segment.wrap_up_configuration.allowed_codes	Array of objects each representing a wrap-up code the agent is allowed to use. Data type: Array `"allowed_codes": [ { "active": Boolean, "code": "String", "description": "String", "external": Boolean, "sys_id": "String", "translated_code": "String", "translated_description": "String" } ]`
segment.wrap_up_configuration.allowed_codes.active	Flag that indicates whether the wrap-up code is active.

Name	Description
	Valid values: • true: The wrap-up code is active. • false: The wrap-up code isn't active. Data type: Boolean Default: true
segment.wrap_up_configuration.allowed_codes.code	Label of the wrap-up code. Data type: String
segment.wrap_up_configuration.allowed_codes.description	Description of the wrap-up code. Data type: String
segment.wrap_up_configuration.allowed_codes.external	Flag that indicates whether the wrap-up code is from an external system. Valid values: • true: The wrap-up code is from an external system. • false: The wrap-up code is internal. Data type: Boolean
segment.wrap_up_configuration.allowed_codes.sys_id	Sys_id of the wrap-up code. Data type: String Table: Interaction Wrap Up Code [interaction_wrap_up_code]
segment.wrap_up_configuration.allowed_codes.translated_code	A translation of the wrap-up code label. Data type: String
segment.wrap_up_configuration.allowed_codes.translated_description	A translation of the wrap-up code description. Data type: String
segment.wrap_up_configuration.default_code	Object containing the wrap-up code to use as the default. Data type: Object

Name	Description
	Default: false
segment.wrap_up_configuration.use_ai_as_default	Flag that indicates whether AI code is automatically set as the default wrap-up code for this configuration. Valid values: • true: AI code is automatically set as the default wrap-up code. • false: AI code is not automatically set as the default wrap-up code. Data type: Boolean
segment.wrap_up_configuration.use_third_party_ai	Flag that indicates if the AI content source is from a third-party external system. Valid values: • true: AI content source is from a third-party external system. • false: Now Assist is the AI content source. Data type: Boolean
segment_id	Sys_id of the wrap-up segment. Data type: String Table: Interaction Wrap Up Segment [interaction_wrap_up_segment]
success	Flag that indicates whether the API request was successfully processed. Valid values: • true: The API request was successful. • false: The API request failed. Data type: Boolean

Example: cURL request

This example retrieves details for a wrap-up segment based on a specified agent and interaction.

  }
}
```

Wrap Up - POST /now/wrapup/code

Creates or updates wrap-up codes.

Wrap-up codes are created in the Interaction Wrap Up Code [interaction_wrap_up_code] table.

URL format

Versioned URL: `/api/now/{api_version}/wrapup/code`

Default URL: `/api/now/wrapup/code`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
codes	Required. Array of objects each representing a wrap-up code. Data type: Array `"codes": [ { "active": Boolean, "code": "String", "description": "String", "translations": [Array] } ]`
codes.active	Flag that indicates whether the wrap-up code is active. Valid values: • true: The wrap-up code is active. • false: The wrap-up code isn't active. Data type: Boolean Default: true
codes.code	Required. Label of the wrap-up code. Data type: String
codes.description	Description of the wrap-up code. Data type: String
codes.translations	Array of objects each representing a translation of the wrap-up code. Data type: Array `"translations": [ { "code": "Abrechnungsproblem", "description": "Ein code für Abrechnungsprobleme", "language": "de" } ]`
codes.translations.code	A translation of the wrap-up code label (*codes.code*). Required if using the *codes.translations* parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
codes.translations.description	A translation of the wrap-up code description (*codes.description*). Required if using the *codes.translations* parameter and a value was provided for *codes.description*. Data type: String
codes.translations.language	Two-letter code for the language used in the translation. Required if using the *codes.translations* parameter. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
207	Successful. Some wrap-up codes created successfully. Validation errors occurred while creating others.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Object containing information about the API request and the created wrap-up codes. Data type: Object `"result": { "message": "String", "resultMap": {Object}, "success": Boolean }`
result.message	Message that describes the outcome of the API request. Data type: String
result.result_map	Object containing an array of created wrap-up codes. Data type: Object `"result_map": { "created_wrap_up_codes": [Array] }`
result.result_map.created_wrap_up_codes	Array of objects each representing a created wrap-up code. Data type: Array `"created_wrap_up_codes": [`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
result.result_map.created_wrap_up_codes.sys_id	Sys_id of the wrap-up code. Data type: String Table: Interaction Wrap Up Code [interaction_wrap_up_code]
result.result_map.created_wrap_up_codes.translated_code	A translation of the wrap-up code label. Data type: String
result.result_map.created_wrap_up_codes.translated_description	A translation of the wrap-up code description. Data type: String
result.success	Flag that indicates whether the API request was successfully processed. Valid values: • true: The API request was successful. • false: The API request failed. Data type: Boolean

Example: cURL request

This example creates a wrap-up code for billing issues with a translation in German.

```
curl "https://instance.service-now.com/api/now/v1/wrapup/code" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"codes\": [
    {
      \"code\": \"Billing Issue\",
      \"description\": \"A code for billing issues\",
      \"translations\": [
        {
          \"language\": \"de\",
          \"code\": \"Abrechnungsproblem\",
          \"description\": \"Ein code für Abrechnungsprobleme\"
        }
      ]
    }
  ]
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}" \
--user 'username':'password'
```

Response body.

```
{
  "result": {
    "message": "All wrap up codes created successfully.",
    "result_map": {
      "created_wrap_up_codes": [
        {
          "code": "Billing Issue",
          "description": "A code for billing issues",
          "active": true,
          "external": true,
          "sys_id": "49c27b679f201210c89656effa0a1cd7",
          "translated_code": "Abrechnungsproblem",
          "translated_description": "Ein code für
 Abrechnungsprobleme"
        }
      ]
    },
    "success": true
  }
}
```

Wrap Up - POST /now/wrapup/segment/create

Opens a wrap-up segment for an interaction.

Wrap-ups are created in the Interaction Wrap Up Segment [interaction_wrap_up_segment] table. Call this endpoint at the start of the wrap-up period.

This endpoint supports AI-generated wrap-up codes and notes directly in the request payload, and it saves the AI configuration flags on the wrap-up configuration. If *external* is set to `false` and AI codes or notes are enabled on the configuration, a synchronous business rule runs after the segment is created. This endpoint calls the internal CSM (NowAssist) API and automatically fills in the AI fields. No extra action is required from the caller.

URL format

Versioned URL: `/api/now/{api_version}/wrapup/segment/create`

Default URL: `/api/now/wrapup/segment/create`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
agent_sys_id	Required. Sys_id of the agent assigned to the interaction. Data type: String Table: User [sys_user]
ai_wrap_up_code	AI-suggested wrap-up code label. Populated automatically by Now Assist if the value of *use_third_party_ai* is `false` or the field is absent from configuration. See also: • GET /now/wrapup/segment/{segment_id} • PUT /api/now/wrapup/segment/update/ai Table: Interaction Wrap Up Segment [interaction_wrap_up_segment] Data type: String
ai_notes	AI-generated notes. Maximum length: 4000 characters Table: Interaction Wrap Up Segment [interaction_wrap_up_segment] Data type: String

configuration	Object containing the code and duration details for an external wrap-up. Required if *external* is `true`.
	
	Data type: Object
	
	`"configuration": {`
	`"allowed_codes": [Array],`
	`"default_code": "String",`
	`"duration": "String",`
	`"enable_codes": Boolean,`
	`"enable_ai_code": Boolean,`

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Interaction Wrap Up Code [interaction_wrap_up_code] Field: Code
configuration.duration	Maximum allowed wrap-up duration. Must be used with *show_timer*. Data type: String Unit: Seconds Default: Empty string (No time limit).
configuration.enable_codes	Flag that indicates whether the agent must select a wrap-up code. Valid values: • true: Agent must select a wrap-up code. • false: Agent isn't required to select a wrap-up code. Data type: Boolean Default: false
configuration.enable_ai_code	Flag that indicates whether AI code generation is enabled for this configuration. Valid values: • true: AI code generation is enabled for this configuration. • false: AI code generation is not enabled for this configuration. Table: Interaction Wrap Up Configuration [interaction_wrap_up_configuration] Data type: Boolean Default: false
configuration.enable_ai_notes	Flag that indicates whether AI notes generation is enabled for this configuration. Valid values: • true: AI notes generation is enabled for this configuration. • false: AI notes generation is not enabled for this configuration.

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Interaction Wrap Up Configuration [interaction_wrap_up_configuration] Data type: Boolean Default: false
configuration.use_ai_as_default	Flag that indicates whether AI code is automatically set as the default wrap-up code for this configuration. Valid values: • true: AI code is automatically set as the default wrap-up code. • false: AI code is not automatically set as the default wrap-up code. Table: Interaction Wrap Up Configuration [interaction_wrap_up_configuration] Data type: Boolean Default: false
configuration.show_timer	Required when using the duration property. Flag that indicates whether the timer displays. Valid values: • true: Timer displays in the UI. • false: Timer does not display in the UI. Data type: Boolean Default: false
external	Flag that indicates whether the interaction segment is from an external system. Valid values: • true: The interaction segment is from an external system. • false: The interaction segment is internal. Data type: Boolean Default: false
external_segment_id	Identifier representing the interaction segment on the external system. Required if *external* is `true`.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
interaction_sys_id	Required. Sys_id of the interaction. Data type: String Table: Interaction [interaction]
opened_on	The start date and time of the wrap-up period according to the external system. Required if using the *`configuration.duration`* parameter. Data type: String
segmented	Flag that indicates whether the wrap-up is segmented. Valid values: • true: The wrap-up is segmented into multiple parts. • false: The wrap-up is one complete segment. Data type: Boolean Default: false
segment_id	Sys_id of the interaction segment. Required if *`external`* and *`segmented`* are both `true`. **Note:** You must implement the InteractionSegment scripted extension point to create and retrieve segment records in your chosen table or use the OpenFrame implementation to create and retrieve segment records in the Phone Log [sn_openframe_phone_log] table. Data type: String
segment_table	Name of the table containing the interaction segment. Required if *`external`* and *`segmented`* are both `true`. Data type: String
wrap_up_configuration_sys_id	Sys_id of the wrap-up configuration to use. Required if *`external`* is `false`. Data type: String

Name	Description
message	Message that describes the outcome of the API request. Data type: String
segment	Object containing data about the interaction and wrap-up segment. Data type: Object `"segment": { "agent": "String", "external": Boolean, "interaction": "String", "opened_on": "String", "segmented": Boolean, "segment_id": "String", "segment_table": "String", "state": "String", "sys_id": "String", "wrap_up_configuration": {Object} }`
segment.agent	Sys_id of the agent assigned to the interaction segment. Data type: String Table: User [sys_user]
segment.external	Flag that indicates whether the interaction segment is from an external system. Valid values: • true: The interaction segment is from an external system. • false: The interaction segment is internal. Data type: Boolean

Name	Description
	Default: false
segment.interaction	Sys_id of the interaction. Data type: String Table: Interaction [interaction]
segment.opened_on	The start date and time of the wrap-up period according to the external system. Data type: String
segment.segmented	Flag that indicates whether the wrap-up is segmented. Valid values: • true: The wrap-up is segmented into multiple parts. • false: The wrap-up is one complete segment. Data type: Boolean Default: false
segment.segment_id	Sys_id of the interaction segment. Data type: String
segment.segment_table	Name of the table containing the interaction segment. Data type: String
segment.state	State of the interaction segment. Interaction segments that the *`Wrap Up`* API creates successfully are in the open state. Data type: String
segment.sys_id	Sys_id of the wrap-up segment. Data type: String Table: Interaction Wrap Up Segment [interaction_wrap_up_segment]
segment.wrap_up_configuration	Object containing details about the wrap-up

Name	Description

	configuration used for the wrap-up segment.
	
	Data type: Object
	
	`"wrap_up_configuration": {`
	`"allowed_codes": [Array],`
	`"default_code": {Object},`
	`"enable_ai_code": Boolean,`
	`"enable_ai_notes": Boolean,`
	`"enable_codes": Boolean,`
	
	`"use_ai_as_default": Boolean,`
	
	`"use_third_party_ai": Boolean`
	`}`

segment.wrap_up_configuration.allowed_codes	Array of objects each representing a wrap-up code the agent is allowed to use.
	
	Data type: Array
	
	`"allowed_codes": [`
	`{`
	`"active": Boolean,`
	`"code": "String",`
	`"description": "String",`
	`"external": Boolean,`
	`"sys_id": "String",`
	
	`"translated_code": "String",`
	
	`"translated_description": "String"`
	`}`
	`]`

segment.wrap_up_configuration.allowed_codes.active	Flag that indicates whether the wrap-up code is active. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: The wrap-up code is active. • false: The wrap-up code isn't active. Data type: Boolean Default: true
segment.wrap_up_configuration.allowed_codes.code	Label of the wrap-up code. Data type: String
segment.wrap_up_configuration.allowed_codes.description	Description of the wrap-up code. Data type: String
segment.wrap_up_configuration.allowed_codes.external	Flag that indicates whether the wrap-up code is from an external system. Valid values: • true: The wrap-up code is from an external system. • false: The wrap-up code is internal. Data type: Boolean
segment.wrap_up_configuration.allowed_codes.sys_id	Sys_id of the wrap-up code. Data type: String Table: Interaction Wrap Up Code [interaction_wrap_up_code]
segment.wrap_up_configuration.allowed_codes.translated_code	A translation of the wrap-up code label. Data type: String
segment.wrap_up_configuration.allowed_codes.translated_description	A translation of the wrap-up code description. Data type: String

segment.wrap_up_configuration.default_code	Object containing the wrap-up code to use as the default.
	
	Data type: Object
	
	`"default_code": {`
	`  "active": Boolean,`
	`  "code": "String",`

Name	Description
segment.wrap_up_configuration.default_code.translated_code	A translation of the wrap-up code label. Data type: String
segment.wrap_up_configuration.default_code.translated_description	A translation of the wrap-up code description. Data type: String
segment.wrap_up_configuration.enable_ai_code	Flag that indicates whether AI code generation is enabled for this configuration. Valid values: • true: AI code generation is enabled for this configuration. • false: AI code generation is not enabled for this configuration. Data type: Boolean
segment.wrap_up_configuration.enable_ai_notes	Flag that indicates whether AI notes generation is enabled for this configuration. Valid values: • true: AI notes generation is enabled for this configuration. • false: AI notes generation is not enabled for this configuration. Data type: Boolean
segment.wrap_up_configuration.enable_codes	Flag that indicates whether the agent must select a wrap-up code. Valid values: • true: Agent must select a wrap-up code. • false: Agent isn't required to select a wrap-up code. Data type: Boolean Default: false

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
segment.wrap_up_configuration.use_ai_as_default	Flag that indicates whether AI code is automatically set as the default wrap-up code for this configuration. Valid values: • true: AI code is automatically set as the default wrap-up code. • false: AI code is not automatically set as the default wrap-up code. Data type: Boolean
segment.wrap_up_configuration.use_third_party_ai	Flag that indicates if the AI content source is from a third-party external system. Valid values: • true: AI content source is from a third-party external system. • false: Now Assist is the AI content source. Data type: Boolean
success	Flag that indicates whether the API request was successfully processed. Valid values: • true: The API request was successful. • false: The API request failed. Data type: Boolean
sys_id	Sys_id of the wrap-up segment. Data type: String Table: Interaction Wrap Up Segment [interaction_wrap_up_segment]

Example: cURL request

This example opens a wrap-up segment for an interaction.

```
curl --request POST \
  --url
 'https://instance.servicenow.com/api/now/wrapup/segment/create'
 \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --user 'username:password' \
  --data '{
    "agent_sys_id": "12341234567856789ab90abcdefcdef",
    "interaction_sys_id": "21341234567856789ab90abcdefcdef",
    "external": true,
    "external_segment_id": "EXT-SEG-001",
    "ai_wrap_up_code": "Billing Issue",
    "ai_notes": "Customer called about an incorrect charge on
 their invoice.",
    "configuration": {
      "enable_codes": true,
      "enable_ai_code": true,
      "enable_ai_notes": true,
      "use_ai_as_default": true,
      "allowed_codes": [{"code": "Billing Issue"}, {"code":
 "Store Issue"}],
      "default_code": "Billing Issue"
    }
  }'

--user 'username':'password'
```

Response body.

```
{
  "success": true,
  "message": "Wrap-up segment created successfully.",
  "sys_id": "abcd1234abcd1234abcd1234abcd1234",
  "segment": {
    "agent": "12341234567856789ab90abcdefcdef",
    "external": true,
    "interaction": "21341234567856789ab90abcdefcdef",
    "state": "open",
    "sys_id": "abcd1234abcd1234abcd1234abcd1234",
    "wrap_up_configuration": {
      "enable_codes": true,
      "enable_ai_code": true,
      "enable_ai_notes": true,

```

Wrap Up - PUT /now/wrapup/segment/update

Updates and closes a wrap-up segment for an interaction.

URL format

Versioned URL: `/api/now/{api_version}/wrapup/segment/update`

Default URL: `/api/now/wrapup/segment/update`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
agent_sys_id	Sys_id of the agent assigned to the interaction. Required along with *`interaction_sys_id`* if neither *`segment_sys_id`* nor *`external_segment_id`* are provided. Data type: String Table: User [sys_user]
external_segment_id	Identifier representing the interaction segment on the external system. Used to identify the wrap-up segment to update if *`segment_sys_id`* isn't provided.
interaction_sys_id	Sys_id of the interaction. Required along with *`agent_sys_id`* if neither *`segment_sys_id`* nor *`external_segment_id`* are provided. Data type: String Table: Interaction [interaction]
segment_sys_id	Sys_id of the wrap-up segment. Data type: String Table: Interaction Wrap Up Segment [interaction_wrap_up_segment]

Request body parameters (XML or JSON)

Name	Description
confirmed_on	The end date and time of the wrap-up period according to the external system. Data type: String
notes	Additional notes added to the wrap-up by the agent. Data type: String
wrap_up_code	Label of the wrap-up code selected by the agent. If the agent doesn't select a code, the configured default code is used. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
	Table: Interaction Wrap Up Code [interaction_wrap_up_code] Field: Code

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Name	Description
segment.wrap_up_configuration.default_code.translated_code	A translation of the wrap-up code label. Data type: String
segment.wrap_up_configuration.default_code.translated_description	A translation of the wrap-up code description. Data type: String
segment.wrap_up_configuration.enable_codes	Flag that indicates whether the agent must select a wrap-up code. Valid values: • true: Agent must select a wrap-up code. • false: Agent isn't required to select a wrap-up code. Data type: Boolean Default: false
success	Flag that indicates whether the API request was successfully processed. Valid values: • true: The API request was successful. • false: The API request failed. Data type: Boolean
sys_id	Sys_id of the wrap-up segment. Data type: String Table: Interaction Wrap Up Segment [interaction_wrap_up_segment]

Example: cURL request

This example updates and closes a wrap-up segment for an interaction.

```
curl
 "https://instance.service-now.com/api/now/v1/wrapup/segment/upd
ate?segment_sys_id=98769876543254321fed1fedcba0cba0&agent_sys_id
=12341234567856789 0ab90abcdefcdef&interaction_sys_id=21341234567
8567890ab90abcdefcde" \
--request PUT \
--header "Accept:application/json" \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Content-Type:application/json" \
--data "{
  \"wrap_up_code\": \"Billing Issue\",
  \"notes\": \"Customer's credit card expired. Had to switch to
 another one.\",
  \"confirmed_on\": \"2024-09-16 18:52:01\"
}" \
--user 'username':'password'
```

Response body.

```

Wrap Up - PUT /now/wrapup/segment/update/ai

Updates an existing open wrap-up segment with AI-recommended wrap-up codes and notes.

This endpoint is intended for external CCaaS systems that generate AI content independently and push it into the ServiceNow platform after segment creation. The *use_third_party_ai* property must be `true` on the wrap-up configuration.

If the *enable_ai_code* or *enable_ai_notes* is `false` in the configuration, the corresponding AI fields are saved, even if they're included in the request payload. The *ai_code_defined_at* and *ai_notes_defined_at* timestamps are automatically set at the time of storage.

AI wrap-up recommendations

AI wrap-up recommendations can come from two sources:

- Internal (Now Assist): When *use_third_party_ai* is false, a business rule triggers automatically after segment creation to call the CSM API and populate *ai_wrap_up_code* and *ai_notes*.
- External (third-party / CCaaS): When *use_third_party_ai* is true, the external system pushes AI data via the new PUT `/api/now/wrapup/segment/update/ai` endpoint.

Use cases

- Reduce agent handle time by providing wrap-up codes and notes with AI suggestions.
- Enable CCaaS platforms to push AI-generated content into ServiceNow AI Platform after an interaction ends.
- Give supervisors cleaner, more consistent wrap-up data for reporting and analytics.

Endpoint call order for an AI-assisted wrap-up flow

1. POST `/api/now/wrapup/segment/create` — Open a segment or pass *ai_wrap_up_code* / *ai_notes* and AI config flags.
2. PUT `/api/now/wrapup/segment/update/ai` — (External AI only) Push AI recommendations onto the open segment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. PUT `/api/now/wrapup/segment/update` — Agent finalizes and closes the segment.
4. GET `/api/now/wrapup/segment/{segment_id}` — Retrieve segment including stored AI fields.

URL format

Versioned URL: `/api/now/{api_version}/wrapup/segment/update/ai`

Default URL: `/api/now/wrapup/segment/update/ai`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
agent_sys_id	Sys_id of the agent assigned to the interaction. Required with *`interaction_sys_id`* if neither *`segment_sys_id`* nor *`external_segment_id`* are provided. Data type: String Table: User [sys_user]
ai_wrap_up_code	AI-recommended wrap-up code label. Stored only if the *`enable_ai_code`* property is `true` in the configuration.Wrap Up - POST /now/wrapup/segment/create Data type: String
ai_notes	AI-generated notes. . Stored only if enable_ai_notes is true on the configuration.Wrap Up - POST /now/wrapup/segment/create Max length: 4000 characters Data type: String
interaction_sys_id	Sys_id of the interaction. Required with *`agent_sys_id`* if neither *`segment_sys_id`* nor *`external_segment_id`* are provided.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String Table: Interaction [interaction]
segment_sys_id	Sys_id of the wrap-up segment. Data type: String Table: Interaction Wrap Up Segment [interaction_wrap_up_segment]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
message	Message that describes the outcome of the API request. Data type: String

segment	Object containing data about the interaction and wrap-up segment.
	
	Data type: Object
	
	`"segment": {`
	`  "agent": "String",`
	`  "ai_code_defined_at": "String",`
	`  "ai_notes": "String",`
	`  "ai_notes_defined_at": "String",`
	`  "ai_wrap_up_code": "String",`
	`  "interaction": "String",`
	`  "sys_id": "String"`
	`}`

segment.agent	Sys_id of the agent assigned to the interaction. Data type: String Table: User [sys_user]
segment.ai_code_defined_at	Timestamp when AI code was stored. Format: Unix epoch milliseconds (e.g., "1752252703000") Data type: String
segment.ai_notes	AI-generated notes stored on the segment. Data type: String
segment.ai_notes_defined_at	Timestamp when AI notes were stored. Format: Unix epoch milliseconds Data type: String
segment.ai_wrap_up_code	AI-recommended code stored on the segment. Data type: String
segment.interaction	Sys_id of the interaction. Data type: String Table: Interaction [interaction]
segment.sys_id	Sys_id of the wrap-up segment. Data type: String

Name	Description
	Table: Interaction Wrap Up Segment [interaction_wrap_up_segment]
success	Flag that indicates whether the API request was successfully processed. Valid values: • true: The API request was successful. • false: The API request failed. Data type: Boolean

Example: cURL request

This example updates and closes a wrap-up segment for an interaction.

```
curl --request PUT \
  --url
 'https://instance.servicenow.com/api/now/wrapup/segment/upda
te/ai' \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --user 'username:password' \
  --data '{
    "segment_sys_id": "abcd1234abcd1234abcd1234abcd1234",
    "agent_sys_id": "12341234567856789ab90abcdefcdef",
    "interaction_sys_id": "21341234567856789ab90abcdefcdef",
    "ai_wrap_up_code": "Plan Update",
    "ai_notes": "Customer requested an upgrade to the Premium
 plan."
  }' \
--user 'username':'password'
```

Response body.

```
{
  "success": true,
  "message": "AI wrap-up data updated successfully.",
  "segment": {
    "sys_id": "abcd1234abcd1234abcd1234abcd1234",
    "agent": "12341234567856789ab90abcdefcdef",
    "interaction": "21341234567856789ab90abcdefcdef",
    "ai_wrap_up_code": "Plan Update",
    "ai_notes": "Customer requested an upgrade to the Premium
 plan.",
    "ai_code_defined_at": "1752252703000",
    "ai_notes_defined_at": "1752252703000"
  }
}
```

WSD Extra Service API

The Workplace Service Delivery (WSD) *`Extra Service`* API provides endpoints to retrieve extra services, such as location layouts and standard services of a workplace location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

This API runs in the `sn_wsd_rsv` namespace. To access this API the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Extra Service Request - PATCH /api/sn_wsd_rsv/wsd_extra_service_request/reservation/{sys_id}

Returns the extra service requests that are associated to a single reservation.

Note: This endpoint does not work for group or multi reservations.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_extra_service_request/reservation/{sys_id}`

Default URL: `/api/sn_wsd_rsv/wsd_extra_service_request/reservation/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation record for which to return the extra service request details. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Reservation sys_id is missing, invalid, or does not exist.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Details about the specified extra service request.
	
	Data type: Object
	
	`"result": {`
	`  "reservableId": "String",`
	`  "reservationId": "String",`
	`  "serviceCategories": {Object},`
	`  "serviceTimes": {Object}`
	`}`

Name	Description
result.serviceTimes.endPreparation	Date and time when the preparation of the workplace service item will end. Data type: String
result.serviceTimes.startCleanup	Date and time when the clean up of the workplace service item will start. Data type: String
result.serviceTimes.startPreparation	Date and time when the preparation of the workplace service item will start. Data type: String

Example: cURL request

This code example shows how to request the details of the extra services or workplace service items for a reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/wsd_extra_servic
e_request/reservation/383e36c1536f01103cf7ddeeff7b1245" \
--request GET \
--header "Accept:application/json" \
--user "username": "password"
```

Return results:

```
{
  "result": {
    "reservationId": "383e36c1536f01103cf7ddeeff7b1245",

WSD Extra Service Request - PATCH /api/sn_wsd_rsv/wsd_extra_service_request/submit

Adds an new or updates an existing extra service request to a specified single reservation.

Note: This endpoint does not work for group or multi reservations.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_extra_service_request/submit`

Default URL: `/api/sn_wsd_rsv/wsd_extra_service_request/submit`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
reservationDateTimeChanged	Flag that indicates whether the reservation date and time has changed. Valid values: • true: The reservation date and time was changed. • false: The reservation date and time wasn't changed. Data type: Boolean Default: false
reservableId	Required. Sys_id of the workplace location that the reservation is created against. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
reservationId	Required. Sys_id of the reservation for which to add the extra service requests. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
serviceCategories	Required. List of workplace service items or extra services to add to the reservation. Data type: Array of Objects

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	`"serviceCategories": [ { "category": "String", "comment": "String", "flexibleServices": [Array] } ]`
serviceCategories.category	Required. Sys_id or name of the workplace service to add to the reservation. Data type: String Table: Workplace Service [sn_wsd_case_workplace_service]
serviceCategories.comment	Required. Comments about the service category. Data type: String
serviceCategories.flexibleServices	Required. Details about each of the workplace service items or extra service to add to or cancel from the reservation. Data type: Array of Objects `"flexibleServices": [ { "cancelFlag": Boolean, "comment": "String", "deliveryTime": "String", "extraServiceRequestId": "String", "flexibleServiceId": "String", "quantity": Number } ]`
serviceCategories.flexibleServices.cancelFlag	Flag that indicates whether to cancel the specified extra service request. Possible values: • true: Delete the associated extra service request. • false: No operation. Data type: Boolean Default: false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
serviceCategories.flexibleServices.comment	Required. Additional comments about the workplace service item or extra service. Data type: String
serviceCategories.flexibleServices.deliveryTime	Required. Delivery time of the workplace service item or extra service. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
serviceCategories.flexibleServices.extraServiceRequestId	Sys_id of the existing extra service request. Provide this parameter to update an existing extra service request. Data type: String Table: Request Service Items [sn_wsd_case_service_item_request]
serviceCategories.flexibleServices.flexibleServiceId	Required. Sys_id of the extra service or workplace service item. Data type: String Table: Workplace Service Item [sn_wsd_case_workplace_service_item]
serviceCategories.flexibleServices.quantity	Required. Number of extra service items requested. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the request. Data type: Object `"result": { "extraServiceRequests": [Array], "reservableId": "String", "reservationId": "String", "success": Boolean }`
result.extraServiceRequests	Details about the added or cancelled extra service request. Data type: Array of Object `"extraServiceRequests": [ { "flexibleServiceId": "String", "requestId": "String" } ]`
result.extraServiceRequests.flexibleServiceId	Sys_id of the extra service item request that was added to the reservation. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: Workplace Service Item [sn_wsd_case_workplace_service_item]
result.extraServiceRequests.requestId	Sys_id of the extra service item that was added to the request. Data type: String Table: Request Service Items [sn_wsd_case_service_item_request]
result.reservableId	Sys_id of the workplace location that the reservation is created against. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
result.reservationId	Sys_id of the reservation for which the extra service request was added. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.success	Flag that indicates whether the extra service request was successfully added to the reservation. Possible values: • true: Successfully added. • false: Operation failed. Data type: Boolean

Example: cURL request

The following code example shows how to add an extra service item request to a reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/wsd_extra_servic
e_request/submit" \
--request POST \
--header "Accept:application/json" \
--header "Concept-Type:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "reservationId": "2dc2efdf531701103cf7ddeeff7b1227",
    "reservableId": "02000d4edb7650106c731dcd13961914",
    "extraServiceRequests": [
```

```
      {
        "requestId": "bea46dbc53e701103cf7ddeeff7b1236",
        "flexibleServiceId": "e2ecf7b307500110c9b36b6e0ad30033"
      }
],
    "success": true
  }
}
```

WSD Extra Service Request API

The Workplace Service Delivery (WSD) *`Extra Service Request`* API provides endpoints to manage extra service requests for reservations.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Extra Service - GET /sn_wsd_rsv/extra_service/list_loc_layouts

Returns the details about the associated location layouts for a specified workplace location.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/extra_service/list_loc_layouts`

Default URL: `/api/sn_wsd_rsv/extra_service/list_loc_layouts`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
location	Required. Sys_id of the workplace location for which to return the location layout details. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters

Name	Description
None	Required.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	List of the layouts associated with the specified workplace location.
	
	Data type: Array of Objects
	
	`"result": [`
	`  {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"capacity": Number,`
	`"cleanup_duration": "String",`
	`"image": {Object},`
	`"is_default": Boolean,`
	`"max_capacity": Number,`
	`"name": "String",`
	`"preparation_duration": "String",`
	`"short_description": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.capacity	Number of people that will attend the meeting. Data type: Number
result.cleanup_duration	Amount of time it takes to clean the reservable for this layout. Data type: Number Unit: Milliseconds

result.image	Details about an image that represents the layout for the associated reservable.
	
	Data type: Object
	
	`"image": {`
	`"link": "String",`
	`"sys_id": "String"`
	`}`
	
	Table: Images [db_image]

result.image.link	Link to an image that represents the layout for this reservable. Data type: String Table: Images [db_image]
result.image.sys_id	Sys_id of the associated image record. Data type: String
result.is_default	Flag that indicates whether the associated layout is the default for the reservable. Valid values: • true: Default. • false: Not default. Data type: Boolean
result.name	Name of the location layout. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.max_capacity	Maximum number of people that the layout associated with the reservable can accommodate. Data type: Number
result.preparation_duration	Amount of time it takes to prepare the associated location layout. Data type: Number Unit: Milliseconds
result.short_description	Brief description of the location layout. Data type: String
result.sys_id	Sys_id of the location layout. Data type: String Table: Layout [sn_wsd_rsv_layout]

Example: cURL request

The following code example shows how to call this endpoint.

```
"http://instance.servicenow.com/api/sn_wsd_rsv/extra_service/lis
t_loc_layouts&location=d2716d4adb7210106c731dcd13961994" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": [
    {
      "sys_id": "f4fee556534301103cf7ddeeff7b12ed",
      "name": "Test",
      "short_description": "test",
      "is_default": false,
      "image": {
        "sys_id": "9648a7c5531301103cf7ddeeff7b1286",
        "link": "9648a7c5531301103cf7ddeeff7b1286.iix"
      },
      "capacity": null,
      "max_capacity": null,
      "preparation_duration": 172800000,
      "cleanup_duration": 86400000
    }
  ]
}
```

WSD Extra Service - GET /api/sn_wsd_rsv/extra_service/list_loc_standard_services

Returns the details about the associated standard services for a specified workplace location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/extra_service/list_loc_standard_services`

Default URL: `/api/sn_wsd_rsv/extra_service/list_loc_standard_services`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
location	Required. Sys_id of the workplace location for which to return the location layout standard services. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Name	Description
result.standard_services.sys_id	Sys_id of the standard service record. Data type: String Table: Standard Service [sn_wsd_rsv_standard_service]

Example: cURL request

The following code example shows how to call this endpoint to obtain the standard services.

```
"http://instance.servicenow.com/api/sn_wsd_rsv/extra_service/lis
t_loc_standard_services&location=d2716d4adb7210106c731dcd139619
94" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": [
    {
      "sys_id": "9b01458edb7650106c731dcd13961945",
      "name": "Flip chart",
      "short_description": "Flip chart with paper sheets",
      "font_awesome_icon": "fa-calendar-o"
    },
    {
      "sys_id": "abd0c18edb7650106c731dcd13961965",
      "name": "Projector screen",
      "short_description": "Connect laptop to screen (HDMI and
 DVI)",
      "font_awesome_icon": "fa-caret-square-o-right"
    },
    {
      "sys_id": "9841858edb7650106c731dcd1396193c",
      "name": "Whiteboard",
      "short_description": "Whiteboard and markers",
      "font_awesome_icon": "fa-pencil-square-o"
    }
  ]
}
```

WSD Group Reservation API

The Workplace Service Delivery (WSD) *`Group Reservation`* API provides endpoints for managing group reservations.

Group reservations allow you to reserve different locations for various people (groups) for the same meeting.

This API runs in the `sn_wsd_rsv` namespace. To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Group Reservation - GET /api/sn_wsd_rsv/group_reservation/{parent_id}

Returns the parent and all child reservations for a specified group reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/group_reservation/{parent_id}`

Default URL: `/api/sn_wsd_rsv/group_reservation/{parent_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
parent_id	Sys_id of the parent reservation record. When a group reservation is created, one group parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For group parent records, this field is set to "Group parent" to indicate that it is a group parent record. For child records, this field is set to "Single". Within a child record, the sys_id of the associated parent reservation record is in the source_reservation field. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Invalid or no parent reservation sys_id provided.
404	Access denied. Unable to cancel group reservation. User has insufficient rights to cancel the requested group reservation.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Details about the parent and children reservations associated with the group reservation. Data type: Object `{ "result": { "parent": {Object}, "children": [Array] } }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following code example shows how to retrieve the details for a group reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/group_reservati
on/e2245051533b01103cf7ddeeff7b12d6" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "parent": {
      "sys_id": "e2245051533b01103cf7ddeeff7b12d6",

WSD Group Reservation - PATCH /api/sn_wsd_rsv/group_reservation/cancel/{id}

Cancels a specified group reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/group_reservation/cancel/{id}`

Default URL: `/api/sn_wsd_rsv/group_reservation/cancel/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the parent reservation record. When a group reservation is created, one group parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For group parent records, this field is set to "Group parent" to indicate that it is a group parent record. For child records, this field is set to "Single". Within a child record, the sys_id of the associated parent reservation record is in the source_reservation field. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
None	

Request body parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data type: String

Request body parameters (continued)

Name	Description
	Default: "Canceled reservation via Group cancel"

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Invalid or no parent reservation sys_id provided.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Access denied. Unable to cancel group reservation. User has insufficient rights to cancel the requested group reservation.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Results of the group reservation cancel request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	Data type: Object
	`"result": {`
	`  "allChildrenCanceled": Boolean,`
	`  "cancelledParent": Boolean,`
	`  "canceledReservations": [Array],`
	`  "failedChildMeetings": [Array],`
	`  "msg": "String",`
	`  "parent": "String",`
	`  "success": Boolean,`
	`  "user_msg": "String"`
	`}`

result.allChildrenCanceled	Flag that indicates whether all child reservations associated with the group reservation were successfully cancelled. Possible values: • true: Successfully cancelled. • false: Not all child reservations were cancelled. The *failedChildMeetings* parameter contains a list of the sys_ids of the child reservations that were not cancelled. Data type: Boolean
result.cancelledParent	Flag that indicates whether the parent reservation for the group reservation were successfully cancelled. Possible values: • true: Parent reservation was cancelled. • false: Parent reservation was not cancelled. Data type: Boolean
result.canceledReservations	List of sys_ids of the child reservations that were successfully canceled. Data type: Array
result.failedChildMeetings	List of sys_ids of the child reservations that were not canceled. Data type: Array
result.msg	If any reservation failed to cancel, this parameter contains a message about the cause of failure. Data type: String
result.parent	Sys_id of the parent reservation that was cancelled. Data type: String
result.success	Flag that indicates whether the group reservation was successfully cancelled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • true: Group reservation was successfully cancelled. • false: One or more of the associated group reservations were not cancelled. Additional details are provided within the results. Data type: Boolean
result.user_msg	Reserved for future use. If any reservation failed to cancel, this parameter contains a translated message about the cause of failure that you can display in the UI. Data type: String

Example: cURL request

The following code example shows how to cancel a group reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/group_reservati
on/cancel/22c1aee353af01103cf7ddeeff7b12d5" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"cancel_notes\":\"Need to postpone until next quarter\"
}" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "success": true,
    "canceledReservations": [
      "6ec1aee353af01103cf7ddeeff7b12d8",
      "aac1aee353af01103cf7ddeeff7b12db"
    ],
    "failedChildMeetings": [],
    "cancelledParent": true,
    "allChildrenCanceled": true,
    "msg": "",
    "user_msg": "",
    "parent": "22c1aee353af01103cf7ddeeff7b12d5"
  }
}
```

WSD Group Reservation - PATCH /api/sn_wsd_rsv/group_reservation/update/{id}

Updates a specified group reservation.

You can update the following reservation parameters:

- Subject
- Start date and time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- End date and time
- Shift associated with the reservation
- Workplace location of any child reservation

Note: You must specify at least one of these parameters in the request body of the endpoint call. Parameters that are not passed in are not modified in the associated records.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/group_reservation/update/{id}`

Default URL: `/api/sn_wsd_rsv/group_reservation/update/{id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the parent reservation record. When a group reservation is created, one group parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For group parent records, this field is set to "Group parent" to indicate that it is a group parent record. For child records, this field is set to "Single". Within a child record, the sys_id of the associated parent reservation record is in the source_reservation field. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
None	

Request body parameters

Name	Description
children	Updated list of child reservations records to associate with the reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: Array of Objects `"children": [ { "is_private": Boolean, "location": "String", "requested_for": "String" } ]`
children.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
children.location	Updated sys_id of the location to reserve. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
children.requested_for	Updated sys_id of the user for whom the reservation is being requested. Data type: String Table: User [sys_user]
end	Updated end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
requested_for	Sys_id or email address of the user for which the reservation is being made. Data type: String Table: User [sys_user]
reservable_module	Required only for April 2026 store and earlier releases. Not required with May 2026 store and later releases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]
shift	Updated sys_id of the shift to associate with the reservation. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String Table: Shift [sn_wsd_core_shift]
start	Updated start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss) Default: Empty - start time is specified in child reservations
subject	Updated subject of the meeting associated with the reservation. Data type: String Default: Empty
workplace_location	Updated sys_id of the workplace location to associate with the group reservation. Data type: String Default: Empty - locations are specified in child reservations Table: Workplace Location [sn_wsd_core_workplace_location

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results from the multi-reservation creation or update.
	
	Data type: Object
	
	`"result": {`
	`  "parent": "String",`
	`  "success": Boolean,`
	`  "successfulReservations":`
	`  [Array],`
	`  "unSuccessfulReservations":`
	`  [Array]`
	`}`

result.parent	Sys_id of the parent reservation that was updated. Data type: String
result.success	Flag that indicates whether the reservation was successfully created. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Successfully created. • false: Operation failed. Data type: Boolean
result.successfulReservations	List of the reservations that were successfully updated. Data type: Array of Objects `"successfulReservations": [ { "msg": "String", "operation": "String" "sys_id": "String", "user_msg": "String" } ]`
result.successfulReservations.msg	Internal message about the update. Provides technical information about the operation. Data type: String
result.successfulReservations.operation	Type of operation that was performed, such as create or update. If a new reservable is added to the group reservation, such as an added room, this value is returned as `create`, otherwise it is set to `update`. Data type: String
result.successfulReservations.sys_id	Sys_id of the reservation that was created. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.successfulReservations.user_msg	User message about the update. This message may be translated based on the user's language preference and should be the one that appears in the UI. Data type: String
result.unSuccessfulReservations	List of the reservations that were unsuccessfully updated. Data type: Array of Objects `"unSuccessfulReservations": [ { "msg": "String", "operation": "String" "sys_id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"user_msg": "String" }]
result.unSuccessfulReservations.msg	Message about the update error. Data type: String
result.unSuccessfulReservations.operation	Type of operation that was performed, such as create or update. Data type: String
result.unSuccessfulReservations.sys_id	Sys_id of the reservation that was created. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.unSuccessfulReservations.user_msg	Message about the update error. Data type: String

Example: cURL request

The following example shows how to call this endpoint to update a group reservation.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/group_reservati
on/update/b84e218a87586550cfaa99b73cbb35ec" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"reservable_module\": \"5db44502dbb650106c731dcd13961937\",

WSD Multi Reservation API

The Workplace Service Delivery (WSD) *`Multi Reservation`* API provides endpoints for managing reservations with multiple workplace locations.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Multi Reservation - PATCH /api/sn_wsd_rsv/multi_reservation/cancel/{sys_id}

Cancels a specified multi-reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/multi_reservation/cancel/{sys_id}`

Default URL: `/api/sn_wsd_rsv/multi_reservation/cancel/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the multi-reservation to cancel. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
None	

Request body parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Details of the results of the cancel request.
	
	Data type: Object
	
	`"result": {`
	`  "error": "String",`
	`  "parent": "String",`
	`  "success": Boolean,`
	`  "successfulReservations": [Array],`
	`  "unSuccessfulReservations": [Array]`
	`}`

result.error	Message that describes the associated error. Data type: String
result.parent	Sys_id of the parent reservation. A parent may have one or more child reservations associated to it. Data type: String
result.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Reservation wasn't cancelled. Data type: Boolean
result.successfulReservations	Details about the successful cancellation of the multi-reservation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array of Objects `"successfulReservations": [ { "msg": "String", "success": Boolean, "sys_id": "String" } ]`
result.successfulReservations.msg	Cancellation message. Data type: String
result.successfulReservations.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Operation failed. Data type: Boolean
result.successfulReservations.sys_id	Sys_id of the reservation that was cancelled. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.unSuccessfulReservations	Details about the unsuccessful cancellation of the multi-reservation. Data type: Array of Objects `"unSuccessfulReservations": [ { "msg": "String", "success": Boolean, "sys_id": "String" } ]`
result.unSuccessfulReservations.msg	Cancellation message. Data type: String
result.unSuccessfulReservations.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Operation failed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
result.unSuccessfulReservations.sys_id	Sys_id of the reservation that was not cancelled. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Example: cURL request

The following code example shows how to cancel a multi-reservations.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/multi_reservati
on/cancel/1b1fdf5987ab01506342b846dabb35ec" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"cancel_notes\":\"Meeting no longer needed.\"}" \
--user "username":"password’"
```

Return results:

```
{
  "result": {
    "success": true,
    "successfulReservations": [
      {
        "success": true,
        "msg": "Cancelled successfully.",
        "sys_id": "5b1f9f1d87ab01506342b846dabb35a4"
      },
      {
        "success": true,
        "msg": "Cancelled successfully.",
        "sys_id": "931f9f1d87ab01506342b846dabb35a0"
      }
    ],
    "unSuccessfulReservations": [],
    "error": null,
    "parent": "1b1fdf5987ab01506342b846dabb35ec"
  }
}
```

WSD Multi Reservation - PATCH /api/sn_wsd_rsv/multi_reservation/update/{sys_id}

Updates the reservations associated with a multi-reservation where the same reservation (meeting) has multiple workplace locations.

This endpoint can handle four different update scenarios:

1. Update the content of the multi-reservation record, such as the subject, date, or time.
2. Convert the multi-reservation into a single reservation based on the parent (reservation for a single workplace location).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Convert a single reservation (reservation for a single workplace location) into a multi-reservation.
4. Add or remove a workplace location to an existing multi-reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/multi_reservation/update/{sys_id}`

Default URL: `/api/sn_wsd_rsv/multi_reservation/update/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to update. • Single reservation to multi-reservation: Sys_id of the single reservation. Table: Workplace Reservation [sn_wsd_rsv_reservation] • Update content of multi-reservation: Sys_id of the parent reservation record. Table: Workplace Reservation [sn_wsd_rsv_reservation] To get the details of a multi parent reservation from the child record, refer to the sys_id in the source_reservation field of the child record. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
end	Required if the *`shift`* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
requested_for	Sys_id or email address of the user for which the reservation is being made. Data type: String Table: User [sys_user]
reservables	List of details about the reservables associated with the reservation. Data type: Array of Objects `"reservables": [ { "is_private": Boolean, "sys_id": "String" } ]`
reservables.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
reservables.sys_id	Sys_id of the location at which to make the reservations. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
reservable_module	Required only for April 2026 store and earlier releases. Not required with May 2026 store and later releases. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]
shift	Conditional. Sys_id of the shift to associate with the reservation. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String Table: Shift [sn_wsd_core_shift]
start	Required. Requested start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
subject	Subject of the meeting associated with the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results from the multi-reservation creation or update.
	
	Data type: Object
	
	`"result": {`
	`  "parent": "String",`
	`  "success": Boolean,`
	`  "successfulReservations": [Array],`
	`  "unSuccessfulReservations": [Array]`
	`}`

result.parent	Sys_id of the parent reservation. A parent may have one or more child reservations associated to it. Data type: String
result.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean

result.successfulReservations	List of the reservations that were successfully created.
	
	Data type: Array of Objects
	
	`"successfulReservations": [`
	`  {`
	`  "cancelled": Boolean,`
	`  "error": "String",`
	`  "reservable": "String"`
	`  "success": Boolean,`
	`  "sys_id": "String",`
	`  "updated": Boolean`
	`  }`
	`]`

result.successfulReservations.cancelled	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Not cancelled.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
result.successfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.SuccessfulReservations.insert	Flag that indicates whether the reservation was successfully inserted. Such as when a reservation is added. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.successfulReservations.reservable	Sys_id of the workplace for which the reservation was made. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
result.successfulReservations.success	Flag that indicates whether the associated operation was successful. Possible values: • true: Operation was successful. • false: Operation failed. Data type: Boolean
result.successfulReservations.sys_id	Sys_id of the reservation that was created. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.successfulReservations.update	Flag that indicates whether the reservation was successfully updated. Possible values: • true: Successfully updated. • false: Not updated. Data type: Boolean
result.unSuccessfulReservations	List of the reservations that were unsuccessful. Data type: Array of Objects

Name	Description

	"unSuccessfulReservations": [
	{
	"cancelled": Boolean,
	"error": "String",
	"insert": Boolean
	"reservable": "String"
	"success": Boolean,
	"sys_id": "String",
	"updated": Boolean
	}
	]

result.unSuccessfulReservations.cancelled	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Not cancelled. Data type: Boolean
result.unSuccessfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.unSuccessfulReservations.insert	Flag that indicates whether the reservation was successfully inserted. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.reservable	Sys_id of the workplace for which the reservation was trying to be made. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
result.unSuccessfulReservations.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.sys_id	Sys_id of the unsuccessful reservation.

Name	Description
	Always null. Data type: String
result.unSuccessfulReservations.update	Flag that indicates whether the reservation was successfully updated. Possible values: • true: Successfully updated. • false: Not updated. Data type: Boolean

Example: cURL request

The following code example shows how to modify the content of an existing multi-reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/multi_reservati
on/update/02000d4edb7650106c731dcd13961914" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"reservables\":[
        {
            \"sys_id\":\"fe1f744edb7650106c731dcd139619ca\"
        },
        {
            \"sys_id\":\"02000d4edb7650106c731dcd13961914\"
        }
    ],

WSD Multi Reservation - POST /api/sn_wsd_rsv/multi_reservation/add

Creates workplace reservations for the same time at different workplace locations.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/multi_reservation/add`

Default URL: `/api/sn_wsd_rsv/multi_reservation/add`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters

Name	Description
end	Required if the *shift* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
requested_for	Sys_id or email address of the user for which the reservation is being made. Data type: String Table: User [sys_user]
reservables	List of details about the reservables associated with the reservation. Data type: Array of Objects `"reservables": [ { "is_private": Boolean, "sys_id": "String" } ]`
reservables.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
reservables.sys_id	Sys_id of the location at which to make the reservations. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
reservable_module	Required only for April 2026 store and earlier releases. Not required with May 2026 store and later releases. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Data type: String

Request body parameters (continued)

Name	Description
	Table: Reservable Module [sn_wsd_rsv_reservable_module]
shift	Conditional. Sys_id of the shift to associate with the reservation. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String Table: Shift [sn_wsd_core_shift]
start	Required. Requested start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
subject	Required. Subject of the meeting associated with the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results from the multi-reservation creation or update.
	
	Data type: Object
	
	`"result": {`
	`  "parent": "String",`
	`  "success": Boolean,`
	`  "successfulReservations": [Array],`
	`  "unSuccessfulReservations": [Array]`
	`}`

result.parent	Sys_id of the parent reservation. A parent may have one or more child reservations associated to it. Data type: String
result.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean

result.successfulReservations	List of the reservations that were successfully created.
	
	Data type: Array of Objects
	
	`"successfulReservations": [`
	`  {`
	`  "error": "String",`
	`  "inserted": Boolean,`
	`  "reservable": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"success": Boolean, "sys_id": "String" }]
result.successfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.successfulReservations.inserted	Flag that indicates whether the reservation was successfully inserted. Such as when a reservation is added. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.successfulReservations.reservable	Sys_id of the workplace for which the reservation was made. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
result.successfulReservations.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean
result.successfulReservations.sys_id	Sys_id of the reservation that was created. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.unSuccessfulReservations	List of the reservations that were unsuccessfully. Data type: Array of Objects "unSuccessfulReservations": [{ "error": "String", "inserted": Boolean, "reservable": "String" "success": Boolean, "sys_id": "String"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`}` `]`
result.unSuccessfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.unSuccessfulReservations.inserted	Flag that indicates whether the reservation was successfully inserted. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.reservable	Sys_id of the workplace for which the reservation was trying to be made. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
result.unSuccessfulReservations.success	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.sys_id	Sys_id of the unsuccessful reservation. Always null. Data type: String

Example: cURL request

This code example shows how to reserve two different workplaces for the same reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/multi_reservati
on/add" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"reservable_module\": \"c31241cedb7650106c731dcd13961917\",
    \"subject\": \"Test-123\",
    \"reservation_purpose\": \"meeting\",
```

        "error": null,
        "reservable": "d1208d4edb7650106c731dcd1396194a"
      }
    ],
    "unSuccessfulReservations": []
  }
}
```

WSD Presence API

The *`WSD Presence`* API enables users to manage their in-office presence schedule, including weekly routines, one-time exceptions, and collaborator visibility.

This API supports the Workplace Service Delivery (WSD) Concierge experience by enabling employees to communicate their planned office attendance to colleagues. Use this API for the following actions:

- Retrieve a user's complete presence data, including their weekly in-office routine, scheduled exceptions, and optionally collaborators' presence information.
- Manage weekly in-office routines so employees can set a recurring schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create and manage one-time exceptions that override the routine for a specific date.
- View and manage collaborators to enable coordinated in-office planning.

All endpoints accept and return JSON. Call endpoints in any order; each operates independently.

The *`WSD Presence`* API belongs to the sn_wsd_concierge namespace. The WSD Reservation API GET `/user/context` endpoint can return presence schedule data from the *`WSD Presence`* API when the concierge plugin is active.

Requirements

The *`WSD Presence`* API requires:

- The sn_wsd_core.workplace_user role assigned to the user.
- The Workplace Service Delivery Core (com.sn_wsd_core) plugin activated.
- At least one user record must exist in sys_user with the sn_wsd_core.workplace_user role assigned.

WSD Presence - DELETE /api/sn_wsd_concierge/v1/presence/collaborator/{collaborator_id}

Removes a collaborator from the authenticated user's presence visibility list. The collaborator is identified by their sys_id. Use this endpoint when a user no longer wants to track a colleague's office attendance.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/collaborator/{collaborator_id}`

Default URL: `/api/sn_wsd_concierge/presence/collaborator/{collaborator_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
collaborator_id	Sys_id of the collaborator to remove from the user's visibility list. Table: User [sys_user] Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json*, *application/xml*, or *text/xml*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Missing or invalid collaborator_id path parameter.
404	Not Found. The specified collaborator wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Object containing results of the request. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"result": {`
	`  "message": "String"`
	`}`

result.message	Confirmation message indicating the number of collaborators removed. Data type: String

Example: cURL request

This example removes a specific collaborator from the authenticated user's presence visibility list.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/collaborator/usr1a2b3c4d5e6" \
--request DELETE \
--header "Accept: application/json" \
--user "username:password"
```

Response body.

```
{
  "result": {
    "message": "1 collaborator(s) removed"
  }
}
```

WSD Presence - DELETE /api/sn_wsd_concierge/v1/presence/exception/{exception_id}

Deletes a specific presence exception identified by its sys_id. Use this endpoint when a user wants to remove a one-time override and revert to their regular weekly routine for that date.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/exception/{exception_id}`

Default URL: `/api/sn_wsd_concierge/presence/exception/{exception_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
exception_id	Required. Sys_id of the presence exception to delete. Data type: String

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`  "message": "String"`
	`}`

result.message	Confirmation message indicating the exception was deleted. Data type: String

Example: cURL request

This example deletes exception exc1a2b3c4d5e6, reverting that date to the user's regular weekly routine.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/exception/exc1a2b3c4d5e6" \
--request DELETE \
--header "Accept: application/json" \
--user "username:password"
```

Response body.

```
{
  "result": {
    "message": "Exception deleted successfully"
  }
}
```

WSD Presence - GET /api/sn_wsd_concierge/v1/presence/collaborator

Retrieves the list of collaborators for the authenticated user along with each collaborator's presence data, routine and exceptions. Use this endpoint to view the office attendance schedules of colleagues, enabling coordinated in-office planning.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/collaborator`

Default URL: `/api/sn_wsd_concierge/presence/collaborator`

Supported request parameters

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`  "count": Number,`
	`  "collaborators": [Array]`
	`}`

result.count	Total number of collaborators returned. Data type: Number

result.collaborators	List of collaborators with their presence data.
	
	If a collaborator has privacy enabled, *privacy_enabled* is true with null *routine* and empty *exceptions*.
	
	Data type: Array of Objects
	
	`"collaborators": [`
	`  {`
	`  "sys_id": "String",`
	`  "name": "String",`
	`  "privacy_enabled": Boolean,`
	`  "routine": {Object},`
	`  "exceptions": [Array]`
	`  }`
	`]`

result.collaborators.sys_id	Sys_id of the collaborator's user record. Table: User [sys_user] Data type: String
result.collaborators.name	Display name of the collaborator as it appears in their sys_user record. Table: User [sys_user] Data type: String
result.collaborators.privacy_enabled	Boolean. Flag that indicates whether the collaborator has enabled privacy on their presence data. Valid values: • true: The collaborator's routine and exceptions are hidden. *routine* will be `null` and *exceptions* will be an empty array. • false: The collaborator's presence data is visible.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean

result.collaborators.routine	Collaborator's weekly in-office routine. Follows the same authenticated user's *routine* parameter.
	
	Returns `null` if `privacy_enabled` is `true`.
	
	Data type: Object
	
	`"routine": {`
	`"monday": "Boolean",`
	`"tuesday": "Boolean",`
	`"wednesday": "Boolean",`
	`"thursday": "Boolean",`
	`"friday": "Boolean",`
	`"saturday": "Boolean",`
	`"sunday": "Boolean"`
	`}`

result.collaborators.exceptions	Collaborator's one-time presence exceptions. Returns an empty array if `privacy_enabled` is `true`.
	
	Data type: Array of Objects
	
	`"exceptions": [`
	`{`
	`"sys_id": "String",`
	`"date": "String",`
	`"in_office": "Boolean",`
	`"origin": "String",`
	`"location": "String"`
	`}`
	`]`

result.collaborators.exceptions.sys_id	Sys_id of the exception record. Data type: String
result.collaborators.exceptions.date	Date this exception applies to, in yyyy-MM-dd format. This is the date the user's routine is being overridden. Data type: String
result.collaborators.exceptions.in_office	Flag that indicates whether the user will be in the office on this date. This overrides whatever the weekly routine specifies for that day of the week. Valid values: • true: User will be in the office. • false: User won't be in the office Data type: String
result.collaborators.exceptions.origin	Source that created the exception. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
result.collaborators.exceptions.location	Name or identifier of the office location the user will be at on this date. Only relevant when `in_office` is `true`. May be an empty string when the user is remote. Data type: String

Example: cURL request

This example retrieves all collaborators and their presence data for the authenticated user.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/collaborator" \
--request GET \
--header "Accept: application/json" \
--user "username:password"
```

Response body.

```
{
  "result": {
    "count": 2,
    "collaborators": [
      {
        "sys_id": "usr1a2b3c4d5e6", "name": "Jane Smith",
 "privacy_enabled": false,
        "routine": {
          "monday": true, "tuesday": true, "wednesday": false,
          "thursday": true, "friday": false, "saturday": false,
 "sunday": false
        },
        "exceptions": [
          { "sys_id": "exc1a2b3c", "date": "2026-03-10",
 "in_office": true, "origin": "user", "location": "Building B" }
        ]
      },
      { "sys_id": "usr7f8g9h0i1j2", "name": "John Doe",
 "privacy_enabled": true, "routine": null, "exceptions": [] }
    ]
  }
}
```

WSD Presence - GET /api/sn_wsd_concierge/v1/presence/exception

Retrieves presence exceptions for the authenticated user. Exceptions can be filtered by a date range or by a specific exception sys_id. Use this endpoint when you need to view one-time overrides to a user's weekly routine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/exception`

Default URL: `/api/sn_wsd_concierge/presence/exception`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
exception_id	Sys_id of a specific exception to retrieve. When provided, overrides the date range filter and returns only the matching exception. Data type: String
exception_start_date	Start date for filtering exceptions. Format: yyyy-MM-dd Data type: String Default: Today
exception_end_date	End date for filtering exceptions. Format: yyyy-MM-dd Data type: String Default: Today +3 months

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json*, *application/xml*, or *text/xml*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Invalid date format for exception_start_date or exception_end_date.
404	Not Found. The specified exception wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`  "exceptions": [Array]`
	`}`

result.exceptions	List of presence exceptions matching the filter criteria.
	
	Data type: Array of Objects
	
	`"exceptions": [`
	`{`
	`  "sys_id": "sys_id",`
	`  "date": "String",`
	`  "in_office": String,`
	`  "origin": "String",`
	`  "location": "String"`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`}` `]`
result.exceptions.date	Date this exception applies to, in yyyy-MM-dd format. This is the date the user's routine is being overridden. Data type: String
result.exceptions.in_office	Flag that indicates whether the user will be in the office on this date. This overrides whatever the weekly routine specifies for that day of the week. Valid values: • true: User will be in the office. • false: User won't be in the office Data type: String
result.exceptions.location	The name or identifier of the office location the user will be at on this date. Only relevant when `in_office` is `true`. May be an empty string when the user is remote. Data type: String
result.exceptions.origin	Source that created the exception. Valid values: • `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
result.exceptions.sys_id	Sys_id of the exception record. Data type: String

Example: cURL request

This example retrieves all exceptions for the first half of 2026.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/exception?exception_start_date=2026-01-01&exception_end_da
te=2026-06-30" \
--request GET \
--header "Accept: application/json" \
--user "username:password"
```

Response body.

```
{
  "result": {
    "exceptions": [
```

```
      { "sys_id": "exc1a2b3c4d5e6", "date": "2026-02-14",
 "in_office": true, "origin": "user", "location": "Building
 A" },
      { "sys_id": "exc7f8g9h0i1j2", "date": "2026-03-17",
 "in_office": false, "origin": "system", "location": "" }
    ]
  }
}
```

WSD Presence - GET /api/sn_wsd_concierge/v1/presence

Retrieves the authenticated user's complete presence data, including their weekly in-office routine, scheduled presence exceptions, and optionally their collaborators' presence information.

Use this endpoint to get a holistic view of a user's planned office attendance. You can also query another user's presence data by providing their sys_id, subject to privacy settings.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence`

Default URL: `/api/sn_wsd_concierge/presence`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
user_id	Sys_id of the target user whose presence data to retrieve. If not provided, returns presence data for the authenticated user. **Note:** Cross-user queries return 401 Unauthorized unless the caller has explicit permission. Table: User [sys_user] Data type: String
exception_start_date	Start date for filtering presence exceptions. Format: yyyy-MM-dd Data type: String Default: Today
exception_end_date	End date for filtering presence exceptions.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Format: yyyy-MM-dd Data type: String Default: Today + 3 months
include	Comma-separated list of related data to include in the response. Valid values: collaborators Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json*, *application/xml*, or *text/xml*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. Invalid date format for exception_start_date or exception_end_date, or invalid user_id format.
401	Unauthorized. The authenticated user doesn't have permission to view the target user's presence data. Returned when user_id is provided and doesn't match the authenticated user.
404	Not Found. The specified user wasn't found.
500	Internal Server Error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the response.
	`"result": {`
	`  "routine": {Object},`
	`  "exceptions": [Array],`
	`  "collaborators": [Array]`
	`}`

result.routine	Weekly in-office routine for the user. Contains a Boolean flag for each day of the week indicating planned office attendance. Displays `true` when user plans to be in-office attendance for that day, and `false` when attendance isn't planned.
	
	Data type: Object
	`"routine": {`
	`  "monday": "Boolean",`
	`  "tuesday": "Boolean",`
	`  "wednesday": "Boolean",`
	`  "thursday": "Boolean",`
	`  "friday": "Boolean",`
	`  "saturday": "Boolean",`
	`  "sunday": "Boolean"`
	`}`

result.exceptions	List of one-time presence exceptions that override the user's routine for specific dates.
	
	Data type: Array of Objects
	`"exceptions": [`
	`  {`
	`  "sys_id": "String",`
	`  "date": "String",`
	`  "in_office": "Boolean",`
	`  "origin": "String",`
	`  "location": "String"`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`}` `]`
result.exceptions.sys_id	Sys_id of the exception record. Data type: String
result.exceptions.date	Date this exception applies to, in yyyy-MM-dd format. This is the date the user's routine is being overridden. Data type: String
result.exceptions.in_office	Flag that indicates whether the user will be in the office on this date. This overrides whatever the weekly routine specifies for that day of the week. Valid values: • true: User will be in the office. • false: User won't be in the office Data type: String
result.exceptions.origin	Source that created the exception. Valid values: • `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
result.exceptions.location	The name or identifier of the office location the user will be at on this date. Only relevant when `in_office` is `true`. May be an empty string when the user is remote. Data type: String

result.collaborators	List of collaborators and their presence data. Only returned when `include=collaborators` is specified.
	
	If a collaborator has privacy enabled, *`privacy_enabled`* is true with null *`routine`* and empty *`exceptions`*.
	
	Data type: Array of Objects
	`"collaborators": [`
	`{`
	`"sys_id": "String",`
	`"name": "String",`
	`"privacy_enabled": Boolean,`
	`"routine": {Object},`
	`"exceptions": [Array]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`}` `]`
result.collaborators.sys_id	Sys_id of the collaborator's user record. Table: User [sys_user] Data type: String
result.collaborators.name	The display name of the collaborator as it appears in their sys_user record. Table: User [sys_user] Data type: String
result.collaborators.privacy_enabled	Boolean. Flag that indicates whether the collaborator has enabled privacy on their presence data. Valid values: • true: The collaborator's routine and exceptions are hidden. *routine* will be `null` and *exceptions* will be an empty array. • false: The collaborator's presence data is visible. Data type: Boolean

result.collaborators.routine	The collaborator's weekly in-office routine. Follows the same authenticated user's *routine* parameter.
	
	Returns `null` if `privacy_enabled` is `true`.
	
	Data type: Object
	`"routine": {`
	`"monday": "Boolean",`
	`"tuesday": "Boolean",`
	`"wednesday": "Boolean",`
	`"thursday": "Boolean",`
	`"friday": "Boolean",`
	`"saturday": "Boolean",`
	`"sunday": "Boolean"`
	`}`

result.collaborators.exceptions	The collaborator's one-time presence exceptions. Follows the same structure as the authenticated user's *exceptions* parameter. Returns an empty array if `privacy_enabled` is `true`.
	
	Data type: Array of Objects
	`"exceptions": [`
	`{`
	`"sys_id": "String",`
	`"date": "String",`
	`"in_office": "Boolean",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`"origin": "String", "location": "String" } ]`

Example: cURL request

This example retrieves the authenticated user's full presence data, including collaborator schedules, for exceptions in Q1 2026.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence?include=collaborators&exception_start_date=2026-01-01&exce
ption_end_date=2026-03-31" \
--request GET \
--header "Accept: application/json" \
--user "username:password"
```

Response body.

```
{
  "result": {
    "routine": {
      "monday": true,  "tuesday": false, "wednesday": true,
      "thursday": true, "friday": false, "saturday": false,
 "sunday": false
    },
    "exceptions": [
      {
        "sys_id": "a1b2c3d4e5f6",
        "date": "2026-02-14",
        "in_office": true,
        "origin": "user",
        "location": "Building A"
      }
    ],
    "collaborators": [
      {
        "sys_id": "f6e5d4c3b2a1",
        "name": "Jane Smith",
        "privacy_enabled": false,
        "routine": {
          "monday": true, "tuesday": true, "wednesday": false,
          "thursday": true, "friday": false, "saturday": false,
 "sunday": false
        },
        "exceptions": []
      }
    ]
  }
}
```

WSD Presence - GET /api/sn_wsd_concierge/v1/presence/routine

Retrieves only the authenticated user's weekly in-office routine. This is a lightweight alternative to GET /presence when you only need the routine schedule without exceptions or collaborators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/routine`

Default URL: `/api/sn_wsd_concierge/presence/routine`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`*, *`application/xml`*, or *`text/xml`*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Not Found. The user or routine wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`  "user_id": "String",`
	`  "routine": {Object}`
	`}`

result.user_id	Sys_id of the user whose routine is returned. Table: User [sys_id] Data type: String

result.routine	User's recurring weekly in-office schedule. Each field is a Boolean which represents a day of the week and indicates whether the user is scheduled to be in-office on that day.
	
	A value of `true` indicates in-office attendance, and `false` indicates no attendance.
	
	Data type: Object
	
	`"routine": {`
	`  "monday": Boolean,`
	`  "tuesday": Boolean,`
	`  "wednesday": Boolean,`
	`  "thursday": Boolean,`
	`  "friday": Boolean,`
	`  "saturday": Boolean,`
	`  "sunday": Boolean`
	`}`

Example: cURL request

This example retrieves the weekly in-office routine for the authenticated user.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/routine" \
--request GET \
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept: application/json" \
--user "username:password"
```

Response body. Shows that the user's routine shows in-office attendance for Monday through Thursday.

```
{
  "result": {
    "user_id": "a1b2c3d4e5f6g7h8",
    "routine": {
      "monday": true,  "tuesday": true,  "wednesday": true,
      "thursday": true, "friday": false, "saturday": false,
 "sunday": false
    }
  }
}
```

WSD Presence - PATCH /api/sn_wsd_concierge/v1/presence/routine

Partially updates the authenticated user's weekly in-office routine. Use this endpoint when a user needs to adjust specific days without resetting the entire schedule.

Only the days provided in the request body are updated. All other days remain unchanged.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/routine`

Default URL: `/api/sn_wsd_concierge/presence/routine`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
routine	Required. The authenticated user's weekly routine, where each day is represented by a Boolean where a value of `true` indicates the user plans to be in-office for that day, and `false` indicates attendance isn't planned. Days omitted in the request remain unchanged. An empty routine object is accepted as a no-op.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`"message": "String",`
	`"result": {Object}`
	`}`

result.message	Confirmation message indicating the routine was updated. Data type: String

result.result	Contains the complete updated routine object with all seven days including unchanged days.
	
	Data type: Object
	
	`"result": {`
	`"routine": {Object}`
	`}`

result.routine	Weekly in-office routine. Contains a Boolean flag for each day of the week where `true` indicates in-office attendance, and `false` indicates no attendance.
	
	Data type: Object
	
	`"routine": {`
	`"monday": "Boolean",`
	`"tuesday": "Boolean",`
	`"wednesday": "Boolean",`
	`"thursday": "Boolean",`
	`"friday": "Boolean",`
	`"saturday": "Boolean",`
	`"sunday": "Boolean"`
	`}`

Example: cURL request

This example updates only Friday and Saturday to true, leaving all other days unchanged.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/routine" \
--request PATCH \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{
  "routine": { "friday": true, "saturday": true }
}'
```

Response body.

```
{
  "result": {
    "message": "Routine updated successfully",
    "result": {
      "routine": {
        "monday": true, "tuesday": true, "wednesday": true,
        "thursday": true, "friday": true, "saturday": true,
 "sunday": false
      }
    }
  }
}
```

WSD Presence - POST /api/sn_wsd_concierge/v1/presence/collaborator

Adds one or more collaborators to the authenticated user's presence visibility list. Collaborators can then view each other's presence data. Use this endpoint to build a team or group of colleagues whose office attendance you want to track.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/collaborator`

Default URL: `/api/sn_wsd_concierge/presence/collaborator`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
collaborator_ids	Required. Non-empty array of sys_id values identifying users to add as collaborators. Table: User [sys_user] Data type: Array of Strings `"collaborator_ids": ["String", "String"]`

© 2026 ServiceNow, Inc. All rights reserved.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json*, *application/xml*, or *text/xml*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.
Content-Type	Data format of the request body: application/json.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Missing collaborator_ids, empty array, or invalid sys_id format.
404	Not Found. One or more collaborator sys_ids weren't found in the sys_user table.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`result": {`
	`  "message": "String",`
	`  "collaborators": [Array]`
	`}`

Name	Description
result.message	Confirmation message indicating collaborator(s) were added. Data type: String
result.collaborators	List of the newly added collaborators with their presence data. Data type: Array `"collaborators": [ { "sys_id": "String", "name": "String", "privacy_enabled": Boolean, "routine": {Object}, "exceptions": [Array] } ]`
result.collaborators.sys_id	Sys_id of the collaborator's user record. Table: User [sys_user] Data type: String
result.collaborators.name	The display name of the collaborator as it appears in their sys_user record. Table: User [sys_user] Data type: String
result.collaborators.privacy_enabled	Boolean. Flag that indicates whether the collaborator has enabled privacy on their presence data. Valid values: • true: The collaborator's routine and exceptions are hidden. *routine* will be `null` and *exceptions* will be an empty array. • false: The collaborator's presence data is visible. Data type: Boolean
result.collaborators.routine	The collaborator's weekly in-office routine. Follows the same authenticated user's *routine* parameter. Returns `null` if `privacy_enabled` is `true`. Data type: Object `"routine": { "monday": "Boolean", "tuesday": "Boolean", "wednesday": "Boolean", "thursday": "Boolean", "friday": "Boolean",`

Name	Description

	`"saturday": "Boolean",`
	`"sunday": "Boolean"`
	`}`

result.collaborators.exceptions	The collaborator's one-time presence exceptions. Returns an empty array if `privacy_enabled` is `true`.
	
