each object includes activity record data for a facet field configured in the Activity Facet [sn_actsub_facet] table record for this facet type. Data type: Array of Objects `"metadata": [ { "key": "String", "label": "String", "type": "String", "value": "String" } ]`
result.children.metadata.key	Name of this facet field. Data type: String
result.children.metadata.label	Label of this facet field. Data type: String
result.children.metadata.type	Type of this facet field. Data type: String
result.children.metadata.value	Value of this facet field. Data type: String
result.children.title	Name of this activity record or child facet. Data type: String
result.facets	List of sys_ids associated with this facet record. For a dynamic facet, this array contains the sys_id of the facet itself. For a static facet, it instead contains the sys_ids of all facets which are children of the facet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"facets": [ "510d7e2e73570010e37d71ef64f6a70d", "bc9bfaaa73570010e37d71ef64f6a771" ]` Table: Activity Facet [sn_actsub_facet]
result.icon	Name of the icon associated with this facet. Data type: String
result.is_dynamic	Flag indicating whether or not this facet is a dynamic facet. This value determines the type of information included in the *`children`* response body parameter. Possible values: • true: This is a dynamic facet. The *`children`* response body parameter value contains activity record details, and the *`facets`* parameter contains the dynamic facet sys_id. • false: This is a static facet (a facet group). The *`children`* response body parameter value contains child facets, and the *`facets`* parameter contains the sys_ids of these child facets. Data type: Boolean
result.message	Error message describing problem encountered during request processing. Data type: String
result.name	Name of the facet or facet group. Data type: String
result.status	HTTP status code returned for request. Possible values: See the Status Code table. Data type: Number

Example: cURL request

Retrieve Chat, Phone, and Knowledge articles facets and activity counts for a Contact:

```
curl
 "https://instance.servicenow.com/api/now/actsub/facets/4a6a035a
73d30010e37d71ef64f6a714/ddce70866f9331003b3c498f5d3ee417\
?get_activity_count=true\
&facets=510d7e2e73570010e37d71ef64f6a70d,bc9bfaaa73570010e37d71e
f64f6a771,c72d7e2e73570010e37d71ef64f6a7b8" \
--request GET \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept: application/json" \
--user "username:password"
```

The response body includes the three requested facets as children of their facet groups, with activity counts displayed:

```
{
  "result": [
    {
      "is_dynamic": false,
      "name": "Interactions",
      "activity_count": 4.0,
      "facets": [
        "510d7e2e73570010e37d71ef64f6a70d",
        "bc9bfaaa73570010e37d71ef64f6a771"
      ],
      "children": [
        {
          "facet": "510d7e2e73570010e37d71ef64f6a70d",
          "icon": "chat_outline",
          "activity_count": 2.0,
          "title": "Chat"
        },
        {
          "facet": "bc9bfaaa73570010e37d71ef64f6a771",
          "icon": "phone_outline",
          "activity_count": 2.0,
          "title": "Phone"
        }
      ]
    },
    {
      "is_dynamic": false,
      "name": "Portal Activity",
      "activity_count": 5.0,

          "activity_count": 5.0,
          "title": "Knowledge articles"
        }
      ]
    }
  ]
}
```

Agent Client Collector API

The *`Agent Client Collector`* API provides endpoints to manage actions on available agents and managing policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API requires the Agent Client Collector Framework (sn_agent) store application and is provided within the `sn_agent` namespace. The endpoints in this API require the agent_client_collector_admin role. For more information, refer to Agent Client Collector.

Agent management endpoints

- Get extensive information of one or more agents. These endpoints are also accessible to users with the agent_client_collector_user role.
  - GET /agents/{agent_id}
  - GET /agents/list
- Submit a request to grab an agent log and retrieving information about the request progress.
  - GET /agents/{agent_id}/log
  - GET /agents/log/{request_id}/
- Disable or enable agent data collection.
  - GET /agents/{agent_id}/data/off
  - GET /agents/{agent_id}/data/on
- Restart an agent with GET /agents/{agent_id}/restart.
- Run discovery on an agent with GET /agents/{agent_id}/discovery.

For information on performing similar tasks in a script include, see AccAgentsAPI.

Policy management and workflow

Use policy management APIs to view details, activate/deactivate a policy, update a policy, and publish a policy.

To update a policy:

1. Get a list of policies and details with GET /agents/policies/list. This endpoint requires the agent_client_collector_user role.
   - To update a policy in the Draft state, use the sys_ids retrieved from the policies list in the update endpoints.
   - To update a policy in Published or Published* state, get an editable sandbox copy with GET /agents/policy/sandbox_from_published/{policy_id}. Use the sys_ids from this response to modify properties using an update endpoint.
2. Modify policy details using an update endpoint.
   - POST /agents/update/policy/{policy_id}
   - POST /agents/update/check/{check_id}
   - POST /agents/update/check_param/{param_id}
   - POST /agents/update/check_secure_param/{param_id}
3. Publish the policy using GET /agents/policy/publish/{policy_id}.

Once published, the policy becomes Active. This API also includes endpoints for activating or deactivating a published policy:

- GET /agents/policy/activate/{policy_id}
- GET /agents/policy/deactivate/{policy_id}

Agent Client Collector - GET /agents/{agent_id}

Gets the information of a specified agent.

URL format

`/api/sn_agent/agents/{agent_id}`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *`GET /agents/list`* endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_user role.
404	Agent with provided ID not found.

Response body parameters (JSON)

Name	Description
<Array>	Array of JSON objects containing extended agent information. `{ "agent_id": "String", "data_collection": Number, "ip_address": "String", "is_duplicate": Boolean, "is_restart_enabled": Boolean, "name": "String", "number_of_running_checks": Number, "status": Number, "up_since": "String", "version": "String" }`
agent_id	ID of the agent as submitted. Data type: String
data_collection	Data collection indicates whether scheduled checks are to be run. These checks are a part of the policies scheduled for this agent to run. Possible values: • 0: On – Checks run as scheduled. • 1: Off (manual) – Checks have been disabled manually. • 2: Off (auto) – Checks have been disabled automatically due to high CPU consumption by the Data type: Number
ip_address	Agent IP address. Data type: String
is_duplicate	Flag that indicates whether this agent is a duplicate of another. There should be only a single agent on a given host. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: The agent has the same host as an Alive/Up agent with a different agent ID. Turn off or uninstall the duplicate • false: This agent has no duplicates in the Alive/Up state. Data type: Boolean
is_restart_enabled	Flag that indicates whether restart is enabled. Agent restart is not configurable. It depends on the OS and the version of the OS the agent is running on. Possible values: • true: Restart is enabled for this agent. • false: Restart is disabled for this agent. Data type: Boolean
name	Name of the agent. Data type: String
number_of_running_checks	The number of checks the agent is scheduled to run. These checks are a part of the policies scheduled for this agent to run. Data type: Number
status	Status of the agent. Possible values: • 0: Alive/Up – The agent is active. • 1: Warning – The agent has not received a keep-alive message in the past few minutes. • 2: Down – The agent has not received a keep-alive message in a long time. • 3: Restarting – The agent is restarting. Data type: Number
up_since	UTC time since the agent's status became alive/up. The value is in GlideDateTime format. Data type: String
version	Version of Agent Client Collector the agent is running. Data type: String

Example: cURL request

The following example shows how to get agent details.

© 2026 ServiceNow, Inc. All rights reserved.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "name": "WIN-V26KAP7PI2G",
  "status": 2,
  "agent_id": "074b14e2eb3ce9d4",
  "ip_address": "10.196.55.14",
  "number_of_running_checks": 11,
  "data_collection": 0,
  "is_restart_enabled": true,
  "is_duplicate": false,
  "up_since": "2021-03-31 12:02:17",
  "version": "2.3.0"
}
```

Agent Client Collector - GET /agents/{agent_id}/data/off

Disables data collection for a specified agent in the up/alive state.

To determine if an agent's data collection is on or off, run the *GET /agents/{agent_id}* endpoint.

URL format

`/api/sn_agent/agents/{agent_id}/data/off`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *GET /agents/list* endpoint. Data type: String

Query parameters

```
{
"message": "Data Collection Disabled For Agent With ID:
 <agent_id>"
}
```

Agent Client Collector - GET /agents/{agent_id}/data/on

Enables data collection for a specified agent in the up/alive state.

To determine if an agent's data collection is on or off, run the *GET /agents/{agent_id}* endpoint.

URL format

`/api/sn_agent/agents/{agent_id}/data/on`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *GET /agents/list* endpoint. Data type: String

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	Agent not found or isn't in the up/alive state.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to turn on agent data collection.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_i
d>/data/on" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "message": "Data Collection Enabled For Agent With ID:
 <agent_id>"
}
```

Agent Client Collector - GET /agents/{agent_id}/discovery

Runs a discovery check to locate CIs related to an agent. The specified agent must be in alive/up status.

URL format

```
/api/sn_agent/agents/{agent_id}/discovery
```

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the `GET /agents/list` endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
404	Agent not found or isn't in the up/alive state.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to run discovery on an agent with alive/up status.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_i
d>/discovery" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "message": "Running Discovery For Agent With ID: <agent_id>"
}
```

Agent Client Collector - GET /agents/check_defs/{check_def_id}

Gets a specified check definition with details.

URL format

`/api/sn_agent/agents/check_defs/{check_def_id}`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table. Data type: String

Query parameters

Name	Description
None

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
X-Include-Check-Params	Flag that indicates whether existing check parameter details are returned. Information for each standard and secure check parameter is included in a JSON object. Valid values: • true: Return check parameter details. • false: Do not return check parameter details. Data type: Boolean Default: False

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Check definition was not found with the sys_id provided.

Response body parameters (JSON)

Properties	Description
check	Details of the specified check definition. { "background": Boolean,

Properties	Description
	"check_group": "String", "check_type": "String", "command": "String", "error": "String", "name": "String", "params": [Array], "plugins": [Array], "proxy_valid": Boolean, "secure_params": [Array], "sys_id": "String", "timeout": Number }
background	Flag that indicates whether this check definition is a background check. A background check is a check which the agent starts execution of and doesn't wait for it to finish running. Valid values: • true: This check definition is a background check. • false: This check definition is not a background check. Data type: Boolean
check_group	Group specified for this check definition. Data type: String
check_type	Type of check. Possible values: • Events – Check results are transformed into an Event Management event. • Metrics – Values from the check result are transformed to metrics. Data type: String
command	Command that the Agent Client Collector executes. Data type: String
error	Message if there is an error. Null otherwise. Data type: String
name	Name of the check. Data type: String
params	List of parameter definitions associated with the check definition. These results are only included if the *withParams* parameter is set to true. "params": [{ "active": Boolean,

Properties	Description

	``
	"secure_params": [
	  {
	  "active": Boolean,
	  "name": "String",
	  "order": Number,
	  "sys_id": "String"
	  }
	]
	``
	Data type: Array

secure_params.active	Flag that indicates whether the secure parameter is active. Valid values: • true: The secure parameter is active. • false: The secure parameter is inactive. Data type: Boolean
secure_params.name	Name of the secure parameter. Data type: String
secure_params.order	Order in which the parameter is sent to the check command/script. Data type: Number
secure_params.sys_id	Sys_id of the secure parameter listed in the Check Secure Parameter Definitions [sn_agent_check_secure_param_def] table. Data type: String
sys_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table. Data type: String
timeout	Timeout in seconds. Data type: Number

Example: cURL request

The following example shows how to get information for a specified check definition.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/check_de
fs/94436b237f705300f128134f8dfa91a4" \

Agent Client Collector - GET /agents/check_defs/list

Gets a list of check definitions with details.

URL format

`/api/sn_agent/agents/check_defs/list`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
X-Enc-Query	An encoded query string to filter the check definition result list. Use null for an unfiltered list of check definitions in the system. Data type: String
X-Include-Check-Params	Flag that indicates whether existing check parameter details are returned. Information for each standard and secure check parameter is included in a JSON object. Valid values: • true: Return check parameter details. • false: Do not return check parameter details. Data type: Boolean Default: False
X-Limit	Limits the number of returned records. Set to null to use the default value. Data type: Number Default: 20,000

  ]
}
```

Agent Client Collector - GET /agents/exec/background/stop/{request_id}

Stops a background check.

To start a background check, use the *POST /agents/check_defs/{check_def_id}/run* API.

URL format

`/api/sn_agent/agents/exec/background/stop/{request_id}`

Supported request parameters

Path parameters

Name	Description
request_id	The ID of a background check request generated by running the *POST /agents/check_defs/{check_def_id}/run* API.

Query parameters

Name	Description
None

Agent Client Collector - GET /agents/exec/run/{request_id}

Gets status of the request with the given ID.

URL format

`/api/sn_agent/agents/exec/run/{request_id}`

Supported request parameters

Path parameters

Name	Description
request_id	The ID of a background check request generated by running the *POST /agents/check_defs/{check_def_id}/run* API.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
202	Message with provided ID indicating that the request is in progress.
400	Error in the arguments provided in the request body.
404	The request with the ID provided is not found.
408	Execution timeout for the request with the ID provided.
500	Error checking the status or the request with the ID provided.

Response body parameters (JSON)

Name	Description
status	Request status. Possible values: • done – Check is successful. • failure – Check has failed. See error message for details. • mid_flow – Request output is being handled by the MID server. • processing – Check is in progress. • timeout – Check processing exceeded time limit set in the `runCheckForCis()` method. Data type: String
err_msg	Error message if any. Possible values: • No agents found for relevant CIs. • No background check request with given ID. • No request with given ID. • No test result with given ID. • Request timeout. Data type: String

Example: cURL request

The following example shows how to get the status of a request.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/exec/run/
12fed13cdb2a30108a0751f4f3961981" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Agent Client Collector - GET /agents/exec/test/{test_result_id}

Gets the test check status of the given test result.

URL format

```
/api/sn_agent/agents/exec/test/{test_result_id}
```

Supported request parameters

Path parameters

Name	Description
test_result_id	A test result ID generated by creating a test check request.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

Status codes (continued)

Status code	Description
202	Message with provided ID indicating that the request is in progress.
404	The request with the ID provided is not found.
408	Execution timeout for the request with the ID provided.
500	Error checking the status of the request with the ID provided.

Response body parameters (JSON)

Properties	Description
status	Status of the test results. Possible values: • 0: Pending • 1: In progress • 2: Complete • 3: No test result with given ID Data type: String
output	Output describing the status. Data type: String

Example: cURL request

The following example shows how get result status of a completed test check request.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/check_ins
tances/99e12466dba530106f4810284b961976/test" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Agent Client Collector - GET /agents/list

Gets a list of agents with related information.

URL format

`/api/sn_agent/agents/list`

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
X-Enc-Query	Encoded query on the Agent Client Collectors [sn_agent_cmdb_ci_agent] table in standard Glide format. See Encoded query strings.
X-Limit	Restricts results to a maximum number of agents. Use null or undefined for both if they are not required.Default/Max: 20,000 Data type: Number

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_user role.

Response body parameters (JSON)

Property	Description
<Array>	Array of JSON objects containing extended agent information. `[ { "agent_id": "String", "data_collection": Number, "ip_address": "String", "is_duplicate": Boolean, "is_restart_enabled": Boolean, "name": "String", "number_of_running_checks": Number, "status": Number, "up_since": "String", "version": "String" } ]`
agent_id	ID of the agent as submitted. Data type: String
data_collection	Data collection indicates whether scheduled checks are to be run. These checks are a part of the policies scheduled for this agent to run. Possible values: • 0: On – Checks run as scheduled. • 1: Off (manual) – Checks have been disabled manually. • 2: Off (auto) – Checks have been disabled automatically due to high CPU consumption by the Data type: Number
ip_address	Agent IP address. Data type: String
is_duplicate	Flag that indicates whether this agent is a duplicate of another. There should be only a single agent on a given host. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• true: The agent has the same host as an Alive/Up agent with a different agent ID. Turn off or uninstall the duplicate • false: This agent has no duplicates in the Alive/Up state. Data type: Boolean
is_restart_enabled	Flag that indicates whether restart is enabled. Agent restart is not configurable. It depends on the OS and the version of the OS the agent is running on. Possible values: • true: Restart is enabled for this agent. • false: Restart is disabled for this agent. Data type: Boolean
name	Name of the agent. Data type: String
number_of_running_checks	The number of checks the agent is scheduled to run. These checks are a part of the policies scheduled for this agent to run. Data type: Number
status	Status of the agent. Possible values: • 0: Alive/Up – The agent is active. • 1: Warning – The agent has not received a keep-alive message in the past few minutes. • 2: Down – The agent has not received a keep-alive message in a long time. • 3: Restarting – The agent is restarting. Data type: Number
up_since	UTC time since the agent's status became alive/up. The value is in GlideDateTime format. Data type: String
version	Version of Agent Client Collector the agent is running. Data type: String

Example: cURL request

The following example shows how to restrict results by query and number. The query returns all agents that are not in the down state with a maximum of two results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl "https://instance.service-now.com/api/sn_agent/agents/list"
 \
--request GET \
--header "Accept:application/json" \
--header "X-Enc-Query: agent_extended_info.status!=2" \
--header "X-Limit: 2" \
--user 'username':'password'
```

Output:

```
{
   "agents": [
     {
       "name": "007-175",
       "status": 0,
        "agent_id": "007-175",
       "ip_address": "11.222.63.66",
        "number_of_running_checks": 0,
       "data_collection": 0,
       "is_restart_enabled": false,
       "is_duplicate": false,
       "up_since": "2021-03-24 14:36:45",
       "version": "2.4.0"
     },
     {
       "name": "win2016-dc-64bit",
       "status": 0,
       "agent_id": "007-64",
       "ip_address": "10.222.333.42",
       "number_of_running_checks": 1,
       "data_collection": 0,
       "is_restart_enabled": true,
       "is_duplicate": false,
       "up_since": "2021-03-24 11:04:38",
       "version": "2.4.0"
     }
   ]
}
```

Example: cURL request

The following example shows how to list every agent in the system. This example uses no query and no maximum number of results.

```
curl "https://instance.service-now.com/api/sn_agent/agents/list"
 \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Agent Client Collector - GET /agents/{agent_id}/log

Requests the log of a specified agent with alive/up status.

Note: To retrieve the log and check its progress, pass the request ID returned to the *GET /agents/log/{request_id}/* endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

`/api/sn_agent/agents/{agent_id}/log`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *GET /agents/list* endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	Agent not found or isn't in the up/alive state.

Response body parameters (JSON)

Name	Description
request_id	Sys_id of a request in the Agent Client Collector Requests [sn_agent_request] table. You can use this ID to retrieve the log and check its progress with the `GET /agents/log/{request_id}/` endpoint. Data type: String

Example: cURL request

The following example shows how to get a log request ID.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<sys_id>/log" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
"request_id": "<sys_id>"
```

Agent Client Collector - GET /agents/log/{request_id}/

Checks the status of a grab log request.

Detects changes in the log retrieving request sent with `GET /api/sn_agent/agents/{agent_id}/log`.

URL format

`/api/sn_agent/agents/log/{request_id}/`

Supported request parameters

Path parameters

Name	Description
request_id	Sys_id of a request in the Agent Client Collector Requests [sn_agent_request] table. For the request id, run `GET /api/sn_agent/agents/{agent_id}/log`.

Response body parameters (JSON)

Properties	Description
output	Information describing the status.

Example: cURL request

The following example shows how to use a request ID to get the status of a grab log request.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/log/<requ
est_ID>" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "output": "SensuSnReadFile OK:
 {\"component\":\"agent\",\"level\":\"info\",\"msg\":\"Agent
 Protection: cpu of all checks:
 0%\",\"time\":\"2021-04-05T00:21:41-07:00\"},...
}
```

Agent Client Collector - GET /agents/policies/list

Gets a list of policies that are in published or unpublished draft state.

URL format

`/api/sn_agent/agents/policies/list`

Supported request parameters

Object (continued)

Property	Description
	Table:
policies.checks.active	Flag that indicates whether the policy check is active. Valid values: • true: Policy check is active. • false: Policy check is inactive. Data type: Boolean
policies.checks.auto_generate	Flag that indicates whether to automatically generate the command with the *command_prefix* value. Valid values: • true: Automatically populate the *command* property with active parameter values. • false: Command isn't automatically generated. Data type: Boolean
policies.checks.check_type	Check type specifying the monitoring option. Possible values: • Discovery: Check that locates CIs related to the agent. • Events: The check's result is transformed into an Event Management event. • Metrics: The values from the check result are transformed to metrics. Data type: String
policies.checks.command	Command that the Agent Client Collector executes. Parameter taken from a template or monitored CI. **Note:** If *auto_generate* is true, this property is automatically populated with the prefix and flags of the active parameters listed in the *parameters* object. Data type: String
policies.checks.command_prefix	If the *auto_generate* property is true, this command is used for automatic generation. The prefix consists of any portion of the command

Object (continued)

Property	Description
	which is static (does not change), such as the script name. Data type: String
policies.checks.event_status_change_threshold	Number of consecutive times that a check's response status must happen before a new event is sent. Returns null if not set. For example, if this value is 3, a check whose response status changes from OK to Error generates a new event with an Error status after the third consecutive occurrence of the status change. Data type: Number
policies.checks.event_status_repair_threshold	Number of consecutive times that a check's response status must improve to close the previous event. Returns null if not set. For example, if this value is 3, a check whose response status changes from Error to OK closes the previous event and generates a new event with an OK status after the third consecutive occurrence of the status change. Data type: Number
policies.checks.interval	Amount of time in seconds to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds. Data type: Number
policies.checks.name	Name of the check. Data type: String
policies.checks.sys_id	Sys_id of the check. Data type: String Table: Check Instances [sn_agent_check]
policies.checks.timeout	Amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops. Data type: String
policies.cred_alias	Credential name.

Object (continued)

Property	Description
	Data type: String Table: Credentials [discovery_credentials]
policies.credential_alias	Sys_id of the credential alias. Data type: String Table: Connection & Credential Aliases [sys_alias]
policies.filter	Filter restricting the policy's checks to monitor only the specified criteria. Data type: String
policies.interval	Amount of time in seconds to wait between policy checks. For example, a value of 60 means that the check runs every 60 seconds. **Note:** The value of the *checks.interval* property overrides the value configured in this field. Data type: Number
policies.monitored_ci_group	Name of the CMDB groups associated with the policy. This field is only applied if the value of the *monitored_ci_type_group* property is true. Data type: String Table: CMDB Groups [cmdb_group]
policies.monitored_ci_script	Script for monitoring CIs. This field is only applied if the value of the *policies.monitored_ci_type_script* property is true. Data type: String
policies.monitored_ci_type_filter	Flag that indicates whether filtering by CI type is enabled. The CI type is listed in the *table* property. Valid values: • true: Filtering by checks group is enabled. • false: Filtering by checks group is disabled.

Object (continued)

Property	Description
	Data type: Boolean
policies.monitored_ci_type_group	Flag that indicates whether monitoring by CMDB group type is enabled. Valid values: • true: CMDB group type is enabled. • false: CMDB group type is disabled. Data type: Boolean
policies.monitored_ci_type_script	Flag that indicates whether the script for monitoring CIs is enabled. Valid values: • true: Script for monitoring CIs is enabled. • false: Script for monitoring CIs is disabled. Data type: Boolean
policies.name	Name of the policy. Data type: String
policies.publish_status	Indicates whether the policy is published. Possible values: • Draft: Policy has not been published and is editable using the update endpoints. • Published: Policy is published. The draft (sandbox copy) and published copy are identical. • Published*: Policy is published, but the draft copy (sandbox view) has changes not found in the published copy. Data type: String
policies.sys_id	Sys_id of the policy. Data type: String Table: Policies [sn_agent_policy]
policies.sys_updated_on	Date and time that the policy was last updated. Data type: String
policies.table	Monitored CI-type field on the policy. This field is only applied if *monitored_ci_type_filter* is true.

Object (continued)

Property	Description
	Data type: String
policies.params	List of objects containing information of check parameters. These results only display if the *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects `"params": [ { "active": Boolean, "flag": "String", "mandatory: Boolean, "name": "String", "sys_id": "String", "value": "String", "value_required": Boolean } ]` Table: Check Parameters [sn_agent_check_param]
policies.params.active	Flag that indicates whether the check parameter is active. Valid values: • true: Check parameter is active. • false: Check parameter is inactive. Data type: Boolean
policies.params.flag	Parameter flag to use during check invocation. Data type: String
policies.params.mandatory	Flag that indicates whether this check is mandatory. Valid values: • true: This check is mandatory. • false: This check is optional. Data type: Boolean
policies.params.name	Name of the parameter. Data type: String
policies.params.sys_id	Sys_id of the parameter. Data type: String

    }
  ]
}
```

Agent Client Collector - GET /agents/policy/activate/{policy_id}

Activates a published policy.

For a list of published policies, use GET /agents/policies/list. This endpoint only supports sys_ids in which the value of the policy's *publish_status* property is `Published` or `Published*`.

URL format

`/api/sn_agent/agents/policy/activate/{policy_id}`

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of the published policy. Data type: String Table: Policies [sn_agent_policy]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Header	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to activate a policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/ac
tivate/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username' : 'password'
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - GET /agents/policy/deactivate/{policy_id}

Deactivates a published policy.

For a list of published policies, use GET /agents/policies/list. This endpoint only supports sys_ids in which the value of the policy's *publish_status* property is `Published` or `Published*`.

URL format

`/api/sn_agent/agents/policy/activate/{policy_id}`

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of the published policy. Data type: String Table: Policies [sn_agent_policy]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Header	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to deactivate a policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/de
activate/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username' : 'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - GET /agents/policy/publish/{policy_id}

Publishes a draft policy.

Use any of the following endpoints to modify a draft or sandbox copy prior to publishing:

- POST /agents/update/policy/{policy_id}
- POST /agents/update/check/{check_id}

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- POST /agents/update/check_param/{param_id}
- POST /agents/update/check_secure_param/{param_id}

URL format

```
/api/sn_agent/agents/policy/publish/{policy_id}
```

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of a policy in the Policies [sn_agent_policy] table that is in Draft state or a sandbox copy. • For a list of policies and details including publish state, use GET /agents/policies/list. • To retrieve sandbox copy of a policy, use GET /agents/policy/sandbox_from_published/{policy_id}. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Header	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to publish a policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/pu
blish/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username' : 'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - GET /agents/policy/sandbox_from_published/{policy_id}

Gets the sandbox copy of a published policy and provides policy details.

Use the sandbox copy to make updates to a policy and publish. You can use the sys_ids in the response body to work with the following endpoints:

- POST /agents/update/policy/{policy_id}
- POST /agents/update/check/{check_id}
- POST /agents/update/check_param/{param_id}
- POST /agents/update/check_secure_param/{param_id}

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a list of published policies, use GET /agents/policies/list. This endpoint only supports sys_ids in which the value of the policy's *publish_status* property is `Published` or `Published*`.

URL format

