Workflow Data Fabric

Increase the impact of your cross-enterprise workflows by connecting any application or data. Connect people, processes, and apps to enhance the value of your ServiceNow investment.

Workflow Data Fabric brings automation, low-code, and AI efficiency to your workflows, all on the same platform. Workflow Data Fabric runs on the ServiceNow AI Platform®, a single system of action for the enterprise.

Automate and connect anything to ServiceNow. Unify your approach to automation with a complete set of capabilities that include insights and oversight, all on a single platform.

Integration Hub

Automate integration tasks and develop custom integrations.

Workflow Data Fabric Home

Unify and simplify data from different systems into one consistent, discoverable experience.

Robotic Process Automation (RPA) Hub

Emulate user actions and eliminate mundane and repetitive human activities.

External Content Connectors

Search content and metadata from supported external data repositories.

Zero Copy Connectors

Fetch real-time data from an external data source without copying it to your instance.

Stream Connect

Connect your Apache Kafka environment to your ServiceNow instance.

Workflow Data Fabric products and features

The following table lists the products and features that are available in Workflow Data Fabric.

Workflow Data Fabric products and features

Product name	Description
Automation Center	Automation Center application governs your end-to-end multi-vendor automation life cycles from one place. By using real-time dashboards, you can manage and measure the health of the automation and prevent automation failures across multiple vendors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow Data Fabric products and features (continued)

Product name	Description
Boomi	Boomi supports full lifecycle API management, including governance, analytics, and API security. ServiceNow has partnered with Boomi to deliver Boomi API Management, a cloud-based platform that enables customers to discover, manage, secure, and monetize their APIs. Boomi provides documentation though their own portal, and customers requesting support with Boomi API Management will contact the Boomi support through their standard channels. To get started, see the Boomi API Management listing on the ServiceNow Store, which includes information about entitlements and required plugins, as well as a link to the Boomi API Management documentation.
Conversational Spokes	Now Assist in Conversational Spokes application to utilize the conversational ability of Integration Hub Spoke actions. Perform business actions through conversational interface like Now Assist and unlock the interactive conversational experience to automate your business workflows.
Workflow Data Fabric Home	Unify data from different systems into one consistent, governed layer. Package trusted, business-ready Data Products with built-in context and meaning. Simplify how teams discover, understand, and reuse data through the catalog.
Data Catalog	The Data Catalog is a centralized and searchable inventory of all data assets across an organization. It's enriched with metadata, context, lineage, and governance policies to make data more discoverable, understandable, and usable by both technical and business users.
Integration Hub	Automate integration tasks using ServiceNow components for ServiceNow® Workflow Studio, or develop custom integrations. A separate subscription is required.
Integration Hub Remote Process Sync	Integration Hub Remote Process Sync enables you to set up one-way or bidirectional integrations among multiple ServiceNow instances, so that your process flows stay in sync.
External Content Connectors	The External Content Connectors ServiceNow® Store application enables AI Search applications to search content and metadata from supported external data repositories, such as Atlassian Confluence Cloud and Microsoft SharePoint Online.
RPA Hub	Robotic Process Automation (RPA) Hub enables end-to-end automation for your organization. With a combination of UI interactions and element-based automations that interact between the various business applications, you can emulate user actions and eliminate mundane and repetitive human activities.
Stream Connect	Connect your Apache Kafka environment to your ServiceNow instance with Stream Connect for Apache Kafka.
Zero Copy Connectors	Securely connect to an external data source and access external data directly from your instance with zero copy connectors. Create zero copy connections and data fabric tables in Workflow Data Fabric Hub after requesting the Zero Copy Connectors app through the Now Support Service Catalog. If it isn't already installed, the app installs Workflow Data Fabric Hub.

Related ServiceNow applications and features

Instance Data Replication

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow® Instance Data Replication (IDR) copies data updates from one instance, called the producer instance, to one or more other instances called the consumer instances. IDR enables you to maintain consistent data across different instances. For example, you can synchronize data between different organizations in your company or even between different companies with separate instances.

Inbound email actions

Define an inbound email action to script how the system responds to an inbound email.

Workflow Studio

Integrate workflow authoring, configuring, and monitoring into a single page experience. Consolidate playbooks, flows, actions, decision tables, and integrations into one design environment.