	Data type: Array of Objects
	
	`"exceptions": [`
	`{`
	`"sys_id": "String",`
	`"date": "String",`
	`"in_office": "Boolean",`
	`"origin": "String",`
	`"location": "String"`
	`}`
	`]`

result.collaborators.exceptions.sys_id	Sys_id of the exception record. Data type: String
result.collaborators.exceptions.date	Date this exception applies to, in yyyy-MM-dd format. This is the date the user's routine is being overridden. Data type: String
result.collaborators.exceptions.in_office	Flag that indicates whether the user will be in the office on this date. This overrides whatever the weekly routine specifies for that day of the week. Valid values: • true: User will be in the office. • false: User won't be in the office Data type: String
result.collaborators.exceptions.origin	Source that created the exception. Valid values: • `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
result.collaborators.exceptions.location	The name or identifier of the office location the user will be at on this date. Only relevant when `in_office` is `true`. May be an empty string when the user is remote.

Name	Description
	Data type: String

Example: cURL request

This example adds two users as collaborators by providing their sys_ids.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/collaborator" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{
  "collaborator_ids": ["usr1a2b3c4d5e6", "usr7f8g9h0i1j2"]
}'
```

Response body.

```
{
  "result": {
    "message": "Collaborator(s) added successfully",
    "collaborators": [
      {
        "sys_id": "usr1a2b3c4d5e6", "name": "Jane Smith",
 "privacy_enabled": false,
        "routine": { "monday": true, "tuesday": true,
 "wednesday": false, "thursday": true, "friday": false,
 "saturday": false, "sunday": false },
        "exceptions": []
      },
      { "sys_id": "usr7f8g9h0i1j2", "name": "John Doe",
 "privacy_enabled": true, "routine": null, "exceptions": [] }
    ]
  }
}
```

WSD Presence - POST /api/sn_wsd_concierge/v1/presence/exception

Creates a one-time presence exception for the authenticated user on a specific date. Use this endpoint when a user plans to be in the office on a day they normally work remotely, or vice versa.

Exceptions override the user's weekly routine for that date.

URL format

Versioned URL: `/api/sn_wsd_concierge/[api_version}/presence/exception`

Default URL: `/api/sn_wsd_concierge/presence/exception`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

exception	Required. Exception object defining the one-time presence override.
	
	Data type: Object
	
	`"exception": {`
	`  "date": "String",`
	`  "in_office": "Boolean",`
	`  "location": "String",`
	`  "origin": "String".`
	`  "sys_id": "String"`
	`}`

exception.date	Date of the exception. Format: yyyy-MM-dd. Data type: String
exception.in_office	Flag that indicates whether the user will be in the office on this date. Possible values: • `true`: User will be in the office. • `false`: User won't be in the office. Data type: Boolean
exception.location	Name or identifier of the office location for this exception. Data type: String
exception.origin	Source of the exception. Valid values:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
exception.sys_id	Sys_id of the existing exception to update. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`*, *`application/xml`*, or *`text/xml`*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.
Content-Type	Data format of the request body: application/json.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Missing required field date or invalid date format.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the result of the POST request.
	
	Data type: Object
	
	`"result": {`
	`  "message": "String",`
	`  "result": {Object}`
	`  }`

result.message	Confirmation message indicating the exception was added. Data type: String

result.result	Contains the created exception(s).
	
	Data type: Object
	
	`"result": {`
	`  "exceptions": [`
	`  {`
	`  "sys_id": "String",`
	`  "date": "String",`
	`  "in_office": Boolean,`
	`  "origin": "String",`
	`  "location": "String"`
	`  }`
	`  ]`
	`  }`

result.result.exceptions.date	Date this exception applies to, in yyyy-MM-dd format. This is the date the user's routine is being overridden. Data type: String
result.result.exceptions.in_office	Flag that indicates whether the user will be in the office on this date. This overrides whatever the weekly routine specifies for that day of the week. Valid values: • true: User will be in the office. • false: User won't be in the office Data type: String
result.result.exceptions.location	The name or identifier of the office location the user will be at on this date. Only relevant when `in_office` is `true`. May be an empty string when the user is remote. Data type: String
result.result.exceptions.origin	Source that created the exception. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
result.result.exceptions.sys_id	Sys_id of the exception record. Data type: String

Example: cURL request

This example creates a presence exception for February 14, 2026, marking the user as in-office at Building A.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/exception" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{
  "exception": {
    "date": "2026-02-14",
    "in_office": true,
    "location": "Building A - Floor 3",
    "origin": "user"
  }
}'
```

Response body.

```
{
  "result": {
    "message": "Exception added successfully",
    "result": {
      "exceptions": [
        {
          "sys_id": "a1b2c3d4e5f6g7h8",
          "date": "2026-02-14",
          "in_office": true,
          "origin": "user",
          "location": "Building A - Floor 3"
        }
      ]
    }
  }
}
```

WSD Presence - POST /api/sn_wsd_concierge/v1/presence/routine

Creates a new weekly in-office routine for the authenticated user. Use this endpoint when a user is setting up their presence routine for the first time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All seven days of the week must be provided as Boolean values.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/routine`

Default URL: `/api/sn_wsd_concierge/presence/routine`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

routine	Required. Weekly in-office routine for the user represented by Boolean values. A value of `true` indicates the user plans to be in-office for that day, and `false` indicates attendance isn't planned.
	
	All days are required.
	
	Data type: Object
	
	`"routine": {`
	`"monday": "Boolean",`
	`"tuesday": "Boolean",`
	`"wednesday": "Boolean",`
	`"thursday": "Boolean",`
	`"friday": "Boolean",`
	`"saturday": "Boolean",`
	`"sunday": "Boolean"`
	`}`

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json*, *application/xml*, or *text/xml*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.
Content-Type	Data format of the request body: application/json.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Missing required field(s) or invalid data type. All seven days must be provided as Boolean values.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`"message": "String",`
	`"result": {Object}`
	`}`

result.message	Confirmation message indicating the routine was created. Data type: String
result.result	Contains the created routine object with all seven days. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"result": {`
	`  "routine": {Object}`
	`}`

result.routine	Weekly in-office routine. Contains a Boolean flag for each day of the week where `true` indicates in-office attendance, and `false` indicates no attendance.
	
	Data type: Object
	
	`"routine": {`
	`  "monday": "Boolean",`
	`  "tuesday": "Boolean",`
	`  "wednesday": "Boolean",`
	`  "thursday": "Boolean",`
	`  "friday": "Boolean",`
	`  "saturday": "Boolean",`
	`  "sunday": "Boolean"`
	`}`

Example: cURL request

This example creates a weekly in-office routine for Monday through Thursday.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/routine" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{
  "routine": {
    "monday": true, "tuesday": true, "wednesday": true,
    "thursday": true, "friday": false, "saturday": false,
 "sunday": false
  }
}'
```

Response body.

```
{
  "result": {
    "message": "Routine created successfully",
    "result": {
      "routine": {
        "monday": true,
        "tuesday": true,
        "wednesday": true,
        "thursday": true,
        "friday": false,
        "saturday": false,
        "sunday": false
      }
    }
```

```
    }
}
```

WSD Presence - PUT /api/sn_wsd_concierge/v1/presence/exception

Updates an existing presence exception by canceling it and creating a replacement. The original exception is identified by its sys_id. Use this endpoint when a user needs to change the details of a previously created exception.

URL format

Versioned URL: `/api/sn_wsd_concierge/{api_version}/presence/exception`

Default URL: `/api/sn_wsd_concierge/presence/exception`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

exception	Required. Exception object containing the updated details. The sys_id and in_office fields are required.
	
	Data type: Object
	
	`"exception": {`
	`  "date": "String",`
	`  "in_office": "Boolean",`
	`  "location": "String",`
	`  "origin": "String",`
	`  "sys_id": "String"`
	`}`

exception.date	Date of the exception. Format: yyyy-MM-dd. Data type: String
exception.in_office	Required. Flag that indicates whether the user will be in the office on this date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Possible values: • `true`: User will be in the office. • `false`: User won't be in the office. Data type: Boolean
exception.location	Name or identifier of the office location for this exception. Data type: String
exception.origin	Source of the exception. Valid values: • `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String Default: user
exception.sys_id	Required. Sys_id of the existing exception to update. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`*, *`application/xml`*, or *`text/xml`*.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.
Content-Type	Data format of the request body: application/json.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Missing required fields sys_id or in_office.
404	Not Found. The specified exception wasn't found or the user doesn't have permission to modify it.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`  "message": "String",`
	`  "result": {Object}`
	`}`

result.message	Confirmation message indicating the exception was updated. Data type: String

result.result	Contains the updated exception(s).
	
	Data type: Object
	
	`"result": {`
	`  "exceptions": [Array]`
	`}`

result.result.exceptions	List of presence exceptions.
	
	Data type: Array of Objects
	
	`"exceptions": [`
	`  {`
	`  "sys_id": "sys_id",`
	`  "date": "String",`
	`  "in_office": String,`
	`  "origin": "String",`
	`  "location": "String"`
	`  }`
	`]`

Name	Description
result.result.exceptions.sys_id	Sys_id of the exception record. Data type: String
result.exceptions.date	Date this exception applies to, in yyyy-MM-dd format. This is the date the user's routine is being overridden. Data type: String
result.exceptions.in_office	Flag that indicates whether the user will be in the office on this date. This overrides whatever the weekly routine specifies for that day of the week. Valid values: • true: User will be in the office. • false: User won't be in the office Data type: String
result.exceptions.origin	Source that created the exception. Valid values: • `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
result.exceptions.location	The name or identifier of the office location the user will be at on this date. Only relevant when `in_office` is `true`. May be an empty string when the user is remote. Data type: String

Example: cURL request

This example updates an existing exception to change the user's status to remote (not in office) on the same date.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_concierge/v1/pre
sence/exception" \
--request PUT \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{
  "exception": {
    "sys_id": "exc1a2b3c4d5e6",

```
  }
}'
```

Response body.

```
{
  "result": {
    "message": "Exception updated successfully",
    "result": {
      "exceptions": [
        { "sys_id": "exc9k0l1m2n3o4", "date": "2026-02-14",
 "in_office": false, "origin": "user", "location": "" }
      ]
    }
  }
}
```

WSD Recurring Reservation API

The Workplace Service Delivery (WSD) *`Recurring Reservation`* API provides endpoints for managing reservations that occur at the same time, but have different dates.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Recurring Reservation - GET /api/sn_wsd_rsv/recurring_reservation/list/{parent_id}

Returns the specified recurring reservation.

If more than six recurring meeting occurrences are available for the reservation, you can paginate through the occurrences using the query parameters. You can also specify occurrence records not to return.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/recurring_reservation/list/{parent_id}`

Default URL: `/api/sn_wsd_rsv/recurring_reservation/list/{parent_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
parent_id	Sys_id of the recurring parent reservation record. When a recurring reservation is created, one recurring parent record and one or more child reservation records are created. Reservation records contain a field called reservation_subtype, that indicates the type of reservation record. For recurring parent records, this field is set to "Recurring parent". For child records, this field is set to "Occurrence". Within a child record, the sys_id of the associated recurring parent record is in the source_reservation field. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
end_index	When paginating through a recurring record set, the zero-based record number at which to stop returning occurrence records. **Note:** If the number of recurring occurrences is less than six the endpoint returns all of the occurrences, otherwise it returns the first six occurrences. To retrieve the occurrences beyond six, you must pass the end_index parameter accordingly. Data type: Number
occurrence_sys_id	Sys_id of an occurrence record in the recurring series not to return. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
start_index	When paginating through a recurring record set, the zero-based record number at which to start returning occurrence records. Data type: Number Default: 0

Request body parameters

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results for the requested recurring reservation.
	
	Data type: Object
	
	`"result": {`
	`  "occurencesTotalCount": "String",`
	`  "reservation": {Object}`
	`}`

result.occurencesTotalCount	Total number of meeting occurrences in the recurring series.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.attendees.name	Attendee's name. Data type: String
result.reservation.attendees.sys_id	Sys_id of the attendee record. Data type: String
result.reservation.attendees.table	Table in which the attendee record exists. Data type: String
result.reservation.attendees.user_name	Attendee's user name. Data type: String
result.reservation.attendees.value	Internal value of the attendee. Data type: String

result.reservation.check_in_state	Details about the check-in state of the reservation.
	
	Data type: Object
	
	`"check_in_state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.check_in_state.display_value	Display value for the current check-in state of the reservation, such as In progress or complete. Data type: String
result.reservation.check_in_state.value	Internal value for the current check-in state of the reservation, such as 2. Data type: String

result.reservation.edit_restriction	Description of the user edit restrictions for the reservation, such as no_restrictions, service_only, or fully_restricted.
	
	Data type: Object
	
	`"edit_restriction": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.edit_restriction.display_value	Display value for the edit restrictions for the reservation, such as No `restriction`. Data type: String

Name	Description
result.reservation.edit_restriction.value	Internal value for the edit restrictions for the reservation, such as `no_restriction`. Data type: String
result.reservation.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.external_ical	Unique external iCalendar identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.is_parent	Flag that indicates whether this reservation is a parent reservation. Possible values: • true: Parent reservation. • false: Not a parent reservation. Data type: Boolean
result.reservation.last_updated_sub_source	Details about the last updated sub-source for the reservation. Sub-sources are used when integrating reservations with an external calendar. This object contains information such as "servicenow_workplace_service_delivery", "google_calendar", or "microsoft_exchange". Data type: Object `"last_updated_sub_source": { "display_value": "String", "value": "String" }`
result.reservation.last_updated_sub_source.display_value	Display value for the last updated sub-source of the reservation, such as `ServiceNow Workplace Service Delivery` or `Google Calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	`"value": "String"` `}`
result.reservation.location.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String
result.reservation.location.building.timezone.value	Internal value for the time zone to which this location belongs. Data type: String

result.reservation.location.campus	Details about the campus associated with the location.
	
	Data type: Object
	
	`"campus": {`
	`"active": Boolean,`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

result.reservation.location.campus.active	Flag that indicates whether the campus is active. Valid values: • true: Campus is active. • false: Campus is inactive. Data type: Boolean
result.reservation.location.campus.display_value	Display value of the campus to which this location belongs, such as Amsterdam Campus. Data type: String
result.reservation.location.campus.sys_id	Sys_id of the campus to which this location belongs. Data type: String Table: Campus [sn_wsd_core_campus]
result.reservation.location.capacity	Maximum number of occupants for the location. Data type: Number
result.reservation.location.description	Brief description of the location. Data type: String
result.reservation.location.display_value	Value to display in the UI for this location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
result.reservation.location.email	Email address for the location. Data type: String

result.reservation.location.floor	Details about the floor associated with the location.
	
	Data type: Object
	
	`"floor": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.location.floor.active	Flag that indicates whether the floor is active. Valid values: • true: Floor is active. • false: Floor is inactive. Data type: Boolean
result.reservation.location.floor.display_value	Display value of the floor to which this location belongs, such as First floor. Data type: String
result.reservation.location.floor.sys_id	Sys_id of the floor to which this location belongs. Data type: String Table: Floor [sn_wsd_core_floor]
result.reservation.location.label_value	Type of value specified in the *name* parameter, such as Room name. Data type: String
result.reservation.location.name	Name of the location. Data type: String
result.reservation.location.number	Reservation number. Data type: String
result.reservation.location.number_of_attendees	Number of attendees for the reservation. Data type: Number
result.reservation.location.reservable_module	Details about the reservable module associated with the reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	Data type: Object
	`"reservable_module": {`
	`  "inline_title": "String",`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "title": "String"`
	`}`

result.reservation.location.reservable_module.inline_title	Inline title of the reservable module. The title appears in line with the descriptive text on the Workplace service portal. Data type: String
result.reservation.location.reservable_module.name	Name of the reservable module. Data type: String
result.reservation.location.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.location.reservable_module.title	Title of the reservable module. Data type: String

result.reservation.location.region	Details about the region associated with the location.
	
	Data type: Object
	`"region": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.location.region.active	Flag that indicates whether the region is active. Valid values: • true: Region is active. • false: Region is inactive. Data type: Boolean
result.reservation.location.region.display_value	Display value of the region to which this location belongs, such as Europe. Data type: String
result.reservation.location.region.sys_id	Sys_id of the region to which this location belongs. Data type: String

Name	Description
	Data type: String
result.reservation.opened_by.name	Name of the user that opened the reservation. Data type: String
result.reservation.opened_by.user_name	User name of the user that opened the reservation. Data type: String
result.reservation.opened_by.value	Internal value of the user that opened the reservation. Data type: String
result.reservation.recording_details	Details about the recordings associated with the reservation (meeting). Data type: Array of Objects `"recording_details": [ "recording_url": "String" ]`
result.reservation.recording_details.recording_url	URL of the recordings associated with the reservation. Data type: String
result.reservation.recurring_pattern	Details about the recurring pattern for the reservation. Data type: Object `"recurring_pattern": { "amountOfDates": "String", "duration": Number, "label": "String", "options": {Object}, "repeats": "String", "startDate":"String", "startDateGdt": {Object} }`
result.reservation.recurring_pattern.amountOfDates	Number of dates for which the reservables are reserved. Data type: String
result.reservation.recurring_pattern.duration	Length of time to reserve the reservable. Data type: Number Unit: Seconds
result.reservation.recurring_pattern.label	Descriptive name for the recurring reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

result.reservation.recurring_pattern.options	Details about the options associated with the recurring reservation.
	
	Data type: Object
	
	`"options": {`
	`  "count": Number,`
	`  "daysOfWeek": "String",`
	`  "every": Number,`
	`  "endDate": "String"`
	`  "endDateGdt": {Object}`
	`}`

result.reservation.recurring_pattern.options.count	Number of times to repeat the pattern. Data type: Number
result.reservation.recurring_pattern.options.daysOfWeek	Days of the week that the reservable is needed. Valid values: • 1 = Monday • 2 = Tuesday • 3 = Wednesday • 4 = Thursday • 5 = Friday • 6 = Saturday • 7 = Sunday For example, to specify Tuesday, Thursday, and Friday, pass 245 (no delimiter). If *`repeats`* is `weekly`, *`count`* is 5, and *`daysOfWeek`* is `245`, then in the return results, the total is equal to `count*daysOfWeek.length` (5*3=15). Data type: String
result.reservation.recurring_pattern.options.every	Pattern repeat interval. For example, the value '2' indicates that the pattern repeats every 2 days or 2 months depending on the value of the *`repeats`* property. **Note:** This setting is not applicable to weekly repeat intervals. You can set the *`repeats`* property to `daily` and this value to `14` for biweekly repeat intervals. Data type: Number Default value: 1

Name	Description
result.reservation.reservable_module.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String
result.reservation.reservable_module.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number
result.reservation.reservable_module.selection_type	Type of selection to display in the search results. Can be one of the following options: • Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.reservation.reservable_module.short_description	Brief description of the reservable module. Data type: String
result.reservation.reservable_module.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.reservation.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.reservable_module.timeSlots	Details about the time slots associated for a reservable module. Data type: Array of Objects `[ { "name": "String", "short_description": "String", "slot_end": "String", "slot_start": "String", "sys_id": "String"`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	`}` `]`
result.reservation.reservable_module.timeSlots.name	Name of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.short_description	Brief description of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_end	End time of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_start	Start time of the slot. Data type: String
result.reservation.reservable_module.timeSlots.sys_id	Sys_id of the time slot record. Data type: String Table: Time Slot [sn_wsd_rsv_time_slot]
result.reservation.reservable_module.title	Title of the reservable module. Data type: String

result.reservation.reservable_module.virtual_meeting_provider	Details about the virtual provider associated with the reservable module.
	
	Data type: Object
	`"virtual_meeting_provider": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.reservable_module.virtual_meeting_provider.display_value	Display value of the virtual meeting provider. Data type: String
result.reservation.reservable_module.virtual_meeting_provider.sys_id	Sys_id of the virtual meeting provider. Data type: String

result.reservation.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation.
	
	Data type: Object
	`"reservationAcl": {`
	`  "read": Boolean,`
	`  "write": {Object}`
	`}`

Name	Description
	Data type: String
result.reservation.shift.name	Name of the shift. Same as *display_value*. Data type: String
Result.reservation.shift.shiftDetails	Details of shift. Data type: String
result.reservation.shift.sys_id	Sys_id of the shift record. Data type: String Table: Shift [sn_wsd_core_shift]

result.reservation.source	Details about the source for the reservation, such as Workplace Services or Google Mail..
	
	Data type: Object
	
	`"source": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.source.display_value	Display value for the reservation source, such as Workplace Services. Data type: String
result.reservation.source.value	Internal value for the reservation source, such as servicenow. Data type: String

result.reservation.source_icon	Details about the source of the icon used in the reservation. This icon is used in the UI.
	
	Data type: Object
	
	`"source_icon": {`
	`  "classNames": "String",`
	`  "imgSrc": "String",`
	`  "tooltip": "String"`
	`}`

result.reservation.source_icon.classNames	Comma-separated class names for the source icon. Data type: String
result.reservation.source_icon.imgSrc	Name of the image source for source icon. This icon is stored in the Images [db_image] table. Data type: String

Name	Description
result.reservation.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z

result.reservation.state	Details about the state of the reservation.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String
result.reservation.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservation.subject	Reservation's subject. Data type: String

result.reservation.sub_source	Details about the sub-source of the reservation. The sub-source specifies where the reservation originated such as Google Calendar or Microsoft Exchange.
	
	Data type: Object
	
	`"sub_source": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.sub_source.display_value	Display value for the sub-source of the reservation, such as Google Calendar. Data type: String
result.reservation.sub_source.value	Internal value of the sub-source field of the reservation, such as google_calendar. Data type: String
result.reservation.sync_state	Details about the synchronization state of a reservation from another service, such as "sync_enqueued" or "synchronized". Data type: Object

Name	Description
	`"sync_state": { "display_value": "String", "value": "String" }`
result.reservation.sync_state.display_value	Display value for the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sync_state.value	Internal value of the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sys_created_on	Date and time when the reservation was created. Data type: String
result.reservation.sys_id	Sys_id of the reservation record. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
Result.reservation.sys_updated_on	Date and time when the reservation was last updated. Data type: String
result.reservation.virtual_meeting	URL of the virtual meeting link. Data type: String

Example: cURL request

The following code example shows how to retrieve a specific recurring reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/recurring_reser
vation/list/d98a381587b789506342b846dabb3563" \
--request GET \
--header "Accept:application/json" \
--user "username": "password"
```

Return results:

```

WSD Recurring Reservation - PATCH /api/sn_wsd_rsv/recurring_reservation/cancel_series/{sys_id}

Cancels an entire specified recurring series reservation or a specific meeting occurrence within the series.

Note: You cannot delete multiple meeting occurrences in a single call.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/recurring_reservation/cancel_series/{sys_id}`

Default URL: `/api/sn_wsd_rsv/recurring_reservation/cancel_series/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	To cancel the entire series, pass the sys_id of the recurring parent reservation record. To cancel a specific occurrence of the series, pass the sys_id of the occurrence of the series.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	The recurring parent record has the column reservation_subtype set to `Recurring parent`. Individual occurrence records have the reservation_subtype field set to `Occurrence`. To get the details of recurring parent reservation from the occurrence record, refer to the sys_id of the source_reservation field of the occurrence record. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data Type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results for the cancel recurring reservation request.
	
	Data type: Object
	
	`"result": {`
	
	`"failedToCancelOccurrenceReservations": [Array],`
	`"seriesId": "String",`
	`"success": Boolean,`
	
	`"successCanceledOccurrences": [Array],`
	`"user_msg": "String"`
	`}`

result.failedToCancelOccurrenceReservations	List of sys_ids of the individual meeting occurrence records that failed to be cancelled. Data type: Array of Strings
result.seriesId	Sys_id of the recurring parent when the whole series is cancelled or the sys_id of a specific occurrence if a single occurrence is cancelled. Data type: String
result.success	Flag that indicates whether the reservation was successfully cancelled. Possible values: • true: Successfully cancelled. • false: Operation failed. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.failedToCancelOccurrenceReservations	List of sys_ids of the individual meeting occurrence records that were successfully cancelled. Data type: Array of Strings
result.user_msg	Message about the request. Data type: String

Example: cURL request

The following code example shows how to cancel an entire recurring reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/recurring_reser
vation/cancel_series/f64983a347274550003a4587746d43b8" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "failedToCancelOccurrenceReservations": [],
    "successCanceledOccurrences": [
      "cb4983a347274550003a4587746d43bd",
      "cf4983a347274550003a4587746d43ba"
    ],
    "user_msg": "Your Recurring reservation has been canceled
 successfully!",
    "seriesId": "f64983a347274550003a4587746d43b8",
    "success": true
  }
}
```

WSD Recurring Reservation - POST /api/sn_wsd_rsv/recurring_reservation/create_series

Creates workplace reservations for the same time but different dates, such as weekly, monthly, or every other week.

Timezone handling

All *dtstart* and *until* values must be provided as local wall-clock time in the timezone specified by *tzid*. Do not use UTC or append a Z suffix.

For example, to create a recurring reservation at 2:30 PM Chicago time:

- Accepted format: `"dtstart": "2025-12-08T14:30:00", "tzid": "America/Chicago"`
- Unaccepted format (UTC — not recommended): `"dtstart": "2025-12-08T20:30:00Z"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: The system uses *tzid* to correctly handle DST transitions. A reservation set for 2:30 PM will remain at 2:30 PM local time regardless of whether the timezone is currently observing standard time or daylight saving time.

Frequency-specific requirements

freq value	Required companion fields
DAILY	None beyond interval
WEEKLY	byweekday (array of 1 or more day codes)
MONTHLY	Either bymonthday **or** (bysetpos + single-value byweekday)
YEARLY	No additional fields beyond dtstart / interval

URL format

Versioned URL: /api/sn_wsd_rsv/{api_version}/recurring_reservation/create_series

Default URL: /api/sn_wsd_rsv/recurring_reservation/create_series

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, v1 or v2. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description

recurringPattern	Details about the recurring pattern for the reservation.
	
	Data type: Object
	
	`"recurringPattern": {`
	`  "freq": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description

	`"interval": Number,`
	`"dtstart": "String",`
	`"until": "String",`
	`"byweekday": [Array],`
	`"duration": Number,`
	`"tzid": "String"`
	`}`

recurringPattern.bymonthday	Conditional. Required if *freq* is `MONTHLY`, unless using *bysetpos* + `byweekday`. Day of the month for the occurrence. Valid values: • `1-31` • or `-1` for last day of month. Mutually exclusive with *bysetpos*. Data type: Number
recurringPattern.bysetpos	Conditional Used together with *byweekday* for "nth weekday of month" patterns (for example, 2nd Monday). Valid values: • `1` • `2` • `3` • `4` • `-1` (= last). Mutually exclusive with *bymonthday*. Data type: Number
recurringPattern.byweekday	Conditional. Required if *freq* is `WEEKLY`. Days of the week that the reservable is needed. Also used with `bysetpos` for monthly "nth weekday" patterns. Valid values: • `MO`: Monday • `TU`: Tuesday • `WE`: Wednesday • `TH`: Thursday • `FR`: Friday • `SA`: Saturday • `SU`: Sunday

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	For example, `["MO", "WE", "FR"]` for Monday, Wednesday, and Friday. If `freq` is `WEEKLY`, `count` is 5, and `byweekday` contains 3 days, then the total number of occurrences is count × byweekday.length (5 × 3 = 15). Data type: Array of Strings, or JSON-stringified array
recurringPattern.count	Conditional. Number of occurrences to generate. Mutually exclusive with *`until`* — exactly one of *`until`* or *`count`* is required. Data type: Number
recurringPattern.dtstart	Required. Start date and time for the recurring pattern, expressed as local wall-clock time in the timezone specified by *`freq`*. Do not include a `Z` suffix — the value represents the local time at the building. For example, `2025-12-08T14:30:00` means 2:30 PM in the timezone specified by *`freq`*. Data type: String Format: `YYYY-MM-DDTHH:mm:ss`
recurringPattern.duration	Required (except shift-based reservations). Length of time to reserve the reservable, in milliseconds. For example, `3600000` = 1 hour. Data type: Number Unit: Milliseconds
recurringPattern.freq	Required. Repeating frequency for the reservation. Valid values (case-sensitive): • `DAILY` • `WEEKLY` • `MONTHLY` • `YEARLY` Data type: String
recurringPattern.interval	Optional. Pattern repeat interval. For example, the value 2 indicates that the pattern repeats every 2 days or 2 months depending on the value of *`freq`*. Data type: Number Default: `1`
recurringPattern.tzid	Required. IANA timezone name for the building where the reservation is located. All date and time values in the pattern

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	(*dtstart*, *until*) must be expressed as local wall-clock time in this timezone. The system uses this timezone to generate occurrences with correct Daylight Saving Time (DST) handling — ensuring that a reservation at, for example, "2:30 PM every Monday" stays at 2:30 PM local time even across DST transitions. For example, `America/Chicago`, `Asia/Kolkata`, `Australia/Sydney`. Data type: String
recurringPattern.until	Conditional. End date boundary for the recurrence, expressed as local wall-clock time in the timezone specified by *tzid*. Mutually exclusive with *count* — exactly one of *until* or *count* is required. Data type: String Format: ISO date or datetime, such as `2026-12-08` or `2026-12-08T23:59:59`

reservation	Details about the recurring reservation to create.
	
	Data type: Object
	
	`"reservation": {`
	`  "is_private": Boolean,`
	`  "location": "String",`
	`  "reservable_module": "String",`
	`  "shift": "String",`
	`  "subject": "String"`
	`}`

reservation.attendees	Comma-separated sys_ids of attendees. Data type: String (glide_list of sys_user)
reservation.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
reservation.location	Required. Sys_id of the location to reserve. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
reservation.requested_for	Sys_id or email of the user the reservation is for. Data type: String
reservation.reservable_module	Required only for April 2026 store and earlier releases. Not required with May 2026 store and later releases. Sys_id of the reservable module to associate with the reservation. A reservable module defines the workplace items needed for a reservation. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]
reservation.shift	Conditional. Sys_id of the shift to associate with the reservation. If this parameter is passed in, the *duration* parameter isn't required — duration derives from the shift. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String Table: Shift [sn_wsd_core_shift]
reservation.subject	Required. Subject of the meeting associated with the reservation. Data type: String

Legacy recurringPattern format (still accepted)

The legacy format is still accepted but is silently converted to the RRULE format server-side. Times can be provided in UTC format (with Z suffix) — the server automatically converts them to the building's local timezone during processing. New integrations should use the RRULE format with `tzid` above.

Legacy field	Maps to (RRULE)	
recurringPattern	*recurringPattern*	Details about the recurring pattern for the reservation. **Note:** Only the Object structure is legacy. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy field	Maps to (RRULE)	

		`"recurringPattern": {`
		`  "duration": Number,`
		`  "label": "String",`
		`  "options": {Object},`
		`  "repeats": "String",`
		`  "startDate": "String"`
		`}`

recurringPattern.duration	*duration*	Required if not a shift-based reservation. Length of time to reserve the reservable. Data type: Number Unit: Milliseconds
recurringPattern.label	-	Descriptive name for the recurring reservation. Data type: String

recurringPattern.options	-	Required. Details about the options set for the recurring pattern.
		
		Data type: Object
		`"options": {`
		`  "count": Number,`
		`  "daysOfWeek": "String",`
		`  "every": Number,`
		`  "endDate": "String"`
		`}`

recurringPattern.options.count	*count*	Required if not a shift-based reservation; ignored for shift-based reservations. Number of times to repeat the pattern. Data type: Number
recurringPattern.options.daysOfWeek	*byWeekday*	Required if the *repeats* parameter is set to `weekly`. Days of the week that the reservable is needed, using concatenated digits with no delimiter. For example, `"245"` for Tuesday, Thursday, and Friday. Valid values: • `1` = Monday • `2` = Tuesday • `3` = Wednesday • `4` = Thursday • `5` = Friday

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy field	Maps to (RRULE)	
		• 6 = Saturday • 7 = Sunday Data type: String
recurringPattern.options.every	*interval*	Pattern repeat interval. Data type: Number
recurringPattern.options.endDate	*until*	End date and time of the recurrence of the meeting, such as "2022-07-08T14:00:00Z". Display only. Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
recurringPattern.repeats	*freq*	Required if not a shift-based reservation. Repeating pattern for the reservable. Valid values: (case-sensitive) • `daily` • `monthly` • `weekly` • `yearly` **Note:** The pattern repeat interval is set in the *`options.every`* property. The only valid repeat interval for weekly patterns is one. Data type: String
recurringPattern.startDate	*dtstart*	Start date and time. Accepts UTC format with Z suffix — automatically converted to building-local. Format: ISO 8601 datetime

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results from the multi-reservation creation or update.
	
	Data type: Object
	
	`"result": {`
	`  "isValid": Boolean,`
	`  "parent": "String",`
	`  "successfulReservations":`
	`  [Array],`
	`  "unSuccessfulReservations":`
	`  [Array]`
	`}`

result.isValid	Flag that indicates whether the reservation was successfully created. Possible values: • true: Successfully created. • false: Operation failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
result.parent	Sys_id of the parent reservation that was updated. Data type: String
result.successfulReservations	List of the reservations that were successfully updated. Data type: Array of Objects `"successfulReservations": [ { "collision": Boolean, "end": "String", "error": "String", "inserted": Boolean, "start": "String" "sys_id": "String" } ]`
result.successfulReservations.collision	Flag that indicates whether a reservation already exists for the specified time and collides with the current reservation. Possible values: • true: Collision. • false: No collision. Data type: Boolean
result.successfulReservations.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.successfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.successfulReservations.inserted	Flag that indicates whether the reservation was successfully inserted. Such as when a reservation is added. Possible values: • true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.successfulReservations.start	Reservation start date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.successfulReservations.sys_id	Sys_id of the reservation that was created. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.unSuccessfulReservations	List of the reservations that were unsuccessfully updated. Data type: Array of Objects `"unSuccessfulReservations": [ { "collision": Boolean, "end": "String", "error": "String", "inserted": Boolean, "start": "String" "sys_id": "String" } ]`
result.unSuccessfulReservations.collision	Flag that indicates whether a reservation already exists for the specified time and collides with the current reservation. Possible values: • true: Collision. • false: No collision. Data type: Boolean
result.unSuccessfulReservations.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.unSuccessfulReservations.error	Error message if there was a problem while creating the reservation. Data type: String
result.unSuccessfulReservations.inserted	Flag that indicates whether the reservation was successfully inserted. Such as when a reservation is added. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Successfully inserted. • false: Operation failed. Data type: Boolean
result.unSuccessfulReservations.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.unSuccessfulReservations.sys_id	Sys_id of the reservation record. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Example: cURL request

Weekly on Mon/Wed/Fri, 4 occurrences (Chicago time)

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/recurring_reser
vation/create_series" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data '{
    "reservation": {
        "reservable_module": "5db44502dbb650106c731dcd13961937",
        "subject": "Weekly team sync",
        "location": "6a11a94adb7210106c731dcd1396194e",
        "requested_for": "6816f79cc0a8016401c5a33be04be441",
        "is_private": false
    },
    "recurringPattern": {
        "freq": "WEEKLY",
        "interval": 1,
        "dtstart": "2025-12-08T14:30:00",
        "count": 4,
        "byweekday": ["MO", "WE", "FR"],
        "duration": 3600000,
        "tzid": "America/Chicago"
    }
}'
```

Return results:

```
{
  "result": {
    "isValid": true,
    "parent": "1e5f65ca87586550cfaa99b73cbb3513",
    "successfulReservations": [
      {

WSD Reservable API

The Workplace Service Delivery (WSD) *`Reservable`* API provides endpoints to retrieve details of a reservable, an entity that can be reserved, such as a workplace location, from a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: A newer version of this API, WSD Reservable V2 API, is available for use. The new version allows you to include all reservables in a POST request to avoid character limitations of the *sys_Id* parameter.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

This API runs in the `sn_wsd_rsv` namespace. To access this API, the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservable - GET /sn_wsd_rsv/reservable/list_reservables/{sys_ids}

Returns the details for one or more specified reservables.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservable/list_reservables/{sys_ids}`

Default URL: `/api/sn_wsd_rsv/reservable/list_reservables/{sys_ids}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_ids	Sys_ids of the reservables whose details to return. If specifying multiple reservables, comma separate the sys_ids. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]

Query parameters

Name	Description
include_flexible_services	Flag that indicates whether to return the flexible services associated with the reservable in to the response. A flexible service is an additional provision available with a reservable workplace item when a reservation is made. For example, Classroom style - Rows of tables arranged with all participants facing towards the front of the room. For additional information on flexible services, see Create a flexible service. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Return the flexible service information. • false: Don't return the flexible service information. Data type: Boolean Default: false
include_layouts	Flag that indicates whether to return the location layout information in the response. Location layout information include such things as capacity, max capacity, preparation, and clean up duration. This information is located in the Location Layout [sn_wsd_rsv_m2m_location_layout] table. Valid values: • true: Return the location layout information. • false: Don't return the location layout information. Data type: Boolean Default: false
include_standard_services	Flag that indicates whether to return the standard services information in the response. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table. A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
reservable_module_sys_id	Required. Sys_id of the reservable module. A reservable module groups similar types of workplace items. For additional information on reservable modules, see Configure a reservable module. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
reservation_start_time	Reservation start time to validate the lead time of extra services. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.building.sys_id	Sys_id of the associated building record. Data type: String

result.building.timezone	Details of the time zone for the building.
	
	Data type: Object
	
	`"timezone": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String
result.building.timezone.value	Internal value of the time zone in which the associated building resides. Data type: String

result.campus	Campus where the reservable is located.
	
	Data type: Object
	
	`"campus": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Campus [sn_wsd_core_campus]

result.campus.display_value	Display value for the campus. Data type: String
result.campus.sys_id	Sys_id of the associated campus record. Data type: String
result.capacity	Number of people that the reservable can accommodate. Data type: Number
result.description	Description of the reservable. Data type: String
result.display_number_of_attendees	Flag that indicates whether users can specify the number of attendees in the reservation. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Users can specify the number of attendees. • false: Users can't specify the display number of attendees. Data type: Boolean
result.display_on_behalf_of	Flag that indicates whether reservations can be made on behalf of someone else. Valid values: • true: On behalf of supported. • false: On behalf of not supported. Data type: Boolean
result.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.email	Email address associated with the reservable. Data type: String
result.employee_override_privacy	Flag that indicates whether users can override the privacy setting for the associated reservable. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Users can override the privacy setting for the associated reservable. • false: Users cannot override the privacy setting for the associated reservable.
result.enable_group_reservations	Flag that indicates whether users can make a group reservation. Valid values: • true: Able to make group reservations. • false: Not able to make group reservations.

Name	Description
	Data type: Boolean
result.enable_reservation_privacy	Flag that indicates the default setting for reservation privacy. For additional information on these privacy settings, see Location privacy settings and impact. Possible values: • true: Reservations are private by default. • false: Reservations are not private by default. Data type: Boolean
result.external_id	External ID of the reservable. Data type: String
result.flexible_services	Populated only if the *include_flexible_services* parameter is set to true and the workplace case management plugin is installed. Description of the flexible services associated with the reservables. There can be a parent flexible service, and several child flexible services. Data type: Object `flexible_services": [ { "additional_text": "String", "allow_only_single_service_item_selection": Boolean, "category": "String", "currency_code": "String", "flexible_service": [Array], "label": "String", "sub_category": "String", "sub_title": "String", "text": "String", "title": {Object} } ]` Table: Workplace Service Item [sn_wsd_case_workplace_service_item]
result.flexible_services.additional_text	Text to prompt user to select additional flexible services.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.flexible_services.allow_only_single_service_item_selection	Flag that indicates whether users can select only one service item among the group of flexible services within a reservation. Valid values: • true: Only able to make a single selection. • false: Able to make multiple selections. Data type: Boolean
result.flexible_services.category	Category of the flexible services. Data type: String
result.flexible_services.currency_code	Currency code used to calculate the amount of currency when ordering flexible services. Data type: String
result.flexible_services.flexible_service	Flexible services corresponding to a parent flexible service. Data type: Array of Objects `"flexible_service": [ { "flexible_service": [Array], "label": "String", "sub_category": "String" } ]` Table: Workplace Service Item [sn_wsd_case_workplace_service_item]
result.flexible_services.flexible_service.flexible_service	Details of each flexible service corresponding to a parent flexible service. Data type: Array of Objects `"flexible_service": [ { "additional_text": "String", "capacity_enabled": Boolean, "category": "String", "category_label": "String", "cleanup_duration": "String", "image": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	"max_capacity": Number, "name": "String", "preparation_duration": "String", "price_per_unit": {Object}, "quantity_enabled": Boolean, "quantity_required": Boolean, "short_description": "String", "sub_category": "String", "sub_category_label": "String", "sub_title": "String", "sys_id": "String", "text": "String", "title": {Object} }]
result.flexible_services.flexible_service.flexible_service.additional_text	Text used to prompt a user to select additional flexible services. Data type: String
result.flexible_services.flexible_service.flexible_service.capacity_enabled	Flag that indicates whether the capacity of the room should appear in the reservation. If this is set to true, *quantity_enabled* will always be false. Valid values: • true: Capacity should appear. • false: Capacity should not appear. Data type: Boolean
result.flexible_services.flexible_service.flexible_service.category	Category of the flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.category_label	Category label of flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.cleanup_duration	Amount of time it takes to clean up or remove the service added to the reservable. Data type: Number Unit: Milliseconds
result.flexible_services.flexible_service.flexible_service.image	Link to the image of the flexible service.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Data type: String
result.flexible_services.flexible_service.flexible_service.max_capacity	Maximum number of occupants that the reservable can accommodate. Data type: Number
result.flexible_services.flexible_service.flexible_service.name	Name of flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.preparation_duration	Amount of time it takes to add the service to the reservable. Data type: String Unit: Milliseconds

result.flexible_services.flexible_service.flexible_service.price_per_unit	Details of the cost of adding the flexible service to the reservable.
	
	Data type: Object
	
	`"price_per_unit": {`
	`  "code": "String",`
	`  "value": "String"`
	`}`

result.flexible_services.flexible_service.flexible_service.price_per_unit.code	Currency code to use when calculating the cost, such as GBP or USD. Data type: String
result.flexible_services.flexible_service.flexible_service.price_per_unit.value	Cost for each unit of the flexible service in the currency defined in the code parameter. Data type: String
result.flexible_services.flexible_service.flexible_service.quantity_enabled	Flag that indicates whether the quantity field should appear in the reservation. If this is set to true, *capacity_enabled* will always be false. Valid values: • true: Quantity should appear. • false: Quantity should not appear. Data type: Boolean
result.flexible_services.flexible_service.flexible_service.quantity_required	Flag that indicates whether the quantity is required. Valid values: • true: Quantity is required. • false: Quantity is not required.

Name	Description
	Data type: Boolean
result.flexible_services.flexible_service.flexible_service.short_description	Brief description of the flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.sub_category	Sub-category name of the flexible service, such as chair_layout. Data type: String
result.flexible_services.flexible_service.flexible_service.sub_category_label	Sub-category label of the flexible service, such as Chair layout. Data type: String
result.flexible_services.flexible_service.flexible_service.sub_title	Sub-title name of the child flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.sys_id	Sys_id of flexible service. Data type: String
result.flexible_services.flexible_service.flexible_service.text	Text used to prompt a user to select flexible services. Data type: String

result.flexible_services.flexible_service.flexible_service.title	Details for the titles to use when adding and editing the child flexible service in the UI.
	
	Data type: Object
	`"title": {`
	`  "add": "String",`
	`  "edit": "String"`
	`}`

result.flexible_services.flexible_service.flexible_service.title.add	Title used when adding a child flexible service in the UI. Data type: String
result.flexible_services.flexible_service.flexible_service.title.edit	Title used when editing a child flexible service in the UI. Data type: String
result.flexible_services.flexible_service.label	Flexible service label. Data type: String
result.flexible_services.flexible_service.sub_category	Sub-category of the parent flexible services, such as additional chair. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
result.flexible_services.flexible_service.sub_title	Sub-title name of the parent flexible service. Data type: String
result.flexible_services.flexible_service.text	Text used to prompt a user to select a parent flexible services. Data type: String

result.flexible_services.flexible_service.title	Details for the titles to use when adding and editing the parent flexible service in the UI.
	
	Data type: Object
	
	`"title": {`
	`  "add": "String",`
	`  "edit": "String"`
	`}`

result.flexible_services.flexible_service.title.add	Title used when adding a parent flexible service in the UI. Data type: String
result.flexible_services.flexible_service.title.edit	Title used when editing a parent flexible service in the UI. Data type: String

result.floor	Details about the floor on which the reservable is located.
	
	Data type: Object
	
	`"floor": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Floor [sn_wsd_core_floor]

result.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.floor.sys_id	Sys_id of the associated record in the Floor table. Data type: String

result.image	Details about an image that represents the associated reservable.
	
	Data type: Object
	
	`"image": {`
	`  "link": "String",`

Name	Description

	`"sys_id": "String"`
	`}`
	
	Table: Images [db_image]

result.image.link	Link to an image that represents the reservable. Data type: String
result.image.sys_id	Sys_id of the associated image record. Data type: String
result.is_reservable	Flag that indicates whether the flexible service can be reserved. Valid values: • true: Flexible service can be reserved. • false: Flexible service can't be reserved. Data type: Boolean

results.layouts	Only populated if the *`include_layouts`* parameter is set to true.
	
	List of the layouts associated with the reservable.
	
	Data type: Array of Objects
	`"layouts": [`
	`{`
	`"capacity": Number,`
	`"cleanup_duration": "String",`
	`"image": {Object},`
	`"is_default": Boolean,`
	`"max_capacity": Number,`
	`"name": "String",`
	`"preparation_duration": "String",`
	`"short_description": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.layouts.capacity	Number of people that will attend the meeting. Data type: Number
result.layouts.cleanup_duration	Amount of time it takes to clean the reservable for this layout. Data type: Number

Name	Description
	Unit: Milliseconds

result.layouts.image	Details about an image that represents the layout for the associated reservable.
	
	Data type: Object
	
	`"image": {`
	`  "link": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Images [db_image]

result.layouts.image.link	Link to an image that represents the layout for this reservable. Data type: String Table: Images [db_image]
result.layouts.image.sys_id	Sys_id of the associated image record. Data type: String
result.layouts.is_default	Flag that indicates whether the associated layout is the default for the reservable. Valid values: • true: Default. • false: Not default. Data type: Boolean
result.layouts.max_capacity	Maximum number of people that the layout associated with the reservable can accommodate. Data type: Number
result.layouts.name	Name of the location layout. Data type: String
result.layouts.preparation_duration	Amount of time it takes to prepare the associated location layout. Data type: Number Unit: Milliseconds
result.layouts.short_description	Brief description of the location layout. Data type: String
result.layouts.sys_id	Sys_id of the location layout.

Name	Description
	Data type: String Table: Layout [sn_wsd_rsv_layout]

result.location_type	Details about the type of location of the reservable, such as workplace/desk, cafe, or gym.
	
	Data type: Object
	
	`"location_type": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Space Type [sn_wsd_core_space_type]

result.location_type.display_value	Display value of the location type. Data type: String
result.location_type.sys_id	Sys_id of the associated record. Data type: String Table: Space Type [sn_wsd_core_space_type]

result.meetingProviders	Details about the virtual meeting providers associated with the reservable.
	
	Data type: Array of Objects
	
	`"meetingProviders": [`
	`  {`
	`  "display_value": "String",`
	`  "value": "String"`
	`  }`
	`]`
	
	Table: Virtual Meeting Provider [sn_wsd_rsv_virtual_meeting_provider]

result.meetingProviders.display_value	Display value of the virtual provider's name. Data type: String
result.meetingProviders.value	Actual value for the virtual provider's name in the record. Data type: String
result.moduleType	Reservable module associated with the reservable, such as desks or meeting room. Data type: String
result.name	Name of the reservable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.order	Order number for the reservable. Data type: Number
result.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.requires_check_in	Flag that indicates whether the reservable requires the user to check in. Valid values: • true: Check in required. • false: Check in isn't required. Data type: Boolean
result.require_subject	Flag that indicates whether the user must enter a subject when making the reservation. Valid values: • true: Subject required. • false: Subject isn't required. Data type: Boolean
result.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer

result.site	Details about the site where the reservable resides.
	
	Data type: Object
	`"site": {`
	`  "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	`"sys_id": "String"`
	`}`
	
	Table: Site [sn_wsd_core_site]

result.site.display_value	Display value of the site. Data type: String

result.standard_services	Only populated if the *include_standard_services* parameter is set to true.
	Associated standard services, such as flip chart, projector screen, and whiteboard and markers.
	
	Data type: Array of Objects
	
	`"standard_services": [`
	`{`
	`"font_awesome_icon": "String",`
	`"name": "String",`
	`"short_description": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service. Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String
result.standard_services.sys_id	Sys_id of the standard service record. Data type: String Table: Standard Service [sn_wsd_rsv_standard_service]
result.site.sys_id	Sys_id of the associated site record. Data type: String Table: Site [sn_wsd_core_site]
result.tableName	Name of the table in which the reservable record resides.

Name	Description
	Data type: String
result.title	Title of the reservable. Data type: String
result.type	Type of a reservable, such as location. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/reservable/list_
reservables/dad3df5977220110b3d7be377b5a99ce,3ed3139977220110b3d
7be377b5a99d1?include_flexible_services=true&include_layouts=fal
se&include_reservable_purposes=true&include_standard_services=tr
ue&reservable_module_sys_id=c31241cedb7650106c731dcd13961917" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```

WSD Reservable V2 API

The Workplace Service Delivery (WSD) *`Reservable V2`* API provides endpoints to retrieve details of a reservable, an entity that can be reserved, such as a workplace location, from a ServiceNow instance.

The *`WSD Reservable V2`* API is a new version of the WSD Reservable API. The *`WSD Reservable V2`* API fetches details of all reservable space(s) on the WSD Portal that you select while making a reservation. The original *`WSD Reservable`* API version used a GET call but limited the sys_ID path parameter to 35 characters. The new *`WSD Reservable V2`* API version is a POST call and takes all the sys_ids in the request body to avoid character limitations.

To access this API, the caller must have the sn_wsd_core.workplace_user role.

This API runs in the `sn_wsd_rsv` namespace. To access this API, the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservable V2 API - POST /sn_wsd_rsv/v2/reservable/list_reservables

Returns the details for one or more specified reservables.

URL format

Default URL: POST `api/sn_wsd_rsv/v2/reservable/list_reservables`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Required. Version of the endpoint to access. Specify `v2` to employ this API, otherwise using `v1` employs the default version of the WSD Reservable API. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
include_flexible_services	Flag that indicates whether to return the flexible services associated with the reservable in to the response. A flexible service is an additional provision available with a reservable workplace item when a reservation is made. For example, Classroom style - Rows of tables arranged with all participants facing towards the front of the room. For additional information on flexible services, see Create a flexible service. Valid values: • true: Return the flexible service information. • false: Do not return the flexible service information. Data type: Boolean Default: false
include_standard_services	Flag that indicates whether to return the standard services information in the response. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table. A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: false
include_reservable_purposes	Optional. Flag that indicates whether to return the purpose associated with the reservable. Valid values: • true: Return the purpose of the reservable. • false: Do not return the purpose of the reservable. Data type: Boolean Default: false
include_layouts	Flag that indicates whether to return the location layout information in the response. Location layout information include such things as capacity, max capacity, preparation, and clean up duration. Valid values: • true: Return the location layout information. • false: Don't return the location layout information. Data type: Boolean Default: false Table: Location Layout [sn_wsd_rsv_m2m_location_layout]
reservable_module_sys_id	Required. Sys_id of the reservable module, for example: desk, meeting room, etc. A reservable module groups similar types of workplace items. For additional information on reservable modules, see Configure a reservable module. Data type: String Default: Empty value Table: Reservable Module [sn_wsd_rsv_reservable_module]
reservation_start_time	Reservation start time to validate the lead time of extra services. Format: UTC format, yyyy-MM-dd HH:mm:ss Data type: String
space_sys_ids	Required. Comma-separated sys_ids of selected spaces. Data type: String

Request body parameters (XML or JSON) (continued)

Name	Description
	Default: Empty value

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the response body. Only supports application/json.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Could not find reservables. Look for the WSD Core Spaces [sn_wsd_core_spaces] table and verify the space record is present.
500	Error occurred! Unable to retrieve reservables. This is a server error. Contact system administration.

Response body parameters

Name	Description
result	Details on each matching reservable.

Name	Description
	Data type: String
result.name	Name of the reservable. Data type: String
result.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.order	Order number for the reservable. Data type: Number
result.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.requires_check_in	Flag that indicates whether the reservable requires the user to check in. Valid values: • true: Check in required. • false: Check in isn't required. Data type: Boolean
result.require_subject	Flag that indicates whether the user must enter a subject when making the reservation. Valid values: • true: Subject required. • false: Subject isn't required. Data type: Boolean
result.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer
result.site	Details about the site where the reservable resides. Data type: Object

Name	Description
result.tableName	Name of the table in which the reservable record resides. Data type: String
result.title	Title of the reservable. Data type: String
result.type	Type of a reservable, such as location. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to return details about the specified reservables.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/v2/reservable/li
st_reservables" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{\"space_sys_ids\":
\"3ed3139977220110b3d7be377b5a99d1\",\"reservable_module_sys
_id\":
\"c31241cedb7650106c731dcd13961917\",\"include_flexible_servi
ces\":true,\"include_standard_services\":true,\"include_reservab
le_purposes\":true,\"include_layouts\":false}" \
--user 'username:'password'
```

Response body. This example returns details about all the reservables listed in the request body.

WSD Reservable Module API

The Workplace Service Delivery (WSD) *`Reservable Module`* API provides endpoints to retrieve details of a reservable module from a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A reservable module groups similar types of workplace items. Employees can view these similar items in a single category. For example, a room is a reservable module and it contains similar workplace items such as meeting rooms, conference rooms, and other rooms.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated. This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservable Module - GET /sn_wsd_rsv/reservable_module/{sys_id}

Returns the details for a specified reservable module.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservable_module/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservable_module/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reversable module record to retrieve. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]

Query parameters

Name	Description
is_buildings_tree_data_required	Flag that indicates whether to return the building data associated with the reservable model. Valid values: • true: Return the building data. • false: Don't return the building data. Data type: Boolean Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
neighborhood	Only available if the Space Management (sn_wsd_spc_mgmt_neighborhood) plugin is activated. Sys_id of the neighborhood record to use in the encoded query. For additional information on neighborhood space reservations, see Create neighborhood reservations. The endpoint checks if the neighborhood is valid and then retrieves the data required for the browse-by-neighborhood path. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
results	Details for the requested reservable module. Data type: Object `{ "result": { "allow_invitees": Boolean, "allow_whole_day": Boolean, "apply_to_shift": Boolean, "browse_by_area_enabled": Boolean, "browse_by_neighborhood_enabled": Boolean, "browse_near_a_person_enabled": Boolean, "buildingsTreeData": [Array], "buildingSysIds": [Array], "checkin_before_minutes": Number, "display_number_of_attendees": Boolean, "display_on_behalf_of": Boolean, "display_sensitivity": Boolean, "display_value": "String", "enable_browse_by_area": Boolean, "enable_browse_by_neighborhood": Boolean,`

Name	Description
	"short_description": "String", "show_map_view": Boolean, "sys_id": "String", "timeSlots": [Array], "title": "String", "virtual_meeting_provider": {Object} } }
result.allow_invitees	Flag that indicates whether employees are able to add invitees to the reservation. Valid values: • true: Allow employees to add invitees to the reservation. • false: Don't allow employees to add invitees to the reservation. Data type: Boolean
result.allow_whole_day	Flag that indicates whether users can reserve the reservable for the entire day. Valid values: • true: Allow users to reserve for the entire day. • false: Don't allow users to reserve for the entire day. Data type: Boolean
result.apply_to_shift	Flag that indicates whether shift-based reservations are enabled for the reservable module. Valid values: • true: Allow shift-based reservations. • false: Don't allow shift-based reservations. Data type: Boolean
result.browse_by_area_enabled	Flag that indicates whether users are able to search for reservable modules by area. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: Boolean
result.browse_by_neighborhood_enabled	Only available if the Space Management - sn_wsd_spc_mgmt plugin is installed. Flag that indicates whether users are able to search in the reservable modules by neighborhood. Valid values: • true: Allow users to browse reservable modules by neighborhood. • false: Don't allow users to browse reservable modules by neighborhood. Data type: Boolean
result.browse_near_a_person_enabled	Flag that indicates whether users are able to search for reservable modules located by a specified person. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.buildingTreeData	Only returned if the *`is_buildings_tree_data_required`* query parameter is set to `true`. Hierarchy of the buildings associate with the reservable module. Hierarchy order: • Region: Located in the Region [sn_wsd_core_region] table. • Site: Located in the Site [sn_wsd_core_site] table. • Campus: Located in the Campus [sn_wsd_core_campus] table. • Building: Located in the Building [sn_wsd_core_building] table. Each `children[ ]` node reflects a different building level/hiearchy: • buildingsTreeData: Region • buildingsTreeData.children: Site

Name	Description
	• buildingsTreeData.children.children: Campus • buildingsTreeData.children.children.children: Building Data type: Array of Objects `"buildingsTreeData": [ { "children": [Array], "data": {Object}, "isSelectable": Boolean, "isValid": Boolean, "label": "String", "uId": "String" } ]`
result.buildingsTreeData.children	Details on the site, campus, or building associated with the reservable module. Each of the parameters in all `children[ ]` nodes are the same. They just apply to different building entities and are only described one time in this section. Data type: Array of Objects `"children": [ { "children": [Array], "data": {Object}, "isSelectable": Boolean, "isValid": Boolean, "label": "String", "uId": "String" } ]`
result.buildingsTreeData.children.data	Details about the building entity. Data type: Object `"data": { "sysId": "String", "table": "String", "timezone": {Object} }`
result.buildingsTreeData.children.data.sys_id	Sys_id of the associated building entity. Data type: String
result.buildingsTreeData.children.data.table	Name of the table in which the building entity record identified in the sys_id is located.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.buildingsTreeData.children.data.timezone	Details about the time zone of the building entity. `"timezone": { "displayValue": "String", "value": "String" }`
result.buildingsTreeData.children.data.timezone.displayValue	Display value in the record for the time zone. Data type: String
result.buildingsTreeData.children.data.timezone.value	Internal value in the record for the time zone. Data type: String
result.buildingsTreeData.children.isSelectable	Flag that indicates whether the associated building entity is available (selectable) for the reservable model. Valid values: • true: Building entity is available for the reservable module. • false: Building entity isn't available for the reservable module. Data type: Boolean
result.buildingsTreeData.children.isValid	Flag that indicates whether the associated building entity is valid for the reservable model. Valid values: • true: Building entity is valid for the reservable module. • false: Building entity isn't valid for the reservable module. Data type: Boolean
result.buildingsTreeData.children.label	Name of the building entity. Data type: String
result.buildingsTreeData.children.uId	Sys_id of the associated building entity record. Data type: String
result.buildingSysIds	List of sys_ids of the buildings associated with the reservable module. Data type: Array of Strings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.checkin_before_minutes	Amount of time before a reservation starts that a user can check into their reservation. Unit: Minutes Data type: Number
result.display_number_of_attendees	Flag that indicates whether users can specify the number of attendees in the reservation. Valid values: • true: Users can specify the number of attendees. • false: Users can't specify the display number of attendees. Data type: Boolean
result.display_on_behalf_of	Flag that indicates whether reservations can be made on behalf of someone else. Valid values: • true: On behalf of supported. • false: On behalf of not supported. Data type: Boolean
result.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.display_value	Display value of the reservable module. Data type: String
result.enable_browse_by_area	Flag that indicates whether users are able to search for reservable modules by area. Same as *`browse_by_area_enabled`*. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area.

Name	Description
	Data type: Boolean
result.enable_browse_by_neighborhood	Flag that indicates whether users are able to search for reservable modules by neighborhood. Valid values: • true: Allow users to browse reservable modules by neighborhood. • false: Don't allow users to browse reservable modules by neighborhood. Data type: Boolean
result.enable_browse_near_a_person	Flag that indicates whether users are able to search for reservable modules located by a specified person. Same as *`browse_near_a_person_enabled`*. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.enable_facet_filter	Flag that indicates whether facet filtering on workplace items is enabled. When enabled, the filter options that appear are based on the search results. Only the items that are available in the generated search result are available to users for selection in the filter. Valid values: • true: Facet filters are enabled. • false: Facet filters aren't enabled. Data type: Boolean
result.enable_group_reservations	Flag that indicates whether users can make a group reservation. Valid values: • true: Able to make group reservations. • false: Not able to make group reservations. Data type: Boolean
result.enable_ical_generation	Flag that indicates whether users can generate an iCalendar for the reservation.

Name	Description
	Valid values: • true: iCalendar generation allowed. • false: iCalendar generation isn't allowed. Data type: Boolean
result.font_awesome_icon	Name of the font icon attached to the reservable module. Data type: String
result.inline_title	Inline title of the reservable module. The title appears in line with the descriptive text on the Workplace service portal. Data type: String

result.layout_mapping	Details about the structure of the layout mapping of locations. Use this data to lay out the information in the UI.
	
	Data type: Object
	`"layout_mapping": {`
	`"body": [Array],`
	`"description": [Array],`
	`"image": "String",`
	`"subtitle": [Array],`
	`"subtitle_asc": [Array],`
	`"title": [Array]`
	`}`

result.layout_mapping.body	Placeholder for mapping the front-end UI data.
	
	Data type: Array of Objects
	`"body": [`
	`{`
	`"field": "String",`
	`"field_to_display":`
	`"String",`
	`"icon": "String",`
	`"label": "String"`
	`}`
	`]`

result.layout_mapping.body.field	Placeholder for mapping the front-end UI data. Data type: String
result.layout_mapping.body.field_to_display	Placeholder for mapping the front-end UI data. Data type: String
result.layout_mapping.body.icon	Placeholder for mapping the front-end UI data.

Name	Description

	browse_by_neighborhood_enabled parameter is set to `true`, and the *neighborhood* parameter is passed in the query parameters.
	
	List of sys_ids of the buildings associated with the reservable module and configured for the neighborhood. Each building element also contains a list of sys_ids of the corresponding floors available for the building.
	
	For example:
	
	`"nbhBuildingsData": {`
	
	`"4703a4cedb3650106c731dcd13961945": [`
	
	`"0f9e304edb7650106c731dcd13961911"`
	`],`
	
	`"6c0364cedb3650106c731dcd13961927": [`
	
	`"b23328cedb3650106c731dcd13961 9f9"`
	`]`
	`}`
	
	Data type: Array of Objects
	
	Table: Records associated with the building sys_ids are located in the Building [sn_wsd_core_building] table. Records associated with the floor sys_ids are located in the Floor [sn_wsd_core_floor] table.

result.nbhBuildingsTreeData	Only returned if the Space Management plugin is installed, the *browse_by_neighborhood_enabled* parameter is set to `true`, and the *neighborhood* parameter is passed in the query parameters.
	
	Hierarchy of the buildings associate with the reservable module and neighborhood.
	
	Data type: Array of Objects
	
	`"buildingsTreeData": [`
	`{`
	`"children": [Array],`
	`"data": {Object},`
	`"isSelectable": Boolean,`
	`"isValid": Boolean,`
	`"label": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"uId": "String"`
	`}`
	`]`
	Hierarchy order:
	• Region: Located in the Region [sn_wsd_core_region] table.
	• Site: Located in the Site [sn_wsd_core_site] table.
	• Campus: Located in the Campus [sn_wsd_core_campus] table.
	• Building: Located in the Building [sn_wsd_core_building] table.

result.nbhBuildingsTreeData.children	Describes the hierarchy of the children associated with the building.
	
	Each `children[]` node reflects a different building level/hierarchy:
	• buildingsTreeData: Region
	• buildingsTreeData.children: Site
	• buildingsTreeData.children.children: Campus
	• buildingsTreeData.children.children.children: Building
	
	Data type: Array of Objects
	`"children": [`
	`{`
	`"children": [Array],`
	`"data": {Object},`
	`"isSelectable": Boolean,`
	`"isValid": Boolean,`
	`"label": "String",`
	`"uId": "String"`
	`}`
	`]`
	The parameters in the `children[]` array are the same as those in the *`nbhBuildingsTreeData`* object, just for the associated location type; region, site, campus, or building.

result.nbhBuildingsTreeData.data	Details about the associated entity; region, site, campus, or building.
	
	Data type: Object
	`"data": {`
	`"sys_id": "String",`
	`"table": "String",`

Name	Description
	`"timezone": {Object}` `}`
result.nbhBuildingsTreeData.data.sysId	Sys_id of the associated entity record. Data type: String
result.nbhBuildingsTreeData.data.table	Table in which the associated record is located. Data type: String

result.nbhBuildingsTreeData.data.timezone	Information about the time zone in which the associated entity resides.
	
	Data type: Object
	
	`"timezone": {`
	`"displayValue": "String",`
	`"value": "String"`
	`}`

result.nbhBuildingsTreeData.data.timezone.displayValue	Time zone value to use in a user interface. Data type: String
result.nbhBuildingsTreeData.data.timezone.value	Internal time zone value. Data type: String
result.nbhBuildingsTreeData.isSelectable	Flag that indicates whether the associated entity is available (selectable) for the reservable model. Valid values: • true: Entity is available for the reservable module. • false: Entity isn't available for the reservable module. Data type: Boolean
result.nbhBuildingsTreeData.isValid	Flag that indicates whether the associated entity is valid for the reservable model. Valid values: • true: Entity is valid for the reservable module. • false: Entity isn't valid for the reservable module. Data type: Boolean
result.nbhBuildingsTreeData.label	Name of the reservable view.

Name	Description
	Data type: String
result.nbhBuildingsTreeData.uId	Sys_id of the associated entity. Data type: String
result.override_approval_policy	Option to specify how to implement the approval policy. Choices: • No override: The approval policy is implemented as set in the **Requires approval** field of a workplace space or room. • Always require approval: The approval policy is required regardless of what is set in the **Requires approval** field of a workplace space or room. • Never require approval: The approval policy is removed regardless of what is set in the **Requires approval**l field of a workplace space or room. Data type: String
result.require_cancel_notes	Flag that indicates whether users must enter a cancellation note before cancelling a reservable module. Valid values: • true: Cancellation note required. • false: Cancellation note not required. Data type: Boolean
result.require_cc_dept_check	Flag that indicates whether to check if there's a cost center or department mismatch between the workspace item and the logged in user. Valid values: • true: Check for a mismatch. • false: Don't check for a mismatch. Data type: Boolean
result.require_subject	Flag that indicates whether the user must enter a subject when making the reservation. Valid values: • true: Subject required. • false: Subject isn't required.

Name	Description
	Data type: Boolean
result.reservable_columns	List of the columns of a reservable. Data type: Array Table: Workplace Location [sn_wsd_core_workplace_location]
result.reservable_container_field	Level of the container, such as a group of desks in a specific area. Data type: String
result.reservable_filter	Filter conditions used to filter out reservable items in the associated Reservable table. Reservable table is a field in the Reservable Module [sn_wsd_rsv_reservable_module] table. These filter conditions were applied to the table contained in the field Reservable table. Data type: String
result.reservable_quantity_field	Reservable quantity of all the spaces. The quantity is used when assigning neighbourhood spaces to an area. For additional information, see Assign neighborhood spaces to an area. Data type: String
result.reservable_table	Table that contains the reservable workplace items. Data type: String
result.reservable_type	Type of the reservable item, such as location. Data type: String

result.reservable_views	Details about the different views associated with the reservable module, such as card view or schedule view.
	
	Data type: Object
	
	`"reservable_views": {`
	`  "iconClass": "String",`
	`  "isDefault": Boolean,`
	`  "label": "String",`
	`  "order": Number,`
	`  "type": "String"`
	`}`
	
	Table: Reservable View [sn_wsd_rsv_reservable_view]

Name	Description
result.reservable_views.iconClass	Icon class of the reservable view. Data type: String
result.reservable_views.isDefault	Flag that indicates whether to make this reservable view the default for reservable modules. Valid values: • true: Make default. • false: Don't make default. Data type: Boolean
result.reservable_views.label	Name of the reservable view. Data type: String
result.reservable_views.order	Order in which the views are displayed for the reservable module in the UI. The lower order number come first in the UI. In case of the same order number, it is assigned random ordering. Data type: Number
result.reservable_views.type	Backend name of the reservable view. Used for internal processing. Data type: String
result.reservation_paths	Reservation paths associated with the reservable modules such as Browse all, Browse near a person. Data type: Array of Objects `"reservation_paths": [ { "displayValue": "String", "value": "String" } ]`
result.reservation_paths.displayValue	Display value for the reservation path, such as "Browse near a person". Data type: String
result.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String

Name	Description
result.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number
result.selection_type	Type of selection to display in the search results. Can be one of the following options: • Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.short_description	Brief description of the reservable module. Data type: String
result.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.sys_id	Sys_id of the reservable module. Data type: String
result.timeSlots	Details about the time slots associated for a reservable module. Data type: Array of Objects `[ { "name": "String", "short_description": "String", "slot_end": "String", "slot_start": "String", "sys_id": "String" } ]`
result.timeSlots.name	Name of the time slot. Data type: String

Name	Description
result.timeSlots.short_description	Brief description of the time slot. Data type: String
result.timeSlots.slot_end	End time of the time slot. Data type: String
result.timeSlots.slot_start	Start time of the slot. Data type: String
result.timeSlots.sys_id	Sys_id of the time slot record. Data type: String Table: Time Slot [sn_wsd_rsv_time_slot]
result.title	Title of the reservable module. Data type: String
result.virtual_meeting_provider	Details about the virtual provider associated with the reservable module. Data type: Object `"virtual_meeting_provider": { "display_value": "String", "sys_id": "String" }`
result.virtual_meeting_provider.display_value	Display value of the virtual meeting provider. Data type: String
result.virtual_meeting_provider.sys_id	Sys_id of the virtual meeting provider. Data type: String

Example: cURL request

This code example shows how to request a reservable module with the buildings tree data.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/reservable_modu
le/5db44502dbb650106c731dcd13961937&is_buildings_tree_data_requi
red=true" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Response body:

```
{
  "result": {
```

WSD Reservation API

The Workplace Service Delivery (WSD) *`Reservation`* API provides endpoints for managing workplace reservations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservation - GET /api/sn_wsd_rsv/reservation/get

Retrieves the specified workplace reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/get`

Default URL: `/api/sn_wsd_rsv/reservation/get`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
external_ical	Unique external iCalendar identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Obtain this value from the associated external iCalendar application. Data type: String
external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Obtain this value from the associated external application. Data type: String
include_multi_child_data	If the reservation_subtype field value in the associated Workplace Reservation [sn_wsd_rsv_reservation] record is set to multi_child, this flag indicates whether to return the reservation details. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• true: Return the reservation details. • false: Do not return the reservation details. Data type: Boolean Default value: false
include_standard_services	Flag that indicates whether to return the standard services information in the response. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table. A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
sys_id	Required. Sys_id of the reservation record. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result.reservation	Details about the reservation.

Name	Description
	Data type: String
result.reservation.attendees.display_value	Display value of the attendee. Same as *displayValue*. Data type: String
result.reservation.attendees.email	Attendee's email address. Data type: String
result.reservation.attendees.initials	Attendee's initials. Data type: String
result.reservation.attendees.name	Attendee's name. Data type: String
result.reservation.attendees.sys_id	Sys_id of the attendee record. Data type: String
result.reservation.attendees.table	Table in which the attendee record exists. Data type: String
result.reservation.attendees.user_name	Attendee's user name. Data type: String
result.reservation.attendees.value	Internal value of the attendee. Data type: String

result.reservation.check_in_state	Details about the check-in state of the reservation.
	
	Data type: Object
	
	`"check_in_state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.check_in_state.display_value	Display value for the current check-in state of the reservation, such as In progress or complete. Data type: String
result.reservation.check_in_state.value	Internal value for the current check-in state of the reservation, such as 2. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

result.reservation.edit_restriction	Description of the user edit restrictions for the reservation, such as no_restrictions, service_only, or fully_restricted.
	
	Data type: Object
	
	`"edit_restriction": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.edit_restriction.display_value	Display value for the edit restrictions for the reservation, such as `No restriction`. Data type: String
result.reservation.edit_restriction.value	Internal value for the edit restrictions for the reservation, such as `no_restriction`. Data type: String
result.reservation.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.external_ical	Unique external iCalendar identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.is_parent	Flag that indicates whether this reservation is a parent reservation. Possible values: • true: Parent reservation. • false: Not a parent reservation. Data type: Boolean
result.reservation.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner.

Name	Description
	For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.

result.reservation.last_updated_sub_source	Details about the last updated sub-source for the reservation. Sub-sources are used when integrating reservations with an external calendar. This object contains information such as "servicenow_workplace_service_delivery", "google_calendar", or "microsoft_exchange".
	
	Data type: Object
	
	`"last_updated_sub_source": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.last_updated_sub_source.display_value	Display value for the last updated sub-source of the reservation, such as `ServiceNow Workplace Service Delivery` or `Google Calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String
result.reservation.last_updated_sub_source.value	Internal value for the last updated sub-source of the reservation, such as `servicenow_workplace_service_delivery` or `google_calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String

result.reservation.location	Details about the location associated with the reservation.
	
	Data type: Object
	
	`"location": {`
	`  "active": Boolean,`
	`  "area": {Object},`

Name	Description
	`"sys_id": "String"` `}`
result.reservation.location.campus.active	Flag that indicates whether the campus is active. Valid values: • true: Campus is active. • false: Campus is inactive. Data type: Boolean
result.reservation.location.campus.display_value	Display value of the campus to which this location belongs, such as Amsterdam Campus. Data type: String
result.reservation.location.campus.sys_id	Sys_id of the campus to which this location belongs. Data type: String Table: Campus [sn_wsd_core_campus]
result.reservation.location.capacity	Maximum number of occupants for the location. Data type: Number
result.reservation.location.description	Brief description of the location. Data type: String
result.reservation.location.display_value	Value to display in the UI for this location. Data type: String
result.reservation.location.email	Email address for the location. Data type: String

result.reservation.location.floor	Details about the floor associated with the location.
	
	Data type: Object
	`"floor": {`
	`"active": Boolean,`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

result.reservation.location.floor.active	Flag that indicates whether the floor is active. Valid values:

Name	Description
	• true: Floor is active. • false: Floor is inactive. Data type: Boolean
result.reservation.location.floor.display_value	Display value of the floor to which this location belongs, such as First floor. Data type: String
result.reservation.location.floor.sys_id	Sys_id of the floor to which this location belongs. Data type: String Table: Floor [sn_wsd_core_floor]
result.reservation.location.label_value	Type of value specified in the *name* parameter, such as Room name. Data type: String
result.reservation.location.name	Name of the location. Data type: String
result.reservation.location.number	Reservation number. Data type: String
result.reservation.location.number_of_attendees	Number of attendees for the reservation. Data type: Number

result.reservation.location.region	Details about the region associated with the location.
	
	Data type: Object
	
	`"region": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.location.region.active	Flag that indicates whether the region is active. Valid values: • true: Region is active. • false: Region is inactive. Data type: Boolean
result.reservation.location.region.display_value	Display value of the region to which this location belongs, such as Europe.

Name	Description
	Data type: String
result.reservation.location.region.sys_id	Sys_id of the region to which this location belongs. Data type: String Table: Region [sn_wsd_core_region]

result.reservation.location.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "user_name": "String"`
	`}`

result.reservation.location.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservation.location.requested_for.sys_id	Sys_id of the user for whom the reservation is being requested. Data type: String Table: User [sys_user]
result.reservation.location.requested_for.user_name	User name of the user for whom the reservation was requested for. Data type: String

result.reservation.location.reservation	Details about the reservation associated with the location.
	
	Data type: Object
	
	`"reservation": {`
	`  "active": Boolean,`
	`  "number": "String",`
	`  "number_of_attendees":`
	` Number,`
	`  "requested_for": {Object},`
	`  "state": {Object},`
	`  "sys_id": "String"`
	`}`

result.reservation.location.reservation.active	Flag that indicates whether the reservation is active. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	• true: Reservation is active. • false: Reservation is inactive. Data type: Boolean
result.reservation.location.reservation.number	Reservation number. Data type: String
result.reservation.location.reservation.number_of_attendees	Number of attendees of the reservation. Data type: Number

result.reservation.location.reservation.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "user_name": "String"`
	`}`

result.reservation.location.reservation.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservation.location.reservation.requested_for.sys_id	Sys_id of the requested for user. Data type: String Table: User [sys_user]
result.reservation.location.reservation.requested_for.user_name	User name of the user for whom the reservation was requested for. Data type: String

result.reservation.location.reservable_module	Details about the reservable module associated with the reservation.
	
	Data type: Object
	
	`"reservable_module": {`
	`  "inline_title": "String",`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "title": "String"`
	`}`

result.reservation.location.reservable_module.inline_title	Inline title of the reservable module. The title appears in line with the descriptive text on the Workplace service portal.

Name	Description
	Data type: String
result.reservation.location.reservable_module.name	Name of the reservable module. Data type: String
result.reservation.location.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.location.reservable_module.title	Title of the reservable module. Data type: String

result.reservation.location.site	Site to which the location belongs.
	
	Data type: Object
	
	`"site": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Site [sn_wsd_core_site]

result.reservation.location.site.active	Flag that indicates whether the site is active. Valid values: • true: Site is active. • false: Site is inactive. Data type: Boolean
result.reservation.location.site.display_value	Display value of the site to which this location belongs, such as Western Europe. Data type: String
result.reservation.location.site.sys_id	Sys_id of the site to which this location belongs. Data type: String Table: Site [sn_wsd_core_site]

result.reservation.location.state	Details about the state of the reservation for the location.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

	`"name": "String",`
	`"sys_id": "String",`
	`"table": "String",`
	`"user_name": "String",`
	`"value": "String"`
	`}`

result.reservation.opened_by.avatar	Avatar for the user that opened the reservation. Data type: String
result.reservation.opened_by.displayValue	Display value of the opened by user. Data type: String
result.reservation.opened_by.display_value	Display value of the opened by user. Data type: String
result.reservation.opened_by.email	Email address for the user that opened the reservation. Data type: String
result.reservation.opened_by.initials	Initials of the user that opened the reservation. Data type: String
result.reservation.opened_by.label	Label for the user that opened the reservation. This is a combination of the title and department of the user. Data type: String
result.reservation.opened_by.name	Name of the user that opened the reservation. Data type: String
result.rservation.opened_by.sys_id	Sys_id_of the user that opened the reservation. Data type: String Table: User [sys_user]

Name	Description
result.rservation.opened_by.table	Table that contains the user record. Data type: String
result.reservation.opened_by.user_name	User name of the user that opened the reservation. Data type: String
result.reservation.opened_by.value	Internal value of the user that opened the reservation. Data type: String
result.reservation.number	Reservation number. Data type: String
result.reservation.number_of_attendees	Number of attendees in this reservation. Data type: Number
result.reservation.recording_details	Details about the recordings associated with the reservation (meeting). Data type: Array of Objects `"recording_details": [ "recording_url": "String" ]`
result.reservation.recording_details.recording_url	URL of the recordings associated with the reservation. Data type: String
result.reservation.requested_for	Details about the user that the reservation was made on behalf of. Data type: Object `"requested_for": { "avatar": "String", "displayValue": "String", "display_value": "String", "email": "String", "initials": "String", "label": "String", "name": "String", "sys_id": "String", "table": "String", "user_name": "String", "value": "String" }`
result.reservation.requested_for.avatar	Avatar for the user that the reservation was made on behalf of.

Name	Description
	Data type: String
result.reservation.requested_for.displayValue	Display value of the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.display_value	Display value of the user that the reservation was made on behalf of. Same as displayValue. Data type: String
result.reservation.requested_for.email	Email address for the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.initials	Initials of the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.label	Label for the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.name	Name of the user that the reservation was made on behalf of. Data type: String
result.rservation.requested_for.sys_id	Sys_id_of the user that the reservation was made on behalf of. Data type: String Table: User [sys_user]
result.rservation.requested_for.table	Table that contains the user record. Data type: String
result.reservation.requested_for.user_name	User name of the user that the reservation was made on behalf of. Data type: String
result.reservation.requested_for.value	Internal value of the user that the reservation was made on behalf of. Data type: String
result.reservation.reservable_module	Details for the requested reservable module. Data type: Object

Name	Description
result.reservation.reservable_module.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.reservation.reservable_module.display_value	Display value of the reservable module. Data type: String
result.reservation.reservable_module.enable_browse_by_area	Flag that indicates whether users are able to search for reservable modules by area. Same as *`browse_by_area_enabled`*. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area. Data type: Boolean
result.reservation.reservable_module.enable_browse_near_a_person	Flag that indicates whether users are able to search for reservable modules located by a specified person. Same as *`browse_near_a_person_enabled`*. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.reservation.reservable_module.enable_facet_filter	Flag that indicates whether facet filtering on workplace items is enabled. When enabled, the filter options that appear are based on the search results. Only the items that are available in the generated search result are available to users for selection in the filter. Valid values: • true: Facet filters are enabled. • false: Facet filters aren't enabled.

Name	Description
	Table: Workplace Location [sn_wsd_core_workplace_location]
result.reservation.reservable_module.reservable_container_field	Level of the container, such as a group of desks in a specific area. Data type: String
result.reservation.reservable_module.reservable_filter	Filter conditions used to filter out reservable items in the associated Reservable table. Reservable table is a field in the Reservable Module [sn_wsd_rsv_reservable_module] table. These filter conditions were applied to the table contained in the field Reservable table. Data type: String
result.reservation.reservable_module.reservable_quantity_field	Reservable quantity of all the spaces. The quantity is used when assigning neighbourhood spaces to an area. For additional information, see Assign neighborhood spaces to an area. Data type: String
result.reservation.reservable_module.reservable_table	Table that contains the reservable workplace items. Data type: String
result.reservation.reservable_module.reservable_type	Type of the reservable item, such as location. Data type: String

result.reservation.reservable_module.reservable_views	Details about the different views associated with the reservable module, such as card view or schedule view.
	
	Data type: Object
	
	`"reservable_views": {`
	`  "iconClass": "String",`
	`  "isDefault": Boolean,`
	`  "label": "String",`
	`  "order": Number,`
	`  "type": "String"`
	`}`
	
	Table: Reservable View [sn_wsd_rsv_reservable_view]

result.reservation.reservable_module.reservable_views.iconClass	Icon class of the reservable view. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.reservable_module.reservable_views.isDefault	Flag that indicates whether to make this reservable view the default for reservable modules. Valid values: • true: Make default. • false: Don't make default. Data type: Boolean
result.reservation.reservable_module.reservable_views.label	Name of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.order	Order in which the views are displayed for the reservable module in the UI. The lower order number come first in the UI. In case of the same order number, it is assigned random ordering. Data type: Number
result.reservation.reservable_module.reservable_views.type	Backend name of the reservable view. Used for internal processing. Data type: String
result.reservation.reservable_module.reservation_paths	Reservation paths associated with the reservable modules such as Browse all, Browse near a person. Data type: Array of Objects `"reservation_paths": [ { "displayValue": "String", "value": "String" } ]`
result.reservation.reservable_module.reservation_paths.display_value	Display value for the reservation path, such as "Browse near a person". Data type: String
result.reservation.reservable_module.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String
result.reservation.reservable_module.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.reservable_module.selection_type	Type of selection to display in the search results. Can be one of the following options: • Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.reservation.reservable_module.short_description	Brief description of the reservable module. Data type: String
result.reservation.reservable_module.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.reservation.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.reservable_module.timeSlots	Details about the time slots associated for a reservable module. Data type: Array of Objects `[ { "name": "String", "short_description": "String", "slot_end": "String", "slot_start": "String", "sys_id": "String" } ]`
result.reservation.reservable_module.timeSlots.name	Name of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.short_description	Brief description of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_end	End time of the time slot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
result.reservation.reservable_module.timeSlots.slot_start	Start time of the slot. Data type: String
result.reservation.reservable_module.timeSlots.sys_id	Sys_id of the time slot record. Data type: String Table: Time Slot [sn_wsd_rsv_time_slot]
result.reservation.reservable_module.title	Title of the reservable module. Data type: String

result.reservation.reservable_module.virtual_meeting_provider	Details about the virtual provider associated with the reservable module.
	
	Data type: Object
	
	`"virtual_meeting_provider": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.reservable_module.virtual_meeting_provider.display_value	Display value of the virtual meeting provider. Data type: String
result.reservation.reservable_module.virtual_meeting_provider.sys_id	Sys_id of the virtual meeting provider. Data type: String

result.reservation.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation.
	
	Data type: Object
	
	`"reservationAcl": {`
	`  "read": Boolean,`
	`  "write": {Object}`
	`}`

result.reservation.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean
result.reservation.reservationAcl.write	Details about the user's write capabilities for the associated reservation.

Name	Description

	Data type: Object
	`"write": {`
	`  "allFields": Boolean,`
	`  "fields": {Object},`
	`  "record": Boolean`
	`}`

result.reservation.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *reservationACL.write.fields* object. If the user only has access to some specific fields, then only those fields are true in the *reservationACL.write.fields* object. Valid values: • true: Check if user can write to all fields specified in the *reservationACL.write.fields* object. • false: Don't check if user can write to all fields specified in the *reservationACL.write.fields* object Data type: Boolean

result.reservation.reservationAcl.write.fields	Details of the access controls on various fields of the reservation.
	
	Data type: Object
	`"fields": {`
	`  "location": Boolean,`
	`  "number_of_attendees": Boolean,`
	`  "requested_for": Boolean,`
	`  "sensitivity": Boolean,`
	`  "subject": Boolean`
	`}`

result.reservation.reservationAcl.write.fields.location	Flag that indicates whether to check if the user can write to the location fields in this reservation. Valid values: • true: Check if user can write to the location fields. • false: Don't check if user can write to the location fields. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
result.reservation.reservationAcl.write.fields.number_of_attendees	Flag that indicates whether to check if the user can write to the number of attendees fields in this reservation. Valid values: • true: Check if user can write to the number of attendees field. • false: Don't check if user can write to the number of attendees field. Data type: Boolean
result.reservation.reservationAcl.write.fields.requested_for	Flag that indicates whether to check if the user can write to the requested for fields in this reservation. Valid values: • true: Check if user can write to the requested for field. • false: Don't check if user can write to the requested for field. Data type: Boolean
result.reservation.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservation.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation. Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservation.reservationAcl.write.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values:

Name	Description
	• true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record. Data type: Boolean

result.reservation.reservation_purpose	Details about the purpose of the reservation.
	
	Data type: Object
	
	`"reservation_purpose": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservation.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String

result.reservation.reservation_type	Details about the type of the reservation.
	
	Data type: Object
	
	`"reservation_type": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.reservation_type.display_value	Display value for the type of the reservation, such as Space. Data type: String
result.reservation.reservation_type.value	Internal value for the type of the reservation, such as space. Data type: String

result.reservation.reservation_subtype	Details about the subtype of the reservation. Subtypes indicate the type of reservation, such as single, Multi parent, Multi child, Recurring parent, or occurrence.
	
	Data type: Object
	
	`"reservation_subtype": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

Name	Description
result.reservation.reservation_subtype.display_value	Display value for the subtype of the reservation, such as Single. Data type: String
result.reservation.reservation_subtype.value	Internal value for the subtype of the reservation, such as single. Data type: String

result.reservation.sensitivity	Details about the sensitivity of the reservation.
	
	Data type: Object
	
	`"sensitivity": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.sensitivity.display_value	Display value for the sensitivity of the reservation, such as high or low. Data type: String
result.reservation.sensitivity.value	Internal value for the sensitivity of the reservation, such as 1 or 3. Data type: String

result.reservation.shift	Details about the shift applied to the reservation.
	
	Data type: Object
	
	`"shift": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "shiftDetails": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.shift.display_value	Display value of the shift. Data type: String
result.reservation.shift.name	Name of the shift. Same as *`display_value`*. Data type: String
Result.reservation.shift.shiftDetails	Details of shift. Data type: String
result.reservation.shift.sys_id	Sys_id of the shift record. Data type: String

Name	Description
	Table: Shift [sn_wsd_core_shift]

result.reservation.source	Details about the source for the reservation, such as Workplace Services or Google Mail..
	
	Data type: Object
	
	`"source": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.source.display_value	Display value for the reservation source, such as Workplace Services. Data type: String
result.reservation.source.value	Internal value for the reservation source, such as servicenow. Data type: String

result.reservation.source_icon	Details about the source of the icon used in the reservation. This icon is used in the UI.
	
	Data type: Object
	
	`"source_icon": {`
	`  "classNames": "String",`
	`  "imgSrc": "String",`
	`  "tooltip": "String"`
	`}`

result.reservation.source_icon.classNames	Comma-separated class names for the source icon. Data type: String
result.reservation.source_icon.imgSrc	Name of the image source for source icon. This icon is stored in the Images [db_image] table. Data type: String
result.reservation.source_icon.tooltip	Tooltip associated with the source icon. Data type: String
result.reservation.source_reservation	Source reservation of the current reservation. For example, in the case of multiple reservations, the parent reservation is the source of the child reservation. Data type: String
result.reservation.start	Reservation start date and time. Data type: String

Name	Description
	Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
Result.reservation.sys_updated_on	Date and time when the reservation was last updated. Data type: String
result.reservation.virtual_meeting	URL of the virtual meeting link. Data type: String

result.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation.
	
	Data type: Object
	
	`"reservationAcl": {`
	`  "read": Boolean,`
	`  "write": {Object}`
	`}`

result.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean

result.reservationAcl.write	Details about the user's write capabilities for the associated reservation.
	
	Data type: Object
	
	`"write": {`
	`  "allFields": Boolean,`
	`  "fields": {Object},`
	`  "record": Boolean`
	`}`

result.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *`reservationACL.write.fields`* object. If the user only has access to some specific fields, then only those fields are true in the *`reservationACL.write.fields`* object. Valid values:

Name	Description
	• true: Check if user can write to all fields specified in the *reservationACL.write.fields* object. • false: Don't check if user can write to all fields specified in the *reservationACL.write.fields* object Data type: Boolean

result.reservationAcl.write.fields	Details of the access controls on various fields of the reservation.
	
	Data type: Object
	
	`"fields": {`
	`"location": Boolean,`
	`"number_of_attendees": Boolean,`
	`"requested_for": Boolean,`
	`"sensitivity": Boolean,`
	`"subject": Boolean`
	`}`

result.reservationAcl.write.fields.location	Flag that indicates whether to check if the user can write to the location fields in this reservation. Valid values: • true: Check if user can write to the location fields. • false: Don't check if user can write to the location fields. Data type: Boolean
result.reservationAcl.write.fields.number_of_attendees	Flag that indicates whether to check if the user can write to the number of attendees fields in this reservation. Valid values: • true: Check if user can write to the number of attendees field. • false: Don't check if user can write to the number of attendees field. Data type: Boolean
result.reservationAcl.write.fields.requested_for	Flag that indicates whether to check if the user can write to the requested for fields in this reservation.

Name	Description
	Valid values: • true: Check if user can write to the requested for field. • false: Don't check if user can write to the requested for field. Data type: Boolean
result.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation. Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservationAcl.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values: • true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record. Data type: Boolean
result.standard_services	Only populated if the *`include_standard_services`* parameter is set to true. Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects

Name	Description
	`"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service. Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String
result.standard_services.sys_id	Sys_id of the standard service record. Data type: String Table: Standard Service [sn_wsd_rsv_standard_service]

Example: cURL request

The following code example shows how to call this endpoint and include the standard services information.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/g
et?sys_id=8e87c722870741106342b846dabb3573&include_standard_serv
ices=true" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
  "result": {
    "reservation": {
      "sys_id": "bf3621de842c2110fa9b813be354f327",

WSD Reservation - GET /api/sn_wsd_rsv/reservation/get_user_reservations

Retrieves the list of reservation for a specified user for the next seven days.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/get_user_reservations`

Default URL: `/api/sn_wsd_rsv/reservation/get_user_reservations`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
userId	Sys_id of the user whose reservations to return. Data type: String Table: User [sys_user]

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Status codes (continued)

Status code	Description
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Reservation return results. Data type: Object `"result":{ "informEmployeePrivacy": Boolean, "reservationsByDate": {Object}, "searchEndDate": "String", "searchStartDate": "String", "sortedReservationDates" : [Array], "workplaceProfile": {Object} }`
result.informEmployeePrivacy	Flag that indicates whether to display a message when reservations are returned that are marked as private. Possible values: • true: Display a message to the user that there are private reservations that are not displayed. • false: Don't display any message. Data type: Boolean
result.reservationsByDate	Details about each reservation by date. Data type: Object - each date in its own Array `"reservationsByDate": { string: [ { "building": {Object}, "floor": {Object}, "location": {Object} }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	``
	  ]
	}
	``

result.reservationsByDate.building	Building where the reservable is located.
	
	Data type: Object
	
	``
	"building": {
	  "display_value": "String",
	  "sys_id": "String",
	  "timezone": {Object}
	}
	``
	
	Table: Building [sn_wsd_core_building]

result.reservationsByDate.building.display_value	Display value for the building. Data type: String
result.reservationsByDate.building.sys_id	Sys_id of the associated building record. Data type: String

result.reservationsByDate.building.timezone	Details of the time zone for the building.
	
	Data type: Object
	
	``
	"timezone": {
	  "displayValue": "String",
	  "value": "String"
	}
	``

result.reservationsByDate.building.timezone.display_value	Display value of the time zone in which the associated building resides. Data type: String
result.reservationsByDate.building.timezone.sys_id	Sys_id of the time zone record in which the associated building resides. Data type: String
result.reservationsByDate.building.value	Internal value for the building. Data type: String

result.reservationsByDate.floor	Details about the floor associated with the reservation.
	
	Data type: Object
	
	``
	"floor": {
	  "displayValue": "String",
	  "value": "String"
	}
	``

result.reservationsByDate.floor.displayValue	Display number of the floor on which the reservable resides, such as 12.

Name	Description
	Data type: String
result.reservationsByDate.floor.value	Internal value of the floor on which the reservation resides. Data type: String

result.reservationsByDate.location	Details on the location of the reservation.
	
	Data type: Object
	
	`"location": {`
	`  "displayValue": "String",`
	`  "type": "String",`
	`  "value": "String"`
	`}`

result.reservationsByDate.location.displayValue	Display value of the location, such as South Parks. Data type: String
result.reservationsByDate.location.type	Type of location, such as workplace/desk, cafe, or gym. Data type: String
result.reservationsByDate.location.value	Internal value for the location, such as south_parks. Data type: String
result.searchEndDate	End date of the reservation search. Seven days from the start date. Format: yyyy-mm-dd Data type: String
result.searchStartDate	Start date of the reservation search. Date on which the endpoint was called. Format: yyyy-mm-dd Data type: String
result.sortedReservationDates	Dates on which the specified user has reservations for the next seven days, sorted in date order. Data type: Array
result.workplaceProfile	Users workplace profile. Describes where the specified user works. Data type: Object

Name	Description
	`"value": "String"` `}`
result.workplaceProfile.floor.displayValue	Display number of the floor on which the user works, such as Floor 8. Data type: String
result.workplaceProfile.floor.value	Internal value of the floor on which the user works. Data type: String

result.workplaceProfile.location	Details on the location of the user.
	
	Data type: Object
	
	`"location": {`
	`"displayValue": "String",`
	`"type": "String",`
	`"value": "String"`
	`}`

result.workplaceProfile.location.displayValue	Display value of the location, such as San Diego. Data type: String
result.workplaceProfile.location.type	Type of location, such as desk or office. Data type: String
result.workplaceProfile.location.value	Internal value for the location, such as san_diego. Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/get
_user_reservations?userId=2de07e1887cb89106342b846dabb35fe" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "sortedReservationDates": [
      "2023-01-24"
    ],
    "workplaceProfile": {
      "location": {
```

WSD Reservation - GET /api/sn_wsd_rsv/reservation/icalendar/{sys_id}

Generates an iCalendar file body for a specified reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/icalendar/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/icalendar/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation for which to generate an iCalendar file body.

WSD Reservation - GET /api/sn_wsd_rsv/reservation/list

Retrieves the list of reservations belonging to a specified user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This endpoint only returns reservations that were requested for or opened by the specified user.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/list`

Default URL: `/api/sn_wsd_rsv/reservation/list`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
encodedQuery	Encoded query to use to filter the returned reservation record results. All fields within the Workplace Reservation [sn_wsd_rsv_reservation] table are valid within the query. For example, `active=true^requested_for=2de07e1887cb89106342b846dabb35fe^building=4703a4cedb3650106c731dcd13961945` Data type: String
endIndex	Last reservation record in the results set to return when specifying indexes for pagination. If this value is greater than the available number of return results records, all remaining records are returned. Data Type: Number
orderByEndDesc	Flag that indicates whether to return the return results in start time descending order. Valid values: • true: Return the results in descending order. • false: Return the results in ascending order. Default: false
searchCriteria	Text that has to match within the reservation for it to be included in the return results. The endpoint checks for this value in the following fields: • configuration_item.name • location.name • private_subject

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• requested_for.name • subject Data Type: String
startIndex	Starting record for which to return records, zero-based. Use this parameter to paginate through large record sets. Data Type: String Default: 0
userId	Sys_id of a user to filter out of the returned reservation information. When this value is passed, the endpoint filters out those reservations where the requested_for or opened_by field is equal to the currently logged-in user. From that reservation list, it then filters out those reservation where the requested_for or opened_by is equal to the passed *`userId`*. Data type: String Default: Returns all reservations where the requested_for or opened_by fields is equal to currently logged-in user. Table: User [sys_user]

Request body parameters

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*. Default: *`application/json`*

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result.reservation	Details about the reservation.
	
	Data type: Object
	
	`"reservation": {`
	`"active": Boolean,`
	`"attendees": [Array],`
	`"check_in_state": {Object},`
	`"end": "String",`
	`"external_ical": "String",`
	`"external_id": "String",`
	`"is_parent": Boolean,`
	`"is_private": Boolean,`
	`"informEmployeePrivacy": Boolean.`
	`"last_updated_sub_source": {Object},`
	`"location" {Object},`
	`"number": "String",`
	`"number_of_attendees": Number,`
	`"recording_details": [Array],`
	`"reservable_module": {Object},`
	`"reservation_purpose": {Object},`

Name	Description
	Data type: String
result.reservation.attendees.display_value	Display value of the attendee. Same as *displayValue*. Data type: String
result.reservation.attendees.email	Attendee's email address. Data type: String
result.reservation.attendees.initials	Attendee's initials. Data type: String
result.reservation.attendees.name	Attendee's name. Data type: String
result.reservation.attendees.sys_id	Sys_id of the attendee record. Data type: String
result.reservation.attendees.table	Table in which the attendee record exists. Data type: String
result.reservation.attendees.user_name	Attendee's user name. Data type: String
result.reservation.attendees.value	Internal value of the attendee. Data type: String

result.reservation.check_in_state	Details about the check-in state of the reservation.
	
	Data type: Object
	
	`"check_in_state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.check_in_state.display_value	Display value for the current check-in state of the reservation, such as In progress or complete. Data type: String
result.reservation.check_in_state.value	Internal value for the current check-in state of the reservation, such as 2. Data type: String

Name	Description

result.reservation.edit_restriction	Description of the user edit restrictions for the reservation, such as no_restrictions, service_only, or fully_restricted.
	
	Data type: Object
	
	`"edit_restriction": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.edit_restriction.display_value	Display value for the edit restrictions for the reservation, such as `No restriction`. Data type: String
result.reservation.edit_restriction.value	Internal value for the edit restrictions for the reservation, such as `no_restriction`. Data type: String
result.reservation.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.external_ical	Unique external iCalendar identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.external_id	Unique external identification of the reservation. Use this value to identify the reservation when this is a calendar sync related reservation. Data type: String
result.reservation.is_parent	Flag that indicates whether this reservation is a parent reservation. Possible values: • true: Parent reservation. • false: Not a parent reservation. Data type: Boolean
result.reservation.is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner.

Name	Description
	For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
result.reservation.last_updated_sub_source	Details about the last updated sub-source for the reservation. Sub-sources are used when integrating reservations with an external calendar. This object contains information such as "servicenow_workplace_service_delivery", "google_calendar", or "microsoft_exchange". Data type: Object `"last_updated_sub_source": { "display_value": "String", "value": "String" }`
result.reservation.last_updated_sub_source.display_value	Display value for the last updated sub-source of the reservation, such as `ServiceNow Workplace Service Delivery` or `Google Calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String
result.reservation.last_updated_sub_source.value	Internal value for the last updated sub-source of the reservation, such as `servicenow_workplace_service_delivery` or `google_calendar`. Used when integrating the reservation with an outside service such as Google calendar or Microsoft Outlook. Data type: String
result.reservation.location	Details about the location associated with the reservation. Data type: Object `"location": { "active": Boolean, "area": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	`"building": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String",`
	`  "timezone": {Object}`
	`}`

result.reservation.location.building.active	Flag that indicates whether the building is active. Valid values: • true: Building is active. • false: Building is inactive. Data type: Boolean
result.reservation.location.building.display_value	Display value of the building to which this location belongs, such as AMS - Bld1. Data type: String
result.reservation.location.building.sys_id	Sys_id of the building to which this location belongs. Data type: String Table: Building [sn_wsd_core_building]

result.reservation.location.building.timezone	Details about the time zone associated with the location.
	
	Data type: Object
	`"timezone": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.reservation.location.building.timezone.display_value	Display value for the time zone to which this location belongs. Data type: String
result.reservation.location.building.timezone.value	Internal value for the time zone to which this location belongs. Data type: String

result.reservation.location.campus	Details about the campus associated with the location.
	
	Data type: Object
	`"campus": {`
	`  "active": Boolean,`
	`  "display_value": "String",`

Name	Description
	`"sys_id": "String"` `}`
result.reservation.location.campus.active	Flag that indicates whether the campus is active. Valid values: • true: Campus is active. • false: Campus is inactive. Data type: Boolean
result.reservation.location.campus.display_value	Display value of the campus to which this location belongs, such as Amsterdam Campus. Data type: String
result.reservation.location.campus.sys_id	Sys_id of the campus to which this location belongs. Data type: String Table: Campus [sn_wsd_core_campus]
result.reservation.location.capacity	Maximum number of occupants for the location. Data type: Number
result.reservation.location.description	Brief description of the location. Data type: String
result.reservation.location.display_value	Value to display in the UI for this location. Data type: String
result.reservation.location.email	Email address for the location. Data type: String

result.reservation.location.floor	Details about the floor associated with the location.
	
	Data type: Object
	`"floor": {`
	`"active": Boolean,`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

result.reservation.location.floor.active	Flag that indicates whether the floor is active. Valid values:

Name	Description
	• true: Floor is active. • false: Floor is inactive. Data type: Boolean
result.reservation.location.floor.display_value	Display value of the floor to which this location belongs, such as First floor. Data type: String
result.reservation.location.floor.sys_id	Sys_id of the floor to which this location belongs. Data type: String Table: Floor [sn_wsd_core_floor]
result.reservation.location.label_value	Type of value specified in the *name* parameter, such as Room name. Data type: String
result.reservation.location.name	Name of the location. Data type: String
result.reservation.location.number	Reservation number. Data type: String
result.reservation.location.number_of_attendees	Number of attendees for the reservation. Data type: Number

result.reservation.location.region	Details about the region associated with the location.
	
	Data type: Object
	`"region": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.location.region.active	Flag that indicates whether the region is active. Valid values: • true: Region is active. • false: Region is inactive. Data type: Boolean
result.reservation.location.region.display_value	Display value of the region to which this location belongs, such as Europe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
result.reservation.location.region.sys_id	Sys_id of the region to which this location belongs. Data type: String Table: Region [sn_wsd_core_region]

result.reservation.location.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "user_name": "String"`
	`}`

result.reservation.location.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservation.location.requested_for.sys_id	Sys_id of the user for whom the reservation is being requested. Data type: String Table: User [sys_user]
result.reservation.location.requested_for.user_name	User name of the user for whom the reservation was requested for. Data type: String

result.reservation.location.reservation	Details about the reservation associated with the location.
	
	Data type: Object
	
	`"reservation": {`
	`  "active": Boolean,`
	`  "number": "String",`
	`  "number_of_attendees":`
	` Number,`
	`  "requested_for": {Object},`
	`  "state": {Object},`
	`  "sys_id": "String"`
	`}`

result.reservation.location.reservation.active	Flag that indicates whether the reservation is active. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	• true: Reservation is active. • false: Reservation is inactive. Data type: Boolean
result.reservation.location.reservation.number	Reservation number. Data type: String
result.reservation.location.reservation.number_of_attendees	Number of attendees of the reservation. Data type: Number

result.reservation.location.reservation.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "user_name": "String"`
	`}`

result.reservation.location.reservation.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservation.location.reservation.requested_for.sys_id	Sys_id of the requested for user. Data type: String Table: User [sys_user]
result.reservation.location.reservation.requested_for.user_name	User name of the user for whom the reservation was requested for. Data type: String

result.reservation.location.reservable_module	Details about the reservable module associated with the reservation.
	
	Data type: Object
	
	`"reservable_module": {`
	`  "inline_title": "String",`
	`  "name": "String",`
	`  "sys_id": "String",`
	`  "title": "String"`
	`}`

result.reservation.location.reservable_module.inline_title	Inline title of the reservable module. The title appears in line with the descriptive text on the Workplace service portal.

Name	Description
	Data type: String
result.reservation.location.reservable_module.name	Name of the reservable module. Data type: String
result.reservation.location.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.location.reservable_module.title	Title of the reservable module. Data type: String

result.reservation.location.site	Site to which the location belongs.
	
	Data type: Object
	
	`"site": {`
	`  "active": Boolean,`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Site [sn_wsd_core_site]

result.reservation.location.site.active	Flag that indicates whether the site is active. Valid values: • true: Site is active. • false: Site is inactive. Data type: Boolean
result.reservation.location.site.display_value	Display value of the site to which this location belongs, such as Western Europe. Data type: String
result.reservation.location.site.sys_id	Sys_id of the site to which this location belongs. Data type: String Table: Site [sn_wsd_core_site]

result.reservation.location.state	Details about the state of the reservation for the location.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

Name	Description
result.rservation.opened_by.table	Table that contains the user record. Data type: String
result.reservation.opened_by.user_name	User name of the user that opened the reservation. Data type: String
result.reservation.opened_by.value	Internal value of the user that opened the reservation. Data type: String
result.reservation.number	Reservation number. Data type: String
result.reservation.number_of_attendees	Number of attendees in this reservation. Data type: Number
result.reservation.recording_details	Details about the recordings associated with the reservation (meeting). Data type: Array of Objects `"recording_details": [ "recording_url": "String" ]`
result.reservation.recording_details.recording_url	URL of the recordings associated with the reservation. Data type: String
result.reservation.requested_for	Details about the user that the reservation was made on behalf of. Data type: Object `"requested_for": { "avatar": "String", "displayValue": "String", "display_value": "String", "email": "String", "initials": "String", "label": "String", "name": "String", "sys_id": "String", "table": "String", "user_name": "String", "value": "String" }`
result.reservation.requested_for.avatar	Avatar for the user that the reservation was made on behalf of.

Name	Description
result.reservation.reservable_module.display_sensitivity	Flag that indicates whether users can set the sensitivity of the reservation, such as normal or private. Valid values: • true: Able to set sensitivity. • false: Not able to set sensitivity. Defaults to normal. Data type: Boolean
result.reservation.reservable_module.display_value	Display value of the reservable module. Data type: String
result.reservation.reservable_module.enable_browse_by_area	Flag that indicates whether users are able to search for reservable modules by area. Same as *browse_by_area_enabled*. Valid values: • true: Allow users to browse reservable modules by area. • false: Don't allow users to browse reservable modules by area. Data type: Boolean
result.reservation.reservable_module.enable_browse_near_a_person	Flag that indicates whether users are able to search for reservable modules located by a specified person. Same as *browse_near_a_person_enabled*. Valid values: • true: Allow users to browse reservable modules near a person. • false: Don't allow users to browse reservable modules near a person. Data type: Boolean
result.reservation.reservable_module.enable_facet_filter	Flag that indicates whether facet filtering on workplace items is enabled. When enabled, the filter options that appear are based on the search results. Only the items that are available in the generated search result are available to users for selection in the filter. Valid values: • true: Facet filters are enabled. • false: Facet filters aren't enabled.

Name	Description
	Table: Workplace Location [sn_wsd_core_workplace_location]
result.reservation.reservable_module.reservable_container_field	Level of the container, such as a group of desks in a specific area. Data type: String
result.reservation.reservable_module.reservable_filter	Filter conditions used to filter out reservable items in the associated Reservable table. Reservable table is a field in the Reservable Module [sn_wsd_rsv_reservable_module] table. These filter conditions were applied to the table contained in the field Reservable table. Data type: String
result.reservation.reservable_module.reservable_quantity_field	Reservable quantity of all the spaces. The quantity is used when assigning neighbourhood spaces to an area. For additional information, see Assign neighborhood spaces to an area. Data type: String
result.reservation.reservable_module.reservable_table	Table that contains the reservable workplace items. Data type: String
result.reservation.reservable_module.reservable_type	Type of the reservable item, such as location. Data type: String

result.reservation.reservable_module.reservable_views	Details about the different views associated with the reservable module, such as card view or schedule view.
	
	Data type: Object
	
	`"reservable_views": {`
	`  "iconClass": "String",`
	`  "isDefault": Boolean,`
	`  "label": "String",`
	`  "order": Number,`
	`  "type": "String"`
	`}`
	
	Table: Reservable View [sn_wsd_rsv_reservable_view]

result.reservation.reservable_module.reservable_views.iconClass	Icon class of the reservable view. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
result.reservation.reservable_module.reservable_views.isDefault	Flag that indicates whether to make this reservable view the default for reservable modules. Valid values: • true: Make default. • false: Don't make default. Data type: Boolean
result.reservation.reservable_module.reservable_views.label	Name of the reservable view. Data type: String
result.reservation.reservable_module.reservable_views.order	Order in which the views are displayed for the reservable module in the UI. The lower order number come first in the UI. In case of the same order number, it is assigned random ordering. Data type: Number
result.reservation.reservable_module.reservable_views.type	Backend name of the reservable view. Used for internal processing. Data type: String
result.reservation.reservable_module.reservation_paths	Reservation paths associated with the reservable modules such as Browse all, Browse near a person. Data type: Array of Objects `"reservation_paths": [ { "displayValue": "String", "value": "String" } ]`
result.reservation.reservable_module.reservation_paths.display_value	Display value for the reservation path, such as "Browse near a person". Data type: String
result.reservation.reservable_module.reservation_paths.value	Internal value for the reservation path, such as "browse_near_a_person". Data type: String
result.reservation.reservable_module.search_limit	Maximum number of search results to return when a user searches for a workplace location. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservation.reservable_module.selection_type	Type of selection to display in the search results. Can be one of the following options: • Specific unit: The search result displays every workplace item. • Container: The search result displays the parent or container of the workplace items. Data type: String
result.reservation.reservable_module.short_description	Brief description of the reservable module. Data type: String
result.reservation.reservable_module.show_map_view	Flag that indicates whether to enable the map view for reservable modules. Valid values: • true: Enable map view. • false: Don't enable map view. Data type: Boolean
result.reservation.reservable_module.sys_id	Sys_id of the reservable module. Data type: String
result.reservation.reservable_module.timeSlots	Details about the time slots associated for a reservable module. Data type: Array of Objects `[ { "name": "String", "short_description": "String", "slot_end": "String", "slot_start": "String", "sys_id": "String" } ]`
result.reservation.reservable_module.timeSlots.name	Name of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.short_description	Brief description of the time slot. Data type: String
result.reservation.reservable_module.timeSlots.slot_end	End time of the time slot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
result.reservation.reservable_module.timeSlots.slot_start	Start time of the slot. Data type: String
result.reservation.reservable_module.timeSlots.sys_id	Sys_id of the time slot record. Data type: String Table: Time Slot [sn_wsd_rsv_time_slot]
result.reservation.reservable_module.title	Title of the reservable module. Data type: String

result.reservation.reservable_module.virtual_meeting_provider	Details about the virtual provider associated with the reservable module.
	
	Data type: Object
	
	`"virtual_meeting_provider": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.reservable_module.virtual_meeting_provider.display_value	Display value of the virtual meeting provider. Data type: String
result.reservation.reservable_module.virtual_meeting_provider.sys_id	Sys_id of the virtual meeting provider. Data type: String

result.reservation.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation.
	
	Data type: Object
	
	`"reservationAcl": {`
	`  "read": Boolean,`
	`  "write": {Object}`
	`}`

result.reservation.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean
result.reservation.reservationAcl.write	Details about the user's write capabilities for the associated reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	Data type: Object
	`"write": {`
	`  "allFields": Boolean,`
	`  "fields": {Object},`
	`  "record": Boolean`
	`}`

result.reservation.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *reservationACL.write.fields* object. If the user only has access to some specific fields, then only those fields are true in the *reservationACL.write.fields* object. Valid values: • true: Check if user can write to all fields specified in the *reservationACL.write.fields* object. • false: Don't check if user can write to all fields specified in the *reservationACL.write.fields* object Data type: Boolean

result.reservation.reservationAcl.write.fields	Details of the access controls on various fields of the reservation.
	
	Data type: Object
	`"fields": {`
	`  "location": Boolean,`
	`  "number_of_attendees":`
	` Boolean,`
	`  "requested_for": Boolean,`
	`  "sensitivity": Boolean,`
	`  "subject": Boolean`
	`}`

result.reservation.reservationAcl.write.fields.location	Flag that indicates whether to check if the user can write to the location fields in this reservation. Valid values: • true: Check if user can write to the location fields. • false: Don't check if user can write to the location fields. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
result.reservation.reservationAcl.write.fields.number_of_attendees	Flag that indicates whether to check if the user can write to the number of attendees fields in this reservation. Valid values: • true: Check if user can write to the number of attendees field. • false: Don't check if user can write to the number of attendees field. Data type: Boolean
result.reservation.reservationAcl.write.fields.requested_for	Flag that indicates whether to check if the user can write to the requested for fields in this reservation. Valid values: • true: Check if user can write to the requested for field. • false: Don't check if user can write to the requested for field. Data type: Boolean
result.reservation.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservation.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation. Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservation.reservationAcl.write.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	• true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record. Data type: Boolean

result.reservation.reservation_purpose	Details about the purpose of the reservation.
	
	Data type: Object
	
	`"reservation_purpose": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservation.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String

result.reservation.reservation_type	Details about the type of the reservation.
	
	Data type: Object
	
	`"reservation_type": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.reservation_type.display_value	Display value for the type of the reservation, such as Space. Data type: String
result.reservation.reservation_type.value	Internal value for the type of the reservation, such as space. Data type: String

result.reservation.reservation_subtype	Details about the subtype of the reservation. Subtypes indicate the type of reservation, such as single, Multi parent, Multi child, Recurring parent, or occurrence.
	
	Data type: Object
	
	`"reservation_subtype": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

Name	Description
result.reservation.reservation_subtype.display_value	Display value for the subtype of the reservation, such as Single. Data type: String
result.reservation.reservation_subtype.value	Internal value for the subtype of the reservation, such as single. Data type: String

result.reservation.sensitivity	Details about the sensitivity of the reservation.
	
	Data type: Object
	
	`"sensitivity": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.sensitivity.display_value	Display value for the sensitivity of the reservation, such as high or low. Data type: String
result.reservation.sensitivity.value	Internal value for the sensitivity of the reservation, such as 1 or 3. Data type: String

result.reservation.shift	Details about the shift applied to the reservation.
	
	Data type: Object
	
	`"shift": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "shiftDetails": "String",`
	`  "sys_id": "String"`
	`}`

result.reservation.shift.display_value	Display value of the shift. Data type: String
result.reservation.shift.name	Name of the shift. Same as *`display_value`*. Data type: String
Result.reservation.shift.shiftDetails	Details of shift. Data type: String
result.reservation.shift.sys_id	Sys_id of the shift record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Table: Shift [sn_wsd_core_shift]

result.reservation.source	Details about the source for the reservation, such as Workplace Services or Google Mail..
	
	Data type: Object
	
	`"source": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservation.source.display_value	Display value for the reservation source, such as Workplace Services. Data type: String
result.reservation.source.value	Internal value for the reservation source, such as servicenow. Data type: String

result.reservation.source_icon	Details about the source of the icon used in the reservation. This icon is used in the UI.
	
	Data type: Object
	
	`"source_icon": {`
	`  "classNames": "String",`
	`  "imgSrc": "String",`
	`  "tooltip": "String"`
	`}`

result.reservation.source_icon.classNames	Comma-separated class names for the source icon. Data type: String
result.reservation.source_icon.imgSrc	Name of the image source for source icon. This icon is stored in the Images [db_image] table. Data type: String
result.reservation.source_icon.tooltip	Tooltip associated with the source icon. Data type: String
result.reservation.source_reservation	Source reservation of the current reservation. For example, in the case of multiple reservations, the parent reservation is the source of the child reservation. Data type: String
result.reservation.start	Reservation start date and time. Data type: String

Name	Description
	Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservation.subject	Reservation's subject. Data type: String
result.reservation.sub_source	Details about the sub-source of the reservation. The sub-source specifies where the reservation originated such as Google Calendar or Microsoft Exchange. Data type: Object `"sub_source": { "display_value": "String", "value": "String" }`
result.reservation.sub_source.display_value	Display value for the sub-source of the reservation, such as Google Calendar. Data type: String
result.reservation.sub_source.value	Internal value of the sub-source field of the reservation, such as google_calendar. Data type: String
result.reservation.sync_state	Details about the synchronization state of a reservation from another service, such as "sync_enqueued" or "synchronized". Data type: Object `"sync_state": { "display_value": "String", "value": "String" }`
result.reservation.sync_state.display_value	Display value for the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sync_state.value	Internal value of the current sync state of the reservation, such as synchronized. Data type: String
result.reservation.sys_created_on	Date and time when the reservation was created. Data type: String
result.reservation.sys_id	Required. Sys_id of the reservation record.

Name	Description
	Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
Result.reservation.sys_updated_on	Date and time when the reservation was last updated. Data type: String
result.reservation.virtual_meeting	URL of the virtual meeting link. Data type: String

result.reservationAcl	Details of the user access control levels (ACL) checks set on the associated reservation.
	
	Data type: Object
	
	`"reservationAcl": {`
	`  "read": Boolean,`
	`  "write": {Object}`
	`}`

result.reservationAcl.read	Flag that indicates whether to check if the user can read this reservation. Valid values: • true: Check if user can read the reservation. • false: Don't check if user can read the reservation. Data type: Boolean

result.reservationAcl.write	Details about the user's write capabilities for the associated reservation.
	
	Data type: Object
	
	`"write": {`
	`  "allFields": Boolean,`
	`  "fields": {Object},`
	`  "record": Boolean`
	`}`

result.reservationAcl.write.allFields	Flag that indicates whether to check if the user can write to all fields specified in the *`reservationACL.write.fields`* object. If the user only has access to some specific fields, then only those fields are true in the *`reservationACL.write.fields`* object. Valid values:

Name	Description
	• true: Check if user can write to all fields specified in the *reservationACL.write.fields* object. • false: Don't check if user can write to all fields specified in the *reservationACL.write.fields* object Data type: Boolean

result.reservationAcl.write.fields	Details of the access controls on various fields of the reservation.
	
	Data type: Object
	
	`"fields": {`
	`"location": Boolean,`
	`"number_of_attendees": Boolean,`
	`"requested_for": Boolean,`
	`"sensitivity": Boolean,`
	`"subject": Boolean`
	`}`

result.reservationAcl.write.fields.location	Flag that indicates whether to check if the user can write to the location fields in this reservation. Valid values: • true: Check if user can write to the location fields. • false: Don't check if user can write to the location fields. Data type: Boolean
result.reservationAcl.write.fields.number_of_attendees	Flag that indicates whether to check if the user can write to the number of attendees fields in this reservation. Valid values: • true: Check if user can write to the number of attendees field. • false: Don't check if user can write to the number of attendees field. Data type: Boolean
result.reservationAcl.write.fields.requested_for	Flag that indicates whether to check if the user can write to the requested for fields in this reservation.

Name	Description
	Valid values: • true: Check if user can write to the requested for field. • false: Don't check if user can write to the requested for field. Data type: Boolean
result.reservationAcl.write.fields.sensitivity	Flag that indicates whether to check if the user can write to the sensitivity fields in this reservation. Valid values: • true: Check if user can write to the sensitivity field. • false: Don't check if user can write to the sensitivity field. Data type: Boolean
result.reservationAcl.write.fields.subject	Flag that indicates whether to check if the user can write to the subject fields in this reservation. Valid values: • true: Check if user can write to the subject field. • false: Don't check if user can write to the subject fields. Data type: Boolean
result.reservationAcl.record	Flag that indicates whether to check if the user can write to the entire reservation record. Valid values: • true: Check if user can write to the entire reservation record. • false: Don't check if user can write to the entire reservation record. Data type: Boolean
result.standard_services	Only populated if the *`include_standard_services`* parameter is set to true. Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects

Name	Description
	`"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.standard_services.font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.standard_services.name	Name of the standard service. Data type: String
result.standard_services.short_description	Brief description of the standard service. Data type: String
result.standard_services.sys_id	Sys_id of the standard service record. Data type: String Table: Standard Service [sn_wsd_rsv_standard_service]

Example: cURL request

This code example shows how to call this endpoint to retrieve a list of reservations associated with the specified user.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/li
st" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "reservations": [
      {
      "sys_id": "12e2da5e87c701106342b846dabb354d",

WSD Reservation - PATCH /api/sn_wsd_rsv/reservation/cancel/{sys_id}

Cancels a specified workplace reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/cancel/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/cancel/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to cancel. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters

Name	Description
cancel_notes	Reason for cancelling the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
sys_id	Sys_id of the cancelled reservation record. Data type: String

Name	Description
	Table: Workplace Reservation [sn_wsd_rsv_reservation]

Example: cURL request

The following code example shows how to cancel a reservation using this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/can
cel/12e2da5e87c701106342b846dabb354d" \
--request PATCH \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
"result": {
  "sys_id": "73c316d2474b0150003a4587746d4337"
}
```

WSD Reservation - PATCH /api/sn_wsd_rsv/reservation/share_details/{sys_id}

Updates and shares the reservation details with a specified list of recipients through an email notification. Optionally you can send a specified message along with the reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/share_details/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/share_details/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to share. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
None

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
sys_id	Sys_id of the reservation record that was shared. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Example: cURL request

The following code example shows how to use this endpoint to share a reservation.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/sha
re_details/60d26a0f47578910003a4587746d4331" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"notification_recipients\":
 [\"5dfb9fcf47d78910003a4587746d4367\"],
\"notification_type\":\"reservation_updated\",
\"notification_custom_message\": \"Please join our design
 brainstorming meeting!\"
}" \
--user "username":"password"
```

Return results:

```
"result": {
  "sys_id": "60d26a0f47578910003a4587746d4331"
}
```

WSD Reservation - PATCH /api/sn_wsd_rsv/reservation/update/{sys_id}

Updates a specified workplace reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/update/{sys_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_wsd_rsv/reservation/update/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation to modify. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Query parameters

Name	Description
ignore_same_day_validation	Flag that indicates whether the reservation search ignores the change of the date validation between the start and end parameters. Valid values: • true: Ignore the change date validation. • false: Don't ignore the change date validation. Data type: Boolean Default: false

Request body parameters

Name	Description
end	Required if the *`shift`* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	• true: Reservation is private. • false: Reservation isn't private. Data type: Boolean Default: Value set for privacy in the system properties.
location	Required. Sys_id of the location to reserve. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
requested_for	Sys_id or email address of the user for which the reservation is being made. Data type: String Table: User [sys_user]
shift	Conditional. Sys_id of the shift to associate with the reservation. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String Table: Shift [sn_wsd_core_shift]
start	Required. Requested start time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
subject	Required. Subject of the meeting associated with the reservation. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Details of the updated reservation.
	
	Data type: Object
	
	`"result": {`
	`  "location_id": "String",`
	`  "sys_id": "String",`
	`  "type_of_change": "String"`
	`}`

result.location_id	Sys_id of the reservation location record. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
result.sys_id	Sys_id of the modified reservation record. Data type: String

Name	Description
	Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.type_of_change	Type of information updated in the reservation. Data type: String

Example: cURL request

The following code example shows how to update a reservation using this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/reservation/upd
ate/b537abc947db4510003a4587746d4351" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"subject\": \"Rsv Update_1\",
\"start\": \"2022-07-21 14:00:00\",
\"end\": \"2022-07-21 15:00:00\",
\"requested_for\": \"workplace_user@example.com\",
\"workplace_location\": \"fe1f744edb7650106c731dcd139619ca\",
\"is_private\": \false\
}" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "sys_id": "b537abc947db4510003a4587746d4351",
    "location_id": "fe1f744edb7650106c731dcd139619ca",
    "type_of_change": "location"
  }
}
```

WSD Reservation - POST /api/sn_wsd_rsv/reservation/add

Creates a new workplace reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/reservation/add`

Default URL: `/api/sn_wsd_rsv/reservation/add`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
ignore_same_day_validation	Flag that indicates whether the reservation search ignores the change of the date validation between the start and end parameters. Valid values: • true: Ignore the change date validation. • false: Don't ignore the change date validation. Data type: Boolean Default: false
timezone	Preferred time zone for performing the request validations. For example: Europe/Amsterdam. This validation checks whether the start and end time fall on the same day. Data type: String Default: User time zone

Request body parameters

Name	Description
end	Required if the *`shift`* parameter isn't passed in. Requested end time of the reservation. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
is_private	Flag that indicates whether the reservation is private. If private, the reservation doesn't appear to anyone except the owner. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Reservation is private. • false: Reservation isn't private.

WSD Reservation Invitees API

The Workplace Service Delivery (WSD) *`Reservation Invitees`* API provides endpoints to add invitees to reservations, fetch invitees of a reservation, and reassign invitees of a reservation.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Reservation Management (sn_wsd_rsv) plugin must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Reservation Invitees - GET /api/sn_wsd_rsv/wsd_reservation_invitees/reservation/{sys_id}

Retrieves details about the invitees associated with a specified reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_reservation_invitees/reservation/{sys_id}`

Default URL: `/api/sn_wsd_rsv/reservation/{sys_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the reservation for which to return the invitee details.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Return results for the invitees associated with the specified reservation. Data type: Object `{ "result": { "invitees": [Array], "reservationId": "String", "reservationSubType": "String", "success": Boolean } }`
result.invitees	Details about the invitees associated with the reservation. Data type: Array of Objects `"invitees": [{ "email": "String", "firstName": "String", "inviteeId": "String", "inviteState": {Object}, "inviteeType": "String", "isVIP": Boolean, "isWifiRequired": Boolean, "isParkingRequired": Boolean, "lastName": "String", "licensePlate": "String", "location": {Object}, "name": "String", "org": "String", "parkingType": "String", "phoneNumber": "String", "privateNotes": "String", "reservationId": "String", "reservationInviteeId": "String", "title": "String", "visitorType": "String" }]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.invitees.email	Email address of the invitee. Data type: String
result.invitees.firstName	First name of the invitee. Data type: String
result.invitees.inviteeId	Sys_id of the employee's user record. Data type: String Table: User [sys_user]

result.invitees.inviteState	Details about the current state of the invitee for the reservation.
	
	Data type: Object
	
	`"inviteState": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.invitees.inviteState.displayValue	Display value for the invitee state, such as New or Removed. Data type: String
result.invitees.inviteState.value	Internal value for the invitee state. Data type: String
result.invitees.inviteeType	Type of invitee. Valid values: (case-sensitive) • employee • visitor Data type: String
result.invitees.isVIP	Flag that indicates whether the invitee is classified as a VIP. Valid values: • true: Invitee is a VIP. • false: Invitee isn't a VIP. Data type: Boolean
result.invitees.isWifiRequired	Flag that indicates whether the WIFI password should be provided to the visitor upon entry. Valid values: • true: Provide WIFI password. • false: Don't provide WIFI password.

Name	Description
	Data type: Boolean
result.invitees.isParkingRequired	Flag that indicates whether the invitee requires parking. Valid values: • true: Parking needed. • false: Parking isn't needed. Data type: Boolean
result.invitees.lastName	Last name of the invitee. Data type: String
result.invitees.licensePlate	License plate of the invitee. Data type: String

result.invitees.location	Details about the workplace location of the invitee.
	
	Data type: Object
	`"location": {`
	`"displayName": "String",`
	`"sysId": "String"`
	`}`

result.invitees.location.displayName	Display name of the invitee's workplace location, such as Dublin. Data type: String
result.invitees.location.sysId	Sys_id of the invitee workplace location. Data type: String Table: Workplace Location [sn_wsd_core_worplace_location]
result.invitees.name	Name of the invitee. Data type: String
result.invitees.org	Organization of the invitee. Data type: String
result.invitees.parkingType	Type of parking required for invitee. Valid values: (case-sensitive) • ev_parking • none • normal_parking • van_accessible_parking

Name	Description
	Data type: String
result.invitees.phoneNumber	Phone number of the invitee. Data type: String
result.invitees.privateNotes	Any additional notes provided by the invitee. Data type: String
result.invitees.reservationId	Sys_id of the reservation to which the invitee is associated. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.invitees.reservationInviteeId	Sys_id of the reservation invitee for visitor. Data type: String Table: Reservation Invitee [sn_wsd_rsv_m2m_reservation_invitee]
result.invitees.title	Title of the invitee. Data type: String
result.invitees.visitorType	Type of invitee. Valid values: (case-sensitive) • client • contractor • friend_family • others Data type: String
result.reservationId	Sys_id of the reservation to which the invitee is associated. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.reservationSubType	Sub-type of the reservation record, such as single or multi-child. Data type: String
result.success	Flag that indicates whether the call was successful. Possible values:

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
reservationId	Required. Sys_id of the reservation for which to reassign the invitees. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
reservationInvitees	List of invitees to reassign to the reservation identified in the *`reservationId`* parameter. This removes the specified invitees from an earlier reservation in which they were present as per the reservation invitee table and moves them to this reservation. Data type: Array of Strings Table: Reservation Invitee [sn_wsd_rsv_m2m_reservation_invitee]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *`application/json`*, *`application/xml`* or, *`text/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Only supports *`application/json`*.

None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Details about the invitee reassignment.
	
	Data type: Object
	
	`"result": {`
	`  "reservationInviteeIds": [Array],`
	`  "success": Boolean`
	`}`

result.reservationInviteeIds	List of sys_ids of the reservation invitees that were re-assigned to the specified reservation. Data type: Array of Strings
result.success	Flag that indicates whether the invitees were reassigned to the reservation. Possible values: • true: Invitees were successfully reassigned. • false: Invitees weren't reassigned. Data type: Boolean

Example: cURL request

The following code example shows how to reassign invitees to a reservation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/wsd_reservation_
invitees/reassign" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"reservationId\":\"3984e6c1532f01103cf7ddeeff7b129b\",
\"reservationInvitees\":
{\"aa31427f531701103cf7ddeeff7b1243\",\"e231427f531701103cf7ddee
ff7b1243\"}
}" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "success": true,
    "reservationInviteeIds": [
      "aa31427f531701103cf7ddeeff7b1243",
      "e231427f531701103cf7ddeeff7b1243"
    ]
  }
}
```

WSD Reservation Invitees - POST /api/sn_wsd_rsv/wsd_reservation_invitees/submit

Adds the specified invitees to a specified reservation.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_reservation_invitees/submit`

Default URL: `/api/sn_wsd_rsv/wsd_reservation_invitees/submit`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

```

Return results:

```
{
  "result": {
    "success": true,
    "reservationId": "17979dc9536b01103cf7ddeeff7b12b3"
  }
}
```

WSD Search API

The Workplace Service Delivery (WSD) *Search* API provides endpoints to search for available locations and workplace items such as reservables, reservable modules, and available shifts.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Search - GET /api/sn_wsd_rsv/search/availability

Checks whether the specified reservables are available for the specified times.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/availability`

Default URL: `/api/sn_wsd_rsv/search/availability`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
end	Required. End time to use to search for available reservable modules. This value must

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	be later than the value specified in the *start* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
include_reservations_within_days	Flag that indicates whether to return all free slots of available times in the response for each reservable for the whole day. Valid values: • true: Return all free slots. • false: Don't return all free slots. Data type: Boolean Default: false
reservable_ids	Required. Comma-separated list of reservable sys_ids to evaluate for availability. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]
reservation_ids	Comma-separated list of existing reservation sys_ids. Pass this parameter if you want to edit the associated reservations. The time blocked for these sys_ids for the corresponding reservables are treated as available. Data type: String Default: None Table: Workplace Reservation [sn_wsd_rsv_reservation]
reservable_module	Required. Sys_id of the reservable module to include in the search. A reservable module groups similar types of workplace items. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]
schedule_view_obj	Details about the schedule view to return. Pass this object if you need 24-hour availability data

Query parameters (continued)

Name	Description
	for reservations that span more than one day. The return results will only contain available times and reservations for the specified date. For this functionality to work properly, the parameters *ignore_same_day_validation* and *include_reservations_within_days* must be set to `true`. Data type: Object `"schedule_view_obj": { "schedule_view_date": "String", "timezone": "String" }`
schedule_view_obj.schedule_view_date	Date for which to start returning reservation availability. This date must be in the time zone specified in the *schedule_view_obj.timezone* parameter. Data type: String Format: YYYY-MM-DD
schedule_view_obj.timezone	Building time zone to use to determine the reservation availability data to return. For example: US/Pacific. Data type: String
shift	Required if the specified reservable modules are based on a shift. Conditional. Sys_id of the shift to associate with the reservation. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String Table: Shift [sn_wsd_core_shift]
start	Required. Start time to use to search for available reservable modules. This value must be prior to the value specified in the *end* parameter. Data type: String

Query parameters (continued)

Name	Description
	Format: UTC or local time (yyyy-mm-dd hh:mm:ss)

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	List of all available resevables for the specified times. Data type: Array of Objects `"result": [ { "availableTimes": [Array], "building": {Object}, "campus": {Object}, "email": "String", "floor": {Object}, "is_available": Boolean, "name": "String", "reservations": [Array], "sys_id": "String" } ]`
result.availableTimes	List of dates/times that the associated reservable is available. Data type: Array
result.building	Details about the building associated with the reservable. Data type: Object `"building": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.building.display_value	Display value for the building. Data type: String
result.building.name	Name of the building. Data type: String
result.building.sys_id	Sys_id of the associated building record. Data type: String
result.campus	Details about the campus associated with the reservable. Data type: Object `"campus": { "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	`"name": "String",`
	`"sys_id": "String"`
	`}`

result.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.campus.name	Name of the campus. Data type: String
result.campus.sys_id	Sys_id of the associated record. Data type: String Table: Campus [sn_wsd_core_campus]
result.email	Email address for the associated reservable. Data type: String

result.floor	Details about the floor associated with the reservable.
	
	Data type: Object
	
	`"floor": {`
	`"display_value": "String",`
	`"name": "String",`
	`"sys_id": "String"`
	`}`

result.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.floor.name	Name of the floor on which the reservable resides. Data type: String
result.floor.sys_id	Sys_id of the associated record. Data type: String Table: Floor [sn_wsd_core_floor]
result.is_available	Flag that indicates whether the reservable is available to reserve. Valid values: • true: Available to reserve. • false: Not available to reserve.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
result.name	Name of the reservable. Data type: String
result.reservations	Details about the associated reservation. Data type: Array of Objects `"reservations": [ { "configuration_item": "String", "end": "String", "is_collided": Boolean, "location": {Object}, "number": "String", "requested_for": {Object}, "reservation_purpose": {Object}, "start": "String", "state": {Object}, "subject": "String", "sys_id": "String" } ]`
result.reservations.configuration_item	Configuration items corresponding to the reservation. Data type: String Table: Configuration Item [cmdb_ci]
result.reservations.end	Reservation end date and time. Data type: String Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservations.is_collided	Flag that indicates whether the reservation collides with the start and end time of the search. This indicates that the associated reservable location is already reserved for the specified search timespan. Possible values: • true: Collision. • false: No collision. Data type: Boolean

Name	Description

result.reservations.location	Details about the location of the reservation.
	
	Data type: Object
	
	`"location": {`
	`  "location": "String",`
	`  "timezone": {Object}`
	`}`

result.reservations.location.location	Sys_id of the associated location record. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]

result.reservations.location.timezone	Details about the time zone associated with the location.
	
	Data type: Object
	
	`"timezone": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.reservations.location.timezone.displayValue	Display value for the time zone to which this location belongs. Data type: String
result.reservations.location.timezone.value	Internal value for the time zone to which this location belongs. Data type: String
result.reservations.number	Reservation number. Data type: String

result.reservations.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

result.reservations.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservations.requested_for.sys_id	Sys_id of the user for whom the reservation is being requested.

Name	Description
	Data type: String Table: User [sys_user]

result.reservations.reservation_purpose	Details about the purpose of the reservation.
	
	Data type: Object
	
	`"reservation_purpose": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservations.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservations.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservations.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z

result.reservations.state	Details about the state of the reservation for the location.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservations.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String
result.reservations.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservations.subject	Reservation's subject. Data type: String
result.reservations.sys_id	Required. Sys_id of the reservation record.

Name	Description
	Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

Example: cURL request

The following code example shows how to call this endpoint. Note: Line breaks have been added to the query parameters for easier reading.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/search/availabi
lity?
reservable_module=5db44502dbb650106c731dcd13961937&
start=2023-10-12T11:00:00Z&
end=2023-10-15T12:00:00Z&
reservable_ids=adb35f1977220110b3d7be377b5a99fc&
reservation_ids=undefined&
shift=undefined&
schedule_view_obj={"schedule_view_date":"2023-10-12","timezone":
"Europe/Paris"}&
timezone=Europe/Paris&
include_reservations_within_days=true&
ignore_same_day_validation=true&
include_unavailable_items=true"  \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": [
    {
      "sys_id": "fe1f744edb7650106c731dcd139619ca",

          }
        }
      ]
    }
  ]
}
```

WSD Search - GET /api/sn_wsd_rsv/search/best_match

Searches for the best reservable item match based on provided search criteria.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/best_match`

Default URL: `/api/sn_wsd_rsv/search/best_match`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
best_match_count	Number of best matched reservables to return. Data type: Number Default: 1
end	Required. End time to use to search for available reservable modules. This value must be later than the value specified in the *`start`* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
include_reservable_purposes	Flag that indicates whether to return the purpose of reserving the workplace location for each reservable in the return results. Valid values: • true: Return the reservable purposes. • false: Don't return the reservable purposes. Data type: Boolean Default: false Table: Reservable Purpose [sn_wsd_rsv_reservable_purpose]
include_reservations_within_days	Flag that indicates whether to return all free slots of available times in the response for each reservable for the whole day. Valid values: • true: Return all free slots. • false: Don't return all free slots. Data type: Boolean Default: false
include_standard_services	Flag that indicates whether to return the standard services information in the response. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	A standard service describes basic provisions available with a reservable workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
q	Required. Encoded query to use to filter the search return results. Within this query you must specify the building sys_id and you can specify parameters such as floor, area, capacity, standard services, and reservable_purposes. All passed parameters must be sys_ids, except for capacity, which is a number. For example: `q=building=94e264cedb3650106c731dcd13961919^floorINfc7368cedb3650106c731dcd13961902^capacity>=1^standard_services=55c0818edb7650106c731dcd13961904^reservable_purposes=d6e5c7cd1ba4e01051848489cc4bcb8` You can locate this information in the following tables: • Area: sn_wsd_core_area • Building: sn_wsd_core_building • Floor: sn_wsd_core_floor • Reservable purposes: sn_wsd_rsv_reservable_purpose • Standard services: sn_wsd_rsv_standard_service Data type: String
reservable_module	Required. Sys_id of the reservable module to include in the search. A reservable module groups similar types of workplace items. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]
start	Required. Start time to use to search for available reservable modules. This value must be prior to the value specified in the *end* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
time_slot	Sys_id of a time slot record for which we are trying to look for the best matching reservable.

Query parameters (continued)

Name	Description
	Data type: String Default: None Table: Time Slot [sn_wsd_rsv_time_slot]
timezone	Preferred time zone, such as Europe/Amsterdam. Data type: String Default: None

Request body parameters

Header	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Status codes (continued)

Status code	Description
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results for the best reservable match.
	
	Data type: Object
	
	`"result": {`
	`"floorsOfSelectedBuilding": [Array],`
	`"hasMore": Boolean,`
	`"nextItemIndex": Number,`
	`"reservableContainers": [Array],`
	`"reservableUnits": [Array]`
	`}`

result.floorsOfSelectedBuilding	Details about the floors on which the reservable is located.
	