```
/api/sn_agent/agents/policy/sandbox_from_published/{policy_id}
```

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of the published policy. Data type: String Table: Policies [sn_agent_policy]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Property	Description
<Object>	Extended details of the sandbox copy associated with the policy. For information on policies, see default checks and policies. `{ "active": Boolean" "agent_ids": "String", "checks": [Array], "cred_alias": "String", "credential_alias": "String", "filter": "String", "interval": "Number", "monitored_ci_group": "String", "monitored_ci_script": "String", "monitored_ci_type_filter": Boolean, "monitored_ci_type_group": Boolean, "monitored_ci_type_script": "String", "name": "String", "params": [Array], "publish_status": "String", "secure_params": [Array], "sys_id": "String", "sys_updated_on": "String", "table": "String" }`
active	Flag that indicates whether the policy is active. Valid values: • true: Policy is active. • false: Policy isn't active. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
agent_ids	Unique ID of an agent. These results only display if the *X-Include-Checks-And-Agents* header parameter is set to true. For extended information of an agent, run the ID in the GET /agents/{agent_id} endpoint. Data type: String Table: In the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table.
checks	List of objects defining checks listed in the Check Instances [sn_agent_check] table. `"checks": [ { "active": Boolean, "auto_generate": Boolean, "check_type": "String" "command_prefix": "String", "command": "String", "event_status_change_threshold": Number, "event_status_repair_threshold": Number, "interval": Number, "name": "String", "sys_id": "String", "timeout": "String" } ]` Data type: Array
checks.active	Flag that indicates whether the policy check is active. Valid values: • true: Policy check is active. • false: Policy check is inactive. Data type: Boolean
checks.auto_generate	Flag that indicates whether to automatically generate the command with the *command_prefix* value. Valid values: • true: Automatically populate the *command* property with active parameter values. • false: Command isn't automatically generated. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
checks.check_type	Check type specifying the monitoring option. Possible values: • Discovery: Check that locates CIs related to the agent. • Events: The check's result is transformed into an Event Management event. • Metrics: The values from the check result are transformed to metrics. Data type: String
checks.command	Command that the Agent Client Collector executes. Parameter taken from a template or monitored CI. **Note:** If *auto_generate* is true, this property is automatically populated with the prefix and flags of the active parameters listed in the *parameters* object. Data type: String
checks.command_prefix	If the *auto_generate* property is true, this command is used for automatic generation. The prefix consists of any portion of the command which is static (does not change), such as the script name. Data type: String
checks.event_status_change_threshold	Number of consecutive times that a check's response status must happen before a new event is sent. Returns null if not set. For example, if this value is 3, a check whose response status changes from OK to Error generates a new event with an Error status after the third consecutive occurrence of the status change. Data type: Number
checks.event_status_repair_threshold	Number of consecutive times that a check's response status must improve to close the previous event. Returns null if not set. For example, if this value is 3, a check whose response status changes from Error to OK closes the previous event and generates a new event with an OK status after the third consecutive occurrence of the status change. Data type: Number
checks.interval	Amount of time in seconds to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Data type: Number
checks.name	Name of the check. Data type: String
checks.sys_id	Sys_id of the check. The POST /agents/update/check/{check_id} endpoint takes this value to update the sandbox copy. Data type: String Table: Check Instances [sn_agent_check]
checks.timeout	Amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops. Data type: String
cred_alias	Credential name. Data type: String Table: Credentials [discovery_credentials]
credential_alias	Sys_id of the credential alias. Data type: String Table: Connection & Credential Aliases [sys_alias]
filter	Filter restricting the policy's checks to monitor only the specified criteria. Data type: String
interval	Amount of time in seconds to wait between policy checks. For example, a value of 60 means that the check runs every 60 seconds. **Note:** The value of the `checks.interval` property overrides the value configured in this field. Data type: Number
monitored_ci_group	Name of the CMDB groups associated with the policy. This field is only applied if the value of the `monitored_ci_type_group` property is true. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Table: CMDB Groups [cmdb_group]
monitored_ci_script	Script for monitoring CIs. This field is only applied if the value of the *policies.monitored_ci_type_script* property is true. Data type: String
monitored_ci_type_filter	Flag that indicates whether filtering by CI type is enabled. The CI type is listed in the *table* property. Valid values: • true: Filtering by checks group is enabled. • false: Filtering by checks group is disabled. Data type: Boolean
monitored_ci_type_group	Flag that indicates whether monitoring by CMDB group type is enabled. Valid values: • true: CMDB group type is enabled. • false: CMDB group type is disabled. Data type: Boolean
monitored_ci_type_script	Flag that indicates whether the script for monitoring CIs is enabled. Valid values: • true: Script for monitoring CIs is enabled. • false: Script for monitoring CIs is disabled. Data type: Boolean
name	Name of the policy. Data type: String
publish_status	Indicates whether the policy is published. Possible values: • Draft: Policy has not been published and is editable using the update endpoints. • Published: Policy is published. The draft (sandbox copy) and published copy are identical. • Published*: Policy is published, but the draft copy (sandbox view) has changes not found in the published copy.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Data type: String
params	List of objects containing information of check parameters. These results only display if the *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects `"params": [ { "active": Boolean, "flag": "String", "mandatory: Boolean, "name": "String", "sys_id": "String", "value": "String", "value_required": Boolean } ]` Table: Check Parameters [sn_agent_check_param]
params.active	Flag that indicates whether the check parameter is active. Valid values: • true: Check parameter is active. • false: Check parameter is inactive. Data type: Boolean
params.flag	Parameter flag to use during check invocation. Data type: String
params.mandatory	Flag that indicates whether this check is mandatory. Valid values: • true: This check is mandatory. • false: This check is optional. Data type: Boolean
params.name	Name of the parameter. Data type: String
params.sys_id	Sys_id of the parameter listed in the Check Parameters [sn_agent_check_param] table. The POST /agents/update/check_param/{param_id} endpoint takes this value to update the sandbox copy. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
params.value	Value of the parameter. Data type: String
params.value_required	Flag that indicates whether the information provided by the value property is required. Valid values: • true: The value property is required. • false: The value property is null or not required. Data type: Boolean
secure_params	List of objects containing information of check secure parameters. For more information, see Create a secure parameter for a check. These results only display if the *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects `"secure_params": [ { "active": Boolean, "name": "String", "order": Number, "sys_id": "String" } ]` Table: Check Secure Parameters [sn_agent_check_secure_param]
secure_params.active	Flag that indicates whether the check secure parameter is active. Valid values: • true: The check secure parameter is active. • false: The check secure parameter is inactive. Data type: Boolean
secure_params.name	Name of the secure parameter. Data type: String
secure_params.order	Order in which the parameter is sent to the check command/script. Data type: Number
secure_params.sys_id	Sys_id of the record. The POST /agents/update/check_secure_param/{param_id} endpoint takes this value to update the sandbox copy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Data type: String Table: Check Secure Parameter [sn_agent_check_secure_param]
sys_id	Sys_id of the policy. The POST /agents/update/policy/{policy_id} endpoint takes this value to update the sandbox copy. Data type: String Table: Policies [sn_agent_policy]
sys_updated_on	Date and time that the policy was last updated. Data type: String
table	Monitored CI-type field on the policy. This field is only applied if *monitored_ci_type_filter* is true. Data type: String

Example: cURL request

The following shows how to get information of the Docker Container Metrics policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/sa
ndbox_from_published/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "name": "Docker Container Metrics",
  "sys_id": "b01e609a1b9fe4943e7f0b05464bcb91",
  "active": "false",

      "secure_params": []
    }
  ]
}
```

Agent Client Collector - GET /agents/{agent_id}/restart

Restarts a specified agent with alive/up status.

If Agent Client Collector performance issues occur, you can restart the agent. Manual restart is supported in the following environments:

- Linux-based agents using `systemd`
- Windows agents

URL format

`/api/sn_agent/agents/{agent_id}/restart`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the `GET /agents/list` endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports `application/json`.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
404	No record found with the provided sys_id or this agent does not support restart.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to restart an agent.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_id>/restart" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "message": "Restarting Agent With ID: <agent_id>"
}
```

Agent Client Collector - POST /agents/check_defs/{check_def_id}/run

Runs a check against the given configuration item.

To stop a background check, use the request ID provided in the *GET /agents/exec/background/stop/{request_id}* API.

URL format

`/api/sn_agent/agents/check_defs/{check_def_id}/run`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of a check definition in the Check Definitions [sn_agent_check_def] table.

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description

params	Map of parameter names and values. These settings can be used to override the parameter records of the check definition and its specified values.
	`"params": {`
	`  "<parameter name>": "String"`
	`}`
	Data type: Object

priority	Priority of the request to be set on the ECC queue. Possible values: • 0: interactive • 1: expedited • 2: standard Data type: Number
query	Encoded query for retrieving the GlideRecord from the table specified in the *table* property. Data type: String
table	Name of the cmdb_ci table for this background check. Data type: String
timeout	Value of the timeout for the request in seconds. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	The is an error in the arguments provided in the request body.
404	The check definition with the ID provided is not found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
requestId	Sys_id of the generated background check request.

Example: cURL request

The following example shows how to run a background check and get its request ID.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/check_de
fs/a90d3c361be1301060d2773ad54bcb6f/run" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"table\":\"sn_agent_check_def\"}" \
--user 'username':'password'
```

Output:

```
{
  "request_id": "278c0170db2a30108a0751f4f3961926"
}
```

Agent Client Collector - POST /agents/check_defs/{check_def_id}/test

Enables building test check requests on check definitions.

Use this API for the following tasks:

- Set the check definition to test
- Set the configuration item to run the test against

You can also specify one of the following identifiers to use during the test:

- Credential sys_id
- Credential alias id
- Credential name

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

`/api/sn_agent/agents/check_defs/{check_def_id}/test`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
ci_id	Sys_id of a CMDB Configuration Item.
credentials_id	Sys_id of a credentials record.
credentials_name	Name of the credentials record.
credentials_alias_id	Sys_id of a credentials alias record.
credentials_alias_name	Name of a credentials alias.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Error building the test request.

Response body parameters (JSON)

Name	Description
result_id	Sys_id of the test result record.

Agent Client Collector - POST /agents/check_instances/{check_instance_id}/test

Enables building test check requests on check instances.

Use this API for the following tasks:

- Set the check instance to test
- Set the configuration item to run the test against

You can also specify one of the following identifiers to use during the test:

- Credential sys_id
- Credential alias id
- Credential name

URL format

```
/api/sn_agent/agents/check_instances/{check_instance_id}/test
```

Supported request parameters

Path parameters

Name	Description
check_instance_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
ci_id	Sys_id of a CMDB Configuration Item.
credentials_id	Sys_id of a credentials record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
credentials_name	Name of the credentials record.
credentials_alias_id	Sys_id of a credentials alias record.
credentials_alias_name	Name of a credentials alias.
proxy_agent_id	Unique ID of an agent proxy to run this check. This value is listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Error building the test request.

Response body parameters (JSON)

Name	Description
result_id	Sys_id of the test result record.

Agent Client Collector - POST /agents/update/check/{check_id}

Updates a selected policy check.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

`/api/sn_agent/agents/update/check/{check_id}`

Supported request parameters

Path parameters

Name	Description
check_id	Sys_id of a policy check sandbox copy in the Check Instances [sn_agent_check] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the policy check is active. Valid values: • true: Policy check is active. • false: Policy check is inactive. Data type: Boolean
auto_generate	Flag that indicates whether to automatically generate the command with the *command_prefix* value. Valid values: • true: Automatically populate the *command* property with active parameter values. • false: Command isn't automatically generated. Data type: Boolean
check_type	Check type specifying the monitoring option. Possible values: • Discovery: Check that locates CIs related to the agent. • Events: The check's result is transformed into an Event Management event. • Metrics: The values from the check result are transformed to metrics.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
command	Command that the Agent Client Collector executes. Parameter taken from a template or monitored CI. **Note:** If *auto_generate* is true, this property is automatically populated with the prefix and flags of the active parameters listed in the *parameters* object. Data type: String
command_prefix	If the *auto_generate* property is true, this command is used for automatic generation. The prefix consists of any portion of the command which is static (does not change), such as the script name. Data type: String
event_status_change_threshold	Number of consecutive times that a check's response status must happen before a new event is sent. Returns null if not set. For example, if this value is 3, a check whose response status changes from OK to Error generates a new event with an Error status after the third consecutive occurrence of the status change. Data type: Number
event_status_repair_threshold	Number of consecutive times that a check's response status must improve to close the previous event. Returns null if not set. For example, if this value is 3, a check whose response status changes from Error to OK closes the previous event and generates a new event with an OK status after the third consecutive occurrence of the status change. Data type: Number
interval	Amount of time in seconds to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds. Data type: Number
name	Name of the check. Data type: String
timeout	Amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to update the event change and repair properties of a policy check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck/<check_sys_id>" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"event_status_change_threshold\" : \"2\",
    \"event_status_repair_threshold\" : \"1\"
}" \
--user 'username':'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - POST /agents/update/check_def_params/{check_def_param_id}

Enables changing one or more field values of a specified check parameter.

URL format

`/api/sn_agent/agents/update/check_def_params/{check_def_param_id}`

Supported request parameters

Path parameters

Name	Description
check_def_param_id	Sys_id of the check parameter. Data type: String Table: Check Parameter Definitions [sn_agent_check_param_def]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the check parameter is active. Valid values: • true: The check parameter is active. • false: The check parameter is inactive. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
default_value	Specifies the default value for this check parameter. Data type: String
mandatory	Flag that indicates whether the check parameter is required. Valid values: • true: The check parameter is required. • false: The check parameter is optional. Data type: Boolean
name	Name of the check parameter. Data type: String

Note: Refer to the data dictionary for a comprehensive list of Check Definition fields and types.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	The check parameter was not found with sys_id provided.
500	Error updating the check parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
None	Success or error message.

Example: cURL request

The following example shows how to activate a check parameter.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_def_params/02d89bb01b307490f271ea42b24bcb63" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"active\":\"true\"}" \
--user 'username':'password'
```

Output:

```
"message": "Check Definition Parameter Updated Successfully"
```

Agent Client Collector - POST /agents/update/check_def_secure_params/{check_def_secure_param_id}

Enables changing one or more field values of a specified check secure parameter.

URL format

```
/api/sn_agent/agents/update/check_def_secure_params/
{check_def_secure_param_id}
```

Supported request parameters

Path parameters

Name	Description
check_def_secure_param_id	Sys_id of the secure parameter. Data type: String Table: Check Secure Parameter Definitions [sn_agent_check_secure_param_def]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the secure parameter is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Valid values: • true: The secure parameter is active. • false: The secure parameter is inactive. Data type: Boolean
name	Name of the secure parameter. Data type: String
order	Order in which the parameter is sent to the check command/script. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	The check secure parameter was not found with sys_id provided.
500	Error updating the check secure parameter.

Response body parameters (JSON)

Name	Description
None	Success or error message.

Example: cURL request

The following example shows how to activate a check secure parameter.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_def_secure_params/2d30a066dba530106f4810284b9619c1" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"active\":\"true\"}" \
--user 'username':'password'
```

Output:

```
"message": "Check Definition Secure Parameter Updated
 Successfully"
```

Agent Client Collector - POST /agents/update/check_defs/{check_def_id}

Enables changing one or more field values of a specified check definition.

URL format

`/api/sn_agent/agents/update/check_defs/{check_def_id}`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Indicates whether this check definition is active. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• 0: This check definition is inactive. • 1: This check definition is active. Data type: Number
background	Flag that indicates whether this check definition is a background check. A background check is a check which the agent starts execution of and doesn't wait for it to finish running. Valid values: • true: This check definition is a background check. • false: This check definition is not a background check. Data type: Boolean
check_group	Group specified for this check definition.
check_type	Type of check. Possible values: • Events – Check results are transformed into an Event Management event. • Metrics – Values from the check result are transformed to metrics. Data type: String
command	Command that the Agent Client Collector executes. Data type: String
name	Name of the check. Data type: String

params	Map of parameter names and values. These settings can be used to override the parameter records of the check definition and its specified values.
	`"params": {`
	`  "<parameter name>": "String"`
	`}`
	
	Data type: Object

plugins	List of Agent Client Collector plugins associated with this check. Data type: Array
proxy_valid	Flag that indicates whether the check definition policy is set to work as a proxy. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• true: This check definition policy is set to work as a proxy. • false: This check definition policy is not set to work as a proxy. Data type: Boolean
query	Encoded query for retrieving the GlideRecord from the table specified in the *table* property. Data type: String
table	Name of the cmdb_ci table for this check. Data type: String
timeout	Timeout in seconds. Data type: Number

Note: Refer to the data dictionary for a comprehensive list of Check Definition fields and types.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	The check definition was not found with sys_id provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Error updating the check definition.

Response body parameters (JSON)

Name	Description
None	Success or error message.

Example: cURL request

The following example shows how to deactivate a check definition.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_defs/99e12466dba530106f4810284b961976" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"active\":\"false\"}" \
--user 'username':'password'
```

Output:

```
"message": "Check Definition Updated Successfully"
```

Agent Client Collector - POST /agents/update/check_param/{param_id}

Updates a selected policy check parameter.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

URL format

`/api/sn_agent/agents/update/check_param/{param_id}`

Supported request parameters

Path parameters

Name	Description
param_id	Sys_id of policy check parameter sandbox copy. Data type: String Table: Check Parameters [sn_agent_check_param]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the check parameter is active. Valid values: • true: Check parameter is active. • false: Check parameter is inactive. Data type: Boolean
flag	
mandatory	Flag that indicates whether this check is mandatory. Valid values: • true: This check is mandatory. • false: This check is optional. Data type: Boolean
name	Name of the parameter. Data type: String
value	Value of the parameter. Data type: String
value_required	Flag that indicates whether the information provided by the value property is required. Valid values: • true: The value property is required. • false: The value property is null or not required. Data type: Boolean

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to update several properties of a policy check parameter.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_param/<param_sys_id>" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"flag\" : \"-d\",
   \"mandatory\" : \"true\",
   \"name\" : \"scheme2\",
   \"value\" : \"120\",
   \"value_required\" : \"false\"
```

```
}" \
--user 'username':'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - POST /agents/update/check_secure_param/{param_id}

Updates a selected policy check secure parameter.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

URL format

`/api/sn_agent/agents/update/check_secure_param/{param_id}`

Supported request parameters

Path parameters

Name	Description
param_id	Sys_id of the policy check secure parameter sandbox copy. Data type: String Table: Check Secure Parameter [sn_agent_check_secure_param]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the check secure parameter is active. Valid values: • true: The check secure parameter is active. • false: The check secure parameter is inactive. Data type: Boolean
name	Name of the secure parameter. Data type: String
order	Order in which the parameter is sent to the check command/script.

Request body parameters (JSON) (continued)

Name	Description
	Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to update the properties of a policy check secure parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_secure_param/<param_sys_id>" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"name\" : \"new name\",
   \"order\" : \"2\"
}" \
--user 'username':'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - POST /agents/update/policy/{policy_id}

Updates a sandbox copy of a policy.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

URL format

`/api/sn_agent/agents/update/policy/{policy_id}`

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of a policy sandbox copy. Data type: String Table: Policies [sn_agent_policy]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
cred_alias	Credential name. Data type: String Table: Credentials [discovery_credentials]
credential_alias	Sys_id of the credential alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String Table: Connection & Credential Aliases [sys_alias]
filter	Filter restricting the policy's checks to monitor only the specified criteria. Data type: String
interval	Amount of time in seconds to wait between policy checks. For example, a value of 60 means that the check runs every 60 seconds. **Note:** The value of the *`checks.interval`* property overrides the value configured in this field. Data type: Number
monitored_ci_group	Name of the CMDB groups associated with the policy. This field is only applied if the value of the *`monitored_ci_type_group`* property is true. Data type: String Table: CMDB Groups [cmdb_group]
monitored_ci_script	Script for monitoring CIs. This field is only applied if the value of the *`policies.monitored_ci_type_script`* property is true. Data type: String
monitored_ci_type_filter	Flag that indicates whether filtering by CI type is enabled. The CI type is listed in the *`table`* property. Valid values: • true: Filtering by checks group is enabled. • false: Filtering by checks group is disabled. Data type: Boolean
monitored_ci_type_group	Flag that indicates whether monitoring by CMDB group type is enabled. Valid values: • true: CMDB group type is enabled. • false: CMDB group type is disabled. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
monitored_ci_type_script	Flag that indicates whether the script for monitoring CIs is enabled. Valid values: • true: Script for monitoring CIs is enabled. • false: Script for monitoring CIs is disabled. Data type: Boolean
name	Name of the policy. Data type: String
table	Monitored CI-type field on the policy. This field is only applied if *monitored_ci_type_filter* is true. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to update the name and filter properties/fields of a policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/po
licy/<policy_sys_id>" \--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"name\" : \"new policy name\",
  \"filter\" : \"operational_status=1\"
}" \
--user 'username':'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Mapping API

The *`Agent Mapping`* API provides an endpoint to map external agent IDs from Contact Center as a Service (CCaaS) systems to internal agent IDs in the ServiceNow AI Platform.

This API requires the External Agent Management Util Pack (sn_external_agent) plugin. To call this API, you must have the interaction_agent role.

For more information about integrating with CCaaS systems, see Integrating with contact centers.

Agent Mapping - PUT /sn_ct_ctr_it_core/agent_mapping/agent/{agentId}/inboundId/{inboundId}

Maps an external agent ID from a Contact Center as a Service (CCaaS) system to an internal agent ID in the ServiceNow AI Platform.

Call this endpoint when an agent logs in or out of the CCaaS system to update their active status. This endpoint creates or updates records in the External Agent Mapping [external_agent_mapping] table with the following data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- External CCaaS agent ID
- Provider channel identity associated with the inbound ID
- Agent's active status in the CCaaS system
- Reference to the User [sys_user] record for the agent

URL format

Default URL: `/api/sn_ct_ctr_it_core/agent_mapping/agent/{agentId}/inboundId/{inboundId}`

Supported request parameters

Path parameters

Name	Description
agentId	Sys_id of the internal agent. Data type: String Table: User [sys_user]
inboundId	Inbound ID from the provider channel identity record for the CCaaS system. Data type: String Table: Provider Channel Identity [sys_cs_provider_application] Field: Inbound ID

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the agent is currently logged in to the CCaaS system. Valid values: • true: The agent is logged in. • false: The agent is logged out. Default: true Data type: Boolean
external_agent_id	Required. External agent ID from the CCaaS system. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	OK. Existing agent mapping record updated.
201	Created. New agent mapping record created.
400	Bad request. The agent ID or inbound ID provided in the request is invalid.

Response body parameters (JSON)

Name	Description
result	Result object containing information about the request. Data type: Object
result.mappingIds	Sys_ids of any created or updated records in the External Agent Mapping [external_agent_mapping] table. Data type: Array of strings
result.message	Message explaining the outcome of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.status	Status of the request. Possible values: • Success • Failure Data type: String

Example: cURL request

This example maps an internal agent with sys_id `da419c1fc312310015519f2974d3ae15` to the corresponding ID `12345` from the external CCaaS system.

```
curl
 "https://instance.service-now.com/api/sn_ct_ctr_it_core/agent_m
apping/agent/da419c1fc312310015519f2974d3ae15/inboundId/ServiceN
owVoice" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"external_agent_id\":\"12345\"}" \
--user 'username':'password'
```

Response body:

```
{
  "result": {
    "message": "Agent Id mapping record inserted",
    "status": "success",
    "mappingIds": [
      "128b74fcc3931a50325a4ad9d00131c3"
    ]
  }
}
```

Example: cURL request

This example sets the *`active`* parameter to `false` to indicate that the agent is logged out of the CCaaS system.

```
curl
 "https://instance.service-now.com/api/sn_ct_ctr_it_core/agent_m
apping/agent/da419c1fc312310015519f2974d3ae15/inboundId/ServiceN
owVoice" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{"external_agent_id":"12345", "active":"false"}" \
--user 'username':'password'
```

Response body:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "result": {
    "message": "Agent Id mapping record updated",
    "status": "success",
    "mappingIds": [
      "cea77cebebef9e10a341fc7acad0cdc2"
    ]
  }
}
```

Aggregate API

The *Aggregate* API provides endpoints that allow you to compute aggregate statistics about existing table and column data.

This API uses GlideAggregate calls and only honors read-only queries if read access is defined for the table being called on based on role ownership.

Aggregate - GET /now/stats/{tableName}

Retrieves records for the specified table and performs aggregate functions on the returned values.

You can specify which aggregate functions to perform by using either the *sysparm_<aggregate>_fields* parameter or *sysparm_having=<aggregate>^field^operator^value* parameter, substituting *<aggregate>* for one of these aggregate functions:

- avg
- max
- min
- sum

URL format

Versioned URL: `/api/now/{api_version}/stats/{tableName}`

Default URL: `/api/now/stats/{tableName}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
tableName	Name of the table for which to retrieve records. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
name-value pairs	An alternative to using the *sysparm_query* parameter. You can filter a query us value pairs where the key is the name of a field. For example, instead of using the parameter `&sysparm_query=active=tru` you can use `&active=true`. You can use the display value when the field is a choice or reference type field, such as `&state=closed` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, such as `&active=true&assigned_to=john.smith`. Data type: String
sysparm_<aggregate>_fields	List of fields on which to perform each aggregate operation. You can specify multi by separating each with a comma. For example, to get the average values from the and priority fields, use `sysparm_avg_fields=duration,priority`. **Note:** Specify this parameter, the *sysparm_count* parameter, or both for query to return meaningful results. If neither parameter is passed, no aggrega operation is performed. Data type: String
sysparm_count	Flag that determines whether to return the number of records returned by the que **Note:** Specify this parameter, the *sysparm_<aggregate>_fields* par or both for your query to return meaningful results. If neither parameter is pas aggregate operation is performed. Data type: String
sysparm_display_value	Data retrieval operation when grouping by reference or choice fields. Based on th the query returns either the display value, the actual value in the database, or bot • true: Returns display values for all fields. • false: Returns actual values from the database. If a value is not specified, this pa defaults to false. • all: Returns both actual and display values. There is no preferred method for setting this parameter. However, specifying the c value may cause performance issues as they are not read from the database and reference other fields and records. For more information on display values and ac see Table API FAQs (KB0534905). Data type: String
sysparm_group_by	Fields by which to group the returned data. You can specify multiple fields by sepa each field with a comma, such as `sysparm_group_by=priority,state`. Data type: String
sysparm_having	Additional query that enables you to filter the data based on an aggregate operati value for this parameter must follow the syntax `aggregate^field^operato` such as `count^priority^>^3` to obtain the number of records within the que

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	with a priority greater than 3. You can specify multiple queries by separating each comma, such `ascount^state^=^1,avg^priority^>^3`. Data type: String
sysparm_order_by	List of values by which to order grouped results. You can specify an order using a an aggregate. For example, if you specify `sysparm_order_by=AVG^state`, g results with lower average state values are returned first. You can also order by CO arrange groups of records by the number of records in each group. When you specify an order, groups are ordered in ascending order by default. Use sort in descending order, such as `sysparm_order_by=state^DESC`. Data type: String
sysparm_query	An encoded query. For example: `(sysparm_query=active=true)` `(sysparm_query=caller_id=javascript:gs.getUserID()^acti` Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
Depends on specified table and specified request parameters.	

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/stats/incident?sysparm
_avg_fields=reassignment_count%2Cbusiness_stc&sysparm_group_by=a
ssignment_group" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "result": [
    {
      "stats": {
        "avg": {
          "business_stc": "804162.7143",
          "reassignment_count": "1.0000"
        }
      },
      "groupby_fields": [
        {
          "value": "",
          "field": "assignment_group"
        }
      ]
    },
    {
      "stats": {
        "avg": {
          "business_stc": "2037371.0000",
          "reassignment_count": "1.5000"
        }
```

    }
  ]
}
```

AI Assets API

AI Assets API provides endpoints to retrieve, update, and create several types of AI assets, such as systems, data sets, prompts, and models.

The *AI Assets* API supports actions that you can perform on AI Asset records in the Expanded Model and Asset Classes application. It requires the Asset Classes (sn_ent) plugin to access it. You must have the asset and model_manager roles to call the endpoints provided by the AI Assets API.

Note: The data included in AI Asset records may be spread across several tables like Product Model, Configuration Item, and others. To reduce complexity when calling this API, however, the *AI Assets* API inserts data into only the Asset, Product Model and Configuration Item tables. Specifics about table updates are provided under each endpoint.

AI Assets API - GET /sn_ent/asset/ai_dataset/{sys_id}

Retrieves the data of the specified AI dataset asset.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_dataset/{sys_id}`

Default URL: `/api/sn_ent/asset/ai_dataset/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the asset. Table: AI Dataset Asset [alm_ai_dataset_digital_asset] Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. Failed to fetch the asset with the given sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Details of the newly created AI Dataset asset.
	
	Data type: Object
	
	`"result": {`
	`  "acceptable_usage": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"base_datasets": [Array], "created": "String", "dataset_card": "String", "data_type": {Object}, "description": "String", "documentation": "String", "display_name": "String", "managed_by": {Object}, "name": "String", "provider": {Object}, "state": "Development", "source": "String", "sys_id": "String", "updated": "String", "version": "String", }

result.acceptable_usage	Acceptable usage for the AI Dataset Asset record. Acceptable usage refers to how a dataset or model can be used, typically for training or evaluation purposes.
	
	Data type: Object
	
	`"acceptable_usage": {`
	`"label": "String"`
	`"value": "String"`
	`}`

result.acceptable_usage.label	Display label of the acceptable usage value. Data type: String
result.acceptable_usage.value	The purpose of the dataset or model, like for training or evaluation. Valid values: • 1: indicates training purpose • 2: indicates an evaluative purpose Data type: String (number)
result.base_datasets	Comma-separated list of base datasets required to build the given dataset. Accepts the name or sys_id of a base data set in the AI Dataset Digital Asset [alm_ai_dataset_digital_asset] table. Data type: Array `"base_datasets": ["String", "String"]`
result.created	Date and time that the AI Dataset Asset record was created. Format: YYYY-MM-DD HH:mm:ss Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

result.data_type	The type of data present in the AI Dataset Asset record.
	
	Data type: Object
	
	`"data_type": {`
	`  "label": "String",`
	`  "value": "String"`
	`}`

result.data_type.label	The display label for the data type value. Data type: String
result.data_type.value	Value of the dataset asset's data type. Data type: String
result.dataset_card	The data set card. A dataset_card is a metadata document that describes the contents, structure, and context of an AI dataset. It provides details like data sources, features, intended use, and any known limitations to ensure proper understanding and usage. Data type: String
result.description	Description of the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.display_name	Display name of the AI Dataset Asset record. Table: AI Dataset Digital Asset [alm_ai_dataset_digital_asset] Data type: String
result.documentation	Documentation of the associated AI Dataset Product Model [cmdb_ai_dataset_product_model] table record. Data type: String

result.managed_by	Details about the user who manages the AI Dataset Asset record.
	