Building actions

Actions automate a repeatable task or operation within a flow. Flows run actions by passing them data as inputs. Actions run a sequence of steps to complete the task, and pass data to the flow as outputs.

Exports

Exports enable you to push data from an instance to an external file. To dynamically export data from a script or web service, export data from the URL.

Imports

Imports enable administrators to import data from various data sources, and then map that data into ServiceNow tables. You can automate data import tasks from a new design environment using Integration Hub.

Classic Orchestration

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance. See Classic Orchestration for more information.

Workflow Data Fabric Home

Unify data from different systems into one consistent, governed layer. Package trusted, business-ready Data Products with built-in context and meaning. Simplify how teams discover, understand, and reuse data through the catalog.

Exploring Workflow Data Fabric Home

Workflow Data Fabric Home is ServiceNow's unified data foundation that connects enterprise data where it lives, governs it through stable contracts, and makes it ready for workflows, analytics, and AI.

Workflow Data Fabric Home overview

Workflow Data Fabric addresses a common enterprise challenge: Data is scattered across dozens of systems, integrations are rebuilt team by team, and AI agents lack the governed context they need to act reliably. Workflow Data Fabric Home addresses this challenge so that once data is connected and governed, any team can discover and reuse it without rebuilding pipelines or compromising data integrity.

ServiceNow Otto for Workflow Data Fabric (WDF)

The AI-guided entry point and parent interface for Workflow Data Fabric, powered by ServiceNow Otto for WDF. Describe what you need and ServiceNow Otto for WDF recommends whether to reuse existing data or connect a new source, and then routes you to the right place.

Connect Hub

Where Connection Admins create and manage connections to external systems. From Connect Hub, admins configure credentials and authentication, set up metadata collectors, and grant Data Stewards access to work with connected data.

For more information, see Workflow Data Fabric Home navigation.

Workflow Data Fabric Home users

Users

User	Description
Connection Admin	Creates and manages connections, configures credentials, sets up metadata collectors, and grants Data Stewards access to connections.
Data Steward	Creates and owns all Data products and Data interfaces. Responsibilities include schema design, governance,

Users (continued)

User	Description
	metadata management, backward compatibility enforcement, and lifecycle management of all data contracts.
WDF Builder	Creates connectors, spokes, and MCP servers to extend the connectivity layer without owning or modifying data contracts.
WDF Operator	Builds deterministic and agentic workflows that consume governed data through Data Interfaces. WDF Operators are consumers of contracts, not owners or modifiers.
WDF Consumer	Explores the Data Catalog to discover data products, evaluates them for use, requests access, and uses governed data through workflows, analytics, AI agents, or APIs.

For more information, see Workflow Data Fabric Home roles.

What to explore next

To learn more about configuring and using Workflow Data Fabric Home, see:

- Configuring Workflow Data Fabric Home
- ServiceNow Otto for Workflow Data Fabric (WDF)
- Connect to external systems
- Workflow Data Fabric Home Reference

Workflow Data Fabric Home navigation

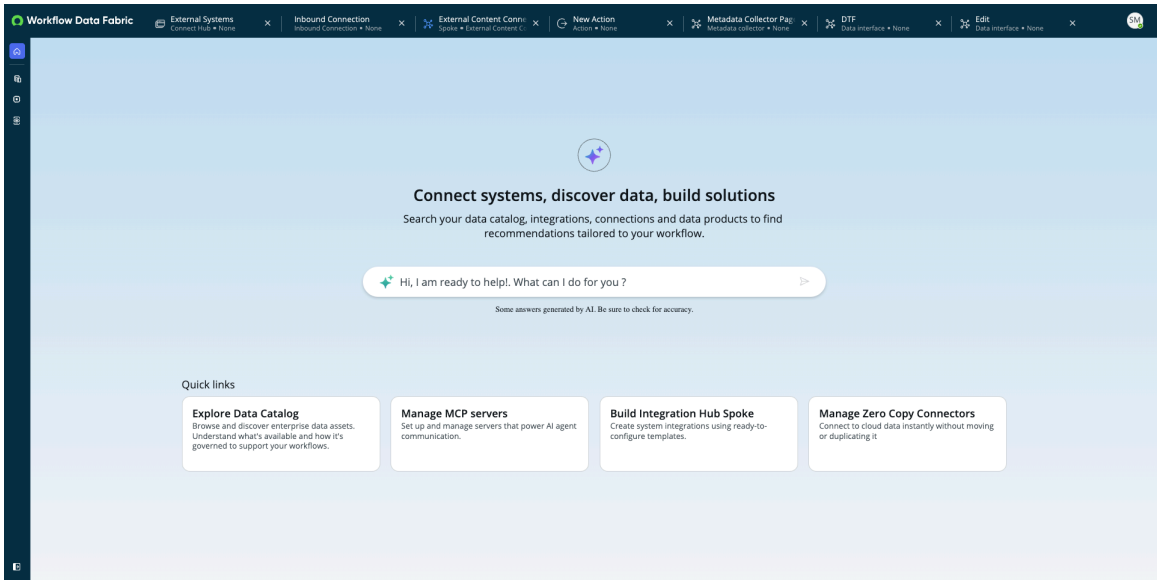
Workflow Data Fabric Home provides a unified, guided experience for connecting, understanding, and using enterprise data to power workflows, analytics, and AI. Access the tools needed to build trusted data assets, govern them, and make them available for consumption.