	Data type: Array of Objects
	
	`"floorsOfSelectedBuilding": [`
	`{`
	`"display_value": "String",`
	`"external_id": "String",`
	`"name": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.floorsOfSelectedBuilding.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.floorsOfSelectedBuilding.external_id	External identifier for the floor. Data type: String
result.floorsOfSelectedBuilding.name	Name of the floor on which the reservable resides. Data type: String
result.floorsOfSelectedBuilding.sys_id	Sys_id of the associated record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Table: Floor [sn_wsd_core_floor]
result.hasMore	Flag that indicates whether there are more reservables in the return results. Possible values: • true: More reservables available. • false: No more reservables available. Data type: Boolean
result.nextItemIndex	Index for the next reservable record to fetch. Use this value when paginating through reservable records. Data type: Number
result.reservableContainers	Only returned for reservable modules whose selection_type field is set to `container`. A container is a grouping of similar items, such as a group of desks. Data type: Array of Objects `"reservableContainers": [ { "building": {Object}, "campus": {Object}, "capacity": Number, "display_value": "String", "floor": {Object}, "image": {Object} "sys_id": "String" } ]`
result.reservableContainers.building	Details about the building associated with the reservable container. Data type: Object `"building": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableContainers.building.display_value	Display value for the building. Data type: String
result.reservableContainers.building.name	Name of the building.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
result.reservableContainers.building.sys_id	Sys_id of the associated building record. Data type: String

result.reservableContainers.campus	Details about the campus on which the reservable is located.
	
	Data type: Object
	
	`"campus": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Campus [sn_wsd_core_campus]

result.reservableContainers.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.reservableContainers.campus.name	Name of the campus. Data type: String
result.reservableContainers.campus.sys_id	Sys_id of the associated record. Data type: String Table: Campus [sn_wsd_core_campus]
result.reservableContainers.capacity	Maximum number of occupants for the reservable. Data type: Number
result.reservableContainers.display_value	Display value for the reservable container. Data type: String

result.reservableContainers.floor	Details about the floor associated with the reservable container.
	
	Data type: Object
	
	`"floor": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

result.reservableContainers.floor.display_value	Display number of the floor on which the reservable resides, such as 12.

Name	Description
	Data type: String
result.reservableContainers.floor.name	Name of the floor on which the reservable resides. Data type: String
result.reservableContainers.floor.sys_id	Sys_id of the associated record. Data type: String Table: Floor [sn_wsd_core_floor]

result.reservableContainers.image	Details about an image that represents the layout for the associated reservable.
	
	Data type: Object
	
	`"image": {`
	`  "link": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Images [db_image]

result.reservableContainers.image.link	Link to an image that represents the layout for this reservable. Data type: String Table: Images [db_image]
result.reservableContainers.image.sys_id	Sys_id of the associated image record. Data type: String
result.reservableContainers.sys_id	Sys_id of the associated container record. Data type: String Table: The table in which this resides can be configured for any container type. By default it is in the Area [sn_wsd_core_area] table.

result.reservableUnits	Details about the reservable units that match the specified search criteria. A reservable unit is a single reservable item such as a desk or a chair.
	
	Data type: Array of Objects
	
	`"reservableUnits": [`
	`  {`
	`  "area": "String",`
	`  "availableTimes": [Array],`
	`  "building": {Object},`

Name	Description
result.reservableUnits.area.sys_id	Sys_id of the area record associated with the reservable. Data type: String
result.reservableUnits.availableTimes	List of dates/times that the associated reservable is available. Data type: Array

result.reservableUnits.building	Details about the building in which the reservable is located.
	
	Data type: Object
	
	`"building": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Building [sn_wsd_core_building]

result.reservableUnits.building.display_value	Display value for the building. Data type: String
result.reservableUnits.building.sys_id	Sys_id of the associated building record. Data type: String

result.reservableUnits.campus	Details about the campus on which the reservable is located.
	
	Data type: Object
	
	`"campus": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Campus [sn_wsd_core_campus]

result.reservableUnits.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.reservableUnits.campus.sys_id	Sys_id of the associated record. Data type: String Table: Campus [sn_wsd_core_campus]
result.reservableUnits.capacity	Maximum number of occupants for the reservable. Data type: Number

Name	Description
result.reservableUnits.defaultPrivacyValue	Flag that indicates the default privacy setting for the reservable. For additional information on these privacy settings, see Location privacy settings and impact. Possible values: • true: Privacy setting for the reservable can be overridden. • false: Privacy setting for the reservable can't be overridden. Data type: Boolean
result.reservableUnits.description	Brief description of the reservable. Data type: String
result.reservableUnits.email	Email address for the reservable. Data type: String
result.reservableUnits.external_id	External ID of the reservable used to sync a space mapped in CMS. This value is only populated if there is a map associated with this location. Data type: String

result.reservableUnits.floor	Details about the floor on which the reservable is located.
	
	Data type: Object
	`"floor": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Floor [sn_wsd_core_floor]

result.reservableUnits.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservableUnits.floor.sys_id	Sys_id of the associated record. Data type: String Table: Floor [sn_wsd_core_floor]
result.reservableUnits.image	Details about an image that represents the layout for the associated reservable. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	``
	"image": {
	  "link": "String",
	  "sys_id": "String"
	}
	``
	
	Table: Images [db_image]

result.reservableUnits.image.link	Link to an image that represents the layout for this reservable. Data type: String Table: Images [db_image]
result.reservableUnits.image.sys_id	Sys_id of the associated image record. Data type: String
result.reservableUnits.includedInResult	Flag that indicates whether the current reservable is included in the return results. Valid values: • true: Included in the return results. • false: Not included in the return results. Data type: Boolean
result.reservableUnits.is_available	Flag that indicates whether the reservable is available to reserve. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_favorite	Flag that indicates whether the reservable is flagged as one of the associated user's favorites. Valid values: • true: Favorite. • false: Not a favorite. Data type: Boolean
result.reservableUnits.is_reservable	Flag that indicates whether it's possible to reserve this reservable.

Name	Description
	Note: If the *include_unavailable_items* query parameter is set to true, unavailable locations are also returned. In this case, if a location is already reserved, then the *is_available* parameter is false, but *is_reservable* is true. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_reserved	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved. Data type: Boolean
result.reservableUnits.is_selected	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved. Data type: Boolean

result.reservableUnits.location_type	Details about the type of location of the reservable, such as workplace/desk, cafe, or gym.
	
	Data type: Object
	`"location_type": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Workplace Location [sn_wsd_core_workplace_location]

result.reservableUnits.location_type.display_value	Display value of the location type. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.reservableUnits.location_type.name	Name of the location type, such as basement or storage. Same as display value. Data type: String
result.reservableUnits.location_type.sys_id	Sys_id of the associated record. Data type: String Table: Space Type [sn_wsd_core_space_type]
result.reservableUnits.name	Name of the reservable. Data type: String
result.reservableUnits.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.reservableUnits.order	Order number for the reservable. Data type: Number
result.reservableUnits.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.reservableUnits.requires_check_in	Flag that indicates whether the reservable requires the user to check in. Valid values: • true: Check in required. • false: Check in isn't required. Data type: Boolean
result.reservableUnits.reservable_purposes	Details about the purpose for reserving the associated reservable. Data type: Array of Objects `"reservable_purposes": [ { "name": "String", "short_description": "String", "sys_id": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
result.reservableUnits.reservable_purposes.name	Name of the reservable. Data type: String
result.reservableUnits.reservable_purposes.short_description	Brief description of the reservable. Data type: String
result.reservableUnits.reservable_purposes.sys_id	Sys_id of the reservable purpose record. Data type: String Table: Reservable Purpose [sn_wsd_rsv_reservable_purpose]
result.reservableUnits.reservations	Details about the reservations associated with the reservable. Only populated if the *include_reservations_within_days* query parameter is true and the *reservation_ids* parameter contains reservation IDs, meaning there are reservations already present for this reservable. Data type: Array of Objects `"reservations": [ { "configuration_item": "String", "end": "String", "is_collided": Boolean, "location": {Object}, "number": "String", "requested_for": {Object}, "reservation_purpose": {Object}, "start": "String", "state": {Object}, "subject": "String", "sys_id": "String" } ]`
result.reservableUnits.reservations.configuration_item	Configuration items corresponding to the reservation. Data type: String Table: Configuration Item [cmdb_ci]
result.reservableUnits.reservations.end	Reservation end date and time. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z
result.reservableUnits.reservations.is_collided	Flag that indicates whether the reservation collides with the start and end time of the search. This indicates that the associated reservable location is already reserved for the specified search timespan. Possible values: • true: Collision. • false: No collision. Data type: Boolean

result.reservableUnits.reservations.location	Details about the location of the reservation.
	
	Data type: Object
	`"location": {`
	`  "location": "String",`
	`  "timezone": {Object}`
	`}`

result.reservableUnits.reservations.location.location	Sys_id of the associated location record. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]

result.reservableUnits.reservations.location.timezone	Details about the time zone associated with the location.
	
	Data type: Object
	`"timezone": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.reservableUnits.reservations.location.timezone.displayValue	Display value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.location.timezone.value	Internal value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.number	Unique identifier of the reservable. This value is more human readable than the sys_id.

Name	Description
	Data type: String

result.reservableUnits.reservations.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

result.reservableUnits.reservations.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservableUnits.reservations.requested_for.sys_id	Sys_id of the user for whom the reservation is being requested. Data type: String Table: User [sys_user]

result.reservableUnits.reservations.reservation_purpose	Details about the purpose of the reservation.
	
	Data type: Object
	
	`"reservation_purpose": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservableUnits.reservations.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting. Data type: String
result.reservableUnits.reservations.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservableUnits.reservations.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z

result.reservableUnits.reservations.state	Details about the state of the reservation for the location.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	`"value": "String"` `}`
result.reservableUnits.reservations.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String
result.reservableUnits.reservations.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservableUnits.reservations.subject	Reservation's subject. Data type: String
result.reservableUnits.reservations.sys_id	Required. Sys_id of the reservation record. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.reservableUnits.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer
result.reservableUnits.showPrivacyOption	Flag that indicates whether an employee can override the privacy settings for the associated reservable. For additional information on these privacy settings, see Location privacy settings and impact. Valid values: • true: Privacy settings can be overridden. • false: Privacy setting can't be overridden. Data type: Boolean

result.reservableUnits.site	Details about the site where the reservable resides.
	
	Data type: Object
	`"site": {`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`

Name	Description
	Table: Site [sn_wsd_core_site]
result.reservableUnits.site.display_value	Display value of the site. Data type: String
result.reservableUnits.site.sys_id	Sys_id of the associated site record. Data type: String Table: Site [sn_wsd_core_site]
result.reservableUnits.standard_services	Associated standard services, such as flip chart, projector screen, and whiteboard and markers. Data type: Array of Objects `"standard_services": [ { "font_awesome_icon": "String", "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.reservableUnits.standard_services. font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.reservableUnits.standard_services.name	Name of the thumbnail icon associated with the standard service. Data type: String
result.reservableUnits.standard_services. short_description	Brief description of the standard service. Data type: String
result.reservableUnits.standard_services.sys_id	Sys_id of the standard service record. Data type: String Table: Standard Service [sn_wsd_rsv_standard_service]
result.reservableUnits.sys_id	Sys_id of the reservable record. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]

WSD Search - GET /api/sn_wsd_rsv/search/overlapping_reservation

Determines whether an overlapping reservation exists based on the passed parameters.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/overlapping_reservation`

Default URL: `/api/sn_wsd_rsv/search/overlapping_reservation`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
end	Required. End time to use to check for overlapping reservations. Data type: String Format: YYYY-MM-DDTHH:MM:SSZ

recurring_pattern	Details about the recurring pattern for the reservation.
	
	Data type: Object
	
	`"recurring_pattern": {`
	`  "duration": Number,`
	`  "options": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description

	`"repeats": "String",`
	`"startDate":"String"`
	`}`

recurring_pattern.duration	Length of time to check. Data type: Number Unit: Seconds

recurring_pattern.options	Details about the options associated with the recurring reservation.
	
	Data type: Object
	
	`"options": {`
	`"count": Number,`
	`"daysOfWeek": "String",`
	`"every": Number`
	`}`

recurring_pattern.options.count	Number of times the pattern is repeated. Data type: Number
recurring_pattern.options.daysOfWeek	Days of the week to check for overlap. Valid values: • 1 = Monday • 2 = Tuesday • 3 = Wednesday • 4 = Thursday • 5 = Friday • 6 = Saturday • 7 = Sunday For example, to specify Tuesday, Thursday, and Friday, pass 245 (no delimiter). Data type: String
recurring_pattern.options.every	Pattern repeat interval to check. For example, if this value is 2, it checks the repeat pattern based on the selection in the *repeats* parameter, such as every other day or every other week. Data type: Number
recurring_pattern.options.repeats	Repeating pattern for the reservation overlap check. Possible values: (case-sensitive)

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• daily • monthly • weekly • yearly Data type: String
reservable_id	Sys_id of the reservable module to check for overlapping reservations. Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]
reservation_id	Sys_id of the reservation to check for overlap. This value is needed in the edit flow of multi/group parents. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]

shift_info_object	Details of the shift to check for overlap.
	
	For additional information on shift-based reservations, see Enable shift-based reservation.
	
	Data type: Object
	
	`"shift_info_object": {`
	`  "applyToShift": Boolean,`
	`  "shift": "String",`
	`  "timezone": "String"`
	`}`

shift_info_object.applyToShift	Flag that indicates whether shift-based reservations are enabled for the reservable module. Valid values: • true: Allow shift-based reservations. • false: Don't allow shift-based reservations. Data type: Boolean
shift_info_object.shift	Sys_id of the shift to associate with the reservation. If this parameter is passed in, the *end* parameter isn't required. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Table:Shift [sn_wsd_core_shift]
shift_info_object.timezone	Time zone of the shift to check for overlap. Data type: String
start	Required. Start time to use to check for overlapping reservations. Data type: String Format: YYY-MM-DDTHH:MM:SSZ
user_id	Required. Sys_id of the user to check for overlapping reservations. Data type: String Table: User [sys_user]

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

results	Details of the results of the overlap check.
	
	Data type: Object
	
	`"results": {`
	`  "isOverlapped": Boolean,`
	`  "reservableId": "String"`
	`}`

results.isOverlapped	Flag that indicates whether an overlapping reservation exists. Valid values: • true: Overlapping reservation exists. • false: Overlapping reservation doesn’t exist. Data type: Boolean
results.reservableId	In the case of a group reservation, the sys_id of the reservable for which the overlap occurs. Data type: String

Example: cURL request

The following code example shows how to check for a reservation overlap for a specific user and for a specific period of time denoted by the *start* and *end* parameters.

```
curl
 "http://instance.servicenow.com/api/sn_wsd_rsv/search/overlappi
ng_reservation?user_id=2e617fecc3d365101e38b23bb00131ec&end=2023
-06-19T8:00:00Z&start=2023-06-19T07:00:00Z" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
"results": {
  "isOverlapped": True,
  "reservableId": ""
  }
}
```

WSD Search - GET /api/sn_wsd_rsv/search/reservable

Searches for available reservable items using a specified reservable model configuration.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/reservable`

Default URL: `/api/sn_wsd_rsv/search/reservable`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
end	Required. End time to use to search for available reservable modules. T value must be later than the value specified in the *`start`* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
exclude_reservables	List of one or more sys_ids of reservables to exclude from the search re Data type: String or Array Table: The table in which these sys_ids are located is specified in the reservable_table field in the Reservable Module [sn_wsd_rsv_reservable_module] table. It can be either the Space [sn_wsd_core_space] or Room [sn_wsd_core_room] table.
ignore_same_day_validation	Flag that indicates whether the reservation search ignores the change date validation between the start and end parameters. Valid values: • true: Ignore the change date validation. • false: Don't ignore the change date validation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: Boolean Default: false
include_reservable_purposes	Flag that indicates whether to return the purpose of reserving the work location for each reservable in the return results. Valid values: • true: Return the reservable purposes. • false: Don't return the reservable purposes. Data type: Boolean Default: false Table: Reservable Purpose [sn_wsd_rsv_reservable_purpose]
include_reservations_within_days	Flag that indicates whether to return all free slots of available times in t response for each reservable for the whole day. Valid values: • true: Return all free slots. • false: Don't return all free slots. Data type: Boolean Default: false
include_standard_services	Flag that indicates whether to return the standard services information in the response. This information is located in the Standard Service [sn_wsd_rsv_standard_service] table. A standard service describes basic provisions available with a reserval workplace item when the reservation is made, such as white boards, additional monitors, and similar services. For additional information on standard services, see Standard services. Valid values: • true: Return the standard services information. • false: Don't return the standard services information. Data type: Boolean Default: false
near_by_location_id	Required if the *rsv_path* parameter is set to `browse_near_a_pe` Sys_id of the location to use in the encoded query. Data type: String Table: Workplace Location [sn_wsd_core_workplace_location]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
neighborhood	Required if the `rsv_path` parameter is set to `browse_by_neighborhood`. Only available if the Space Management (sn_wsd_spc_mgmt_neighbo plugin is activated. Sys_id of the neighborhood record to use in the encoded query. For additional information on neighborhood space reservations, see C neighborhood reservations. Data type: String Table: Neighborhood [sn_wsd_spcmgmt_neighborhood]
next_item_index	Index of next item to retrieve. Pass this parameter when paginating the results. Data type: Number Default: 0
page_size	Maximum number of records to return in the return results. Data type: Number Default: 6
q	Required. Encoded query to use to filter the search return results. Withi query you must specify the building sys_id and you can specify param such as floor, area, capacity, standard services, and reservable_purpos All passed parameters must be sys_ids, except for capacity, which is a number. For example: `q=building=94e264cedb3650106c731dcd1396 ^floorINfc7368cedb3650106c731dcd13961902^capacit ^standard_services=55c0818edb7650106c731dcd13961 ^reservable_purposes=d6e5c7cd1ba4e01051848489cc4` You can locate this information in the following tables: • Area: sn_wsd_core_area • Building: sn_wsd_core_building • Floor: sn_wsd_core_floor • Reservable purposes: sn_wsd_rsv_reservable_purpose • Standard services: sn_wsd_rsv_standard_service Data type: String
reservable_module	Required. Sys_id of the reservable module to include in the search. A reservable module groups similar types of workplace items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String Table: Reservable Module [sn_wsd_rsv_reservable_module]
reservation_ids	Comma-separated list of existing reservation sys_ids. Pass this parame you want to edit the associated reservations. The time blocked for these sys_ids for the corresponding reservables a treated as available. Data type: String Default: None Table: Workplace Reservation [sn_wsd_rsv_reservation]
rsv_path	Reservation path to apply to the search. Valid values: • browse_all: Search all reservables. • browse_by_area: Search the reservables near a specific location. An identifier must be passed in the encoded query (*q* parameter). • browse_by_neighborhood: Search the reservables near the neighbo specified in the *neighborhood* parameter. • browse_near_a_person: Search the reservables near the workplace location of the person specified in the *near_by_location_id* parameter. Data type: String Default: browse_all

schedule_view_obj	Details about the schedule view to return. Pass this object if you need 1 hour availability data for reservations that span more than one day. The results will only contain available times and reservations for the specifi date.
	
	For this functionality to work properly, the parameters *ignore_same_day_validation* and *include_reservations_within_days* must be set to `true`.
	
	Data type: Object
	`"schedule_view_obj": {`
	`  "schedule_view_date": "String",`
	`  "timezone": "String"`
	`}`

schedule_view_obj.schedule_view_date	Date for which to start returning reservation availability. This date must in the time zone specified in the *schedule_view_obj.timezone* parameter. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Format: YYYY-MM-DD
schedule_view_obj.timezone	Building time zone to use to determine the reservation availability data return. For example: US/Pacific. Data type: String
start	Required. Start time to use to search for available reservable modules. value must be prior to the value specified in the *end* parameter. Data type: String Format: UTC or local time (yyyy-mm-dd hh:mm:ss)
shift	Conditional. Sys_id of the shift to associate with the reservation. If this parameter is passed in, the *end* parameter isn't required. For additional information on shift-based reservations, see Enable shift reservation. Data type: String Table: Shift [sn_wsd_core_shift]
sort_by	Desired sort order of the returned reservable items. Valid values: • a_z: Ascending sort order. • favorites_first: Sorted by the user's favorite workplace reservables fir ascending for the rest. • z_a: Descending sort order. Data type: String Default: a_z
timezone	Preferred time zone, such as Europe/Amsterdam. Data type: String Default: None

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results for the specified search.
	
	Data type: Object
	
	`"result": {`
	`  "filter": {Object},`
	`  "hasMore": Boolean,`
	`  "nextFavIndex": Number,`
	`  "nextItemIndex": Number,`
	`  "reservableContainers": [Array],`
	`  "reservableUnits": [Array],`
	`  "totalProcessed": Number`
	`}`

result.filter	Details about the floors, standard services, and reservable purposes of the reservables. If the *include_standard_services* or *include_reservable_purposes*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	parameters are set to false, *standard_services* and *reservable_purposes* are empty arrays.
	
	Data type: Object
	
	`"filter": {`
	`"floors": [Array],`
	`"reservable_purposes": [Array],`
	`"standard_services": [Array]`
	`}`

result.filter.floors	Details about the floor on which the reservable is located.
	
	Data type: Object
	
	`"floors": [`
	`{`
	`"display_value": "String",`
	`"sys_id": "String"`
	`}`
	`]`

result.filter.floors.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.filter.floors.sys_id	Sys_id of the associated record. Data type: String Table: Floor [sn_wsd_core_floor]

result.filter.standard_services	Only populated if the *include_standard_services* parameter is set to true.
	Associated standard services, such as flip chart, projector screen, and whiteboard and markers.
	
	Data type: Array of Objects
	
	`"standard_services": [`
	`{`
	`"font_awesome_icon": "String",`
	`"name": "String",`
	`"short_description": "String",`
	`"sys_id": "String"`
	`}`
	`]`

Name	Description
result.filter.standard_services. font_awesome_icon	Name of the thumbnail icon associated with the standard service. Data type: String
result.filter.standard_services.name	Name of the standard service. Data type: String
result.filter.standard_services.short_description	Brief description of the standard service. Data type: String
result.filter.standard_services.sys_id	Sys_id of the standard service record. Data type: String Table: Standard Service [sn_wsd_rsv_standard_service]
result.filter.reservable_purposes	Details about the purpose for reserving the associated reservable. Data type: Array of Objects `"reservable_purposes": [ { "name": "String", "short_description": "String", "sys_id": "String" } ]`
result.filter.reservable_purposes.name	Name of the reservable. Data type: String
result.filter.reservable_purposes. short_description	Brief description of the reservable. Data type: String
result.filter.reservable_purposes.sys_id	Sys_id of the reservable purpose record. Data type: String Table: Reservable Purpose [sn_wsd_rsv_reservable_purpose]
result.hasMore	Flag that indicates whether there are more reservables in the return results. Possible values: • true: More reservables available. • false: No more reservables available.

Name	Description
	Data type: Boolean
result.nextFavIndex	Index for the next favorite reservable for the user. Use this value when paginating through the user's favorite reservables. Data type: Number
result.nextItemIndex	Index for the next reservable record to fetch. Use this value when paginating through reservable records. Data type: Number
result.reservableContainers	Only returned for reservable modules whose selection_type field is set to `container`. A container is a grouping of similar items, such as a group of desks. Data type: Array of Objects `"reservableContainers": [ { "building": {Object}, "campus": {Object}, "capacity": Number, "display_value": "String", "floor": {Object}, "image": {Object} "sys_id": "String" } ]`
result.reservableContainers.building	Details about the building associated with the reservable container. Data type: Object `"building": { "display_value": "String", "name": "String", "sys_id": "String" }`
result.reservableContainers.building.display_value	Display value for the building. Data type: String
result.reservableContainers.building.name	Name of the building. Data type: String
result.reservableContainers.building.sys_id	Sys_id of the associated building record. Data type: String

Name	Description

result.reservableContainers.campus	Details about the campus on which the reservable is located.
	
	Data type: Object
	
	`"campus": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Campus [sn_wsd_core_campus]

result.reservableContainers.campus.display_value	Display number of the Campus on which the reservable resides, such as East Bay. Data type: String
result.reservableContainers.campus.name	Name of the campus. Data type: String
result.reservableContainers.campus.sys_id	Sys_id of the associated record. Data type: String Table: Campus [sn_wsd_core_campus]
result.reservableContainers.capacity	Maximum number of occupants for the reservable. Data type: Number
result.reservableContainers.display_value	Display value for the reservable container. Data type: String

result.reservableContainers.floor	Details about the floor associated with the reservable container.
	
	Data type: Object
	
	`"floor": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

result.reservableContainers.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservableContainers.floor.name	Name of the floor on which the reservable resides. Data type: String

Name	Description

result.reservableUnits.floor	Details about the floor on which the reservable is located.
	
	Data type: Object
	
	`"floor": {`
	`  "display_value": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Floor [sn_wsd_core_floor]

result.reservableUnits.floor.display_value	Display number of the floor on which the reservable resides, such as 12. Data type: String
result.reservableUnits.floor.sys_id	Sys_id of the associated record. Data type: String Table: Floor [sn_wsd_core_floor]

result.reservableUnits.image	Details about an image that represents the layout for the associated reservable.
	
	Data type: Object
	
	`"image": {`
	`  "link": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Images [db_image]

result.reservableUnits.image.link	Link to an image that represents the layout for this reservable. Data type: String Table: Images [db_image]
result.reservableUnits.image.sys_id	Sys_id of the associated image record. Data type: String
result.reservableUnits.includedInResult	Flag that indicates whether the current reservable is included in the return results. Valid values: • true: Included in the return results. • false: Not included in the return results. Data type: Boolean
result.reservableUnits.is_available	Flag that indicates whether the reservable is available to reserve.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_favorite	Flag that indicates whether the reservable is flagged as one of the associated user's favorites. Valid values: • true: Favorite. • false: Not a favorite. Data type: Boolean
result.reservableUnits.is_reservable	Flag that indicates whether it's possible to reserve this reservable. **Note:** If the *`include_unavailable_items`* query parameter is set to true, unavailable locations are also returned. In this case, if a location is already reserved, then the *`is_available`* parameter is false, but *`is_reservable`* is true. Valid values: • true: Available to reserve. • false: Not available to reserve. Data type: Boolean
result.reservableUnits.is_reserved	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved. Data type: Boolean
result.reservableUnits.is_selected	Flag that indicates whether the reservable is already reserved. Valid values: • true: Available to reserve. • false: Already reserved.

Name	Description
	Data type: Boolean

result.reservableUnits.location_type	Details about the type of location of the reservable, such as workplace/desk, cafe, or gym.
	
	Data type: Object
	
	`"location_type": {`
	`  "display_value": "String",`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`
	
	Table: Workplace Location [sn_wsd_core_workplace_location]

result.reservableUnits.location_type.display_value	Display value of the location type. Data type: String
result.reservableUnits.location_type.name	Name of the location type, such as basement or storage. Same as display value. Data type: String
result.reservableUnits.location_type.sys_id	Sys_id of the associated record. Data type: String Table: Space Type [sn_wsd_core_space_type]
result.reservableUnits.name	Name of the reservable. Data type: String
result.reservableUnits.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String
result.reservableUnits.order	Order number for the reservable. Data type: Number
result.reservableUnits.require_approval	Flag that indicates whether reserving the reservable requires an approval. Possible values: • true: Approval required. • false: Approval isn't required. Data type: Boolean
result.reservableUnits.requires_check_in	Flag that indicates whether the reservable requires the user to check in.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	Data type: Object
	`"timezone": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.reservableUnits.reservations.location.timezone.displayValue	Display value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.location.timezone.value	Internal value for the time zone to which this location belongs. Data type: String
result.reservableUnits.reservations.number	Unique identifier of the reservable. This value is more human readable than the sys_id. Data type: String

result.reservableUnits.reservations.requested_for	Details about the person for whom the reservation was requested on behalf of.
	
	Data type: Object
	`"requested_for": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

result.reservableUnits.reservations.requested_for.name	Name of the user for whom the reservation was requested for. Data type: String
result.reservableUnits.reservations.requested_for.sys_id	Sys_id of the user for whom the reservation is being requested. Data type: String Table: User [sys_user]

result.reservableUnits.reservations.reservation_purpose	Details about the purpose of the reservation.
	
	Data type: Object
	`"reservation_purpose": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservableUnits.reservations.reservation_purpose.display_value	Display value for the purpose of the reservation, such as Company meeting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description
	Data type: String
result.reservableUnits.reservations.reservation_purpose.value	Internal value for the purpose of the reservation, such as company_meeting. Data type: String
result.reservableUnits.reservations.start	Reservation start date and time. Data type: String Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2021-02-05T18:00:00Z

result.reservableUnits.reservations.state	Details about the state of the reservation for the location.
	
	Data type: Object
	
	`"state": {`
	`  "display_value": "String",`
	`  "value": "String"`
	`}`

result.reservableUnits.reservations.state.display_value	Display value for the current state of the reservation, such as confirmed. Data type: String
result.reservableUnits.reservations.state.value	Internal value for the current state of the reservation, such as 2. Data type: String
result.reservableUnits.reservations.subject	Reservation's subject. Data type: String
result.reservableUnits.reservations.sys_id	Required. Sys_id of the reservation record. Data type: String Table: Workplace Reservation [sn_wsd_rsv_reservation]
result.reservableUnits.reservable_quantity	Maximum number of times the associated reservable can be reserved for the same time. This value is used when assigning neighborhood spaces to an area. Data type: Integer
result.reservableUnits.site	Details about the site where the reservable resides. Data type: Object

WSD Search - GET /api/sn_wsd_rsv/search/shift/{building_id}/{module_id}

Returns an encoded query that you can use to search for available shifts in the Shift [sn_wsd_core_shift] table.

Only applicable if the appy_to_shift field in the specified reservable module is enabled. Otherwise, the returned encoded query string will be empty.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/shift/{building_id}/{module_id}`

Default URL: `/api/sn_wsd_rsv/search/shift/{building_id}/{module_id}`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
building_id	Sys_id of the building to include in the search query. Data type: String Table: Building [sn_wsd_core_building]
module_id	Sys_id of the reservable module to include in the search query. A reservable module groups similar types of workplace items, such a chairs or desks. Data type: String Table: Reservable Module [sn_wsd_core_reservable_module]

Query parameters

Name	Description
None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters

Name	Description
end_date	Shift end date and time to include in the encoded query. Data type: String Format: yyyy-mm-dd hh:mm:ss
start_date	Shift start date and time to include in the encoded query. Data type: String Format: yyyy-mm-dd hh:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description

result	Encoded query to use to acquire the specified available shifts.
	
	Data type: Object
	
	`"result": {`
	`  "moduleHasShift": Boolean,`
	`  "query": "String"`
	`}`

moduleHasShift	Flag that indicates whether the specified reservable module has shifts enabled. Valid values: • true: Reservable module has shifts enabled. • false: Reservable module doesn't has shifts enabled. No encoded query returned. Data type: Boolean
query	Encoded query to use to retrieve shift information for the specified reservable module. Data type: String

Example: cURL request

The following code example shows how to use this endpoint to obtain a shift encoded query.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/search/shift/94
e264cedb3650106c731dcd13961919/fc71f64fdb42a01097acc900399619
a8?start_date=2022-04-23 16:00:00&end_date=2022-04-28 16:00:00"
 \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "moduleHasShift" : true,
    "query" :
 "active=true^state=2^building=94e264cedb3650106c731dcd13961919^
building.is_reservable=true^building.active=true^floorISEMPTY^OR
floor.is_reservable=true^floorISEMPTY^ORfloor.active=true^start<
=2022-04-26 16:00:00^ORstartISEMPTY^end>=2022-04-28
 16:00:00^ORendISEMPTY^start<=2022-04-28
 16:00:00^ORstartISEMPTY^end>=2022-04-28 16:00:00^ORendISEMPTY"
  }
}
```

WSD Search - POST /api/sn_wsd_rsv/search/availability_score

Returns an availability score for reservable items for specified timeslots.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/search/availability_score`

Default URL: `/api/sn_wsd_rsv/search/availability_score`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description

recurringPattern	Required if *`startEndDateTimes`* parameter is not specified. Recurring pattern to use to search for reservables that are available for the specified recurring events.
	
	Data type: Object
	
	`"recurringPattern": {`
	`  "duration": Number,`
	`  "label": "String",`
	`  "options": {Object},`
	`  "repeats": "String",`
	`  "startDate": "String"`
	`}`

recurringPattern.duration	Required. Length of time for which the reservable must be available. Data type: Number Unit: Milliseconds
recurringPattern.label	Description of the recurring pattern, such as `Repeats daily, 5 times`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String

recurringPattern.options	Availability options for the recurring reservation to search for.
	
	Data type: Object
	
	`"options": {`
	`  "count": Number,`
	`  "daysOfWeek": "String",`
	`  "endDate": "String"`
	`}`

recurringPattern.options.count	Required if *endDate* is not passed. If both are passed, *count* is used. Number of times to repeat the meeting pattern. Data type: Number
recurringPattern.options.daysOfWeek	Required if the *recurringPattern.repeats* parameter is set to `weekly`. Days of the week that the reservable is needed. Valid values: • 1 = Monday • 2 = Tuesday • 3 = Wednesday • 4 = Thursday • 5 = Friday • 6 = Saturday • 7 = Sunday For example, to specify Tuesday, Thursday, and Friday, pass 245 (no delimiter). If *repeat* is weekly, *count* is 5, and *daysOfWeek* is 245, then in the return results, the total is equal to `count*daysOfWeek.length` (5*3=15). Data type: String
recurringPattern.options.endDate	Required if *recurringPattern.options.count* is not passed. If both are passed, *count* is used. End date and time of the recurrence of the meeting, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
recurringPattern.repeats	Required. Repeating pattern for the reservable.

Request body parameters (continued)

Name	Description
	Valid values (case-sensitive): • daily • monthly • weekly • yearly Data type: String
recurringPattern.startDate	Required. Start date and time for the recurring pattern, such as "2022-07-08T14:00:00Z". Data type: String Format: UTC yyyy-mm-dd hh:mm:ss
reservableIds	Required. List of sys_ids of the reservables to include in the availability score. Data type: Array Table: Workplace Location [sn_wsd_core_workplace_location]
reservableType	Required. Type of reservable to include in the availability score. Used to refine the search. Valid values (case-sensitive): • configuration_item • location Data type: String
startEndDateTimes	List of start and end dates and times in the user's timezone to search on. Data type: Array of Objects `"startEndDateTimes": [ { "end": "String", "start": "String" } ]` Default: Must specify *recurringPattern* parameter.
startEndDateTimes.end	End date and time of the reservable. Data type: String

Request body parameters (continued)

Name	Description
	Format: yyyy-mm-dd hh:mm:ss
startEndDateTimes.start	Start date and time of the reservable. Data type: String Format: yyyy-mm-dd hh:mm:ss

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

result	Return results for the specified availability score.
	
	Data type: Object
	
	`"result": {`
	`  "reservable_sys_id": {Object}`
	`}`

result.reservable_sys_id	Details about the availability score.
	
	Data type: Object
	
	`"reservable_sys_id": {`
	`  "available": Number,`
	`  "score": "String",`
	`  "total": Number`
	`}`

result.reservable_sys_id.available	Number of available reservables that met the specified search criteria. Data type: Number
result.reservable_sys_id.score	Availability score. Number of available reservables over the total number of reservables that met the specified search criteria. For example, if *`available`* is 2 and *`total`* is 4, the *`score`* value is 2/4. Data type: String
result.reservable_sys_id.total	Total number of reservables that met the specified search criteria. Data type: Number

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/search/availabi
lity_score" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"reservableType\": \"location\",
  \"reservableIds\": [
    \"fe1f744edb7650106c731dcd139619ca\",
    \"5eafb44edb7650106c731dcd13961943\"
  ],
  \"recurringPattern\": {
    \"duration\": 3600000,

      "score": "2/2"
    }
  }
```

WSD Shift API

The Workplace Service Delivery (WSD) *`Shift`* API provides an endpoint that returns shift time spans for a specified date and time.

To access this API, the caller must have the sn_wsd_core.workplace_user role and the Workplace Safety Management (sn_wsd_core) and Workplace Reservation Management (sn_wsd_rsv) plugins must be activated.

This API runs in the `sn_wsd_rsv` namespace.

For additional information on Workplace Reservation Management, see Workplace Reservation Management.

WSD Shift - GET /api/sn_wsd_rsv/wsd_shift/{shift_id}/timespan

Returns the shift time span for a specified date/time and shift.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/wsd_shift/{shift_id}/timespan`

Default URL: `/api/sn_wsd_rsv/wsd_shift/{shift_id}/timespan`

Note: Available versions are specified in the REST API Explorer. For scripted REST APIs there is additional version information on the Scripted REST Service form.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
shift_id	Sys_id of the shift to retrieve the time span for. For additional information on shift-based reservations, see Enable shift-based reservation. Data type: String Table: Shift [sn_wsd_core_shift]

Query parameters

Name	Description
attempt_earlier_start	Flag that indicates whether to set an early start time if the specified start value is within the shift's time span. Valid values: • true: If the specified shift includes the date/time specified in the *`start`* parameter, return the specified start date/time as the start of the time span. • false: Return the shift timespan as defined in the associated record. Data type: Boolean Default: false
start	Required. Date and time of the start of the shift time spans to return. Format: UTC - yyyy-mm-ddThh:mm:ssZ, such as 2022-05-23T08:00:00Z
timezone	Time zone to use when qualifying the shift time spans, such as ECT or PST. Also returns the shift time spans in this time zone. Format: UTC Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: User's timezone

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the request body. Supported types: *application/json*, *application/xml* or, *text/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
result	Details about the shift timespan that matched the search criteria. Data type: Object `"result":{ "end": "String", "start": "String" }`
result.end	End date and time of the shift timespan in the specified time zone. Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2022-05-23T08:00:00Z Data type: String
result.start	Start date and time of the shift timespan in the specified time zone. Format: UTC: yyyy-mm-ddThh:mm:ssZ, such as 2022-05-23T08:00:00Z Data type: String

Example: cURL request

The following code example shows how to retrieve the timespan of a shift.

```
curl
 "https://instance.servicenow.com/api/sn_wsd_rsv/wsd_shift/e5d23
acfdb42a01097acc9003996193a/timespan?attempt_earlier_start=true&
start=2022-05-23T08:00:00Z&timezone=ECT" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "start": "2022-05-23T08:00:00Z",
    "end": "2022-05-23T15:00:00Z"
  }
}
```

WSD Unified Search API

The *`WSD Unified Search`* API provides an endpoint to search across workplace users and locations.

The *`WSD Unified Search`* API runs in the sn_wsd_core namespace and powers the search/type ahead experience in the Workplace Service Delivery (WSD) portal, returning matching users, spaces, floors, buildings, campuses, and neighborhoods in a single response.

Requirements

The *`WSD Unified Search`* API requires:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The calling user have the sn_wsd_core.workplace_user role.
- The Workplace Service Delivery Core (com.sn_wsd_core) plugin be active.
- At least one building and floor be configured in the workplace location hierarchy.

WSD Unified Search - POST /api/sn_wsd_core/wsd_unified_search/users_and_locations

Searches for users and workplace locations matching the provided search term. Returns a combined list of matching results with pagination support.

URL format

Versioned URL: `/api/sn_wsd_core/{api_version}/wsd_unified_search/users_and_locations`

Default URL: `/api/sn_wsd_core/wsd_unified_search/users_and_locations`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
search_term	Search query used to find matching users and workplace locations. Accepts a comma-separated list of values to search for multiple terms simultaneously. For example, `"Conference, Desk"` returns results matching either term. Empty segments are ignored. Data type: String Default value: Empty string (returns all results)
show_location	Flag that indicates whether to include the user's current location in the result label. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `true`: Display the user's current location in the result label. • `false`: Don't display the user's current location in the result label. Data type: Boolean Default: true
show_loggedin_user	Flag that indicates whether to display the authenticated user as the first result when no search term is provided. Only applies to desktop clients at offset 0. Possible values: • `true`: Show the authenticated user as the first result. • `false`: Don't show the authenticated user as the first result. Data type: Boolean Default: true
include_user_email	Flag that indicates whether to include user email addresses in result labels and allow searching by email address. Possible values: • `true`: Include email in result labels and enable email search. • `false`: Don't include email in result labels or enable email search Data type: Boolean Default: false
filterConfig	Object containing one or more table names as keys to restrict results to specific entity types. When empty, both users and locations are returned. Valid fields (table names):

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• sys_user • sn_wsd_core_workplace_location • sn_wsd_core_region • sn_wsd_core_site • sn_wsd_core_campus • sn_wsd_core_building • sn_wsd_core_floor • sn_wsd_core_area • sn_wsd_core_space • sn_wsd_core_room • sn_wsd_core_neighborhood Data type: Object `"filterConfig": { "<table_name>": Boolean }` Default: {} (no filter applied)
filterConfig.<table_name>	Flag that indicates whether to include results from the specified table. Set to true to include results from that entity type. Valid values: • `true`: Include results from that entity type. • `false`: Don't include results from that entity type. Data type: Boolean
options	Object containing additional configuration for search behavior. Data type: Object `"options": { "search_in_parent": Boolean, "cache": Boolean, "rsvModule": {Object} }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
options.search_in_parent	Flag that indicates whether to include results from parent location records when filtering by a child entity. Possible values: • `true`: Include parent location results. • `false`: Don't include parent location results. Data type: Boolean
options.cache	Flag that indicates whether to use cached search results. Possible values: • `true`: Use cached results where available. • `false`: Always fetch fresh results Data type: Boolean
options.rsvModule	Object containing reservation module configuration for filtering results by reservable module context. Data type: Object `"rsvModule": { "value": "String" }`
options.rsvModule.value	Sys_id of the reservable module to use for filtering available spaces. Table: Reservable Module [sn_wsd_rsv_reservable_module] Data type: String
options.rsvModule.enable_restricted_neighborhood_rules	Flag that indicates whether to apply restricted neighborhood rules when filtering results by reservation module. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• `true`: Apply restricted neighborhood rules. • `false`: Don't apply restricted neighborhood rules. Data type: Boolean
sysparam_offset	Pagination offset. Number of records to skip before returning results. Use with *`sysparam_limit`* for pagination. Minimum value: 0 Data type: Number Default value: 0
sysparam_limit	Maximum number of records to return per request. Use with *`sysparam_offset`* for pagination. Minimum value: 1 Data type: Number Default value: 10

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: application/json, application/xml, text/xml.
Content-Type	Data format of the request body: application/json.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Invalid request body format.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`  "result": [Array],`
	`  "more": Boolean,`
	`  "isMobile": Boolean`
	`}`

result.isMobile	Flag that indicates whether the request was detected as originating from a mobile client. Possible values: • `true`: Request originated from a mobile client. • `false`: Request originated from a desktop client. Data type: Boolean
result.more	Flag that indicates whether additional results are available beyond the current page. Possible values: • `true`: More results are available. Increment *`sysparam_offset`* by *`sysparam_limit`* to retrieve the next page. • `false`: No more results are available. Data type: Boolean
result.result	Array of matching user and location objects. Each object contains common fields shared across all result types, as well as type-specific fields that are only present for user results. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	"result": [
	  {
	  "displayValue": "String",
	  "value": "String",
	  "table": "String",
	  "label": "String",
	  "selectedTreeBranch": "String",
	  "timezone": {Object},
	  "wsdSource": "String",
	  "externalId": "String",
	  "floorId": "String",
	  "isReservable": Boolean
	  }
	]

result.result.displayValue	Display name of the result. For example, `Conference Room A - Floor 1` for a space or `Jane Doe` for a user. Data type: String
result.result.externalId	Identifier of the result record in an external source system, when applicable. Data type: String
result.result.floorId	Sys_id of the floor on which the result location resides. Present for location results only. Table: Workplace Floor [sn_wsd_core_floor] Data type: String
result.result.isReservable	Flag that indicates whether the result location can be reserved. Possible values: • `true`: The location is reservable. • `false`: The location isn't reservable. Data type: Boolean
result.result.label	Secondary display string providing additional context for the result. For example, the location hierarchy for a space, or the department and title for a user. Data type: String
result.result.selectedTreeBranch	Sys_id of the parent location record in the workplace hierarchy associated with this result. Used to pre-select the location tree in the UI. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.result.table	Table name from which the result originates. For example, `sn_wsd_core_space` or `sys_user`. Data type: String

result.result.timezone	Time zone associated with the result location. Present for location results.
	
	Data type: Object
	
	`"timezone": {`
	`  "displayValue": "String",`
	`  "value": "String"`
	`}`

result.result.timezone.displayValue	Human-readable time zone name. For example, `Eastern Standard Time`. Data type: String
result.result.timezone.value	IANA time zone identifier for the result location. For example, `America/New_York`. Data type: String

result.result.userDetails	Object containing additional details about a user result. Present for user results only (User [sys_user] table).
	
	Data type: Object
	
	`"userDetails": {`
	`  "userID": "String",`
	`  "name": "String",`
	`  "department": "String",`
	`  "avatar": "String",`
	`  "initials": "String"`
	`}`

result.result.userDetails.avatar	Relative URL path to the user's profile avatar image. Data type: String
result.result.userDetails.department	Name of the department the user belongs to. Data type: String
result.result.userDetails.initials	Initials derived from the user's display name, used as a fallback when no avatar is available. For example, `JD` for Jane Doe. Data type: String
result.result.userDetails.name	Full display name of the user. For example, `Jane Doe`. Data type: String
result.result.userDetails.userID	Sys_id of the user record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Table: User [sys_user] Data type: String.
result.result.value	Sys_id of the result record. Data type: String
result.result.wsdSource	Source system identifier for the result. Used when the location originates from an external integration. Data type: String

Example: cURL request

The following example searches for spaces matching "Conference" or "Desk" within a specific building, returning up to 10 results.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_core/wsd_unified
_search/users_and_locations" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username:password" \
--data '{
  "search_term": "Conference, Desk",
  "show_location": true,
  "show_loggedin_user": true,
  "include_user_email": false,
  "filterConfig": {},
  "options": {
       "search_in_parent": false,
       "cache": true
              },
       "sysparam_offset": 0,
       "sysparam_limit": 10
  }
}'
```

Response body.

```
{
  "result": {
    "result": [
      {
        "displayValue": "Conference Room A - Floor 1",
        "value": "space_123",
        "table": "sn_wsd_core_space",
        "label": "Floor 1, Building A, Main Campus",
        "selectedTreeBranch": "building_456",
        "timezone": {
          "value": "America/New_York",
          "displayValue": "Eastern Standard Time"
        },
```

    "isMobile": false
  }
}
```

WSD User API

The *WSD User* API is a Scripted REST API which returns the authenticated user's workplace context, including their assigned workspace location, in-office presence schedule, collaborators, and past and future reservations.

This *WSD User* is featured with the Workplace Service Delivery (WSD) Reservation product and provides a single-call entry point for initializing the reservation booking experience with all relevant user data. This API sits within the Workplace Service Delivery Reservation (com.sn_wsd_rsv) plugin and serves as the entry point for surfacing a user's complete workplace identity and history.

Common use cases:

- Reservation portal initialization: Load a user's home location, schedule, and booking history in a single call when opening a workplace app or portal.
- Custom mobile or web apps: Fetch all the user context without stitching together multiple table API calls,for example when building front-end reservation experiences.
- In-office presence tracking: Identify which employees are scheduled to be in-office on a given day.

Requirements

The *WSD User* API requires:

- At least one user record must exist with the sn_wsd_core.workplace_user role.
- The Workplace Service Delivery Concierge (com.sn_wsd_concierge), Workplace Service Delivery Core (com.sn_wsd_core), and Workplace Service Delivery Reservation (com.sn_wsd_rsv) plugins to be active.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related APIs

The *WSD User* API belongs to a family of APIs all under the `sn_wsd_rsv` namespace that together support the full reservation lifecycle:

- WSD Search API: Find available reservable spaces based on location, time, and capacity criteria.
- WSD Reservation API: Create reservations and manage check-in/check-out.
- WSD Reservable Module API: Retrieve the booking rule configurations that govern what users can reserve and how.

WSD User - GET /api/sn_wsd_rsv/v1/user/context

Retrieves the authenticated user's workplace context, including their assigned workplace location, presence schedule, collaborators, and past and future reservations.

Use this endpoint to initialize a reservation experience by loading all relevant user context in a single call. Collaborator data is optionally included when the com.sn_wsd_concierge plugin is active.

URL format

Versioned URL: `/api/sn_wsd_rsv/{api_version}/user/context`

Default URL: `/api/sn_wsd_rsv/user/context`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
include	Value to include related data in the response. Uses strict equality matching (not comma-separated parsing). **Note:** *`include`* is only effective when the Workplace Service Delivery Concierge (com.sn_wsd_concierge) plugin is active. Valid value: collaborators Data type: String Default: Excludes collaborators from the response.
past_reservations_months	Number of months of past reservations to return. Data type: Number

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Minimum value: 0 Maximum value: 12 Default value: 3
future_reservations_months	Number of months of future reservations to return. Data type: Number Minimum value: 0 Maximum value: 12 Default value: 3

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: application/json, application/xml, text/xml.
Authorization	Authentication credentials. Supports Basic authentication or session-based authentication.

Response headers

Header	Description
Content-Type	Data format of the response body: application/json.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object containing results of the request.
	
	Data type: Object
	
	`"result": {`
	`  "collaborators": [Array],`
	`  "reservations": {Object},`
	`  "schedule": {Object},`
	`  "workplace_location": {Object}`
	`}`

collaborators	List of the user's collaborators with their presence data.
	
	Data type: Array of Objects
	
	`"collaborators": [`
	`  {`
	`  "sys_id": "String",`
	`  "name": "String",`
	`  "routine": "Object",`
	`  "exceptions": "Array"`
	`  }`
	`]`

collaborators.exceptions	List of dates on which the collaborator's in-office schedule deviates from their routine. Data type: Array of Objects
collaborators.name	Display name of the collaborator. For example, `Jane Smith`. Data type: String
collaborators.routine	The collaborator's recurring weekly in-office schedule. Follows the same day-of-week Boolean structure as *`schedule.routine`*. A value of `true` indicates in-office attendance, and `false` indicates no attendance. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"routine": {`
	`  "monday": Boolean,`
	`  "tuesday": Boolean,`
	`  "wednesday": Boolean,`
	`  "thursday": Boolean,`
	`  "friday": Boolean,`
	`  "saturday": Boolean,`
	`  "sunday": Boolean`
	`}`

collaborators.sys_id	Sys_id of the collaborator's user record. Table: User [sys_user] Data type: String

reservations	Object containing the user's past and future reservations. Private and location-less reservations are excluded.
	
	Maximum 100 reservations per direction.
	
	Filtered by states: confirmed, completed.
	
	Data type: Object
	
	`"reservations": {`
	`  "past": [Array],`
	`  "future": [Array]`
	`}`

reservations.future	List of the user's future reservations within the requested month range. Ordered by start datetime, soonest first.
	
	Data type: Array of Object
	
	`"future": [`
	`  {`
	`  "sys_id": "String",`
	`  "number": "String",`
	`  "start": "String",`
	`  "end": "String",`
	`  "state": "String",`
	`  "subject": "String,`
	`  "location": {Object},`
	`  "building": {Object}`
	`  }`
	`]`

reservations.future.building	Building in which the reserved location resides.
	
	Data type: Object
	
	`"building": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

Name	Description
reservations.future.building.name	Display name of the building. For example, `HQ Building A`. Data type: String
reservations.future.building.sys_id	Sys_id of the building record. Table: Workplace Building [sn_wsd_core_building] Data type: String
reservations.future.end	End date time of the reservation in UTC. Format: yyyy-MM-dd HH:mm:ss Data type: String

reservations.future.location	The reserved space.
	
	Data type: Object
	
	`"location": {`
	`  "sys_id": "String",`
	`  "name": "String"`
	`}`

reservations.future.location.name	Display name of the reserved location. For example, `Desk 42`. Data type: String
reservations.future.location.sys_id	Sys_id of the reserved location. Table: Workplace Location [sn_wsd_core_workplace_location] Data type: String
reservations.future.number	Human-readable reservation number. For example, `RSV0001234`. Data type: String
reservations.future.start	Start date time of the reservation in UTC. Format: yyyy-MM-dd HH:mm:ss Data type: String
reservations.future.state	Current state of the reservation. Valid values: • `confirmed` • `completed` Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
reservations.future.subject	Subject or title of the reservation. For example, `Team standup desk`. Data type: String
reservations.future.sys_id	Sys_id of the reservation record. Table: Workplace Reservation [sn_wsd_rsv_reservation] Data type: String
reservations.past	List of the user's past reservations within the requested month range. Ordered by start datetime, most recent first. Follows the same array structure as *`reservation.future`*. Data type: Array of Objects `"past": [ { "sys_id": "String", "number": "String", "start": "String", "end": "String", "state": "String", "subject": "String, "location": {Object}, "building": {Object} } ]`
schedule	User's in-office presence schedule, including their recurring weekly routine and any exceptions. **Note:** When the com.sn_wsd_concierge plugin is inactive, routine is null and exceptions is an empty array. Data type: Object `"schedule": { "exceptions": [Array], "routine": {Object} }`
schedule.exceptions	List of dates on which the user's in-office schedule deviates from their routine. Data type: Array of Objects `"exceptions": [ { "sys_id": "sys_id", "date": "String", "in_office": String, "origin": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	`"location": "String"`
	`}`
	`]`

schedule.exceptions.date	Date this exception applies to, in yyyy-MM-dd format. This is the date the user's routine is being overridden. Data type: String
schedule.exceptions.in_office	Flag that indicates whether the user will be in the office on this date. This overrides whatever the schedule specifies for that day of the week. Valid values: • true: User will be in the office. • false: User won't be in the office Data type: String
schedule.exceptions.location	The name or identifier of the office location the user will be at on this date. Only relevant when `in_office` is `true`. May be an empty string when the user is remote. Data type: String
schedule.exceptions.origin	Source that created the exception. Valid values: • `user`: Created manually by the employee. • `system`: Created automatically by the platform. • `manual`: Created by an admin or on behalf of the user. Data type: String
schedule.exceptions.sys_id	Sys_id of the exception record. Data type: String

schedule.routine	User's recurring weekly in-office schedule. Each field is a Boolean which represents a day of the week and indicates whether the user is scheduled to be in-office on that day.
	
	A value of `true` indicates in-office attendance, and `false` indicates no attendance.
	
	Data type: Object
	`"routine": {`
	`"monday": Boolean,`
	`"tuesday": Boolean,`
	`"wednesday": Boolean,`
	`"thursday": Boolean,`
	`"friday": Boolean,`
	`"saturday": Boolean,`

Name	Description
	`"sunday": Boolean` `}`

workplace_location	The user's assigned workplace location, including floor, building, and campus details.
	
	Data type: Object
	
	`"workplace_location": {`
	`"building": {Object},`
	`"campus": {Object},`
	`"floor": {Object},`
	`"name": "String",`
	`"sys_id": "String"`
	`}`

workplace_location.building	Building in which the workplace location resides.
	
	Data type: Object
	
	`"building": {`
	`"name": "String",`
	`"sys_id": "String"`
	`}`

workplace_location.building.name	Display name of the building. For example, `HQ Building A`. Data type: String
workplace_location.building.sys_id	Sys_id of the building record. Table: Workplace Building [sn_wsd_core_building] Data type: String

workplace_location.campus	Campus on which the building resides.
	
	Data type: Object
	
	`"campus": {`
	`"name": "String",`
	`"sys_id": "String"`
	`}`

workplace_location.campus.name	Sys_id of the campus record. Table: Workplace Campus [sn_wsd_core_campus] Data type: String
workplace_location.campus.sys_id	Display name of the campus. For example, `Main Campus`. Data type: String
workplace_location.floor	Floor on which the workplace location resides.

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description

	Data type: Object
	`"floor": {`
	`  "name": "String",`
	`  "sys_id": "String"`
	`}`

workplace_location.floor.name	Sys_id of the floor record. Table: Workplace Floor [sn_wsd_core_floor] Data type: String
workplace_location.floor.sys_id	Display name of the floor. For example, `Floor 3`. Data type: String
workplace_location.name	Display name of the user's assigned workplace location. For example, `Desk 42 - Floor 3`. Data type: String
workplace_location.sys_id	Sys_id of the user's assigned workplace location. Table: Workplace Location [sn_wsd_core_workplace_location] Data type: String

Example: cURL request

The following example retrieves the authenticated user's full workplace context, including collaborators, 1 month of past reservations, and 6 months of future reservations.

```
curl
 "https://<instance>.service-now.com/api/sn_wsd_rsv/v1/user/cont
ext?include=collaborators&past_reservations_months=1&future_rese
rvations_months=6" \
  --request GET \
  --header "Accept: application/json" \
  --user "username:password"
```

ServiceNow Fluent

Define application metadata in source code using the ServiceNow Fluent domain-specific programming language.

Overview of ServiceNow Fluent

ServiceNow Fluent is a declarative, domain-specific language (DSL) based on TypeScript for defining the metadata files [sys_metadata] that make up applications and includes APIs for the different types of metadata, such as tables, roles, ACLs, business rules, and Automated Test Framework tests.

Developers define this metadata in a few lines of code instead of through a form or builder tool user interface. Applications created or converted with the ServiceNow IDE or ServiceNow SDK support development in ServiceNow Fluent.

ServiceNow Fluent supports two-way synchronization, which allows changes to metadata to be synced from other ServiceNow AI Platform user interfaces into source code and changes to source code to be synced back to metadata across the instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To get started using the ServiceNow IDE or ServiceNow SDK, see the ServiceNow IDE or ServiceNow SDK documentation.

ServiceNow Fluent APIs

ServiceNow Fluent includes APIs for many types of metadata. You can use the Record API to define application metadata that doesn't have a dedicated API. For the latest list of supported APIs and examples, see the ServiceNow Fluent API reference and ServiceNow SDK examples repository on GitHub .

Note: A limited number of metadata types, such as Metadata Snapshots [sys_metadata_link] and UX Assets [sys_ux_lib_asset], can't be represented as ServiceNow Fluent code and aren't transformed. These metadata types remain as metadata XML files in the `metadata` directory of your application.

ServiceNow Fluent usage

In files with the `.now.ts` extension, use objects in the ServiceNow Fluent APIs to define metadata in the application. You must also include the required imports for the APIs from `@servicenow/sdk/core`. For objects with server-side scripts, such as the *`BusinessRule`* object, you can import and use code from JavaScript modules.

The following example includes the definitions of a table, client script, and business rule in the application. The client script uses a script from the `client-script.js` file. The business rule uses a function from the `script.js` JavaScript module.

```
import '@servicenow/sdk/global'
import { BusinessRule, ClientScript, DateColumn, StringColumn,
 Table } from '@servicenow/sdk/core'
import { showStateUpdate } from '../server/script.js'

//creates todo table, with three columns (deadline, status and task)
export const x_snc_example_to_do = Table({
    name: 'x_snc_example_to_do',
    schema: {
        deadline: DateColumn({ label: 'Deadline' }),
        state: StringColumn({
            label: 'State',
            choices: {
                ready: { label: 'Ready' },
                completed: { label: 'Completed' },
                inProgress: { label: 'In Progress' },
            },
        }),
        task: StringColumn({ label: 'Task', maxLength: 120 }),
    },
})

//creates a client script that pops up 'Table loaded successfully!!' message everytime todo
 record is loaded
ClientScript({
    $id: Now.ID['cs0'],
    name: 'my_client_script',
    table: 'x_snc_example_to_do',
    active: true,
    appliesExtended: false,
    global: true,
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    uiType: 'all',
    description: 'Custom client script generated by Now SDK',
    isolateScript: false,
    type: 'onLoad',
    script: Now.include('../client/client-script.js'),
})

//creates a business rule that pops up state change message whenever a todo record is
 updated
BusinessRule({
    $id: Now.ID['br0'],
    action: ['update'],
    table: 'x_snc_example_to_do',
    script: showStateUpdate,
    name: 'LogStateChange',
    order: 100,
    when: 'after',
    active: true,
})
```

The client script referenced from the *ClientScript* object:

```
function onLoad() {
    g_form.addInfoMessage("Table loaded successfully!!")
}
```

The JavaScript module referenced from the *BusinessRule* object:

```
import { gs } from '@servicenow/glide'

export function showStateUpdate(current, previous) {
    const currentState = current.getValue('state')
    const previousState = previous.getValue('state')

    gs.addInfoMessage(`state updated from "${previousState}"
 to "${currentState}"`)
}
```

After building the application, this source code generates the following application metadata files on the instance.

Application metadata generated from ServiceNow Fluent code

Tip: You can use the following directives in a code comment to help manage your code:

- `@fluent-ignore`: Suppresses ServiceNow Fluent diagnostic warnings and errors in the following line of code.
- `@fluent-disable-sync`: Turns off syncing changes to a ServiceNow Fluent object. Use before a call expression (for example, `Record({ ... })`) to turn off syncing for that object and its child objects. Only use this directive if you want to ignore changes made outside of the source code to the object and never update it when syncing.
- `@fluent-disable-sync-for-file`: Turns off syncing changes to a ServiceNow Fluent file (`.now.ts`). Use in the first line of the file to turn off syncing for all code in the file. Only use this directive if you want to ignore changes made outside of the source code to the file and never update it when syncing.

Browse APIs by product

Find APIs to use with your ServiceNow products.

Browse the table below to view which Server, REST, and Client APIs are supported by a specific ServiceNow product. All products and APIs display by default in alphabetical order. To see only APIs of those products you're interested in, select one or more product names in the **Product** filter drop-down on this page. Once you select a product in the filter, only the APIs for your selection(s) display in the table. Clear filter criteria by deselecting options in the filter drop-down.

Developer guides

These developer guides can help you integrate your applications with the ServiceNow AI Platform.

Each developer guide addresses a single ServiceNow product such as Financial Services Operations.

Available ServiceNow developer guides

Developer guides	Description
Alarm Management Open API Developer Guide	Use the `Alarm Management Open API` to create and update data in the Events [em_event] table. This developer guide provides information on how to extend the Alarm Management Open API to make various customizations.
Event Notification Management Open API Developer Guide	Use the `Event Notification Management Open` API to create, update, and delete event records in the Events [em_event] table. This developer guide provides information on how to extend the `Event Notification Management Open` API to make various customizations.
Financial Services Operations developer guide	ServiceNow® Financial Services Operations (FSO) enables financial services institutions (FSIs) to securely automate core operational processes through pre-built digital applications and workflows. FSO connects operations across all departments—front, middle, and back-office—for financial institutions with a single platform. This developer guide provides information on how to extend the FSO base capabilities as well as integrate your existing applications with ServiceNow FSO.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available ServiceNow developer guides (continued)

Developer guides	Description
GlideGeoPoint Developer Guide	The GlideGeoPoint developer guide contains information about how to compute distances between latitude and longitude values (geopoints), return locations within geopoint and radius values, and additional functionality provided by supported `GlideGeoPoint` API functions.
Product Order Open API Developer Guide	Use the `Product Order Open API` to create, update, and retrieve product order information. This developer guide provides information on how to extend the Product Order Open API to make various customizations.
Resource Inventory Open API Developer Guide	Use the `Resource Inventory Open API` to create, retrieve, update, and delete resources such as interface cards, logical and physical connections, network sites, and more. This developer guide provides information on how to extend the Resource Inventory Open API to make various customizations.
ScopedCacheManager API Developer Guide	Scoped caches allow customers to store custom data in memory for faster access, and define when it becomes invalidated. This can be useful when working with data takes longer to obtainthat from scratch, such as the results of a query across multiple tables. Use the `ScopedCacheManager` API to retrieve, set, and flush cache data for scoped applications. This developer guide provides information on how to create a scoped cache and assign it a pair type.
Service Order Open API Developer Guide	Use the `Service Order Open API` to create, update, and retrieve service order information. This developer guide provides information on how to extend the Service Order Open API to make various customizations.
Trouble Ticket Open API Developer Guide	Use the `Trouble Ticket Open API` to manage ticket information between external ticketing systems and the ServiceNow AI Platform. This API creates, updates, and retrieves data from the Case [sn_customerservice_case] and Incident [incident] tables. This developer guide provides information on how to extend the Trouble Ticket Open API to make various customizations.

Run UI Test Script Developer Guide

The `Run UI Test Script` test step runs a client-side test script in the browser to drive and verify the user interface with no server-side execution needed. Use this step to automate multi-step UI journeys on both classic and Now Experience pages, like navigating, filling fields, clicking, impersonating users, uploading attachments, and asserting page state.

The `Run UI Test Script` step is an Automated Test Framework (ATF) test step that runs a JavaScript test script entirely in the browser, with no server-side execution. The script drives the tested page and verifies its state through a set of browser-side APIs: shadow-DOM-aware

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

element queries, realistic user-interaction simulation, and utilities for navigation, page evaluation, impersonation, and file uploads. The tested page loads in an iframe inside the Client Test Runner, and the script interacts with it through these APIs.

Release availability

The *`Run UI Test Script`* step is available only on ZP10/ AP3 releases and higher.

Who uses this step

Test authors, QA engineers, and developers who build automated UI tests use the Run UI Test Script step when the built-in, low-code ATF UI steps don't cover a scenario. The step gives a script full programmatic control of the page, so it suits teams that need to test Now Experience or UI Builder components, validate multi-step user journeys, or assert detailed UI state that the built-in steps don't expose.

When to use this step

Use the *`Run UI Test Script`* step to do any of the following:

- Verify UI state after user actions, such as field values, element visibility, and disabled state.
- Simulate realistic user interactions, such as clicks, typing, keyboard shortcuts, and tab order.
- Navigate between pages and assert state across navigations.
- Test Now Experience components whose DOM lives inside shadow roots.
- Upload attachments to classic forms, Service Portal, workspaces, or catalog variables.
- Impersonate a different user and verify what they see.

This step applies to UI journeys that span multiple user actions. For simpler assertions about page state after a built-in step, consider the built-in **Verify field value** or **Assert current page** steps first. For example, confirming that a record opened.

How scripts work

Scripts run as an `async` function so you can use `await` anywhere. A synchronous script, such as one with no `return` or `await`, resolves automatically when the last statement runs. An async script must return a Promise. The `async` wrapper is applied automatically; `await` works without any extra boilerplate.

```
// Click a button and verify the resulting state
const [btn] = await screen.findAllByRole('button', { name:
 'Submit' });
await user.click(btn);
await screen.findByText('Record saved');
```

The step timeout defaults to 30 seconds. An explicit `step.timeout` value on the step record overrides the default. When a timeout occurs, the step fails with `Test timed out after` `Nms`.

The internal DOM structure of ServiceNow pages and components can change between releases. A UI test script that passes in one release may fail in a later release if a component is restructured, even if the visible UI looks identical. You may need to update scripts to reflect changes made in the underlying DOM.

Scripting APIs

The test step has access to the following global APIs. Each has its own reference topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- screen — DOM queries — find elements on the tested page with shadow-DOM-aware queries.
- user — user interactions — simulate realistic user interactions, such as clicks, typing, and keyboard input.
- sn_atf — utility APIs — navigate, evaluate code in the page, impersonate users, upload attachments, and use shadow-DOM utilities.
- expect — assertions — assert element and value conditions.
- Script helper functions — `waitFor`, `within`, `steps`, and `params`.
- Element predicates — synchronous Boolean checks such as `isVisible` and `isEnabled`.

For end-to-end scripts, see UI Test Script examples. For common issues, see Troubleshooting.

Shadow DOM support

Now Experience components render their content inside shadow roots, which are normally invisible to `document.querySelector`. All `screen` queries traverse these boundaries transparently, so you can query by role or text whether the element is in light DOM or shadow DOM. This makes the step suitable for testing modern ServiceNow interfaces as well as classic Jelly and UI16 pages.

Run the UI Test Script

Learn how to use the *`Run UI Test Script`* step to navigate to records, fill fields, click buttons, impersonate users, upload attachments, and assert UI state on classic and Now Experience pages.

The test script has access to shadow-DOM-aware query APIs, realistic user-interaction simulation, and utility APIs for navigation, page evaluation, impersonation, and file uploads. For an overview of the step and the scripting APIs, see Run UI Test Script Developer Guide. For more examples about how to use the test script, see UI Test Script examples.

Input fields

Run UI Test Script input fields

Field	Description
Execution order	Integer that specifies the order in which the test runs this step. As you create steps, the system assigns each step an incremental value so that the test runs steps in the order that you create them. To change the default order, edit the **Execution order** values.
Active	Option that activates this test step for use.
Application	Application scope in which the system runs this step.
Test	Read-only name of the test that you're adding the step to.
Step config	Read-only name of the step.
Description	Description of the test step. The system sets this value automatically from the field values of the test step. This field appears after you submit the test step.
Notes	Notes about the test step.
Timeout	Number of seconds allowed before the step fails. The default is 30.
Script	Test body to run. Available APIs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Run UI Test Script input fields (continued)

Field	Description
	• `expect` assertions, • `screen`: DOM queries such as `getByRole`, `findByText`, and `getBySelector`. • `sn_atf`: `navigate`, `evaluate`, `upload`, `impersonate`, `getAttachmentFile`, `querySelector`, `delay`, and `waitForElementToBeRemoved`. • `user`: user interactions such as `click`, `type`, `keyboard`, `tab`, and `clear`. • Script helpers: `waitFor` (polling), `within` (scoped queries), `steps` (prior step outputs), `params` (parameter set values). • Element predicates: such as `isVisible`, `isEnabled`, and `hasClass`. Return a Promise or use `async/await`.

Note: The test script runs as an `async` function automatically. All element interactions, such as `user.click()` and `user.type()`, return Promises — use `await`. A synchronous script that doesn't use `await` resolves automatically when the last statement runs.

Add the step to a test

To add a script to a text:

1. Open your test record and click **Add test step**.
2. In the step picker, select the **UI** category and choose **Run UI Test Script**.
3. Write your script in the **Script** field.
4. Save the test step.

The step runs inside the browser context of the Client Test Runner. The tested page loads in an iframe, and your script interacts with it through the scripting APIs.

For script test examples, see UI Test Script examples.

expect — assertions

The *`expect`* API makes assertions about elements or values in a Run UI Test Script step. Pass a DOM element for element-specific matchers, or pass any other value for value matchers.

Element matchers

```
const [btn] = screen.getAllByRole('button', { name: 'Submit' });
expect(btn).toBeVisible();
expect(btn).toBeEnabled();
expect(btn).not.toBeDisabled();
expect(btn).toHaveTextContent('Submit');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element matchers

Matcher	Asserts
`.toBeVisible()`	Element is in the DOM and visible, not hidden by CSS.
`.toBeHidden()`	Element isn't visible.
`.toBeEnabled()`	Form control isn't disabled.
`.toBeDisabled()`	Form control is disabled or has `aria-disabled="true"`.
`.toBeChecked()`	Check box or radio is checked.
`.toBePartiallyChecked()`	Check box is indeterminate.
`.toBeInTheDocument()`	Element exists in the document.
`.toBeEmptyDOMElement()`	Element has no child nodes.
`.toHaveFocus()`	Element has keyboard focus.
`.toHaveTextContent(text)`	Element's text content matches a string or RegExp.
`.toHaveValue(value)`	Form control's current value matches.
`.toHaveDisplayValue(value)`	Visible label of a `<select>` matches.
`.toHaveAttribute(name, value?)`	Element has the attribute, optionally with a specific value.
`.toHaveClass(...classes)`	Element has all listed CSS classes.
`.toHaveStyle(styles)`	Element has the given inline or computed styles.
`.toHaveAccessibleName(name)`	ARIA accessible name matches.
`.toHaveAccessibleDescription(desc)`	ARIA accessible description matches.
`.toContainElement(child)`	Element contains `child`.
`.toHaveRole(role)`	Element has the given ARIA role.
`.toHaveFormValues(values)`	Form element's fields match the given value map.
`.toBeRequired()`	Form control is required.
`.toBeValid()`	Form control passes validation.
`.toBeInvalid()`	Form control fails validation.
`.toHaveErrorMessage(text?)`	Element has an associated error message.

Value matchers

When `expect` receives a non-element value, it delegates to value matchers.