	Data type: Object
	
	`"managed_by": [`
	`  {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`  }`
	`]`

result.managed_by.name	Name of the user who manages the AI Dataset Asset record. Table: User [user]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.managed_by.sys_id	Sys_id of the user who manages the AI Dataset Asset record. Table: User [user] Data type: String
result.name	Name of the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String

result.provider	Provider of the associated AI Dataset Product Model record.
	
	Table: AI Dataset Product Model [cmdb_ai_dataset_product_model]
	
	Data type: Object
	
	`provider: {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

result.provider.name	Name of the provider. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.provider.sys_id	Sys_id of the provider in the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.source	Details about the source of AI dataset asset. Valid values: • Link to the source of the dataset asset. • Details (in plain text) of the source of the dataset asset. For example, the name of a product or website. Data type: String Default: empty or null
result.state	State of the AI Dataset Asset record. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	• In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.sys_id	Sys_id of the AI Dataset Asset record. Table: AI Dataset Digital Asset [alm_ai_dataset_digital_asset] Data type: String
result.updated	Date and time that the AI Dataset Asset record was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.version	Version number of the associated AI Dataset Product Model record. For example, V2. Data type: String

Example: cURL request

The following example.

```
curl
 "https://instance.servicenow.com/api/sn_ent/asset/ai_dataset/
 cc419cb2331e92101c9aca989d5c7b4c" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Output:

```
{
  "result": {
    "sys_id": "9d60fb5f40d21210f877b00c113d1fea",
    "display_name": "ServiceNow Closed Incidents v1",

AI Assets API - GET /sn_ent/asset/ai_model/{sys_id}

Retrieves the data of the specified AI model asset.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_model/{sys_id}`

Default URL: `/api/sn_ent/asset/ai_model/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the asset. Table: AI Model Asset [alm_ai_model_digital_asset] Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. Failed to fetch the asset with the given sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

result	Details of the model asset record.
	
	Data type: Object
	
	`result: {`
	`"base_model": {Object},`
	`"context_window": "String",`
	`"created": "String",`
	`"deployment_guideline": "String",`
	`"description": "String",`
	`"display_name": "String",`
	`"documentation": "String",`

result.created	Date and time that the AI Dataset Asset record was created. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.deployment_guideline	Instructions applicable for models developed and deployed within an organization. Data type: String
result.description	Description to give the AI Model Product Model. Table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String
result.documentation	Documentation of the AI Prompt Product Model record. Table: AI Prompt Product Model [cmdb_ai_model_product_model] Data type: String

result.evaluation_datasets	Comma-separated list of sys_ids or display names of AI datasets of the AI Dataset Digital Asset used for evaluating the model.
	
	Mostly applicable for models developed within an organization.
	
	Data type: Array
	
	`"evaluation_datasets": [`
	`  "name": "String",`
	`  "sys_id": "String"`
	`]`

result.evaluation_metrics_report	Reference to the evaluation results. Possible values: • Details (in plain text) outlining results • Links to specific results Data type: String

result.managed_by	Details about the user who manages the AI Model Asset record.
	
	Data type: Object
	
	`"managed_by": [`
	`  {`
	`  "name": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	`"sys_id": "String"`
	`}`
	`]`

result.managed_by.name	Name of the user who manages the AI Dataset Asset record. Table: User [user] Data type: String
result.managed_by.sys_id	Sys_id of the user who manages the AI Dataset Asset record. Table: User [user] Data type: String
result.model_size_in_mb	Size of the model in MB. Mostly applicable for models developed and deployed within an organization. Data type: Number
result.name	Required. Name of the AI Model Product Model. Table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String
result.parameters_info	Properties of the training data that learn during the learning process. For example: `7B` or `30B`. Data type: String

result.provider	Provider of the associated AI Dataset Product Model record.
	
	Data type: Object
	
	`provider: {`
	`"name": "String",`
	`"sys_id": "String"`
	`}`

result.provider.name	Name of the provider. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.provider.sys_id	Sys_id of the provider in the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model]

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	Data type: String
result.required_infrastructure	Documentation of infrastructure needs for the model deployment. For example, details about the infrastructure stack and processing needs. Mostly applicable for models deployed within an organization. Data type: String
result.result.display_name	Display name of the asset record. Data type: String
result.source	Details about the source of the model. Possible values: • Link to the source of the model. For example, `https://huggingface.co/mistralai/Mixtral-8x7B-Instruct-v0.1` or a link to Github. • Details of the source in plain text. For example, `Microsoft Azure` Data type: String
result.state	State to apply to the AI Model Asset. Possible values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.supported_languages	Languages that are supported by the AI Model. Data type: Array `"supported_languages": [ { "name": "String", "sys_id": "String" } ]`
result.supported_languages.name	Name of the Language record. For example, `"French", "English"`. Table: Language [sys_language]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	Data type: String
result.supported_languages.sys_id	Sys_id of the Language record. Table: Language [sys_language] Data type: String
result.sys_id	Sys_id of the AI model asset record. Table: AI Model Asset [alm_ai_model_digital_asset] Data type: String
result.training_datasets	Reference to 1+ associated data sets used for training the model. Data type: Array `"training_datasets": [ { "name": "String", "sys_id": "String" } ]`
result.training_procedure	Type of AI training applied to the model. Possible values: • 1: Decision Trees • 2: Deep Neural Networks • 3: Linear Regression • 4: Logistic Regression • 5: Random Forest • 6: Supervised Learning • 7: Unsupervised Learning • 8: Reinforcement Learning • 9: Transfer Learning • 10: Semi-Supervised Learning • 11: Instruction Finetuning • 12: Supervised Finetuning Data type: String
result.updated	Date and time that the AI model asset was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

result.version	Version for AI Model Product Model. For example, V2. Data type: String

Example: cURL request

The following example.

```
curl
 "https://instance.servicenow.com/api/sn_ent/asset/ai_model/cc41
9cb2331e92101c9aca989d5c7b4c" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Output:

```

Name	Description
	Possible values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.sys_id	Sys_id of the AI Prompt Asset record. Table: AI Prompt Asset [alm_ai_prompt_digital_asset] Data type: String
result.updated	Date and time that the AI Prompt Asset record was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.version	Version of the associated AI Prompt Product Model record. For example, V2. Data type: String

Example: cURL request

The following example shows how to retrieve information about a AI Prompt Asset Model using a specific ID.

```
curl
 "https://instance.servicenow.com/api/sn_ent/asset/ai_prompt/cc4
19cb2331e92101c9aca989d5c7b4c" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

The response body returns details about the specific prompt asset model that was retrieved.

```
{
  "result": {
    "sys_id": "cc419cb2331e92101c9aca989d5c7b4c",
    "display_name": "ServiceNow ServiceNow Incident
 Summarization Prompt 4 V8",
    "name": "ServiceNow Incident Summarization Prompt 4",
    "description": "Prompt for Incident Summarization",
    "version": "V8",
    "provider": {
      "sys_id": "93d4ecfac0a8000b6294d71b733977fb",
      "name": "ServiceNow"
    },
```

result.ai_prompts.sys_id	Sys_id of the AI Prompt Digital Asset record. Table: AI Prompt Digital Asset [alm_ai_prompt_digital_asset] Data type: String
result.created	Date and time that the AI System Asset was created. Format: YYYY-MM-DD HH:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.description	Description of the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: String
result.display_name	Display name of the AI System Asset record. Table: AI System Asset [cmdb_ai_ system_asset_model] Data type: String
result.documentation	Documentation for the AI System Product System record. Table: AI System Product System [cmdb_ai_system_product_system] Data type: String
result.evaluation_datasets	List of AI datasets used for evaluating the model in the AI System Digital Asset record. Mostly applicable for models developed within an organization. Tables: AI Dataset Digital Asset [alm_ai_dataset_digital_asset], AI System Asset [alm_ai_system_digital_asset] Data type: Array `"evaluation_datasets": [ { "name": "String", "sys_id": "String" } ]` Default: empty string
result.evaluation_datasets.name	Name of the AI Dataset Digital Asset. Data type: String
result.evaluation_datasets.sys_id	Sys_id of the AI Dataset Digital Asset record. Table: AI Dataset Digital Asset [alm_ai_dataset_digital_asset] Data type: String
result.evaluation_metrics_report	Evaluation results of the AI system asset record. Possible values:

Name	Description
	• Details (in plain text) outlining results • Links to specific results Data type: String
result.managed_by	Details about the user who manages the AI System Asset record. Data type: Object `"managed_by": [ { "name": "String", "sys_id": "String" } ]`
result.managed_by.name	Sys_id of the user who manages the AI System Asset record. Table: User [user] Data type: String
result.managed_by.sys_id	Name of the user who manages the AI System Asset record. Table: User [user] Data type: String
result.name	Name of the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: String
result.provider	Value of the Provider field in the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: Object `provider: { "name": "String", "sys_id": "String" }`
result.provider.name	Name of the provider in the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: String

Name	Description
result.provider.sys_id	Sys_id of the provider in the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: String
result.state	State of the AI System Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Possible values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.sys_id	Sys_id of the AI System Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String
result.updated	Date and time that the AI System Asset was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.version	Version number of the associated AI System Product Model record. For example, `V2`. Data type: String

Example: cURL request

The following example shows how to retrieve an AI System Model Asset with a given ID.

```
curl
 "https://instance.servicenow.com/api/sn_ent/asset/ai_system/3b1
40397435a9210a63d00002fb8f2d7" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

The response body returns details about the given AI System Model Asset.

```
{
  "result": {
```

AI Assets API - POST /sn_ent/asset/ai_dataset

Creates a new AI dataset asset entry in the AI Dataset Digital Asset [alm_ai_dataset_digital_asset] and AI Dataset Product Model [cmdb_ai_dataset_product_model] according to details you provide in the request body.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_dataset`

Default URL: `/api/sn_ent/asset/ai_dataset`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
{object}	`{ "acceptable_usage": "String", "base_datasets": [Array], "dataset_card": "String" "data_type": "String", "description": "String", "documentation": "String", "managed_by": "String", "name": "String", "provider": "String", "state": "String" "source": "String", "version": "String" }`
{object}.acceptable_usage	The purpose of the dataset or model, like for training or evaluation. Valid values: • `1`: indicates training purpose • `2`: indicates an evaluative purpose Data type: String (number)
{object}.base_datasets	Comma-separated list of base datasets needed to build this dataset. Accepts names or sys_ids of datasets present in AI Dataset Digital Asset [alm_ai_dataset_digital_asset] table. Data type: Array `“base_datasets”: ["String", “String"]`
{object}.data_type	Type of data present in the dataset. For example, `Text`, `Video`, `Image` or `1`, `2`. Data type: String
{object}.dataset_card	The data set card. A dataset_card is a metadata document that describes the contents, structure, and context of an AI dataset. It

Request body parameters (XML or JSON) (continued)

Name	Description
	provides details like data sources, features, intended use, and any known limitations to ensure proper understanding and usage. Data type: String
{object}.description	Description of the associated AI Dataset Product Model. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
{object}.documentation	Documentation for the AI Dataset Product Model. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
{object}.managed_by	Sys_id or name value of the user in the Managed by field of the AI Dataset Product Model record. Tables: User [sys_user], AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
{object}.name	Required. Name of the associated record in the AI Dataset Product Model [cmdb_ai_dataset_product_model] table. Data type: String
{object}.provider	Required. Sys_id or name value of the Provider field of the Company [core_company] table record. Data type: String
{object}.source	Details about the source of the dataset. Valid values: • Link to the source of the dataset. • Details of the source in plain text. Data type: String Default: empty or null
{object}.state	State of the AI dataset asset. Valid values: • In use • Deployed • Retired

Request body parameters (XML or JSON) (continued)

Name	Description
	• Development • Unknown • N/A Data type: String
{object}.version	Version number of the associated AI Dataset Product Model record. For example, V2. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Details of the newly created AI Dataset asset.
	
	Data type: Object
	
	`"result": {`
	`  "acceptable_usage": {Object},`
	`  "base_datasets": [Array],`
	`  "created": "String",`
	`  "dataset_card": "String",`
	`  "data_type": {Object},`
	`  "description": "String",`
	`  "documentation": "String",`
	`  "display_name": "String",`
	`  "managed_by": {Object},`
	`  "name": "String",`
	`  "provider": {Object},`
	`  "state": "Development",`
	`  "source": "String",`
	`  "sys_id": "String",`
	`  "updated": "String",`
	`  "version": "String",`
	`}`

result.acceptable_usage	Acceptable usage for the AI Dataset Asset record. Acceptable usage refers to how a dataset or model can be used, typically for training or evaluation purposes.
	
	Data type: Object
	
	`"acceptable_usage": {`
	`  "label": "String"`
	`  "value": "String"`
	`}`

result.acceptable_usage.label	Display label of the acceptable usage value. Data type: String
result.acceptable_usage.value	The purpose of the dataset or model, like for training or evaluation. Valid values: • 1: indicates training purpose • 2: indicates an evaluative purpose Data type: String (number)
result.base_datasets	Comma-separated list of base datasets required to build the given dataset. Accepts the name or sys_id of a base data set in the AI Dataset Digital Asset [alm_ai_dataset_digital_asset] table. Data type: Array

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"base_datasets": ["String", "String"]`
result.created	Date and time that the AI Dataset Asset record was created. Format: YYYY-MM-DD HH:mm:ss Data type: String

result.data_type	The type of data present in the AI Dataset Asset record.
	
	Data type: Object
	
	`"data_type": {`
	`  "label": "String",`
	`  "value": "String"`
	`}`

result.data_type.label	The display label for the data type value. Data type: String
result.data_type.value	Value of the dataset asset's data type. Data type: String
result.dataset_card	The data set card. A dataset_card is a metadata document that describes the contents, structure, and context of an AI dataset. It provides details like data sources, features, intended use, and any known limitations to ensure proper understanding and usage. Data type: String
result.description	Description of the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.display_name	Display name of the AI Dataset Asset record. Table: AI Dataset Digital Asset [alm_ai_dataset_digital_asset] Data type: String
result.documentation	Documentation of the associated AI Dataset Product Model [cmdb_ai_dataset_product_model] table record. Data type: String

result.managed_by	Details about the user who manages the AI Dataset Asset record.
	
	Data type: Object
	
	`"managed_by": [`
	`  {`

Name	Description

	`"name": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.managed_by.name	Name of the user who manages the AI Dataset Asset record. Table: User [user] Data type: String
result.managed_by.sys_id	Sys_id of the user who manages the AI Dataset Asset record. Table: User [user] Data type: String
result.name	Name of the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String

result.provider	Provider of the associated AI Dataset Product Model record.
	
	Table: AI Dataset Product Model [cmdb_ai_dataset_product_model]
	
	Data type: Object
	
	`provider: {`
	`"name": "String",`
	`"sys_id": "String"`
	`}`

result.provider.sys_id	Sys_id of the provider in the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.provider.name	Name of the provider. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.source	Details about the source of AI dataset asset. Valid values: • Link to the source of the dataset asset. • Details (in plain text) of the source of the dataset asset. For example, the name of a product or website.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Default: empty or null
result.state	State of the AI Dataset Asset record. Possible values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.sys_id	Sys_id of the AI Dataset Asset record. Table: AI Dataset Digital Asset [alm_ai_dataset_digital_asset] Data type: String
result.updated	Date and time that the AI Dataset Asset record was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.version	Version number of the associated AI Dataset Product Model record. For example, V2. Data type: String
result.warnings	Comma-separated list of warning messages that are present when creating the dataset. These warnings can be validation checks, such as when the sys_id of an optional parameter is invalid. Data type: Array `"warnings": ["String"]`

Example: cURL request

The following example shows how to create a new AI dataset asset record.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_ent/asset/ai_dataset' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "name": "Dataset One",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "description": "Description for dataset ",
  "provider": "servicenow",
  "version": "V1",
  "state": 31,
  "source": "Source of dataset",
  "documentation": "document",
  "dataset_card": "Dataset Card",
  "base_datasets": ["Dataset Two", "Dataset Three"],
  "data_type": "1,2",
  "acceptable_usage": "1,2",
  "managed_by": "abel.tuter"
}'
```

Response body. The results of the newly created dataset asset record.

```
{
  "result": {
    "asset": {
      "sys_id": "da8393eb40d25210f877b00c113d1fc1",
      "display_name": "ServiceNow Closed Incidents",
      "name": "Closed Incidents",
      "description": "Incidents with resolution",
      "documentation": "Sample Documentation",
      "source": "incident table on servicenow instance",
      "dataset_card": "Dataset Card",
      "state": "Deployed",
      "version": null,
      "data_type": {
        "value": "1",
        "label": "Text"
      },

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_prompt`

Default URL: `/api/sn_ent/asset/ai_prompt`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
object	Required. Content of the AI Prompt asset to update. Data type: Object `{ "ai_model": "String", "description": "String", "documentation": "String", "managed_by": "String" "name": "String", "prompt_info": "String", "provider": "String", "state": Number, "version": "String" }`
ai_model	Name of sys_id value of the AI Model field in the AI Model Digital Asset record. Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: String Default: empty string
description	Description to give the AI Prompt Product Model. Table: AI Prompt Product Model [cmdb_ai_prompt_product_model] Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: empty string
documentation	Documentation of the AI Prompt Product Model. Table: AI Prompt Product Model [cmdb_ai_prompt_product_model] Data type: String Default: empty string
managed_by	Name or sys_id of the user that manages the asset. Located in the Managed by field of the asset record. Tab;e: User [sys_user] Data type: String Default: empty string
name	Required. Name of the associated record in the AI Prompt Product Model [cmdb_ai_prompt_product_model] table. Data type: String Default: empty string
prompt_info	Prompt information for AI Prompt Asset. Data type: String Default: empty string
provider	Required. Provider name or sys_id of the Company table record. Table: Company [core_company] Data type: String
state	State to apply to the AI Model Asset. For example, Valid values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
version	Version number to assign the AI Prompt Product Model. For example, V2. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: empty string

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Results of the new AI asset prompt.
	
	Data type: Object
	
	`"result": {`
	`  "asset": Object,`
	`  "warnings": [Array]`
	`}`

Name	Description
	Data type: Array `"ai_prompts": [ { "name": "String", "sys_id": "String" } ]`
result.asset.ai_prompts.name	Name of the AI prompt. Data type: String
result.asset.ai_prompts.sys_id	Sys_id of the AI System Digital Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String
result.asset.created	Date and time that the AI model asset was created. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.asset.description	Description of the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: String
result.asset.display_name	Display name of the AI System Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String
result.asset.documentation	Documentation of the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: String
result.asset.evaluation_datasets	List of sys_ids or display names of the AI datasets used to evaluate the AI system asset model. Mostly applicable for models developed within an organization. Tables: AI Dataset Digital Asset [alm_ai_dataset_digital_asset], AI System Digital Asset [alm_ai_system_digital_asset]

Name	Description
	Data type: Array `"evaluation_datasets": [ { "name": "String", "sys_id": "String" } ]`
result.asset.evaluation_datasets.name	Name of the AI Dataset Digital Asset. Data type: String
result.asset.evaluation_datasets.sys_id	Sys_id of the AI System Digital Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String
result.asset.evaluation_metrics_report	Evaluation results of the AI system asset. Possible values: • Details (in plain text) outlining results • Links to specific results Data type: String
result.asset.managed_by	Details about the user who manages the asset. Data type: Object `"managed_by": [ { "name": "String", "sys_id": "String" } ]`
result.asset.managed_by.name	Name of the user who manages the AI model asset record. Table: User [user] Data type: String
result.asset.managed_by.sys_id	Sys_id of the user who manages the AI model asset record. Table: User [user] Data type: String
result.asset.name	Name of the associated AI System Product Model record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.asset.updated	Date and time that the AI model asset was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.warning	Comma-separated list of warning messages. These warnings can be validation checks, such as when the sys_id of an optional parameter is invalid. Data type: Array `"warnings": ["String"]`

Example: cURL request

The following example shows how to use the POST method to create a new AI prompt according to details provided in the request body.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_ent/asset/ai_prompt' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
  "name": "Incident Summarization prompt1",
  "description": "Prompt for Incident Summarization",
  "provider": "servicenow",
  "version": "V1",
  "state": 31,
  "documentation": "Document",
  "ai_model": "mixtral-instruct",
  "prompt_info": "Provide incident summary using
 short_decription, state, worknotes",
  "managed_by": "abel.tuter"
 }'
```

Response body.

```
{
  "result": {
    "asset": {
      "sys_id": "9833721b331e92101c9aca989d5c7bf0",
      "display_name": "ServiceNow Incident Summarization prompt1
 V1",
      "name": "Incident Summarization prompt1",
      "description": "Prompt for Incident Summarization",
      "version": "V1",
      "provider": {
        "sys_id": "93d4ecfac0a8000b6294d71b733977fb",
        "name": "ServiceNow"
      },
      "documentation": "Document",
      "state": "Deployed",
      "ai_model": {
```

```

AI Assets API - POST /sn_ent/asset/ai_model

Creates a new AI model asset entry in the AI Model Digital Asset [alm_ai_model_digital_asset] and AI Model Product Model [cmdb_ai_model_product_model] tables according to details you provide in the request body.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_model`

Default URL: `/api/sn_ent/asset/ai_model`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

{object}	Required. Details to apply to the new asset model record.
	
	Data type: Object
	
	`"object": {`
	`  "base_model": {Object},`
	`  "context_window:" "String",`
	`  "deployment_guideline": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	"description": "String", "documentation": "String", "evaluation_datasets": [Array], "evaluation_metrics_report": "String", "managed_by": "String", "model_size_in_mb": "String", "model_weights_info": "String", "name": "String", "parameters_info": "String", "provider": "String", "required_infrastructure": "String", "source": "String", "state": Number, "supported_languages: [Array], "training_datasets": [Array], "training_procedure": "String", "version": "String" }

{object}.base_model	AI model that this model version was derived from.
	
	Note: Only applicable for models developed within the organization.
	
	Data type: Object
	
	{
	"name": "String",
	"sys_id": "String"
	}

{object}.base_model.name	Name of the AI model asset to model this AI model after. Data type: String
{object}.base_model.sys_id	Sys_id of the AI model asset to model this AI model after. Table: AI Model Digital Asset [alm_ai_dataset_digital_asset] Data type: String Default: empty string
{object}.context_window	Size of input sequences (in other words, the number of tokens) that the model can handle. Data type: Integer Default: empty value
{object}.deployment_guideline	Instructions applicable for models developed and deployed within an organization. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: empty string
{object}.description	Description to give the AI Model Product Model. Updated table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String Default: empty string
{object}.documentation	Documentation of the AI Model Product Model. Data type: String Default: empty string
{object}.evaluation_datasets	Comma-separated list of sys_ids or display names of AI datasets of the AI datasets used for evaluating the model. Mostly applicable for models developed within an organization. Tables: AI Dataset Digital Asset [alm_ai_dataset_digital_asset], AI Model Asset [alm_ai_model_digital_asset] Data type: Array `"evaluation_datasets": ["String", "String"]` Valid values: • Name of the AI Dataset Digital Asset record. • Sys_id of the AI Dataset Digital Asset record. Default: empty string

{object}.evaluation_metrics_report	Reference to the evaluation results located within the text field of the AI model digital asset record. For example:
	
	`Testing results:  link to the result document`
	
	`Details:`
	`Accuracy: 85%`
	`Hallucination: 10%`
	`Eval Run 1: link`
	`Eval Run 2: link`
	
	Table: AI model digital asset [alm_ai_model_digital_asset]
	
	Data type: String
	
	Default: empty string

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
{object}.managed_by	Value of the 'Managed by' field of an existing record in the User [sys_user] table. Valid values: • Name of the User [sys_user] record • Sys_id of the User [sys_user] record Data type: String Default: empty string
{object}.model_size_in_mb	Size of the model in MB. Mostly applicable for models developed and deployed within an organization. Data type: Number Default: null or empty
{object}.model_weights_info	Additional model information, if available. Mostly applicable for models developed within an organization. Data type: String Default: null or empty
{object}.name	Required. Name of the AI Model Product Model. Table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String Default: null or empty
{object}.parameters_info	Number of parameters given to for the model. Data type: String Default: empty string
{object}.provider	Required. Sys_id or name of the user to assign the Provider field in the AI Model Product Model record. Table: Company [core_company] Data type: String Default: empty string
{object}.required_infrastructure	Documentation of infrastructure needs for the model deployment. For example, details about the infrastructure stack and processing needs. Mostly applicable for models deployed within an organization. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: empty or null
{object}.source	Details about the source of who or what created the model. Valid values: • Link to the source of the model. For example, `https://huggingface.co/mistralai/Mixtral-8x7B-Instruct-v0.1` or a link to Github. • Details of the source in plain text. For example, `Microsoft Azure` Data type: String Default: empty or null
{object}.state	State to apply to the AI Model Asset. Valid values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
{object}.supported_languages	Comma-separated list of languages that are supported by the AI Model. Data type: Array `"supported_languages": [ "String", "String" ]` Valid values: • Sys_id of the Language [sys_language] record. • Name of the Language [sys_language] record. For example, `"French", "English"`. Default: empty string
{object}.training_datasets	Datasets used to train the AI Model. Comma-separated list of sys_ids or display names of the AI Dataset Asset [alm_ai_dataset_digital_asset] table. Mostly applicable for models developed within an organization. Data type: Array

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"training_datasets": [ "String", "String" ]` Default: empty string
{object}.training_procedure	Number indicating the type of training to apply to the AI model. Valid values: • `1`: Decision Trees • `2`: Deep Neural Networks • `3`: Linear Regression • `4`: Logistic Regression • `5`: Random Forest • `6`: Supervised Learning • `7`: Unsupervised Learning • `8`: Reinforcement Learning • `9`: Transfer Learning • `10`: Semi-Supervised Learning • `11`: Instruction Finetuning • `12`: Supervised Finetuning Data type: String represented with a number (for example, `"3"`) Default: 1: Decision Trees
{object}.version	Version for AI Model Product Model. For example, `V2`. Data type: String Default: empty string

Response body parameters (JSON or XML)

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Results of the AI model asset creation.
	
	Data type: Object
	
	`"result": {`
	`  "asset": Object,`
	`  "warnings": [Array],`
	`  }`

result.asset	Details about the created AI model asset.
	
	Data type: Object
	
	`"asset": {`
	`  "base_model": Object,`
	`  "context_window": String,`
	`  "created": "String",`
	`  "deployment_guideline": String,`
	`  "description": "String",`
	`  "display_name": "String",`
	`  "documentation": "String",`
	`  "evaluation_datasets": Array,`

Name	Description
result.asset.sys_id	Sys_id of the AI Model Asset record Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: String
result.asset.training_datasets	Reference to 1+ associated data sets used for training the model. Data type: Array `"training_datasets": [ { "name": "String", "sys_id": "String" } ]`
result.asset.training_procedure	A numeric value indicating the type of AI training applied to the model. Possible values: • `1`: Decision Trees • `2`: Deep Neural Networks • `3`: Linear Regression • `4`: Logistic Regression • `5`: Random Forest • `6`: Supervised Learning • `7`: Unsupervised Learning • `8`: Reinforcement Learning • `9`: Transfer Learning • `10`: Semi-Supervised Learning • `11`: Instruction Finetuning • `12`: Supervised Finetuning Data type: String represented by a number
result.asset.updated	Date and time that the AI model asset was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.asset.version	Version of the associated AI Model Product Model record. Table: AI Model Product Model [cmdb_ai_model_product_model table]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.required_infrastructure	Documentation of infrastructure needs for the model's deployment. For example, details about the infrastructure stack and processing needs. Data type: String
result.asset.parameters_info	Properties of the training data that learn during the learning process. For example: 7B or 30B. Data type: String
result.asset.supported_languages	Details about the languages supported by the AI model asset. Table: Language [sys_language] Data type: Object `"supported_languages": [ { "name": "String", "sys_id": "String" } ]`
result.asset.supported_languages.name	Name of the language that is supported by the asset. Table: Language [sys_language] Data type: String
result.asset.supported_languages.sys_id	Sys_id of the language that is supported by the asset. Table: Language [sys_language] Data type: String
result.warnings	Comma-separated list of warning messages. These warnings can be validation checks, such as when the sysId of an optional parameter is invalid. Data type: Array `"warnings": ["String"]`

Example: cURL request

The following example creates an AI model asset according to details provided in the request body.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_ent/asset/ai_prompt' \
  -H 'Accept: application/json' \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d ' {
  "name": "Now LLM",
  "description": "enables text-to-text like question answering
 and summarization",
  "provider": "servicenow",
  "documentation": "Now LLM V5 Documentation",
  "version": "V8",
  "parameters_info": "7B",
  "supported_languages": [
    "English",
    "French"
  ],
  "model_size_in_mb": "87",
  "deployment_guideline": "Deployed on ServiceNow
 infrastructure",
  "source":
 "https://huggingface.co/mistralai/Mixtral-8x7B-Instruct-v0.1",
  "training_procedure": "2",
  "context_window": "8000",
  "state": "31",
  "base_model": "Servicenow Now LLM V6",
  "model_weights_info": "refer to weights and biases project",
  "required_infrastructre": "GPUs needed: 1, GPU Type: A100",
  "training_datasets": [
    "Servicenow Open Incidents"
  ],
  "evaluation_datasets": [
    "Servicenow Open Incidents"
  ],
  "evaluation_metrics_report": "Testing results: See files
 attached to this record",
  "managed_by": "abel.tuter"
}'
```

The response body shows details about the newly created AI model asset, including the resultant sys_id.