ServiceNow Otto for Workflow Data Fabric (WDF)

You return to the home page by selecting the Home icon .

From the Workflow Data Fabric Home landing page, use the Now Assist search field with the icon for guidance on setting up integrations. Navigate straight to selected capabilities using the **Quick links**. For more information, see ServiceNow Otto for Workflow Data Fabric (WDF).

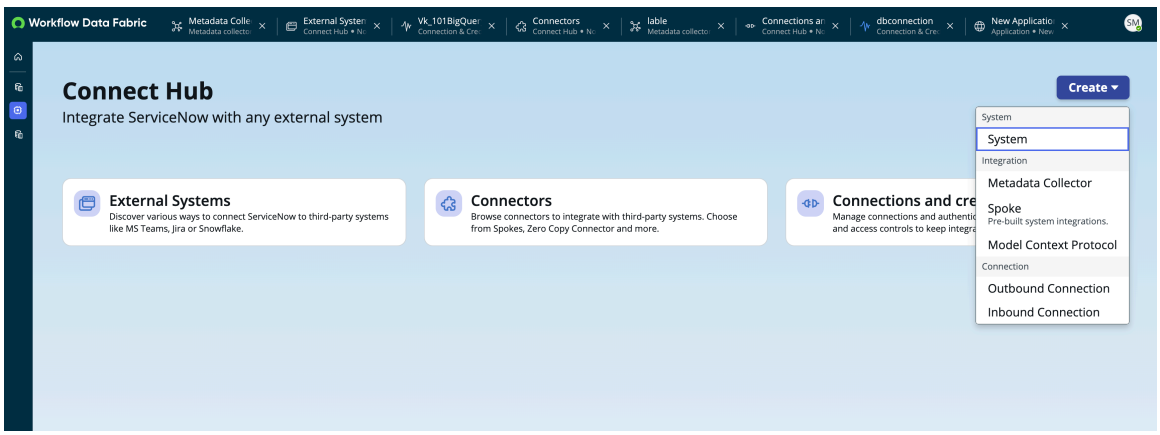
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Connect Hub

You access Connect Hub by selecting the Connect Hub icon .

Discover, manage, and connect ServiceNow to external systems using Connect Hub. The unified interface eliminates the need to switch between multiple tools and interfaces, reducing knowledge silos and improving collaboration across teams working with different integrations types. Connect Hub provides consistent access to integration capabilities and shared resources. For more information, see Connect to external systems.



Configuring Workflow Data Fabric Home

Install Workflow Data Fabric Home and supporting applications to integrate data from multiple sources, unify it into a consistent structure, and make it available across UI, workflows, GenAI, agents, and processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

1. Install other required Workflow Data Fabric applications if they aren't already installed.

   Other Workflow Data Fabric store applications

Application	App ID	Link
Zero Copy Connectors	(sn_data_fabric_zcc) and (sn_data_fabric)	Configuring Zero Copy Connectors
Workflow Data Fabric Credits	(sn_wdf_token)	Workflow Data Fabric Credits

2. Install the Connect Hub (sn_wdf_connect_hub) store application. WDF Unified Hub (sn_wdf_unified_hub) and ServiceNow Otto for Workflow Data Fabric (WDF) (sn_nowassist_wdf) are automatically installed with Connect Hub (sn_wdf_connect_hub).