```
expect(2 + 2).toBe(4);
expect({ a: 1 }).toEqual({ a: 1 });
expect([1, 2, 3]).toContain(2);
expect('hello').toMatch(/ell/);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
expect(null).toBeNull();
expect(undefined).toBeUndefined();
```

Polling with expect

`expect` throws synchronously on failure. Combine it with `waitFor` to retry.

```
await waitFor(() => {
  expect(screen.getByRole('status')).toHaveTextContent('Saved');
});
```

screen — DOM queries

The *`screen`* API is the primary interface for finding elements on the page tested by a *`Run UI Test Script step`*. All query methods pierce shadow roots automatically, so they work with Now Experience components as well as classic Jelly and UI16 pages.

Query method variants

Each query type comes in the following variants.

Query method variants

Variant	Returns	Throws when missing?	Async?
`getBy*`	Single element	Yes, throws immediately	No
`getAllBy*`	Array of elements	Yes, if empty	No
`queryBy*`	Single element or `null`	No	No
`queryAllBy*`	Array, which may be empty	No	No
`findBy*`	Single element	Yes, rejects the Promise	Yes, polls until found
`findAllBy*`	Array of elements	Yes, if empty	Yes, polls until found

Use `findBy*` when the element appears asynchronously, such as after an API response, animation, or navigation. Use `getBy*` when the element must already exist. Use `queryBy*` to check whether an element is absent.

Query types

Each variant supports the following query types.

Query types

Type	Finds elements by	Example
`Role`	ARIA role, implicit or explicit	`screen.getByRole('button', { name: 'Save' })`
`Text`	Visible text content	`screen.findByText('Incident created')`
`LabelText`	Associated `<label>` text	`screen.getByLabelText('Short description')`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query types (continued)

Type	Finds elements by	Example
`PlaceholderText`	`placeholder` attribute	`screen.getByPlaceholderText('Search…')`
`AltText`	`alt` attribute	`screen.getByAltText('Company logo')`
`Title`	`title` attribute	`screen.getByTitle('Close dialog')`
`TestId`	`data-testid` attribute	`screen.getByTestId('submit-btn')`
`DisplayValue`	Current display value of a form control	`screen.getByDisplayValue('High')`
`Selector`	CSS selector, shadow-piercing	`screen.getBySelector('input[name="priority"]')`

`getByRole` is the recommended default because it validates accessibility as it queries. Use `getBySelector` only when no accessible query matches.

screen.waitFor(callback, options?)

Polls `callback` until it stops throwing. Use this method to wait for a condition that isn't directly an element query.

```
await screen.waitFor(() => {

 expect(screen.getByRole('status')).toHaveTextContent('Complete
');
});
```

Options: `{ timeout: 5000, interval: 50 }`, in milliseconds.

screen.debug(element?)

Logs the outer HTML of `element`, or the whole page body when omitted, to the browser console, including shadow root contents. Use it when a query doesn't match what you expect.

```
screen.debug(); // log the full page
screen.debug(screen.getByRole('form')); // log a specific
 subtree
```

Shadow DOM traversal

All `screen.getBy*`, `screen.findBy*`, and `screen.queryBy*` queries automatically pierce shadow roots. Now Experience components render their content inside shadow roots, which are normally invisible to `document.querySelector`. The ATF testing library traverses these boundaries transparently, so you can query by role or text whether the element is in light DOM or shadow DOM.

`getByRole` resolves accessible names by reading shadow root text content when the host element's own text content is empty, matching the behavior that a screen reader reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`getBySelector` uses a custom shadow-piercing CSS selector engine that handles cross-shadow combinators, for example `now-typeahead input`.

sn_atf — utility APIs

The *`sn_atf`* API provides utility methods for a *`Run UI Test Script`* step: navigation, page evaluation, impersonation, file uploads, and shadow-DOM utilities.

Navigation

Navigation methods

Method	Description
`sn_atf.navigate(url)`	Navigate the tested iframe to a URL, relative or absolute. Awaits full page load.
`sn_atf.reload()`	Reload the current page in the iframe.
`sn_atf.goBack()`	Go to the previous page in the navigation history managed by this step.
`sn_atf.goForward()`	Go to the next page in the navigation history.

All navigation methods return Promises and resolve when the `load` event of the new page fires. The `screen` object automatically retargets to the new document body after navigation.

```
await
 sn_atf.navigate('/now/nav/ui/classic/params/target/incident_lis
t.do');
const row = await screen.findByRole('row',
 { name: /INC0001234/ });
await user.click(row);
await screen.findByRole('heading', { name: /INC0001234/ });
```

sn_atf.evaluate(fn, arg?)

Runs `fn` inside the JavaScript realm of the tested iframe and returns a Promise with the result. This method mirrors the `page.evaluate()` contract in Playwright.

```
// Read a value from the iframe's context
const title = await sn_atf.evaluate(() => document.title);

// Pass an argument into the iframe context
const attr = await sn_atf.evaluate((sel) =>
 document.querySelector(sel)?.dataset.state,
 '[data-testid="status"]');
```

The function is serialized through `.toString()` and evaluated in the iframe, so it can't close over variables from the test script scope. Pass data through the `arg` parameter instead.

`fn` can return a plain value or a Promise. When it returns a Promise, `evaluate` awaits it.

sn_atf.impersonate(userId)

Impersonates a user for the remainder of the step. Accepts a `sys_id` or `user_name`. The iframe reloads automatically after impersonation succeeds, and the original session is always restored when the step ends, whether the step passes, fails, or times out.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
await sn_atf.impersonate('fred.luddy');
// Or by sys_id:
await sn_atf.impersonate('6816f79cc0a8016401c5a33be04be441');

// Now interact as that user
const btn = await screen.findByRole('button', { name: 'Create
 Incident' });
expect(btn).toBeEnabled();
```

Impersonation requires the ATF runner session to have the `impersonator` role.

File uploads

File upload methods

Method	Signature	Description
`sn_atf.upload(source)`	`upload(sysId | File)`	Upload to the current classic ServiceNow form. Pass a `sys_attachment` sys_id to copy server-side, with no bytes transferred, or pass a `File` object to upload through REST.
`sn_atf.uploadInWS(source, table?, sysId?)`	`uploadInWS(sysId | File, tableName?, recordSysId?)`	Upload to a Workspace record. `table` and `sysId` are inferred from the current URL when omitted.
`sn_atf.uploadInSP(source, table?, sysId?)`	`uploadInSP(sysId | File, tableName?, recordSysId?)`	Upload to a Service Portal form record. `table` and `sysId` are read from the URL query parameters when omitted.
`sn_atf.uploadInSCVariable(source, variableName)`	`uploadInSCVariable(sysId | File, variableName)`	Upload to a service catalog attachment variable in the classic catalog. `variableName` is the column name, for example `'proof_of_id'`.
`sn_atf.uploadInSPVariable(source, variableName, opts?)`	`uploadInSPVariable(sysId | File, variableName, { timeout? })`	Upload to a Service Portal catalog attachment variable. `variableName` is the column

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File upload methods (continued)

Method	Signature	Description
		name without the `sp_formfield_` prefix.

`sn_atf.upload()` returns Promise<void>, not Promise<{ sysId, name, size }>. Only uploadInWS, uploadInSP, uploadInSCVariable, and uploadInSPVariable return { sysId, name, size }.

```
// Copy an existing attachment to the current form (no bytes
 transferred)
await sn_atf.upload('a1b2c3d4e5f67890a1b2c3d4e5f67890');

// Upload a File retrieved from another attachment
const file = await
 sn_atf.getAttachmentFile('a1b2c3d4e5f67890a1b2c3d4e5f67890');
await sn_atf.uploadInWS(file);
```

sn_atf.getAttachmentFile(sysId)

Fetches the bytes of a `sys_attachment` record through the REST API and returns a `Promise<File>` with the correct name and content type. Use this method to read an attachment from one record and upload it to another.

```
const file = await
 sn_atf.getAttachmentFile('a1b2c3d4e5f67890a1b2c3d4e5f67890');
await sn_atf.upload(file);
```

DOM utilities

DOM utility methods

Method	Description
`sn_atf.querySelector(root, selector)`	Shadow-DOM-piercing `querySelector`. Finds the first element that matches `selector` under `root`, crossing shadow boundaries.
`sn_atf.querySelectorAll(root, selector)`	Shadow-DOM-piercing `querySelectorAll`. Returns all matching elements.
`sn_atf.getActiveElement(root?)`	Returns the currently focused element, piercing shadow roots and iframes.
`sn_atf.waitForElementToBeRemoved(element, opts?)`	Waits until `element` is removed from the DOM. Resolves immediately if the element is already disconnected.
`sn_atf.delay(ms)`	Returns a Promise that resolves after `ms` milliseconds. Prefer `waitFor` or `findBy*` for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DOM utility methods (continued)

Method	Description
	dynamic waits, and use `delay` only when a fixed pause is unavoidable.

user — user interactions

The *`user`* API simulates realistic user interactions in a Run UI Test Script step. Each interaction fires the same events a real browser user produces, such as focus, input, change, blur, and keyboard events, so that client scripts and reactive frameworks respond correctly.

user methods

user methods

Method	Description
`user.click(el)`	Single click.
`user.dblClick(el)`	Double click.
`user.tripleClick(el)`	Triple click, which selects all text in an input.
`user.hover(el)`	Move the pointer over the element.
`user.unhover(el)`	Move the pointer away from the element.
`user.type(el, text)`	Type text character by character, firing key events.
`user.keyboard(seq)`	Send a key sequence, for example `'{Enter}'`, `'{Tab}'`, or `'{Control>}a{/Control}'`.
`user.tab(opts?)`	Press Tab, or Shift+Tab with `{ shift: true }`.
`user.clear(el)`	Select all and delete the current value.
`user.selectOptions(el, values)`	Select one or more `<option>` values in a `<select>`.
`user.deselectOptions(el, values)`	Deselect options in a multi-select.
`user.copy()`	Copy the selection to the clipboard.
`user.cut()`	Cut the selection to the clipboard.
`user.paste()`	Paste from the clipboard.

Usage

All `user.*` methods return Promises — always `await` them.

```
const field = screen.getByRole('textbox', { name: 'Short
 description' });
await user.click(field);
await user.type(field, 'Cannot connect to VPN');
```

`user.type` fires `keydown`, `keypress`, `input`, and `keyup` for each character. Use it when keystroke-level events matter. For long strings where only the final value matters, use the `user.clear` and `user.type` pattern

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script helper functions

A *`Run UI Test Script`* step provides 4 global helper functions for polling, scoping queries, and reading data from other parts of the test: `waitFor`, `within`, `steps`, and `params`.

waitFor(callback, options?)

`waitFor()` polls `callback` repeatedly until it stops throwing. Use this function for conditions that aren't expressible as a single `findBy*` query.

```
await waitFor(
  () =>
 expect(screen.getByRole('progressbar')).not.toBeInTheDocument
(),
  { timeout: 10000, interval: 200 }
);
```

waitFor options

Option	Default	Description
`timeout`	5000 ms	Maximum time to wait.
`interval`	50 ms	How often to retry.

Note:

`screen.waitFor` and the top-level `waitFor` are the same function.

within(element) — scoped queries

`within()` scopes all queries to a subtree. Use it to disambiguate when the same text or role appears multiple times on the page.

```
const form = screen.getBySelector('form');
const submitBtn = within(form).getByRole('button', { name:
 'Submit' });
await user.click(submitBtn);
```

steps(stepSysId) — access prior step outputs

`steps()` reads output variables from a previously run step in the same test. The argument is the sys_id of the step record, not the step result.

```
// Read a flat output value
const incidentSysId =
 String(steps('abc123def456...').record_sys_id);

// Dotwalk through a reference field
const deptName =
 String(steps('abc123def456...').assigned_to.department.name);
```

Behavior notes:

- Returns a lazy Proxy. No network call is made until the value is coerced to a string, through a template literal, `==`, `String()`, or string concatenation.
- Use `==` rather than `===` for comparisons. Strict `===` against a string literal doesn't match the Proxy object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Returns an empty string for unknown step IDs or unresolvable dotwalk paths.
- Resolves dotwalked, multi-segment paths through a synchronous server call on first access.

Note: `steps(SYS_ID)` takes the sys_id of the step record, not the step result. Find it in the URL when you open the step record.

params(paramName) — parameter set values

`params()` reads a parameter value from the active parameter set when the test runs with a **Test Data — Parameter Set** entry.

```
// Read a simple parameter
const username = String(params('username'));

// Dotwalk through a reference field on the parameter value
const deptName = String(params('assigned_to').department.name);
```

Behavior notes:

- Returns a lazy Proxy, with the same lazy resolution and caching behavior as `steps()`.
- Returns an empty string (`''`) when the test isn't parameterized or the named parameter doesn't exist.
- Use `==` rather than `===` for comparisons.

Comparison behavior with steps() and params()

`steps()` and *`params()`* return ES6 Proxy objects, not plain strings. Coercing them to a string works correctly, through template literals, `==`, or `String()`, but strict equality (`===`) against a string literal is always `false`. This behavior is similar to the server-side `GlideElement`.

```
// Correct
if (String(steps('abc').state) === '1') { … }
if (steps('abc').state == '1') { … }
const val = `${steps('abc').state}`;

// Does not work as expected
if (steps('abc').state === '1') { … } // always false
```

Element predicates

Element predicates are synchronous Boolean checks available in a *`Run UI Test Script`* step. Use them inside *`.find()`* or *`.filter()`* callbacks to pick one element from a list based on its state.

Element predicates

These functions return `true` or `false` synchronously.

```
// Find the first visible element with the text "Number"
const labels = await screen.findAllByText(/^Number$/);
const visible = labels.find(el => isVisible(el));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element predicates

Predicate	Tests
`isVisible(el)`	Element is visible.
`isHidden(el)`	Element isn't visible.
`isEnabled(el)`	Form control is enabled.
`isDisabled(el)`	Form control is disabled or has `aria-disabled="true"`.
`isChecked(el)`	Check box or radio is checked.
`isPartiallyChecked(el)`	Check box is indeterminate.
`isInDocument(el)`	Element is connected to the document.
`isEmpty(el)`	Element has no child nodes.
`hasFocus(el)`	Element has keyboard focus.
`hasClass(el, ...classes)`	Element has all listed CSS classes.
`hasAttribute(el, name, value?)`	Element has the attribute, optionally with a value.
`hasText(el, text)`	Element's text content matches.
`hasValue(el, value)`	Form control's current value matches.
`hasFormValues(el, values)`	Form's field values match the given map.
`hasRole(el, role)`	Element has the given ARIA role.
`hasStyle(el, styles)`	Element has the given styles.
`hasAccessibleName(el, name)`	ARIA accessible name matches.
`hasAccessibleDescription(el, desc)`	ARIA accessible description matches.
`containsElement(el, child)`	`el` contains `child`.

UI Test Script examples

Reference example scripts to use in a *`Run UI Test Script`* step.

These examples include:

- Element verification,
- filling and saving records,
- waiting for async conditions,
- impersonation,
- file uploads,
- step outputs,
- parameter values,
- and scoped queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Assert that a heading is visible on the current page

```
const heading = screen.getByRole('heading', { name: 'My
 Application' });
expect(heading).toBeVisible();
```

Example: Navigate to a record, fill a field, and save

```
await sn_atf.navigate('/incident.do?sys_id=-1');

// Update Caller
const caller = screen.getByRole('searchbox', { name:
 'Caller' });
await user.click(caller);
await user.type(caller, 'Abel Tuter');
await user.tab();

// Update Short description
const short_desc = screen.getByRole('textbox', { name: 'Short
 description' });
await user.click(short_desc);
await user.type(short_desc, 'Cannot connect to VPN');

// Click Submit
await sn_atf.delay(1000);
const [submitBtn] = screen.getAllByRole('button', { name:
 'Submit' });
await user.click(submitBtn);
await waitFor(() => {
  const numField =
 screen.getBySelector('[name="incident.number"]');
  expect(numField.value).toMatch(/^INC/);
}, { timeout: 10000 });
```

Example: Test as an impersonated user

```
// Accepts a user_name or sys_id. The iframe reloads
 automatically.
// The original session is always restored when the step ends.
await sn_atf.impersonate('beth.anglin');
await sn_atf.navigate('/now/sow/home');
const listTab = await screen.findByRole('tab', { name: 'List',
 timeout: 10000 });
await user.click(listTab);
const incidentItem = await screen.findByRole('treeitem', { name:
 'Incidents', timeout: 10000 });
expect(incidentItem).toBeVisible();
```

Example: Upload an attachment to the current form

```
// Pass a sys_id to copy an existing attachment server-side (no
 file bytes transferred).
// Pass a File object (from sn_atf.getAttachmentFile) to upload
 through REST.
await sn_atf.navigate('/incident.do?sys_id=' +
 steps('PREVIOUS_STEP_SYS_ID').record_id);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
await
 sn_atf.upload(steps('PREVIOUS_STEP_SYS_ID').attachment_sys_id);
await screen.findByText('evidence.pdf');
```

Example: Wait for an async condition by using waitFor

```
await sn_atf.navigate('/incident.do?sys_id=<sys_id>');
await screen.findByRole('heading', { name: /INC/ });
const [updateBtn] = screen.getAllByRole('button', { name:
 'Update' });
await waitFor(
  () => expect(updateBtn).toBeEnabled(),
  { timeout: 10000 }
);
```

Example: Access step outputs and parameter values

```
// steps() retrieves output variables from a prior step by its
 sys_id.
// params() retrieves parameter values when running a
 parameterized test.
// Both support dotwalking for reference fields, for example
// steps('...').assigned_to.department.name.
// Use == or String() for comparisons — not ===.
const dept =
 String(steps('PREVIOUS_STEP_SYS_ID').assigned_to.department.nam
e);
const expected = String(params('expected_department'));
expect(dept == expected).toBe(true);
```

Note:

`steps(SYS_ID)` takes the sys_id of the step record, not the step result. Find it in the URL when you open the step record.

Example: Verify an element on a classic form

```
await sn_atf.navigate('/incident.do?sys_id=<sys_id>');
const heading = await screen.findByRole('heading',
 { name: /INC/ });
expect(heading).toBeVisible();
const shortDesc = screen.getByRole('textbox', { name: 'Short
 description' });
expect(shortDesc).toBeVisible();
```

Example: Navigate to a record, fill a field, and save

```
await sn_atf.navigate('/incident.do?sys_id=<sys_id>');
await screen.findByRole('heading', { name: /INC/ });
const shortDesc = screen.getByRole('textbox', { name: 'Short
 description' });
await user.tripleClick(shortDesc);
await user.type(shortDesc, 'Updated by ATF');
const [updateBtn] = screen.getAllByRole('button', { name:
 'Update' });
await user.click(updateBtn);
await screen.findByRole('heading', { name: /INC/ });
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

On classic forms, `findByLabelText` can throw a "found multiple elements" error because ServiceNow uses both `<label for>` and `aria-labelledby` associations at the same time. Prefer `getByRole('textbox', { name: '...' })` for text inputs, or `getByRole('searchbox', { name: '...' })` for reference fields. Classic forms also render every action button — Submit, Update, Delete — in both the header and the footer. Use `getAllByRole` and destructure to take the first one.

Example: Wait for an async condition

Use `waitFor` to poll a condition that is not simply a new element appearing. The callback is retried until it stops throwing or the timeout expires.

```
await sn_atf.navigate('/incident.do?sys_id=<sys_id>');
await screen.findByRole('heading', { name: /INC/ });
const [updateBtn] = screen.getAllByRole('button', { name:
 'Update' });
await waitFor(
  () => expect(updateBtn).toBeEnabled(),
  { timeout: 10000 }
);
```

Example: Test as an impersonated user

```
await sn_atf.impersonate('beth.anglin');
await sn_atf.navigate('/now/sow/home');
const listTab = await screen.findByRole('tab', { name: 'List',
 timeout: 10000 });
await user.click(listTab);
const incidentItem = await screen.findByRole('treeitem', { name:
 'Incidents', timeout: 10000 });
expect(incidentItem).toBeVisible();
```

Example: Upload an attachment

```
// Copy an existing attachment to the current form (no file
 bytes transferred)
await sn_atf.navigate('/incident.do?sys_id=<sys_id>');
await sn_atf.upload('<source_attachment_sys_id>');
await screen.findByText('<file_name>;);
```

Example: Upload to a Workspace record

```
await sn_atf.navigate('/now/sow/record/incident/<sys_id>');
const result = await
 sn_atf.uploadInWS('<source_attachment_sys_id>');
expect(result.name).toBe('evidence.pdf');
```

Example: Use step outputs with dotwalking

```
// steps(<step_sys_id>) — use the sys_id shown in the step
 record's URL
const assigneeDept =
 String(steps('abc123def456abc123def456abc12345').assigned_to.de
partment.name);
expect(assigneeDept).toBe('IT');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Use parameter set values

```
// In a parameterized test, read values from the active
 parameter row
await sn_atf.navigate('/incident.do?sys_id=-1');
const shortDesc = screen.getByRole('textbox', { name: 'Short
 description' });
await user.type(shortDesc, String(params('description')));
const [submitBtn] = screen.getAllByRole('button', { name:
 'Submit' });
await user.click(submitBtn);
await waitFor(() => {
  const numField =
 screen.getBySelector('[name="incident.number"]');
  expect(numField.value).toMatch(/^INC/);
}, { timeout: 10000 });
```

Example: Use within to scope queries

```
// Scope queries to a specific section of the page to avoid
 ambiguous matches
const form = screen.getBySelector('form');
const shortDesc = within(form).getByRole('textbox', { name:
 'Short description' });
expect(shortDesc).toBeVisible();
```

Example: Find the visible instance of a duplicated element

```
// The page renders two elements with the same text; find the
 visible one
const matches = await screen.findAllByText('Number');
const label = matches.find(el => isVisible(el));
expect(label).toBeTruthy();
```

Writing resilient tests: Query Selection and Debugging

Resilient automated tests are built by querying components semantically, through ARIA roles and accessible names, rather than relying on implementation details that teams can change at any time.

Building Resilient Test Queries

The foundation of reliable automated testing rests on a single principle: query your components the way users interact with them, not the way they're built internally.

When you select elements using ARIA roles and accessible names, through queries like `getByRole` and `getByLabelText`, your tests reflect the semantic contract of the component. This approach proved invaluable in a recent case where the SoW team restructured the DOM of a critical component. Tests written against role-based queries continued to pass seamlessly, while tests relying on CSS selectors and internal element IDs shattered immediately. The difference was striking: semantic queries stayed resilient through refactoring, while implementation-dependent queries became brittle.

Recommended query hierarchy:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Start with `getByRole` and `getByLabelText` as your primary tools. These queries prioritize accessibility and semantic meaning, ensuring your tests validate what users actually experience.
- Only reach for `getBySelector` when no accessible query satisfies your needs. Document why the accessible option wasn't viable.
- Avoid anchoring tests to element IDs, generated class names, or deeply nested CSS paths. Component teams can refactor these implementation details without warning, leaving your tests fragile and your test suite unmaintainable.

Handling Asynchronous Content

Automated tests must account for the reality of modern interfaces: content doesn't always appear immediately. After navigation events, API calls, or animations complete, elements enter the DOM asynchronously. In these cases, `findBy*` queries (such as `findByRole`) are essential. They poll the DOM at intervals until the element appears or the timeout expires—a far more reliable approach than `getBy*`, which throws an exception immediately if the element isn't found on the first check.

Debugging Failed Queries

When a query doesn't match what you expected, start with *`screen.debug()`*. This method outputs the complete live DOM of the tested page directly to your browser console, including shadow root contents. You're seeing the actual markup your query runs against, an invaluable reference point for diagnosis.

For scenarios where you need to inspect computed values or execute code in the page context, use `sn_atf.evaluate(() => ...)`. This function runs arbitrary JavaScript inside the tested iframe and returns the result, giving you direct access to component state and runtime values.

When async failures occur, wrap your assertion in `waitFor` with an extended timeout and monitor the console for intermediate states. This technique isolates timing issues and reveals whether content is appearing later than expected or not appearing at all. Combined with *`screen.debug()`* calls at key moments, you can identify the root cause and adjust your test accordingly.

Troubleshooting

Resolve common issues with the *`Run UI Test Script`* step, including reference errors, elements that aren't found, step timeouts, comparison failures, and impersonation failures.

user.type times out on a Workspace input

In certain Workspace (SOW) input components, *`user.type()`* can stall waiting for network activity that never completes, causing the step to time out. When this occurs, set the field value through the native browser DOM APIs directly. This approach is not part of the ATF testing library — it relies on standard web platform APIs available to any browser-side script — and should be treated as a targeted workaround rather than a general pattern. Prefer *`user.type()`* for all other contexts.

```
const input = screen.getByRole('searchbox', { name:
 'Caller' });
await user.click(input);

const nativeSetter = Object.getOwnPropertyDescriptor(
  HTMLInputElement.prototype,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  'value'
).set;

nativeSetter.call(input, 'Abel Tuter');
input.dispatchEvent(
  new InputEvent('input', {
    bubbles: true,
    composed: true,
    inputType: 'insertText',
  })
);
input.dispatchEvent(
  new Event('change', { bubbles: true, composed:
 true })
);

const host = input.getRootNode?.()?.host;
if (host) {
  host.dispatchEvent(
    new InputEvent('input', { bubbles: true, composed:
 true })
  );
  host.dispatchEvent(
    new Event('change', { bubbles: true, composed:
 true })
  );
}
```

`ReferenceError: X is not defined`

When a variable name isn't recognized, the error message lists all available APIs. The most common causes are:

- `waitForElementToBeRemoved` — Use `sn_atf.waitForElementToBeRemoved(el)`, not a top-level function.
- `fill` — There is no `fill` function. Use `user.type(el, text)`, or `user.clear(el)` and then `user.type(el, text)`.

Element not found

- The element might be inside a shadow root. All `screen.*` queries pierce shadow roots. If the element still isn't found, use `screen.debug()` to inspect the DOM.
- The element might not yet exist. Use `findBy*`, which is async and polls, instead of `getBy*`, which is synchronous and throws immediately.
- The element might exist but not be visible to the query type. Use `getBySelector` with a CSS selector as a fallback.

Step times out

- The default timeout is 30 seconds. If your test involves slow navigations or network requests, configure a longer timeout on the step record.
- A `findBy*` query waits up to 5 seconds by default before failing. Pass `{ timeout: 15000 }` in the second argument to extend it, for example

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`screen.findByRole('button', { name: 'Save', timeout: 15000 })`. Timeout must go inside the second argument alongside name.

- Ensure that all Promises are awaited. An unawaited Promise silently discards its result, and the step might resolve before the action completes.

Comparison with `steps()` or `params()` always fails

Use `==` or `String()` for comparisons. See the 'Comparison behavior' section in Script helper functions for more information.

Impersonation fails

- The ATF runner session requires the `impersonator` role.
- Verify that the user identifier, sys_id or user_name, is correct. The error message includes the resolved ID.
- The step restores the session on exit, including on timeout, so a session that isn't restored after a test failure doesn't occur in practice.

Alarm Management Open API Developer Guide

Use the *`Alarm Management Open API`* to create and update data in the Events [em_event] table.

This developer guide provides information on how to extend the Alarm Management Open API to make various customizations.

Extending the Alarm Management Open API

The *`Alarm Management Open API`* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- `TMFAlarmAPIConstants`: Contains constants and required parameter information.
- `TMFAlarmAPIUtil`: Contains functions to handle API requests.
- `AlarmAPIProcessorOOB`: Contains helper functions that support functions in `TMFAlarmAPIUtil`.
- `AlarmAPIProcessor`: An empty script include file. Use this file to define any functions that you want to override from `AlarmAPIProcessorOOB`.

Extend the *`Alarm Management Open API`* to make the following customizations.

Required parameters

The *`Alarm Management`* API utilizes JSON schemas to hold required parameters information. These JSON schemas are defined in the *`TMFAlarmAPIConstants`* script include. These schemas are used to validate whether request payloads are valid. These schemas are not referenced directly in script includes and are returned by the following methods in the *`AlarmAPIProcessorOOB`* script include:

- `getCreateEventSchema`: Returns the validating schema for creating an event.
- `getClearEventSchema`: Returns the validating schema for clearing an event alarm.
- `getPatchEventSchema`: Returns the validating schema for patching an event.

To override existing schemas, define new schemas in the `AlarmAPIProcessor` script include and override the `AlarmAPIProcessorOOB` script include methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var AlarmAPIProcessor = Class.create();
AlarmAPIProcessor.prototype =
 Object.extendsObject(AlarmAPIProcessorOOB, {
 // Define overriding functions here

 // Define getCreateEventSchema here to override OOTB method in
 AlarmAPIProcessorOOB
 getCreateEventSchema: function() {
  return JSON.parse(AlarmAPIProcessor.CUSTOMIZED_SCHEMA);
 },
    type: 'AlarmAPIProcessor'
});

// Define a new schema
AlarmAPIProcessor.CUSTOMIZED_SCHEMA =
 "{\"title\":\"CreateAlarm\",\"type\":\"object\",
\"properties\":{\"externalAlarmId\":{\"type\":
\"string\"},\"alarmType\":{\"type\":\"string\"},
\"perceivedSeverity\":{\"type\":\"string\"},\"probableCause\":
{\"type\":\"string\"},
\"alarmedObject\":{\"type\":\"object\",\"properties\":{\"id\":
{\"type\":\"string\"},
\"href\":{\"type\":\"string\"}},\"required\":
[\"id\"]},\"sourceSystemId\":{\"type\":\"string\"}},
\"required\":[\"externalAlarmId\",\"alarmType\",
\"perceivedSeverity\",\"probableCause\",
\"alarmedObject\",\"sourceSystemId\"]}";
```

Request body validation

To perform additional validation on the request body, override the following functions in the `AlarmAPIProcessorOOB` script include . These functions are called by the specified functions in the `TMFAlarmAPIUtil` script include.

- `verifyCreateEventPayload()` - Called by `processCreateEvent()`.
- `verifyClearEventPayload()` - Called by `processClearEvent()`.
- `verifyPatchEventPayload()` - Called by `processPatchEvent()`.

All of these functions return `true` by defalut. If a helper function returns `false`, it stops the API operation.
To apply custom validations, override AlarmAPIProcessorOOB helper functions with identically-named function names and parameters in AlarmAPIProcessor. The new AlarmAPIProcessor functions are called by TMFAlarmAPIUtil to replace the default AlarmAPIProcessorOOB helper functions.

In this example, a function in a custom AlarmAPIProcessor script include overrides a default function in AlarmAPIProcessorOOB to perform validation on the name attribute.

```
var AlarmAPIProcessor = Class.create();
AlarmAPIProcessor.prototype =
 Object.extendsObject(AlarmAPIProcessorOOB, {
 // Define overriding functions here

    verifyCreateEventPayload: function(eventPayload,
 apiResponseProcessor){
        // Returning false terminates the POST request
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        // Make sure to assign error message and reason
        if (eventPayload.type != "unique") {
            apiResponseProcessor.setMessage("Failed");
            apiResponseProcessor.setReason("No reason needed");
            return false;
        }
    },

    type: 'AlarmAPIProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET, PATCH, and POST operations, create additional scripted REST resources for the *Alarm Management Open* API. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in TMFAlarmAPIUtil.

Field mapping

When creating or updating records, the *Alarm Management Open* API maps request body parameters to event record fields. When retrieving records, the API maps record fields to response object attributes.

The AlarmAPIProcessorOOB script include contains the following functions to map a PATCH or POST request body to a record in the Event [em_event] table.

- `mapCreateAlarmObjectToEvent()`
- `mapClearAlarmObjectToEvent()`
- `mapPatchAlarmObjectToEvent()`

It also contains the following functions to map an event GlideRecord to a JSON response object for GET, PATCH, or POST requests.

- `modifyCreateEventResponse()`
- `modifyClearEventResponse()`
- `modifyPatchEventResponse()`

You can customize field mappings to add and retrieve data for additional Event [em_event] table fields or change the default field mappings. To work with mappings, create functions with identical names and parameters in *AlarmAPIProcessor* to override *AlarmAPIProcessorOOB* mapping functions. *TMFAlarmAPIUtil* uses these *AlarmAPIProcessor* functions to replace the default *AlarmAPIProcessorOOB* mapping functions.

In the following example, two *AlarmAPIProcessor* functions override the default functions in *AlarmAPIProcessorOOB* to change the **Type** field mapping and add a mapping for the **Severity** field.

```
var AlarmAPIProcessor = Class.create();
AlarmAPIProcessor.prototype =
 Object.extendsObject(AlarmAPIProcessorOOB, {
 // Define overriding functions here

    // Function name and parameters must be identical to the
 function it overrides
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    mapCreateAlarmObjectToEvent: function(eventGr, eventObject){
        // Override default mapping for the severity field
        eventGr.severity = "High";
    },

    modifyCreateEventResponse: function(eventGr, eventObject){
        // Override default mapping for the type field
        eventGr.type = "Customized Event";
    },

    type: 'AlarmAPIProcessor'
});
```

AP Invoice API Developer Guide

This developer guide describes how to define custom invoice fields that aren't provided by default with the *AP Invoice* API for Accounts Payable Invoice Processing. Instructions are also provided for setting authentication when using cXML as the payload.

You can define custom invoice fields for the request body. Use the following flow to add custom fields, map them to target tables, and format them for availability in the payload:

1. Add custom fields for invoice import
2. Map custom fields between source and target tables
3. Map custom fields to a payload source format

Define credentials for cXML payloads in the Source system credential [sn_spend_intg_source_system_credential] table. For instructions, see Setting credentials for authentication in the cXML payload.

You can apply a filter condition for invoice lines containing multiple ERPs. For information, see Integration errors.

See also:

- Accounts Payable Invoice Processing
- AP Invoice API reference

Note: The *AP Invoice* API requires the Accounts Payable Invoice Processing (com.sn_ap_apm) and Source-to-Pay Integration Framework (sn_spend_intg) applications, which are available on the ServiceNow Store.

Add custom fields for invoice import

Use the following procedure to add custom fields for invoices, invoice lines, and invoice tax lines to be used with the *AP Invoice* API.

Before you begin

- Role required: admin
- Application scope: Source-to-Pay Integrations

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select one of the following invoice import tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Invoice Import [sn_spend_intg_imp_invoice]
- Invoice Line Import [sn_spend_intg_imp_invoice_line]
- Invoice Tax Line Import [sn_spend_intg_imp_invoice_tax_line]

3. On the **Table Columns** tab, select **New**.
4. Select a type associated with the field value (for example, `Integer`) from the **Type** menu.

   Note: For a list of valid types, see Field types reference.

5. Enter a meaningful name in the **Column label** field.
   Text including the label is automatically populated in the **Column name** field.
6. Select **Save** or **Submit**.
7. Add a column of the same name and type to the Invoice [sn_shop_invoice] table.

   Note: For more information on columns and fields, see Exploring field administration.

8. Map the fields between the source and target tables.

Map custom fields between source and target tables

Use the following procedure to map custom fields between source and target tables for the AP Invoice API.

Before you begin

- Role required: admin
- Application scope: Source-to-Pay Integrations

Create table columns for mapping the new field from the source table to the target table. Use the steps in Add custom fields for invoice import.

Procedure

1. Navigate to **All** > **System Import Sets** > **Transform Maps**.
2. Open the Invoice Import table transform map.
3. Click **New** on the **Field Maps** tab.
4. Select the name of the custom field from the **Source field** menu.
5. Select the name of the custom field from the **Target field** menu.
6. Select **Save** or **Submit**.
7. Map custom fields to a payload source format.

Map custom fields to a payload source format

Use the following procedure to map custom fields to a payload entry in JSON, cXML, or XML for the AP Invoice API.

Before you begin

- Role required: admin
- Application scope: Source-to-Pay Integrations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add custom fields for invoice import
- Map custom fields between source and target tables

Procedure

1. Navigate to **All** > **Procurement Integrations** > **Suppliers** > **Invoice Integration Field Mappings**.
2. Select **New**.
3. Add the name of the source system to the **Source system** field.
   - If this field mapping applies to all source systems, enter `Default`.
   - If the mapping is specific to a particular source system, this value must match the value of the Source-System header parameter received in the API.

     Note: All remaining field mappings must be configured specifically for this source system.
4. Select the format of the source system for which the mapping is being created from the **Source format** choice list (cXML or JSON).
5. Provide a name (JSON property) or path (cXML/XML attribute or element) for the payload entry in the **Source field** field.
   You can view the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table for examples of cXML and XML path settings.
6. Add the name of an attribute if the field is to be defined as an element attribute for cXML payloads, otherwise leave the field empty.
7. Select the name of the target table containing your custom field from the **Related table** list.
8. Select the name of the custom field from the **Target field** list.
9. Select **Save** or **Submit**.
   The mapped field is added to the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table.

Setting credentials for authentication in the cXML payload

The *`sn_spend_intg/ap_invoice/cxml`* endpoint is authenticated in the payload using credentials stored in the Source System Credential [sn_spend_intg_source_system_credential] table.

Before you begin

Role required: admin

Identify the payload source system listed in the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table.

See also AP Invoice – POST /sn_spend_intg/ap_invoice/cxml.

Procedure

1. Navigate to **All** > **Procurement Integrations** > **Source System Credentials**.
2. Select **New**.
3. Add the name of the source system listed in the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table in the **Source System** field.
   The source system name must match the Source-System header parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Add the user name to be fetched in the **User name** field.
   Use this value in the `/cXML/Header/To/Credential [@domain='NetworkID']/Identity` element.
5. Add a strong combination of letters, numbers, and special characters to the **Password** field.
   Use this value in the `/cXML/Header/Sender/Credential [@domain='NetworkID']/SharedSecret` element.
6. Select **Submit**.

Customizing TSOM connector behavior with extension points

Learn how to use extension points to extend ServiceNow Telecommunications Service Operations Management (TSOM) connector behavior without modifying any default code.

TSOM ships 19 extension points across 5 connector scopes.

Each TSOM extension point controls one aspect of connector behavior, from life cycle status assignment, to event-to-CI mapping, to metric aggregation. Implement an extension point when the default behavior doesn't match how your organization models or processes discovered data.

For the full attribute matrix, see TSOM extension point quick reference. The extension points are grouped by function:

- Lifecycle management (4)
- Event-to-CI mapping (1)
- Webhook field mapping (1)
- Metrics customization (2)
- Vendor-specific customizations (5)
- Fortinet discovery extensibility (3)
- Meraki discovery extensibility (3)

Requirements

This guide describes how to implement the extension points that TSOM offers. To define new extension points in your own application, see the platform documentation on scripted extension points in server-side scripts.

Confirm the prerequisites: which plugin(s) / store apps deliver each connector scope (sn_sgc_meraki, sn_sgc_fortinet, sn_sgc_vcloud, sn_sgc_catalyst, sn_tsom_em_conns), and the activation steps. The source Pocket Guide assumes the connectors are already installed.

Writer / dev verificationConfirm the role(s) required to create Script Includes and Extension Instance records (admin, or a scoped-app developer role). Not stated in the source material.

Key terminology

The following table describes the key terms and tables that back them when you implement a TSOM extension point.

Extension point terminology

Term	Table	Description
Extension point	sys_extension_point	The contract definition. Declares the methods an implementation must provide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extension point terminology (continued)

Term	Table	Description
Extension instance	sys_extension_instance	A registration record that links a Script Include to an extension point.
Script Include	sys_script_include	The code that implements the extension point contract.
Order	sys_extension_instance.order	Numeric priority. A lower number is a higher priority.
restrict_scope	sys_extension_point.restrict_scope	When `true`, only implementations from the same scope can register.

TSOM extension point resolution at runtime

The resolution chain, the order field, the three dispatch patterns, and the scope restrictions determine whether a registered implementation runs and which implementation's result is applied at runtime. Review these mechanisms before implementing an extension point.

When TSOM invokes an extension point, it calls `GlideScriptedExtensionPoint` to retrieve all active `sys_extension_instance` records linked to that extension point, each instantiated as a Script Include object. The calling code then selects one or more implementations from the returned array according to the extension point's dispatch pattern.

```
var ep = new GlideScriptedExtensionPoint();
var implementations =
 ep.getExtensions('scope.ExtensionPointName');
```

The resolution chain

The resolution chain proceeds from contract to registration to implementation: `sys_extension_point` (contract) → `sys_extension_instance` (registration, `active=true`) → `sys_script_include` (implementation).

The order field

Every `sys_extension_instance` has an integer `order` field. OOB implementations use `order = 100`. Lower numbers take priority.

Reserved order ranges

Order range	Reserved for
`1-49`	ServiceNow emergency hotfixes. Do not use.
`50-99`	Customer overrides. Recommended: `order = 50`.
`100`	OOB default implementations.
`101+`	Fallback or lower-priority extensions.

Dispatch patterns

The dispatch pattern of an extension point determines how the framework selects among registered implementations and, in turn, how a custom implementation affects runtime behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Handler pattern (all implementations invoked): The framework iterates over all active implementations and invokes the handler method on each. A custom implementation's result takes precedence when it is registered at an `order` value below 100. Used by the four lifecycle status extension points and by the firmware-version and contract-parsing extension points.
2. Vendor-dispatch pattern (matched by vendor or rule name): A resolver iterates over all implementations, calls `getVendor()` (and, where applicable, `getRuleName()`), and returns the first match. When more than one implementation matches, the implementation with the lowest `order` value is selected. Used by the event field mapping, webhook field mapping, and recovery handler extension points.
3. Single-override pattern (lowest order selected): The framework uses only the implementation with the lowest `order` value; exactly one implementation runs. Used by the metrics aggregation, uplink throughput, Nokia MPN formula, and tag transformation extension points.
4. Validated-contract pattern (first complete implementation selected): The framework uses the first implementation it finds that satisfies the entire contract, and exactly one implementation runs. An implementation that omits any required method is rejected in full rather than partially merged; an error names the missing method or key and the OOB implementation is used instead. Used by the three Fortinet discovery extension points — `sn_sgc_fortinet.FortinetCollectionPlan`, `sn_sgc_fortinet.FortinetParserHooks`, and `sn_sgc_fortinet.FortinetFieldMappings` — and the three Meraki discovery extension points — `sn_sgc_meraki.MerakiCollectionPlan`, `sn_sgc_meraki.MerakiParserHooks`, and `sn_sgc_meraki.MerakiFieldMappings`.

Note:

Under the validated-contract pattern, `order` still governs the sequence in which implementations are examined, so register a custom implementation below 100 to have it considered before the OOB implementation. Selection then depends on whether that implementation is complete.

Scope restrictions

The `restrict_scope` field on the extension point controls who can register an implementation.

Scope restriction behavior

restrict_scope	Meaning	Impact
`false` (17 of 19)	Implementations from any scoped app are accepted.	Create a custom scoped app with your Script Include; it works cross-scope.
`true` (2 of 19)	Same scope only.	You can't override from your own scope. Contact ServiceNow support.

Important:

The two extension points with `restrict_scope = true` are `sn_tsom_em_conns.WebhookFieldMapping` and `sn_tsom_em_conns.RecoveryHandlerSEP`. An instance registered from a different scope is ignored silently; no error is raised.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lifecycle stage status extension points

Four extension points—one each for the Meraki, Fortinet, VeloCloud, and Catalyst connectors—control the lifecycle stage status assigned to discovered CIs. All four share the same contract.

By default, each connector assigns the status `In Use` to every discovered CI, regardless of class. Implement a lifecycle stage status extension point when the lifecycle status must vary by CI class. For example, to distinguish operational routers from interfaces undergoing maintenance.

These extension points use the handler dispatch pattern: a custom implementation runs alongside the out-of-the-box logic, and its returned value takes precedence when its extension instance is registered at a lower `order` value. All four extension points have `restrict_scope = false`, so implementations can be registered from a custom scoped application.

For the procedure to override a single connector, see Override the lifecycle stage status. To apply identical logic across all four connectors without duplication, see Share lifecycle logic across vendor connectors. For the contract and per-connector API names, see Lifecycle stage status contract.

Lifecycle stage status contract

Reference the shared contract and per-connector API names for the four lifecycle stage status extension points.

Contract

Attribute	Value	Description
Method	`handlers.getLifeCycleStageStatus(entityClass)`	Returns the lifecycle stage status for CIs of the given class.
Parameter	`entityClass` (String)	The CMDB class of the discovered CI, for example `cmdb_ci_ip_router`.
Returns	String	The lifecycle stage status to assign.
OOB default	`In Use`	Returned for all entity classes.
Dispatch	Handler	All active implementations are called.

Lifecycle stage status extension points

Connector	API name	Scope
Meraki	`sn_sgc_meraki.MerakiCustomizedLifeCycleStageStatus`	`sn_sgc_meraki`
Fortinet	`sn_sgc_fortinet.FortinetCustomizedLifeCycleStageStatus`	`sn_sgc_fortin`
VeloCloud	`sn_sgc_vcloud.VeloCloudCustomizedLifeCycleStageStatus`	`sn_sgc_vcloud`
Catalyst	`sn_sgc_catalyst.CatalystCustomizedLifeCycleStageStatus`	`sn_sgc_cataly`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Override the lifecycle stage status

Assign a lifecycle stage status that varies by CI class for CIs discovered by a TSOM vendor connector. This procedure uses the Meraki connector; the steps are identical for Fortinet, VeloCloud, and Catalyst.

Before you begin

Role required: XX.

Confirm the target connector (for Meraki, `sn_sgc_meraki`) is installed and active. Because this extension point has `restrict_scope = false`, you can register your implementation from a custom scoped application; you don't need to work inside the connector scope.

About this task

The extension point uses the handler pattern, so your implementation supplements rather than replaces default logic. Returning a value with an `order` below 100 makes your value win.

Procedure

1. Create a Script Include in your scoped application that implements the contract method *`handlers.getLifeCycleStageStatus(entityClass)`*.
2. Return the status string for each CI class and fall through to `In Use` for unmatched classes.

```
var MyMerakiLifeCycleOverride = Class.create();
MyMerakiLifeCycleOverride.prototype = {
    initialize: function() {},
    handlers: {
        getLifeCycleStageStatus: function(entityClass) {
            // Routers -> Operational, interfaces -> In
 Maintenance
            if (entityClass == 'cmdb_ci_ip_router') return
 'Operational';
            if (entityClass == 'cmdb_ci_ni_interface') return
 'In Maintenance';
            return 'In Use';
        }
    },
    type: 'MyMerakiLifeCycleOverride'
};
```

3. Set the `type` value to exactly match the Script Include record name.

   Note: The resolver looks up `order` by `type`. A mismatch causes your order to be ignored and to default to 100.

4. Navigate to **System Definition** > **Extension Instances** and create a registration record.

Extension instance fields

Field	Value
Point	`sn_sgc_meraki.MerakiCustomizedLifeCycleSta`
Script Include	Your Script Include
Order	50 (recommended customer-override range is 50–99)
Active	`true`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

On the next Meraki discovery sync, discovered CIs receive the lifecycle status your implementation returns. Verify on a CI's `life_cycle_stage_status` field.

To confirm the override is loaded, see **Verify that an extension instance is active**. To reuse this logic across the other three connectors, see **Share lifecycle logic across vendor connectors**.

Share lifecycle logic across vendor connectors

Apply one set of lifecycle stage status rules across the Meraki, Fortinet, VeloCloud, and Catalyst connectors by centralizing the logic in a helper Script Include and delegating to it from thin per-connector wrappers.

Before you begin

Role required: user role

About this task

Each connector has its own extension point, but all four share an identical contract. Rather than duplicate the mapping logic four times, put it in a shared helper and register one thin wrapper per connector extension point.

Procedure

1. Create a shared helper Script Include that returns a status for a CI class.
   This is a plain helper, not an extension point implementation.

```
var MyLifeCycleHelper = Class.create();
MyLifeCycleHelper.prototype = {
    initialize: function() {},
    getStatus: function(entityClass) {
        var mapping = {
            'cmdb_ci_ip_router':    'Operational',
            'cmdb_ci_ip_switch':    'Operational',
            'cmdb_ci_ni_interface': 'In Maintenance'
        };
        return mapping[entityClass] || 'In Use';
    },
    type: 'MyLifeCycleHelper'
};
```

2. Create one thin wrapper Script Include per connector extension point that delegates to the helper.
   The example shows the Fortinet wrapper; repeat for Meraki, VeloCloud, and Catalyst.

```
var MyFortinetLifeCycle = Class.create();
MyFortinetLifeCycle.prototype = {
    initialize: function() {},
    handlers: {
        getLifeCycleStageStatus: function(entityClass) {
            return new
 MyLifeCycleHelper().getStatus(entityClass);
        }
    },
    type: 'MyFortinetLifeCycle'
};
```

3. Register each wrapper against its connector's extension point with `order = 50` and `active = true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
All four connectors apply the same lifecycle rules, and you maintain the logic in one place.

event-to-CI mapping extension point

The EventFieldMapping extension point binds an incoming event to a configuration item. Use it to change how an existing vendor's events resolve to CIs, or to add CI mapping for a new vendor.

`sn_tsom_em_conns.EventFieldMapping` uses the **vendor-dispatch** pattern: a resolver matches on `getVendor()` and `getRuleName()`, and the lowest `order` wins among matches. The extension point has `restrict_scope = false` and is available since TSOM v3.4.

To replace mapping for a vendor that TSOM already supports, see **Override event-to-CI mapping for a vendor**. To add a vendor, see **Add event-to-CI mapping** for a new vendor. For the contract and OOB implementations, see **Event field mapping contract**.

Note:

In an EventFieldMapping implementation, set fields on the event and return `true` or `false` only. Calling `eventGr.update()` corrupts the event pipeline.

Event field mapping contract

Contract methods and shipped implementations for the EventFieldMapping extension point.

Extension point

Attribute	Value	Description
API name	`sn_tsom_em_conns.EventFieldMapping`	
restrict_scope	`false`	
Dispatch	Vendor-dispatch	Match vendor and rule name; lowest order wins.
Since	TSOM v3.4	

Contract methods

Method	Parameters	Returns
`getVendor()`	none	String, for example `Fortinet`
`getRuleName()`	none	String. Must match `em_mapping_rule.name` exactly.
`mapCi(eventGr, origEventSysId, fieldMappingRuleName)`	`eventGr` (GlideRecord, temp), `origEventSysId` (String), `fieldMappingRuleName` (String)	Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shipped implementations

Script Include	Vendor	Rule name
`FortinetCIMapper`	Fortinet	Fortinet CI Mapper
`FortinetWebhookEventCIMapper`	Fortinet	Fortinet Webhook Event CI Mapper
`FortinetWebhookMetricCIMapper`	Fortinet	Fortinet Webhook Metric CI Mapper
`MerakiCIMapper`	Meraki	Meraki CI Mapper
`VelocloudCIMapper`	VeloCloud	VeloCloud CI Mapper
`VelocloudWebhookEventCIMapper`	VeloCloud	VeloCloud Webhook Event CI Mapper

Event field mapping contract

Contract methods and shipped implementations for the EventFieldMapping extension point.

Extension point

Attribute	Value	Description
API name	`sn_tsom_em_conns.EventFieldMapping`	
restrict_scope	`false`	
Dispatch	Vendor-dispatch	Match vendor and rule name; lowest order wins.
Since	TSOM v3.4	

Contract methods

Method	Parameters	Returns
`getVendor()`	none	String, for example `Fortinet`
`getRuleName()`	none	String. Must match `em_mapping_rule.name` exactly.
`mapCi(eventGr, origEventSysId, fieldMappingRuleName)`	`eventGr` (GlideRecord, temp), `origEventSysId` (String), `fieldMappingRuleName` (String)	Boolean

Shipped implementations

Script Include	Vendor	Rule name
`FortinetCIMapper`	Fortinet	Fortinet CI Mapper
`FortinetWebhookEventCIMapper`	Fortinet	Fortinet Webhook Event CI Mapper
`FortinetWebhookMetricCIMapper`	Fortinet	Fortinet Webhook Metric CI Mapper
`MerakiCIMapper`	Meraki	Meraki CI Mapper
`VelocloudCIMapper`	VeloCloud	VeloCloud CI Mapper

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shipped implementations (continued)

Script Include	Vendor	Rule name
`VelocloudWebhookEventCIMapper`	VeloCloud	VeloCloud Webhook Event CI Mapper

Add event-to-CI mapping for a vendor

Provide CI binding for a vendor that TSOM does not ship an event-to-CI mapper for.

Before you begin

Role required: xxx

About this task

Return a new vendor and rule name that no OOB implementation matches, then implement your binding logic in `mapCi()`.

Procedure

1. Create a Script Include for the new vendor.

```
var PaloAltoCIMapper = Class.create();
PaloAltoCIMapper.prototype = {
    initialize: function() {},
    getVendor:   function() { return 'PaloAlto'; },
    getRuleName: function() { return 'PaloAlto CI Mapper'; },
    mapCi: function(eventGr, origEventSysId, ruleName) {
        // Your Palo Alto CI binding logic here
        return true;
    },
    type: 'PaloAltoCIMapper'
};
```

2. Register the extension instance against `sn_tsom_em_conns.EventFieldMapping`, `active = true`.

Result

Events from the new vendor resolve to CIs through your mapper.

Override event-to-CI mapping for a vendor

Replace how TSOM binds a supported vendor's events to configuration items.

Before you begin

Identify the OOB rule you are replacing—its name must match an `em_mapping_rule.name` value exactly.Tell the writer/developer where to find valid em_mapping_rule.name values (list view or navigation path). Not specified in the source.

Role required: xxx

About this task

Match the vendor and rule name of the OOB implementation, and register with a lower `order` so your implementation wins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a Script Include that returns the target vendor and rule name and binds the CI in `mapCi()`.

```
var MyFortinetCIMapper = Class.create();
MyFortinetCIMapper.prototype = {
    initialize: function() {},
    getVendor:   function() { return 'Fortinet'; },
    getRuleName: function() { return 'Fortinet CI Mapper'; },
    mapCi: function(eventGr, origEventSysId,
 fieldMappingRuleName) {
        var deviceName = eventGr.getValue('node');
        if (!deviceName) return false;
        var ciGr = new GlideRecord('cmdb_ci_ip_firewall');
        ciGr.addQuery('name', deviceName);
        ciGr.query();
        if (ciGr.next()) {
            eventGr.cmdb_ci = ciGr.getUniqueValue();
            eventGr.ci_type = 'cmdb_ci_ip_firewall';
            return true;
        }
        return false;
    },
    type: 'MyFortinetCIMapper'
};
```

2. Set `type` to exactly match the Script Include record name.
   The resolver uses `impl.type` to look up the order. A mismatch means your order is ignored and defaults to 100.
3. Register the extension instance against `sn_tsom_em_conns.EventFieldMapping` with `order = 50` and `active = true`.

Result

Create a test event and confirm the `em_event.cmdb_ci` and `ci_type` values resolve through your implementation.

About the webhook field mapping extension point

WebhookFieldMapping maps a vendor webhook payload to TMF688 event fields. This extension point is same-scope only, so you can't implement it from a custom scope.

`sn_tsom_em_conns.WebhookFieldMapping` uses the vendor-dispatch pattern (matched by `getVendor()`) and is available since TSOM v3.2. It ships implementations for Fortinet, Meraki, VeloCloud, and Elastic.

Restriction: This extension point has `restrict_scope = true`. You cannot register an implementation from your own scoped app. To customize webhook field mapping for a new vendor, contact ServiceNow support.

For the contract, see **Webhook field mapping contract**.

OOB implementations: Fortinet, Meraki, VeloCloud, Elastic.

Webook field mapping contract

Contract methods for the WebhookFieldMapping extension point (same-scope only).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extension point

Attribute	Value	Description
API name	`sn_tsom_em_conns.WebhookFieldMapping`	
Scope	`sn_tsom_em_conns`	
restrict_scope	`true`	Same scope only.
Dispatch	Vendor-dispatch	Match `getVendor()`.
Since	TSOM v3.2	

Contract methods

Method	Returns	Description
`getVendor()`	String	Vendor identifier.
`getFieldMapping()`	Object (TMF688 structure)	Maps the vendor webhook payload to TMF688 event fields.
`getDetectionRules()`	Object	Rules for detecting event type from the payload.

Metrics customization extension points

Two extension points control metric behavior: MetricsAggrSEP customizes aggregation, and UplinkThroughputPercentage customizes uplink throughput calculation.

Both extension points have `restrict_scope = false` and use the **single-override pattern**. Only the lowest-order implementation runs.

- `sn_tsom_em_conns.MetricsAggrSEP` (since v3.1) customizes how a metric is aggregated. The OOB default aggregates `meraki_uplink_status` from `cmdb_ci_ni_interface` child CIs using Decision Table rules and Clotho time-series data.
- `sn_tsom_em_conns.UplinkThroughputPercentage` (since v3.3) processes and aggregates uplink throughput data.

To customize aggregation, see *`Override metric aggregation`*. For contracts, see *`Metrics aggregation contract`* and *`Uplink throughput contract`*.

Metrics aggregation contract

Contract methods for the MetricsAggrSEP extension point.

Extension point

Attribute	Value	Description
API name	`sn_tsom_em_conns.MetricsAggrSEP`	
restrict_scope	`false`	
Dispatch	Single-override	Lowest order wins.
Since	TSOM v3.1	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contract methods

Method	Parameters	Returns
`aggrMetric(period)`	`period` (String)	void
`metricData()`	none	Object: `{ metricName, childClassName }`

Default behavior: aggregates `meraki_uplink_status` from `cmdb_ci_ni_interface` child CIs using Decision Table rules and Clotho time-series data.

Uplink throughput contract

Contract methods for the UplinkThroughputPercentage extension point.

Extension point

Attribute	Value	Description
API name	`sn_tsom_em_conns.UplinkThroughputPercentage`	
restrict_scope	`false`	
Dispatch	Single-override	
Since	TSOM v3.3	

Contract methods

Method	Parameters	Returns
`process(data)`	`data` (Array)	Array (modified data)
`aggrMetric(period)`	`period` (String)	void
`metricData()`	none	Object

Override metric aggregation

Replace the OOB metric aggregation logic with your own using the MetricsAggrSEP extension point.

Before you begin

Role required: xcdfsa

About this task

Because this extension point uses the single-override pattern, only your lowest-order implementation runs. Implement both metricData() (to declare the metric and child class) and aggrMetric(period) (your aggregation logic).

Procedure

1. Create a Script Include implementing both contract methods.

```
var MyMetricsAggr = Class.create();
MyMetricsAggr.prototype = {
    initialize: function() {},
    aggrMetric: function(period) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        var inputs = this.metricData();
        gs.info('Custom agg: ' + inputs.metricName);
        // Your custom aggregation logic
    },
    metricData: function() {
        return {
            metricName: 'my_custom_metric',
            childClassName: 'cmdb_ci_ni_interface'
        };
    },
    type: 'MyMetricsAggr'
};
```

2. Register the extension instance against `sn_tsom_em_conns.MetricsAggrSEP` with the lowest active `order` (for example 50).

Result

After the scheduled aggregation job runs, confirm the results on `sa_metric_instance`.

Vendor-specific extension points

Five extension points customize narrow, vendor-specific behaviors: firmware version formatting, contract parsing, tag transformation, Nokia MPN formula handling, and recovery handling.

- `sn_sgc_fortinet.FortinetCustomizedFirmwareVersion` (handler)—format the firmware version string. See Override firmware version formatting.
- `sn_sgc_fortinet.FortinetCustomizedContractParsing`—parse contract items into license attributes. See Contract parsing contract.
- `sn_sgc_meraki.TagTransformationExtensionPoint` (single-override, filtered by `handles()`)—transform discovered tags. See Transform discovered tags.
- `sn_tsom_em_conns.NokiaMpnFormulaEngineSEP` (single-override)—clean and validate MPN formulas. See Clean and validate Nokia MPN formulas.
- `sn_tsom_em_conns.RecoveryHandlerSEP` (vendor-dispatch, same-scope only)—handle recovery queue records. See About the recovery handler extension point.

All except the recovery handler have `restrict_scope = false`.

Override firmware version formatting

Format the Fortinet firmware version string differently from the OOB default.

Before you begin

Role required: xxcxcx

About this task

Return a formatted string, or return `null` to fall back to the default format, which is `[device.os_ver, device.mr, device.patch].join('.')` (for example `7.4.11`). This extension point uses the handler pattern.

Procedure

1. Create a Script Include implementing `handlers.formatFirmwareVersion(device)`.

```
var MyFirmwareVersion = Class.create();
MyFirmwareVersion.prototype = {
    initialize: function() {},
    handlers: {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        formatFirmwareVersion: function(device) {
            if (device.os_ver && device.mr && device.patch) {
                return 'FortiOS v' + device.os_ver + '.'
                    + device.mr + ' Patch ' + device.patch;
            }
            return null; // fall back to default
        }
    },
    type: 'MyFirmwareVersion'
};
```

2. Register the extension instance against `sn_sgc_fortinet.FortinetCustomizedFirmwareVersion` with `order = 50` and `active = true`.

Result
Discovered Fortinet devices display the formatted firmware version.

Fortinet discovery extensibility

Three extension points let you add API endpoints to Fortinet discovery, register new entity types, and reshape discovered data, without editing default code.

Before these extension points, adding an endpoint to Fortinet discovery meant rebuilding the discovery configuration from the start. You can now augment discovery incrementally: declare a new endpoint, describe how its response is parsed, and map the result onto configuration item attributes.

The three extension points

Each extension point covers one stage of the discovery pipeline. All three are in the `sn_sgc_fortinet` scope, have `restrict_scope = false`, and are available starting with TSOM v3.5. Each ships a default implementation registered at `order = 100`.

Fortinet discovery extension points

Extension point	Controls	Required methods
`sn_sgc_fortinet.FortinetCollectionPlan`	Which API calls the connector makes, in what order, and how each response is routed.	`getCollectionPlan(parser)`. `getConstants()` is optional.
`sn_sgc_fortinet.FortinetParserHooks`	How a raw response is unwrapped, enriched, filtered, and stored. Registers additional entity types.	All five of `unwrapResponse`, `beforeMapping`, `afterMapping`, `postProcess`, and `shouldStore`. `getEntityTypes(constants)` is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fortinet discovery extension points (continued)

Extension point	Controls	Required methods
`sn_sgc_fortinet.FortinetFieldMappings`	The declarative field mappings that shape an API response into a configuration item payload.	`getFieldMappings()`. `getTransforms()` is optional.

Note:

The `FortinetParserHooks` handlers `beforeMapping` and `afterMapping` were previously named `beforeExtract` and `afterExtract`. A custom implementation that still uses the old names continues to work, but the connector logs a deprecation warning. Rename the handlers in your implementation to remove the warning.

How a discovery run uses the extension points

A discovery run reads the collection plan first, then processes each response through the parser hooks and the field mappings:

1. The active `FortinetCollectionPlan` returns the plan. The connector sorts the steps by their `dependsOn` declarations into execution levels. A circular dependency stops collection.
2. Each step calls the shared Data Fetch action. The step's `url` function returns a request-body template key and the values substituted into that template.
3. If the step defines `onResponse`, that function handles the response and nothing else runs for it. Otherwise the response goes to `parser.parseData()`.
4. Responses that reach `parser.parseData()` pass through the `FortinetParserHooks` handlers, and each item is mapped by `FortinetFieldMappings`.
5. Steps marked `write: 'deferred'` are written after every step and post-collection hook finishes.

Note:

In the default collection plan, only the `devices` step reaches the parser hooks. The `contracts` and `adoms` steps handle their own responses in `onResponse` and populate parser state for later steps to read.

Contract validation and fallback

These three extension points don't resolve by `order` alone. The connector uses the first implementation it finds that satisfies the whole contract, and it uses only one implementation per extension point.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Validation is all or nothing. A `FortinetParserHooks` implementation missing any of the five handlers is rejected in full, and a `FortinetFieldMappings` implementation that doesn't return all five resource types is rejected in full. The connector logs an error naming the missing handlers or keys and falls back to the default implementation.

Because a partial implementation is discarded rather than merged, start from a copy of the default implementation and add to it. Omitting the `contracts`, `adoms`, or `devices` steps from a custom collection plan silently drops license, ADOM, and device collection.

For how this compares with the other TSOM dispatch patterns, see TSOM extension point resolution at runtime.

Attributes you can't remap

Custom field mappings and custom transforms are for `additional_attributes` entries. Changing the mapping of a core configuration item attribute can break identity resolution, deduplication, and downstream processing.

Warning:

Don't remap `key`, `name`, `serial_number`, `ip_address`, `model_name`, `class`, `company`, `devices`, or `net_mask`.

A custom transform whose name matches a built-in transform is skipped and a warning is logged. The built-in transform is used instead.

Retired extension point

The `sn_sgc_fortinet.FortinetCustomAttributes` extension point is retired. Its registration record and its default implementation, `FortinetDefaultCustomAttributes`, are removed during upgrade.

Warning:

If you implemented `FortinetCustomAttributes` to enrich Fortinet configuration items with custom attributes, move that logic to `FortinetFieldMappings`. The retired extension point isn't invoked after upgrade.

Requirements

Role required:

Plugin:

Navigation path:

Related tasks

- Add an API endpoint to Fortinet discovery
- Extend Fortinet field mappings

Add an API endpoint to Fortinet discovery

Add a FortiManager API endpoint to Fortinet discovery so the connector collects data it doesn't collect by default and stores it on configuration items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Identify the FortiManager JSON-RPC call you want to add and the parameters it takes.
- Decide whether the endpoint is fetched once per run or once per ADOM.
- Open the default `FortinetCollectionPlan`, `FortinetParserHooks`, and `FortinetFieldMappings` script includes so you can copy their contents.

Role required:

About this task

Adding an endpoint touches four things: the collection plan declares the call, a request-body template defines the payload, a parser hook shapes the response, and a field mapping turns each item into a configuration item payload. Skipping any one of them means the endpoint either isn't called or its data isn't stored.

Important:

Each of these extension points accepts one implementation only, and rejects an implementation that doesn't satisfy its whole contract. Copy the default implementation and add to the copy rather than writing a new implementation that returns only your additions.

For background on how the three extension points work together, see Fortinet discovery extensibility.

Procedure

1. Create a script include in your own scoped application that implements `sn_sgc_fortinet.FortinetCollectionPlan`, and copy the default collection plan into its `getCollectionPlan(parser)` method.

   Warning:

   Return the complete plan. Omitting the `contracts`, `adoms`, or `devices` steps drops license, ADOM, and device collection with no error.

2. Add your entity type key and request-body template key to `getConstants()`.

   Custom constants are merged into a per-run constants object rather than written to the global `FortinetConstants` object. Read them as `parser.constants.`YOUR_KEY, never as `FortinetConstants.`YOUR_KEY. Default constants win on a name collision, so you can't redefine an existing constant.

   ```
   getConstants: function() {
       return {
           FIRMWARE_UPGRADES: 'firmware_upgrades',
           GET_FIRMWARE_UPGRADES:
    'sgfortinet_get_firmware_upgrades'
       };
   }
   ```

3. Add a step for your endpoint to the plan you copied.

   Name the step after the entity type it collects. The `url` property is always a function that returns the request-body template key and the values substituted into it. For a step fetched once per ADOM, the function receives the ADOM name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
firmware_upgrades: {
    dependsOn: ['adoms'],
    fetch: { scope: 'per_parent', parentEntity: 'adoms',
 strategy: 'single' },
    write: 'deferred',
    url: function(adomName) {
        return { apiName:
 parser.constants.GET_FIRMWARE_UPGRADES, inputs: { adom_name:
 adomName } };
    }
}
```

For every step property and its accepted values, see Fortinet collection plan step properties.

4. Register the request-body template for your `apiName` key.

   Every Fortinet API call goes through one shared Data Fetch action. The `apiName` returned by your `url` function selects which FortiManager JSON-RPC call is made by looking up a template in the active request-body extension. The default templates are in `ActionRequestBodyFortinetDefault`.

5. Create a script include that implements `sn_sgc_fortinet.FortinetParserHooks`, copy all five default handlers into it, and add a branch for your entity type.

   At minimum, add a branch to `unwrapResponse` that returns the array your endpoint nests its items under. Keep every existing `devices` branch, or you lose port attachment, license attribute lookup, and network site creation.

```
unwrapResponse: function(responseJson, type, parser) {
    if (type === parser.constants.FIRMWARE_UPGRADES) {
        return responseJson?.result?.[0]?.data ?? [];
    }
    return responseJson;
}
```

6. Return your entity type from `getEntityTypes(constants)` so it's registered in the shared store.

   This optional handler receives the merged constants object and returns an array of entity type keys. Add it when your collection plan step introduces a type that isn't in the default plan.

```
getEntityTypes: function(constants) {
    return [constants.FIRMWARE_UPGRADES];
}
```

7. Create a script include that implements `sn_sgc_fortinet.FortinetFieldMappings`, copy the default mappings into `getFieldMappings()`, and add an entry for your entity type.

   Return mappings for all five default resource types as well as your own: `port`, `network_site`, `network_service_instance`, `organization`, and `devices`. Add your custom fields inside an `additional_attributes` block and leave core configuration item attributes as they are.

   For field mapping syntax and transform registration, see Extend Fortinet field mappings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Register each script include by creating an extension instance record that points to its extension point.

   Set `order` to a value between 50 and 99 so your implementation is found before the default implementation at `order = 100`, and set `active` to true.

9. Run Fortinet discovery and confirm your endpoint's data appears on the expected configuration items.

   Because nothing is cached between runs, a change to your implementation takes effect on the next run.

Result
The connector calls your endpoint on every discovery run, and the data it returns is stored as additional attributes on the configuration items you mapped.

What to do next
If discovery runs but your data is missing, check the connector logs for a rejection message naming a missing handler or resource type. A rejected implementation is replaced by the default implementation for that extension point, and the rest of discovery continues normally.

Extend Fortinet field mappings

Map extra fields from a FortiManager response onto Fortinet configuration items, and register transform functions to reshape the values.

Before you begin

- Identify the field in the FortiManager response you want to capture, and its path within the response object.
- Open the default `FortinetFieldMappings` script include so you can copy the default mappings.

Role required:

About this task
Use this procedure when the data you want is already in a response the connector collects, but isn't mapped onto a configuration item. This is also the replacement path for the retired `sn_sgc_fortinet.FortinetCustomAttributes` extension point, described in Fortinet discovery extensibility.

Procedure

1. Create a script include in your own scoped application that implements `sn_sgc_fortinet.FortinetFieldMappings`.
2. Copy the default mappings into `getFieldMappings()`.

   Important:

   Return mappings for all five resource types: `port`, `network_site`, `network_service_instance`, `organization`, and `devices`. If any key is missing, the whole implementation is rejected, an error names the missing keys, and the default mappings are used instead.

3. Add your fields to the `additional_attributes` block of the resource type you're extending.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each entry names the attribute and where its value comes from. Use `source` for a path into the raw response object, `value` for a fixed value, and `transform` to name a function that post-processes the resolved value.

```
additional_attributes: {
    additional_attributes: [
        { status:    { source: 'conn_status' } },
        { hostname:  { source: 'hostname' } },
        { site_code: { source: 'meta fields.SiteCode' } },
        { region:    { source: 'adomName', transform:
 'prefixRegion' } }
    ]
}
```

Warning:

Add fields only inside `additional_attributes`. Changing the mapping of `key`, `name`, `serial_number`, `ip_address`, `model_name`, `class`, `company`, `devices`, or `net_mask` can break configuration item identity resolution and deduplication.