```
{

AI Assets API - POST /sn_ent/asset/ai_system

Creates a new AI system asset entry in the AI System Digital Asset [alm_ai_system_digital_asset] and AI System Product Model [cmdb_ai_system_product_model] tables according to details you provide in the request body.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_system`

Default URL: `/api/sn_ent/asset/ai_system`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
object	Required. Details to update in the AI system. Data type: Object `{ "name": "String", "description": "String", "provider": "String", "version": "String", "state": Number, "documentation": "String", "ai_models": "String", "ai_prompts": "Strings", "evaluation_datasets": [Array], "evaluation_metrics_report": "String", "managed_by": "String" }`
object.name	Required. Name for the AI System Product Model. Data type: String
object.description	Description for the AI System Product Model. Data type: String
object.provider	Required. Sys_id or name value of the Provider field of the Company [core_company] table record. Data type: String
object.state	State to apply to the AI System Asset. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• In use • Deployed • Retired • Development • Unknown • N/A Data type: String Default: empty string
object.version	Version for AI System Product Model. For example, V2. Data type: String Default: empty string
object.documentation	Documentation of the AI System Asset. Data type: String Default:
object.ai_models	Comma-separated list of names or sys_ids of the AI Model Digital Asset record, where each string represents an AI Model field value of an existing AI Model Digital Asset record. Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: Array of Strings `"ai_models": [{String", "String"}]` Default: empty string
object.evaluation_datasets	Comma-separated list of names or sys_ids of the AI datasets used for evaluating the AI System Asset record. Mostly applicable for models developed within an organization. Tables: AI Dataset Digital Asset [alm_ai_dataset_digital_asset], AI System Asset [AI System Digital Asset alm_ai_system_digital_asset] Data type: Array of Strings `"evaluation_datasets": [{String", "String"}]` Default: empty string

Request body parameters (XML or JSON) (continued)

Name	Description

object.evaluation_metrics_report	Reference to the evaluation results located within the text field of the AI system asset record. For example:
	`Testing results:  link to the result document`
	
	`Details:`
	`Accuracy: 85%`
	`Hallucination: 10%`
	`Eval Run 1: link`
	`Eval Run 2: link`
	
	Table: AI System Digital Asset [alm_ai_system_digital_asset]
	
	Data type: String
	
	Default: empty string

object.managed_by	Sys_id or name of the 'Managed by' field of an existing User [sys_user] table record. Data type: String Default: empty string

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Results of the new AI system asset.
	
	Data type: Object
	
	`"result": {`
	`  "asset": Object,`
	`  "warnings": [Array]`
	`}`

result.asset	Details about the newly created entry.
	
	Data type: Object
	
	`"asset": {`
	`  "ai_model": [Array],`
	`  "ai_prompts": [Array]`
	`  "created": "String",`
	`  "description": "String",`
	`  "display_name": "String",`
	`  "documentation": "String",`
	`  "evaluation_datasets": [Array],`
	`  "evaluation_metrics_report":`
	` String,`
	`  "managed_by": Object,`
	`  "name": "String",`
	`  "provider": Object,`
	`  "state": "String",`
	`  "sys_id": "String",`
	`  "updated": "String",`
	`  "version": "String",`
	`  "warnings": [Array]`
	`}`

result.asset.ai_models	List of AI models in the AI System Digital Asset record.
	
	Table: AI System Digital Asset [alm_ai_system_digital_asset]
	
	Data type: Array
	
	`"ai_models": [`
	`  {`

Name	Description

	`"name": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.asset.ai_models.name	Name of the AI System Digital Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String
result.asset.ai_models.sys_id	Sys_id of the AI System Digital Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String

result.asset.ai_prompts	List of AI Prompts of the AI System Digital Asset [alm_ai_system_digital_asset] record.
	
	Data type: Array
	
	`"ai_prompts": [`
	`{`
	`"name": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.asset.ai_prompts.name	Name of the AI prompt. Data type: String
result.asset.ai_prompts.sys_id	Sys_id of the AI System Digital Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String
result.asset.created	Date and time that the AI model asset was created. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.asset.description	Description of the associated AI System Product Model record. Table: AI System Product Model [cmdb_ai_system_product_model] Data type: String
result.asset.display_name	Display name of the AI System Asset record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: System Product Model [cmdb_ai_system_product_model] Data type: String
result.asset.state	State of the AI Model Asset. Possible values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.asset.sys_id	Sys_id of the AI System Asset record. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String
result.asset.updated	Date and time that the AI model asset was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.asset.version	Version number of the associated AI System Product Model record. For example, V2. Data type: String
result.asset.warnings	Comma-separated list of warning messages. These warnings can be validation checks, such as when the sys_id of an optional parameter is invalid. Data type: Array `"warnings": ["String"]`

Example: cURL request

The following example inserts a new entry into the AI System Digital Asset and AI System Product Model tables using details included in the request body.

```
curl -X POST
 'https://instance.servicenow.com/api/sn_ent/asset/ai_prompt' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
```

AI Assets API - PUT /sn_ent/asset/ai_dataset/{sys_id}

Updates the data of a specific AI dataset asset record according to information that you provide in the request body.

Note: Provide only the parameter-value pairs for the specific data you want to update. This endpoint overwrites the data for any parameters that are sent in the request.

Use the AI Assets API - GET /sn_ent/asset/ai_dataset/{sys_id} method to retrieve an existing AI dataset record with a given ID. You can then use this PUT method to update values in the dataset using the same ID information.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_dataset/{sys_id}`

Default URL: `/api/sn_ent/asset/ai_dataset/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the asset. Table: AI Dataset Asset [alm_ai_dataset_digital_asset] Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

{object}	`{`
	`  "acceptable_usage": "String",`
	`  "base_datasets": [Array],`

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Details of the newly created AI Dataset asset.
	
	Data type: Object
	
	`"result": {`
	`  "acceptable_usage": {Object},`
	`  "base_datasets": [Array],`
	`  "created": "String",`
	`  "dataset_card": "String",`

Name	Description
	`"version": "String",` `}`

result.acceptable_usage	Acceptable usage for the AI Dataset Asset record. Acceptable usage refers to how a dataset or model can be used, typically for training or evaluation purposes.
	
	Data type: Object
	
	`"acceptable_usage": {`
	`"label": "String"`
	`"value": "String"`
	`}`

result.acceptable_usage.label	Display label of the acceptable usage value. Data type: String
result.acceptable_usage.value	The purpose of the dataset or model, like for training or evaluation. Valid values: • `1`: indicates training purpose • `2`: indicates an evaluative purpose Data type: String (number)
result.base_datasets	Comma-separated list of base datasets required to build the given dataset. Accepts the name or sys_id of a base data set in the AI Dataset Digital Asset [alm_ai_dataset_digital_asset] table. Data type: Array `"base_datasets": ["String", "String"]`
result.created	Date and time that the AI Dataset Asset record was created. Format: YYYY-MM-DD HH:mm:ss Data type: String

result.data_type	The type of data present in the AI Dataset Asset record.
	
	Data type: Object
	
	`"data_type": {`
	`"label": "String",`
	`"value": "String"`
	`}`

result.data_type.label	The display label for the data type value. Data type: String
result.data_type.value	Value of the dataset asset's data type.

Name	Description
	Data type: String
result.provider	Provider of the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: Object `provider: { "name": "String", "sys_id": "String" }`
result.provider.name	Name of the provider. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.provider.sys_id	Sys_id of the provider in the associated AI Dataset Product Model record. Table: AI Dataset Product Model [cmdb_ai_dataset_product_model] Data type: String
result.source	Details about the source of AI dataset asset. Valid values: • Link to the source of the dataset asset. • Details (in plain text) of the source of the dataset asset. For example, the name of a product or website. Data type: String Default: empty or null
result.state	State of the AI Dataset Asset record. Possible values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.sys_id	Sys_id of the AI Dataset Asset record.

Name	Description
	Table: AI Dataset Digital Asset [alm_ai_dataset_digital_asset] Data type: String
result.updated	Date and time that the AI Dataset Asset record was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.version	Version number of the associated AI Dataset Product Model record. For example, V2. Data type: String
result.warnings	Comma-separated list of warning messages that are present when creating the dataset. These warnings can be validation checks, such as when the sys_id of an optional parameter is invalid. Data type: Array `"warnings": ["String"]`

Example: cURL request

The following example shows how to update details in an AI dataset record with a given ID. The request body contains the parameter values to update.

```
curl -X PUT
 'https://instance.servicenow.com/api/sn_ent/asset/ai_dataset/98
33721b331e92101c9aca989d5c7bf0' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
  "name": "Dataset One",
  "description": "Description for dataset ",
  "provider": "servicenow",
  "version": "V1",

AI Assets API - PUT /sn_ent/asset/ai_prompt/{sys_id}

Updates the data of a specific AI prompt asset record according to information you provide in the request body.

See also:

- AI Assets API - GET /sn_ent/asset/ai_system/{sys_id}
- AI Assets API - POST /sn_ent/asset/ai_prompt

Note: Provide only the parameter-value pairs for the specific data you want to update. This endpoint overwrites the data for any parameters that are sent in the request.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_prompt/{sys_id}`

Default URL: `/api/sn_ent/asset/ai_prompt/{sys_id}`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the asset. Table: AI Prompt Asset [alm_ai_prompt_digital_asset] Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
object	Required. Content of the AI Prompt asset to update. Data type: Object `{ "ai_model": "String", "description": "String", "documentation": "String", "managed_by": "String" "name": "String", "prompt_info": "String", "provider": "String", "state": Number, "version": "String" }`
ai_model	Name of sys_id value of the AI Model field in the AI Model Digital Asset record. Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: String Default: empty string
description	Description to give the AI Prompt Product Model. Table: AI Prompt Product Model [cmdb_ai_prompt_product_model] Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: empty string
documentation	Documentation of the AI Prompt Product Model. Table: AI Prompt Product Model [cmdb_ai_prompt_product_model] Data type: String Default: empty string
managed_by	Name or sys_id of the user that manages the asset. Located in the Managed by field of the asset record. Tab;e: User [sys_user] Data type: String Default: empty string
name	Required. Name of the associated record in the AI Prompt Product Model [cmdb_ai_prompt_product_model] table. Data type: String Default: empty string
prompt_info	Prompt information for AI Prompt Asset. Data type: String Default: empty string
provider	Required. Provider name or sys_id of the Company table record. Table: Company [core_company] Data type: String
state	State to apply to the AI Model Asset. For example, Valid values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
version	Version number to assign the AI Prompt Product Model. For example, V2. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: empty string

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. Failed to fetch the asset with the given sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	`result: {`
	`  "asset": {Object},`
	`  "warnings": [Array]`
	`}`

AI Assets API - PUT /sn_ent/asset/ai_system/{sys_id}

Updates the data of a specific AI system record according to information you provide in the request body.

Note: Provide only the parameter-value pairs for the specific data you want to update. This endpoint overwrites the data for any parameters that are sent in the request.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_system/{sys_id}`

Default URL: `/api/sn_ent/asset/ai_system/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the asset. Table: AI System Digital Asset [alm_ai_system_digital_asset] Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
object	Required. Details to update in the AI system. Data type: Object `{ "name": "String", "description": "String", "provider": "String", "version": "String", "state": Number,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	"documentation": "String", "ai_models": "String", "ai_prompts": "Strings", "evaluation_datasets": [Array], "evaluation_metrics_report": "String", "managed_by": "String" }
object.name	Required. Name for the AI System Product Model. Data type: String
object.description	Description for the AI System Product Model. Data type: String
object.provider	Required. Sys_id or name value of the Provider field of the Company [core_company] table record. Data type: String
object.state	State to apply to the AI System Asset. Valid values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String Default: empty string
object.version	Version for AI System Product Model. For example, V2. Data type: String Default: empty string
object.documentation	Documentation of the AI System Asset. Data type: String Default:
object.ai_models	Comma-separated list of names or sys_ids of the AI Model Digital Asset record, where each string represents an AI Model field value of an existing AI Model Digital Asset record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: Array of Strings `"ai_models": [{String", "String"}]` Default: empty string
object.evaluation_datasets	Comma-separated list of names or sys_ids of the AI datasets used for evaluating the AI System Asset record. Mostly applicable for models developed within an organization. Tables: AI Dataset Digital Asset [alm_ai_dataset_digital_asset], AI System Asset [AI System Digital Asset alm_ai_system_digital_asset] Data type: Array of Strings `"evaluation_datasets": [{String", "String"}]` Default: empty string

object.evaluation_metrics_report	Reference to the evaluation results located within the text field of the AI system asset record. For example:
	
	`Testing results:  link to the result document`
	
	`Details:`
	`Accuracy: 85%`
	`Hallucination: 10%`
	`Eval Run 1: link`
	`Eval Run 2: link`
	
	Table: AI System Digital Asset [alm_ai_system_digital_asset]
	
	Data type: String
	
	Default: empty string

object.managed_by	Sys_id or name of the 'Managed by' field of an existing User [sys_user] table record. Data type: String Default: empty string

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. Failed to fetch the asset with the given sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Results of the updated AI System Asset.
	
	Data type: Object
	
	`"result": {`
	`  "asset": Object,`
	`  "warnings": [Array]`
	`}`

result.asset	Details about the newly created asset.
	
	Data type: Object
	
	`"asset": {`
	`  "ai_model": [Array],`
	`  "ai_prompts": [Array]`
	`  "created": "String",`
	`  "description": "String",`
	`  "display_name": "String",`
	`  "documentation": "String",`

Name	Description
	Data type: String
result.asset.warnings	Comma-separated list of warning messages. These warnings can be validation checks, such as when the sys_id of an optional parameter is invalid. Data type: Array `"warnings": ["String"]`

Example: cURL request

The following example updates the AI System with details to update in the request body.

```
curl -X PUT
 'https://instance.servicenow.com/api/sn_ent/asset/ai_prompt/3b1
40397435a9210a63d00002fb8f2d7' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
  "name": "Incident Summarization",
  "description": "Skill to summarize incident",
  "provider": "servicenow",
  "documentation": "Sample Documentation",
  "version": "V3",
  "state": 31,
  "ai_models": [
    "llm_generic_small"
  ],
  "ai_prompts": [
    "LLM Prompt"
  ],
  "evaluation_datasets": [
    "Base dataset"
  ],
  "evaluation_metrics_report": "Sample Report",
  "managed_by": "abel.tutor"
}'
```

Response body shows the results of the update that was applied to the given AI system sys_id.

```
{
  "result": {
    "asset": {
      "sys_id": "3b140397435a9210a63d00002fb8f2d7",

AI Assets API - PUT /sn_ent/asset/ai_model/{sys_id}

Updates the data of a specific AI model asset record according to information you provide in the request body.

Note: Provide only the parameter-value pairs for specific data you want to update. This endpoint overwrites the data for all parameters that are sent in the request.

URL format

Versioned URL: `/api/sn_ent/{api_version}/asset/ai_model/{sys_id}`

Default URL: `/api/sn_ent/asset/ai_model/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the asset. Table: AI Prompt Asset [alm_ai_prompt_digital_asset] Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
object	Required. Details to update in the given AI model. Data type: Object `{ "base_model": "String", "context_window": "String", "deployment_guideline": "String", "description": "String", "documentation": "String", "evaluation_datasets": "String", "evaluation_metrics_report": "String", "managed_by": "String", "model_size_in_mb": "String", "model_weights_info": "String", "name": "String", "parameters_info": "String", "provider": "String", "required_infrastructure": "String", "state": Number, "supported_languages": "String", "training_datasets": "String", "training_procedure": "String", "version": "String" }`
base_model	AI model that this model version was derived from. **Note:** Only applicable for models developed within the organization. Data type: Object `{ "name": "String", "sys_id": "String" }` Default: empty object
base_model.name	Name of the AI model asset to model this AI model after. Table: AI Model Digital Asset alm_ai_model_digital_asset Data type: String
base_model.sys_id	Sys_id of the AI model asset to model this AI model after.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: AI Model Digital Asset alm_ai_model_digital_asset Data type: String
context_window	Size of input sequences (in other words, the number of tokens) that the model can handle. Data type: Integer Default: 0
deployment_guideline	Instructions applicable for models developed and deployed within an organization. Data type: String Default: empty
description	Description to give the AI Model Product Model. Updated in table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String Default: empty
documentation	Documentation of the AI Prompt Product Model record. Table: AI Prompt Product Model [cmdb_ai_model_product_model] Data type: String Default: empty

evaluation_datasets	Comma-separated list of sys_ids or display names of AI datasets of the AI Prompt Digital Asset used for evaluating the model. Mostly applicable for models developed within an organization.
	
	Tables: AI Dataset Digital Asset [alm_ai_dataset_digital_asset], AI Prompt Digital Asset [alm_ai_prompt_digital_asset]
	
	Data type: Array
	
	`"evaluation_datasets": [`
	`  "String",`
	`  "String"`
	`]`
	
	Valid values:
	• Name of the AI Dataset Digital Asset record.
	• Sys_id of the AI Dataset Digital Asset record.
	
	Default: empty string

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

evaluation_metrics_report	Reference to the evaluation results located within the text field of the AI Dataset Asset record. For example:
	`Testing results:  link to the result document`
	
	`Details:`
	`Accuracy: 85%`
	`Hallucination: 10%`
	`Eval Run 1: link`
	`Eval Run 2: link`
	
	Table: AI Dataset Asset [alm_ai_dataset_digital_asset]
	
	Data type: String
	
	Default: empty string

managed_by	Sys_id or name of the user in the 'Managed by' field of the AI Dataset Asset record. Table: User [sys_user] Data type: String Default: empty
model_size_in_mb	Size of the model in MB. Mostly applicable for models developed and deployed within an organization. Data type: Number Default: empty
model_weights_info	Additional model information, if available. Mostly applicable for models developed within an organization. Data type: String Default: empty
name	Required. Name of the AI Model Product Model. Updated in table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String
parameters_info	Number of parameters to give to the model. Data type: String Default: empty string

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
provider	Required. Sys_id or name value of the 'Provider' field of an existing Company [core_company] table record. Assigns this provider to the new AI model. Data type: String
required_infrastructure	Documentation of infrastructure needs for the model deployment. For example, details about the infrastructure stack and processing needs. Mostly applicable for models deployed within an organization. Data type: String Default: empty
source	Details about the source of who or what created the model. Valid values: • Link to the source of the model. For example, `https://huggingface.co/mistralai/model1` or a link to Github. • Details of the source in plain text. For example, `Microsoft Azure` Data type: String Default: empty or null
state	State to apply to the AI Model Asset. Valid values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
supported_languages	Comma-separated list of languages that are supported by the AI Model. Data type: Array `"supported_languages": [ "String", "String" ]` Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• Sys_id of the Language [sys_language] record • Name of the Language [sys_language] record. For example, `"French", "English"` Default: empty string
training_datasets	Reference to 1+ associated datasets used for training the model. Comma-separated list of sys_ids or display names of the AI Dataset Asset [alm_ai_dataset_digital_asset] table. Mostly applicable for models developed within an organization. Data type: Array `"training_datasets": [ "String", "String" ]` Default: empty string
training_procedure	Type of training to apply to the AI model. Valid values: • `1`: Decision Trees • `2`: Deep Neural Networks • `3`: Linear Regression • `4`: Logistic Regression • `5`: Random Forest • `6`: Supervised Learning • `7`: Unsupervised Learning • `8`: Reinforcement Learning • `9`: Transfer Learning • `10`: Semi-Supervised Learning • `11`: Instruction Finetuning • `12`: Supervised Finetuning Data type: String represented with a number (for example, `"3"`) Default: 1: Decision Trees
version	Version for AI Model Product Model. For example, `V2`. Data type: String Default: empty

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description

result	Results of the AI model asset creation.
	
	Data type: Object
	
	`"result": {`
	`  "asset": Object,`
	`  "warnings": [Array],`
	`}`

result.asset	Details about the created AI model asset.
	
	Data type: Object
	
	`"asset": {`
	`  "base_model": Object,`
	`  "context_window": String,`
	`  "created": "String",`
	`  "deployment_guideline": String,`
	`  "description": "String",`
	`  "display_name": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"documentation": "String", "evaluation_datasets": Array, "evaluation_metrics_report": String, "managed_by": Object, "model_size_in_mb": String, "name": "String", "parameters_info": "String", "provider": Object, "required_infrastructure": String, "state": "String", "source": String, "supported_languages": Array, "sys_id": "String", "training_datasets": Array, "training_procedure": String, "updated": "String", "version": "String" }

result.asset.base_model	Information about the AI model asset from which this version derived from.
	
	Data type: Object
	"base_model": {
	"name": "String",
	"sys_id": "String"
	}

result.asset.base_model.name	Display name of AI model asset. Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: String
result.asset.base_model.sys_id	Sys_id of AI model asset. Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: String
result.asset.context_window	Size of input sequences that the model can handle. In other words, the number of tokens. Data type: String represented with a number. For example, `"6000"`.
result.asset.created	Date and time that the AI model asset was created. Format: YYYY-MM-DD HH:mm:ss Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.asset.deployment_guideline	Instructions applicable for models developed and deployed within an organization. Data type: String
result.asset.description	Description of the associated AI Model Product Model record. Table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String
result.asset.display_name	Display name of the AI Model Asset record. Table: AI Model Digital Asset [alm_ai_model_digital_asset] (display_name field) Data type: String
result.asset.documentation	Documentation of the associated AI Model Product Model record. Table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String
result.asset.evaluation_datasets	AI datasets used for evaluating the model. Mostly applicable for models developed within an organization. Tables: AI Dataset Digital Asset [alm_ai_dataset_digital_asset], AI Model Digital Asset [alm_ai_model_digital_asset] Data type: Array `"evaluation_datasets": [ { "name": "String", "sys_id": "String" } ]`
result.evaluation_datasets.name	Name of the AI Dataset Digital Asset. Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: String
result.evaluation_datasets.sys_id	Sys_id of the AI Model Digital Asset record. Table: AI Model Digital Asset [alm_ai_model_digital_asset]

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.asset.evaluation_metrics_report	Reference to the evaluation results. Possible values: • Details (in plain text) outlining results • Links to specific results Data type: String
result.asset.managed_by	User that manages the AI model asset record. Data type: Object `" managed_by": { "name": "String", "sys_id": "String" }`
result.asset.managed_by.name	Name of the user who manages the AI model asset record. Table: User [user] Data type: String
result.asset.managed_by.sys_id	Sys_id of the user who manages the AI model asset record. Table: User [user] Data type: String
result.asset.model_size_in_mb	Size of the model in MB. Usually applicable for models developed and deployed within an organization. Data type: Number
result.asset.name	Name of the associated AI Model Product Model record. Table: AI Model Product Model [cmdb_ai_model_product_model] Data type: String
result.asset.provider	Provider of the associated AI Model Product Model record. Table: AI Model Product Model [cmdb_ai_model_product_model] Data type: Object `"provider": { "name": "String",`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"sys_id": "String"` `}`
result.asset.provider.name	Name of the the Company record that corresponds to the provider of the associated AI Model Product Model record. Tables: Company [core_company], AI Model Product Model [cmdb_ai_model_product_model] Data type: String
result.asset.provider.sys_id	Sys_id of the Company record that corresponds to the provider of the associated AI Model Product Model record. Tables: Company [core_company], AI Model Product Model [cmdb_ai_model_product_model] Data type: String
result.asset.source	Details about the source of the asset. Valid values: • Link to the source of the model. For example, `https://huggingface.co/mistralai/Mixtral-8x7B-Instruct-v0.1` or a link to Github. • Details of the source in plain text. For example, `Microsoft Azure` Data type: String
result.asset.state	State of the AI Model Asset record. Possible values: • In use • Deployed • Retired • Development • Unknown • N/A Data type: String
result.asset.supported_languages.name	Name of the supported language. Table: Language [sys_language] Data type: String
result.asset.supported_languages.sys_id	Sys_id of the supported language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Language [sys_language] Data type: String
result.asset.sys_id	Sys_id of the AI Model Asset record Table: AI Model Digital Asset [alm_ai_model_digital_asset] Data type: String
result.asset.training_datasets	Reference to 1+ associated data sets used for training the model. Data type: Array `"training_datasets": [ { "name": "String", "sys_id": "String" } ]`
result.asset.training_procedure	A numeric value indicating the type of AI training applied to the model. Possible values: • `1`: Decision Trees • `2`: Deep Neural Networks • `3`: Linear Regression • `4`: Logistic Regression • `5`: Random Forest • `6`: Supervised Learning • `7`: Unsupervised Learning • `8`: Reinforcement Learning • `9`: Transfer Learning • `10`: Semi-Supervised Learning • `11`: Instruction Finetuning • `12`: Supervised Finetuning Data type: String represented by a number
result.asset.updated	Date and time that the AI model asset was last updated. Format: YYYY-MM-DD HH:mm:ss Data type: String
result.asset.version	Version of the associated AI Model Product Model record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: AI Model Product Model [cmdb_ai_model_product_model table] Data type: String
result.required_infrastructure	Documentation of infrastructure needs for the model's deployment. For example, details about the infrastructure stack and processing needs. Data type: String
result.asset.parameters_info	Properties of the training data that learn during the learning process. For example: 7B or 30B. Data type: String
result.asset.supported_languages	Details about the languages supported by the AI model asset. Table: Language [sys_language] Data type: Object `"supported_languages": [ { "name": "String", "sys_id": "String" } ]`
result.asset.supported_languages.name	Name of the language that is supported by the asset. Table: Language [sys_language] Data type: String
result.asset.supported_languages.sys_id	Sys_id of the language that is supported by the asset. Table: Language [sys_language] Data type: String
result.warnings	Comma-separated list of warning messages. These warnings can be validation checks, such as when the sysId of an optional parameter is invalid. Data type: Array `"warnings": ["String"]`

Example: cURL request

The following example shows how to update a given AI asset model using the PUT method.

AI Assets Inventory API

The *AI Assets Inventory* APIs provide programmatic access to AI assets managed under the AI Control Tower application.

The *AI Assets Inventory* endpoints enable:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Listing assets filtered by asset class with optional filtering, pagination, and sorting.
- Retrieving detailed information about a specific asset including its related assets.
- Querying governance data such as lifecycle phase, risk classification, and assessments (when the GRC AI Governance plugin is active).

The *`AI Assets Inventory`* API requires the sn_ai_governance.integration.rest role and the AI Governance [sn_ai_governance] plugin to access it. The *`GET /details`* endpoint requires the AI Control Tower Core [sn_grc_ai_gov] plugin to be active for Governance, Risk, and Compliance (GRC) lookups.

This API belongs to the sn_ai_governance namespace.

See AI asset inventory for more information about managing AI assets inventory in the AI Control Tower.

AI Assets Inventory - GET /api/sn_ai_governance/assets/{asset_class}

Retrieves a paginated list of AI governance records of a given asset class, with optional filters, sorting, and pagination.

Use this endpoint to:

- Browse all AI assets of a specific class.
- Filter assets by governance status, risk level, department, vendor, provider, etc.
- Page through inventories for reporting purposes.