   For more information, see Install Workflow Data Fabric Home store applications.

3. Configure the ServiceNow Otto for Workflow Data Fabric (WDF) (sn_nowassist_wdf) plugin. Create a ServiceNow Product Documentation connector, and activate the flow generation skill to enable full AI agent capabilities

   For more information, see Configure ServiceNow Otto for Workflow Data Fabric (WDF).

4. Assign Workflow Data Fabric roles to control access to features, capabilities, and data in Workflow Data Fabric Home.

   For more information, see Assign roles to Workflow Data Fabric Home users.

Install Workflow Data Fabric Home store applications

You can install Workflow Data Fabric store applications if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Workflow Data Fabric Home application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

Roles are installed with the Workflow Data Fabric Home store applications. For more information, see Workflow Data Fabric Home roles.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Connect Hub (sn_wdf_connect_hub) Home store applications using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow Data Fabric Home store applications installed with Connect Hub

Name	App ID
WDF Unified Hub	sn_wdf_unified_hub
ServiceNow Otto for Workflow Data Fabric (WDF)	sn_nowassist_wdf

A list of the versions available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Assign roles to Workflow Data Fabric Home users

Assign roles to control access to features, capabilities, and data in Workflow Data Fabric Home.

Before you begin

Set the application scope using the application picker.

Role required: admin

About this task

For detailed information about roles that are installed with Workflow Data Fabric Home, see Workflow Data Fabric Home roles.

Procedure

Assign roles to users and groups using the ServiceNow AI Platform user administration feature.

- Assign a role to a user
- Assign a role to a group

ServiceNow Otto for Workflow Data Fabric (WDF)

Use ServiceNow Otto for Workflow Data Fabric (WDF) to describe what you want to achieve and get AI-driven recommendations on the right Workflow Data Fabric tools, data assets, and next steps.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about applications (and associated application files) in which app generation was utilized. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

Exploring ServiceNow Otto for Workflow Data Fabric (WDF)

With the ServiceNow Otto for Workflow Data Fabric (WDF) application, you can obtain information about setting up integrations.

ServiceNow Otto for WDF overview

Use ServiceNow Otto for WDF to discover data fabric tables, connectors, and collectors, and request guidance on how to set up integrations.

ServiceNow Otto for WDF includes the oneExtend LLM skill that enables you to find information about collectors, connectors, data fabric tables, data products, and more.

ServiceNow Otto for WDF users

Users

User	Description
All Workflow Data Fabric user roles	• Connection Admin • Data Steward • WDF Builder • WDF Operator • WDF Consumer

What to explore next

To learn more about configuring and using Now Assist for WDF, see:

- Configure ServiceNow Otto for Workflow Data Fabric (WDF)
- Ask ServiceNow Otto for Workflow Data Fabric (WDF) for recommendations
- ServiceNow Otto for Workflow Data Fabric (WDF) Reference

oneExtend LLM skill

ServiceNow Otto for Workflow Data Fabric (WDF) includes the oneExtend LLM skill that guides you through integration setup.

Important: Some generative AI skills, AI agents, and agentic workflows are turned on by default. For more information, see AI agents, skills, and agentic workflows on by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The oneExtend LLM skill is included with the ServiceNow Otto for WDF experience. Follow the instructions in Configure ServiceNow Otto for Workflow Data Fabric (WDF) to install the plugin.

By default, all skills exist in the global domain. When you use AI in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses the summarization skill, AI only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the AI Admin Hub console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

Configure ServiceNow Otto for Workflow Data Fabric (WDF)

If you have the admin role, you can configure the ServiceNow Otto for Workflow Data Fabric (WDF) application to enable AI capabilities across the Workflow Data Fabric platform.

Before you begin

To install any Now Assist plugin, you must have Now Assist capabilities activated. For more information, see AI Admin Hub.

Role required: admin

About this task

Use the AI Admin Hub console to configure Now Assist for WDF. For additional information, see Overview tab in AI Admin Hub.