4. If a value needs reshaping, add a transform function to `getTransforms()` and reference it by name from your mapping.

   A transform receives the resolved source value as its first argument. When a mapping lists several sources, the resolved values are passed in the order they're listed. Inside a transform, `this` gives access to the active parser and to the built-in transforms.

```
getTransforms: function() {
    return {
        prefixRegion: function(adomName) {
            return 'Region-' + adomName;
        },
        buildDisplayName: function(value1, value2) {
            return value1 + ' (' + value2 + ')';
        }
    };
}
```

   Return `null` if you have no custom transforms.

   Note:

   A custom transform whose name matches a built-in transform is skipped and a warning is logged. Pick a name that isn't already in use.

5. Read multiple source values into one transform by passing an array to `source`.

   To read from the parent context object rather than the raw item, prefix the path with `$parent.`. Use `defaultValue` for a fallback when the source resolves to null or is absent.

   Note:

   `defaultValue` doesn't catch an empty string. When the API can return an empty string instead of omitting the key, handle it in a transform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Create an extension instance record that points your script include at `sn_sgc_fortinet.FortinetFieldMappings`, and set `order` to a value between 50 and 99.

7. Run Fortinet discovery and confirm your attributes appear on the configuration items.

Result

Your fields are written as additional attributes on the mapped configuration items on every discovery run.

What to do next

If an `additional_attributes` list resolves to nothing because every entry was excluded, it resolves to `null` rather than an empty array. An empty array is rejected during load, so don't replace this behavior with one that returns an empty array.

Fortinet collection plan step properties

Properties that define a step in a Fortinet collection plan: how the endpoint is called, which entity it iterates over, and when its data is written.

A collection plan is an object keyed by step name. The step name is also the entity type passed to the parser hooks. The following properties are available on each step.

Collection plan step properties

Property	Type	Description
`url`	Function	Required. Returns an object with `apiName` and `inputs`. `apiName` is a request-body template key that selects which FortiManager call is made. `inputs` supplies the values substituted into that template. For a step whose scope is `per_parent`, the function receives the parent ID.
`fetch.scope`	String	`root` fetches once per run with no iteration. `per_parent` fetches once per ID of another entity type.
`fetch.strategy`	String	`single` sends exactly one request per parent ID. This is the only strategy Fortinet supports.
`fetch.parentEntity`	String	Required when `fetch.scope` is `per_parent`. The entity type whose IDs are iterated over. For `adoms`, the IDs are the ADOM names.
`dependsOn`	Array of strings	Step names in the same plan that must finish first. Used to sort steps into execution levels. A circular dependency stops collection. A dependency on a name that isn't in the plan is ignored.
`write`	String	`deferred` writes after every step and post-collection hook finishes. `immediate` with `writeKeys` writes as soon as a response is parsed. Omit the property for a step that only populates parser state and produces no configuration items of its own.
`onResponse`	Function	Receives the entity ID, the result, and the active parser. When present, no other processing happens for that response unless this function triggers it. Omit it to send

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Collection plan step properties (continued)

Property	Type	Description
		the response through the standard parser hooks and field mappings.

Note:

The `immediate` value for `write` is supported by the underlying orchestrator but isn't used by the default plan.

Default steps

The default collection plan contains three steps. A custom plan must return all three in addition to any steps you add.

Steps in the default collection plan

Step	Behavior
`contracts`	Populates the license expiration map. Parses its own response in `onResponse` and produces no configuration items directly.
`adoms`	Builds the filtered ADOM list that later steps iterate over. Parses its own response in `onResponse` and produces no configuration items directly.
`devices`	Collects devices per ADOM and writes with `deferred`. Defines `onResponse` to unwrap the response, then calls the parser explicitly so the response passes through the parser hooks and field mappings.

Warning:

Omitting `contracts`, `adoms`, or `devices` from a custom plan drops license, ADOM, and device collection without raising an error.

Fortinet parser hook handlers

The five handlers a FortinetParserHooks implementation must provide, the arguments each receives, and what each returns.

An implementation of `sn_sgc_fortinet.FortinetParserHooks` must provide all five handlers. An implementation missing any handler is rejected in full and the default implementation is used instead. In every handler, `type` is the step name from the active collection plan.

Note:

`beforeMapping` and `afterMapping` were previously named `beforeExtract` and `afterExtract`. An implementation that still uses the old names continues to work, but the connector logs a deprecation warning. Rename the handlers to remove the warning.

Required parser hook handlers

Handler	Arguments	Called and returns
`unwrapResponse`	`responseJson`, `type`, `parser`	Once per fetched response, before any item is mapped. Returns the value to iterate over, usually an array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required parser hook handlers (continued)

Handler	Arguments	Called and returns
`beforeMapping`	`rawItem`, `type`, `store`, `parser`	Once per raw item, before field mapping. Mutates `rawItem` in place so a mapping can reference the added data as a normal source path. Returns nothing.
`afterMapping`	`mappedItem`, `type`, `store`, `rawItem`, `parser`	Once per item, after field mapping. Mutates `mappedItem` in place to add attributes or relationships that depend on the mapped shape. Returns nothing.
`postProcess`	`results`, `type`, `parser`	Once per response, with every item already mapped for that type. Returns the items to store or write, optionally filtered or transformed.
`shouldStore`	`mappedItem`, `type`, `parser`	Per item. Returns `false` to exclude the item from the shared store.

Default handler behavior for devices

In the default collection plan, only the `devices` step reaches these handlers. Keep the following default behavior in any copy you customize.

- `beforeMapping` fetches the device's ports and stamps them onto the raw item, and stamps the device's license attributes from the map built by the `contracts` step.
- `afterMapping` stores the port relationships, merges the response's own metadata fields into `additional_attributes`, and creates the network site and network service instance for the device.
- `shouldStore` excludes any mapped item without a `key`.

Warning:

Removing the `devices` branches from a custom implementation silently drops port attachment, port relationships, license attributes, and network site and network service instance creation.

Registering additional entity types

The optional `getEntityTypes(constants)` handler registers extra entity type keys in the shared store. It receives the merged constants object and returns an array of keys. Add it when a custom collection plan step introduces an entity type that isn't in the default plan.

```
getEntityTypes: function(constants) {
    return [constants.FIRMWARE_UPGRADES];
}
```

Extension point safety and best practices

Avoid the mistakes that most often break a TSOM extension point implementation, and understand what an upgrade does and doesn't touch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common mistakes

Common mistakes

Mistake	What happens	Fix
Modifying the OOB Script Include directly	Overwritten on the next TSOM upgrade.	Create a new Script Include and a new extension instance instead.
Registering against a `restrict_scope = true` extension point from a custom scope	The platform silently ignores the registration. No error is logged.	Check `restrict_scope` before implementing. See TSOM extension point quick reference.
The `type` field doesn't match the Script Include name	The resolver can't look up the order for the implementation, so it defaults to 100.	Ensure `type` is an exact match.
Forgetting to set `active = true`	The implementation never loads.	Verify the record in **System Definition** > **Extension Instances**.
Calling `eventGr.update()` inside an `EventFieldMapping` implementation	Corrupts the event pipeline.	Only set fields on the passed-in `eventGr`; return `true` or `false` and let the framework persist the record.

Upgrade safety

Note:

Your custom extension instances aren't touched during upgrades. OOB instances registered at `order = 100` may be updated, but a lower-order custom override keeps its priority. New extension points may be introduced in a release; check TSOM extension point quick reference after each upgrade for additions.

Security considerations

- **Privilege model.** An extension point implementation runs with the calling process's context, typically the TSOM integration user or a MID Server. Your code inherits that context's privileges.
- **Audit regularly.** Review `sys_extension_instance` records periodically through **System Definition** > **Extension Instances**.
- **Validate inputs.** A malformed payload passed into your implementation can cause cascading exceptions further down the pipeline. Validate before acting on it.

Verify that an extension point implementation is active

Confirm that your custom implementation is registered, active, and resolving at the priority you expect before you rely on it in production.

About this task

Run both scripts in **System Definition** > **Scripts - Background**. The first confirms the runtime sees your implementation at all; the second confirms its `order` and `active` state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. List the runtime implementations for the extension point, substituting its API name.

```
var epName =
 'sn_sgc_meraki.MerakiCustomizedLifeCycleStageStatus';
var ep = new GlideScriptedExtensionPoint();
var impls = ep.getExtensions(epName);
if (!impls || !impls.length) {
    gs.info('No implementations for: ' + epName);
} else {
    gs.info('Found ' + impls.length + ' impl(s) for: ' +
 epName);
    for (var i = 0; i < impls.length; i++) {
        gs.info('  [' + i + '] type=' + impls[i].type);
    }
}
```

2. Check the registration order and active state for that same extension point.

```
var gr = new GlideRecord('sys_extension_instance');
gr.addQuery('point', 'sn_tsom_em_conns.EventFieldMapping');
gr.addActiveQuery();
gr.orderBy('order');
gr.query();
while (gr.next()) {
    gs.info('SI: ' + gr.script_include.name +
        ' | order: ' + gr.getValue('order') +
        ' | active: ' + gr.getValue('active'));
}
```

3. Confirm your implementation appears in both outputs, with the `order` you registered and `active = true`.

   To audit every TSOM extension point at once instead of one at a time, see Extension point diagnostic script.

Result

Once your implementation is confirmed active, verify the resulting behavior for its category. See Verify behavior by extension point category.

Verify behavior by extension point category

Once an implementation is confirmed active, use this table to confirm it produces the expected result for its category.

Verification by category

Extension point category	How to verify
Lifecycle stage status	Run a vendor discovery sync, then check the discovered CI's `life_cycle_stage_status` field.
Event field mapping	Create a test event, then check the resulting `em_event` record's `cmdb_ci` and `ci_type` fields.
Webhook field mapping	Send a test webhook, then check the resulting `em_event` field mapping.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verification by category (continued)

Extension point category	How to verify
Metrics aggregation	Wait for the scheduled aggregation job to run, then check the `sa_metric_instance` table.
Tag transformation	Run a discovery sync on a CI with tags, then check its `additional_attributes` field.
Nokia MPN formula engine	Import a Nokia MPN Excel file, then check the resulting formula table.
Recovery handler	Create a test recovery queue record, then confirm your handler fires.

Extension point diagnostic script

Run this script in Scripts - Background to audit every order-based TSOM extension point on your instance in one pass.

```
(function() {
    var EPS = [
        'sn_sgc_meraki.MerakiCustomizedLifeCycleStageStatus',

 'sn_sgc_fortinet.FortinetCustomizedLifeCycleStageStatus',
        'sn_sgc_vcloud.VeloCloudCustomizedLifeCycleStageStatus',

 'sn_sgc_catalyst.CatalystCustomizedLifeCycleStageStatus',
        'sn_tsom_em_conns.EventFieldMapping',
        'sn_tsom_em_conns.WebhookFieldMapping',
        'sn_tsom_em_conns.MetricsAggrSEP',
        'sn_tsom_em_conns.UplinkThroughputPercentage',
        'sn_sgc_fortinet.FortinetCustomizedFirmwareVersion',
        'sn_sgc_fortinet.FortinetCustomizedContractParsing',
        'sn_sgc_meraki.TagTransformationExtensionPoint',
        'sn_tsom_em_conns.NokiaMpnFormulaEngineSEP',
        'sn_tsom_em_conns.RecoveryHandlerSEP'
    ];

    gs.info('=== TSOM Extension Point Diagnostic ===');
    gs.info('Date: ' + new GlideDateTime().getDisplayValue());

    for (var e = 0; e < EPS.length; e++) {
        var epName = EPS[e];
        gs.info('--- ' + epName + ' ---');
        try {
            var ep = new GlideScriptedExtensionPoint();
            var impls = ep.getExtensions(epName);
            var cnt = (impls && impls.length) ? impls.length :
 0;
            gs.info('  Runtime impls: ' + cnt);
            for (var i = 0; i < cnt; i++)
                gs.info('    ['+i+'] type='+impls[i].type);
        } catch(ex) {
            gs.info('  ERROR: ' + ex.message);
        }
```

        gr.addQuery('point', epName);
        gr.orderBy('order');
        gr.query();
        while (gr.next())
            gs.info('  Instance: ' + gr.script_include.name +
                ' | order=' + gr.getValue('order') +
                ' | active=' + gr.getValue('active'));
    }
    gs.info('=== Diagnostic Complete ===');
})();
```

Recover from a custom extension point causing production issues

Disable a misbehaving custom implementation and fall back to the out-of-the-box default without waiting for a fix.

About this task

Because the OOB default implementation for every order-based extension point is registered at `order = 100`, deactivating your lower-order override immediately restores default behavior. No other configuration change is required.

Procedure

1. Navigate to **System Definition** > **Extension Instances** and open your extension instance record.
2. Set `active` to `false` and save.

   The OOB implementation at `order = 100` takes over immediately; no cache flush or restart is needed.
3. Check the system log for exceptions thrown by your Script Include to diagnose the failure.
4. Fix the implementation and test it in a sub-production instance before you set `active` back to `true` in production.

TSOM extension point quick reference

API name, scope, restrict_scope, and dispatch pattern for every TSOM extension point, in one table.

Extension point attribute matrix

Extension point	API name	Scope
Meraki lifecycle stage status	`sn_sgc_meraki.MerakiCustomizedLifeCycleStageStatus`	`sn_sgc_mer`

Extension point attribute matrix (continued)

Extension point	API name	Scope
Meraki field mappings	`sn_sgc_meraki.MerakiFieldMappings`	`sn_sgc_mer`

The three Fortinet and three Meraki discovery extensibility rows don't resolve by `order`; see Fortinet discovery extensibility and Meraki discovery extensibility for how they're validated and how they fall back to the default implementation.

Event Notification Management Open API Developer Guide

Use the *`Event Notification Management Open`* API to create, update, and delete event records in the Events [em_event] table.

This developer guide provides information on how to extend the *`Event Notification Management Open`* API to make various customizations.

Extending the Event Notification Management Open API

You can extend and modify the functionality of the *`Event Notification Management Open`* API by editing its associated script include files.

The following are the script includes that the *`Event Notification Management Open`* API uses to process event notification requests passed to the API:

- `AlarmAPIProcessorOOB`: Contains helper functions that support functions in the `TMFTopicEventAPIUtil` script include. For additional information on the `AlarmAPIProcessorOOB` script include, see the Alarm Management Open API Developer Guide.
- `AlarmAPIProcessor`: An empty script include file. Update this file to define any functions that you want to override in the `AlarmAPIProcessorOOB` script include.
- `JSONSchemaValidation`: Contains functions to handle the validation of schemas for the payload defined in the `TMFAlarmAPIConstants` script include. This script include is under the tmt_core plugin.
- `TMFAlarmAPIConstants`: Contains constants and required parameter information. It also contains the schemas for the payloads passed in the *`Event Notification Management Open`* endpoint.
- `TMFTopicEventAPIUtilOOB`: Contains functions to handle API requests that are triggered by external trigger definition flows that have the actions `AlarmCreateNotification`, `AlarmChangeNotification`, `AlarmDeleteNotification` which create, update, and delete events.
- `TMFTopicEventAPIUtil`: An empty script include file. Update this file to define any functions that you want to override in the `TMFTopicEventAPIUtilOOB` script include.

The following sections provide examples of some of the customizations that you can make to the *`Event Notification Management Open`* API processing by extending/modifying these script include files.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required parameters

The *Event Notification Management* API utilizes JSON schemas to define required parameters. These JSON schemas are defined in the `TMFAlarmAPIConstants` script include. These schemas are used to validate whether request payloads are valid. These schemas are not directly referenced in the script includes, but are returned by the following functions in the *TMFTopicEventAPIUtilOOB* script include:

- `getAlarmCreateEventSchema()`: Returns the validating schema for creating an event.
- `getAlarmDeleteEventSchema()`: Returns the validating schema for deleting an event alarm.
- `getAlarmChangeEventSchema()`: Returns the validating schema for changing fields in an event.

To override the existing schemas, define new schemas in the `TMFTopicEventAPIUtilOOB` script include and override the `TMFTopicEventAPIUtil` script include functions.

For example:

```
var TMFTopicEventAPIUtil = Class.create();
TMFTopicEventAPIUtil.prototype =
 Object.extendsObject(TMFTopicEventAPIUtilOOB, {
 // Define overriding functions here
 // Define getAlarmCreateEventSchema here to override OOTB
 function in TMFTopicEventAPIUtilOOB
 getAlarmCreateEventSchema: function() {
  return JSON.parse(TMFTopicEventAPIUtil.CUSTOMIZED_SCHEMA);
 },
    type: 'TMFTopicEventAPIUtil'
});
```

```
// New schema
TMFTopicEventAPIUtil.CUSTOMIZED_SCHEMA = "{
  \"title\":\"AlarmCreateEvent\",
  \"type\":\"object\",
  \"properties\":{
    \"event\":{
      \"type\":\"object\",
      \"properties\":{
        \"alarm\":{
          \"type\":\"object\",
          \"properties\":{
            \"id\":{
              \"type\":\"string\"
            },
            \"href\":{
              \"type\":\"string\"
            },
            \"externalAlarmId\":{
              \"type\":\"string\"
            },
            \"alarmType\":{
              \"type\":\"string\"
            },
            \"perceivedSeverity\":{
              \"type\":\"string\"
```

```
            },
            \"probableCause\":{
              \"type\":\"string\"
            },
            \"alarmedObject\":{
              \"type\":\"object\",
              \"properties\":{
                \"id\":{
                  \"type\":\"string\"
                },
                \"href\":{
                  \"type\":\"string\"
                }
              },
              \"required\":[
                \"id\"
              ]
            },
            \"crossedThresholdInformation\":{
              \"type\":\"object\",
              \"properties\":{
                \"thresholdId\":{
                  \"type\":\"string\"
                }
              },
              \"required\":[
                \"thresholdId\"
              ]
            },
            \"affectedService\":{
              \"type\":\"array\",
              \"properties\":{
                \"id\":{
                  \"type\":\"string\"
                },
                \"href\":{
                  \"type\":\"string\"
                }
              },
              \"items\":{
                \"type\":\"object\",
                \"required\":[
                  \"id\"
                ]
              }
            },
            \"sourceSystemId\":{
              \"type\":\"string\"
            },
            \"specificProblem\":{
              \"type\":\"string\"
            }
          },
          \"required\":[

 \"externalAlarmId\",\"alarmType\",\"perceivedSeverity\",
\"probableCause\",\"sourceSystemId\",\"alarmedObject\"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          ]
        }
      },
      \"required\":[
        \"alarm\"
      ]
    }
  },
  \"required\":[
    \"event\"
  ]
}";
```

Request body validation

To perform additional validation on the request body, override the following functions in the `TMFTopicEventAPIUtilOOB` script include. These functions are called by the specified functions in the same script include.

- `verifyAlarmCreateEventPayload()`: Called by `processAlarmCreateEvent()`.
- `verifyAlarmDeleteEventPayload()`: Called by `processAlarmDeleteEvent()`.
- `verifyAlarmChangeEventPayload()`: Called by `processAlarmChangeEvent()`.

All of these functions return success by default. If a helper function returns an error, it stops the API operation.

To apply custom validations, override the helper functions in the `TMFTopicEventAPIUtilOOB` script include with identical function names and parameters in the `TMFTopicEventAPIUtil` script include.

In this example, a function in a custom `TMFTopicEventAPIUtil` script include overrides the default function in the `TMFTopicEventAPIUtilOOB` script include to perform validation on the name attribute.

```
var TMFTopicEventAPIUtil = Class.create();
TMFTopicEventAPIUtil.prototype =
 Object.extendsObject(TMFTopicEventAPIUtilOOB, {

    // Define overriding functions here
    verifyAlarmCreateEventPayload:
 function(eventPayload,responseObject){

        // Returning error status terminates the POST request
        // Make sure to assign error message and reason
        if (eventPayload.type != "unique") {
            responseObject.setMessage("Failed");
            responseObject.setReason("No reason needed");
            return responseObject.status = “error”;
        }
    },

    type: ‘TMFTopicEventAPIUtil’
});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body subscription validation

To modify the request body subscription validation for the API, you need to override the `validateSubscription()` function in the `TMFTopicEventAPIUtilOOB` script include. This function validates whether the callbackURL you are using to create the event notification is registered and determines whether the *`eventType`* is registered for the raised callback. This function is called by the *`processAlarmCreateEvent()`*, *`processAlarmDeleteEvent()`*, and *`processAlarmChangeEvent()`* functions which are also in the `TMFTopicEventAPIUtilOOB` script include.

Field mapping

When creating or updating records, the *`Event Notification Management Open`* API maps request body parameters to Event record fields. When retrieving records, the API maps Event record fields to response object attributes.

The `TMFTopicEventAPIUtilOOB` script include contains the following functions that map change, create, and delete requests, based on the value in the *`eventType`* parameter, to a record in the Event [em_event] table.

- *`mapAlarmChangeObjectToEvent()`*
- *`mapCreateAlarmObjectToEvent()`*
- *`mapDeleteAlarmObjectToEvent()`*

You can customize field mappings to add and retrieve data for additional Event [em_event] table fields or change the default field mappings. To work with mappings, create functions with identical names and parameters in `TMFTopicEventAPIUtil` to override `TMFTopicEventAPIUtilOOB` mapping functions.

GlideGeoPoint Developer Guide

The GlideGeoPoint developer guide contains information about how to compute distances between latitude and longitude values (geopoints), return locations within given geopoint and radius values, and use additional functionality provided by supported *`GlideGeoPoint`* API functions.

The Geo point field type allows you to store a latitude and longitude pair in a single field. Geopoints can be useful anytime you want to store a geographical point of interest, to ask how far a part two points of interest are from one another, or to search for all points within a certain distance from another point. For example, you can use geopoint functionality to quickly determine all of your customer's delivery locations and then adjust delivery fees based on their distance from the store.

Key aspects of the geotype data type are:

- It consists of a pair of decimal numbers representing longitude and latitude values.
- The range for longitude is (-180, 180]. Any value outside this range is normalized to the equivalent value inside this range.
- The range for latitude is [-90, 90]. Any value outside this range is normalized to the equivalent value inside this range.
- Geopoint values are always accepted as input and display as a comma-separated pair: “longitude,latitude”. Parentheses may optionally surround the expression.
- Both longitude and latitude values are stored up to 6 decimal places of precision.

For more information about the geopoint data type, see Function field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The examples in this guide assume that a custom table, `u_geopoint`, is populated with fields `u_name` and `u_location`, where `u_name` is of type 'string' and lists the names of major cities and `u_location` is of type 'geopoint' and lists the latitude/longitude points of each city respectively.

Create geopoints using the GlideGeoPoint API

Use the *`GlideGeoPoint`* API to insert new records and create new geopoints.

The GlideGeoPoint - Global API allows you to set and retrieve geopoint values. However, you can perform additional functionality to insert new records by setting geopoints directly in a script using string notation or a GlideGeoPoint object.

Inserting a new record using string notation.

Set the value of the geopoint field `u_location` using a string. The string consists of a comma-delimited pair of longitude and latitude values. The following example shows how to set a new geopoint in the `u_geopoint` table using string notation.

Note: *`GlideGeoPoint`* API values are always listed in longitude, latitude order.

```
const longitude = "-87.628018";
const latitude = "41.885778";
const geopoint = longitude + "," + latitude;

const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.initialize();
myGeoPoint.setValue("u_name", "Chicago");
myGeoPoint.setValue("u_location", geopoint);
myGeoPoint.insert();
```

Inserting a new record using the GlideGeoPoint object.

Set the value of the geopoint field `u_location` using a GlideGeoPoint object.

```
const longitude = -87.628018;
const latitude = 41.885778;
const geopoint = new GlideGeoPoint(longitude,
 latitude);

const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.initialize();
myGeoPoint.setValue("u_name", "Chicago");
myGeoPoint.setValue("u_location", geopoint);
myGeoPoint.insert();
```

Read geopoint values using the GlideGeoPoint API

Use the *`getDisplayValue()`* GlideGeoPoint API function to read all geopoint values from a specific table.

The standard GlideGeoPoint API allows you to retrieve a geopoint value via the GlideGeoPoint - getDisplayValue() function. However, it is possible to read all geopoints defined in an entire table. The following example script demonstrates how to use the *`getDisplayValue()`* function to retrieve all records from the `u_geopoint` table, which includes the `u_location` field of type 'geopoint'. You can this example script and adjust it to your own specific use case.

Note: *`GlideGeoPoint`* API values are always listed in longitude, latitude order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.query();

while (gr.next())
  gs.info("Name: {0}  Location: {1}",
    myGeoPoint.getDisplayValue('u_name'),
    myGeoPoint.getDisplayValue('u_location'));
```

The output returns all records in the `u_geopoint` table. The display value of a geopoint includes the longitude followed by the latitude, separated by a comma and surrounded in parentheses.

```
Name: London  Location: (-0.189937, 51.473584)
Name: Puerto Rico  Location: (-66.561301, 18.291136)

Name: Dublin  Location: (-6.304994, 53.348317)
```

Calculate the distance between two geopoints

Use the `distance_sphere` glide function to return the distance between geopoints in meters.

The geopoint glide function, `distance_sphere`, allows you to compute the distance between two geopoints. The function returns the distance in meters. `distance_sphere` can be used in the definition of a function field element on a table or via a script. Three syntaxes are supported and all parameters are required:

- `glidefunction:distance_sphere(geopoint1, geopoint2)`
- `glidefunction:distance_sphere(geopoint1, longitude2, latitude2)`
- `glidefunction:distance_sphere(longitude1, latitude1, longitude2, latitude2)`

When using these syntaxes, note that:

- geopoint1 and geopoint2 are table elements of type 'geopoint'
- longitude1, longitude 2, latitude 1, latitude 2 are numerical table elements or constants
- In all cases, the return value of this function is a decimal representing the distance between two geopoints in meters

The following example script defines a `distance_sphere` function to compute the distance between all geopoints stored in the `u_location` field of the `u_geopoint` table and the point `-0.189937` longitude, `51.473584` latitude (which is roughly the location of London). The function is added to the GlideRecord query to produce results.

```
const distToLondon =
"glidefunction:distance_sphere(u_location, '-0.189937',
 '51.473584')";

const myGeoPoint = new GlideRecord('u_geopoint');
gr.addFunction(distToLondon);
gr.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
while(myGeoPoint.next())
  gs.info("Name: {0}  Dist to London(m): {1}",
    myGeoPoint.u_name, gr.getValue(distToLondon));
```

The output lists the distance between London and cities in the `u_location` field in meters.

```
Name: London  Dist to London(m): 0
Name: Glasgow  Dist to London(m): 555985.58456358
Name: Dublin  Dist to London(m): 464000.328892816
Name: Miami  Dist to London(m): 7123803.25406323
Name: Bermuda  Dist to London(m): 5547607.95564083
Name: Puerto Rico  Dist to London(m): 6799201.00905107
Name: Perth  Dist to London(m): 14485217.5596414
Name: Sydney  Dist to London(m): 17001034.4875494
Name: Tasmania  Dist to London(m): 17324634.4559516
```

Filter the distance between two geopoints

Use the `DISTANCE_SPHERE_WITHIN` query condition to filter for records having a geopoint value within the radius of a defined latitude, longitude point.

`DISTANCE_SPHERE_WITHIN` must follow syntax `geopointDISTANCE_SPHERE_WITHINlongitude,latitude<radius` where:

- `geopoint` is a geopoint field
- `longitude` and `latitude` are decimal constants
- `radius` is a decimal constant (in meters)

Note: The less-than symbol (<) in this expression is required and only used as a delimiter. Any other comparison operator is invalid.

The `DISTANCE_SPHERE_WITHIN` accepts kilometer or meter values in the request but always returns the output value in meters.

The following example script shows how to build an encoded query that returns only records having a `u_location` less than 1,000,000 kilometers away from the point `-0.189937` longitude, `51.473584` latitude (which is roughly the location of London). When executed, it returns three records representing cities within the specified radius of London.

```
const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.addEncodedQuery("u_locationDISTANCE_SPHERE_WITHIN-0.1
89937,51.473584<1000000");
myGeoPoint.query();

while(gr.next())
    gs.info("Name:" + myGeoPoint.getDisplayValue("u_name")
         + " Location:" +
 myGeoPoint.getDisplayValue("u_location"));
```

Output:

```
Name:London Location:(-0.189937, 51.473584)
Name:Dublin Location:(-6.304994, 53.348317)
Name:Glasgow Location:(-4.223964, 55.867846)
```

The following example script is equivalent to the first but uses an alternative syntax for GlideRecord.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
const myGeoPoint = new GlideRecord("u_geopoint");
myGeoPoint.addQuery("u_location", "DISTANCE_SPHERE_WITHIN",
 "-0.189937,51.473584<1000000");
myGeoPoint.query();

while(myGeoPoint.next())
    gs.info("Name:" + myGeoPoint.getDisplayValue("u_name")
         + " Location:" +
 myGeoPoint.getDisplayValue("u_location"));
```

Output:

```
Name:London Location:(-0.189937, 51.473584)
Name:Dublin Location:(-6.304994, 53.348317)
Name:Glasgow Location:(-4.223964, 55.867846)
```

Mobile SDK Developer Guide - Android

The ServiceNow Mobile SDK enables you to leverage the functionality and resources of the ServiceNow platform within your standalone mobile Android applications.

Using the Mobile SDK, you can perform the following within your applications:

- Access data on your ServiceNow instance through its public REST APIs or custom scripted REST APIs that you develop.
- Embed and enable Virtual Agent within your application interface.
- Embed a real-time, AI-powered voice agent directly in your mobile application. NowVoice provides a full-screen voice interface with live transcripts, mute controls, and post-call transcript sharing.
- Gather and track custom analytics events for analysis.
- Attach documents (attachments) to a record within your ServiceNow instance.
- Load web pages hosted on your ServiceNow instance in a native web view or Cabrillo.
- Provide simple authentication flows using JSON Web Tokens for third-party applications to authenticate users.
- Send push notifications.

The Mobile SDK provides a sample app that includes code examples for integration with different Mobile SDK modules. In the 2.1 release and later, the Engagement Messenger is included in the sample app. To learn more about the Engagement Messenger, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB1587611.

NowSDK architecture

The NowSDK is the top-level entity of the Mobile SDK class framework.

It contains numerous classes, interfaces, and functions that enable you to use the significant capabilities provided by the Mobile SDK and your ServiceNow instance. This document focuses on describing the primary feature services exposed in the Mobile SDK that enable you to interact with your ServiceNow instance.

To use any of the feature services provided by the Mobile SDK, you must integrate the NowSDK library into your code. You must call the core library to configure and initialize the SDK before using any SDK functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowSDK provides the following capabilities:

- SDK initialization and settings retrieval and configuration.
- Seamless authorization and user session handling.
- Logging interface. The NowSDK provides logging services to all feature services. By default, log messages are written to system logs using platform-specific functionality. You can control the logging threshold through a parameter that is part of the call to configure the SDK. There is also an option to suppress all log messages generated by the SDK and its feature services (`log level = none`). If you already have your own logging solution in place, the Mobile SDK allows you to use it.
- Build and release infrastructure.

NowSDK provides the following feature services and associated APIs:

- NowDataSDK

  Enables third-party applications to access the public REST APIs exposed by your ServiceNow instance. Development is streamlined because the NowDataSDK utilizes the authentication and session handling features provided by the NowSDK.

  Primary APIs:

  - NowAPIService: This API provides functionality that enables you to interact with the publicly exposed REST APIs on your ServiceNow instance.
  - NowAttachmentService: This API provides functionality to upload and query file attachments on your ServiceNow instance within your Android application.
  - NowGraphQLService: This API provides functionality that enables you to use GraphQL queries to obtain data from tables within your ServiceNow instance using the ServiceNow REST *`GraphQL API`*.
  - NowTableService: This API provides functionality that enables you to perform create, read, update, and delete (CRUD) operations on existing tables in your ServiceNow instance that get serviced through the ServiceNow REST *`Table API`*.
- NowChat

  Enables you to embed a native Virtual Agent chat window in your applications. This service includes UI/UX features.

  Primary API: NowChatService: This API provides Virtual Agent and Live Agent chat capabilities to your Android applications. Use the full service chat capabilities provided by the ServiceNow platform by simply implementing *`NowChatService`* within your application.

- NowPush

  Enables you to send unsolicited messages to your applications that use the NowChat/Virtual Agent functionality.

  Primary APIs:

  - NowPushSDK: This API provides the function necessary to create a `NowPushService` that enables the sending of unsolicited (push) notifications to Android devices.
  - NowPushService: This API provides functions that enable interaction with the Push Service.
- NowWeb

  Enables you to load web pages hosted on your ServiceNow instance in a native web view or Cabrillo. It automatically handles user authentication and session management instead of forcing users to log in to the instance via a login web page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the webview is requested to load a web page hosted on a ServiceNow instance, it creates an HTTP request with the appropriate bearer header containing the OAuth access token provided by the NowSDK. When the instance receives this request, it starts a new user session and returns cookies related to that session. As the user interacts with the web pages in the webview, the instance uses the cookies to validate that the session is still valid. At this point, the bearer header is no longer relevant, only the cookies are used for session validation. The web session expires if the user stops interacting with the website for longer than the timeout period. After the session expires, if the user tries to interact with the web page, they are automatically redirected to the login page. The NowWebViewController detects the redirection and attempts to start a new web session by requesting a refreshed access token from the NowSDK and using the token to create a HTTP request (with bearer header) for the last known loaded page.

Primary API: NowWebSDK: This API provides functionality to create a NowWeb service object that enables web pages from your ServiceNow instance to be displayed in your Android application.

- NowVoice

  Embed a real-time, AI-powered voice agent directly in your mobile application. NowVoice provides a full-screen voice interface that connects users to a ServiceNow voice agent, with live transcripts, mute controls, and post-call transcript sharing.

  Primary API: NowVoiceService: This API provides functions to manage voice agent sessions for a single ServiceNow instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started with Mobile SDK - Android

You must complete the tasks outlined in this section to prepare your development environment to support writing Android applications that integrate with the ServiceNow Mobile SDK.

- Download and install the ServiceNow Mobile SDK libraries. For detailed instructions, see Download and install the Mobile SDK library.
- Install and configure the Mobile SDK scoped application. For detailed instructions, see Install and configure the Mobile SDK scoped application.
- Configure your project. For more information, see Configure your project.
- Activate and configure the Mobile SDK on your ServiceNow instance. For details, see Configure certificate and create an OAuth Entity.

Once all of these tasks are completed, you can then start creating mobile applications that leverage the significant resources on your ServiceNow instance.

Download and install the Mobile SDK library

Before you can create mobile applications that interact with your ServiceNow instance, you must first download and install the ServiceNow Mobile SDK Android library.

Before you begin

Role required: none

Before you start the download and installation process, ensure that your development environment meets the following minimum requirements:

- ServiceNow instance must be Washington DC or later.
- Android version must be API 29 or later.

Procedure

1. Download the Mobile SDK Android library, called NowSDK, from the ServiceNow Store. You can find the Android libraries in the following locations:
   - Mobile SDK: https://store.servicenow.com/sn_appstore_store.do#!/store/application/5282184680312010104 0fe43e5b9ee8c
   - Android library: https://store.servicenow.com/sn_appstore_store.do#!/store/application/f06b29b487ea3014970e2178cebb3511

   For details on installing applications on your instance, see Administering applications.
2. Unzip the NowSDK file into a temporary folder.
3. Use Android Studio IDE to import the NowSDK as a module into your project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In Android Studio IDE, select **File -> New -> Import Module**.

b. When prompted for the source path, select **nowsdk**.

As the project is imported, the IDE will report a build error.

c. To resolve any build errors, make sure the following key-value pairs are added inside the nowsdk module's#`build.gradle` file.
This information defines the versions for each of the transitive dependencies of the NowSDK.

```
ext {
    kotlin_version = "2.1.0"
    hilt_version = "2.55"
    navigationVersion = '2.8.5'
    mapsKtxVersion = '3.4.0'
    mapsComposeVersion = '2.11.0'
    androidxCoreVersion = '1.13.1'
    recyclerViewVersion = '1.3.2'
    appCompatVersion = '1.6.1'
    constraintLayoutVersion = '2.2.0'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    lifecycleVersion = '2.8.7'
    roomRuntimeVersion = '2.6.1'
    roomRxJavaVersion = '2.6.1'
    timberVersion = '5.0.1'
    rxAndroidVersion = '3.0.2'
    rxJavaVersion = '3.1.10'
    rxKotlinVersion = '3.0.1'
    daggerVersion = '2.55'
    androidxAnnotationVersion = '1.9.1'
    materialVersion = '1.9.0'
    retrofitVersion = '2.11.0'
    okhttpVersion = '4.12.0'
    cardViewVersion = '1.0.0'
    gsonVersion = '2.11.0'
    firebaseBomVersion = '33.7.0'
    exifinterfaceVersion = '1.3.7'
    kotlinxCoroutinesVersion = '1.10.1'
    moshiVersion = '1.15.2'
    androidxBrowserVersion = '1.8.0'
    composeBomVersion = '2025.01.00'
    composeViewmodelVersion = '2.5.1'
    composeActivityVersion = '1.9.3'
    jsoupVersion= '1.18.3'
    cameraxVersion = '1.2.3'
    lottieVersion = '6.6.1'
    fragmentKtxVersion = '1.5.2'
    coroutinesCoreVersion = '1.5.1'
    coroutinesAndroidVersion = '1.5.1'
}
```

d. In the nowsdk module's#`build.gradle` #file, ensure that the following section is added to include the NowSDK repositories.

```
rootProject.allprojects {
  repositories {
    flatDir { dirs rootProject.rootDir.path +
 "/nowsdk/libs" }
  }
}
```

e. In the app level `build.gradle` file, add the NowSDK as a dependency.

```
dependencies {
  // NowSDK
  implementation project (":nowsdk")
```

Once `gradle` syncs, you should be able to reference the *NowSDK* APIs.

Install and configure the Mobile SDK scoped application

Before writing any application that leverages the Mobile SDK, you must install and configure the Mobile SDK scoped application.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Mobile SDK page on the ServiceNow Store web site.
   For details, see Install an application or plugin.
2. Select **Request Install** to download the Mobile SDK scoped application onto your ServiceNow instance.
3. Verify that the Mobile SDK scoped application was properly installed on your ServiceNow instance.

   a. Open the plugin's form: `System Definition` > `Plugins`.

   b. In the search field, enter `mobile_sdk`.
   A screen similar to the following should appear:

   c. Verify that the plugin **Id** is `sn_mobile_sdk` and that the version is the latest.

4. Open the Mobile SDK Settings [sn_mobile_sdk] table and create a new application record for the application that will leverage the Mobile SDK.

   a. In the **Name** field, enter the name of your application that will leverage the Mobile SDK.

   b. In the **Android Application ID** and **Apple Bundle ID** fields, enter the ID of your mobile application.
   For example, if the Mobile SDK was added to your mobile applications, then these IDs would be the IDs of the mobile applications.

   c. In the **SDK Settings** field, enter JSON configuration properties for all of the feature services that your application will leverage, set to `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example:

```
{
    "graphql": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "table": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "api": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "attachment": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "chat": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "web": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "push": {
        "enabled" : true
    }
}
```

Ensure that the **Advanced** check box is unselected. This allows you to enter JSON in the **SDK Settings** field.

Any applicable configuration added in **SDK Settings** is used in conjunction with the ServiceNow instance configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if `chat: enabled = true`, your ServiceNow instance must have the Virtual Agent plugin installed to leverage the chat functionality. If the Virtual Agent plugin is installed, but **SDK Settings** contains `chat: enabled = false`, your application is not able to leverage the chat interface.

d. Select **Submit** to save your application settings.

5. Optional. If you want your application to leverage Usage Insights, register your application with the Usage Insights application.

a. Reopen your application's Mobile SDK Settings record.

b. In the bottom-left of the screen, select **Register for Analytics**.
A screen similar to the following appears:

c. Select **Update** to save the registration.

6. Verify your SDK Settings.

a. Navigate to the **REST API Explorer**.

b. Enter the following in the specified fields:

- **Namespace**: `sn_mobile_sdk`
- **API Name**: `Mobile SDK`
- **API Version**: `latest`

c. Select **Get settings for Android App (GET)**.

d. In the **applicationID** field, enter the Android Application ID that you entered in the associated Mobile SDK Settings record and then select **Send**.
The response should look similar to the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```

Configure your project

Before writing any application that leverages the Mobile SDK for Android, you must configure your project to use the SDK.

Before you begin

Role required: none

Procedure

To include the nowsdk module in your project, add the following line to the `settings.gradle` file in your application folder:

```
include ':nowsdk'
```

Configure certificate and create an OAuth Entity

You must configure your ServiceNow instance to accept and exchange a JSON Web Token (JWT) for an OAuth access token. To enable this functionality you must install a certificate that matches the JWT provider's private key on the ServiceNow instance that you will use as the JWT Token consumer and create an OAuth Entity on that instance.

Before you begin

Role required: admin

Procedure

1. If not already configured, configure your ServiceNow instance as an OAuth JWT provider. For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
2. Navigate to **System Definition** > **Certificates**.
3. Select **New** and then create a new public certificate as shown in the following image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on creating this certificate, see Update your X.509 certificate.

4. Create an OAuth Entity.
   For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
5. Add and select the **Public Client** field to the form.

   Note: This field is not shown by default.

6. Save the record.
7. Add a JWT Verifier Map entry.
   After the record is saved, a new section called **Jwt Verifier Maps** appears at the bottom of the form.

   a. Add a name in the **Name** field, this can be whatever name you choose, and select the certificate that was added.
      The other fields, **Kid** and **Shared key**, can be left blank, as they are auto-filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Ensure that the form contains information similar to the following once you are finished with your configuration:

Configure guest user access

To enable SDK services to be accessible by unauthenticated users, you must configure the Mobile SDK on your ServiceNow instance to allow guest user access. A guest user can view public web pages hosted in an instance using *NowWeb*, have a conversation as a guest using *NowChat*, access public data on the instance using *NowTableService* and *NowGraphQLService*, and access custom API services configured for unauthenticated users using *NowAPIService*.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Mobile SDK** > **All** and select the application to which you want to allow guest access.
2. For each service that you want to enable guest access, add `"allowGuestAccess":true` to its configuration array.

Note: The *NowAttachment* service does not currently support guest access.

Initialize the NowSDK in your application

In order to use the Mobile SDK in your application, you need to perform SDK initialization, authorization, and logging.

As you use the NowSDK, it makes a request to configure the SDK and provides callbacks from the SDK. Once the SDK is configured, an application can use the feature services and their associated APIs. This setup/configuration helps to make an authenticated call to a ServiceNow instance.

The following is an example of how to initialize the NowSDK in your Android application.

```
//Helper class to encapsulate value needed to initialize the sdk
data class NowSDKSettings(val instanceBaseURL : String, val
 clientId: String, val user: String?)

class SampleApplication : Application(),
 NowSDKAuthorizationProviding, DevicePermissionDelegate {

    private val nowSdkSettings = NowSDKSettings(
        instanceBaseURL =
 "https://instance-name.service-now.com",
        clientId = "client_id",
        user = "user"
    )

    private val coroutineScope = CoroutineScope(Dispatchers.IO)

    private val nowSDKConfiguration = NowSDKConfiguration(this,
 this, NowLogLevel.Debug)

    override fun onCreate() {
        super.onCreate()
        NowSDK.configure(this, nowSDKConfiguration)
    }

    override fun requestAuthorization(
        instanceURL: URL,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        callback: Consumer<List<AuthorizationToken>?>
    ) {
        coroutineScope.launch {
            when {
                nowSdkSettings.user.isNullOrBlank().not() ->
 authorizeWithJWT(
                    callback = callback,
                    user = nowSdkSettings.user,
                    clientId = nowSdkSettings.clientId
                )

                else -> authorizeWithGuest(callback = callback)
            }
        }
    }

    override fun canRequestPermission(permission:
 DevicePermission): Boolean {
        return true
    }

    private fun authorizeWithJWT(
        callback: Consumer<List<AuthorizationToken>?>,
        user: String?,
        clientId: String
    ) {
        //Get JWT token needed for the sdk initialization.
        val jwtToken ="jwt_token"

 callback.accept(listOf(AuthorizationToken(AuthorizationTokenTyp
e.JWT, jwtToken)))
    }

    private fun authorizeWithGuest(callback:
 Consumer<List<AuthorizationToken>?>) {
        callback.accept(
            listOf(
                AuthorizationToken(
                    AuthorizationTokenType.Guest,
                    ""
                )
            )
        )
    }
}
```

Implement Virtual and Live Agent chat

The Mobile SDK enables you to easily implement Virtual and Live Agent chat services within your Android application.

You use the NowChatSDK API to create the chat service. Once the service is created, you must then start the chat user interface.

The following is a snippet that shows how to create the chat service and start the interface.

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var chatService: NowChatService? = null

    /**
     * Create the NowChatService once in the lifetime of the
 application, inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowChatService should be created after initializing the
 NowSDK.
     */
    suspend fun getNowChatService(): NowChatService? {
        if (chatService != null) return chatService

        return
 NowChatSDK.makeChatService(URL("https://
instance-name.service-now.com"),
            object : NowChatSdkCallbacks {})
            .getOrThrow()
            .also { this.chatService = it }
    }
}

//Activity that will start the NowChat
class MainActivity : AppCompatActivity() {

    @Inject
    lateinit var sdkManager: SdkManager

    override fun onCreate(savedInstanceState: Bundle?) {
        super.onCreate(savedInstanceState)

        //Start NowChat using the activity
        lifecycleScope.launch {

 sdkManager.getNowChatService()?.start(this@MainActivity)
        }
    }
}
```

Before you can leverage the chat functionality within your application, you must configure Virtual Agent within your ServiceNow instance. For details, see Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Passing context variables to Live Agent and Virtual Agent chat

You can pass chat context variables when starting a chat session by passing the *contextData* parameter in the NowChatService-start() function. For additional information on chat context variables, see Live agent chat context variables.

```
class MainActivity : AppCompatActivity() {
  @Inject

  lateinit var sdkManager: SdkManager

  override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)

    val contextData = mapOf("sys_id" to "123456789", "table" to
 "wm_task")
    //Start NowChat using the activity
    lifecycleScope.launch {
      sdkManager.getNowChatService()?.start(this@MainActivity,
 contextData = contextData)
    }
  }
}
```

Theme the chat user interface

You can customize the colors of the Live Agent and Virtual Agent chat UI by passing a theme object in the *start()* call. For a list of elements that you can customize, see NowChatService - launchIntent(context:Context, nowChatTheme:NowChatTheme):Intent. By default, the chat UI uses the *nowUIColor* theme for all NowSDK UI elements. Refer to the sample application for an example on how to apply a theme to your chat UI.

Pass NowChatConfiguration to modify the behavior of NowChat

You can pass an optional *NowChatConfiguration* parameter when starting a chat session to modify some of the behavior of NowChat.

The NowChatConfiguration object contains the following options:

- *closePrompt*: Prompt text that appears before exiting a chat window. You define this prompt text through the following parameters:
  - *header*: Nullable string value that appears on the prompt's header.
  - *message*: String value that appears on the prompt's main body.
  - *acceptButtonTitle*: String value that appears on the primary button of the prompt. This button closes the chat window.
  - *declineButtonTitle*: String value that appears on the secondary button of the prompt. This button dismisses the prompt without closing the chat window.
- *disabledFeatures*: List of NowChat features to disable. Refer to the *NowChatConfiguration.Feature* enum class for the list of features that you can disable.
- *conversationOptions*: List of conversation options to apply to NowChat. Refer to the *NowChatConvestation.ConversationOption* enum class for the list of options that you can apply.
- *uiConfiguration*: UIConfiguration value used to configure UI components in NowChat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to use *NowChatConfiguration()* to configure NowChat.

```
class MainActivity : AppCompatActivity() {
  @Inject

  lateinit var sdkManager: SdkManager

  override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)

    //Drawable to use instead of the default NowChat back
 button.
    val myDrawable = ContextCompat.getDrawable(activity,
 R.drawable.my_drawable)

    val nowChatConfiguration = NowChatConfiguration(
      closePrompt = NowChatConfiguration.ClosePrompt(
        header = null,
        message = "Are you sure you want to leave?",
        acceptButtonTitle = "Yes",
        declineButtonTitle = "No"
      ),
      disabledFeatures =
 listOf(NowChatConfiguration.Feature.START_NEW_CONVERSATION),
      conversationOptions =
 listOf(NowChatConfiguration.ConversationOption.FORCE_NEW_CONVER
SATION),
      uiConfiguration = NowChatConfiguration.UIConfiguration(
        closeButton =  NowChatConfiguration.CloseButton(
          icon = myDrawable
        ),
        attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible = false)
      )
    )

    //Start NowChat
    lifecycleScope.launch {
      sdkManager.getNowChatService()?.start(this@MainActivity,
 nowChatConfiguration = nowChatConfiguration)
    }
  }
}
```

For additional information, see NowChatConfiguration class - Android and NowChatService - start(activity: Activity, themeColors: NowChatTheme = object: NowChatTheme{}, contextData: Map<String, Any> = mapOf(), chatConfiguration: NowChatConfiguration? = null).

Embed an AI voice agent with NowVoice

Use the NowVoice module to embed a real-time AI voice agent session into your Android application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NowVoice features

NowVoice gives your app a complete, ready-to-launch voice agent experience. When a user starts a voice agent session, the SDK:

- Authenticates against your ServiceNow instance using the token your app provides.
- Opens a WebSocket connection to the configured voice agent endpoint.
- Launches a full-screen `Activity` with microphone controls and a live transcript.
- Delivers real-time transcript messages and mute-state changes to your app through callbacks.
- Shows an optional post-call transcript summary screen on session end.

All public types in the NowVoice module are in the `com.servicenow.nowsdk.voice` package.

Theming

NowVoice integrates with the NowUI theming system. Implement `NowVoiceTheme` to apply custom colors. `NowVoiceThemeDark` is provided as a built-in alternative to the default light theme.

Mobile SDK instance settings

The NowVoice module reads the following keys from your ServiceNow instance's Mobile SDK settings response.

```
{
  "voice": {
    "enabled": true,
    "configurations": [
      {
        "voiceServiceId": "String",
        "voiceWebhookURL": "String",
        "mobileChannelType": "String",
        "mobileChannelId": "String"
      }
    ]
  }
}
```

Configure NowVoice

Configure NowVoice to add a real-time voice agent to your Android application.

Before you begin

Role required: admin

- Mobile SDK 2.22.0 or later must be added to your project via Gradle.
- Your ServiceNow instance must have voice agent services enabled. Confirm that `sdk.voice.enabled` is `true` in the Mobile SDK settings.

Procedure

1. Declare permissions in your app's `AndroidManifest.xml`.
   NowVoice requires microphone and internet permissions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

```
<uses-permission android:name="android.permission.RECORD_AUDIO" />
<uses-permission android:name="android.permission.INTERNET" />
<uses-permission android:name="android.permission.ACCESS_NETWORK_STATE" />
```

Note: `RECORD_AUDIO` is a classified as a dangerous (runtime) permission. It must also be requested at runtime on Android 6.0 (API 23) and later. When permission is needed, NowVoice SDK automatically triggers a request before calling `NowVoiceService.start()`.

2. Configure NowSDK.
   If you have not already done so, call `NowSDK.configure()` once at app launch. NowVoice requires NowSDK to be configured before any voice operations.

   Example

```
import com.servicenow.nowsdk.NowSDK
import com.servicenow.nowsdk.NowSDKConfiguration

NowSDK.configure(
    NowSDKConfiguration.Builder(this)
        .authorizationProvider(yourAuthProvider)
        .build()
)
```

3. Create a NowVoiceService.
   Import NowVoice and call `NowVoiceSDK.makeVoiceService(instanceURL)`. This is a suspend function; call it from a coroutine scope.

   Example

```
import com.servicenow.nowsdk.voice.NowVoiceSDK
import kotlinx.coroutines.launch
import java.net.URL

lifecycleScope.launch {
    val result = NowVoiceSDK.makeVoiceService(
        instanceURL =
 URL("https://your-instance.service-now.com")
    )

    result
        .onSuccess { voiceService ->
            // Service is ready; proceed to select an endpoint
        }
        .onFailure { error ->
            // Handle NowServiceError
            Log.e("NowVoice", "Service creation failed:
 $error")
        }
}
```

4. Select a voice endpoint.
   Use `NowVoiceService.nowVoiceEndpoints` to retrieve the available voice endpoints. In most apps there is a single endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

```
val endpoint = voiceService.nowVoiceEndpoints.firstOrNull() ?:
 return
```

5. Launch the voice UI.
   Call `start(context:endpoint:uiConfiguration:callbacks:theme:)` to launch the full-screen voice agent Activity. This is a suspend function that returns after the session ends.

   Example

```
voiceService.start(
    context = this@MainActivity,
    endpoint = endpoint,
    uiConfiguration = NowVoiceUiConfiguration(
        hidePostCallTranscript = false,
        shouldBlockAttachmentSharing = false
    ),
    callbacks = object : NowVoiceCallbacks {
        override fun onCallEnd(conversationId: String?, error:
 NowVoiceError?) {
            if (error != null) {
                Log.e("NowVoice", "Session ended with error:
 $error")
            } else {
                Log.d("NowVoice", "Session complete. ID:
 $conversationId")
            }
        }

        override fun onMuteStateChanged(isMuted: Boolean) {
            // Update your UI to reflect the current mute state
            Log.d("NowVoice", "Microphone muted: $isMuted")
        }

        override fun onMessageReceived(message:
 TranscriptMessage) {
            // Receive real-time transcript messages
            Log.d("NowVoice", "${message.role}:
 ${message.content}")
        }
    },
    theme = object : NowVoiceTheme {}  // Uses default light
 theme
)
```

6. **Optional:** Apply a custom theme.
   To apply custom colors, implement `NowVoiceTheme` and pass it to `start(context:endpoint:uiConfiguration:callbacks:theme:)` or `updateTheme(theme:)`. Or, use the prebuilt dark theme.

   Example

```
// Prebuilt dark theme
voiceService.start(context, endpoint, theme =
 NowVoiceThemeDark())
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Custom theme
val myTheme = object : NowVoiceTheme {
    override val primary: Int = Color.parseColor("#0072C6")
    override val backgroundPrimary: Int =
 Color.parseColor("#FFFFFF")
    // ... override additional properties as needed
}

// Apply theme at voice session launch
voiceService.start(context, endpoint, theme = myTheme)

// Or update theme while a voice session is active
voiceService.updateTheme(NowVoiceThemeDark())
```

Result

The voice agent Activity launches full-screen. The user can begin a real-time voice session with transcript and mute-state updates delivered to your app through the configured callbacks.

Example: Complete example

```
import com.servicenow.nowsdk.voice.*
import kotlinx.coroutines.launch
import java.net.URL

class MainActivity : AppCompatActivity() {

    private fun launchVoiceSession() {
        lifecycleScope.launch {
            val result = NowVoiceSDK.makeVoiceService(
                instanceURL =
 URL("https://your-instance.service-now.com")
            )

            result.onSuccess { voiceService ->
                val endpoint =
 voiceService.nowVoiceEndpoints.firstOrNull() ?:
 return@onSuccess

                voiceService.start(
                    context = this@MainActivity,
                    endpoint = endpoint,
                    callbacks = object : NowVoiceCallbacks {
                        override fun onCallEnd(conversationId:
 String?, error: NowVoiceError?) {
                            runOnUiThread { updateUI(ended =
 true) }
                        }

                        override fun onMuteStateChanged(isMuted:
 Boolean) {
                            runOnUiThread
 { updateMuteButton(isMuted) }
                        }

                        override fun onMessageReceived(message:
 TranscriptMessage) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                            runOnUiThread
 { appendTranscript(message) }
                        }
                    }
                )
            }.onFailure { error ->
                Log.e("NowVoice", "Failed: $error")
            }
        }
    }
}
```

Interact with table data in a ServiceNow instance

The Mobile SDK enables you to interact with data in tables that reside on your ServiceNow instance. You can interact with this data through the ServiceNow REST *Table* API using the *NowTableService()* API that directly calls the REST interface, or through the *NowGraphQLService()* API that executes a specified GraphQL query against the REST *GraphQL* API.

If you want to return data from multiple tables within a single call, you will need to use the *NowGraphQLService()* API. If you need to interact with ServiceNow REST APIs other than the *Table* API, see Interact with the public REST API on a ServiceNow instance.

Using NowGraphQLService to interact with ServiceNow tables

The NowGraphQLService class provides methods that enable you to construct and execute GraphQL queries on a specified table within your ServiceNow instance if the logged in user has the proper authorization. You can define all CRUD operations within your GraphQL query.

The following example shows how to import the NowData framework and then initialize a NowGraphQLService object that you can then use to interact with tables in your ServiceNow instance.

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowGraphQLService: NowGraphQLService? = null

    /**
     * Create the NowGraphQLService once in the lifetime of the
 application inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowGraphQLService should be created after initializing
 the NowSDK
     */
    suspend fun getNowGraphQLService(): NowGraphQLService? {
        if (nowGraphQLService != null) return nowGraphQLService

        return
 NowDataSDK.makeGraphQLService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowGraphQLService = it }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
}
```

This example shows how to obtains published KB articles using a GraphQL query.

```
suspend fun loadList() = withContext(Dispatchers.IO) {
    val kbArticlesQuery = """
    {
        GlideRecord_Query {
            kb_knowledge(queryConditions:
 "active=true^ORDERBYpublishedDESC"
            pagination:{ limit: 10, offset: 0 }) {
                _results {
                    sys_id { value },
                    number { displayValue },
                    short_description { displayValue },
                    author { displayValue }
                    published { displayValue }
                }
            }
        }
     }
 """
    val graphQLService = sdkManager.getNowGraphQLService()

    //graphQLService?.graphQLRequest(kbArticlesQuery)?.execute()
 can also be used
    graphQLService?.graphQLRequest(kbArticlesQuery)?.enqueue(
        { response ->
            response.body?.let {
                val resultString = String(it)
            }

        }, { nowDataError ->
            //handle error
        })
}
```

Using NowTableService to interact with ServiceNow tables

The NowTableService class provides methods to perform CRUD operations on the records in tables that reside on your ServiceNow instance. Through this interface you can directly access any of the records within any ServiceNow table for which the logged in user is authorized. *`NowTableService`* supports dot-walking for reference fields. For example, if a table contains a reference to the User table, the dot-walked value `user.name` returns the name of the user.

When returning the requested data, all applicable Access Control Lists (ACLs) are applied to the data, which may result in fewer results than expected, or authorization errors if the authenticated user does not have access rights to the specified table.

The following example shows how to import the *`NowData`* framework and then initialize a NowTableServce object that you can then use to interact with ServiceNow instance tables.

```
/**
 * Helper class used to handle different Now service instances.
 It has an application scope or is Singleton
 */
@Singleton
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
class SdkManager @Inject constructor() {

    private var nowTableService: NowTableService? = null

    /**
     * Create the NowTableService once in the lifetime of the
 application inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowTableService should be created after initializing the
 NowSDK
     */
    suspend fun getNowTableService(): NowTableService? {
        if (nowTableService != null) return nowTableService

        return
 NowDataSDK.makeTableService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowTableService = it }
    }
 }

suspend fun loadCases() = withContext(Dispatchers.IO) {
    val tableService = sdkManager.getNowTableService()

    //configure what data to pass back
    val fetchConfiguration =
 FetchConfiguration(Filter("active=true"), 10)

    val response = runCatching {
        tableService?.records(
            "sn_customerservice_case",
            fetchConfiguration
        )?.execute()
    }

    if (response.isSuccess) {
        val resultString = response.getOrNull()?.body?.let
 { String(it) }
    } else {
        //handle unsuccessful result
    }
}
```

For additional code examples using the available *NowTableService* methods, refer to the NowTableService API documentation.

Configure return results data

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint, you can configure what data is passed back in the return results.

You configure what data to pass back using the FetchConfiguration API. This interface enables you to configure:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The specific records to return from a table.
- The specific fields to return from the records.
- The number of records to return.

Note: Generally you want to use the same FetchConfiguration for all of your CRUD operations for a certain model type as it determines which fields are returned. It should at least match the required properties on your model, or else JSON Decoding will fail.

Configuring the specific records to return

The Filter object within a *FetchConfiguration* call enables you to define the filter and sort requirements for the records that are fetched from a ServiceNow instance and passed back in the return results from a REST endpoint. This filter is passed in the *sysparm_query* parameter of the REST API endpoint. For additional information, see Table API.

You can initialize the *Filter* object in two different ways depending on the desired filtering capabilities:

1. Filter by criteria. This filter enables you to filter based on one or more filter criteria that are OR'd together.

   For example, a manager has an employee Abel Tuter who is on PTO. They want to know if there are active incidents that are not assigned to anyone or assigned to Abel Tuter so they can assign/reassign them. They also want to see in that same list, all of the incidents that have high or overdue escalation so that they can also address those. The following shows how to create the necessary filters to obtain this data:

```
val activeIncidents =
 BooleanSimpleCondition.conditionIs("active", true)
val assignedToEmpty =
 StringSimpleCondition.isEmpty("assigned_to")
val assignedToAbel =
 StringSimpleCondition.conditionIs("assigned_to", "Abel Tuter")

val assignedToAbelOrEmpty =
  CompoundCondition(
  ConditionUtils.CompoundOperator.OR,
  listOf(assignedToEmpty, assignedToAbel))

val needToReassign =
 Criteria().addConditions(listOf(activeIncidents,
  assignedToAbelOrEmpty))

val highEscelations =
 StringSimpleCondition.conditionIs("escalation", "2")
val overdueEscelations =
 StringSimpleCondition.conditionIs("escalation", "3")

val highOrOverdueEscelations =
  CompoundCondition(ConditionUtils.CompoundOperator.OR,
    listOf(highEscelations, overdueEscelations))

val needToHandleEscalation =
  Criteria().addCondition(highOrOverdueEscelations)

val myPrioritiesForTodayFilter = Filter(listOf(needToReassign,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  needToHandleEscalation))

// Get record using filter
val response = runCatching {
  getNowTableService()?.records(
    "sn_customerservice_case",
    FetchConfiguration(myPrioritiesForTodayFilter, 10)
  )?.execute()
}
```

To use this type of filtering, use the Filter(criteriaList: List<Criteria>, sortBy: List<Sort>? = null) function.

2. Filter by keywords and conditions. This filter enables you to filter records based on specific keywords and conditions that can be AND'd or OR'd together.

   For example:

```
val keywords = "iOS 13 | iOS 14"
val conditionA = BooleanSimpleCondition.conditionIs(testField,
 true)
val conditionB = BooleanSimpleCondition.conditionIs(testField2,
 false)
val sortA = Sort(testField,
 ConditionUtils.SortOperator.ORDER_ASC)
val filter = Filter(conditions = listOf(conditionA,
 conditionB), keywords = keywords, sortBy = listOf(sortA))
assertEquals(filter.query().second,
 "${conditionA.makeConditionQuery()}^${conditionB.makeCondition
Query()}^123TEXTQUERY321=$keywords^EQ^${sortA.makeSortQuery()
}")
```

   To use this type of filtering, use the Filter - Filter(conditions: List<Condition>, keywords: String? = null, sortBy: List<Sort>? = null) function.

Configuring the specific fields to return

The FieldReadConfiguration object within the *`FetchConfiguration()`* method call allows you to configure what fields to pass back in the return results. In addition, you can configure the format/content of the returned fields as:

- display values
- actual values
- exclude reference links

Configure field write options

Within the Mobile SDK, when writing data to a ServiceNow instance through a REST endpoint, you can define field write options.

You configure field write options using the FieldWriteOptions API. This interface enables you to configure:

- Whether to suppress automatic generation of system fields.
- Whether to set field values using their display value display value rather than their actual value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Paginate return results record sets

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint using the *NowTableService*, you can create a Paginator object that enables you to iterate over the records in the return results.

You typically use paginated return results to provide infinite scroll capabilities for table records or to simplify page iteration of results in general.

The *NowTableService* class provides a method for creating a Paginator object that contains the return results from a REST endpoint call:

NowTableService - paginator(tableName: String, configuration: FetchConfiguration)

This method creates a Paginator object that contains the specified records from the specified table in raw data format. If you do not include the FetchConfiguration object in the call, it contains all records and their associated fields in the return results.

The returned Paginator object provides the following methods that enable you to page through the returned records. You must first call the *observe()* function to set the Paginator's callback.

- *first()*
- *hasNext()*
- *hasPrevious*
- *isBusy*
- *last()*
- *next()*
- *observe()*
- *previous()*
- *reset()*

Note: Some *Paginator* methods may throw an exception, such as when there are no more pages to fetch.

The following code example shows how to paginate through data.

```
// Configure what data to pass back
val fetchConfiguration =
 FetchConfiguration(Filter("active=true"), 10)

val paginator = getNowTableService()?.paginator(
  "sn_customerservice_case", fetchConfiguration)
  ?.observe(object : PaginatorCallBack<ByteArray> {
    override fun onSuccess(response: Response<List<ByteArray>>)
 {
      val byteArray = response.rawBody ?: throw Exception("Null
 Result")
      val responseString = String(byteArray)
    }

    override fun onFailure(e: NowDataError) {
      // Handle error
    }
  })
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Use paginator operators to navigate. Example
while (paginator.hasNext() && !paginator.isBusy()) {
  paginator.next()
}
```

Configure tables to work with guests

If you want guest users to be able to interact with data within a table on your ServiceNow instance, you must configure the table to be guest accessible.

Before you begin

Role required: admin

Procedure

1. Create a Public Pages (sys_public) record for the table that you want to enable public access for.

   a. In the **All** tab search bar, enter `sys_public.do`.

   b. In the **Page** field, enter the name of the table for which to add public access.

   a. Select **Submit.**

2. Ensure the public role is enabled for the table.

   a. Navigate to the table for which you want to allow guest (public) access, **All → System Definition → Tables**, select the table.

   b. Select the **Controls** tab.

   c. Under the **Security Rules (ACLs)** section, ensure **Create access controls** is selected and that **User role** contains `public`, if not, add them.

3. Create the public ACL for each of the CRUD operations that you want to enable guest access for.
   There must already be ACLs specified for each of the CRUD operations for which you are adding public access. If not, you need to create these ACLs also. To do this, follow the instructions below, but don't add the "*" in the second part of the **Name** field and don't add the public role to the required roles.

   a. Select the **Access Controls** tab.

   b. Select **New**.

   c. Enter the following values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Type	record
Application	Global
Operation	<Operation for which you want to allow guest access, such as read or write>
Name (first part)	<Name of the table that you want to provide guest access for>
Name (second part)	*

d. In **Requires role**, insert a new row and select the `public` role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit** to save your changes.
   When complete, there should be two ACLs for each guest user (public) CRUD operation. One with a ".*" at the end of the table name and one without.

Access Controls (8) | Labels (1) | Database Indexes (2) | Table Subscription Configuration (1)

Name | Search

Access Controls

Name	Operation	Type	Active
test_execution	edit_task_relations	record	true
test_execution	create	record	true
test_execution	delete	record	true
test_execution	read	record	true
test_execution	write	record	true
test_execution.*	create	record	true
test_execution.*	delete	record	true
test_execution.*	write	record	true

Interact with the public REST API on a ServiceNow instance

The Mobile SDK provides functionality that enables Android applications to call the public REST API on a ServiceNow instance.

Using the NowAPIService API you can interact with any of the base ServiceNow public REST APIs, or create custom REST APIs within the instance and call those from your Android application.

Before making a call to a ServiceNow REST API, you must call themakeNowAPIService() method to create an instance of the service. The service instance is returned in the callback if successful otherwise, an error is thrown.

The following shows how to initialize a NowAPIService object:

```
/**
 * Helper class used to handle different Now service instances.
 It has an application scope or is Singleton
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowApiService: NowAPIService? = null

    /**
     * Create the NowAPIService once in the lifetime of the
 application inside the Application class or another manager
 class
     * that will be injected into other classes via dagger/hilt.
     * NowAPIService should be created after initializing the
 NowSDK
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
     */
    suspend fun getNowApiService(): NowAPIService? {
        if (nowApiService != null) return nowApiService

        return
 NowDataSDK.makeAPIService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowApiService = it }
    }

}
```

Once the NowAPIService object is initialized, use the NowAPIService data() method to specify the REST endpoint to call and all of its associated parameters:

```
 suspend fun makeNowApiCall() {
  val apiService = sdkManager.getNowApiService()

  val apiPath = "api/now/table/sn_customerservice_case"
  val endpoint = NowAPIService.Endpoint(HttpMethod.GET, apiPath,
 true)
  val fieldNames =
 "sys_id,number,short_description,number,priority,state," +

 "opened_at,account.name,account.number,contact.name,contact.ema
il," +
    "contact_type,assignment_group.name,assigned_to.name"

  val queryParamsMap = mapOf("sysparm_fields" to fieldNames,
 "sysparm_limit" to "10")

  val queryParams =
 QueryParams.Builder().addAll(queryParamsMap).build()

  val response = runCatching {
    apiService?.data(endpoint = endpoint, queryParams =
 queryParams)?.execute()
  }

  if (response.isSuccess) {
    val resultString = response.getOrNull()?.body?.let
 { String(it) }
  } else {
    // Handle error
  }
}
```

Retrieve attachments and attachment metadata

The *NowAttachmentService* API enables you to perform CRUD operations on attachments and retrieve attachment metadata from your ServiceNow instance.

Note: The *NowAttachment* API works for guest users in the base ServiceNow system.

Using this API you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Upload attachments to your ServiceNow instance and associated them to a specific record.
- Download one or more attachments.
- Delete attachments.
- Validate an attachment by comparing the computed hash of the attachment to the expected hash.
- Download attachment metadata. This metadata is generated by your ServiceNow instance when an attachment is uploaded.

For additional information on working with attachments, see Attachment API.

The following shows how to instantiate the NowAttachmentService:

```
/**
 * Helper class used to handle different Now service instances.
 * It has an application scope or is a Singleton.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowAttachmentService: NowAttachmentService? =
 null

    /**
     * Create the NowAttachmentService once in the lifetime of
 the application
     * inside the Application class or another manager class
     * that will be injected into other classes via dagger/hilt.
     * NowAttachmentService should be created after initializing
 the NowSDK
     */
    suspend fun getNowAttachmentService(): NowAttachmentService?
 {
        if (nowAttachmentService != null) return
 nowAttachmentService

        return
 NowDataSDK.makeAttachmentService(URL("https://
instance-name.service-now.com"))
            .getOrThrow()
            .also { this.nowAttachmentService = it }
    }
}
```

The following shows how to obtain a Call object that fetches metadata for a particular attachments. It creates an executable object that is able to perform the specified request and return `Response<NowAttachmentMetadata>`.

```
suspend fun fetchMetadata(sysId: String) {
    val response = runCatching {

 sdkManager.getNowAttachmentService()?.attachmentMetadata(sysId)
?.execute()
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    if (response.isSuccess) {
        val nowAttachmentMetadata = response.getOrNull()?.body
    } else {
        Log.e("NowSDK", "result not successful")
    }
}
```

The following shows how to obtain a Call object that fetches metadata for multiple attachments. It creates an executable object that is able to perform the specified request and return `Response< List<NowAttachmentMetadata>>`.

```
suspend fun fetchMultipleMetadata() {
    val filterQuery = "content_type=text/plain"
    val limit = 5

    val response = runCatching {

 sdkManager.getNowAttachmentService()?.attachmentMetadata(Filter
(filterQuery), limit)?.execute()
    }

    if (response.isSuccess) {
        val attachmentMetadataList = response.getOrNull()?.body
    } else {
        Log.e("NowSDK", "result not successful")
    }
}
```

Attachment metadata pagination

You can use the *`NowAttachmentService`* methods to download attachment metadata for one or more attachments. When downloading metadata from multiple attachments, you may want to use the NowAttachmentService - attachmentMetadataPaginator(filter: Filter? = null, limit: Int? = null) method, which returns a Paginator object that enables you to easily iterate over the potentially large amount of data that is returned.