URL format

Versioned URL: `/api/sn_ai_governance/{api_version}/assets/{asset_class}`

Default URL: `/api/sn_ai_governance/assets/{asset_class}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
asset_class	Required. Asset class table name. The value is matched against the Model Categories table, asset_class [cmdb_model_category.asset_class] field. Valid table values: • `alm_ai_system_digital_asset`: AI Systems (skills, agents, use cases) • `alm_ai_model_digital_asset`: AI Models • `alm_ai_prompt_digital_asset`: AI Prompts • `alm_ai_dataset_digital_asset`: AI Datasets Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
risk_classification	Filters results by the risk score of the AI asset. Supports comma-separated values. Valid values: • 1: High risk • 2: Medium risk • 3: Low risk • 4: Unacceptable risk • 5: To be determined (default for new records) • 6: Critical Data type: String as an integer
lifecycle_status	Filters results by life cycle status of the AI asset. Valid values: • 1: In review • 2: Approved • 3: Rejected • 4: Deployed • 5: AI steward review • 6: Approved for development • 7: Ready for deployment • 8: Approved for deployment • 9: Canceled • 10: Offboarded Data type: String
state	Filters results by the installation status of the AI asset. Values are instance-dependent. Refer to the install_status field's choice list on the cmdb_ci table in your instance to enumerate them. The platform default 'Installed' is typically value 1. Data type: String
asset_type	Filter by model category name or sys_id. Valid names: • AI System • AI Model • AI Prompt • AI Dataset • Generative AI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Agentic AI • Classic AI These values are the canonical names referenced by the app and are stable across instances unless renamed. Table: CMDB Model Category [cmdb_model_category] for name; AIGovernanceWsConstants.MODEL_CATEGORIES for sys_id. Data type: String
lifecycle_phase	Filter by lifecycle phase name or sys_id. Valid name values: • Assess • New • Build and test • Build • Pre-deploy • Deploy • Offboard • Assess offboarding • Pre-offboarding **Note:** Customer instances may add or rename these values. Refer to your instance's sn_ai_governance_lifecycle table. Table: AI Governance Lifecycle [sn_ai_governance_lifecycle] Data type: String
department	Filter by department name or sys_id. Table: Department [cmn_department] Data type: String
managed_by	Filter by user_name or sys_id of the user managing the asset. Table: User [sys_user] Data type: String
vendor	Filter by vendor company name or sys_id. Table: Core Company [core_company] Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
provider	Filter by provider/manufacturer name or sys_id (matched against the product model's manufacturer). Table: Core Company [core_company] Data type: String
created_from	Display date format of the calling user's session. Format: YYYY-MM-DD Data type: String
created_to	Display date format of the calling user's session. Format: YYYY-MM-DD Data type: String
limit or sysparm_limit	Number of records to return. If *limit* is missing, less than 1, or non-numeric, the configured default is used. If limit exceeds the configured maximum, it's silently capped to the maximum (no warning). Minimum: 1 Maximum: 500 Default: 100 Data type: Integer
offset or sysparm_offset	Number of records to skip. If offset is missing or non-numeric, it's treated as 0; negative offsets are clamped to 0. Default: 0 Data type: Integer
sort_by	Field to sort by. Valid values: • risk_classification • lifecycle_phase • lifecycle_status • asset_type • department • managed_by • state • vendor • provider

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String Default: Filters by the sys_created_on table field (table: [sn_ai_governance_asset_governance_details]), descending (newest first).
order_by	Sort direction. Case-insensitive. Only applied when sort_by is provided and valid. Valid values: • `asc`: Ascending order • `desc`: Descending order Default: `asc` Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Response body parameters (JSON or XML)

Name	Description
sys_id	Sys ID of the governance record. Table: sn_ai_governance_asset_governance_details
asset_name	Display name of the underlying digital asset. Table/field: Asset [asset], display_name
asset_type	Name of the underlying asset's model category. Table/field: Asset Model Category [asset.model_category], name
created_on	Display value of the governance record's sys_created_on field. Table: sn_ai_governance_asset_governance_details

Example: Get All AI Systems

This example retrieves all AI systems in the given instance.

```
curl -X GET \

 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_system_digital_asset' \
  -u 'username:password' \
  -H 'Accept: application/json'
```

Response body.

```
{
  "result": [
    {
      "sys_id": "a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6",

      "sys_id": "e5f6a7b8c9d0e1f2a3b4c5d6e7f8a9b0",
      "asset_name": "Document Summarization Agent",
      "asset_type": "Generative AI",
      "created_on": "2025-04-23 17:20:00"
    }
  ]
}
```

Example: Get High-Risk AI Systems in Production

This example retrieves all AI Systems with a high-risk classification in the instance.

```
curl -X GET \
 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_system_digital_asset?risk_classification=1&state=1' \
  -u 'username:password' \
  -H 'Accept: application/json'
```

Response body.

```
{
  "result": [
    {
      "sys_id": "f6a7b8c9d0e1f2a3b4c5d6e7f8a9b0c1",
      "asset_name": "Fraud Detection System",
      "asset_type": "AI System",
      "created_on": "2025-05-07 10:00:00"
    },
    {
      "sys_id": "a7b8c9d0e1f2a3b4c5d6e7f8a9b0c1d2",
      "asset_name": "Credit Risk Scoring Engine",
      "asset_type": "Classic AI",
      "created_on": "2025-04-07 14:30:00"
    }
  ]
}
```

Example: Get AI Models with Pagination

The following example retrieves a paginated list of AI Model digital assets of max 50 records starting at the first record.

```
curl -X GET \

 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_model_digital_asset?limit=50&offset=0' \
  -u 'username:password' \
  -H 'Accept: application/json'
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body.

```
{
  "result": [
    {
      "sys_id": "1a2b3c4d5e6f7a8b9c0d1e2f3a4b5c6d",
      "asset_name": "GPT-4o Fine-tuned - Legal Review",
      "asset_type": "AI Model",
      "created_on": "2025-01-31 16:00:00"
    },
    {
      "sys_id": "2b3c4d5e6f7a8b9c0d1e2f3a4b5c6d7e",
      "asset_name": "BERT Sentiment Classifier v2",
      "asset_type": "AI Model",
      "created_on": "2025-01-30 12:00:00"
    },
    {
      "sys_id": "3c4d5e6f7a8b9c0d1e2f3a4b5c6d7e8f",
      "asset_name": "Whisper Speech-to-Text",
      "asset_type": "AI Model",
      "created_on": "2025-01-29 08:00:00"
    }
  ]
}
```

Example: Get AI Systems Created in a Date Range

This example retrieves all AI Systems created in Q1 2025 (January 1 – March 31) from the AI Governance inventory.

```
curl -X GET \

 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_system_digital_asset?created_from=2025-01-01&created_t
o=2025-03-31' \
  -u 'username:password' \
  -H 'Accept: application/json'
```

Response body.

```
{
  "result": [
    {
      "sys_id": "4d5e6f7a8b9c0d1e2f3a4b5c6d7e8f9a",
      "asset_name": "Q1 2025 Sales Forecasting Agent",
      "asset_type": "Generative AI",
      "created_on": "2025-03-28 09:00:00"
    },
    {
      "sys_id": "5e6f7a8b9c0d1e2f3a4b5c6d7e8f9a0b",
      "asset_name": "Compliance Monitoring System",
      "asset_type": "AI System",
      "created_on": "2025-02-27 11:30:00"
    },
    {
      "sys_id": "6f7a8b9c0d1e2f3a4b5c6d7e8f9a0b1c",
      "asset_name": "Employee Onboarding Assistant",
      "asset_type": "Agentic AI",
```

      "asset_type": "Classic AI",
      "created_on": "2025-01-01 04:00:00"
    }
  ]
}
```

Example: Get AI Prompts by Department and Vendor

This example retrieves all AI Prompts from the Engineering department associated with the Acme vendor from the AI Governance inventory.

```
curl -X GET \

 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_prompt_digital_asset?department=Engineering&vendor=Ac
me' \
  -u 'username:password' \
  -H 'Accept: application/json'
```

Response body.

```
{
  "result": [
    {
      "sys_id": "8b9c0d1e2f3a4b5c6d7e8f9a0b1c2d3e",
      "asset_name": "Code Review Prompt Template",
      "asset_type": "AI Prompt",
      "created_on": "2025-06-18 12:00:00"
    },
    {
      "sys_id": "9c0d1e2f3a4b5c6d7e8f9a0b1c2d3e4f",
      "asset_name": "Bug Triage Summarization Prompt",
      "asset_type": "AI Prompt",
      "created_on": "2025-05-21 15:45:00"
    }
  ]
}
```

Example: Get AI Systems Managed by a Specific User, Sorted by Department Descending

This example retrieves all AI Systems managed by Jane Smith from the AI Governance inventory, sorted by department in descending order.

```
curl -X GET \

 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_system_digital_asset?managed_by=jane.smith&sort_by=dep
artment&order_by=desc' \
  -u 'username:password' \
  -H 'Accept: application/json'
```

AI Assets Inventory - GET /api/sn_ai_governance/assets/{sys_id}/details

Retrieves comprehensive details about a specific AI governance record.

This endpoint retrieves the following record information for a single asset:

- Basic asset information such as display name, asset class, asset type.
- Life cycle phase and status, risk classification, state.
- Related assets.
- Governance, Risk, and Compliance (GRC) information (assessments, risks, issues, policy exceptions) when the sn_grc_ai_gov plugin is active.

URL format

Versioned URL: `/api/sn_ai_governance/{api_version}/assets/{sys_id}/details`

Default URL: `/api/sn_ai_governance/assets/{sys_id}/details`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the governance record to retrieve. Table: AI Asset Governance Details [sn_ai_governance_asset_governance_details] **Note:** This isn't the sys_id of the AI Dataset Digital Asset [alm_ai_dataset_digital_asset] table. Data type: String

Query parameters

Name	Description
include_risk_info	Optional. Flag that indicates whether to perform GRC plugin lookups, such as ai_assessments, risk_assessments, regulatory_risk_assessments, bulk_risk_assessments, control_assessments, issues, policy_exceptions, and risks. Has no effect when the sn_grc_ai_gov plugin is inactive. Valid values: • true: Enables the lookup. Missing values or any other value ('true', 'False', '0') enables the lookup. • false: (case sensitive) Skips the lookup operation.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: true Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	*Sys_id* path parameter missing or empty. Provide a valid *sys_id* in the URL path.
401	Invalid or missing credentials. Check username/password or OAuth token.
403	Caller lacks the required role(s). Ensure the user holds the sn_ai_governance.integration.rest role.
404	Possible causes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• *asset_class* doesn't match any Model Categories table, asset_class [cmdb_model_category.asset_class] value. Use one of the four documented *asset_class* values. • No governance record exists for the given *sys_id*. Verify the *sys_id* is a row in the AI Asset Governance Details [sn_ai_governance_asset_governance_details] table.
500	Unhandled exception. For example, invalid date format. Check logs to verify date inputs use the calling user's session date format.

Response body parameters (JSON or XML)

The top-level response shape is the same for all asset classes. The related_assets object structure varies by asset class. See the **Related Assets** section for response parameters categorized by class.

Common response parameters

Name	Description
ai_assessments	GRC AI assessments associated with this asset. Empty array if the GRC plugin isn't active or *include_risk_info* is `false`. Data type: Array of Objects
asset_class	Table name (sys_class_name) of the digital asset. Valid values: • `alm_ai_system_digital_asset`: AI Systems (sub_ai_systems, tools, ai_models, ai_prompts, evaluation_datasets, input_outputs, configuration_items, business_applications) • `alm_ai_model_digital_asset`: AI Models (derived_ai_models, training_datasets, evaluation_datasets, ai_systems, input_outputs, model_lineages, configuration_items, business_applications) • `alm_ai_prompt_digital_asset`: AI Prompts (ai systems) • `alm_ai_dataset_digital_asset`: AI Datasets (ai_systems, ai_models, parent_datasets, child_datasets) Data type: String
asset_type	Display value of the asset's model_category. Data type: String
bulk_risk_assessments	GRC bulk risk assessments. Same conditions as *ai_assessments*.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common response parameters (continued)

Name	Description
	Data type: Array of Objects `"bulk_risk_assessments": [ { } ]`
control_assessments	GRC controls. Data type: Array of Objects `"control_assessments": [ { } ]`
display_name	Display name of the underlying digital asset. Data type: String
issues	GRC issues associated with this asset. Data type: Array of Objects `"issues": [ { } ]`
lifecycle_phase	Life cycle phase of the asset. Data type: Object `"lifecycle_phase": { "sys_id": "String", "name": "String" }`
lifecycle_phase.sys_id	Sys_id of the life cycle phase record. Table: AI Governance Lifecycle [sn_ai_governance_lifecycle] Data type: String
lifecycle_phase.name	Display value of the life cycle phase record. Data type: String
lifecycle_status	Raw stored integer value of the status field on the governance record. This is the choice value, not the display label. Refer to the status field's choice list to enumerate values. Data type: String
policy_exceptions	GRC policy exceptions. Data type: Array of Objects

Common response parameters (continued)

Name	Description

	``
	"policy_exceptions": [
	{
	}
	]
	``

regulatory_risk_assessments	GRC regulatory risk classifications. Same conditions as ai_assessments.
	
	Data type: Array of Objects
	
	``
	"regulatory_risk_assessments": [
	{
	}
	]
	``

related_assets	Related-asset groupings; structure depends on asset_class. returns different fields depending on the asset_class of the requested governance record. See the Related Assets section for associated parameters organized by asset type.
	
	Data type: Object
	
	``
	"related_assets": [
	{
	}
	]
	``

risk_assessments	GRC risk assessments. Same conditions as ai_assessments.
	
	Data type: Array of Objects
	
	``
	"risk_assessments": [
	{
	}
	]
	``

risk_classification	Display value of risk_score on the governance record. Possible values: • `1`: High risk • `2`: Medium risk • `3`: Low risk • `4`: Unacceptable risk • `5`: To be determined (default for new records) • `6`: Critical Data type: String
risks	GRC risks. Data type: Array of Objects

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common response parameters (continued)

Name	Description
	`"risks": [ { } ]`
state	Install status on the linked digital asset. The serialized value reflects the raw integer (for example, 1), not the display label. **Note:** This differs from the state field inside related_assets items, which returns the display value. Data type: String

Related Assets

The *related_assets* object returns different fields depending on the asset_class of the requested governance record. Each table documents the fields returned for that asset class, along with the structure of each item in the returned array.

Note: For related assets that have a governance record,

- *sys_id* is the governance record's sys_id (not the digital asset's sys_id),
- *name* is the governance display value,
- additional governance fields (*risk_classification*, *lifecycle_status*, *lifecycle_phase*, *state*) are included.

When no governance record exists, only the base fields are returned.

AI System (asset_class: alm_ai_system_digital_asset)

Name	Description
ai_models	AI Models referenced from the system's ai_models field. Data type: Object `ai_models: [ { "sys_id": "String", "name": "String", "asset_class": "String", "asset_type": "String", // Governance fields (when record exists): "risk_classification": "String", "lifecycle_status": "String", "lifecycle_phase": "String", "state": "String" } ]`
ai_prompts	AI Prompts referenced from the system's ai_prompts field. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI System (asset_class: alm_ai_system_digital_asset) (continued)

Name	Description
	```ai_prompts: [{ "sys_id": "String", "name": "String", "asset_class": "String", "asset_type": "String", // Governance fields (when record exists): "risk_classification": "String", "lifecycle_status": "String", "lifecycle_phase": "String", "state": "String" }]``` Data type: Object
business_applications	Business applications mapped to this asset's product model via the Product Model Map [sn_apm_ws_ba_product_model_map] table. Returned only if that table exists in the instance. Data type: Object ```business_applications: [{ "sys_id": "String", "name": "String" }]``` Data type: Object
configuration_items	CIs related to this digital asset via the Asset-CI Relationship [cmdb_rel_asset_ci] table. Data type: Object ```configuration_items: [{ "sys_id": "String", "name": "String" }]``` Data type: Object
evaluation_datasets	AI datasets referenced from the system's evaluation_datasets field. Data type: Object ```evaluation_datasets: [{ "sys_id": "String", "name": "String", "asset_class": "String", "asset_type": "String", // Governance fields (when record exists): "risk_classification": "String", "lifecycle_status": "String", "lifecycle_phase": "String", "state": "String"``` Data type: Object

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI System (asset_class: alm_ai_system_digital_asset) (continued)

Name	Description
	`}` `]`

input_outputs	Input/output specifications for this system.
	
	Table/field: AI Input Output [sn_ent_ai_input_output], Category [io_category]
	
	Data type: Object
	
	`input_outputs: [`
	`  {`
	`  "sys_id": "String",`
	`  "name": "String",`
	`  "description": "String",`
	`  "io_type": "String",`
	`  "information_object": "String"`
	`  }`
	`]`

sub_ai_systems	AI Systems registered as subcomponents of this system, sourced from the AI System Subcomponent Map [sn_ent_ai_system_subcomponent_m2m] table where `ai_subcomponent_reference_table = alm_ai_system_digital_asset`; this indicates that the field name ai_subcomponent_reference_table should be filled with the AI Asset tables.
	
	When a governance record exists for the related asset, the governance record's sys_id, name, and governance fields are included. When no governance record exists, only the base fields are returned.
	
	Data type: Array of Objects
	
	`sub_ai_systems: [`
	`  {`
	`  "sys_id": "String",`
	`  "name": "String",`
	`  "description": "String",`
	`  "asset_class": "String",`
	`  // Governance fields (when record exists):`
	`  "risk_classification": "String",`
	`  "lifecycle_status": "String",`
	`  "lifecycle_phase": "String",`
	`  "state": "String"`
	`  }`
	`]`

tools	Enterprise AI tools registered as subcomponents, sourced the AI System Subcomponent Map [sn_ent_ai_system_subcomponent_m2m] table where `ai_subcomponent_reference_table = sn_ent_ai_tool`; this indicates that the field name ai_subcomponent_reference_table should be filled with the tools tables.

Example: Quick Command Reference

List all AI systems:

```
curl -X GET
 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_system_digital_asset'
 -u 'user:password'
```

Get high-risk assets:

```
curl -X GET
 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_system_digital_asset?risk_classification=1'
 -u 'user:password'
```

Get asset details (skip GRC data):

```
curl -X GET
 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/{sys_id}/details'
 -u 'user:password'
```

Paginate results:

```
curl -X GET
 'https://instance.service-now.com/api/sn_ai_governance/v1/asse
ts/alm_ai_system_digital_asset?limit=100&offset=0'
 -u 'user:password'
```

AI Search External User Mapping API

The *`AI Search External User Mapping`* API provides endpoints that enable ingestion of user mapping information from external sources into the ServiceNow® AI Search application's index.

AI Search External User Mapping - POST /ais/external_content/user_mapping/import_multiple/{target_table}

Imports a list of external user mappings into an AI Search user mapping table. Each mapping specifies externally defined user and group aliases for a ServiceNow AI Platform user. AI Search uses these aliases to determine which external document search results the user can view.

To learn how AI Search external content security utilizes external user mappings, see External content security for AI Search.

User and group names in external user mappings should match those specified in security access permissions for external documents ingested via the *`External Content Ingestion`* API's *`POST /ais/external_content/ingestDocument/{schema_table_name}`* endpoint. For more information on ingesting external documents with security access permissions for externally defined users and groups, see External Content Ingestion API.

To view import histories for external user mapping records imported through this endpoint, navigate to *`AI Search`* > **External Content** > **User mapping import history**. From a history

record, you can view the Import Set [sys_import_set] and Multi Import Set [sys_multi_import_set] records for an import task. Use information from these records to verify that your external user mappings were imported correctly.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/user_mapping/import_multiple/{target_table}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
target_table	The name of the AI Search user mapping table that you want the imported mappings to appear in. For example, `x_snc_sharepoint_user_table`. **Note:** You must create the target AI Search user mapping table via the *AI Search* > **External Content** > **Create User Mapping** module before using this endpoint. If you specify a user mapping table that does not exist, the request fails. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
{object}	Required. Unnamed object. Data type: Object `{ "records": [Array] }`
{object}.records	Required. Array of objects in which each object represents a user mapping to import into the specified target table. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	`"records": [ { "external_group": [Array], "external_user": [Array], "mapping_value": "String" } ]`
{object}.records.external_group	Array of strings where each string is the name of an externally defined group to set as an alias for the ServiceNow AI Platform user specified by the **{object}.records.mapping_value** parameter. Data type: Array Values can be in any format, depending on the names of the externally defined groups selected for the user mapping. Examples include: `"external_group": [ "itil", "hr-admin", "report-dev" ]`
{object}.records.external_user	Array of strings where each string is the name of an externally defined user to set as an alias for the ServiceNow AI Platform user specified by the **{object}.records.mapping_value** parameter. Data type: Array Values can be in any format, depending on the names of the externally defined user accounts selected for the user mapping. Examples include: `"external_user": [ "beth-anglin", "ad\beth.anglin", "beth-anglin@sharepoint" ]`
{object}.records.mapping_value	**Email** field value that uniquely identifies an existing record. All externally defined user and group aliases in the request are mapped to the ServiceNow AI Platform user with this email address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Note: The API treats this parameter as the unique identifier for the user mapping record. If you import another user mapping with the same **mapping_value** as an existing user mapping record, the new record overwrites the existing record. Data type: String Table: User [sys_user]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description

error	Object describing the error encountered during processing of the request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
import_set_id	Sys_id for the new record created in the Import Set [sys_import_set] table by a successful request. Data type: String
multi_import_set_id	Sys_id for the new record created in the Multi Import Set [sys_multi_import_set] table by a successful request. Data type: String
result	Result for an unsuccessful request. Includes a message describing the reason for the request failure. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Import externally defined user and group aliases for ServiceNow AI Platform users Beth Anglin and Abel Tuter into an AI Search user mapping table named x_snc_sharepoint_user_table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl -X POST
 'https://instance.servicenow.com/api/now/v1/ais/external_conte
nt/user_mapping/import_multiple/x_snc_sharepoint_user_table' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
    "records": [
      {
        "mapping_value": "beth.anglin@example.com",
        "external_user": [
          "ad\beth-anglin",
          "beth.anglin@sharepoint"
        ],
        "external_group": [
          "itil",
          "itil-admin",
          "itil-dev"
        ]
      },
      {
        "mapping_value": "abel.tuter@example.com",
        "external_user": [
          "ad\abel-tuter",
          "abel.tuter@sharepoint"
        ],
        "external_group": [
          "hr",
          "hr-admin",
          "hr-dev"
        ]
      }
    ]
  }'
```

The response shows the sys_ids for the generated Import Set and Multi Import Set records.

```
{
  "import_set_id": "6e9ddb629d987010f877878bd9f0e9dd",
  "multi_import_set_id": "269ddb629d987010f877878bd9f0e9de"
}
```

Example: cURL request

Import invalid request containing an empty mapping record.

```
curl
 'https://instance.servicenow.com/api/now/v1/ais/external_conte
nt/user_mapping/import_multiple/u_ext_content_user_mapping' \
  --request POST \
  --user 'username':'password' \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --data '{
    "records": [
      {
        "mapping_value": "beth.anglin@example.com",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "external_user": [
          "ad\beth-anglin",
          "beth.anglin@sharepoint"
        ],
        "external_group": [
          "reports",
          "reports-admin",
          "reports-dev"
        ]
      },
      {}
    ]
  }'
```

The request fails with status 400 and the response indicates the nature of the failure.

```
{
  "result": "Error in processing the message"
}
```

Alarm Management Open API

The *`Alarm Management Open`* API provides endpoints to create, update, and retrieve data from the Events [em_event] and Alert [em_alert] tables.

The telecommunications *`Alarm Management Open`* API (sn_ind_tmf642) is a ServiceNow® implementation of the TM Forum Open API specification. This API is based on the TMF642 Alarm Management API User Guide v5.0.0, September 2023.

The calling user must have to access the `sn_ind_tmf642.alarm_mgmt_integration` endpoint.

This API is provided within the `sn_ind_tmf642` namespace.

The TM Forum Open API specification requires a synchronous response for every inbound request it receives. Apply correlation and de-duplication in the source operational support system (OSS) before forwarding payloads to the system.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Alarm Management Open API Developer Guide.

The *`Alarm Management Open`* API is conformance certified by TM Forum.

Alarm Management Open API – GET /sn_ind_tmf642/alarm_mgmt/alarm

Retrieves a list of all alarm records from the Events [em_event] and Alert [em_alert] tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
alarmRaisedTime	Date the alarm was raised. Only alarms with a date matching the value of this parameter are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • alarmedObject • alarmRaisedTime • alarmType • crossedThresholdInformation • externalAlarmId • id • perceivedSeverity • probableCause • source • sourceSystemId • state • type Default: All fields Data type: String
id	Alarm ID. Only alarms with an ID matching the value of this parameter are returned in the response. Data type: String Table: In the Message key field in the Events [em_event] table.
limit	Maximum number of records to return. For requests that exceed this number of records, use the *offset* parameter to paginate record retrieval. Default: 1000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Maximum: 2000 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Data type: Number Default: 0
probableCause	Probable cause of the alarm. Only alarms with a probable cause matching the value of this parameter are returned in the response. Data type: String
state	Alarm state. Only alarms with a state matching the value of this parameter are returned in the response. Data type: String
sourceSystemId	Source system ID of the alarm. Only alarms with a source system ID matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

Response body parameters (JSON)

Name	Description
affectedService	List of one or more services affected by the alarm. Data type: Array of Objects `"affectedService":[ { "href": "String", "id": "String" }, ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
affectedService.href	URL reference that provides details of the affected service. Data type: String
affectedService.id	Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
alarmDetails	Additional details about the alarm. Data type: String
alarmedObject	Details of the alarm object. `"alarmedObject": { "href": "String", "id": "String" }` Data type: Object
alarmedObject.id	Unique identifier of the alarm object. This value maps to a CI in the system. Data type: String
alarmedObject.href	URL reference to get the details of the alarm object. Data type: String
alarmedObjectType	Type or class of object associated with the event. Data type: String
alarmRaisedTime	Date and time at which the alarm occurs at its source. Data type: String
alarmReportingTime	Date and time at which the OSS reports its alarm. This value might differ from the *alarmRaisedTime* value. For example, if an element management system (EMS) maintains the alarm list:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• The *alarmRaisedTime* is the time of alarm detection by the network element (NE). • The *alarmReportingTime* is the alarm report time of storage in the EMS alarm list. Data type: String
alarmType	Alarm category. Data type: String
crossedThresholdInformation	Details about the crossed threshold. Data type: Object `"crossedThresholdInformation": { "direction": "String", "granularity": "String", "indicatorName": "String", "indicatorUnit": "String", "observedValue": "String", "thresholdCrossingDescription": "String", "thresholdId": "String", "thresholdRef": "String" }`
crossedThresholdInformation.direction	Threshold crossing direction. Valid values: • DOWN • UP Data type: String
crossedThresholdInformation.granularity	Granularity at which the indicator is evaluated for threshold crossing. For example, 5MINUTES. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
crossedThresholdInformation.indicatorName	Name of the indicator that crosses the alarm threshold. Data type: String
crossedThresholdInformation.indicatorUnit	Measurement unit of the indicator corresponding to the crossed threshold. Data type: String
crossedThresholdInformation.observedValue	Number identifying the indicator crossing the threshold. Data type: String
crossedThresholdInformation.thresholdCrossingDescription	More threshold details of the threshold crossing alarm. Data type: String
crossedThresholdInformation.thresholdId	Unique identifier of the threshold that caused the alarm. Data type: String
crossedThresholdInformation.thresholdRef	URL of the threshold object. Data type: String
externalAlarmId	Unique identifier for the alarm from the source system posting the alarm. Data type: String
href	URL of the resource. Data type: String
id	Unique identifier for the system to identify and process the alarm payload as an event. Data type: String
perceivedSeverity	Alarm severity. Valid values: • CLEAR • CRITICAL • MAJOR • MINOR • WARNING

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
plannedOutageIndication	Indicates that the managed object for this alarm is in a planned outage state. For example, planned maintenance or out-of-service. Data type: String
probableCause	Most likely situation to trigger the alarm. Use with *alarmType* to qualify the alarm. Data type: String
proposedRepairActions	If available to the system, provides a repair action to resolve the issue that triggers the alarm. Data type: String
serviceAffecting	Flag that indicates whether the alarm affects service. Valid values: • true: Alarm affects service performance or availability. • false: Alarm doesn't affect service. Default: false Data type: Boolean
sourceSystemId	Instance ID of the source alarm. Data type: String
specificProblem	Specific problem that triggers the alarm. Use with the *probableCause* tparameter o qualify the alarm. Data type: String
state	Alarm state. Valid values: • Error • Ignored • Ready • Processed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	If an invalid value is provided, the state is set to `Ready`. If the state is `Ready`, an alert is created in the Alert [em_alert] table and the state then becomes `Processed`. If the state is `Processed`, `Ignored`, or `Error` no alert is created. Default value: Ready Data type: String

Example: cURL request

This example retrieves all alarms.

```
curl
 "https://instance.servicenow.com/api/sn_ind_tmf642/alarm_mgmt/a
larm" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

Alarm Management Open API – GET /sn_ind_tmf642/alarm_mgmt/alarm/{id}

Retrieves a specified alarm record from the Events [em_event] or Alert [em_alert] table.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm/{id}`

Supported request parameters

Path parameters

Name	Description
id	Unique identifier of the record to retrieve. Data type: String Table: In the Message key field of the Events [em_event] table.

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • alarmedObject • alarmRaisedTime • alarmType • crossedThresholdInformation • externalAlarmId • id • perceivedSeverity • probableCause • source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• sourceSystemId • state • type Default value: All fields Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Invalid path parameter. • Invalid URI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Status codes (continued)

Status code	Description
404	Record not found. A record associated with the specified ID is not found in the Event [em_event] or Alert [em_alert] table.

Response body parameters (JSON)

Name	Description
affectedService	List of one or more services affected by the alarm. Data type: Array of Objects `"affectedService":[ { "href": "String", "id": "String" }, ]`
affectedService.href	URL reference that provides details of the affected service. Data type: String
affectedService.id	Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
alarmDetails	Additional details about the alarm. Data type: String
alarmedObject	Details of the alarm object. Data type: Object `"alarmedObject": { "href": "String", "id": "String" }`
alarmedObject.id	Unique identifier of the alarm object. This value maps to a CI in the system. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
alarmedObject.href	URL reference to get the details of the alarm object. Data type: String
alarmedObjectType	Type or class of object associated with the event. Data type: String
alarmRaisedTime	Date and time at which the alarm occurs at its source. Data type: String
alarmReportingTime	Date and time at which the OSS reports its alarm. This value might differ from the *alarmRaisedTime* value. For example, if an element management system (EMS) maintains the alarm list: • The *alarmRaisedTime* is the time of alarm detection by the network element (NE). • The *alarmReportingTime* is the alarm report time of storage in the EMS alarm list. Data type: String
alarmType	Alarm category. Data type: String
crossedThresholdInformation	Details about the crossed threshold. Data type: Object `"crossedThresholdInformation": { "direction": "String", "granularity": "String", "indicatorName": "String", "indicatorUnit": "String", "observedValue": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"thresholdCrossingDescription": "String", "thresholdId": "String", "thresholdRef": "String" }
crossedThresholdInformation.direction	Threshold crossing direction. Valid values: • DOWN • UP Data type: String
crossedThresholdInformation.granularity	Granularity at which the indicator is evaluated for threshold crossing. For example, `5MINUTES`. Data type: String
crossedThresholdInformation.indicatorName	Name of the indicator that crosses the alarm threshold. Data type: String
crossedThresholdInformation.indicatorUnit	Measurement unit of the indicator corresponding to the crossed threshold. Data type: String
crossedThresholdInformation.observedValue	Number identifying the indicator crossing the threshold. Data type: String
crossedThresholdInformation.thresholdCrossingDescription	More threshold details of the threshold crossing alarm. Data type: String
crossedThresholdInformation.thresholdId	Unique identifier of the threshold that caused the alarm. Data type: String
crossedThresholdInformation.thresholdRef	URL of the threshold object. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
externalAlarmId	Unique identifier for the alarm from the source system posting the alarm. Data type: String
href	URL of the resource. Data type: String
id	Unique identifier for the system to identify and process the alarm payload as an event. Data type: String
perceivedSeverity	Alarm severity. Valid values: • CLEAR • CRITICAL • MAJOR • MINOR • WARNING Data type: String
plannedOutageIndication	Indicates that the managed object for this alarm is in a planned outage state. For example, planned maintenance or out-of-service. Data type: String
probableCause	Most likely situation to trigger the alarm. Use with *alarmType* to qualify the alarm. Data type: String
proposedRepairActions	If available to the system, provides a repair action to resolve the issue that triggers the alarm. Data type: String
serviceAffecting	Flag that indicates whether the alarm affects service. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Alarm affects service performance or availability. • false: Alarm doesn't affect service. Default: false Data type: Boolean
sourceSystemId	Instance ID of the source alarm. Data type: String
specificProblem	Specific problem that triggers the alarm. Use with the *`probableCause`* tparameter o qualify the alarm. Data type: String
state	Alarm state. Valid values: • Error • Ignored • Ready • Processed If an invalid value is provided, the state is set to `Ready`. If the state is `Ready`, an alert is created in the Alert [em_alert] table and the state then becomes `Processed`. If the state is `Processed`, `Ignored`, or `Error` no alert is created. Default value: Ready Data type: String

Example: cURL request

This example retrieves an alarm.