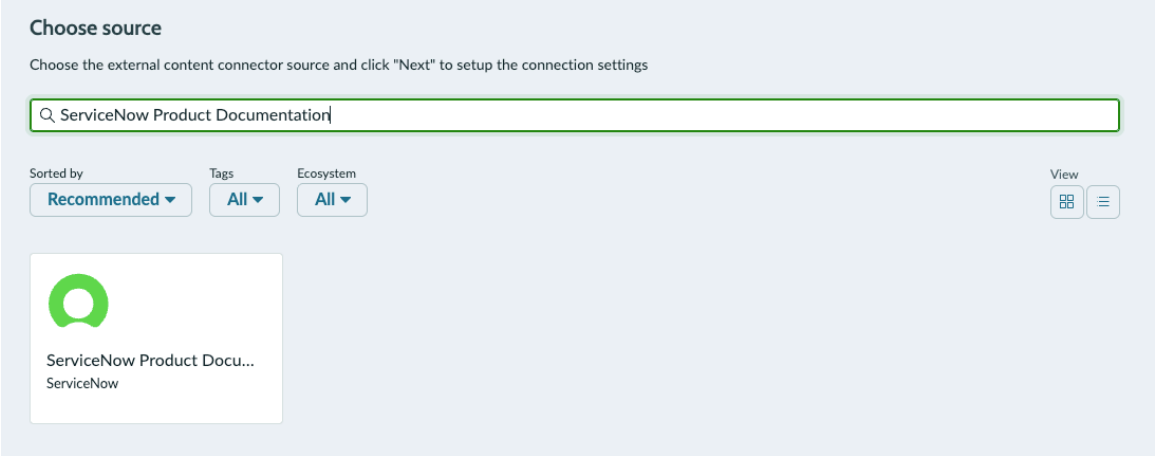
The oneExtend LLM skill is included in Now Assist for WDF.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Find the ServiceNow Otto for WDF plugin (sn_nowassist_wdf) using the filter criteria and search bar and install the ServiceNow Otto for WDF plugin (sn_nowassist_wdf).

   For information about the installation process, see Install plugins for ServiceNow Otto.
3. Select the Now Assist for WDF plugin tile, select **Install**, and confirm.
4. **Optional:** Navigate to **All** > **External Content Connectors** > **External Content Admin Home** and create the **ServiceNow Product Documentation** connector to index and enhance AI search with content from the ServiceNow product documentation site.
   Core functionality isn't affected if skipped, but some AI agent capabilities may be limited. For more information, see https://www.servicenow.com/docs/r/platform-administration/ai-search/servicenow-product-documentation-external-content-connector.html.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. **Optional:** Activate the flow generation skill.

   (Optional) Core functionality isn't affected if skipped, but some AI agent capabilities may be limited.

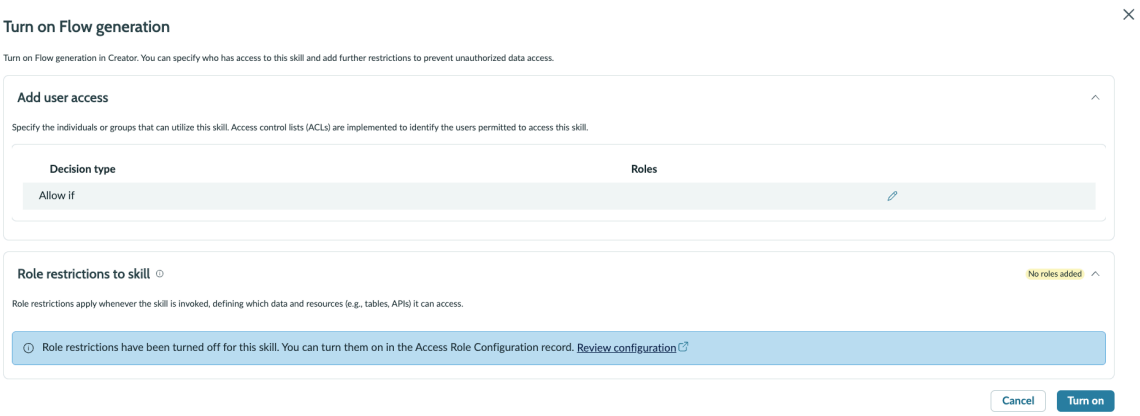
   a. Navigate to **All** > **Now Assist Admin** > **Skills**.

   (Optional)

   b. On the **Flow generation** tile, select **Turn on** and confirm to activate the skill.