You can then iterate through the returned metadata using Paginator methods and receiving the response in the *`observe()`* callback.

```
 suspend fun createAttachmentMetadataPaginator() {
  val filterQuery: String = "content_type=text/plain"
  val filter = filterQuery.let(::Filter)
  val limit = 10

  val paginator =
 sdkmanager.getNowAttachmentService()?.attachmentMetadataPaginat
or(filter, limit)
    ?.observe(object : PaginatorCallBack<NowAttachmentMetadata>
 {
      override fun onSuccess(response:
 Response<List<NowAttachmentMetadata>>) {
        // Handle response
      }

      override fun onFailure(e: NowDataError) {
        // Handle error
      }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    })
    ?: throw Exception("Response is null")

  // Use paginator operators to navigate. Example
  while (paginator.hasNext() && !paginator.isBusy()) {
    paginator.next()
  }
}
```

The returned Paginator object provides the following methods that enable you to page through the returned records. You must first call the *observe()* function to set the Paginator's callback.

- *first()*
- *hasNext()*
- *hasPrevious*
- *isBusy*
- *last()*
- *next()*
- *observe()*
- *previous()*
- *reset()*

Note: Some *Paginator* methods may throw an exception, such as when there are no more pages to fetch.

Display web pages hosted on your ServiceNow instance

You can display web pages hosted within your ServiceNow instance in your native Android application.

The Mobile SDK provides seamless handling of the required authentication and session management, while the NowWebSDK API provides the functionality required to handle pages residing on your ServiceNow instance. These web pages have all the dynamic interactions that are possible on the ServiceNow platform.

To use these features, you must first create an instance of the *NowWebService*. To do this, you must call the makeWebService() method and provide the URL to your ServiceNow instance and an already initialized NowSDK. In addition, you must have imported NowWeb within your application. You should hold a reference to the *NowWebService* for as long as you're using the NowWeb service.

The following shows an example of how to create a NowWebService object:

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowWebService: NowWebService? = null

    /**
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
     * Create the NowWebService once in the lifetime of the
 application inside the Application class or
     * another manager class that will be injected into other
 classes via dagger/hilt.
     * NowWebService should be created after initializing the
 NowSDK
     */
    suspend fun getNowWebService(): NowWebService? {
        if (nowWebService != null) return nowWebService

        return
 NowWebSDK.makeWebService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowWebService = it }
    }
}
```

Pre-load pages to improve NowWeb load time

You can pre-load pages with cacheable resources in the background to improve initial *NowWeb* load times. The following example shows how to use the *webService.preloadWebCache()* function to pre-load the `mesp` page. This method takes a list of URIs to pre-fetch more pages.

```
suspend fun preloadNowWeb() {
  val webService = sdkmanager.getNowWebService()
  webService.preloadWebCache(listOf(URI("mesp")))
}
```

Create views to display web content

After you've instantiated an instance of *NowWebService*, you can use it to launch an activity to display web pages hosted on your ServiceNow instance.

The following example shows how to launch a NowWeb activity:

```
//Activity that will start the NowWeb
class MainActivity : AppCompatActivity() {

  @Inject
  lateinit var sdkManager: SdkManager

  override fun onCreate(savedInstanceState: Bundle?) {
    super.onCreate(savedInstanceState)

    // Start NowWeb
    lifecycleScope.launch {
      sdkManager.getNowWebService()?.launch(this@MainActivity,
 URL("https://instance-name.service-now.com"), object :
 NowWebTheme{})
    }
  }
}
```

In this example, *url* is the URL of the initial page to load within the view. This URL must point to a page that is hosted on the specified ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Color theme support for NowWeb UI elements

You can specify a custom color theme that applies to all UI elements within a view when calling the NowWebService *launch()* method. To create this custom color theme, create a type that implements the *NowWebTheme* interface and pass it in the theme parameter of the *NowWebService.launch()* call.

```
suspend fun launchNowWeb() {
    val webService = getNowWebService()

    val webTheme = object : NowWebTheme {
        override val brand: Int
            get() = Color.BLUE

        override val textPrimary: Int
            get() = Color.BLACK

        //Override remaining theme colors
    }
    webService?.launch(activity,
 URL("https://instance-name.service-now.com"), webTheme)
}
```

For additional information on applying color themes within a web view, see Use NowUIColoring to theme NowWebTheme and NowChatTheme.

Configure push notifications

Push notifications enable the sending of unsolicited messages (notifications) from a ServiceNow instance to a specific registered user and an application that leverages the ServiceNow Mobile SDK framework.

You must set up push notifications on both your ServiceNow instance and within the application that will receive the notifications.

Note: For the current release, only the Virtual Agent service supports the receipt of push notifications.

Setting up push notifications on your ServiceNow instance

For each Mobile SDK application that incorporates the Virtual Agent service and leverages push notifications, you must complete the following configuration process on your ServiceNow instance.

- Retrieve the Firebase push server key.
- Add a push application record in the Push Application [sys_push_application] table.
- Add a push notification message content record in the Push Notification Message Content [sys_push_notif_msg_content] table.
- Add a default push registration.
- Add a push notification message in the Push Notification Message [sys_push_notif_msg] table.
- Modify the push notification record in the Notification [sysevent_email_action] table.

Retrieve the Firebase push server key

You must retrieve your unique Google Firebase push server key from your Firebase account so that you can associate it to your Mobile SDK applications that leverage push notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

You must already have a Firebase account set up. For information on how to create a Firebase account and download the corresponding SDK, refer to the Google Firebase website.

Procedure

1. From your Firebase account, select the configuration gear next to the **Project Overview** link on the left navigation bar, and then select **Project settings.**

2. From the Project settings page, select the **Cloud Messaging** tab.

3. Select and copy the Server key token.

> **Note:** For security purposes, this key has been blocked from view in the screen shot above; covered with "Key here".

Add a push application record

You must enter your Google Firebase Cloud Messaging server key in your push application record to use push notifications in a Mobile SDK application that leverages Virtual Agent and push notifications.

Before you begin
Role required: admin
This record is stored in the Push Application [sys_push_application] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Select **New** to add a new record.
3. In the **Display Name** and **Name** fields, enter the name of your application.
4. In the **Push** field, change the value from **REST API** to **Direct**.
5. In the **Google** tab, paste your Google Firebase server key in the **API Key** field.
6. Select **Submit**.

Add a default push registration

Register the push notification so that all users of your application receive the push notifications by default.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Locate and open the push notification that you created earlier.
3. In the related list, select the **Push Default Registrations** tab, then select **New**.
4. In **Notification**, enter `Virtual Agent Message Push Notification`.

5. Select **Submit**.

Add a push notification message content record

The push notification message content record contains the location users are directed to when they tap on a notification, as well as the appearance and layout of the notification.

Before you begin

Role required: admin

Complete the Push Notification Message Content form to:

- Name the notification.
- Select the mobile application to which the notification is sent.
- Optionally, customize the appearance of the notification message.

This information is saved in the Push Notification Message Contents [sys_push_notif_msg_content] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Message Content**.
2. Select **New**.
3. In the Push Message Content form, fill in the following fields:

Push Notification Message Content form

Field	Description
Name	Descriptive name of the push message content record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to send the notification to. This is the application that you added in "Add a push application record".

Push Message Generation	Script block that contains the notification link. To implement push notifications in a Mobile SDK Virtual Agent application, use the following script:
	`(function buildJSON(/*GlideRecord*/ current, /*String*/ message, /*Object*/ attributes) {`
	`var json = {`
	`"aps": {`
	`"alert": {`
	`"title": current.push_title,`
	`"body": sn_cs.VASystemObject.getTextValueForMessage(current.message_id)`
	`},`
	`"sound": "default",`
	`"thread-id": "launch_virtual_agent"`
	`},`
	`"type": "launch_virtual_agent"`
	`};`
	`return json;`
	`})(current, message, attributes);`

4. Select **Submit**.

Add a push notification message

Configure the message displayed to users when they receive their push notification.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Messages**.
2. Select **New**.
3. In the Push Message form, fill in the following fields:

Push Message form

Field	Description
Name	Descriptive name for the push notification message record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to which you want to send the notification. This is the application that you added in "Add a push application record".
Push message	Push notification message content record created in "Add a push notification message content record".
Table	Table the message originates from. Select `Push Notification [sys_cs_message_notification]`.

4. Select **Submit** to create the record.

Modify the push notification

Modify the Virtual Agent Message Push Notification record to include your application. This record is used to trigger notifications to the Virtual Agent. All applications that will push notifications to the Virtual Agent must be configured in this record.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Notifications**.
2. Locate and open the push notification "Virtual Agent Message Push Notification".
   Ensure that the layout is set to the Advanced view. If not, switch to the Advanced view by selecting the associated link under **Related Links**.
3. Select the **What it will contain** tab.
4. In **Push Messages**, add the name of the push message record created in "Add a push notification message".

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Update**.

Setting up push notifications in your Android application

In addition to the tasks that you must perform on your ServiceNow® instance to configure a push notification, you must also include specific code in your Android application.

Create the NowSDK NowPushService

One of the first things that needs to be done in your application is to retrieve the NowSDK *`NowPushService`*. Add code similar to the following snippet early within your main code body.

```
/**
 * Helper class used to handle different Now service instances.
 */
@Singleton
class SdkManager @Inject constructor() {

    private var nowPushService: NowPushService? = null

    /**
     * Create the NowPushService once in the lifetime of the
 application inside the Application
     * class or another manager class that will be injected into
 other classes via dagger/hilt.
     * NowPushService should be created after initializing the
 NowSDK
     */
    suspend fun getNowPushService(): NowPushService? {
        if (nowPushService != null) return nowPushService

        return
 NowPushSDK.makePushService(URL("https://
instance-name.service-now.com")).getOrThrow()
            .also { this.nowPushService = it }
    }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For additional information on the *NowPushSDK.makePushService()* method, refer to NowPushSDK - makePushService(instanceURL: URL).

Register the push token

Google Firebase provides a unique push token that identifies the device and application to receive push notifications. In order for an application to receive push notification, you must register this token using the *NowPushService*. Add a function similar to the following code snippet in your Android application. Ensure that you change *PushAppName* to the name of your Android application. This application must be registered with your ServiceNow® instance.

```
FirebaseMessaging.getInstance().token.addOnCompleteListener
 {task ->
  val token = task.result

  if (!task.isSuccessfull || token == null) {
    throw Exception("Unable to fetch token"))
  }

  pushService.registerPushToken(token, "PushAppName", {
      Log.v(TAF, "Successfully registered push token")
  }, { e ->
      Log.e(TAG, "Error registrating push", e)
  })
}
```

For additional information on the *registerPushToken()* method, refer to NowPushService - registerPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>).

Unregister the push token

You need to unregister the push token whenever the user exits your application, such as when the user logs out. Use code similar to the following code snippet to unregister the push token. Ensure that you change *PushAppName* to the name of your Android application.

```
pushService.unregisterPushToken(token, "PushAppName", {
      Log.v(TAG, "Successfully unregistered push token")
}, { e ->
      Log.e(TAG, "Error unregistering push", e)
})
```

For additional information on the *unregisterPushToken()* method, refer to NowPushService - unregisterPushToken(pushToken: String, pushApp: String, successCallback: Runnable, errorCallback: Consumer<Throwable>).

Implement the FirebaseMessagingService

You must implement the `FirebaseMessagingService` within your application. To setup and implement this service, follow the instructions in the Android Firebase documentation.

Once setup, override the *onMessageReceived()* method and pass the *RemoteMessage* through to the `NowPushService`. If the `NowPushService` recognizes the notification, it will process it and return the notification object for the application to handle. Currently, the only implemented notification is `NowPushVirtualAgent`. An unknown notification returns a `NotSupportedPushError` object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Custom coroutineScope created in the Firebase service class
private val serviceCoroutineScope =
 CoroutineScope(Dispatchers.IO)

override fun onMessageReceived(remoteMessage: RemoteMessage) {
  serviceCoroutineScope.launch {
    val result = handleNowPush(remoteMessage)

    if (result.isSuccess) {
      when (val push = result.getOrNull()) {
        is NowPushVirtualAgent -> handleVirtualAgentPush(push)
      }
    } else {
      // Not a NowPush. Handle host app push notification
 message here
    }
  }
}

private suspend fun handleNowPush(remoteMessage: RemoteMessage):
 Result<NowPushPayload> {
  val nowPushService = sdkManager.getNowPushService()

  return suspendCoroutine { cont ->
    nowPushService?.handlePush(remoteMessage,
      { cont.resume(Result.success(it)) },
 { cont.resumeWithException(it) })
  }
}
```

For additional information on the *`handlePush()`* method, refer to NowPushService - handlePush(remoteMessage: RemoteMessage, successCallback: Consumer<NowPushPayload>, errorCallback: Consumer<Throwable>).

In addition, you must override *`onNewToken(token: String)`*. Be sure to pass the token through to the *`pushService.registerPushToken()`*, similar to what was done in the "Register the push token" section.

Use NowUIColoring to theme NowWebTheme and NowChatTheme

The *`NowUIColoring`* interface contains all the colors used by all NowSDK modules.

For scenarios where you use similar color variables across multiple SDK modules, you can implement the *`NowUIColoring`* interface. Using this interface you can override color values and then use that implementation to override the nowUIColoring values inside the theme classes NowWebTheme and NowChatTheme. If color variables aren't overridden, the *`NowUIColoring`* interface uses the default colors.

The following code example shows how to override colors for both a web UI and a chat UI.

```
// Implement the NowUIColoring and override desired color
 variables
val nowUIColoringImpl = object : NowUIColoring {
    override val brand: Int
        get() = Color.BLUE

    override val textPrimary: Int
        get() = Color.WHITE
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    //override the rest of color variables

}

// Override the nowUIColoring for NowWeb value using the
 NowUIColoring implementation
lifecycleScope.launch {
    sdkManager.getNowWebService()?.launch(activity,
 URL("https://instance-name.service-now.com"), object :
 NowWebTheme {
        override val nowUIColoring: NowUIColoring
            get() = nowUIColoringImpl
    })
}

//Override the nowUIColoring for NowChat value using the
 NowUIColoring implementation
lifecycleScope.launch {
    sdkManager.getNowChatService()?.start(activity, object :
 NowChatTheme {
        override val nowUIColoring: NowUIColoring
            get() = nowUIColoringImpl
    })
}
```

Dark theme support

To support a dark theme in NowChat, you can either provide your own dark theme implementation of the NowChatTheme and use that in the *`NowChatService.start()`* and *`NowChatService.updateTheme()`* functions. Or you can use a NowChatThemeDark class that implements the NowChatTheme interface with default dark theme colors. You can also use this class as a base for your custom dark theme implementation.

```
val chatService = serviceManager.getNowChatService()

val chatThemeLight = object : NowChatTheme {
    override val backgroundPrimary: Int
        get() = Color.WHITE

    override val textPrimary: Int
        get() = Color.BLACK

    // Override remaining theme colors
}

//create dark theme using the NowChatThemeDark class
val chatThemeDark = object : NowChatThemeDark(){
    override val backgroundPrimary: Int
        get() = Color.BLACK

    override val textPrimary: Int
        get() = Color.WHITE

    // Override remaining theme colors
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//start NowChat with light theme
chatService?.start(activity, chatThemeLight)

//update NowChat theme to dark theme
chatService?.updateTheme(chatThemeDark)
```

Mobile SDK Developer Guide - iOS

The ServiceNow Mobile SDK enables you to leverage the functionality and resources of the ServiceNow platform within your standalone mobile iOS applications.

Using the Mobile SDK, you can perform the following within your applications:

- Access data on your ServiceNow instance through its public REST APIs or custom scripted REST APIs that you develop.
- Embed and enable Virtual Agent within your application interface.
- Embed a real-time, AI-powered voice agent directly in your mobile application. NowVoice provides a full-screen voice interface with live transcripts, mute controls, and post-call transcript sharing.
- Gather and track custom analytics events for analysis.
- Attach documents (attachments) to a record within your ServiceNow instance.
- Load web pages hosted on your ServiceNow instance in a native web view or Cabrillo.
- Provide simple authentication flows using JSON Web Tokens for third-party applications to authenticate users.

The Mobile SDK provides a sample app that includes code examples for integration with different Mobile SDK modules. In the 2.1 release and later, the Engagement Messenger is included in the sample app. To learn more about the Engagement Messenger, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB1587276.

NowSDK architecture

The NowSDK is the top-level entity of the Mobile SDK class framework.

It contains numerous classes, structures, protocols, type aliases, and functions that enable you to use the significant capabilities provided by the Mobile SDK and your ServiceNow instance. This document focuses on describing the primary feature services exposed in the Mobile SDK that enable you to interact with your ServiceNow instance.

To use any of the feature services provided by the Mobile SDK, you must integrate the NowSDK library into your code. You must call the core library to configure and initialize the SDK before using any SDK functionality.

NowSDK provides the following capabilities:

- SDK initialization and settings retrieval and configuration.
- Seamless authorization and user session handling.
- Logging interface. The NowSDK provides logging services to all feature services. By default, log messages are written to system logs using platform-specific functionality. You can control the logging threshold through a parameter that is part of the call to configure the SDK. There's also an option to suppress all log messages generated by the SDK and its feature services

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(`log level = none`). If you already have your own logging solution in place, the Mobile SDK allows you to use it.

- Build and release infrastructure.

NowSDK provides the following feature services and associated APIs:

- NowData

  Enables third-party applications to access the public REST APIs exposed by your ServiceNow instance. Development is streamlined because NowData utilizes the authentication and session handling features provided by the NowSDK.

  Primary APIs:

  - NowAPIService: This API provides functionality that enables you to interact with the publicly exposed REST APIs on your ServiceNow instance.
  - NowAttachmentService: This API provides functionality to upload and query file attachments on your ServiceNow instance within your iOS application.
  - NowGraphQLService: This API provides functionality that enables you to use GraphQL queries to obtain data from tables within your ServiceNow instance using the ServiceNow REST *`GraphQL API`*.
  - NowTableService: This API provides functionality that enables you to perform create, read, update, and delete (CRUD) operations on existing tables in your ServiceNow instance that are serviced through the ServiceNow REST *`Table API`*.

- NowChat

  Enables you to embed a native Virtual Agent chat window in your applications. This service includes UI/UX features.

  Primary API: NowChatService: This API provides Virtual Agent and Live Agent chat capabilities to your iOS applications. Use the full-service chat capabilities provided by the ServiceNow platform by simply implementing NowChatService within your application.

- NowPush

  Now Push: Enables you to send unsolicited messages to your applications.

  Primary APIs:

  - NowPushPayload: This is a generic protocol that you can use to define a push notification protocol within the `NowSDK` framework.
  - NowPushService: This API provides functions that enable interaction with the Push Notification service.

- NowWeb

  Enables you to load web pages hosted on your ServiceNow instance in a native web view, with support for Cabrillo. It automatically handles user authentication and session management instead of forcing users to log in to the instance via a login web page.

  Primary API: NowWebService: This API provides functionality that enables the browsing of web pages on your ServiceNow instance.

- NowVoice

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Embed a real-time, AI-powered voice agent directly in your mobile application. NowVoice provides a full-screen voice interface that connects users to a ServiceNow voice agent, with live transcripts, mute controls, and post-call transcript sharing.

Primary API: NowVoiceService: This API provides functions to manage voice agent sessions for a single ServiceNow instance.

Get started with Mobile SDK - iOS

You must complete the tasks outlined in this section to prepare your development environment to support writing iOS applications that integrate with the ServiceNow Mobile SDK.

- Download and install the ServiceNow Mobile SDK libraries. For detailed instructions, see Download and install the Mobile SDK libraries.
- Install and configure the Mobile SDK scoped application. For detailed instructions, see Install and configure the Mobile SDK scoped application.
- Configure your project. For more information, see Configure your project.
- Activate and configure the Mobile SDK on your ServiceNow instance. For details, see Configure certificate and create an OAuth Entity.
- Configure guest users. For details, see Configure guest user access.

After all of these tasks are completed, you can then start creating mobile applications that leverage the significant resources on your ServiceNow instance.

Download and install the Mobile SDK libraries

Before you are able to create mobile applications that interact with your ServiceNow instance, you must first download and install the ServiceNow Mobile SDK libraries.

Before you begin

Role required: none

Before you start the download and installation process, ensure that your development environment meets the following minimum requirements:

- ServiceNow instance must be Washington DC or later.
- iOS version must be 16.0 or later.

Procedure

1. In your development environment, create a folder alongside the rest of your application code in which to download the Mobile SDK iOS library.

   It is a good practice to create a folder named `vendor` in the root of your project's location on the file system and download the unzipped Mobile SDK folder into that folder. It is also a good practice to check the SDK contents into your repository. This allows for a portable codebase and makes any accidental change to the SDK highly visible.

2. Download the Mobile SDK iOS library, called NowKit from the ServiceNow Store.
   You can find the iOS libraries in the following locations:
   - Mobile SDK: https://store.servicenow.com/sn_appstore_store.do#!/store/application/5282184680312010104 0fe43e5b9ee8c
   - iOS library: https://store.servicenow.com/sn_appstore_store.do#!/store/application/1539a1f087ea3014970e2178cebb3564
   For details on installing applications on your instance, see Administering applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Navigate to the packaged_sdk folder and unzip the `NowKit.zip` file which contains the NowSDK libraries.

   Note: It is important not to edit any ServiceNow Mobile SDK files or file structure. If you are experiencing issues with the SDK, open a support issue through your standard ServiceNow support process.

Install and configure the Mobile SDK scoped application

Before writing any application that leverages the Mobile SDK, you must install and configure the Mobile SDK scoped application.

Before you begin

Role required: admin

Procedure

1. Navigate to the Mobile SDK page on the ServiceNow Store web site.
   For details, see Install an application or plugin.
2. Select **Request Install** to download the Mobile SDK scoped application onto your ServiceNow instance.
3. Verify that the Mobile SDK scoped application was properly installed on your ServiceNow instance.

   a. Open the plugin's form: `System Definition` > `Plugins`.

   b. In the search field, enter `mobile_sdk`.
   A screen similar to the following should appear:

   c. Verify that the plugin **Id** is `sn_mobile_sdk` and that the version is the latest.

4. Open the Mobile SDK Settings [sn_mobile_sdk] table and create a new application record for the application that will leverage the Mobile SDK.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Name** field, enter the name of your application that will leverage the Mobile SDK.

b. In the **Android Application ID** and **Apple Bundle ID** fields, enter the ID of your mobile application.
For example, if the Mobile SDK was added to your mobile applications, then these IDs would be the IDs of the mobile applications.

c. In the **SDK Settings** field, enter JSON configuration properties for all of the feature services that your application will leverage, set to `true`.

For example:

```
{
    "graphql": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "table": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "api": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "attachment": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "chat": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "web": {
        "enabled" : true,
                "allowGuestAccess" : true
    },
    "push": {
        "enabled" : true
    }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure that the **Advanced** check box is unselected. This allows you to enter JSON in the **SDK Settings** field.

Any applicable configuration added in **SDK Settings** is used in conjunction with the ServiceNow instance configuration.

For example, if `chat: enabled = true`, your ServiceNow instance must have the Virtual Agent plugin installed to leverage the chat functionality. If the Virtual Agent plugin is installed, but **SDK Settings** contains `chat: enabled = false`, your application is not able to leverage the chat interface.

d. Select **Submit** to save your application settings.

5. Optional. If you want your application to leverage Usage Insights, register your application with the Usage Insights application.

a. Reopen your application's Mobile SDK Settings record.

b. In the bottom-left of the screen, select **Register for Analytics**.
A screen similar to the following appears:

c. Select **Update** to save the registration.

6. Verify your SDK Settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to the **REST API Explorer**.

b. Enter the following in the specified fields:

- **Namespace**: `sn_mobile_sdk`
- **API Name**: `Mobile SDK`
- **API Version**: `latest`

c. Select **Get settings for Android App (GET)**.

d. In the **applicationID** field, enter the Android Application ID that you entered in the associated Mobile SDK Settings record and then select **Send**.
The response should look similar to the following:

The JSON **Response Body** should look similar to the following:

```
{
 "platformVersion": "utah",
 "enabled": true,
 "analytics": {
 "AnalyticsEnabled": true,
 "AnalyticsEnabledForUnauthenticatedUser": false,
 "EndpointUrl": "https://my-instance.servicenow.com.com",
 "InstanceId": "db63a848db9f6091fd3467c8f4879524",
 "ApiKey":
 "de742fc9db9f6090e03ad7c8f4961923:af0f36b91bc074109a9054a260
32a6bf",
 "ApiAuth": "11ab4240a6d5459c96d2bfb8e1aa3ddd",
 "ConsentSettings": null,
 "AppName": "TestNow App",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 "AppType": "MobileSDK",
 "ChannelType": "sdk",
 "Configuration": {}
 },
 "sdk": {
 "graphql": {
 "enabled": true
 },
 "table": {
 "enabled": true
 },
 "api": {
 "enabled": true
 },
 "attachment": {
 "enabled": true
 },
 "chat": {
 "enabled": true
 },
 "web": {
 "enabled": true
 },
   "push": {
   "enabled": true
 }
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure your project

Before writing any application that leverages the Mobile SDK for iOS, you must configure your project to use the SDK.

Procedure

1. Add the Mobile SDK to your project.

   a. In Xcode, drag the NowKit folder from Finder on to your Project Navigator pane (#+1). Xcode recognizes the folder as a Swift package and displays a folder icon next to **NowKit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Add the Mobile SDK to your target in the **Frameworks, Libraries, and Embedded Content** section of the project's general settings by pressing the **+** icon and selecting the **NowKit** framework from the presented list.

2. Update your project settings.

The SDK uses several device features which require user permissions. You'll need to add SDK feature grouped entries to your project's Info.plist for the following keys:

- NowChat
  - NSLocationWhenInUseUsageDescription
  - NSLocationAlwaysAndWhenInUseUsageDescription
  - NSMicrophoneUsageDescription
  - NSSpeechRecognitionUsageDescription
- NowWeb
  - NSCameraUsageDescription
  - NSPhotoLibraryUsageDescription

Ensure that you provide messages that are helpful to customers, such as the following:

```
...
<key>NSCameraUsageDescription</key>
<string>[Your App] requires permission to access your camera to
 take attachment photos and scan barcodes.</string>
<key>NSPhotoLibraryUsageDescription</key>
<string>[Your App] requires permission to upload your photos to
 a record.</string>
...
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure certificate and create an OAuth Entity

You must configure your ServiceNow instance to accept and exchange a JSON Web Token (JWT) for an OAuth access token. To enable this functionality you must install a certificate that matches the JWT provider's private key on the ServiceNow instance that you will use as the JWT Token consumer and create an OAuth Entity on that instance.

Before you begin

Role required: admin

Procedure

1. If not already configured, configure your ServiceNow instance as an OAuth JWT provider.
   For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
2. Navigate to **System Definition** > **Certificates**.
3. Select **New** and then create a new public certificate as shown in the following image.

   For details on creating this certificate, see Update your X.509 certificate.

4. Create an OAuth Entity.
   For details, see Create an OAuth JWT API endpoint for external clients (machine to machine integration).
5. Add and select the **Public Client** field to the form.

   Note: This field is not shown by default.

6. Save the record.
7. Add a JWT Verifier Map entry.
   After the record is saved, a new section called **Jwt Verifier Maps** appears at the bottom of the form.

   a. Add a name in the **Name** field, this can be whatever name you choose, and select the certificate that was added.
      The other fields, **Kid** and **Shared key**, can be left blank, as they are auto-filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Ensure that the form contains information similar to the following once you are finished with your configuration:

Configure guest user access

To enable SDK services to be accessible by unauthenticated users, you must configure the Mobile SDK on your ServiceNow instance to allow guest user access. A guest user can view public web pages hosted in an instance using *NowWeb*, have a conversation as a guest using *NowChat*, access public data on the instance using *NowTableService* and *NowGraphQLService*, and access custom API services configured for unauthenticated users using *NowAPIService*.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Mobile SDK** > **All** and select the application to which you want to allow guest access.
2. For each service that you want to enable guest access, add `"allowGuestAccess":true` to its configuration array.

Note: The *NowAttachment* service does not currently support guest access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Update** to save your changes.

Initialize the NowSDK in your application

To access the functionality provided by the NowSDK, you must first initialize the NowSDK in your application.

The Mobile SDK initialization is asynchronous. It is a good practice to start the initialization process as early as possible, such as in the application delegate's `application(application:didFinishLaunchingWithOptions:)` function. Initialization only needs to occur once per application launch. There is no need to reinitialize when foregrounded or when a new scene is detected.

To initialize the ServiceNow Mobile SDK in your iOS application you'll need an authorization provider conforming to `NowSDKAuthorizationProviding`, which uses your JWT provider information, and a delegate conforming to `DevicePermissionDelegate`.

The following is an example of a structure of an SDK initialization. For additional code examples, refer to the ServiceNow Mobile SDK sample application.

```
//

//  JWTProvider.swift

import Foundation
import NowSDK

class JWTProvider: NowSDKAuthorizationProviding {
  let token: String

  init(token: String) {
    self.token = token
  }

  func requestAuthorization(for instanceUrl: URL, completion:
 @escaping ([AuthorizationToken]?) -> Void) {
    completion([AuthorizationToken(type: .jwt, token: token)])
  }
}
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//
//  PermissionProvider.swift

import Foundation
import NowSDK

class PermissionProvider: DevicePermissionDelegate {
  var isUserPermissionAllowed: Bool { Bool.random() }

  func canRequestPermission(_ permission: DevicePermission) ->
 Bool {
    guard isUserPermissionAllowed else { false }
    return true
  }
}
```

```
//
//  AppDelegate.swift

import Foundation
import NowSDK

@main
class AppDelegate: UIResponder, UIApplicationDelegate {
  func application(_ application: UIApplication,
 didFinishLaunchingWithOptions launchOptions:
 [UIApplication.LaunchOptionsKey: Any]?) -> Bool {

    let jwtProvider = JWTProvider(token: "a_valid_token”)
    let permissionDelegate = PermissionProvider()
    let logLevel: NowLogLevel = .debug

    let config = NowSDKConfiguration(authorizationProvider:
 jwtProvider, permissionDelegate: permissionProvider, logLevel:
 logLevel)

    do {
      try NowSDK.configure(with: config)
    } catch {
      // Handle 'error'
    }

    return true

}
```

Guest users

If the current user is not authenticated, it is possible to for them to access SDK functionality as a guest. To indicate that the current user is a guest, the *`requestAuthorization`* function in the authorization provider should complete with a guest type of *`AuthorizationToken`*, as shown below. The token value in this case is not important so long as the *`AuthorizationTokenType`* is set to `.guest`. For additional information on guest users, see Configure guest user access.

```
//  GuestTokenProvider.swift
import Foundation
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
import NowSDK
class GuestTokenProvider: NowSDKAuthorizationProviding {
    func requestAuthorization(for instanceUrl: URL,
        completion: @escaping ([AuthorizationToken]?) -> Void) {
        completion([AuthorizationToken(type: .guest, token:
 "")])
    }
}
```

Logging users out of the SDK

After a user is logged out of a host application, you should call the `NowSDK.logout()` method to clear that user's ServiceNow sessions and tokens from the SDK. For example:

```
func onLogout() {
  NowSDK.logout()
}
```

Implement Virtual and Live Agent chat

The Mobile SDK enables you to easily implement Virtual and Live Agent chat services within your iOS application.

You use the NowChatService API to create the chat user interface. Once the UI is created, you must then start the chat session, and then start the chat service. Similar to other Mobile SDK feature services, the *`NowChatService`* API provides two implementations for some of its methods, including the *`startChat()`* method. One implementation returns a Combine publisher, and the other calls a completion handler with the return results.

The following is a snippet from the sample application that shows how to initialize and start a chat UI and session.

```
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()))
  switch result {
    case .success(let chatViewController):
      return chatViewController
    case .failure(let error):
      debugPrint("Chat screen creation failed with error:
 \(error)")
      return nil
  }
}
```

```
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }
  chatService.startChat { [weak self] result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
  }
}
```

Before you can leverage the chat functionality within your application, you must configure Virtual Agent within your ServiceNow instance. For details, see Virtual Agent.

Theme the chat user interface

You can customize the colors of the Live Agent and Virtual Agent chat UI by passing a theme object in the *makeChatUI()* call. For a list of all of the elements that you can customize, see NowChatColoring protocol - iOS. By default, the chat UI uses the *NowUIColor* theme for all NowSDK UI elements. Refer to the NowChatThemeable protocol - iOS for sample code snippets on how to apply a theme to your chat UI.

Passing context variables to Live Agent and Virtual Agent chat

You can pass chat context variables when starting a chat session by passing the *contextData* parameter.

You can pass this value using the NowChatService - startChat(contextData: [String: Any]? = nil, _ completion: @escaping (Result<Void, NowChatServiceError>) -> Void) functions.

For additional information on chat context variables, see Live agent chat context variables.

In addition, you can also pass an optional *NowChatConfiguration* parameter when starting a chat session to modify some of the behavior of NowChat.

- *closePrompt*: Prompt text that appears before exiting a chat window. You define this prompt text through the following parameters:
  - *header*: Nullable string value that appears on the prompt's header.
  - *message*: String value that appears on the prompt's main body.
  - *acceptButtonTitle*: String value that appears on the primary button of the prompt. This button closes the chat window.
  - *declineButtonTitle*: String value that appears on the secondary button of the prompt. This button dismisses the prompt without closing the chat window.
- *disabledFeatures*: List of NowChat features to disable. Refer to the *NowChatConfiguration.Feature* enum class for the list of features that you can disable.
- *conversationOptions*: List of conversation options to apply to NowChat. Refer to the *NowChatConvestation.ConversationOption* enum class for the list of options that you can apply.
- *uiConfiguration*: UIConfiguration value used to configure UI components in NowChat.

The following code example shows how to call this method:

```
// Close Button Type
func closeButtonText(title: String?) ->
 NowChatConfiguration.CloseButtonType? {
 guard let title else { return nil }
 return .text(title)
}
func closeButtonImage(name imageName: String?) ->
 NowChatConfiguration.CloseButtonType? {
  guard let imageName,
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let buttonImage = UIImage(named: imageName) else { return
 nil }
  return .image(buttonImage)
}

// Create the chat UI
func makeChatScreen() -> UIViewController? {
  guard let chatService = chatService else { return nil }
  let closePrompt = NowChatConfiguration.ClosePrompt(header:
 "Close Window",
    message: "Are you sure you want to close the chat window?",
    acceptButtonTitle: "Yes",
    declineButtonTitle: "No")

  let attachmentUploadButton =
 NowChatConfiguration.AttachmentUploadButton(isVisible:
 false) // default isVisible = true

  let chatConfiguration = NowChatConfiguration(closePrompt:
 closePrompt,
    disabledFeatures: [.startNewConversation],
    conversationOptions:
 [.forceNewConversation, .endConversationOnExit],
    uiConfiguration:
 NowChatConfiguration.UIConfiguration(closeButton:
 closeButtonImage(name: "arrow.left"), attachmentUploadButton:
 attachmentUploadButton))

  let result = chatService.makeChatUI(theme:
 CarrascoChatTheme(chatColors: ChatColors()), chatConfiguration:
 chatConfiguration)

  switch result {
    case .success(let chatViewController):
      return chatViewController
    case .failure(let error):
      debugPrint("Chat screen creation failed with error:
 \(error)")
      return nil
  }
}

// Start the chat session
func startChat() {
  guard let chatService = chatService else {
    debugPrint("Chat service is invalid")
    viewState = makeViewState()
    return
  }
  chatService.startChat { [weak self] result in
    if case .failure(let error) = result {
      debugPrint("Chat session initialization failed with error:
 \(error)")
      self?.resetChat()
    }
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 }

// Initialize the chat service
private func initializeChatService() {
  NowChat.makeChatService(instanceUrl: instanceUrl, delegate:
 self) { [weak self] result in
    guard let self = self else { return }
    switch result {
      case .success(let service):
        self.chatService = service
      case .failure(let error):
        debugPrint("Creating the chat service failed with error:
 \(error)")
    }
    self.viewState = self.makeViewState()
  }
}
```

Embed an AI voice agent with NowVoice

Use the NowVoice module to embed a real-time AI voice agent session into your iOS application.

NowVoice features

NowVoice gives your app a complete, ready-to-present voice agent UI. When a user starts a voice agent session, the SDK:

- Authenticates against your ServiceNow instance using the token your app provides.
- Opens a WebSocket connection to the configured voice agent endpoint.
- Renders a full-screen native SwiftUI view with microphone controls and a live transcript.
- Delivers real-time transcript messages and mute-state changes to your app through callbacks.
- Shows an optional post-call transcript summary screen on session end.

Theming

NowVoice integrates with the NowUI theming system. Pass any type conforming to `NowVoiceThemeable` to apply custom colors. `NowVoiceDefaultTheme` is provided as a default.

NowChat integration

If your app uses NowChat, you can enable NowVoice in the chat interface. Set `NowChatConfiguration` properties to configure voice within the NowChat UI and add a voice button. Tapping it launches the voice agent UI as a full-screen overlay within the chat flow.

Mobile SDK instance settings

The NowVoice module reads the following keys from your ServiceNow instance's Mobile SDK settings response.

```
{
  "sdk": {
    "voice": {
      "enabled": true,
      "configurations": [
        {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          "voiceServiceId": "String",
          "voiceWebhookURL": "String",
          "mobileChannelType": "String",
          "mobileChannelId": "String"
        }
      ]
    }
  }
}
```

Configure NowVoice

Configure NowVoice to add a real-time voice agent to your iOS application.

Before you begin

Role required: admin

- Mobile SDK 2.22.0 or later must be added to your Xcode project via Swift Package Manager.
- Your ServiceNow instance must have voice agent services enabled. Confirm that `sdk.voice.enabled` is `true` in the Mobile SDK settings.

Procedure

1. Add microphone usage description.
   Add the `NSMicrophoneUsageDescription` key to your app's `Info.plist`:

   Example

   ```
   <key>NSMicrophoneUsageDescription</key>
   <string>This app uses your microphone to communicate with the
    ServiceNow voice agent.</string>
   ```

   Note: Omitting this key can cause iOS to crash the app when the voice session begins.

2. Configure NowSDK.
   If you have not already done so, configure NowSDK once at app launch. NowVoice requires NowSDK to be configured before any voice operations.

   a. Call `NowSDK.configure(with:)`.

   Example

   ```
   import NowSDK

   try NowSDK.configure(with: NowSDKConfiguration(
       authorizationProvider: self,
       permissionDelegate: self,
       logLevel: .error
   ))
   ```

   b. Implement `NowSDKAuthorizationProviding` to supply OAuth tokens for your instance.

   Example

   ```
   func requestAuthorization(for instanceUrl: URL, completion:
    @escaping ([AuthorizationToken]?) -> Void) {
       // Retrieve and return your OAuth tokens here.
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    completion(yourTokens)
}
```

c. Implement `DevicePermissionDelegate` to allow microphone access.

Example

```
func canRequestPermission(_ permission: DevicePermission) ->
 Bool {
    return true
}
```

3. Create a NowVoiceService.
Import NowVoice and call `makeVoiceService(instanceUrl:)` with the URL of your ServiceNow instance. This is an async function; call it from an async context or a Task.

Example

```
import NowVoice

let instanceUrl = URL(string:
 "https://your-instance.service-now.com")!

do {
    let voiceService = try await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)
} catch {
    // Handle NowServiceError
    print("Failed to create voice service: \(error)")
}
```

4. Select a voice endpoint.
Use `NowVoiceService.configurations` to retrieve the available voice endpoints. In most apps, there is a single endpoint.

Example

```
guard let endpoint = voiceService.configurations.first else {
    // No voice endpoints configured on this instance.
    return
}
```

5. Launch the voice UI.
Call `startVoice(endpoint:uiConfiguration:callbacks:theme:)` to obtain a `UIViewController` with the voice agent UI. Present it full-screen.

Example

```
let vc = try await voiceService.startVoice(
    endpoint: endpoint,
    uiConfiguration: NowVoiceUIConfiguration(
        hidesPostCallTranscript: false,
        shouldBlockTranscriptSharing: false
    ),
    callbacks: NowVoiceCallbacks(
        onMuteStateChanged: { isMuted in
            // Update your UI to reflect the current mute
 state.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            print("Microphone muted: \(isMuted)")
        },
        onMessageReceived: { message in
            // Receive real-time transcript messages during the
 session.
            print("[\(message.role)]: \(message.content)")
        },
        onCallEnded: { conversationId, error,
 endedFromCallKitUI in
            // Called when the voice session ends.
            if let error {
                print("Session ended with error: \(error)")
            } else {
                print("Session complete. Conversation ID:
 \(conversationId ?? "unknown")")
            }
        },
        onCallMinimized: {
            // Called when the voice UI is minimized.
            print("Voice chat is minimized")
        }
    ),
    theme: NowVoiceDefaultTheme()
)

vc.modalPresentationStyle = .fullScreen
present(vc, animated: true)
```

Note: `startVoice()` fetches an OAuth access token automatically before launching the voice UI.

6. **Optional:** Apply a custom theme.
   To match the voice UI to your app's visual identity, create a type conforming to `NowVoiceThemeable` and pass it to `startVoice(endpoint:uiConfiguration:callbacks:theme:)` or `updateTheme(theme:)`.

   Example

```
struct MyVoiceTheme: NowVoiceThemeable {
    var color: NowUIColoring = MyAppColors()
}

// Apply at voice session launch
let vc = try await voiceService.startVoice(endpoint: endpoint,
 theme: MyVoiceTheme())

// Or update while a voice session is active
voiceService.updateTheme(theme: MyVoiceTheme())
```

7. **Optional:** Embed voice inside NowChat.
   If your app already uses NowChat, you can enable NowVoice in the chat interface. Pass the voice configuration directly to `NowChatConfiguration`. A voice button appears in the chat UI automatically when a valid voice endpoint is provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When using NowChat with voice, don't call `startVoice(endpoint:uiConfiguration:callbacks:theme:)` to launch the voice UI. NowChat manages the voice session lifecycle internally.

Example

```
import NowChat
import NowVoice

// voiceConfiguration is optional — omit it to have the SDK use
 instance settings automatically
let chatConfig = NowChatConfiguration(
    closePrompt: NowChatConfiguration.ClosePrompt(
        header: "Leave chat?",
        message: "Your conversation will end.",
        acceptButtonTitle: "Leave",
        declineButtonTitle: "Stay"
    ),
    disabledFeatures: [],
    conversationOptions: [.forceNewConversation],
    uiConfiguration: NowChatConfiguration.UIConfiguration(
        closeButton: .text("Close"),
        attachmentUploadButton: .init(isVisible: true),
        hideBranding: false
    ),
    voiceConfiguration: voiceService.configurations.first, //
 optional endpoint override
    voiceUIConfiguration: NowVoiceUIConfiguration(
        hidesPostCallTranscript: false,
        shouldBlockTranscriptSharing: false
    ),
    voiceCallbacks: NowVoiceCallbacks(
        onMuteStateChanged: { isMuted in
            print("Muted: \(isMuted)")
        },
        onMessageReceived: { message in
            print("Transcript: \(message)")
        },
        onCallEnded: { conversationId, error,
 endedFromCallKitUI in
            // Called when the embedded voice session ends
        },
        onCallMinimized: {
            // Called when the voice UI is minimized.
            print("Voice chat is minimized")
        }
    )
)

let chatVC = try await chatService.startChat(configuration:
 chatConfig)
present(chatVC, animated: true)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The voice agent UI is presented full-screen. The user can begin a real-time voice session with transcript and mute-state updates delivered to your app through the configured callbacks.

Example: Complete example

```
import NowSDK
import NowVoice

// --- App launch ---
try NowSDK.configure(with: NowSDKConfiguration(
    authorizationProvider: self,
    permissionDelegate: self
))

// --- When the user taps "Start Voice" ---
func startVoiceSession() async {
    let instanceUrl = URL(string:
 "https://your-instance.service-now.com")!

    do {
        let voiceService = try await
 NowVoice.makeVoiceService(instanceUrl: instanceUrl)

        guard let endpoint = voiceService.configurations.first
 else { return }

        let vc = try await voiceService.startVoice(
            endpoint: endpoint,
            callbacks: NowVoiceCallbacks(
                onMuteStateChanged: { [weak self] isMuted in
                    self?.updateMuteIndicator(isMuted: isMuted)
                },
                onMessageReceived: { [weak self] message in
                    self?.appendTranscript(message)
                },
                onCallEnded: { [weak self] _, error,
 endedFromCallKitUI in
                    self?.dismiss(animated: true)
                },
                onCallMinimized: {
                    // Called when the voice UI is minimized.
                    print("Voice chat is minimized")
                }
            )
        )
        vc.modalPresentationStyle = .fullScreen
        present(vc, animated: true)

    } catch let error as NowServiceError {
        handleServiceError(error)
    }
}
```

Interact with table data in a ServiceNow instance

The Mobile SDK enables you to interact with data in tables that reside on your ServiceNow instance. You can interact with this data through the ServiceNow REST `Table` API using the `NowTableService()` API that directly calls the REST interface, or through the `NowGraphQLService()` API that executes a specified GraphQL query against the REST `GraphQL` API.

If you want to return data from multiple tables within a single call, you will need to use the `NowGraphQLService()` API. If you need to interact with other ServiceNow REST APIs, see Interact with the public REST API on a ServiceNow instance.

Using NowGraphQLService to interact with ServiceNow tables

The NowGraphQLService class provides methods that enable you to construct and execute GraphQL queries on a specified table within your ServiceNow instance if the logged in user has the proper authorization. You can define all CRUD operations within your GraphQL query.

`NowGraphQLService` supports fetching results for a query by returning a completion handler:

```
func execute(_ query: GraphQLQuery, completion: @escaping
 (Result<Data, NowDataError>) → Void)
```

Through async/await:

```
func execute(_ query: GraphQLQuery) async throws -> Data
```

Or, a Combine publisher (which is currently deprecated):

```
func publisher(for query: GraphQlQuery) → AnyPublisher<Data,
 NowDataError>
```

The following example shows how to import the NowData framework and then initialize a NowGraphQLService object that you can then use to interact with tables in your ServiceNow instance.

```
// Import the NowData framework
import NowData

// Initialize a NowGraphQLService
// The makeGraphQLService completion handler returns a result
 that wraps
// the NowGraphQLService upon success or error.

private func initializeGraphQLService(instanceUrl: URL) {
  makeGraphQLService(instanceUrl: instanceUrl) { [weak self]
 result in
    switch result {
    case .success(let service):
      self?.graphQLService = service
    case .failure(let error):
      debugPrint("Creating GraphQL service failed with error:
 \(error.localizedDescription)")
      self?.graphQLService = nil
    }
  }
}
```

This example shows how to create an async function that fetches and publishes the most recently published KB articles.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
private func fetchArticles() async throws -> [Article] {
    guard let graphQLService = graphQLService else {
        throw ArticleListError.invalidGraphQLService
    }

    do {
        let data = try await
 graphQLService.execute(GraphQLQuery(query:
 recentlyPublishedQuery))
        let articles = try dataToArticleList(data)
    } catch let error as NowDataError {
        throw ArticleListError.fetchError(error)
    } catch {
        throw error
    }
}
private let recentlyPublishedQuery =
"""

{
  GlideRecord_Query {
    kb_knowledge(queryConditions:
 "active=true^ORDERBYpublishedDESC" pagination: { limit: 10,
 offset: 0 }) {
      _results {
        sys_id {
          value
        },
        number {
          displayValue
        },
        short_description {
          displayValue
        },
        author {
          displayValue
        }
        published {
          displayValue
        }
      }
    }
  }
}
"""
```

Using NowTableService to interact with ServiceNow tables

The NowTableService class provides methods to perform CRUD operations on the records in tables that reside on your ServiceNow instance. Through this interface you can directly access any of the records within any ServiceNow table for which the logged in user is authorized. *`NowTableService`* supports dot-walking for reference fields. For example, if a table contains a reference to the User table, the dot-walked value `user.name` returns the name of the user.

When returning the requested data, all applicable Access Control Lists (ACLs) are applied to the data, which may result in fewer results than expected, or authorization errors if the authenticated user does not have access rights to the specified table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Most *NowTableService* methods provide three implementations for returning results data. One that uses async/await, one that calls a completion handler with a *Result* enumeration, and one that returns a Combine publisher, which is currently deprecated.

For example, all *createRecord()* methods insert a constructed record into a specified table, however, the

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions, configuration: FieldReadConfiguration, completion: @escaping (Result<Data, NowDataError>)

method calls a completion handler with a *Result* enumeration (the `.success` case contains the results as its associated value).

The

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil) async throws

method performs an async/await function. While the

NowTableService - createRecord(with fields: [FieldName: FieldValue], in tableName: String, writeOptions: FieldWriteOptions? = nil, configuration: FieldReadConfiguration? = nil)

method returns a Combine publisher, but is currently deprecated.

In addition, *NowTableService* provides two different implementations of CRUD methods, one that returns raw data, and one that returns Codable models. For example, both the *update()* and *updateRecord()* methods update a specified record in a specified table, but the *update()* methods return a Codable model and the *updateRecord()* methods return raw data. In some cases, Codable methods might be preferable, as a strongly typed Codable structure provides more flexibility than a collection of raw data fields.

The following example shows how to import the *NowData* framework and then initialize a NowTableService object that you can then use to interact with ServiceNow instance tables.

```
// Import the NowData framework
import NowData

// Initialize a NowTableService
// The makeTableService completion handler returns a result that
 wraps
// the NowTableService upon success or error.

makeTableService(instanceUrl: instanceUrl) { [weak self] result
 in
  guard let self = self else { return }

  switch result {
  case .success(let tableService):
    debugPrint("Successfully created a table service
 \(tableService)")
    self.tableService = tableService
  case .failure(let error):
    debugPrint("Creating table service failed with error:
 \(error.localizedDescription)")
  }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For additional code examples using the available *NowTableService* methods, refer to the NowTableService class - iOS API documentation.

Configure return results data

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint, you can configure what data is passed back in the return results.

You configure what data to pass back using the FetchConfiguration structure. This structure enables you to configure:

- The specific records to return from a table.
- The specific fields to return from the records.
- The number of records to return.

Note: Generally you want to use the same FetchConfiguration for all of your CRUD operations for a certain model type as it determines which fields are returned. It should at least match the required properties on your model, or else JSON Decoding will fail.

Configuring the specific records to return

The Filter structure within a *FetchConfiguration* call enables you to filter and sort the records that are fetched from a ServiceNow instance and passed back in the return results from a REST endpoint. This filter is passed in the *sysparm_query* parameter of the REST API endpoint. For additional information, see Table API.

You can initialize the *Filter* structure in four different ways depending on the desired filtering capabilities:

1. Filter by encoded query encoded query. This type of filter enables you to pass an encoded query that is applied to the records within the specified table.

   For example, the following call only returns those records that are active and whose short description field contains the word "broken":

   ```
   Filter(query: "active=true^short_descriptionLIKEbroken"
   ```

   To use this type of filtering, initialize the *Filter* structure using the Filter - init(query: String, queryCategory: String? = nil) function.

2. Filter by criteria. This filter enables you to filter based on one or more filter criteria that are OR'd together.

   For example, a manager has an employee Abel Tuter who is on PTO. They want to know if there are active incidents that are not assigned to anyone or assigned to Abel Tuter so they can assign/reassign them. They also want to see in that same list, all of the incidents that have high or overdue escalation so that they can also address those. The following shows how to create the necessary filters to obtain this data:

   ```
   let activeIncidents = Condition.boolean(field:
    "active", .is(true))

   let assignedToEmpty = Condition.string(field:
    "assigned_to", .isEmpty)

   let assignedToAbel = Condition.string(field:
    "assigned_to", .is("Abel Tuter"))
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
let assignedToAbelOrEmpty =
 CompoundCondition.or([assignedToEmpty, assignedToAbel])

let needToReassign = Criteria(conditions: [activeIncidents,
 assignedToAbelOrEmpty])

let highEscelations = Condition.string(field:
 "escalation", .is("2"))

let overdueEscelations = Condition.string(field:
 "escalation", .is("3"))

let highORoverdueEscelations =
 CompoundCondition.or([highEscelations, overdueEscelations])

let needToHandleEscalation = Criteria(condition:
 highOrOverdueEscelations)

let myPrioritiesForTodayFilter = Filter(criteria:
 [needToReassign, needToHandleEscalation])
```

To use this type of filtering, initialize the *Filter* structure using the Filter - init(criteria criteriaList: [Criteria], sortBy: [Sort]? = nil, queryCategory: String? = nil) function.

3. Filter by keywords and conditions. This filter enables you to filter records based on specific keywords and conditions that are AND'd together.

   For example, the following filters for all records that contain the keyword "iOS13 or iOS 14" and meet the specified condition sorted by testField.

```
testKeywordsAndConditionsAndSort() {
  let keywords = "iOS 13 | iOS 14"
  let conditionA = Condition.boolean(field:
 testField, .is(true))
  let conditionB = Condition.boolean(field:
 testField2, .is(false))
  let sortA = Sort.asc(testField)
  let filter = Filter(keywords: keywords, conditions:
 [conditionA, conditionB], sortBy: [sortA])

  XCTAssertEqual(filter.query,
 "123TEXTQUERY321=\(keywords)^\(conditionA.query)^\(conditionB.
query)^EQ^\(sortA.query)")
}
```

   To use this type of filtering, initialize the *Filter* structure using the Filter - init(keywords: String? = nil, conditions: [Condition], sortBy: [Sort]? = nil) function.

4. Filter by conditions. This filter enables you to filter records that meet all specified conditions (AND'd together).

   For example, the following filters for all records in which the Active field is "true" and the date value of the SLA due field is on "today" or any date after today.

```
// Where the record is active
let condition1 = Condition.boolean(field: "active", .is(true))
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// AND the date value of the SLA due field is on "today" or any
 date after today.
let condition2 = Condition.dateTime(field:
 "sla_due", .atOrAfter(0, .daysAgoStart))

let filter = Filter(conditions: [condition1, condition2])
```

To use this type of filtering, initialize the *Filter* structure using the Filter - init(conditions: [QueryProviding], sorts: [Sort]? = nil) function.

Configuring the specific fields to return

The FieldReadConfiguration structure - iOS within the *FetchConfiguration* method call allows you to configure what fields to pass back in the return results. In addition, you can configure the format/content of the returned fields as:

- display values
- actual values
- exclude reference links

Note: Configuring the fields to match a Codable model may reduce the payload returned by the ServiceNow instance, improving network efficiency by reducing data transfer.

Configure field write options

Within the Mobile SDK, when writing data to a ServiceNow instance through a REST endpoint, you can define field write options.

You configure field write options using the FieldWriteOptions class - iOS structure. This structure enables you to configure:

- Whether to suppress automatic generation of system fields.
- Whether to set field values using their display value display value rather than their actual value.

Paginate return results record sets

Within the Mobile SDK, when interacting with data from a ServiceNow instance through a REST endpoint using the *NowTableService*, you can create a Paginator object that enables you to iterate over the records in the return results.

You typically use paginated return results to provide infinite scroll capabilities for table records presented inside a UITableView, a UICollectionView (UIKit), or a List (SwiftUI), or to simplify page iteration of results in general.

The *NowTableService* class provides two methods for creating a Paginator object that contains the return results from a REST endpoint call:

- NowTableService - paginator(from tableName: String, configuration: FetchConfiguration? = nil)

  This method creates a Paginator object that contains the specified records from the specified table. If you do not include the FetchConfiguration object, it contains all records and their associated fields in the return results. This method returns raw data.

- NowTableService - paginator<Model: Decodable>(from tableName: String, path: String = Constants.resultPath, coder: Coder = .default, configuration: FetchConfiguration? = nil)

  This method creates a Paginator object that contains the specified records from the specified table. If you do not include the FetchConfiguration object, it contains all records and their

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

associated fields in the return results. This method returns Codable models and enables you to define a custom `Coder` for Codable models that require custom decoding. You can supply a custom `JSONDecoder` by supplying a `NowData.Coder.custom` enumeration value that contains the custom `JSONDecoder` and `JSONEncoder`.

The paginator type is determined by the Generics and the compiler type inference.

In the following example, the compiler infers that `service.paginator(...)` returns a paginator of type `Paginator<[User]>`, a paginator that publishes a collection of users, such as, Codable User structures, through its Combine publisher.

```
let paginator: Paginator<[User]> = service.paginator(from:
 "sys_user", path: "result")
```

After obtaining a Paginator object, subscribe to its publisher to start receiving data.

```
paginator.publisher
  .subscribe(on: DispatchQueue.global())
  .receive(on: DispatchQueue.main)
  .sink { ... }
  .store(in: &subscriptions)
```

The returned Paginator object provides the following methods that enable you to page through the returned records:

- *`first()`*
- *`last()`*
- *`next()`*
- *`previous()`*
- *`reset()`*

Note: Some *`Paginator`* methods may throw an exception, such as when there are no more pages to fetch.

In addition, the Paginator object provides properties that enable you to obtain insights into the paginated data. For additional details on these properties and the available methods, see Paginator API - iOS.

Transform data

The *`NowData`* framework provides the ability to easily transform data into records.

Using the NowRecord convenience structure, which contains the properties `sysId` and `fields`, you can easily transform data into a record. Whenever you obtain a `Data` wrapping `Result` or `Publisher`, you can easily transform it into a `NowRecord` wrapping `Result` or `Publisher` using the *`convertToRecord()`* and *`convertToRecords()`* methods. For additional information, see NowTableService class - iOS.

Note: While *`NowRecord`* makes it very easy to quickly obtain data, depending on your use case, the Codable methods might be preferable as a strongly typed Codable structure provides more flexibility than a collection of "any" fields.

Interact with the public REST API on a ServiceNow instance

The Mobile SDK provides functionality that enables iOS applications to call the public REST API on a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the NowAPIService API you can interact with any of the base ServiceNow public REST APIs, or create custom REST APIs within the instance and call those from your iOS application.

Retrieve attachments and attachment metadata

The *NowAttachmentService* API enables you to perform CRUD operations on attachments and retrieve attachment metadata from your ServiceNow instance.

Using this API you can:

- Upload attachments to your ServiceNow instance and associated them to a specific record.
- Download one or more attachments.
- Delete attachments.
- Validate an attachment by comparing the computed hash of the attachment to the expected hash.
- Download attachment metadata. This metadata is generated by your ServiceNow instance when an attachment is uploaded.

For additional information on working with attachments, see Attachment API.

All NowAttachmentService methods provide three implementations for returning results data. One that calls a completion handler with the return results, one that preforms an async/await, and another that returns a Combine publisher (deprecated). For example, each *upload()* method uploads and associates a specified attachment to a specified record. However, the NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate, completion: @escaping (Result<NowAttachmentMetadata, NowDataError>)) method calls a completion handler with the return results, the NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate) async throws method performs an async/await, and the NowAttachmentService - upload(data: Data, configuration: NowAttachmentUploadConfiguration, progressUpdate: @escaping ProgressUpdate) method returns a Combine publisher.

Before you are able to use the *NowAttachmentService* API, you must import *NowData* and then initialize a NowAttachmentService object.

```
// Import the NowData framework
import NowData

func makeAttachmentService(instanceUrl: URL,
  completion: @escaping ((Result<NowAttachmentService,
 NowServiceErrors>) → Void))
```

Attachment metadata pagination

You can use the *NowAttachmentService* methods to download attachment metadata for one or more attachments. When downloading metadata from multiple attachments, you may want to use the NowAttachmentService - attachmentMetadataPaginator(filter: Filter, limit: Int) method, which returns a Paginator object that enables you to easily iterate over the potentially large amount of data that is returned. You typically use paginated return results to provide infinite scroll capabilities for data presented inside a UITableView, a UICollectionView (UIKit), or a List (SwiftUI), or to simplify page iteration of results in general.

After obtaining a Paginator object, subscribe to its publisher to start receiving data.

```
paginator.publisher
  .subscribe(on: DispatchQueue.global())
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .receive(on: DispatchQueue.main)
  .sink { ... }
  .store(in: &subscriptions)
```

The returned Paginator object provides the following methods that enable you to page through the returned records:

- *first()*
- *last()*
- *next()*
- *previous()*
- *reset()*

Note: Some *Paginator* methods may throw an exception, such as when there are no more pages to fetch.

In addition, the Paginator object provides properties that enable you to obtain insights into the paginated data. For additional details on these properties and the available methods, see Paginator API - iOS.

Display web pages hosted on your ServiceNow instance

You can display web pages hosted within your ServiceNow instance in your native iOS application.

The Mobile SDK provides seamless handling of the required authentication and session management, while the NowWebService API provides the functionality required to handle pages residing on your ServiceNow instance. These web pages have all the dynamic interactions that are possible on the ServiceNow platform.

When the webview is requested to load a web page hosted on a ServiceNow instance, it creates an HTTP request with the appropriate bearer header containing the OAuth access token provided by the NowSDK. When the instance receives this request, it starts a new user session and returns cookies related to that session. As the user interacts with the web pages in the webview, the instance uses the cookies to validate that the session is still valid. At this point, the bearer header is no longer relevant, only the cookies are used for session validation. The web session expires if the user stops interacting with the website for longer than the timeout period. After the session expires, if the user tries to interact with the web page, they are automatically redirected to the login page. The NowWebViewController detects the redirection and attempts to start a new web session by requesting a refreshed access token from the NowSDK and using the token to create a HTTP request (with bearer header) for the last known loaded page.

To use these features, you must first create an instance of the *NowWebService*. To do this you must call the *makeWebService()* method and provide the URL to your ServiceNow instance and an already initialized NowSDK. In addition, you must have imported NowWeb within your application. You should hold a reference to the *NowWebService* for as long as you are using the NowWeb service.

The following shows an example of how to create a NowWebService object using async/await:

```
do {
    let service = try await NowWeb.makeWebService(instanceUrl:
 instanceUrl)
    self.webService = service
} catch {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    debugPrint("Web Service creation failed with error:
 \(error.localizedDescription)")
}
```

The following shows an example of how to create a NowWebService object using a completion handler:

```
import Combine
import NowWeb
import UIKit
...
public func makeWebService(instanceUrl: URL,
  completion: @escaping ((Result<NowWeb.NowWebService,
 NowSDK.NowServiceError>) -> Void))
```

Pre-load pages to improve NowWeb load time

You can pre-load pages with cacheable resources in the background to improve initial *NowWeb* load times. The following example shows how to use the *webService.preloadWebCache()* function to pre-load specified pages.

```
private func preloadURLs(urls: [URL]) {
  guard let webService = webService else {
    debugPrint("Web service not initialized")
    return
  }
  do {
       try webService.preloadWebCache(urls: urls) {
         debugPrint("URLs did complete preloading")
       }

  } catch {
      debugPrint(error.localizedDescription)
  }
}
```

Create views to display web content

Once you have instantiated an instance of NowWebService, you can use it to create views to display web pages hosted on your ServiceNow instance.

The following example shows how to create a NowWebViewController view:

```
let result = webService.makeWebViewController(for: url,
  delegate: self, theme: MyWebTheme(nowUITheme: MyUITheme()))
switch result {
case .success(let viewController):
  return viewController
case .failure(let error):
  debugPrint("Web view creation failed with error:
 \(error.localizedDescription)")
}
```

In this example, *url* is the URL of the initial page to load within the view. This URL must point to a page that is hosted on the specified ServiceNow instance. Relative URLs also work and are relative to the ServiceNow instance targeted by the NowWebService.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once created, you can push the NowWebViewController onto an existing navigation stack. The initial page is not loaded until you call the loadPage() method.

Theme the web user interface

You can customize the colors of the web UI by passing a theme object in the `makeWebViewController()` call. For a list of all of the elements that you can customize, see NowWebColoring protocol - iOS. By default, the web UI uses the NowUIColor theme for all NowSDK UI elements. Refer to the NowWebThemeable protocol - iOS for sample code snippets on how to apply a theme to your web UI.

Configure push notifications

Push notifications enable the sending of unsolicited messages (notifications) from a ServiceNow instance to a specific registered user and an application that leverages the ServiceNow Mobile SDK framework.

You must set up push notifications on both your ServiceNow instance and within the application that will receive the notifications.

Note: For the current release, only the Virtual Agent service supports the receipt of push notifications.

Setting up push notifications on your ServiceNow instance

For each Mobile SDK application that incorporates the Virtual Agent service and leverages push notifications, you must complete the following configuration process on your ServiceNow instance.

- Generate and retrieve an iOS push certificate.
- Add a push application record in the Push Application [sys_push_application] table.
- Add a push notification message content record in the Push Notification Message Content [sys_push_notif_msg_content] table.
- Add a default push registration.
- Add a push notification message in the Push Notification Message [sys_push_notif_msg] table.
- Modify the push notification record in the Notification [sysevent_email_action] table.

Generate and retrieve an iOS push certificate

You must retrieve your unique iOS push certificate from your Apple Developer account so that you can associate it to your Mobile SDK applications that leverage push notifications.

Before you begin

Role required: admin

You must already have an Apple Developer account set up. For information on how to create an Apple Developer account and download the corresponding SDK, refer to the Apple Developer website.

Procedure

1. From your Apple Developer account, select **Identifiers**, and then select your application's bundle ID from the displayed list.
   A screen similar to the following appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select the **Push Notifications** check box and then select **Edit**.
3. Using the instructions provided by Apple, create a production SSL certificate.
4. Once created, double-click the downloaded certificate, which saves it to the KeyChain Access application.
5. From your Applications folder, open the Keychain Access application, and locate the certificate that you created.
6. Right-click the certificate and then select the **Export** option.

7. Ensure that the **File Format** field is set to `Personal Information Exchange (.p12)`.
8. Enter a secure password for the certificate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a push certificate record

After generating your iOS push certificate, you must save the push certificate record to your instance. The push certificate is stored in the X.509 Certificate [sys_certificate] table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. In the search field, select **Name** and enter `sys_certificate`.
3. Open the X.509 Certificate [sys_certificate] table.
4. Create a certificate record by selecting the **New** button.
5. Add the Personal Information Exchange (.p12) certificate that you exported in Generate and retrieve an iOS push certificate to the certificate record as an attachment.

   a. In the upper-right corner, select the attachment icon.

   b. In the **Name** field, enter a name for the certificate.
   You can enter any name that clearly identifies the purpose of the certificate to other team members.

   c. In the **Type** field, enter or select `PKCS12 Key Store`.

   d. In the **Notify on expiration** field, select the person to receive a notification when the certificate is about to expire.

   e. In the **Warn in days to expire** field, enter the number of days prior to when the certificate is scheduled to expire, to send a notification about the expiration.

   f. In the **Key store password** field, enter the password that you used when exporting the certificate from the keychain.

   g. At the bottom left-corner of the form, select the **ValidateStores/Certificates** link.
   The system validates the attached certificate.

   h. After the certificate validation is confirmed, select **Update** to submit the form.

Add a push application record

You must create a push application record and enter your Apple Push Notification certificate in that record to use push notifications in a Mobile SDK application that leverages Virtual Agent and push notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

This record is stored in the Push Application [sys_push_application] table.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Select **New** to add a new record.
3. In the **Display Name** and **Name** fields, enter the name of your application.
4. In the **Push** field, change the value from **REST API** to **Direct**.
5. In the **iOS** tab, select the search icon to the left of the **Certificate** field and select the certificate that you created.
6. Select **Submit**.

Add a default push registration

Register the push notification so that all users of your application receive the push notifications by default.

Before you begin
Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Application**.
2. Locate and open the push notification that you created earlier.
3. In the related list, select the **Push Default Registrations** tab, then select **New**.
4. In **Notification**, enter `Virtual Agent Message Push Notification`.

5. Select **Submit**.

Add a push notification message content record

The push notification message content record contains the location users are directed to when they tap on a notification, as well as the appearance and layout of the notification.

Before you begin
Role required: admin

Complete the Push Notification Message Content form to:

- Name the notification.
- Select the mobile application to which the notification is sent.
- Optionally, customize the appearance of the notification message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This information is saved in the Push Notification Message Contents [sys_push_notif_msg_content] table.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Message Content**.
2. Select **New**.
3. In the Push Message Content form, fill in the following fields:

Push Notification Message Content form

Field	Description
Name	Descriptive name of the push message content record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to send the notification to. This is the application that you added in "Add a push application record".

Push Message Generation	Script block that contains the notification link. To implement push notifications in a Mobile SDK Virtual Agent application, use the following script:
	`(function buildJSON(/*GlideRecord*/ current, /*String*/ message, /*Object*/ attributes) {`
	
	`var json = {`
	`"aps": {`
	`"alert": {`
	`"title": current.push_title,`
	`"body":`
	`sn_cs.VASystemObject.getTextValueForMessage(current.message_id)`
	`},`
	`"sound": "default",`
	`"thread-id": "launch_virtual_agent"`
	`},`
	`"type": "launch_virtual_agent"`
	`};`
	
	`return json;`
	
	`})(current, message, attributes);`

4. Select **Submit**.

Add a push notification message

Configure the message displayed to users when they receive their push notification.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Notification** > **Push** > **Push Messages**.
2. Select **New**.
3. In the Push Message form, fill in the following fields:

Push Message form

Field	Description
Name	Descriptive name for the push notification message record. **Note:** This name is not visible in the notification, it is only a reference for use during configuration.
Push app	Mobile application to which you want to send the notification. This is the application that you added in "Add a push application record".
Push message	Push notification message content record created in "Add a push notification message content record".
Table	Table the message originates from. Select `Push Notification [sys_cs_message_notification]`.

4. Select **Submit** to create the record.

Modify the push notification

Modify the Virtual Agent Message Push Notification record to include your application. This record is used to trigger notifications to the Virtual Agent. All applications that will push notifications to the Virtual Agent must be configured in this record.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Notification** > **Push** > **Push Notifications**.
2. Locate and open the push notification "Virtual Agent Message Push Notification".
   Ensure that the layout is set to the Advanced view. If not, switch to the Advanced view by selecting the associated link under **Related Links**.
3. Select the **What it will contain** tab.
4. In **Push Messages**, add the name of the push message record created in "Add a push notification message".

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Update**.

Setting up push notifications in your iOS application

In addition to the tasks that you must perform on your ServiceNow instance to configure a push notification, you must also include specific code in your iOS application.

Create the NowSDK NowPushService

One of the first things that needs to be done in your application is to create a `NowPushService`. The `NowPush` SDK provides a factory function to create this service. Add code similar to the following snippet early within your main code body.

```
func setup(with instanceURL: URL) -> AnyPublisher<NowService,
 ConfigurationError> {
  NowPush.makePushService(instanceUrl: instanceURL)
    .mapError { .sdkError($0) }
    .map { $0 as NowService }
    .eraseToAnyPublisher()
}
```

For additional information on the *`NowPush.makePushService()`* method, refer to NowPush API - iOS.

Register the push token

Apple provides a unique push notification token that identifies the device and application to receive push notifications. In order for an application to receive push notification, you must register this token using the `NowPushService`. Add a function similar to the following code snippet in your iOS application. This application must be registered with your ServiceNow instance.