```
curl
 "https://instance.servicenow.com/api/sn_ind_tmf642/alarm_mgmt/a
larm/001a0ca629078d10f87759e2f69e4c64_2212331" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Alarm Management Open API – PATCH /sn_ind_tmf642/alarm_mgmt/alarm/{id}

Updates a specified alarm and any associated alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This endpoint writes the response body to the **Additional Info** field of the event record in the Events [em_event] table.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm/{id}`

Supported request parameters

Path parameters

Name	Description
id	Unique identifier of the record to update. Data type: String Table: In the Message key field of the Events [em_event] table.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
affectedService	List of one or more services affected by the alarm. Data type: Array of Objects `"affectedService":[ { "href": "String", "id": "String" }, ]`
affectedService.href	URL reference that provides details of the affected service. Data type: String
affectedService.id	Required. Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
alarmChangedTime	Indicates the last date and time the alarm changed on the alarm-owning system. Any change to the alarm updates this

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid payload. Missing required alarm ID. • Invalid payload. Required field missing:<field name>. • Invalid payload. Missing required object. • Event not created, failed. • Unable to clear event. • Unable to update event. • The event doesn't exist.

Response body parameters (JSON)

Name	Description
alarmChangedTime	Date and time the alarm changed in GMT on the alarm-owning system. This value updates when changes to the alarm from the alarmed resource occur or a change from a client update triggers the alarm. This value is required in the response.

© 2026 ServiceNow, Inc. All rights reserved.

}
```

Alarm Management Open API – POST /sn_ind_tmf642/alarm_mgmt/alarm

Creates an alarm record in the Events [em_event] table.

When the alarm record is created, an ID for the alarm is added in the *`Message key`* field.

An alert record might also be created based on Alert management rules.

This endpoint writes the response body to the **Additional Info** field of the event record in the Events [em_event] table.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm`

Name	Description
	Data type: String
probableCause	Most likely situation to trigger the alarm. Use with *alarmType* to qualify the alarm. Data type: String
proposedRepairActions	If available to the system, provides a repair action to resolve the issue that triggers the alarm. Data type: String
serviceAffecting	Flag that indicates whether the alarm affects service. Valid values: • true: Alarm affects service performance or availability. • false: Alarm doesn't affect service. Default: false Data type: Boolean
sourceSystemId	Instance ID of the source alarm. Data type: String
specificProblem	Specific problem that triggers the alarm. Use with the *probableCause* tparameter o qualify the alarm. Data type: String
state	Alarm state. Valid values: • Error • Ignored • Ready • Processed If an invalid value is provided, the state is set to `Ready`. If the state is `Ready`, an alert is created in the Alert

Name	Description
	[em_alert] table and the state then becomes `Processed`. If the state is `Processed`, `Ignored`, or `Error` no alert is created. Default value: Ready Data type: String

Example: cURL request

This example creates an alarm.

```
curl
 "https://<instance>.service-now.com/api/sn_ind_tmf642/alarm_mg
mt/alarm" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \

Alarm Management Open API – POST /sn_ind_tmf642/alarm_mgmt/alarm/{id}/clear

Clears a specified alarm and closes any associated alert.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm/{id}/clear`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
id	Unique identifier of the alarm to clear. Data type: String Table: In the Message key field of the Events [em_events] table.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
alarmClearedTime	Date and time at which the alarm clears at the source. Data type: String Table: In the Time of event field of the Events [em_events] table.
clearSystemId	Required. Name of the instance from which the *alarmCleared* operation was invoked. Data type: String
clearUserId	Required. Unique ID of the user who invoked the *alarmCleared* operation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Name	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid payload. Missing required alarm ID. • Invalid payload. Required field missing:<field name>. • Invalid payload. Missing required object. • Event not created, failed. • Unable to clear event. • Unable to update event. • The event doesn't exist.

Response body parameters (JSON)

Name	Description
alarmClearedTime	Date and time at which the alarm clears at the source. Data type: String Table: In the Time of event field of the Events [em_events] table.
clearSystemId	Name of the instance from which the *alarmCleared* operation was invoked. Data type: String
clearUserId	Unique ID of the user who invoked the *alarmCleared* operation. Data type: String
href	URL of the alarm. Data type: String
id	Unique ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: In the Message key field of the record in the Events [em_events] table.

Example: cURL request

This example clears an alarm.

```
curl
 "https://<instance>.service-now.com/api/sn_ind_tmf642/alarm_mg
mt/alarm/6e116bb8db09201087b9a8394b961950_<external-alarm-id>/cl
ear" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"alarmClearedTime\": \"2017-08-15 06:04:15\",
  \"clearSystemId\": \"<source_instance_name>\",
  \"clearUserId\": \"SOURCE_SYSTEM_vManage_00000_000_00\"
}" \
--user 'user':'password'
```

Response body.

```
{
  "result": {
    "alarmClearedTime": "2017-08-15 06:04:15",
    "clearSystemId": "<source_instance_name>",
    "clearUserId": "SOURCE_SYSTEM_vManage_00000_000_00",
    "id": "6e116bb8db09201087b9a8394b961950_<external-alarm-id>"
  }
}
```

AP Invoice API

Allows external systems, such as those used by vendors, to securely submit invoices directly into an accounts payable system in a structured and automated manner.

This API requires the Accounts Payable Invoice Processing (com.sn_ap_apm) and Source-to-Pay Integration Framework (sn_spend_intg) applications, which are available on the ServiceNow Store. For information, see Accounts Payable Invoice Processing.

Refer to AP Invoice API Developer Guide for help with the following tasks:

- Define a custom field for invoices, invoice lines, and invoice tax lines.
- Map the custom field between source and target tables.
- Map the custom field to a payload entry in a specific format, such as JSON, cXML, or XML.
- Setting credentials for authentication when using cXML as the payload.

You can apply a filter condition for invoice lines containing multiple ERPs. For information, see Integration errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The maximum default payload size is 100 records. This value is configurable in the *sn_spend_intg.ap.invoice.create.api.record_limit* system property.

Invoice attachments

The XML and JSON endpoints support attachments at the invoice, invoice line, and invoice case levels. The cXML endpoint does not support attachments.

Use the following guidelines for attachments:

- Do not use the reserved "SD_" prefix for attachment file names.
- All attachments must be encoded as Base64 format.

AP Invoice – POST /sn_spend_intg/ap_invoice/cxml

Processes an automated invoice in commerce XML (cXML) format.

Use the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table to determine how the fields are mapped to cXML tags.

For additional cXML resources, refer to the cXML Reference Guide at https://xml.cxml.org.

Credentials for this API are included in the payload. You can set up credentials in the Source system credential [sn_spend_intg_source_system_credential] table. For instructions, see Setting credentials for authentication in the cXML payload.

You can define custom invoice fields for the request body. Use the following flow to add custom fields, map them to target tables, and format them for availability in the payload:

1. Add custom fields for invoice import
2. Map custom fields between source and target tables
3. Map custom fields to a payload source format

URL format

Versioned URL: `/api/sn_spend_intg/v1/ap_invoice/cxml`

Default URL: `/api/sn_spend_intg/ap_invoice/cxml`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None

/cXML/Request/InvoiceDetailRequest/ InvoiceDetailSummary /ShippingAmount/ Money	Total shipping cost for the entire purchase. Target field: u_shipping_amount Related table: Invoice Import [sn_spend_intg_imp_invoice]
/cXML/Request/InvoiceDetailRequest/ InvoiceDetailSummary /GrossAmount/Money	Required. Currency for subtotal, tax, and shipping. The subtotal, tax, and shipping should be in the same currency. Target field: u_currency Related table: Invoice Import [sn_spend_intg_imp_invoice]
/cXML/Request/InvoiceDetailRequest/ InvoiceDetailSummary / InvoiceDetailDiscount/Money	Discounts that are applied toward the invoice. Target field: u_discounts Related table: Invoice Import [sn_spend_intg_imp_invoice]
/cXML/Request/InvoiceDetailRequest/ InvoiceDetailSummary /NetAmount/Money	Total amount of money to be paid to the supplier including tax and shipping charges. Target field: u_amount_invoiced Related table: Invoice Import [sn_spend_intg_imp_invoice]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *`application/xml`*.
Source-System	Specifies the source system from which the request is coming from. Available systems are listed in the Source systems credentials [sn_spend_intg_source_system_credential] table. This setting helps to determine if the request provided follows the structure in the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table. This setting is also used to fetch credentials from the Source system credentials [sn_spend_intg_source_system_credential] table.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	Request Accepted. The request is successful and invoice processing is in progress.
400	Bad Request. A bad request type or malformed request was detected.
429	Too Many Requests. The request rate has exceeded the maximum of 10 requests per hour.

Response body parameters

Name	Description
batch_id	Unique identifier for the batch request. This ID can be used to track the status of the request. This record is stored in the Invoice integration log [sn_spend_intg_invoice_integration_log] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
error	Contains error message and details when the request fails. `{ "detail": String, "message": String }` Data type: Object
error.detail	Additional details about the request error. Possible results: • Failed API level ACL Validation - User does not have read/write access to the resource. • Rate limit of 13 requests per hour for AP Invoice exceeded – The number of records in the batch is more than the batch size set. • Required to provide Auth information - Either the password is wrong or user name is wrong. Data type: String
error.message	Error message containing the reason the request failed Possible errors: • Invalid payload - Invalid content type. • Invalid payload - Error: Invalid payload structure. • Invalid payload - Error: Payload exceeds allowed invoices limit in a batch. The number of records in the batch is more than the batch size set. The maximum default payload size is 100 records. This value is configurable in the *`sn_spend_intg.ap.invoice.create.api.record_limit`* system property. • Invalid payload - Error: Empty invoices. No data to process. The number of records in the batch is zero. • Rate limit of 500 requests per hour for APO Invoice Ingestion exceeded. • User Not Authenticated. Either the password is wrong or user name is wrong. • Failed API level ACL Validation - User does not have read/write access to the resource. Data type: String
message	Success message, for example, `Your request has been successfully received and is being processed.` You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Data type: String
status	Indicates the result of the request.

```

The following result shows that the request is successful and the invoice data is processing. You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Use the batch ID listed in the Batch ID column to find the invoice.

```
{
    "batchId": "API INV1729711710733280",
    "status": "Success",
    "message": "Your request has been successfully received and
 is being processed."
}
```

AP Invoice – POST /sn_spend_intg/ap_invoice/json

Processes an automated invoice in JSON format.

Role required: sn_spend_intg.procurement_integrator

Use the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table to determine how the fields are mapped to JSON properties.

You can define custom invoice fields for the request body. Use the following flow to add custom fields, map them to target tables, and format them for availability in the payload:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Add custom fields for invoice import
2. Map custom fields between source and target tables
3. Map custom fields to a payload source format

URL format

Versioned URL: `/api/sn_spend_intg/v1/ap_invoice/json`

Default URL: `/api/sn_spend_intg/ap_invoice/json`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
invoices	List containing each invoice to be processed. Data type: Object of nested invoice objects. `"invoices": { { "amount_invoiced": "String", "bill_to_city": "String", "bill_to_country": "String", "bill_to_state_or_province": "String", "bill_to_street": "String", "bill_to_zip_or_postal_code": "String", "business_owner": "String", "currency": "String", "discounts": "String", "erp_number": "String", "external_invoice_number": "String", "invoice_copy_attachment": [Array], "invoice_date": "String", "invoice_line_count": "String",`

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.
Source-System	Specifies the source system from which the request is coming from. This setting helps to determine if the request provided follows the structure in the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	Request Accepted. The request is successful and invoice processing is in progress.
400	Bad Request. A bad request type or malformed request was detected.
429	Too Many Requests. The request rate has exceeded the maximum of 10 requests per hour.

Response body parameters

Name	Description
batch_id	Unique identifier for the batch request. This ID can be used to track the status of the request. This record is stored in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Data type: String
error	Contains error message and details when the request fails. `{ "detail": String, "message": String }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object
error.detail	Additional details about the request error. Possible results: • Failed API level ACL Validation - User does not have read/write access to the resource. • Rate limit of 13 requests per hour for AP Invoice exceeded – The number of records in the batch is more than the batch size set. • Required to provide Auth information - Either the password is wrong or user name is wrong. Data type: String
error.message	Error message containing the reason the request failed Possible errors: • Invalid payload - Invalid content type. • Invalid payload - Error: Invalid payload structure. • Invalid payload - Error: Payload exceeds allowed invoices limit in a batch. The number of records in the batch is more than the batch size set. The maximum default payload size is 100 records. This value is configurable in the *`sn_spend_intg.ap.invoice.create.api.record_limit`* system property. • Invalid payload - Error: Empty invoices. No data to process. The number of records in the batch is zero. • Rate limit of 500 requests per hour for APO Invoice Ingestion exceeded. • User Not Authenticated. Either the password is wrong or user name is wrong. • Failed API level ACL Validation - User does not have read/write access to the resource. Data type: String
message	Success message, for example, `Your request has been successfully received and is being processed.` You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Data type: String
status	Indicates the result of the request. Possible values: • Success • Fail Data type: String

Example: cURL request

The following example shows how to process an invoice provided as a request in JSON format. Base64 encoding varies in size and can be very large. The content value has been truncated to conserve space. The information reflects proper payload structure.

```
curl
 "https://instance.servicenow.com/api/sn_spend_intg/v1/ap_invoi
ce/json" \
--request \
 POST \
--header \
 "Source-System: Coupa" \
--header \
 "Content-Type: application/json" \
--user 'username' \
:'password' \
--data \

          "uom": "Hours"
        }
      ]
    }
  ],
  "target_erp": ""
}'
```

The following result shows that the request is successful and the invoice data is processing. You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Use the batch ID listed in the Batch ID column to find the invoice.

```
{
    "batchId": "APIINV1729711710733280",
    "status": "Success",
    "message": "Your request has been successfully received and
 is being processed."
}
```

AP Invoice – POST /sn_spend_intg/ap_invoice/xml

Processes an automated invoice in XML format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table to determine how the fields are mapped to XML tags.

You can define custom invoice fields for the request body. Use the following flow to add custom fields, map them to target tables, and format them for availability in the payload:

1. Add custom fields for invoice import
2. Map custom fields between source and target tables
3. Map custom fields to a payload source format

URL format

Versioned URL: `/api/sn_spend_intg/v1/ap_invoice/xml`

Default URL: `/api/sn_spend_intg/ap_invoice/xml`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body elements (XML)

Path	Description
/Invoice/AmountInvoiced	Total amount of money to be paid to the supplier including tax and shipping charges. Target field: u_amount_invoiced Related table: Invoice Import [sn_spend_intg_imp_invoice]
Invoice/BillToCity	The city to which the invoice is sent. Target field: u_bill_to_city Related table: Invoice Import [sn_spend_intg_imp_invoice]
/Invoice/BillToCountry	The country to which the invoice is sent in ISO 3166 format. For example, US. Target field: u_bill_to_country

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *`application/xml`*.
Source-System	Specifies the source system from which the request is coming from. Available systems are listed in the Source systems credentials [sn_spend_intg_source_system_credential] table. This setting helps to determine if the request provided follows the structure in the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table. This setting is also used to fetch credentials from the Source system credentials [sn_spend_intg_source_system_credential] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	Request Accepted. The request is successful and invoice processing is in progress.
400	Bad Request. A bad request type or malformed request was detected.
429	Too Many Requests. The request rate has exceeded the maximum of 10 requests per hour.

Response body parameters

Name	Description
batch_id	Unique identifier for the batch request. This ID can be used to track the status of the request. This record is stored in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Data type: String
error	Contains error message and details when the request fails. `{ "detail": String, "message": String }` Data type: Object
error.detail	Additional details about the request error. Possible results: • Failed API level ACL Validation - User does not have read/write access to the resource. • Rate limit of 13 requests per hour for AP Invoice exceeded – The number of records in the batch is more than the batch size set. • Required to provide Auth information - Either the password is wrong or user name is wrong. Data type: String
error.message	Error message containing the reason the request failed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible errors: • Invalid payload - Invalid content type. • Invalid payload - Error: Invalid payload structure. • Invalid payload - Error: Payload exceeds allowed invoices limit in a batch. The number of records in the batch is more than the batch size set. The maximum default payload size is 100 records. This value is configurable in the *sn_spend_intg.ap.invoice.create.api.record_limit* system property. • Invalid payload - Error: Empty invoices. No data to process. The number of records in the batch is zero. • Rate limit of 500 requests per hour for APO Invoice Ingestion exceeded. • User Not Authenticated. Either the password is wrong or user name is wrong. • Failed API level ACL Validation - User does not have read/write access to the resource. Data type: String
message	Success message, for example, `Your request has been successfully received and is being processed.` You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Data type: String
status	Indicates the result of the request. Possible values: • Success • Fail Data type: String

Example: cURL request

The following example shows how to process an invoice provided as a request in XML format. Base64 encoding varies in size and can be very large. The content value has been truncated to conserve space. The information reflects proper payload structure.

```
curl -X POST
 https://instance.servicenow.com/api/sn_spend_intg/v1/ap_invoi
ce/xml \
-H "Source-System: Ariba" \
-H "Content-Type: application/json" \
-d '<Invoices>
    <Invoice>
        <InvoiceType>po_invoice</InvoiceType>

 <SupplierInvoiceNumber>S-AttachmentInvoice-A1-
SupportDoc1</SupplierInvoiceNumber>
```

</Invoices>'
```

The following result shows that the request is successful and the invoice data is processing. You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Use the batch ID listed in the Batch ID column to find the invoice.

```
{
    "batchId": "APIINV1736249646168148",
    "status": "Success",
    "message": "Your request has been successfully received and
 is being processed."
}
```

Application Service API

The *Application Service* API provides endpoints that enable you to create, modify, and update application services.

This API requires that the user have the Application Service administrator [app_service_admin] role.

Important: Starting with the Rome release, the *Application Service* API is no longer enhanced or supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Application Service - GET /now/cmdb/app_service/{sys_id}/getContent

Retrieves a list of configuration items (CI) in a mapped application service and the relationships between them. Only retrieves content for services that were manually created.

URL format

Default URL: `/api/now/cmdb/app_service/{sys_id}/getContent`

Supported request parameters

Path parameters

Name	Description
sys_id	Sys_id of the mapped application service. Data type: String Table: Mapped Application Service [cmdb_ci_service_discovered]

Query parameters

Name	Description
Mode	Amount of relationship data to return. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Full: Return CI attributes and lookup information in addition to the data returned in shallow mode. • Shallow: Return parent and child relationships between CIs within a service. The values are not case-sensitive. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or they do not have the app_service_admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
cmdb	List of objects that describe the CIs associated with the specified application service. Data type: Object `"cmdb": [ { "items": {Object}, "relations": [Array] } ]`
cmdb.items	CIs within the application service. If the full query parameter was passed in the request, this section includes attributes and lookup information for each CI. Data type: Array `"items": [ { "className": "String", "values": {Object} } ]`
cmdb.items.className	Name of the class that contains the CI. Data type: String
cmdb.items.values	Information to use to locate an associated CI. Data type: Object `"values": { "name": "String", "sys_id": "String" }`
cmdb.items.values.name	Name of the CI. Data type: String
cmdb.items.values.sys_id	Sys_id of the CI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
cmdb.relations	Relationship data for associated CIs, such as hosts and their children. Data type: Array
service	List of services related to the identified service. Data type: Array of Objects `"service": [ { "name": "String", "service_relations": [Array], "url": "String" } ]`
service.name	Name of the application service. Data type: String
service.service_relations	Hierarchy data for the CIs within the application service. All CIs form pairs with a parent and child CI. The top-level CI, referred to as the entry point of an application service, does not have a parent CI. Data type: Array of Objects `"service_relations": [ { "child": "String", "parent": "String" } ]`
service.service_relations.child	Name of a child CI related to the CI. Data type: String
service.service_relations.parent	Name of a parent CI related to the CI. Data type: String
service.url	Relative path to the application service. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/cmdb/app_service/2fce4
2d80a0a0bb4004af34d7e3984c8/getContent?mode=shallow" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Application Service - GET /now/cmdb/csdm/app_service/find_service

Returns basic information about a specified application service and its associated business context.

Note: This endpoint has been deprecated, use SG Services – POST /sg_services/app_service/find instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/find_service`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
name	Required, if *number* is not passed in. Name of the service for which to return information. Data type: String Table: Service Instance [cmdb_ci_service_auto]
number	Required, if *name* is not passed in. Unique number that identifies the application service for which to return information. Data type: String

Query parameters (continued)

Name	Description
	Table: Service Instance [cmdb_ci_service_auto]

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or they do not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Describes an encountered error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Object
	`"error": {`
	`  "details": "String",`
	`  "message": "String"`
	`}`

error.details	Additional information about the error. Data type: String
error.message	Message describing the error. Data type: String

services	Array of objects, each object containing details of services associated with the specified application service.
	
	Data type: Array
	`"services": [`
	`  {`
	`  "environment": "String",`
	`  "name": "String",`
	`  "number": "String",`
	`  "relationships":`
	` {Object},`
	`  "sys_id": "String",`
	`  "version": "String"`
	`  }`
	`]`

services.environment	Environment in which the application service is deployed, such as "Production" or "Test Lab 2." This can be any value that makes sense to the implementer. Data type: String Maximum length: 40 Default: null
services.name	Required. Name of the application service. Must be a unique name from all other application services. Data type: String Maximum length: 255
services.number	Unique number that identifies the application service. This value is initially generated by the endpoint.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
services.relationships	Service types associated with the application service. Data type: Object `"relationships": { "business_app": [Array], "business_service_offering": [Array], "technical_service_offering": [Array] }`
services.relationships.business_app	List of sys_ids of the business applications related to the application service. Data type: Array
services.relationships.technical_service_offering	List of sys_ids of the technology management offerings (formerly technical service offerings) related to the application service. Data type: Array
services.relationships.business_service_offering	List of sys_ids of the business service offerings related to the application service. Data type: Array
services.sys_id	Sys_id of the application service. Data type: String
services.version	Application service version number. Data type: String Maximum length: 40 Format: User definable Default: null

Example: Sample cURL request

```
curl -X GET \

 https://instance.servicenow.com/api/now/cmdb/csdm/app_service/find_service?name=Email_East&number=SNSVC0001018 \
  -H 'Accept: application/json' \
  -u 'username':'password'
```

        ],
        "technical_service_offering": [],
        "business_service_offering": [
          "069c7e20db54101037740f95ca9619bf"
        ]
      }
    }
  ]
 }
}
```

Application Service - POST /now/cmdb/app_service/create

Creates an application service or update an existing application service.

URL format

Default URL: `/api/now/cmdb/app_service/create`

Supported request parameters

Parameters

Parameter	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Request body

The API accepts these JSON elements in the request body. In addition, you can add any field from the Mapped Application Service [cmdb_ci_service_discovered] table to pass data to the application service record. For example, to add content to the Comments field, add `"comments": "Passing data to the Comments field"` to the JSON request.

Elements accepted in the request body

Element	Description
name	Name of the application service you wish to create or update.
service_relations	Information about CIs and the hierarchy they form. All CIs form pairs with a parent CI and a child CI. The top-level CI, referred to as the entry point of an application service, does not have a parent CI.
parent	Sys_ id of the CI whose outgoing connection joins this CI with the CI at the lower level in the map hierarchy.
child	Sys_ id of the CI whose incoming connection joins this CI with the CI located of the higher level in the map hierarchy.

Response body

The API returns these JSON elements in the response body.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements returned in the response body

Element	Description
URL	URL of the standard table REST API for showing the sys_id of an application service record. This element appears only if the endpoint is successful. Data type: String
getContentUrl	REST API path for getting the application service content. This element appears only if the endpoint is successful. Data type: String
info	Number of CIs added to the application service. This element appears only if the endpoint is successful. Data type: String
error	Error message details. This element appears only if the endpoint fails. Data type: Object
message	Error message describing the nature of the failure. This element appears only if the endpoint fails. Data type: String
status	States "failure" if the REST API fails. This element appears only if the endpoint fails. Data type: String

Example: Sample cURL request

```
curl
 "http://<instance.servicenow.com>/api/now/cmdb/app_service/crea
te" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"name\": \"myTestAppService\",
\"comments\": \"Passing data to the Comments field\",
\"service_relations\": [
{ \"parent\": \"\",
\"child\": \"3a70f789c0a8ce010091b0ea635b982a\"
},{ \"parent\": \"3a70f789c0a8ce010091b0ea635b982a\",
\"child\": \"b4fd7c8437201000deeabfc8bcbe5dc1\"
},{ \"parent\": \"b4fd7c8437201000deeabfc8bcbe5dc1\",
\"child\": \"53fdbc8437201000deeabfc8bcbe5d10\"
```

    "info": "3 CIs added to service"
  }
}
```

Application Service - POST /now/cmdb/csdm/app_service/register_service

Creates an application service record stub in the Service Instance [cmdb_ci_service_auto] table and populates it with the passed in information.

Before storing the record, it validates the passed parameters and the uniqueness of the application service name. It also creates upstream relationships which provide business context to the service by associating the specified business applications, business service offerings, and technology management offerings (formerly technical service offerings) to the service application. It does not create downstream relationships to infrastructure. To define downstream relationships you must call the *`Application Service - PUT /now/cmdb/csdm/app_service/{service_sys_id}/populate_service`* endpoint.