   (Optional) You're asked to specify any ACLs permitted to access the flow generation skill and configure role restrictions. You can leave these fields empty. For more information, see https://www.servicenow.com/docs/r/build-workflows/now-assist-for-creator/turn-on-the-flow-generation-skill.html.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Delete a skill by selecting **Deactivate skill** on the skill's tile, and confirm.

Overview tab in AI Admin Hub

Configuring Now Assist Admin features

Ask ServiceNow Otto for Workflow Data Fabric (WDF) for recommendations

Find guidance on setting up integrations, understand the advantages of different integration tools, and get links to sources of information.

Before you begin

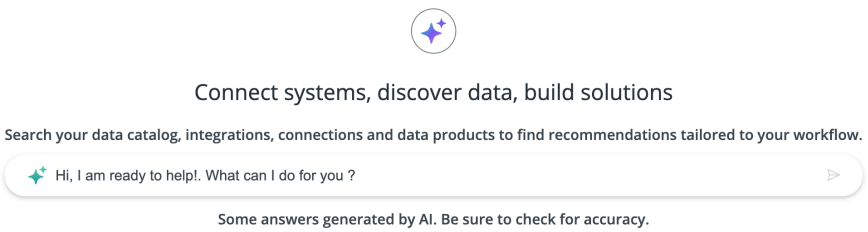
Role required: df_data_steward, connection_admin, wdf_operator, wdf_builder, wdf_consumer

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. On the landing page, enter your question in the Now Assist search field .

   Ask for information in plain language. For example, `How can I connect to Jira`.

   If specific applications have data available that you want to use, enter the application name and get relevant links. For example, `MySQL`.

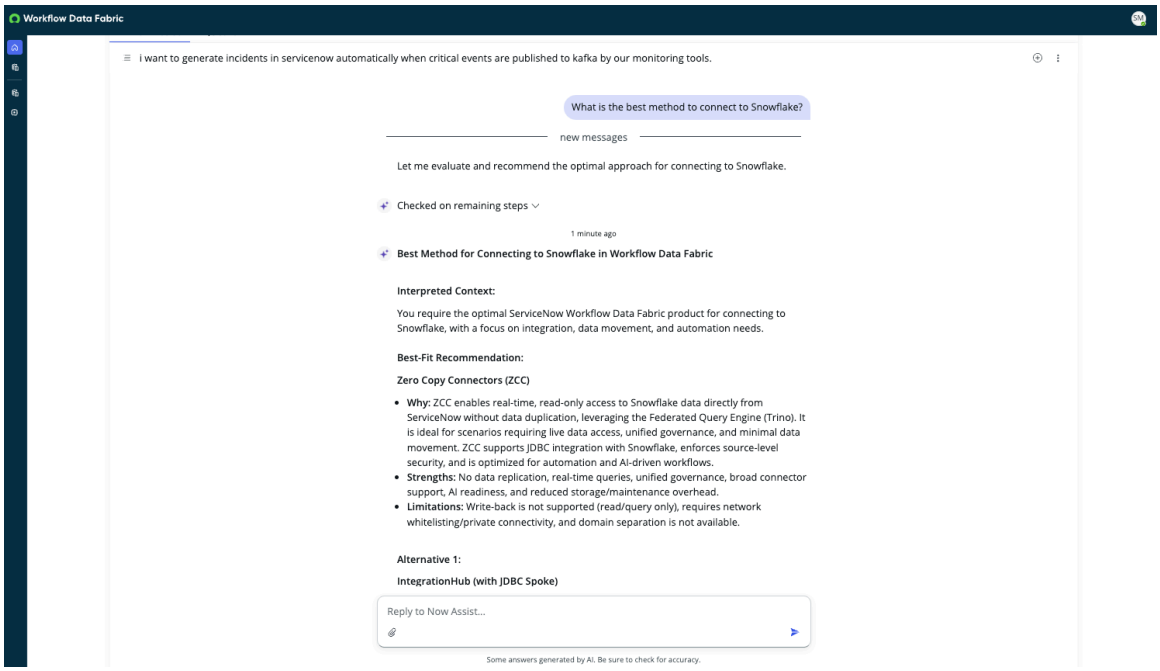


3. **Optional:** Select source links to see more information about a topic.