```
func registerForPushNotifications(deviceToken: Data) {
  pushService.registerPushToken(deviceToken,
      pushAppName: "TestPushApp", // Modify this to be your iOS
 application name
      environment: environment) { [weak self] result in
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    guard let self = self else { return }
    switch result {
    case .success:
      UserDefaults.standard.set(true, forKey:
 "pushNotificationsRegistered")
      self.pushRegistrationState = .registrationSuccess
    case .failure:
      UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
      self.pushRegistrationState = .registrationFailed
    }
  }
}
```

For additional information on the *registerPushToken()* method, refer to NowPushService - registerPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void).

Unregister the push token

You need to unregister a push token whenever the user exits your application, such as when the user logs out. Use code similar to the following code snippet to unregister a push token. Ensure that you change *pushAppName* to the name of your iOS application.

```
func unregisterFromPushNotifications(deviceToken: Data) {
  pushService.unregisterPushToken(deviceToken, pushAppName:
 "TestPushApp", environment: environment) { [weak self] result
 in
    guard let self = self else { return }
    switch result {
    case .success:
      UserDefaults.standard.set(false, forKey:
 "pushNotificationsRegistered")
      self.pushRegistrationState = .unregisterSuccess
    case .failure:
      self.pushRegistrationState = .unregisterFailed
    }
  }
}
```

For additional information on the *unregisterPushToken()* method, refer to NowPushService - unregisterPushToken(_token: Data, pushAppName: String, environment: NowPushEnvironment, completion: @escaping (Result<Data, NowPushError>) -> Void).

Parse push payload

You will need to parse push notification payloads into a `NowPushPayload` object to collect information and to use the data in other parts of the application. Currently, this is only available for Virtual Agent push notifications. Use code similar to the following

```
func userNotificationCenter(_ center: UNUserNotificationCenter,
    didReceive response: UNNotificationResponse,
    withCompletionHandler completionHandler: @escaping () ->
 Void) {
  guard let pushService = pushService else {
    completionHandler()
    return
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  let userInfo = response.notification.request.content.userInfo
  _ = pushService.payloadFromUserInfo(userInfo)
    .flatMap(handleNowPushPayload)
}

func handleNowPushPayload(_ payload: NowPushPayload) ->
 Result<Void, NowPushError> {
  guard payload is NowPushVirtualAgent else {
    return .failure(NowPushError.unsupportedData)
  }
  launchVirtualAgent()
  return .success(())
}
```

Work with coders and Codable models

The iOS implementation of the Mobile SDK provides the additional functionality of coders and Codable models.

Coder enumeration

The `Coder` enumeration wraps a `JSONEncoder` with an accompanying `JSONDecoder` so that both provide the same coding strategy. Since many of the NowData framework APIs that handle Codable models rely on coding and decoding from JSON, the `Coder` simplifies and standardizes the way to specify encoders and decoders. Typically, using the default `Coder` (`.default`), which encodes and decodes dates using the `nonISO8601UTC` date formatting, is sufficient. The `DateFormatter.nonISO8601UTC` is a static date formatter provided by the NowData framework. It is responsible for encoding and decoding dates that were stored by the ServiceNow platform in the UTC (GMT+0) time zone, and are used by the *`Table`* API in `yyyy-MM-dd HH:MM:SS` format, by taking a device's locale and time zone into consideration.

If custom JSON coding is required, such as when handling specific date formats, you can create a custom `Coder` by supplying the custom `JSONEncoder` and `JSONDecoder` as the custom Coder's associated types. Both the encoder and decoder must use the same coding strategy.

For example:

```
let myEncoder = JSONEncoder()
myEncoder.dateEncodingStrategy = .formatted(.nonISO8601UTC)
let myDecoder = JSONDecoder()
myDecoder.dateDecodingStrategy = .formatted(.nonISO8601UTC)

let myCoder: Coder = .custom(myEncoder, myDecoder)
```

Codable extension for nested structures

The NowData framework provides functionality to decode nested structures by dot-separated path. This functionality makes it easier to consume nested data by removing the necessity of using wrapper structure and nested JSON decoding.

Archive your application for publishing

It is important to disable **rebuild from bitcode** when archiving your application for publication for release.

To disable rebuild from bitcode, either set **ENABLE_BITCODE** to NO in your project settings or clear the **Rebuild from Bitcode** check box when using Xcode to distribute your application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use NowUIColoring to create themes

Use *NowUIColoring* to create themes with *NowWebThemeable*, *NowChatThemeable*, and *NowVoiceThemeable*. The *NowUIColoring* interface contains all the colors used by all NowSDK modules.

For scenarios where you use similar color variables across multiple SDK modules, you can implement the *NowUIColoring* interface. Using this interface you can override color values and then use that implementation to override the *NowUIColoring* values inside the theme classes NowWebThemeable, NowChatThemeable, and NowVoiceThemeable. If color variables aren't overridden, the *NowUIColoring* interface uses the default colors.

NowWebThemeable contains specific colors that only pertain to NowWeb, *NowChatThemeable* contains specific colors that only pertain to NowChat, and *NowVoiceThemeable* contains specific colors that only pertain to NowVoice. Common colors are defined by *NowUIColoring*. *NowUIColoring* also contains all the default colors.

The default colors use the Coral theme (light).

Producer Event Notification Framework developer guide

The Producer Event Notification Framework for Telecommunications, Media, and Technology enables the external distribution of events, such as trouble tickets, using a message-bus implemented in your network.

The Producer Event Notification Framework supports two different message-bus use cases:

1. Publishing events through the Hermes Messaging Service: If you plan to publish events using Hermes Kafka, you must configure the Producer Event Notification Framework for the Kafka message-bus. You can only use this message-bus for cloud-based instances. For details, see Configure the Producer Event Notification Framework to use the Hermes Messaging Service.

   For additional information on how to publish trouble ticket notifications using Hermes, see Producing outbound API notifications using Hermes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Before you are able to implement this use case, you must already have the Hermes Messaging Service installed and configured on your instance. For details, see Hermes Messaging Service.

2. Publishing events through the open message bus: If your instance uses a custom message-bus, you must configure the Producer Event Notification Framework to use the open message bus to send events from your ServiceNow instance to consumers on your network. Both cloud-based and on-premise ServiceNow instances can publish events through the open message bus. For details, see Configure the Producer Event Notification Framework to use the Open Message Bus.

   For additional information on how to publish trouble ticket notifications using the open message bus, see Outbound trouble ticket notifications via open message bus.

This document describes the system configuration that must be performed, including the script includes that must be overridden to deploy these message-bus implementations in your ServiceNow ecosystem.

Producer system properties

The following table lists the properties within your ServiceNow instance that control the functionality of the Producer Event Notification Framework. Review the default values of these properties and if necessary, modify them for your specific implementation. To modify these properties, in the ServiceNow UI go to **All** > **System Properties** > **All Properties**.

Property	Description
sn_api_notif_mgmt.event.log	Level of logging to written to the debug logs. Valid values: • alert • crit • debug • emerg • err • info • notice • warning Default: err
sn_api_notif_mgmt.glide.mutex.script.maxspins	Maximum number of attempts to acquire a mutex lock on the records in the inbound queue. Default: 100
sn_api_notif_mgmt.glide.mutex.script.spinwait	Time to wait between attempts to acquire a lock on the records in the inbound queue. Unit: Milliseconds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Default: 100
sn_api_notif_mgmt.inboundqueue.batch.limit	Number of records that the scheduler will pull and process from the inbound queue at one time (one batch). Default: 200
sn_api_notif_mgmt. inboundqueue.maxrecords	Maximum number of records that the scheduler will pull from the inbound queue for one scheduler run. This value is used in conjunction with the *sn_api_notif_mgmt.inboundqueue.batch.limit* parameter. For example, if the batch limit is set to 50 and the maxrecords is set to 200, and the number of records that are in the inbound queue is 130, the scheduler would pull three different batches of records in a single run; two with 50 records and one with 30 records. If the number of records in the inbound queue is 220, the scheduler would pull four batches of 50 records and the remaining 20 records would not be processed until the next time the scheduler runs. When setting this value, you must also consider the time that it will take for the scheduler to process multiple batches and set the *sn_api_notif_mgmt.schedule.max.runtime* value accordingly. Default: 200
sn_api_notif_mgmt. publisher_message_bus_configuration	Defines whether messages are published using the Hermes Messaging Service, the open message bus, or both message buses. Valid values: • hermes = Hermes Messaging Service • openMessageBus = open message bus • both = Event/message is sent out on both message buses. Default: openMessageBus
sn_api_notif_mgmt.schedule.max.runtime	Max time that a schedule job can run before it fails and reports an error. Unit: Milliseconds Default: 90,000

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create outbound Order Management notifications using the open message bus

Learn how to produce an outbound notification from a ServiceNow® instance using the open message bus. Customers can consume the details of the notification from the message bus in their external system.

Introduction to outbound order management notifications

In this event-driven architecture, notifications are produced to the open message bus from your ServiceNow® instance. The framework contains topic synchronization and topic picker mechanisms. The topic synchronization mechanism synchronizes the topics that you have created in the instance containing the open message bus. When the event occurs in the framework, the topic picker mechanism picks the relevant topic and publishes the message to the topic using a REST proxy. Customers can consume the outbound notification from the message bus in their external system.

Supported Order Management events

The following events are supported for Order management notification.

Product Order Management:

1. CancelProductOrderCreateEvent
2. CancelProductOrderStateChangeEvent
3. ProductOrderCreateEvent
4. ProductOrderDeleteEvent
5. ProductOrderJeoperdyAlertEvent
6. ProductOrderStateChangeEvent

Service Order Management:

1. CancelServiceOrderCreateEvent
2. CancelServiceOrderStateChangeEvent
3. ServiceOrderCreateEvent
4. ServiceOrderDeleteEvent
5. ServiceOrderJeoperdyAlertEvent
6. ServiceOrderStateChangeEvent

Prerequisites

Before producing outbound notifications, it's necessary to create the egress topics in the Topic [sn_api_notif_mgmt_topic] table in the ServiceNow® instance. When you create an egress topic, the system runs a business rule and attempts to synchronize the topic to the message bus based on configuration. To learn more about manually creating a topic in the Topic table, see Create a topic. The system synchronizes only the egress topic with the message bus in the external system. The `user_created` field in the associated topic record is set to `true`.

Alternatively, you can create the topics on the message bus in your external system and push them into the Topic table in ServiceNow® instance. To do this, invoke the Event Management Topic Open API endpoint, which stores the topic in the Topic [sn_api_notif_mgmt_topic] table of the instance. The user_created field in the associated topic record is set to false.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a business rule for a new Order Management event

Learn how to configure business rules on a ServiceNow® instance to recognize new Order Management events and push them into the notification system.

When you want ServiceNow® to notify external systems about a new type of order event, you must create a business rule. The business rule captures the event (like creating a new order) and pushes a snapshot of the order record into the Inbound Queue [sn_tmt_core_inbound_queue] table. The Producer Notification Framework then processes this queue and sends out the appropriate notification. You need to specify the event type in your business rule code (event must be unique).

Supported business rules

The following business rules supported for Order Management notifications.

Product Order Management:

1. Trigger Cancel ProductOrder Create Event
2. Trigger cancelProductOrderStateChange
3. Trigger Product Order Create Event
4. Trigger Product Order Delete Event
5. Trigger product order jeopardy event
6. Trigger Product Order State Change Event

Service Order Management:

1. Trigger Cancel Service Order Event
2. Trigger cancelServiceOrderStateChange
3. Trigger Service Order Create Event
4. Trigger Service Order Delete Event
5. Trigger service order jeopardy event
6. Trigger Service Order State Change Event

Example

The following code example adds a business rule for processing the ProductOrderCreateEvent order notification event on the Customer Order [sn_ind_tmt_orm_order] table. When calling the *pushEventsToQueue()* method to push the event onto the inbound queue, you must pass the event type. The example below uses the ProductOrderCreateEvent event type. This event type can be any alphanumeric value that you want, but it must be unique because it is used by the system to determine how to process the order management event. The list of event types for the base system are defined in the Constants.EVENT_TYPES object in the Constants [sn_api_notif_mgmt.Constants] script include.

```
// Add following lines of code in script section (Advanced tab)
 of BR for pushing 'ProductOrderCreateEvent' to the inbound
 queue.
(function executeRule(current, previous /*null when async*/ ) {

// Note that event needs to be passed at BR level itself as
 after this step, we would be left with glide snapshot only.
new OrderNotificationUtilOOB().pushEventsToQueue(current,
 sn_api_notif_mgmt.Constants.EVENT_TYPES.PRODUCT_ORDER_CREATE);
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
})(current, previous)
```

Configure the Producer Event Notification Framework to use the Hermes Messaging Service

If you are using the Hermes Messaging Service in your instance, you must configure the Producer Event Notification Framework for the Kafka message-bus.

Before you begin

Role required: admin

The Hermes Messaging Service must be activated. For details, see Activating the Hermes Messaging Service.

The following code snippet shows the *HermesEventPublisher* methods that must be called to configure the elements needed to send a message to a topic using the Hermes Messaging Service. The ProducerV2 API is then called to send the message.

```
publishEventToHermesKafka: function(tmfEventPayload) {
  if (gs.nil(tmfEventPayload)) {
    return;
  }
  this.publishMessageThroughProducerV2API(tmfEventPayload)

},

publishMessageThroughProducerV2API: function(message) {
  if (gs.nil(message)) return;
  var comptableTopicSysIds =
 this.fetchTopicsForMessage(message);
  if (gs.nil(comptableTopicSysIds)) return;

  for (var i = 0; i < comptableTopicSysIds.length; i++) {
    var partitionKey = this.fetchPartionKey(message);
    var headers = this.fetchMessageHeaders(message)
    try {
      var producer = new sn_ih_kafka.ProducerV2();
      producer.send(comptableTopicSysIds[i], partitionKey,
 JSON.stringify(message), false, headers);
    } catch (ex) {
      this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
    }
  }
},
```

Procedure

1. Set up a secure connection to the Hermes Messaging Service.
   For details, see Set up a secure connection to the Hermes Messaging Service.
2. Override the default functionality in the HermesEventPublisherOOB - fetchTopicsForMessage(Object message) method with your custom topic picker logic when publishing a message to the Hermes Messaging Service.
   In the *HermesEventPublisher - fetchTopicsForMessage()* method, you must provide logic that determines which Kafka topic or topics to send a specified message to. You then return the sys_ids of those topic records in an array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can select a topic based on an attribute in the message payload or you can return the same topic for each message if your implementation only utilizes a single topic.

The following example shows how to return the same topic record sys_id for each passed message.

```
// Return the same topic for all messages if your
 // implementation only supports one kind of topic

fetchTopicsForMessage: function(message) {
// Return the same sys_id for all passed messages which
// implies that all of the messages are published to the same
 topic.
return ['91564fc087f8351063151f473cbb35f8'];
},
```

The following example shows how to identify topics to send a message to based on the event type in the message.

```
// Fetch the topic based on the message content.
// This could be based on the message domain type or the
 message event type.

fetchTopicsForMessage: function(message) {
// Implement to return topic based on a message content
// Implementor may decide a topic based on 'eventType' or any
 other attribute.

var eventType = message.eventType;

var topicSysIdsArr =
 this.fetchTopicBasedOnEventType(eventType);
return topicSysIdsArr

},
```

3. Override the default functionality in the HermesEventPublisherOOB - fetchPartionKey(Object message) method with your custom logic to return the partition key to use when publishing a message to the Hermes Messaging Service.
   The following list includes some possible types of partition keys to return and their associated benefits:
   - An auto-generated unique ID. This type of partition key ensures that messages are evenly published across topic partitions. This is the default implementation.
   - A unique key based on the message event type (or any other message attribute). This type of partition key ensures sequencing of messages of that event type (or other message attribute).
   - The same partition key, which causes messages to be sent on the same partition. This type of partition key ensures strict sequencing of messages at the Kafka consumer group level.

   The following example shows how to return a random ID for each partition key.

```
fetchPartionKey: function(message) {
// Implement it for custom partition key
// Random message keys ensure better distribution of message
 across partitions.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Same message keys ensure that message always goes to the
 same partition.
// This ensures strict sequencing of messages at the Kafka
 consumer group level.
return gs.generateGUID();
},
```

The following example shows how to return a partition key based on the event type in the message.

```
// Implementation where the partition key is decided based on
 the event type.
fetchPartionKey: function(message) {

var eventType = message.eventType;
var partionKey = fetchPartionKeyForMessage(eventType);
return partionKey;
},
```

4. Override the default functionality in the HermesEventPublisherOOB - fetchMessageHeaders(Object message) method with your custom logic to fetch the header for a specified message before publishing the message through the Hermes Messaging Service. Refer to the Apache Kafka documentation for more information on these headers.

   The following example shows how to return headers based on the event type in the message.

```
fetchMessageHeaders: function(message) {
// Returned headers are based on the event type passed in the
 message object.
  var eventType = message.eventType;
  var headerObject = fetchHeadersBasedOnEventType(eventType);
  return headerObject;
},
```

Configure the Producer Event Notification Framework to use the Open Message Bus

If you have deployed or plan to deploy the Open Message Bus in your instance, you must configure the Producer Event Notification Framework for this message-bus. You can deploy this message-bus for both cloud and on-premise instances.

Before you begin

Role required: admin

For additional information on the publishing of messages using the open message bus, see Outbound trouble ticket notifications via open message bus.

Procedure

1. Synchronize the topics in your current message-bus with your ServiceNow instance.

   For additional information on synchronizing topics, see Outbound trouble ticket notifications via open message bus.

2. Customize the OpenMessageBusEventPublisherOOB - publishMessageToComptibleRestProxy(Object tmfEventPayload, Array compatibleTopicArr) method to send messages directly to a preconfigured REST action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method is responsible for sending a message to the custom message platform's REST proxy using spoke selector. The custom message platform is your message-bus through which messages are published.

The following code example shows how to customize this method to use spoke selector flow and a custom action instead of a spoke selector.

```
publishMessageToComptibleRestProxy: function(tmfEventPayload,
 compatibleTopicArr) {

  if (gs.nil(tmfEventPayload) || gs.nil(compatibleTopicArr)) {
    return;
  }
  for (var i = 0; i < compatibleTopicArr.length; i++) {

    // Invoking spoke selector flow which will in turn pick the
 rest proxy based on the input condition
    var topicGr = new GlideRecord(Constants.TABLE_TOPIC);
    topicGr.get(compatibleTopicArr[i]);
    if (!topicGr.isValidRecord()) {
      this._logger.debug("Invalid topic sys_id passed
 to open message publisher. Sys_id passed is " +
 compatibleTopicArr[i]);
      return;
    }

    // NOTE THAT IN THIS IMPLEMENTATION INVOKES A CUSTOM ACTION
 INSTEAD OF SPOKE SELECTOR
    var restProxyResponse = new
 sn_appss.RequestAPI(spokeSelectorRequestTypeId,
 spokeSelectorRequestTypeInputMap,
 spokeSelectorRequestTypeContextObject).execute();

    // var restProxyResponse =
 sn_fd.FlowAPI.executeActionQuick('sn_api_notif_mgmt.demo_topic
_rest_proxy_response', spokeSelectorRequestTypeInputMap);
    var responseCode = restProxyResponse.response.code;
    if
 (Constants.REGISTRATION_RESPONSE_SUCCESS_CODES.indexOf(respons
eCode) == -1) {
      this._logger.logErr("Publishing message to Message bus
 rest proxy failed with HTTP response code " + responseCode);
    }
  }
},
```

3. Configure the REST proxy for the topics.
   After the spoke is configured, messages are published in the specified REST proxy for topics configured in the spoke.

   a. Navigate to **All** > **Spoke selector** > **Request type**

   b. Select **Topic Rest Proxy Outbound Request**.

   c. Select the tab **Integration request definitions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Create an integration request definition entry to configure the spoke.
You can also refer to the **Demo Rest Proxy Response Def** entry for additional guidance.

Configure trouble ticket notifications using the Producer Event Notification Framework

The base implementation of trouble ticket notification includes a set of trouble ticket events to demonstrate the capabilities of the system.

These trouble ticket events include:

- Trouble ticket created (incident): `TROUBLE_TICKET_CREATE : "TroubleTicketCreateEvent"`
- Trouble ticket created (case): `TROUBLE_TICKET_CREATE_FOR_CASE : "TroubleTicketCreateEventForCase"`
- Trouble ticket status change (incident): `TROUBLE_TICKET_STATUS_CHANGE : "TroubleTicketStatusChangeEvent"`
- Trouble ticket attribute value change (incident): `TROUBLE_TICKET_ATTRIBUTE_CHANGE : "TroubleTicketAttributeChangeEvent"`

If needed, you can add trouble ticket events to your implementation by performing the following steps:

1. Add a new business rule. This business rule must be associated with the table in which the record, incident or case, is stored. For additional information, see Add a business rule for a new trouble ticket event.
2. Configure the payload generation for the new trouble ticket event. For additional information see, Generate the payload for a new trouble ticket event

You can also modify the payload of existing trouble ticket events. For details, see Modify a trouble ticket event payload.

Add a business rule for a new trouble ticket event

When adding a new trouble ticket event to your implementation, you must add a business rule to your ServiceNow instance.

This business rule must push the Glide snapshot of the corresponding incident or case record into the Producer Notification Framework inbound queue, Inbound Queue [sn_tmt_core_inbound_queue] table, where it is then processed and published by the Producer Notification Framework.

The following code snippet shows an example of a business rule for processing the `ResolveTroubleTicketEventForIncident` ticket notification event on the Incident [incident] table. When calling the *`pushEventsToQueue()`* method to push the event onto the inbound queue, you must pass the event type. For this example it is `ResolveTroubleTicketEventForIncident`. This event type can be any alphanumeric value that you want, but it must be unique as it is used by the system to determine how to process the trouble ticket event. The list of event types for the base system are defined in the *`Constants.EVENT_TYPES`* object in the `Constants [sn_api_notif_mgmt.Constants]` script include.

For details on creating a business rule, see Create a business rule for your service.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Add following lines of code in script section (Advanced tab)
 of BR for pushing 'ResolveTroubleTicketEventForIncident' to the
 inbound queue.

(function executeRule(current, previous /*null when async*/ ) {

// Note that event needs to be passed at BR level itself as
 after this step, we would be left with glide snapshot only

new
 TroubleTicketNotificationUtil().pushEventsToQueue(current,'Reso
lveTroubleTicketEventForIncident',
 Constants.TROUBLE_TICKET_TYPE.INCIDENT);

})(current, previous)
```

Generate the payload for a new trouble ticket event

When adding a trouble ticket event to your implementation, you must create a function that generates the required TMF-compliant payload for that event type. In addition, you must add that function to the case statement that directs the logic to this function when processing this type of event record.

Create a method that generates the payload for the new trouble ticket event

In the `TroubleTicketNotificationUtil` script include, you must add a method that constructs the required TMF-compliant payload for the new trouble ticket event and then return that payload.

For examples of methods that create payloads for the base system trouble ticket events, refer to the following methods in the `TroubleTicketNotificationUtilOOB` script include:

- *`generateCreateTroubleTicketEventPaylaod()`*
- *`generateCreateTroubleTicketEventPaylaodForCase()`*
- *`generateTroubleTicketAttributeChangePayload()`*
- *`generateTroubleTicketStatusChangePayload()`*

Add the event to the fetchEventHandlerAndCreateTMFEvent() switch/case logic

For the function that you created to be executed, you must add it in the `switch/case` logic within the *`fetchEventHandlerAndCreateTMFEvent()`* method of the `EventProcessorUtil` script include. The following code snippet shows the updates necessary to add the `ResolveTroubleTicketEventForIncident` event type to this method. For details on the *`fetchEventHandlerAndCreateTMFEvent()`* method, see EventProcessorUtilOOB - fetchEventHandlerAndCreateTMFEvent(Object eventSnapshot, String eventType, String eventId).

```
fetchEventHandlerAndCreateTMFEvent: function(eventSnapshot,
 eventType, eventId) {
  var eventPayload;
  switch (eventType) {
    case Constants.EVENT_TYPES.TROUBLE_TICKET_STATUS_CHANGE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketStatusChangePayload(eventSnapshot, eventType, eventId);
      break;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    case Constants.EVENT_TYPES.TROUBLE_TICKET_CREATE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateCreate
TroubleTicketEventPaylaod(eventSnapshot, eventType, eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_ATTRIBUTE_CHANGE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateTroubl
eTicketAttributeChangePayload(eventSnapshot, eventType,
 eventId);
      break;

    case Constants.EVENT_TYPES.TROUBLE_TICKET_CREATE_FOR_CASE:
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateCreate
TroubleTicketEventPaylaodForCase(eventSnapshot, eventType,
 eventId);
      break;

    // Add a new case statement for the
 ResolveTroubleTicketEventForIncident event type
    case 'ResolveTroubleTicketEventForIncident':
      eventPayload = new
 sn_ind_tsm_sdwan.TroubleTicketNotificationUtil().generateResolv
eTroubleTicketEventPyaload(eventSnapshot, eventType, eventId);
      break;

    default:
      this._logger.debug("Event with id " + eventId + " could
 not find the matching payload generator");
      eventPayload = null;
  }
  return eventPayload;
},
```

Modify a trouble ticket event payload

The base trouble ticket event notification implementation provides multiple default trouble ticket event type examples. You may need to alter the payloads for these events within your implementation to meet your actual needs. You may also need to configure the payload for any new trouble ticket events that you add to your implementation.

This section describes how to modify the payload for the "Attribute change event for Incident" trouble ticket event. Use these same steps to modify the payload of any trouble ticket event type.

Add event header attributes to all trouble ticket event payloads

To add event header attributes to all trouble ticket event payloads, you must override the *`addAdditionalEventAttributes()`* method in the `TroubleTicketNotificationUtil` script include. Adding new attributes in this method adds header-level attributes to all trouble ticket event payloads.

The following code example shows how to add the attribute `schemaLocation` to all trouble ticket event payloads.

```
addAdditionalEventAttributes': function(tmfEventPayload) {
  // Add "schemaLocation" as a header attribute
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  TroubleTicketEventObject.schemaLocation =
 "http://xx/Event.schema.json",
}
```

Add attributes to a specific trouble ticket event payload

To add attributes to a specific trouble ticket event payload, you must override the method associated with that event such as the *addAttributeChangeTroubleTicketAttributes()* method in the `TroubleTicketNotificationUtil` script include. Adding new attributes in this method adds event-level attributes to that specific trouble ticket event payload.

The following code example shows how to add the attribute `correlationId` to the "Attribute change event for Incident" trouble ticket event.

```
addAttributeChangeTroubleTicketAttributes:
 function(troubleTicketGr) {
  var troubleTicketResource = {};
  var troubleTicketAttributesObj = {};

 this.addMandatoryTroubleTicketAttributes(troubleTicketAttribute
sObj, troubleTicketGr);

// Add the new attribute correlation id.
  TroubleTicketAttributesObj.correlationId =
 troubleTicketGr._value.correlation_id;
  troubleTicketResource.troubleTicket =
 troubleTicketAttributesObj;
  return troubleTicketResource;
},
```

Override Event Management Topic Open API functionality

The *Event Management Topic Open API* enables you to save topic records in the Topic [sn_api_notif_mgmt_topic] table after validating the topic payload.

You can override the processing of a topic record by updating the methods in the TopicAPIUtilsOOB API in the *TopicAPIUtils* API.

The following is the list of available methods within this API and the default functionality that they provide:

- TopicAPIUtilsOOB - createTopicHelper(Object topicObject, Array warnings): Inserts the payload passed in the *Event Management Topic Open API - POST / sn_api_notif_mgmt/topic* endpoint into the Topic [sn_api_notif_mgmt_topic] table.
- TopicAPIUtilsOOB - getCreateTopicSchema(): Returns the defined schema for the payload used by the *Event Management Topic Open API - POST / sn_api_notif_mgmt/topic* endpoint to validate the topic payload. The default payload schema, *Constants.SCHEMA*, is located in the `sn_api_notif_mgmt.Constants` script include.
- TopicAPIUtilsOOB - isValidCreateTopicPayload(Object topicObject, String schema, Array warnings): Validates the payload passed into the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint. This validation is performed on the request body and the schema.
- TopicAPIUtilsOOB - prepareCreateTopicResponse(Object topicObject, String topicSysId, Array warnings): Generates and returns the response to a *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- TopicAPIUtilsOOB - processTopicCreation(Object topicObject): Processes the request made by the *Event Management Topic Open API* endpoint. This method invokes the helper methods needed for data insertion, schema validation, request body validation, and response-orchestration. Override this method if you need to customize the fundamental processing of the Event Management Topic Open - POST /sn_api_notif_mgmt/topic request. Otherwise, override the individual helper methods.
- TopicAPIUtilsOOB - transformCreateTopicResponse(Object topicObject, String topicSysId): Provides the ability to add custom data to the response object returned to the *Event Management Topic Open API - POST /sn_api_notif_mgmt/topic* endpoint.
- TopicAPIUtilsOOB - validateTopicAttributes(Object topicObject, Array details): Validates whether the topic name, header-query, content-query, and namespace combination passed in the *Event Management Topic Open API* endpoint payload is unique. The endpoint uses this attribute combinations to determine whether the topic currently exists in the Topic [sn_api_notif_mgmt_topic] table. The default implementation also checks whether the *name* attribute, which is defined as required in the default topic payload schema, is included in the passed payload.
- TopicAPIUtilsOOB - validateTopicExternalId(Object topicObject, Array details): Validates the topic external ID passed in the request body of the *Event Management Topic Open API* endpoint. In the base implementation this only validates that the external ID is not empty.

Product Order Open API Developer Guide

Use the *Product Order Open API* to create, update, and retrieve product order information.

This developer guide provides information on how to extend the Product Order Open API to make various customizations.

Extending the Product Order Open API

The *Product Order Open API* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- `TMFProductOrderAPIUtil`: Contains functions to handle POST requests.
- `TMFProductOrderGetAPIUtil`: Contains functions to handle GET requests.
- `ProductOrderExtensionOOB`: Contains helper functions that support functions in `TMFProductOrderAPIUtil` and `TMFProductOrderGetAPIUtil`.
- `ProductOrderProcessor`: An empty script include file. Use this file to define any functions that you want to override from `ProductOrderExtensionOOB`.

Extend the *Product Order Open API* to make the following customizations.

Required parameters

To change which request body parameters are required or not required to create a product order, override the function `getProductOrderSchema()` contained in the `ProductOrderExtensionOOB` script include.

The function `getProductOrderSchema()` reads the schema from the `TMFOrderAPIConstants` script include. `TMFOrderAPIConstants` is protected and can't be edited, so you can't just update the schema. Instead, a new schema must be read from a different file. You can override `getProductOrderSchema()` to read a new schema. To override `getProductOrderSchema()`, write a function with the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

same name in the `ProductOrderProcessor` script include. The new function in `ProductOrderProcessor` will be called by `TMFProductOrderAPIUtil` to replace the default `getProductOrderSchema()` function in `ProductOrderExtensionOOB`.

In this example, `getProductOrderSchema()` returns a custom schema that is defined in a new constant file.

```
// ProductOrderProcessor

var ProductOrderProcessor = Class.create();
ProductOrderProcessor.prototype =
 Object.extendsObject(ProductOrderExtensionOOB, {
   // Define overriding functions here
   // Function name and parameters must be identical to the
 function it overrides

   getProductOrderSchema: function() {
     //Define your own custom schema in a new constant file
       return JSON.parse(Constants.SCHEMA.CREATE_PRODUCT_ORDER);
   },

   type: 'ProductOrderProcessor'
});
```

Request body validation

To perform additional validation on the request body, override `ProductOrderExtensionOOB` functions. `ProductOrderExtensionOOB` contains the following four helper functions that return `true` by default.

- `validatePostRequest()` - Called by `processCreateOrder()` in `TMFProductOrderAPIUtil`.
- `validateProductObj()` - Called by `processCreateOrder()` in `TMFProductOrderAPIUtil`.
- `validateRelatedPartyObj()` - Called by `processCreateOrder()` in `TMFProductOrderAPIUtil`.
- `validateGetRequest()` - Called by `processGetOrder()` in `TMFProductOrderGetAPIUtil`.

If a helper function returns `false`, it stops the API operation. To apply custom validation, override `ProductOrderExtensionOOB` helper functions by creating functions with identical names and parameters in `ProductOrderProcessor`. These new `ProductOrderProcessor` functions will be called by `TMFProductOrderAPIUtil` and `TMFProductOrderGetAPIUtil` to replace the default `ProductOrderExtensionOOB` helper functions.

In this example, a function in `ProductOrderProcessor` overrides a default function in `ProductOrderExtensionOOB` to perform validation on the *`productOrderItem`* attribute.

```
// ProductOrderProcessor

var ProductOrderProcessor = Class.create();
ProductOrderProcessor.prototype =
 Object.extendsObject(ProductOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    validatePostRequest: function(orderObject, details) {
        // Returning false terminates the POST request
        // Make sure to push error message in details array in
 case of error
        if (gs.nil(orderObject.productOrderItem)) {
            details.push(new
 TMFCommonOrderAPIUtil().getErrorDetailsObj(TMFOrderAPIConstants
.MESSAGES.MISSING_ORDER_ITEM, '/'));
            return false;
        }
        return true;
    },

    type: 'ProductOrderProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET and POST operations, create additional scripted REST resources for the *`Product Order Open API`*. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in a new script include.

Field mapping

When creating records, the API maps request body parameters to record fields. When retrieving records, the API maps record fields to response object attributes.

`ProductOrderExtensionOOB` contains the following functions to map a POST request body to a GlideRecord.

- `transformOrderGr()`
- `transformOrdLineItemGr()`
- `getLineItemPrice()`
- `transformPriceOrderTypeAndState()`
- `transformCustLineItmContact()`
- `transformOrderItemChar()`

`ProductOrderExtensionOOB` contains the following functions to map a GlideRecord to a response object for GET or POST requests.

- `transformPostOrderResponse()`
- `transformGetOrderResponse()`
- `transformProductObj()`
- `transformRelatedPartyCustomerLineItem()`
- `transformOrderItemRelationship()`
- `transformGetOrdLineItmResponse()`
- `transformProductCharacteristics()`
- `transformProductSpecification()`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customize field mappings to add and retrieve data for additional fields, or to change the default mappings for fields. To customize the field mappings, override `ProductOrderExtensionOOB` mapping functions by creating functions with identical names and parameters in `ProductOrderProcessor`. These new `ProductOrderProcessor` functions will be used by `TMFProductOrderAPIUtil` and `TMFProductOrderGetAPIUtil` to replace the default `ProductOrderExtensionOOB` mapping functions.

In this example, two functions in `ProductOrderProcessor` override the default functions in `ProductOrderExtensionOOB` to create mappings for the *`external_id`* and *`sys_id`* fields.

```
// ProductOrderProcessor

var ProductOrderProcessor = Class.create();
ProductOrderProcessor.prototype =
 Object.extendsObject(ProductOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    transformOrderGr: function(requestObject, orderGr) {
        orderGr.external_id = requestObject.externalId;
        return orderGr;
    },

    transformPostOrderResponse: function(orderObject, orderGr) {
        orderObject.id = orderGr.getValue('sys_id');
        return orderObject;
    },

    type: 'ProductOrderProcessor'
});
```

Resource Inventory Open API Developer Guide

Use the *`Resource Inventory Open API`* to create, retrieve, update, and delete resources such as interface cards, logical and physical connections, network sites, and more.

This developer guide provides information on how to extend the Resource Inventory Open API to make various customizations.

Extending the Resource Inventory Open API

The *`Resource Inventory Open API`* can be extended using extension points and script includes.

Extension points

The *`Resource Inventory Open API`* includes extension points that can be used to modify the existing schema for the API, which defines required parameters. Extension points can also be used to add new parameters and map them to fields on the ServiceNow AI Platform, or to change the mapping for existing parameters. For example, you can add new resource characteristics and map them to the appropriate fields.

The following extension points are included with the *`Resource Inventory Open API`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `TNITMFResourceInventoryAPICreateResource`: Extension point to create a resource.
- `TNITMFResourceInventoryAPIPatchResource`: Extension point to update a resource.
- `TNITMFResourceInventoryAPITransformToIREPayload`: Extension point to create an Identification and Reconciliation engine (IRE) payload from a TMF request.
- `TNITMFResourceInventoryAPITransformToResponse`: Extension point to create a TMF response from a resource *`GlideRecord`*.
- `TNITMFResourceInventoryAPIValidateCreate`: Extension point to validate a TMF POST request.
- `TNITMFResourceInventoryAPIValidatePatch`: Extension point to validate a TMF PATCH request.

Script includes

Use script includes to override the default validation and transformation functions. Default functions are defined in the `sn_ni_core.TNITMFResourceInventoryProcessorOOB` script include. To override the default functions, create functions with identical names and parameters in the `sn_ni_core.TNITMFResourceInventoryProcessor` script include.

ScopedCacheManager API Developer Guide

Scoped caches allow customers to store custom data in memory for faster access, and define when it becomes invalidated. This can be useful when working with data takes longer to obtainthat from scratch, such as the results of a query across multiple tables. Use the *`ScopedCacheManager`* API to retrieve, set, and flush cache data for scoped applications.

This guide includes instructions for creating a scoped cache and table pair to use with the ScopedCacheManager API.

You can assign the following types of table pairs to a scoped cache:

- **Table pair cache**: When you need to perform any update operation in the table, all the entries in the cache are also flushed.
- **Table row pair cache**: When you need to perform any update operation in the table, only the entries that have the same sys_id as the edited record get flushed from the cache. The other entries remain the same.
- **Table column pair cache**: When you edit a field in the list of selected columns, the entire cache is flushed.
- **Table column and row pair cache**: When you edit a field in the list of selected columns, the entries that have the same sys_id as the edited record get flushed from the cache.

Creating a scoped cache and table pair

Create a scoped cache and define its cache pair.

Before you begin

Role required: caching_admin

Procedure

1. Create a scoped cache. Go to **All** > **System Definition** > **Scoped Caches**.
2. Click **New** and enter a meaningful name in the **Cache Name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter a number in the **Max Entries** field. This value represents the maximum number of entries allowed for this cache. The maximum value is 100.

   Note: The **Application** field should automatically include the name of the scoped application for which this cache is being created.

4. Make sure the **Active** check box is selected.
5. Check the **Always Compress** check box if you want the scoped cache values to occupy less memory space by compressing it.
6. Click **Submit**.
   The scoped cache has been created.
7. Create a cache pair. Go to **All** > **System Definition** > **Scoped Cache Pairs**.
8. Click **New** and click the magnifying glass to select a cache in the **Scoped Cache** field.
9. Select a table from the **Table** menu.
10. Select an option from the **Pair type** menu.
    - **Table pair cache**: When you need to perform any update operation in the table, all the entries in the cache are also flushed.
    - **Table row pair cache**: When you need to perform any update operation in the table, only the entries that have the same sys_id as the edited record get flushed from the cache. The other entries remain the same.
    - **Table column pair cache**: When you edit a field in the list of selected columns, the entire cache is flushed.
    - **Table column and row pair cache**: When you edit a field in the list of selected columns, the entries that have the same sys_id as the edited record get flushed from the cache.
11. Click **Submit**.
    The scoped cache table pair has been created and is ready to use with the *`ScopedCacheManager`* API.

Service Order Open API Developer Guide

Use the *`Service Order Open API`* to create, update, and retrieve service order information.

This developer guide provides information on how to extend the Service Order Open API to make various customizations.

Extending the Service Order Open API

The *`Service Order Open API`* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- `TMFServiceOrderAPIUtil`: Contains functions to handle POST requests.
- `TMFServiceOrderGetAPIUtil`: Contains functions to handle GET requests.
- `ServiceOrderExtensionOOB`: Contains helper functions that support functions in `TMFServiceOrderAPIUtil` and `TMFServiceOrderGetAPIUtil`.
- `ServiceOrderProcessor`: An empty script include file. Use this file to define any functions that you want to override from `ServiceOrderExtensionOOB`.

Extend the *`Service Order Open API`* to make the following customizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required parameters

To change which request body parameters are required or not required to create a service order, override the function `getServiceOrderSchema()` contained in the `ServiceOrderExtensionOOB` script include.

The function `getServiceOrderSchema()` reads the schema from the `TMFOrderAPIConstants` script include. `TMFOrderAPIConstants` is protected and can't be edited, so you can't just update the schema. Instead, a new schema must be read from a different file. You can override `getServiceOrderSchema()` to read a new schema. To override `getServiceOrderSchema()`, write a function with the same name in the `ServiceOrderProcessor` script include. The new function in `ServiceOrderProcessor` will be called by `TMFServiceOrderAPIUtil` to replace the default `getServiceOrderSchema()` function in `ServiceOrderExtensionOOB`.

In this example, `getServiceOrderSchema()` returns a custom schema that is defined in a new constant file.

```
// ServiceOrderProcessor

var ServiceOrderProcessor = Class.create();
ServiceOrderProcessor.prototype =
 Object.extendsObject(ServiceOrderExtensionOOB, {
   // Define overriding functions here
   // Function name and parameters must be identical to the
 function it overrides

   getServiceOrderSchema: function() {
     //Define your own custom schema in a new constant file
       return JSON.parse(Constants.SCHEMA.CREATE_SERVICE_ORDER);
   },

   type: 'ServiceOrderProcessor'
});
```

Request body validation

To perform additional validation on the request body, override `ServiceOrderExtensionOOB` functions. `ServiceOrderExtensionOOB` contains the following four helper functions that return `true` by default.

- `validatePostRequest()` - Called by `processPostOrder()` in `TMFServiceOrderAPIUtil`.
- `validateServiceObj()` - Called by `processPostOrder()` in `TMFServiceOrderAPIUtil`.
- `validateRelatedPartyObj()` - Called by `processPostOrder()` in `TMFServiceOrderAPIUtil`.
- `validateGetRequest()` - Called by `processGetOrder()` in `TMFServiceOrderGetAPIUtil`.

If a helper function returns `false`, it stops the API operation. To apply custom validation, override `ServiceOrderExtensionOOB` helper functions by creating functions with identical names and parameters in `ServiceOrderProcessor`. These new `ServiceOrderProcessor` functions will be called by `TMFServiceOrderAPIUtil` and `TMFServiceOrderGetAPIUtil` to replace the default `ServiceOrderExtensionOOB` helper functions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, a function in `ServiceOrderProcessor` overrides a default function in `ServiceOrderExtensionOOB` to perform validation on the *`serviceOrderItem`* attribute.

```
// ServiceOrderProcessor

var ServiceOrderProcessor = Class.create();
ServiceOrderProcessor.prototype =
 Object.extendsObject(ServiceOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    validatePostRequest: function(orderObject, details) {
        // Returning false terminates the POST request
        // Make sure to push error message in details array in
 case of error
        if (gs.nil(orderObject.serviceOrderItem)) {
            details.push(new
 TMFCommonOrderAPIUtil().getErrorDetailsObj(TMFOrderAPIConstants
.MESSAGES.MISSING_ORDER_ITEM, '/'));
            return false;
        }
        return true;
    },

    type: 'ServiceOrderProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET and POST operations, create additional scripted REST resources for the *`Service Order Open API`*. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in a new script include.

Field mapping

When creating records, the API maps request body parameters to record fields. When retrieving records, the API maps record fields to response object attributes.

`ServiceOrderExtensionOOB` contains the following functions to map a POST request body to a GlideRecord.

- `transformOrderGr()`
- `transformOrdLineItemGr()`
- `transformCustLineItmContact()`
- `transformOrderItemChar()`

`ServiceOrderExtensionOOB` contains the following functions to map a GlideRecord to a response object for GET or POST requests.

- `transformPostOrderResponse()`
- `transformGetOrderResponse()`
- `transformServiceObj()`
- `transformRelatedPartyCustomerLineItem()`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `transformOrderItemRelationship()`
- `transformGetOrdLineItmResponse()`
- `transformServiceCharacteristics()`
- `transformServiceSpecification()`

Customize field mappings to add and retrieve data for additional fields, or to change the default mappings for fields. To customize the field mappings, override `ServiceOrderExtensionOOB` mapping functions by creating functions with identical names and parameters in `ServiceOrderProcessor`. These new `ServiceOrderProcessor` functions will be used by `TMFServiceOrderAPIUtil` and `TMFServiceOrderGetAPIUtil` to replace the default `ServiceOrderExtensionOOB` mapping functions.

In this example, two functions in `ServiceOrderProcessor` override the default functions in `ServiceOrderExtensionOOB` to create mappings for the *`external_id`* and *`sys_id`* fields.

```
// ServiceOrderProcessor

var ServiceOrderProcessor = Class.create();
ServiceOrderProcessor.prototype =
 Object.extendsObject(ServiceOrderExtensionOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    transformOrderGr: function(requestObject, orderGr) {
        orderGr.external_id = requestObject.externalId;
        return orderGr;
    },

    transformPostOrderResponse: function(orderObject, orderGr) {
        orderObject.id = orderGr.getValue('sys_id');
        return orderObject;
    },

    type: 'ServiceOrderProcessor'
});
```

Synthetic Monitoring Developer Guide

Use Synthetic Monitoring APIs create multiple synthetic monitors in a single operation.

This developer guide provides information on how to use the SyntheticsAsyncBulkCreate API to bulk create monitors from Postman or Terminal.

For more information about monitors, see Synthetic monitoring.

Import and create synthetic monitors in bulk using API

Create multiple synthetic monitors simultaneously by importing raw JSON or CSV files through the SyntheticsAsyncBulkCreate API.

Before you begin

Role required: sn_sow_synthetics.synthetics_admin or sn_sow_synthetics.synthetics_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Valid ServiceNow instance credentials
- Access to Http endpoint
- Base URL: `https://<your-instance>.service-now.com/api/sn_sow_synthetics/v1/synthetics_async_bulk_create`
- Prepared raw JSON or CSV file with monitor data containing required fields:
  - Monitor name
  - HTTP endpoint sys_id
  - Parent service sys_id
  - Location sys_id
  - sys id of support group
  - interval (frequency)
  - Method (`GET`, `POST`, `PUT`, `DELETE`, `PATCH`, `HEAD`)
  - Assertion field

One of the following tools: Terminal (with curl command), Postman, or scripting environment.

About this task

The SyntheticsAsyncBulkCreate API uses a two-step process:

1. Creates a job ID by uploading your monitor data file.
2. Checks job status to verify monitor creation status.

You can access this API through one of the following methods:

- Terminal using curl commands
- Postman application
- Custom scripts

The API requires either a basic authentication or oauth token authentication.

- Basic auth:

```
curl -u "username:password"
```

- OAuth token:

```
curl -H "Authorization: Bearer <your-oauth-token>"
```

Procedure

1. Prepare your monitor data file in raw JSON or CSV format.
2. Choose your preferred method (Terminal, Postman, or Script).
3. Call the bulk import API endpoint to upload the file and generate a job ID.
4. Use the status check URL to verify monitor creation status.
5. Review the response for successful monitor creation or error details.
6. Update the source file with correct data (if there are errors), and resubmit.

Result

Monitors are created in the ServiceNow instance. The API response indicates:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Processing status (processing/complete)
- Successfully created monitors
- Failed monitors with error details (required fields missing, invalid sys_ids, and so forth)

Create monitors in bulk using Terminal

Use curl commands in Terminal to create multiple synthetic monitors simultaneously by importing JSON or CSV files through the SyntheticsAsyncBulkCreate API.

Before you begin

Role required: sn_sow_synthetics.synthetics_admin or sn_sow_synthetics.synthetics_editor

- Valid ServiceNow instance credentials
- Access to Http endpoint
- Base URL: `https://<your-instance>.service-now.com/api/sn_sow_synthetics/v1/synthetics_async_bulk_create`
- Prepared raw JSON or CSV file with monitor data containing required fields:
  - Monitor name
  - HTTP endpoint sys_id
  - Parent service sys_id
  - Location sys_id
  - sys id of support group
  - interval (frequency)
  - Method (`GET`, `POST`, `PUT`, `DELETE`, `PATCH`, `HEAD`)
  - Assertion field

About this task

The SyntheticsAsyncBulkCreate API uses a two-step process when accessed through Terminal. First, upload your monitor data file using a curl command to generate a job ID. Then, check the job status to verify monitor creation. The API processes records asynchronously and provides detailed feedback on successful creations and errors.

Different curl commands are required depending on whether you are uploading a JSON or CSV file.

Procedure

1. Open Terminal on your system.
2. Navigate to the directory containing your monitor data file.
3. Execute the appropriate curl command to upload your file and create a job ID.

For JSON files:

```
curl -X POST
 "https://{your-instance}.service-now.com/api/sn_sow_syntheti
cs/v1/synthetics_async_bulk_create" \
  -H "Content-Type: application/json" \
  -H "Accept: application/json" \
  -u "admin:password" \
  -d @{filename}.json
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For CSV files:

```
curl -X POST
 "https://{your-instance}.service-now.com/api/sn_now_syntheti
cs/v1/synthetics_async_bulk_create?filename=filename.csv" \
  -H "Content-Type: text/csv" \
  -H "Accept: application/json" \
  -u "admin:password" \
  --d "$(jq -Rs '{csv_content: .}'filename.csv"
```

Replace the following placeholders:

- `{your-instance}`: Your ServiceNow instance name
- `{filename}`: The name of your monitor data file

The API returns a response containing a job ID and status check URL.

```
{
  "result": {
    "job_id": "abc123def456",
    "status": "processing",
    "status_check_url":
 "https://{your-instance}.service-now.com/api/now/synthetic/mon
itor/bulk/status/abc123def456"
  }
}
```

4. Copy the status check URL from the response.
5. Execute the status check curl command to verify job processing status.

```
curl -X GET
 "https://{your-instance}.service-now.com/api/sn_sow_syntheti
cs/v1/synthetics_async_bulk_create/{job_id}" \
  -H "Accept: application/json" \
  -u "{username}:{password}"
```

The API returns one of the following status responses:

Processing status:

```
{
  "result": {
    "job_id": "abc123def456",
    "status": "processing",
    "total_records": 10,
    "processed_records": 3
  }
}
```

Complete status (successful):

```
{
  "result": {
    "job_id": "abc123def456",
    "status": "complete",
    "total_records": 10,
    "successful_records": 10,
    "failed_records": 0,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "details": []
  }
}
```

Complete status (with errors):

```
{
  "result": {
    "job_id": "abc123def456",
    "status": "complete",
    "total_records": 10,
    "successful_records": 8,
    "failed_records": 2,
    "details": [
      {
        "name": "Monitor_API_001",
        "status": "failed",
        "error_code": "MISSING_REQUIRED_FIELD",
        "reason": "CMDB CI is required"
      },
      {
        "name": "Monitor_API_002",
        "status": "failed",
        "error_code": "INVALID_REFERENCE",
        "reason": "Location not found for this sys_id"
      }
    ]
  }
}
```

6. If the status is "processing", wait for few moments and repeat the status check command. The system processes records asynchronously. Continue checking until the status changes to "complete".
7. If any monitors failed to create, review the error details in the response.

   a. Identify the failed monitor name from the compiled details.

   b. Review the error code and reason provided.

   c. Update your source JSON or CSV file to correct the data issues.

      Common errors include:

      - Missing required fields (CMDB CI, location, method)
      - Invalid sys_id references that don't exist in the instance
      - Incorrect data formats

   d. Resubmit the corrected file by repeating the upload curl command.

Result

Monitors are created in your ServiceNow instance. Successfully created monitors are immediately available for use. Failed monitors are reported with specific error details, allowing you to correct the data and resubmit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Complete workflow example

Step 1: Upload JSON file

```
curl -X POST
 "https://myinstance.service-now.com/api/sn_sow_synthetics/v1/sy
nthetics_async_bulk_create" \
  -H "Content-Type: application/json" \
  -H "Accept: application/json" \
  -u "admin:password123" \
  -d @monitor_data.json
```

Response:

```
{
  "result": {
    "job_id": "xyz789abc123",
    "status": "processing",
    "status_check_url":
 "https://myinstance.service-now.com/api/sn_sow_synthetics/v1/sy
nthetics_async_bulk_create/status/xyz789abc123"
  }
}
```

Step 2: Check status

```
curl -X GET
 "https://myinstance.service-now.com/api/sn_sow_synthetics/v1/sy
nthetics_async_bulk_create/status/xyz789abc123" \
  -H "Accept: application/json" \
  -u "admin:password123"
```

Final response:

```
{
  "result": {
    "job_id": "xyz789abc123",
    "status": "complete",
    "total_records": 5,
    "successful_records": 5,
    "failed_records": 0
  }
}
```

What to do next

After successful creation, verify your monitors in the ServiceNow UI by navigating to **Synthetic Monitoring** > **Monitors**. You can configure additional monitor settings and schedules, as needed.

Create monitors in bulk using Postman

Use Postman to create multiple synthetic monitors simultaneously by importing JSON files through the SyntheticsAsyncBulkCreate API.

Before you begin

Role required: sn_sow_synthetics.synthetics_admin or sn_sow_synthetics.synthetics_editor

- Valid ServiceNow instance credentials
- Access to Http endpoint

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Base URL: `https://<your-instance>.service-now.com/api/sn_sow_synthetics/v1/synthetics_async_bulk_create`
- Prepared raw JSON file with monitor data containing required fields:
  - Monitor name
  - HTTP endpoint sys_id
  - Parent service sys_id
  - Location sys_id
  - sys id of support group
  - interval (frequency)
  - Method (`GET`, `POST`, `PUT`, `DELETE`, `PATCH`, `HEAD`)
  - Assertion field

About this task

The SyntheticsAsyncBulkCreate API uses a two-step process when accessed through Postman. First, create a POST request to upload your monitor data file and generate a job ID. Then, use the status check URL to verify monitor creation. Postman provides a user-friendly interface for testing the API and viewing formatted responses.

Only use Postman to import JSON files for this API. To import CSV files, use Terminal instead.

Procedure

1. Open the Postman application.
2. Create a new request by selecting the **+** button or **New** > **HTTP Request**.
3. Set the request method to **POST** from the drop-down menu, and enter the bulk import API endpoint base URL in the request URL field.

   Replace `{instance-name}` in the base URL with your ServiceNow instance name.
4. Configure authentication credentials.

   a. Select the **Authorization** tab below the **URL** field.

   b. Select **Basic Auth** from the **Type** dropdown.

   c. Enter your ServiceNow username in the **Username** field.
   Ensure this user has the synthetic admin role.

   d. Enter your password in the **Password** field.
5. Configure the request body to upload your monitor data file.

   a. Select the **Body** tab.

   b. Select **binary** as the body type.

   c. Select the **Select File** button, and browse to your monitor data file location and select your JSON file.
6. Add the filename as a query parameter in the URL, and select **Send** to submit the request.
   For example if your filename is monitors .json, then the filepath will be `https://<your-instance>.service-now.com/api/sn_sow_synthetics/v1/synthetics_async_bulk_create?filename=monitors.json`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The API returns a JSON response containing a job ID and status check URL.

```
{ "result": { "job_id": "abc123def456", "status": "processing",
"status_check_url": "https://{instance-name}.service-now.com/
api/now/synthetic/monitor/bulk/status/abc123def456" } }
```

7. Copy the status check URL from the response.
8. Create a new GET request to check the job status.

   a. Click the status check URL in the response, or manually create a new request.
   If the URL is click-able in Postman, it will automatically create a new GET request with the URL populated.

   b. If creating manually, set the request method to **GET**.

   c. Paste the status check URL (`https://<your-instance>.service-now.com/api/sn_sow_synthetics/v1/synthetics_async_bulk_create/{job_id}`) into the **ß** field.

   Replace {job_id} with the job ID from the POST response.

9. Configure authentication for the status check request.
   If you are in the same Postman workspace, the authorization may already be inherited. If not, repeat the Basic Auth configuration from step 4.
10. Select **Send** to check the job status.
    You can save the requests in a collection for reuse.

    The API returns one of the following status responses:

    Processing status:

```
{
  "result": {
    "job_id": "abc123def456",
    "status": "processing",
    "total_records": 10,
    "processed_records": 3
  }
}
```

Complete status (successful):

```
{
  "result": {
    "job_id": "abc123def456",
    "status": "complete",
    "total_records": 10,
    "successful_records": 10,
    "failed_records": 0,
    "details": []
  }
}
```

Complete status (with errors):

```
{
  "result": {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "job_id": "abc123def456",
    "status": "complete",
    "total_records": 10,
    "successful_records": 8,
    "failed_records": 2,
    "details": [
      {
        "name": "Monitor_API_001",
        "status": "failed",
        "error_code": "MISSING_REQUIRED_FIELD",
        "reason": "CMDB CI is required"
      },
      {
        "name": "Monitor_API_002",
        "status": "failed",
        "error_code": "INVALID_REFERENCE",
        "reason": "Location not found for this sys_id"
      }
    ]
  }
}
```

11. If the status is "processing", wait for few moments and select **Send** again to refresh the status. The system processes records asynchronously. Continue checking until the status changes to "complete".
12. If any monitors failed to create, review the error details in the response.
    a. Expand the `details` array in the Postman response viewer to see individual error records.
    b. Note the monitor name, error code, and reason for each failure.
    c. Update your source JSON file to correct the identified issues.

       Common errors include:

       - Missing required fields (CMDB CI, location, method)
       - Invalid sys_id references that don't exist in the instance
       - Incorrect data formats or field names
    d. Return to your original POST request and resubmit with the corrected file.

Result
Monitors are created in your ServiceNow instance. Successfully created monitors are immediately available for use. Failed monitors are reported with specific error details in a structured JSON format that is easy to review in Postman's response viewer.

Example: Complete workflow example

Step 1: Configure POST request

- Method: POST
- URL: https://myinstance.service-now.com/api/now/synthetic/monitor/bulk/import
- Authorization: Basic Auth (username: admin, password: ********)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Body: binary, file selected: monitor_data.json
- Headers: Content-Type: application/json, Accept: application/json

Response received:

```
{
  "result": {
    "job_id": "xyz789abc123",
    "status": "processing",
    "status_check_url":
 "https://myinstance.service-now.com/api/now/synthetic/monitor/b
ulk/status/xyz789abc123"
  }
}
```

Step 2: Configure GET request for status check

- Method: GET
- URL: https://myinstance.service-now.com/api/now/synthetic/monitor/bulk/status/xyz789abc123
- Authorization: Basic Auth (inherited from workspace)

Final response:

```
{
  "result": {
    "job_id": "xyz789abc123",
    "status": "complete",
    "total_records": 5,
    "successful_records": 5,
    "failed_records": 0
  }
}
```

What to do next

- Save your Postman requests to a collection for future use and easy resubmission.
- Verify your monitors in the ServiceNow UI by navigating to Synthetic Monitoring > Monitors.
- Configure additional monitor settings such as schedules, notifications, and thresholds as needed.

JSON file format

The JSON file should contain an array of monitor objects, either directly or wrapped in a `checks` or `monitors` property.

Direct array

```
[
  {
    "name": "API Health Check",
    "method": "GET",
    "cmdb_ci": "sys_id_of_http_endpoint",
    "interval": 5,
    "locations": ["location_sys_id_1"],
    "enabled": true,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "parent_service_sys_id": "service_sys_id",
    "support_group_sys_id": "group_sys_id"
  }
]
```

Wrapped in object

```
{
  "checks": [
    {
      "name": "API Health Check",
      "method": "GET",
      "cmdb_ci": "sys_id_of_http_endpoint",
      ...
    }
  ]
}
```

CSV file format

CSV files must include a header row followed by data rows.

CSV header

```
name,method,description,interval,cmdb_ci,enabled,should_create_a
lert,alert_severity,locations,headers,alert_tags,valid_http_code
_type,valid_http_code,max_latency_ms,query_string,credential,bod
y,body_condition,parent_service_sys_id,support_group_sys_id
```

CSV example

```
name,method,description,interval,cmdb_ci,enabled,should_create_a
lert,alert_severity,locations,headers,alert_tags,valid_http_code
_type,valid_http_code,max_latency_ms,query_string,credential,bod
y,body_condition,parent_service_sys_id,support_group_sys_id
"My Monitor","GET","Health
 check",1,"0bd58579ff1232109a07fffffffff72",true,true,1,"10eb9e
1cffa2f2109a07fffffffff27","[]","{}","equals","200","5000","","
","","","81d847959f030200fe2ab0aec32e7031","2156c3a80b982300cac6
c08393673a7e"
```

CSV special formatting

- **locations**: Pipe-separated sys_ids (example, `loc1_sys_id|loc2_sys_id`)
- **headers**: JSON array string (example, `[{"name":"Authorization","value":"Bearer xxx"}]`)
- **alert_tags**: JSON object string (example, `{"env":"prod","team":"api"}`)
- **body_condition**: Colon-separated type:expression (example, `jsonpath:$.status`)
- **Boolean values**: `true`, `false`, `1`, `0`, `yes`, `no`

Example of bulk monitors using CSV file

This is an example of using a CSV file wrapped in a JSON object to create bulk monitors using terminal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step 1: Submit bulk job in CSV format

```
curl -X POST "https://<instance>.service-now.com/api/sn_sow_synthetics/v1/synthetics_async_bulk_create" \ -u "admin:password" \ -H "Content-Type: application/json" \ -H "Accept: application/json" \ -d @monitors.json
```

Response

```
{ "result": { "job_id": "a1b2c3d4e5f6...", "status": "pending", "total_count": 2, "message": "Bulk job accepted for processing" } }
```

Step 2: Check the job status

```
curl -X GET "https://<instance>.service-now.com/api/sn_sow_synthetics/v1/synthetics_async_bulk_create/{job_id}" \ -u "admin:password" \ -H "Accept: application/json"
```

Response

```
{ "result": { "job_id": "a1b2c3d4e5f6...", "status": "completed", "total_count": 2, "success_count": 2, "error_count": 0, "processed_count": 2 } }
```

Trouble Ticket Open API Developer Guide

Use the *`Trouble Ticket Open API`* to manage ticket information between external ticketing systems and the ServiceNow AI Platform. This API creates, updates, and retrieves data from the Case [sn_customerservice_case] and Incident [incident] tables.

This developer guide provides information on how to extend the Trouble Ticket Open API to make various customizations.

Extending the Trouble Ticket Open API

The *`Trouble Ticket Open API`* can be extended by editing script includes.

These script includes should only be edited with an understanding of the consequences of the changes.

- `TMFTroubleTicketAPIConstants`: Contains constants and required parameter information.
- `TMFTroubleTicketAPIUtil`: Contains functions to handle POST, GET, and PATCH requests.
- `TroubleTicketProcessorOOB`: Contains helper functions that support functions in TMFTroubleTicketAPIUtil.
- `TroubleTicketProcessor`: An empty script include file. Use this file to define any functions that you want to override from TroubleTicketProcessorOOB.

Extend the *`Trouble Ticket Open API`* to make the following customizations.

Required parameters

To change which request body parameters are required or not required, update the TMFTroubleTicketAPIConstants script include. By default, the request body to create a ticket

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(POST) requires the parameters *description*, *severity*, and *ticketType*. By default, the request body to update a ticket (PATCH) doesn't have required parameters.

- `TMFTroubleTicketAPIConstants.TROUBLE_TICKET_CREATION_SCHEMA`: Sets the required request body parameters to create a ticket.
- `TMFTroubleTicketAPIConstants.TROUBLE_TICKET_UPDATE_SCHEMA`: Sets the required request body parameters to update a ticket.

In this example, the *description*, *severity*, *status*, and *ticketType* parameters are required to create a ticket.

```
// TMFTroubleTicketAPIConstants
TMFTroubleTicketAPIConstants.TROUBLE_TICKET_CREATION_SCHEMA = {
    "title": "CreateTroubleTicket",
    "type": "object",
    "properties": {
        "description": {
            "type": "string"
        },
        "severity": {
            "type": "string"
        },
        "status": {
            "type": "string"
        },
        "ticketType": {
            "type": "string"
        }
    },
    "required": [
        "description",
        "severity",
        "status",
        "ticketType"
    ]
};
```

Request body validation

To perform additional validation on the request body, override TroubleTicketProcessorOOB functions. TroubleTicketProcessorOOB contains the following six helper functions that return `true` by default. These functions are called in TMFTroubleTicketAPIUtil.

- `verifyGetRequestForCase()` - Called by `processGetRequestForCase()`.
- `verifyPatchRequestForCase()` - Called by `processPatchRequestForCase()`.
- `verifyPostRequestForCase()` - Called by `processPostRequestForCase()`.
- `verifyGetRequestForIncident()` - Called by `processGetRequestForIncident()`.
- `verifyPatchRequestForIncident()` - Called by `processPatchRequestForIncident()`.
- `verifyPostRequestForIncident()` - Called by `processPostRequestForIncident()`.

If a helper function returns `false`, it stops the API operation. To apply custom validation, override TroubleTicketProcessorOOB helper functions by creating functions with identical names

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and parameters in TroubleTicketProcessor. These new TroubleTicketProcessor functions will be called by TMFTroubleTicketAPIUtil to replace the default TroubleTicketProcessorOOB helper functions.

In this example, a function in TroubleTicketProcessor overrides a default function in TroubleTicketProcessorOOB to perform validation on the name attribute.

```
// TroubleTicketProcessor
var TroubleTicketProcessor = Class.create();
TroubleTicketProcessor.prototype =
 Object.extendsObject(TroubleTicketProcessorOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    verifyPostRequestForCase: function(caseObject,
 apiResponseProcessor){
        // Returning false terminates the POST request
        // Make sure to assign error message and reason
        if (caseObject.name != "Hello world") {

 apiResponseProcessor.setMessage(TMFTroubleTicketAPIConstants.ME
SSAGES.CASE_CREATION_FAILURE);
            apiResponseProcessor.setReason("No reason needed");
            return false;
        }
    },

    type: 'TroubleTicketProcessor'
});
```

Additional REST operations

To create additional operations beyond the existing GET, PATCH, and POST operations, create additional scripted REST resources for the Trouble Ticket Open API. The logic of the new scripted REST resources should be consistent with the existing operations. Define functions for the new operations in TMFTroubleTicketAPIUtil.

Field mapping

When creating or updating records, the API maps request body parameters to case and incident record fields. When retrieving records, the API maps record fields to response object attributes.

TroubleTicketProcessorOOB contains the following functions to map a PATCH or POST request body to a case or incident GlideRecord.

- `mapPatchRequestToCase()`
- `mapPostRequestToCase()`
- `mapPatchRequestToIncident()`
- `mapPostRequestToIncident()`

TroubleTicketProcessorOOB contains the following functions to map a case or incident GlideRecord to a JSON response object for GET, PATCH, or POST requests.

- `createGetResponseForCase()`
- `createPatchResponseForCase()`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `createPostResponseForCase()`
- `createGetResponseForIncident()`
- `createPatchResponseForIncident()`
- `createPostResponseForIncident()`

Customize field mappings to add and retrieve data for additional case and incident fields, or to change the default mappings for fields. To customize the field mappings, override TroubleTicketProcessorOOB mapping functions by creating functions with identical names and parameters in TroubleTicketProcessor. These new TroubleTicketProcessor functions will be used by TMFTroubleTicketAPIUtil to replace the default TroubleTicketProcessorOOB mapping functions.

In this example, two functions in TroubleTicketProcessor override the default functions in TroubleTicketProcessorOOB to change the Description field mapping and add a mapping for the Contract field.

```
// TroubleTicketProcessor
var TroubleTicketProcessor = Class.create();
TroubleTicketProcessor.prototype =
 Object.extendsObject(TroubleTicketProcessorOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    mapPostRequestToCase: function(caseGr, caseObject){
        // Override default mapping for the Description field
        caseGr.description = "All cases will be created with
 this description";
        // Add new mapping to the Contract field
        caseGr.contract = caseObject.contract;
     },

    createPostResponseForCase: function(caseGr, caseObject){
        // Override default mapping for the description
 attribute
        caseObject.description = "This will always be the
 retrieved description";
        // Add new contract attribute to the response object
        caseObject.contract = caseGr.contract;
    },

    type: 'TroubleTicketProcessor'
});
```

Mapping logic for choice fields

The **State**, **Priority**, and **contact_type** fields are choice fields, where each choice is composed of a label and a corresponding value. For example, if the **State** field is set to **New**, the label is **New** and the value is **1**. The mapping between choice labels and values can be changed by overriding the choice field mapping functions.

TroubleTicketProcessorOOB contains the following choice field mapping functions.

- `transformCaseSeverity()`
- `transformCaseChannel()`

- `transformCaseStatus()`
- `transformIncidentSeverityToUrgency()`
- `transformIncidentSeverityToImpact()`
- `transformIncidentChannel()`
- `transformIncidentStatus()`

Override TroubleTicketProcessorOOB choice field mapping functions by creating functions with identical names and parameters in TroubleTicketProcessor. These new TroubleTicketProcessor functions will be used by TMFTroubleTicketAPIUtil to replace the default TroubleTicketProcessorOOB choice field mapping functions.

In this example, a function in TroubleTicketProcessor overrides a default function in TroubleTicketProcessorOOB to change the choice mapping for the **Status** field.

```
// TroubleTicketProcessor
var TroubleTicketProcessor = Class.create();
TroubleTicketProcessor.prototype =
 Object.extendsObject(TroubleTicketProcessorOOB, {
    // Define overriding functions here
    // Function name and parameters must be identical to the
 function it overrides

    transformCaseStatus: function(status){
        if (status == "Draft")
            return 1;
        else return 10;
    },

    type: 'TroubleTicketProcessor'
});
```

Client GlideList API in the Workspace Experience UI Developer Guide

Add a custom button to the Agent Workspace Lists page that returns list information in the current view. Define the information to return by adding client *`GlideList`* API methods to an action assignment.

Before you begin

Role required: admin

GlideList API methods are provided in the Action Assignments [sys_declarative_action_assignment] **List Action** view. You can add *`GlideList`* functionality to a custom button in the Workspace Experience UI. You can use the button to apply a *`GlideList`* method to the current view. Use the *`GlideList`* methods to manage table lists by getting list view details, setting filters, sorting by column, and more.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Actions & Components** > **List Actions**.
   If you are using *`getFixedQuery()`*, navigate to **Related List Actions** instead of **List Actions**.
2. Create a new action assignment by selecting **New**.
3. In the **Action label** field, type a button label.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Type a name into the **Action** name field.
   Providing text in this field ensures that you can add multiple buttons to the view.
5. From the **Implemented as** menu, select **Client Script**.
6. Right-click in the form header and select **Save**.
7. In the **Client Script** editor, add one or more method calls into the `onClick{}` method definition.
   This method defines what actions to take when the button is selected. For a list of available methods, see GlideList (Now Experience).

8. Select **Update**.
   You can test your button in a Workspace Experience table list view.

   Note: If the button uses the *`getFixedQuery()`* method, select the tab on a record in a Workspace Experience list to test your button.

   The following table illustrates successful button implementation in the Agent Workspace **Incidents (All)** table. The button implements the *`GlideList addFilter()`* method to display only active records.

Example button action applying a filter to a list

List before clicking	List after clicking
Before selecting the button, an assortment of active and inactive (closed) records display in the view.	Selecting the button filters the view to display only active records.