Note: This endpoint has been deprecated, use SG Services – POST /sg_services/app_service/register instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/register_service`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters

Name	Description
basic_details	Required. Details of the service associated with the specified application service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description

	Data type: Object
	`"basic_details": {`
	`"environment": "String",`
	`"name": "String",`
	`"version": "String"`
	`}`

basic_details.environment	Environment in which the application service is deployed, such as "Production" or "Test Lab 2." This can be any value that makes sense to the implementer. Data type: String Maximum length: 40 Default: null
basic_details.name	Required. Name of the application service. Must be a unique name from all other application services. Data type: String Maximum length: 255
basic_details.version	Application service version number. Data type: String Maximum length: 40 Format: User definable Default: null

relationships	Upstream (parent) service types to associate with the application service.
	
	Data type: Object
	`"relationships": {`
	`"business_app": [Array],`
	`"business_service_offering": [Array],`
	`"technical_service_offering": [Array]`
	`}`
	
	Table: CI Relationships [cmdb_rel_ci]

relationships.business_app	List of sys_ids of the business applications to relate to the application service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: Array
relationships.business_service_offering	List of sys_ids of the business service offerings to relate to the application service. Data type: Array
relationships.technical_service_offering	List of sys_ids of the technical service offerings to relate to the application service. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The application service was successfully registered.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or they do not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description

error	Describes an encountered error.
	
	Data type: Object
	
	`"error": {`
	`  "details": "String",`
	`  "message": "String"`
	`}`

error.details	Additional information about the error. Data type: String
error.message	Message describing the error. Data type: String
number	Unique number that identifies the application service. This number is generated by the endpoint. Data type: String
service_sys_id	Sys_id of the registered application service. Data type: String

Example: Sample cURL request

```
curl -X POST \

 https://instance.servicenow.com/api/now/cmdb/csdm/app_service/r
egister_service \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password'
  -d '{
  "basic_details": {
    "environment": "Test Lab 2",
    "name": "Test Lab 2",
    "version": "1.1.1"
  },
  "relationships": {
    "business_app":["f07c7620db54101037740f95ca96199a"],

 "business_service_offering":["069c7e20db54101037740f95ca9619b
f"]
  }
}'
```

```
{
  "result": {

```
    }
}
```

Application Service - PUT /now/cmdb/csdm/app_service/{service_sys_id}/populate_service

Populates the specified application service with a specified set of downstream configuration items (CI).

Before calling this endpoint, you must call the POST /now/cmdb/csdm/app_service/register_service endpoint to create the application service.

Note: This endpoint has been deprecated, use SG Services – POST /sg_services/app_service/populate instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/{service_sys_id}/populate_service`

Supported request parameters

Path parameters

Name	Description
service_sys_id	Sys_id of the application service to populate with the specified CIs. Data type: String Table: Service Instance [cmdb_ci_service_auto]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

population_method	CIs to associate with the specified application service. The elements in the *`population_method`* object depend on the type of information being populated, which is defined by the *`type`* parameter.
	
	Data type: Object
	
	For *`type`* = cmdb_group_based
	
	`"population_method": {`
	`  "group_id": "String",`
	`  "type": "String"`
	`}`
	
	For *`type`* = discovery

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description

	Note: To use this type you must activate the Service Mapping (com.snc.service-mapping) plugin.
	`"population_method": {`
	`  "attributes": [Array],`
	`  "entry_point_id": "String",`
	`  "type": "String"`
	`}`
	For *type* = tag_list
	Note: To use this type you must activate the Service Mapping (com.snc.service-mapping) plugin.
	`"population_method": {`
	`  "tags": [Array],`
	`  "type": "String"`
	`}`

population_method.attributes	List of attributes to associate with the CI, such as host, port, name, and URL.
	Note: You must pass all required attributes.
	Data type: Array
	`"attributes": {`
	`  "name":"String",`
	`  "value":"String"`
	`}`

population_method.attributes.name	Name of the attribute, such as host, port, name, and URL. Data type: String
population_method.attributes.value	Attribute value. Data type: String
population_method.entry_point	Required if *population_method.type* = discovery. Entry point into the application service. For additional information on entry points, see Entry point attributes and Create entry point types for Service Mapping. Data type: String
population_method.group_id	Required if *population_method.type* = cmdb_group_based. Sys_id of the group to associate with the CI. Data type: String Title: CMDB Group [cmdb_group]

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
    "result": {}
}
```

The following code example shows how to populate a discovery application service.

```
curl -X PUT \

 https://instance.servicenow.com/api/now/cmdb/csdm/app_service/f
809cb60db94101037740f95ca96190f/populate_service \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
  "population_method": {
    "type":"discovery",
    "entry_point_id":"cmdb_ci_endpoint_ad_forest",
    "attributes": [
      {
        "name":"host",
        "value":"test1.com"
      },
      {
        "name":"port",
        "value":"500"
      },
      {
        "name":"protocol",
        "value":"ssh"
      }
    ]
  }
}'
```

```
{
    "result": {}
}
```

Application Service - PUT /now/cmdb/csdm/app_service/{service_sys_id}/service_details

Updates the specified application service with the passed in basic information.

It also validates the uniqueness of the application service by checking the passed in information against the Identification and Reconciliation engine (IRE) rules defined on the application service class.

Note: This endpoint has been deprecated, use SG Services – POST /sg_services/app_service/update instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/{service_sys_id}/service_details`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
service_sys_id	Sys_id of the application service to updated. Data type: String Table: Service Instance [cmdb_ci_service_auto]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

basic_details	Details of the service associated with the specified application service.
	
	Data type: Object
	
	`"basic_details": {`
	`  "environment": "String",`
	`  "name": "String"`
	`}`

basic_details.environment	Environment in which the application service is deployed, such as "Production" or "Test Lab 2." This can be any value that makes sense to the implementer. Data type: String Maximum length: 40 Default: null
basic_details.name	Required. Name of the application service. Must be a unique name from all other application services. Data type: String Maximum length: 255

relationships	Service types to associate with the application service. Located in the CI Relationships [cmdb_rel_ci] table.
	
	Data type: Object
	
	`"relationships": {`
	`  "business_app": [Array],`

Appointment API

The *Appointment* API provides endpoints for interacting with the appointment booking application. Use this API to book and reschedule appointments, check available appointment slots, and fetch appointment booking configuration details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before using this API, the Appointment Booking Configuration and Service Configuration must be setup. In addition, a task for which the appointment is being booked must already exist. For additional information, see Configuring Appointment Booking.

The *Appointment* API requires the Appointment Booking plugin (com.snc.appointment_booking) and is provided within the `sn_apptmnt_booking` namespace. To access this API you must have the snc_internal role.

Appointment - GET /sn_apptmnt_booking/appointment/calendar

Returns the time range for which you can book appointments. The return results honor the lead time and maximum future bookable dates configured in the appointment booking service configuration.

For additional information on lead time and maximum future bookable dates configuration, see Create or modify an application configuration for Appointment Booking.

You must have either the snc_internal or snc_external role to access this endpoint.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/calendar`

Default URL: `/api/sn_apptmnt_booking/appointment/calendar`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
catalog_id	Required. Sys_id of the record producer configured with an appointment booking service configuration. Table: Record Producer [sc_cat_item_producer] Data type: String
location	Required. Sys_id of the location of the appointment. Table: Location [cmn_location] Data type: String
opened_for	Required. Sys_id of the user for whom the appointment is being booked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Table: User [sys_user] Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Information about the results of the endpoint request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Object
	`"result": {`
	`  "range_end": "String",`
	`  "range_start": "String"`
	`}`

result.range_end	End of the range in which the appointments can be booked. `Range End = Today + Maximum future bookable days` Data type: String Format: Appointment's time zone in internal date time format.
result.range_start	Start of the range in which the appointments can be booked. `Range Start = Today + Lead time` Data type: String Format: Appointment's time zone in internal date time format.

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_apptmnt_booking/v1/appoi
ntment/calendar?catalog_id=e4c1116b3b810300ce8a4d72f3efc40f&loca
tion=32e8499cdb2d2200d75270f5bf9619d6&opened_for=6816f79cc0a8016
401c5a33be04be441" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Result:

```
{
  "result": {
    "range_start": "2023-02-08 03:52:27",
    "range_end": "2023-02-21 23:52:27"
  }
}
```

Appointment - GET /sn_apptmnt_booking/appointment/configuration

Returns the configuration defined in a specified Appointment Booking Service Configuration.

In addition, it returns the translations and user date and time preferences required to render the slots on the appointment booking widgets.

You must have either the snc_internal or snc_external role to access this endpoint.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/configuration`

Default URL: `/api/sn_apptmnt_booking/appointment/configuration`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
catalog_id	Required. Sys_id of the record producer configured with the appointment booking service configuration. Data type: String Table: Record Producer [sc_cat_item_producer]

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Results of the endpoint request.
	
	Data type: Object
	
	`"result": {`
	`  "active": Boolean,`
	`  "active_string": "String",`
	`  "advanced_calendar_view_portal": Boolean,`
	`  "auto_acceptance": Boolean,`
	`  "locale_language": "String",`
	`  "service_config": {Object},`
	`  "task_table": "String",`
	`  "translations": {Object},`
	`  "userDateFormatOptions": {Object},`
	`  "useRR": Boolean,`
	`  "userTimeFormat": {Object},`
	`  "userTimeFormatOptions": {Object},`
	`  "view_scale": "String"`
	`}`

result.active	Flag that indicates whether the service configuration setup for the associated catalog ID is active. Possible values: • true: Service configuration setup for the catalog ID is active. • false: Service configuration setup for the catalog ID isn't active. Data type: Boolean

Name	Description
result.active_string	Text representation of the status of the service configuration setup for the associated catalog ID. Data type: String
result.advanced_calendar_view_portal	Flag that indicates whether the advanced calendar view displays on the portal or displays the base view. For additional information on the advanced calendar view, see Create or modify an application configuration for Appointment Booking. Possible values: • true: Advanced calendar view displays on the portal. • false: Basic view displays on the portal. Data type: Boolean
result.auto_acceptance	Flag that indicates whether the appointment automatically transitions to the accepted state. Possible values: • true: Appointment automatically transitions to the accepted state. • false: Agent must manually accept the appointment. Data type: Boolean
result.locale_language	User's language setting. Data type: String Format: ISO 639.1 language code
result.service_config	Details about the service configuration. Data type: Object "service_config": { "active": Boolean, "active_string": "String", "appointment_booking_config": "String", "appointment_duration": "String", "appointments_per_bookable_slot": "String", "bookable_days": "String", "cancel_by_time": "String", "default_timezone": "String", "enable_advanced_config": Boolean, "field_mapping": {Object},

Name	Description
	"future_bookable_max_days": "String", "lead_time": "String", "mandatory": "String", "use_slot_end_time_as": "String", "work_duration": "String" }
result.service_config.active	Flag that indicates the active status of the appointment booking service configuration. Possible values: • true: Active • false: Inactive Data type: Boolean
result.service_config.active_string	Text representation of the status of the appointment booking service configuration. Data type: String
result.service_config. appointment_booking_config	Sys_id of the appointment booking service configuration setup for the associated catalog ID. Data type: String Table: Appointment Booking Service Configuration [sn_apptmnt_booking_service_config]
result.service_config. appointment_duration	Length of the appointment. Data type: String Unit: Minutes
result.service_config. appointments_per_bookable_slot	Number of appointments that can be booked for the associated slot. Data type: String
result.service_config.bookable_days	Comma-separated values representing the days on which appointments can be booked. Days are represented as integers where, Monday = 1 and Sunday = 7. Data type: String
result.service_config.cancel_by_time	Minimum amount of time prior to the start of an appointment that a user can cancel the appointment. For example, if you have an appointment booked for 1:00pm and there's a 2 hour cancel by time, you must cancel the appointment no later than 10:59 am.

Name	Description
	Format: This value is the date and time difference from “1970-01-01 00:00:00”. So if the returned value is "1970-01-01 04:00:00, it means that the room must be canceled four hours before the meeting starts. Data type: String
result.service_config.default_timezone	Time zone configuration that appointments are booked in. Possible values: • location: Use the time zone of the location of the appointment. • user: Use the time zone of the person for whom the appointment is being booked. Data type: String
result.service_config. enable_advanced_config	Flag that indicates whether appointment booking configurations and appointment booking rules are considered when booking appointments. For additional information, see Create appointment booking advanced configuration. Possible values: • true: Appointment booking configurations and appointment booking rules are considered when booking appointments. • false: Appointment booking configurations and appointment booking rules aren't considered when booking appointments. Data type: Boolean

result.service_config.field_mapping	Details about the catalog variables mapped to the location and contact values used to book the appointment.
	
	Data type: Object
	`"field_mapping": {`
	`"contact": "String",`
	`"contactRPVariable": {Object},`
	`"location": "String",`
	`"locationRPVariable": {Object}`
	`}`

result.service_config. field_mapping.contact	Name of the catalog variable that contains the contact value. Data type: String

Name	Description

result.service_config.field_mapping.contactRPVariable	Details about the location catalog variables data.
	
	Data type: Object
	
	`"contactRPVariable": {`
	`  "displayName": "String",`
	`  "label": "String",`
	`  "name": "String"`
	`}`

result.service_config.field_mapping.contactRPVariable.displayName	Display name of the contact catalog variable. Data type: String
result.service_config.field_mapping.contactRPVariable.label	Label of the contact catalog variable. Data type: String
result.service_config.field_mapping.contactRPVariable.name	Name of the contact catalog variable. Data type: String
result.service_config.field_mapping.location	Name of the catalog variable that contains the location value. Data type: String

result.service_config.field_mapping.locationRPVariable	Details about the location catalog variables data.
	
	Data type: Object
	
	`"locationRPVariable": {`
	`  "displayName": "String",`
	`  "label": "String",`
	`  "name": "String"`
	`}`

result.service_config.field_mapping.locationRPVariable.displayName	Display name of the location catalog variable. Data type: String
result.service_config.field_mapping.locationRPVariable.label	Label of the location catalog variable. Data type: String
result.service_config.field_mapping.locationRPVariable.name	Name of the location catalog variable. Data type: String
result.service_config.future_bookable_max_days	Maximum number of days in the future that an appointment can be booked. Data type: String
result.service_config.lead_time	Minimum amount of time prior to the start of an appointment that a user can book the appointment. For example, if you want to book an appointment

Name	Description
	at 1:00pm and there's a 2-hour lead time, you must book the appointment no later than 10:59 am. Format: This value is the date and time difference from "1970-01-01 00:00:00". So if the returned value is "1970-01-01 04:00:00, it means that the room must be booked four hours before the meeting starts. Data type: String
result.service_config.mandatory	Indicator for whether the appointment is mandatory. Possible values: • 0: Appointment isn't mandatory. • 1: Appointment is mandatory. Data type: String
result.service_config. use_slot_end_time_as	Indicator as to when an agent will arrive or complete the work scheduled for the associated appointment. Possible values: • arrive_by: Agent will arrive at the location for the appointment within the specified time slot. • complete_by: Agent will complete the work for the appointment within the specified time slot. • empty: Same as completed_by. Data type: String
result.service_config.work_duration	Amount of time it takes to work on the appointment. Work duration is configured in the appointment booking service configuration. For additional information, see Create or modify service configuration for Appointment Booking. Data type: String Unit: Minutes
result.task_table	Name of the table for which the appointment can be booked. Configured in the appointment booking service configuration. Data type: String
result.translations	Name-value pairs of text translations used by the appointment booking widget. Contains translated values for actions, messages, days, and months. Data type: Object

Name	Description

result.userDateFormatOptions	Describes the date format options that are needed to render JS date objects. These values are set in appointment booking constants which are not modifiable.
	
	Data type: Object
	
	`"userDateFormatOptions": {`
	`  "day": "String",`
	`  "month": "String",`
	`  "week": "String",`
	`  "weekday": "String"`
	`}`

result.userDateFormatOptions.day	Day date format. Data type: String Format: Numeric (Values or 1-31)
result.userDateFormatOptions.month	Month date format. Data type: String Format: Short (Values on Jan, Feb, Mar, and so on)
result.userDateFormatOptions.week	Week date format. Data type: String Format: Numeric (Values of 1-5)
result.userDateFormatOptions.weekday	Weekday date format. Data type: String Format: Short (Values of Mon, Tue, Wed, and so on)
result.useRR	Value of the sn_apptmnt_booking.use_read_replica_from_ui property. This value defines whether to use the read replica database to fetch appointment slots when the query is performed from the UI. Possible values: • true: Use the read replica database to fetch the slots. • false: Don't use the read replica database to fetch the slots. Data type: Boolean
result.userTimeFormat	Describes the user's time format. The user is the person making the endpoint request. If made through the platform, it is an agent. If made through the portal, it is a customer.

Name	Description

	Data type: Object
	`"userTimeFormat": {`
	`  "type": "String",`
	`  "value": "String"`
	`}`

result.userTimeFormat.type	Type of time format. Possible values: • 12hr • 24hr Data type: String
result.userTimeFormat.value	Preferred time format, such as "HH:mm:ss". Data type: String

result.userTimeFormatOptions	Describes the time format options that are needed to render JS time objects. These values are set in the appointment booking constants which can't be modified.
	Data type: Object
	`"userTimeFormatOptions": {`
	`  "hour": "String",`
	`  "hourCycle": "String",`
	`  "minute": "String"`
	`}`

result.userTimeFormatOptions.hour	Format for hours. Format: numeric (Values 1-12)
result.userTimeFormatOptions.hourCycle	Format for hour cycle. Only possible value is `h23`.
result.userTimeFormatOptions.minute	Format for minutes. Format: numeric (Values of 1-60)
result.view_scale	View configured in the service configuration. Possible values: • day • week Data type: String

Example: cURL request

Appointment - GET /sn_apptmnt_booking/appointment/execute_rule_conditions

Returns the sys_id of the appointment booking service configuration rule that matches a specified task sys_id or a set of specified catalog item data.

The passed task ID or catalog item data is evaluated against the rules defined for a service configuration. The sys_id for the first rule for which these conditions match is returned. You must then pass this rule sys_id to subsequent availability requests to fetch the correct slots, which are defined in the rule.

You must have either the snc_internal or snc_external role to access this endpoint.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/execute_rule_conditions`

Default URL: `/api/sn_apptmnt_booking/appointment/execute_rule_conditions`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
catalogId	Required. Sys_id of the record producer configured with the appointment booking service configuration. Data type: String Table: Record Producer [sc_cat_item_producer]
otherInputs	Required if the *`taskId`* parameter isn't specified. Name-value pairs of catalog item variables to compare against the rules defined for a service configuration. For example: `"otherInputs": { "u_sn_point_of_sale_variable_set": "true", "short_description": "Point-of-Sale Installation", "contact": "6816f79cc0a8016401c5a33be04be441", "description": "Install new point-of-sale system with cash tray", "location": "32e8499cdb2d2200d75270f5bf9619d6" }` Data type: Object

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
taskId	Required if the *otherInputs* parameter isn't specified. Sys_id of the task record for which the appointment is being booked. Located in the task table for which the appointment is being booked. The *catalogId* corresponds to a particular appointment booking configuration and every config has a task table on which the appointment is booked. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Description of the information returned by the endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Object
	`“result": {`
	`  "dedicatedCapacity": Boolean,`
	`  "futureMaxBookableDays": "String",`
	`  "ruleId": "String",`
	`  "ruleName": "String"`
	`}`

result.dedicatedCapacity	Flag that indicates whether the associated rule has dedicated capacity. For additional information on dedicated capacity, see Create service configuration rules for a service configuration. Possible values: • true: Rule has dedicated capacity. • false: Capacity is shared between the associated rule and the base configuration. It’s also shared with other rules that don't have dedicated capacity. Data type: Boolean
result.futureMaxBookableDays	Maximum number of days in the future for which an appointment with the matching rule can be booked. Data type: String
result.ruleId	Sys_id of the appointment booking service configuration rule that matches the *taskId* or *otherInputs* parameters passed in the request. Data type: String Table: Service Configuration Rule [sn_apptmnt_booking_config_rule]
result.ruleName	Name of the rule that matched the passed parameters. Data type: String

Example: cURL request

The following code example shows how to use the *taskId* parameter to make the rule comparison request.

```
curl
 "http://instance.servicenow.com/api/sn_apptmnt_booking/v1/appoi
ntment/execute_rule_conditions" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"catalogId\": \"e4c1116b3b810300ce8a4d72f3efc40f\",
  \"taskId\": \"ce1f397c43b861105e0dbcba6ab8f298\"}" \
--user 'username':'password'
```

Response:

```
{
  "result": {
    "ruleId": "f7d5d98f437c21105e0dbcba6ab8f2fc",
    "ruleName": "Priority 1 rule",
    "dedicatedCapacity": true,
    "futureMaxBookableDays": "14"
  }
}
```

Example: cURL request

The following code example shows how to use the *otherInputs* parameter to make the rule comparison request.

```
curl

Appointment - POST /sn_apptmnt_booking/appointment/appointment

Enables you to book and reschedule appointments for a Field Service Management task.

Note: This endpoint only enables you to book and schedule appointments that have start and end times defined in the associated appointment booking service configuration and have available slots.

For additional information on Field Service Management tasks, see Configuring Appointment Booking.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/appointment`

Default URL: `/api/sn_apptmnt_booking/appointment/appointment`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
actualEndDate	Required. End date and time for the appointment slot in the appointment's time zone. Date type: String Format: YYYY-MM-dd HH:mm:ss
actualStartDate	Required. Start date and time for the appointment slot in the appointment's time zone. Date type: String Format: YYYY-MM-dd HH:mm:ss
catalogId	Sys_id of the record producer configured for the appointment booking service configuration. If you don't pass this parameter, the endpoint will attempt to discern this information from the *`taskId`* and *`taskTable`* parameters. If it can't, the endpoint fails, and an error is returned. Date type: String Table: The Catalog Item field of the Appointment Booking Service Configuration [sn_apptmnt_booking_service_config] table.
endDateUTC	Required. End date and time for the appointment slot in UTC time zone.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Date type: String Format: YYYY-MM-dd HH:mm:ss
location	Required. Sys_id of the location record related to the appointment. Date type: String Table: Location [cmn_location]
openedFor	Required. Sys_id of the user for which the appointment is being booked. Date type: String Table: User [sys_user]
reschedule	Required. Flag that indicates whether the appointment is being rescheduled. Valid values: • true: Appointment currently exists and is being rescheduled. • false: New appointment. Data type: Boolean
service_cofig_rule	If the appointment is being booked under a rule, the sys_id of the service configuration rule. Date type: String Table: Service Configuration Rule [sn_apptmnt_booking_config_rule]
startDateUTC	Required. Start date and time for the appointment slot in UTC time zone. Date type: String Format: YYYY-MM-dd HH:mm:ss
taskId	Required. Sys_id of the task record for which the appointment is being booked. Date type: String Table: Defined in the *`taskTable`* parameter.
taskTable	Required. Name of the table containing the task record for which the appointment is being booked. Date type: String
timezone	Required. Time zone to use when booking or updating the specified appointment slot. Format: Country/City or Area format, such as US/Eastern

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Date type: String
validate_request	Flag that indicates whether to validate the appointment request. If any of the validations fail, the endpoint fails and returns an error message that describes the problem. The following validations are performed: • Catalog ID validation: Verifies that the passed *catalogId* parameter is a valid sys_id. • Time zone validation: Verifies that the passed *timezone* parameter is a valid time zone. • Task ID validation: Verifies that the passed *taskId* parameter is a valid sys_id and the task is in the pending dispatch state. • Duplicate slot validation: For reschedules, if you pass the same slot as the original appointment, the slot is invalid as the slot is technically already booked. • Slot validation: Verifies that the passed slot information matches what is configured and that the slot has the same time frame. For example, if in the configuration a two-hour slot is configured, but you pass a three-hour slot, the slot is not valid. Similarly, if the 9:00 a.m. to 11:00 a.m. slot is available, but the passed slot is for 9:30 a.m. to 11:30 a.m., then the passed slot is invalid. Valid values: • true: Validate the appointment information. • false: Don't validate the appointment information. Data type: Boolean Default: false

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Information about the results of the endpoint request.
	
	Data type: Object
	
	`"result": {`
	`  "data": "String",`
	`  "message": "String",`
	`  "reason": "String",`
	`  "success": Boolean`
	`}`

result.data	Sys_id of the appointment record that has been created or rescheduled. Data type: String
result.message	Message that explains whether the appointment request was scheduled or failed. For example, error responses might include: • Your appointment cannot be scheduled. • Your appointment cannot be rescheduled. If the operation is successful, a message similar to the following is returned: Your appointment has been scheduled successfully. Data type: String
result.reason	Additional information about the results of the appointment request. Data type: String
result.success	Flag that indicates whether the request was successful.

Name	Description
	Possible values: • true: Request succeeded • false: Request failed Data type: Boolean

Example: cURL request

The following example shows how to create a new appointment booking for a task in the Work Order [wm_order] table.

```
curl
 "https://instance.servicenow.com/api/sn_apptmnt_booking/appoint
ment/appointment" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"startDateUTC\": \"2023-02-01 20:00:00\",
\"endDateUTC\": \"2023-02-01 22:00:00\",
\"actualStartDate\": \"2023-02-01 15:00:00\",
\"actualEndDate\": \"2023-02-01 17:00:00\",
\"taskTable\": \"wm_order\",
\"location\": \"32e8499cdb2d2200d75270f5bf9619d6\",
\"catalogId\": \"e4c1116b3b810300ce8a4d72f3efc40f\",
\"openedFor\": \"ddce70866f9331003b3c498f5d3ee417\"
\"taskId\": \"ce1f397c43b861105e0dbcba6ab8f298\",
\"reschedule\": false,
\"service_configuration_rule\": \"\",
\"timezone\": \"US/Eastern\"
}" \

--user 'username':'password'
```

Response:

```
{
"result": {
  "success": true,
  "message": "Your appointment has been scheduled
 successfully.",
  "reason": "Appointment created!",
  "data": "7a5f393c43b861105e0dbcba6ab8f29f"
  }
}
```

Appointment - POST /sn_apptmnt_booking/appointment/availability

Returns the slots that have been configured in the appointment booking service configuration along with their availability.

If advanced configurations are enabled for the service configuration, the endpoint honors these configurations, and returns the data according to the rules and advanced configuration. You can also use this endpoint to find the first available slot by passing the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

get_next_available_slot parameter or *get_next_available_day_data* parameter in the request body as `true`.

You must have either the snc_internal or snc_external role to access this endpoint.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/availability`

Default URL: `/api/sn_apptmnt_booking/appointment/availability`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
catalog_id	Sys_id of the record producer configured for the appointment booking service configuration. If you don't pass this parameter, the endpoint will attempt to discern this information from the *taskId* and *task_table* parameters. If it can't, the endpoint fails, and an error is returned. Data type: String Table: In the Catalog Item field in the related record of the Appointment Booking Service Configuration [sn_apptmnt_booking_service_config] table.
end_date	Required. End date and time for which to fetch appointments. Data type: String Format: UTC time zone and in the format YYYY-MM-dd HH:mm:ss
fetch_days_slot	Flag that indicates whether to return the first available slot in each day for the requested date range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Valid values: • true: Return the first available slot for each day. • false: Don't return the first available slot for each day. Data type: Boolean Default: false
full_day	Required. Flag that indicates whether to return all appointments for the specified date range passed regardless of the time values in start and end date. Valid values: • true: Return all appointments regardless of specified times. • false: Only return appointments that correspond to the specified dates and times. Data type: Boolean
get_next_available_slot	Flag that indicates whether to return the first available appointment slot with the response even if it isn't part of the passed-in *start_date* and *end_date* parameters. Valid values: • true: Return the first available appointment slots. • false: Don't return the first available appointment slots. Data type: Boolean Default: false
limit	Maximum number of appointments to return. Data type: Number Default: Value specified in the sn_apptmnt_booking .max_appointments_ returned property or 1000 if the property is empty.
location	Required. Sys_id of the location record associated with the appointment. Data type: String Table: Location [cmn_location]
opened_for	Required. Sys_id of the user for which the appointment is being booked. Data type: String

Request body parameters (continued)

Name	Description
	Table: User [sys_user]
otherInputs	Name-value pairs of any other values needed to calculate the availability in the scripted method. Typically these values are catalog item variables, however, if you customize your booking application you can pass any values needed by your implementation. For example: `"otherInputs": { "u_sn_point_of_sale_variable_set": "true", "short_description": "Point-of-Sale Installation", "contact": "6816f79cc0a8016401c5a33be04be441", "description": "Install new point-of-sale system with cash tray", "location": "32e8499cdb2d2200d75270f5bf9619d6" }` Data type: Object
service_config_rule	Sys_id of the service configuration rule to use to calculate the appointment slots and availability. Data type: String Table: Service Configuration Rule [sn_apptmnt_booking_config_rule]
start_date	Required. Start date and time for which to fetch appointments. Data type: String Format: UTC time zone and in the format YYYY-MM-dd HH:mm:ss
taskId	Sys_id of the task record for which the appointment is being booked. Date type: String Table: Defined in the *taskTable* parameter.
task_table	Required. Name of the table containing the task record for which the appointment is being booked. Data type: String
use_read_replica	Flag that indicates whether to use the read replica of the database when fetching the appointment slots and their availability. Valid values: • true: Use the read replica of the database. • false: Don't use the read replica of the database.

Appointment Open API

The *Appointment Open* API is a telecommunication API that allows you to interact with the appointment booking application. Use this API to book appointments and search available time slots.

The *Appointment Open* API is a ServiceNow® implementation of the Open API TMForum TMF646 Appointment REST API specification and is conformance certified by TM Forum. This implementation is based on TMF646 Appointment API REST Specification R16.0.1.

This API requires the following plugins available on the ServiceNow Store.

- Appointment Booking (com.snc.appointment_booking)
- Field Service Management (com.snc.work_management)
- Field Service Management for Telecommunications (com.sn_fsmt)
- Telecommunication Open APIs (com.sn_tmf_api)

Before using this API, Appointment Booking Configuration and Service Configuration must be set up. In addition, a task for which the appointment is being booked must exist.

This API is provided within the `sn_tmf_api` namespace. The calling user must have the sn_tmf_api.appointment_integrator role.

Appointment Open - DELETE /api/sn_tmf_api/appointment/appointment/{id}

Deletes an appointment record with a given ID.

URL format

Default URL: `/api/sn_tmf_api/appointment/appointment/{id}`

Supported request parameters

Path parameters

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON)

Name	Description
message	Response message acknowledging successful deletion. Success: "The appointment (<id>) is successfully cancelled." Errors: • "Appointment cancellation failed.": The ID can't be found in the system and returns a 404 status code. • "Appointment cancellation failed.": The appointment is already in a cancelled or completed state or can't be deleted, and returns a 404 status code. • "The appointment (<id>) can't be cancelled as it is beyond the Cancel by time.": The appointment is already beyond the 'cancel by time', which is configured in the appointment booking service configuration. Returns a 400 status code.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: cURL request

The following example deletes an appointment with a specific ID.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/appointment/appo
intment/68cc0a5a9314521060320dd548373" \
--request GET\
--user 'username':'password'
```

Response body:

```
"The appointment (68cc0a5a9314521060320dd548373cbd) is
 successfully cancelled."
```

Appointment Open - GET /api/sn_tmf_api/appointment/appointment/{id}

Retrieves an appointment record associated with a specified ID.

URL format

Default URL: `/api/sn_tmf_api/appointment/appointment/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the appointment to retrieve. Data type: String Table: Appointment booking [sn_apptmnt_booking_appointment_booking]

Query parameters

Name	Description
category	Filter the appointment by category sys_id. Data type: String Table: Location [cmn_location] Default: Returns all appointments if category sys_id is not provided.

relatedEntity	Details about the related entity associated with the work order.
	
	Data type: Object
	
	`"relatedEntity": {`
	`  "id": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.

Query parameters (continued)

Name	Description
relatedEntity.id	Required. Sys_id of the related entity. Data type: String Table: workOrder [wm_order] Default: Returns all if sys_id is not provided.

relatedParty	Filter the appointment by the sys_id of the related party associated with the appointment.
	
	Data type: Object
	
	`"relatedParty": {`
	`  "id": "String",`
	`  "name": "String"`
	`}`
	
	Default: Returns all appointments if *`relatedParty`* is not provided.

relatedParty.id	Sys_id of the related party. Data type: String Table: User [sys_user]
relatedParty.name	Name of the related party. Data type: String

relatedPlace	Filter the appointment by the place where the service or repair is scheduled to happen.
	
	Data type: Object
	
	`"relatedPlace": {`
	`  "id": "String"`
	`}`
	
	Default: Returns all appointments if *`relatedPlace`* is not provided.

relatedPlace.id	Sys_id of the related place. Data type: String Table: Location [cmn_location]

validFor	Filter the appointment by a date range that the appointment is valid for.
	
	Data type: Object
	
	`"validFor":`
	`{`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`

Appointment Open - GET /api/sn_tmf_api/appointment/appointment

Retrieves a list of appointment records.

URL format

Default URL: `/api/sn_tmf_api/appointment/appointment`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
category	Filter the appointment by category sys_id. Data type: String Table: Location [cmn_location] Default: Returns all appointments if category sys_id is not provided.

relatedEntity	Details about the related entity associated with the work order.
	
	Data type: Object
	
	`"relatedEntity": {`
	`  "id": "String"`
	`}`

relatedEntity.id	Required. Sys_id of the related entity. Data type: String Table: workOrder [wm_order] Default: Returns all if sys_id is not provided.

relatedParty	Filter the appointment by the sys_id of the related party associated with the appointment.
	
	Data type: Object
	
	`"relatedParty": {`
	`  "id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Query parameters (continued)

Name	Description
	Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43. Table: Location [cmn_location]

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *`application/json`*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Query parameters

Name	Description
catalog_id	Required. Sys_id of the record producer configured with an appointment booking service configuration. Data type: String Table: Record Producer [sc_cat_item_producer]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
end_date	Required. End date and time of the time period in which you want to search for the appointment. Data type: String Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 12:00:00`.
location	Sys_id of the appointment's location. Table: Location [cmn_location] Data type: String Default: Returns all locations if not specified.
opened_for	Required. Sys_id of the user for whom the appointment is being booked. Table: Contact [customer_contact] Data type: String
start_date	Required. Start date and time of the time period in which you want to search for the appointment. Data type: String Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:00:00`.

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
availableTimeSlot	List of appointment slots within the specified block of time requested. Data type: Array of Objects `'availableTimeSlot': [ { "available": Boolean, "end_date": "String", "end_date_display": "String", "end_dateUTC": "String", "start_date": "String", "start_date_display": "String", "start_dateUTC": "String" } ]`
availableTimeSlot.available	Flag that indicates whether the associated time slot is available. Possible values: • true: Time slot is available. • false: Time slot is unavailable. Data type: Boolean
availableTimeSlot.end_date	End date and time of the associated appointment. The time zone is based on the value in the *timeZone* parameter. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
availableTimeSlot.end_date_display	Display end date and time of the associated appointment. The time zone is based on the value in the *timeZone* parameter. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
availableTimeSlot.end_dateUTC	End date and time of the associated appointment. Data type: String Format: UTC
availableTimeSlot.start_date	Start date and time of the associated appointment. Reflects the value of the *timeZone* parameter. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
availableTimeSlot.start_date_display	Display start date and time of the associated appointment. Reflects the value of the *timeZone* parameter. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
availableTimeSlot.start_dateUTC	Start date and time of the associated appointment. Data type: String Format: UTC
hasMore	Flag that indicates whether there are more appointment slots to fetch after returning the limit. The limit is specified in the Appointment Booking property, sn_apptmnt_booking.max_appointments_returned (Default: 100). See Appointment booking components for more details about this property. Possible values: • true: More appointment slots can be fetched. • false: No more appointment slots are available. Data type: Boolean
noApptAvailable	Flag that indicates whether there are more appointment slots available for the specified date and time. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: More appointment slots are available for the specified date and time. • false: No more appointment slots are available for the specified date and time. Data type: Boolean
searchResult	Results for appointment availability within the designated search time slot. Possible values: • success • fail Data type: String
status	Completion status of the search for available time slots. For example, done. Data type: String
timeZone	Time zone used when booking or updating the specified appointment slot. Date type: String Format: Country/city or area format, such as US/Eastern

Example: cURL request

The following code example shows how to call this endpoint.

```
curl --location --request GET
 'https://instance.service-now.com/api/sn_tmf_api/appointment/se
archTimeSlot?
start_date=2024-07-10 09:00:00&end_date=2024-07-20
 23:00:00&catalog_id=ada50a93f0220210f8776517d8c8e776&
opened_for=51670151c35420105252716b7d40ddfe&location=f48b21850a0
a0ba7004182b18099696d ' \
--user 'username':'password'
```

Result:

```
{
  "searchResult": "success",
  "status": "done",
  "availableTimeSlot": [
    {
      "start_date": "2024-07-10 09:00:00",

```

Appointment Open - PATCH /api/sn_tmf_api/appointment/appointment/{id}

Reschedule appointments with a given ID for a#work order.

URL format

Default URL: PATCH `/api/sn_tmf_api/appointment/appointment/{id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the appointment to reschedule. Data type: String Table: Appointment booking [sn_apptmnt_booking_appointment_booking]

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
note	If canceling the appointment, you can add work notes here. Updates the work notes of the work order and the message of the appointment. Data type: Array of Objects `"note": [ { "author": "String", "date": "String", "text": "String" } ]` Stored in: Appointment Booking [sn_apptmnt_booking_appointment_booking] table
note.author	Name of the person who writing the note. Data type: String
note.date	Date and time that the note was published. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2018-02-04T11:00:18.071Z.
note.text	Descriptive text about the work order that is attached to the appointment. For example, updates on the work order's progress. Data type: String
status	Status of the appointment. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• cancelled: The appointment reschedule is cancelled. • completed: The rescheduled appointment is completed. • confirmed: The appointment reschedule is accepted and booked. • new: The appointment rescheduling request was recently created. • pending: The appointment reschedule is pending. • ready: The appointment reschedule is requested. Data type: String
validFor	Filter the appointment by a date range that the appointment is valid for. Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }` Default: Returns all appointments if *validFor* is not provided.
validFor.endDateTime	End date and time of the appointment. Only appointments with the specified end date and time are returned in the response. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43. Table: Location [cmn_location]
validFor.startDateTime	Start date and time of the appointment. Only appointments with the specified start date and time are returned in the response. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43. Table: Location [cmn_location]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
creationDate	Date and time that the appointment was created. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
href	Unique reference link of the appointment. You can use this link in another request to get an appointment. Data type: String
id	Sys_id of the appointment that was rescheduled. Data type: String Stored in: Appointment booking [sn_apptmnt_booking_appointment_booking] table
lastUpdate	Date and time the appointment was last updated. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
reason	Purpose for updating the appointment. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• "Appointment rescheduled.": The PATCH method was used to reschedule the appointment. • "The appointment (id) is successfully cancelled.": The PATCH method was used to cancel the appointment. Data type: String
relatedParty	Customer details of the associated appointment. Data type: Array of Objects `"relatedParty": [ { "@referredType": "String", "id": "String", "name": "String", "role": "String" } ]`
relatedParty.id	Sys_id of the customer contact. Data type: String Stored in: Contact [customer_contact] table
relatedParty.name	Name of the customer contact. Data type: String
relatedPlace.@referredType	Type of customer. Data type: String Only possible value: Individual
relatedParty.role	Role of the contact. Data type: String Only possible value: Contact
success	Flag that indicates whether the request was successful. Possible values: • true: The appointment was successfully rescheduled. • false: The appointment couldn't be rescheduled. Data type: Boolean

Example: cURL request

The following example demonstrates how to use a PATCH method to reschedule an appointment with a given ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl -X POST
 'https://instance.service-now.com/api/sn_tmf_api/appointment/ap
pointment/68cc0a5a9314521060320dd548373cbd ' \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-data {
  "validFor": {
      "startDateTime": "2024-07-30 00:0:00",
      "endDateTime": "2024-08-30 00:00:00"
             }
  "note": {
      "date": "85388c25b71011104eed4643ae11a993",
      "author": "Sarah Johnson",
      "text": "customer"
    }
  "state": "active"
   }
  ]
}
```

The response body shows a success message that the appointment was rescheduled.

```
{
  "relatedParty": [
    {
      "id": "85388c25b71011104eed4643ae11a993",
      "name": "Sarah Johnson",
      "role": "customer",
      "@referredType": "Individual"
    }
  ],
  "success": true,
  "reason": "Appointment rescheduled!",

ATF Code Coverage API

The ATF Code Coverage API provides endpoints to compute code coverage from Automated Test Framework (ATF) runs. Coverage can be retrieved by filtered line numbers, for specific script IDs, or for all scripts covered by a set of test suite/test runs.

ATF code coverage is a tool that enables you to determine what percentage of code in a deployment request is covered by ATF test suites.

By default, if ATF test suites cover less than 70% of the code in a deployment request, ReleaseOps transitions the deployment request to the Reconciling state and a test failure task is automatically created. You can adjust the ATF code coverage threshold in the deployment request assessment playbook. For more information, see Set Automated Test Framework (ATF) code coverage.

For information on ATF and Performance Analyzer, see Testing and debugging applications.

For information on deployment analyzer, see Deployment analyzer in ReleaseOps.

ATF Code Coverage - POST /now/atf/code_coverage/all

Aggregates coverage across all scripts covered by the provided ATF runs. Supports combining test suite runs and individual test runs.

URL format

Versioned URL: `/api/now/v1/atf/code_coverage/all`

Default URL: `/api/now/atf/code_coverage/all`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
test_suite_result_ids	Required unless `test_result_ids` are provided. List of test suite result sys_ids. Both `test_result_ids` and `test_suite_result_ids` can be included in the same request. Table: Test Suite Results [sys_atf_test_suite_result] Data type: Array of strings
test_result_ids	Required unless `test_suite_result_ids` are provided. List of test result sys_ids to include. Both `test_result_ids` and `test_suite_result_ids` can be included in the same request. Table: Test Results [sys_atf_test_result] Data type: Array of strings
verbose	Flag that indicates level of detail to provide in the response for each custom test script. Valid values: • true: Include detailed per-item coverage in the response body *`details`* object. • false: The response body *`details`* object will return empty or not at all. Default: false Data type: Boolean
sys_scopes	Filter results to specified application scopes. For example, `["x_my_app", "global"]`. Multiple scopes use OR logic, so any matching scope is included. No filtering occurs if any empty or NULL array is provided. Data type: Array of strings

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
link	Link to the request record. Data type: String
details.<scriptId>	Lists the ATF aggregation coverage percent of each custom test script by script sys_id. Data type: Number
api_request_sys_id	The sys_id of the request. Table: ATF code coverage API requests [sys_atf_code_coverage_request] Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

result	Success or error message.
	
	Error response formats:
	
	• 400 Bad Request
	
	`{ "result": "Validation error: <specific_error_message>" }`
	
	• 500 Internal Server Error
	
	`{ "result": "Internal server error: <error_message>" }`
	
	Possible errors:
	
	• Request body validation - `Request body is required and cannot be empty`
	• Test ID validation - `At least one valid (non-empty) ID must be provided in either test_result_ids or test_suite_result_ids`
	• Type mismatch - `Invalid data type in request parameters`
	
	Data type: String

total	Overall code coverage percentage reflecting the combined ATF code coverage of the scripts listed in the *`details`* property. The value is zero if no custom scripts are associated with the tests provided or no percentage of code coverage has been provided. Possible values: 0-100 Data type: Number
truncation_message	If request data was truncated during persistence, provides details about what scripts have truncated information. Example message: `truncation_message: "Field atf_code_coverage_request.metadata_info truncated from 5000 to 4000 characters (max: 4000). Consider increasing column length to prevent data loss"` Data type: String
was_truncated	Flag that indicates whether request data was truncated during persistence. You can change the default number of characters supported using *`glide.db.truncate_utf8`* system property as described in the Additional information section. Valid values: • true: Request data was truncated during persistence. • false: Request data was not truncated during persistence.

Name	Description
	Data type: Boolean Default number of characters: 4000

Example: cURL request

The following example shows how to retrieve all of the code coverage for a selected test result suite and test result.

```
curl
 "https://instance.service-now.com/api/now/atf/code_coverage/a
ll" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"test_suite_result_ids\":
 [\"5f81c7c4ff943210b88affffffffffc5\"],
  \"test_result_ids\": [\"bb8daec1ff103210b88affffffffff1c\"],
  \"verbose\": true,
  \"sys_scopes\": [\"x_my_app\", \"global\"]
}" \
--user 'username':'password'
```

Output:

```
{
  "result": "success",
  "total": 73,
  "details": {
    "sys_script_include_a1b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6": 85,
    "sys_script_include_b2c3d4e5f6a7b8c9d0e1f2a3b4c5d6e7": 92,
    "sys_ui_script_c3d4e5f6a7b8c9d0e1f2a3b4c5d6e7f8": 45,
    "sys_script_d4e5f6a7b8c9d0e1f2a3b4c5d6e7f8a9": 68,
    "sys_script_include_e5f6a7b8c9d0e1f2a3b4c5d6e7f8a9b0": 100
  },
  "api_request_sys_id": "f6a7b8c9d0e1f2a3b4c5d6e7f8a9b0c1",
  "link":
 "https://instance.service-now.com/sys_atf_code_coverage_request
.do?sys_id=f6a7b8c9d0e1f2a3b4c5d6e7f8a9b0c1"
}
```

ATF Code Coverage - POST /now/atf/code_coverage/by_script_id

Computes coverage for specific script records.

To compute code coverage for all scripts covered by specified ATF runs, use the endpoint `/now/atf/code_coverage/all`.

URL format

Versioned URL: `/api/now/v1/atf/code_coverage/by_script_id`

Default URL: `/api/now/atf/code_coverage/by_script_id`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
details.<scriptId>	Lists the ATF aggregation coverage percent of each custom test script by script sys_id. Data type: Number
api_request_sys_id	The sys_id of the request. Table: ATF code coverage API requests [sys_atf_code_coverage_request] Data type: String

result	Success or error message.
	
	Error response formats:
	• 400 Bad Request
	`{ "result": "Validation error: <specific_error_message>" }`
	• 500 Internal Server Error
	`{ "result": "Internal server error: <error_message>" }`
	
	Possible errors:
	• Request body validation - `Request body is required and cannot be empty`
	• Script array validation results if the *`script_array`* request entries provided are null, empty, or whitespace - `"script_array is required and cannot be empty - script_array must contain at least one valid script identifier"`
	• Test ID validation - `At least one valid (non-empty) ID must be provided in either test_result_ids or test_suite_result_ids`
	• Type mismatch - `Invalid data type in request parameters`
	
	Data type: String

total	Overall code coverage percentage reflecting the combined ATF code coverage of the scripts listed in the *`details`* property. The value is zero if no custom scripts are associated with the tests provided or no percentage of code coverage has been provided. Possible values: 0-100 Data type: Number
truncation_message	If request data was truncated during persistence, provides details about what scripts have truncated information. Example message:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`truncation_message: "Field atf_code_coverage_request.metadata_info truncated from 5000 to 4000 characters (max: 4000). Consider increasing column length to prevent data loss"` Data type: String
was_truncated	Flag that indicates whether request data was truncated during persistence. You can change the default number of characters supported using *glide.db.truncate_utf8* system property as described in the Additional information section. Valid values: • true: Request data was truncated during persistence. • false: Request data was not truncated during persistence. Data type: Boolean Default number of characters: 4000

Additional information

Large request payloads may be truncated when persisted if the request data exceeds database field limits.

The following fields in the ATF code coverage API requests [sys_atf_code_coverage_request] table are subject to truncation:

- test_suite_results - JSON array of test suite result IDs.
- test_results - JSON array of test result IDs.
- metadata_info - JSON object containing filtered lines or a script array.

If the *was_truncated* property is true, details are provided in the *truncation_message* property of the response body. Additionally, the system logs the following message:

```
Field <table_name>.<field_name> truncated from <original_length>
to <truncated_length> characters (max: <max_field_length>).
Consider increasing column length to prevent data loss"
```

The *glide.db.truncate_utf8* system property truncation behavior:

- If *glide.db.truncate_utf8* is true, the information truncates at UTF-8 byte boundaries. This setting is safer for multi-byte characters.
- If *glide.db.truncate_utf8* is false (default), the information truncates at character boundaries. The default boundary is 4000 characters.

Example: cURL request

The following example shows how to retrieve the code coverage for a selected test result suite filtered by a specific test script. When *verbose* is `false` or omitted, the *details* object is empty. Only the overall *total* percentage is returned.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
test_suite_result_ids	Required unless `test_result_ids` are provided. List of test suite result sys_ids. Both `test_result_ids` and `test_suite_result_ids` can be included in the same request. Table: Test Suite Results [sys_atf_test_suite_result] Data type: Array of strings
test_result_ids	Required unless `test_suite_result_ids` are provided. List of test result sys_ids to include. Both `test_result_ids` and `test_suite_result_ids` can be included in the same request. Table: Test Results [sys_atf_test_result] Data type: Array of strings
filtered_lines	Required. Map of metadata sys_ids and corresponding code lines to designate for code coverage (e.g., `{ "<metadata_sys_id>": { "script": [...] } }`). Data type: Object
filtered_lines.<sys_id>	Required, must not be empty. One or more script sys_ids to evaluate for code coverage. Must contain at least one valid (non-empty) script identifier. Null, empty, or whitespace-only entries are filtered out. Table: Metadata Tracing [sys_traced_metadata] Data type: Object

filtered_lines.<sys_id>.script	Required. List of line numbers and strings of ranges of lines numbers. All values provided must be positive integers greater than or equal to 1.
	
	Valid line number formats:
	• Individual lines: [1, 7, 10]
	• Ranges: For example, ["1-7"] expands to [1, 2, 3, 4, 5, 6, 7].
	  ○ The format is start-end, where the value of start is less than or equal to end.
	  ○ The maximum range is 10000 lines.
	• Mixed formats. For example, [1, "3-6", 7] expands to [1, 3, 4, 5, 6, 7].
	
	Example:
	`{ "filtered_lines": {`

Start value (<start>) must be less than or equal to end value (<end>)"` ◦ Line range selection error, such as "-5-10" - `"Invalid range: <range>. Line numbers must be positive (start: <start>)"` ◦ Line range selection error, such as "1-50000" - `"Range too large: <range>. Maximum range size is 10000 lines (requested: <size>)"` • Request body validation - `Request body is required and cannot be empty` • Test ID validation - `At least one valid (non-empty) ID must be provided in either test_result_ids or test_suite_result_ids` • Type mismatch - `Invalid data type in request parameters` Data type: String
total	Overall code coverage percentage reflecting the combined ATF code coverage of the scripts listed in the *`details`* property. The value is zero if no custom scripts are associated with the tests provided or no percentage of code coverage has been provided. Possible values: 0-100 Data type: Number
truncation_message	If request data was truncated during persistence, provides details about what scripts have truncated information.

Name	Description
	Example message: `truncation_message: "Field atf_code_coverage_request.metadata_info truncated from 5000 to 4000 characters (max: 4000). Consider increasing column length to prevent data loss"` Data type: String
was_truncated	Flag that indicates whether request data was truncated during persistence. You can change the default number of characters supported using *glide.db.truncate_utf8* system property as described in the Additional information section. Valid values: • true: Request data was truncated during persistence. • false: Request data was not truncated during persistence. Data type: Boolean Default number of characters: 4000

Additional information

Large request payloads may be truncated when persisted if the request data exceeds database field limits.

The following fields in the ATF code coverage API requests [sys_atf_code_coverage_request] table are subject to truncation:

- test_suite_results - JSON array of test suite result IDs.
- test_results - JSON array of test result IDs.
- metadata_info - JSON object containing filtered lines or a script array.

If the *was_truncated* property is true, details are provided in the *truncation_message* property of the response body. Additionally, the system logs the following message:

```
Field <table_name>.<field_name> truncated from <original_length> to <truncated_length> characters (max: <max_field_length>). Consider increasing column length to prevent data loss"
```

The *glide.db.truncate_utf8* system property truncation behavior:

- If *glide.db.truncate_utf8* is true, the information truncates at UTF-8 byte boundaries. This setting is safer for multi-byte characters.
- If *glide.db.truncate_utf8* is false (default), the information truncates at character boundaries. The default boundary is 4000 characters.

Example: cURL request

The following example shows how to retrieve all code coverage for a selected test result suite and test result.

```
curl
 "https://instance.service-now.com/api/now/atf/code_coverage/by_
line_number" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"test_suite_result_ids\":
 [\"5f81c7c4ff943210b88affffffffffc5\"],
  \"test_result_ids\": [\"bb8daec1ff103210b88affffffffff1c\"],
  \"filtered_lines\": {
    \"sys_script_include_db95cb370a0a0b2b00244880b5cacda7\": {
      \"script\": [1, \"3-6\", 7, \"10-12\"]
    }
  },
  \"verbose\": true,
  \"sys_scopes\": [\"x_my_app\", \"global\"]
}" \
--user 'username':'password'
```

Output:

```
{
  "result": "success",z
  "total": 64,
  "details": {
    "sys_script_include_db95cb370a0a0b2b00244880b5cacda7": 80,

  "was_truncated": false
}
```

Attachment API

The *Attachment* API provides endpoints that allow you to upload and query file attachments.

You can upload or retrieve a single file with each request.

The *Attachment* API respects any system limitations on uploaded files, such as maximum file size and allowed attachment types. You can control these settings using the properties *com.glide.attachment.max_size*, 1024MB by default, and *glide.attachment.extensions*.

Note: The *Attachment* API accepts all Content-Type values (*/*). Specify the file content type when uploading an attachment. The content type is stored with file metadata allowing other tools to correctly identify and parse the file.

The following video provides more information on the *Attachment* API:

Attachment API role requirements

To create attachments, the user record used to authenticate the HTTP request with ServiceNow must have any roles required to create Attachment [sys_attachment] records. It must also have

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

any roles required to read and write records on the target table, such as the itil role to add attachments to incident records.

By default there is no single role allowing a user to add attachments. You can create a role to explicitly allow adding attachments, then assign this role to the user account being used to make the request.

Attachment - DELETE /now/attachment/{sys_id}

Deletes a specified attachment.

URL format

Versioned URL: `/api/now/v1/attachment/{sys_id}`

Default URL: `/api/now/attachment/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
sys_id	Sys_id of the attachment. Data type: String Table: Attachment [sys_attachment]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
204	Indicates the request ran successfully.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/attachment/615ea769c0a
80166001cf5f2367302f5" \
--request DELETE \
--user 'username':'password'
```

```
""
```

Attachment - DELETE /now/attachment/{sys_id}/attributes

Deletes all attributes for an attachment.

Attributes are deleted from the Attachment Attributes [sys_attachment_attribute] table.

URL format

Versioned URL: `/api/now/{api_version}/attachment/{sys_id}/attributes`

Default URL: `/api/now/attachment/{sys_id}/attributes`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
204	No Content. The attributes were successfully deleted and no content was returned in the response body.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

This example deletes all attributes from an attachment.

```
curl
 "https://instance.service-now.com/api/now/attachment/a3af695b0a
0006871b657c200acf62e0/attributes" \
--request DELETE \
--user 'username':'password'
```

Response body.

```
""
```

Attachment - DELETE /now/attachment/{sys_id}/attributes/{attribute_key}

Deletes a specified attribute from an attachment.

Attributes are deleted from the Attachment Attributes [sys_attachment_attribute] table.

URL format

Versioned URL: `/api/now/{api_version}/attachment/{sys_id}/attributes/{attribute_key}`

Default URL: `/api/now/attachment/{sys_id}/attributes/{attribute_key}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the attachment.

204	No Content. The attribute was successfully deleted and no content was returned in the response body.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

This example deletes a specified attribute from an attachment.

```
curl
 "https://instance.service-now.com/api/now/attachment/a3af695b0a
0006871b657c200acf62e0/attributes/example_key" \
--request DELETE \
--user 'username':'password'
```

Response body.

```
""
```

Attachment - GET /now/attachment

Returns the metadata for multiple attachments.

URL format

Versioned URL: `api/now/v1/attachment`

Default URL: `api/now/attachment`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
sysparm_limit	Limit to be applied on pagination.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: Unusually large `sysparm_limit` values can impact system performance. Data type: String Default: 1000
sysparm_offset	Number of records to exclude from the query. Use this parameter to get more records than specified in *`sysparm_limit`* parameter. For example, if *`sysparm_limit`* is set to 500, but there are additional records you want to query, you can specify a *`sysparm_offset`* parameter value of 500 to get the second set of records. Data type: String Default: 0
sysparm_query	Encoded query. Queries for the *`Attachment`* API are relative to the Attachments [sys_attachment] table. For example: *`(sysparm_query=file_name=attachment.doc)`* The encoded query provides support for *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in sysparm_query. For example, `sysparm_query=ORDERBYfile_name^ORDERBYDESCtable_Name` orders the results in ascending order by name first, then in descending order by table name. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
Content-Type	Content type of the response. For metadata requests, this is the content type of the metadata, not the content type of the attachment files.
Link	Links to download the attachments.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
Returned information depends on the selected attachments.	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/attachment?sysparm_lim
it=1" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