Note: You can access support information and toggle audio notifications from the Support and setting icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
ServiceNow Otto for Workflow Data Fabric (WDF) provides the information that you requested, including alternatives, sources, and a summary.



Example: Search documents across cloud drives
Employees collaborate in Google Drive and Microsoft OneDrive. We need near real-time indexing so the latest documents are searchable in ServiceNow immediately.

Example: Build dashboards with external data
We want to build executive dashboards using finance data stored in BigQuery/Redshift, but we don't want to copy or synchronize that data into ServiceNow or another system.

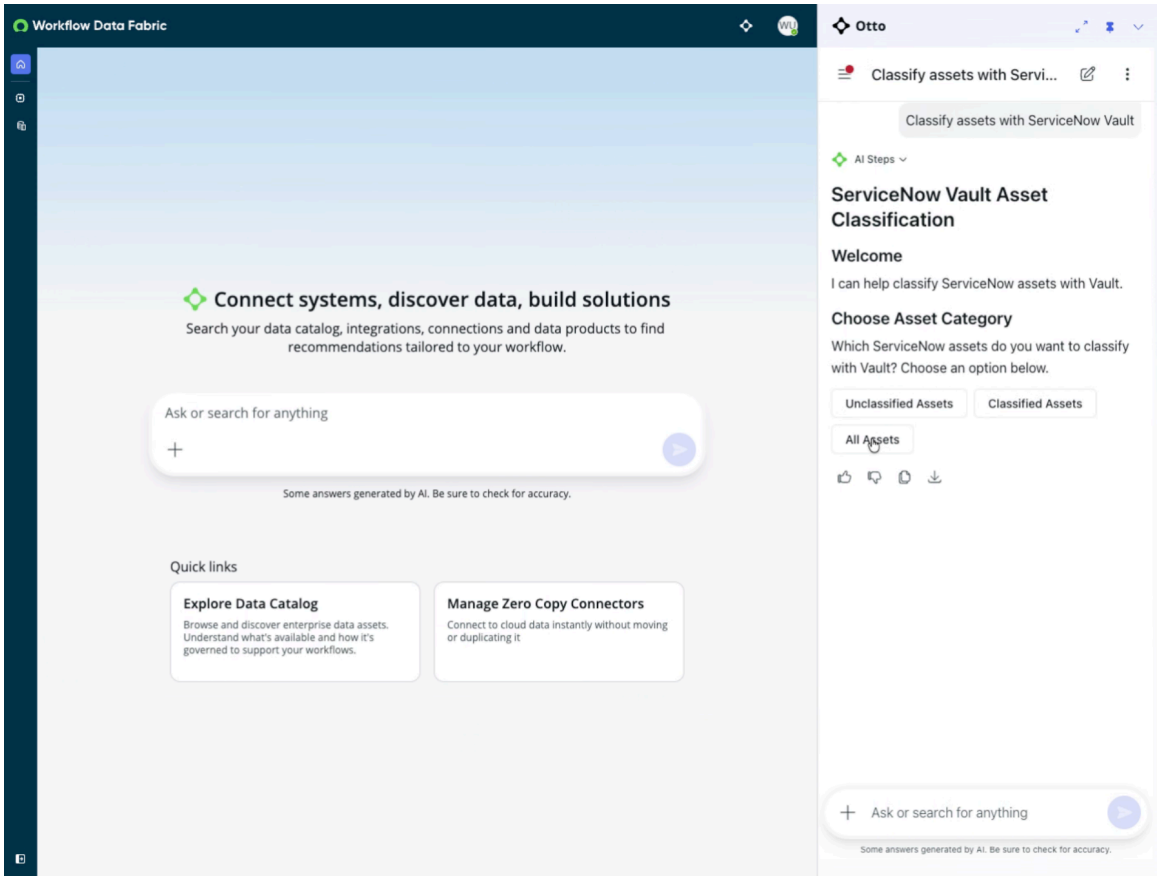
Example: Automate incident creation
I want to generate incidents in ServiceNow automatically when critical events are published to Apache Kafka by our monitoring tools.

Example: Unify customer data
Customer data exists across Salesforce SAP, and internal databases. We need a unified view for support and operations without syncing everything into a single system.

Example: Search the data catalog
The support team is investigating customer churn. It wants to find data assets in the Data Catalog that hold subscription and cancellation records, along with the related glossary terms.

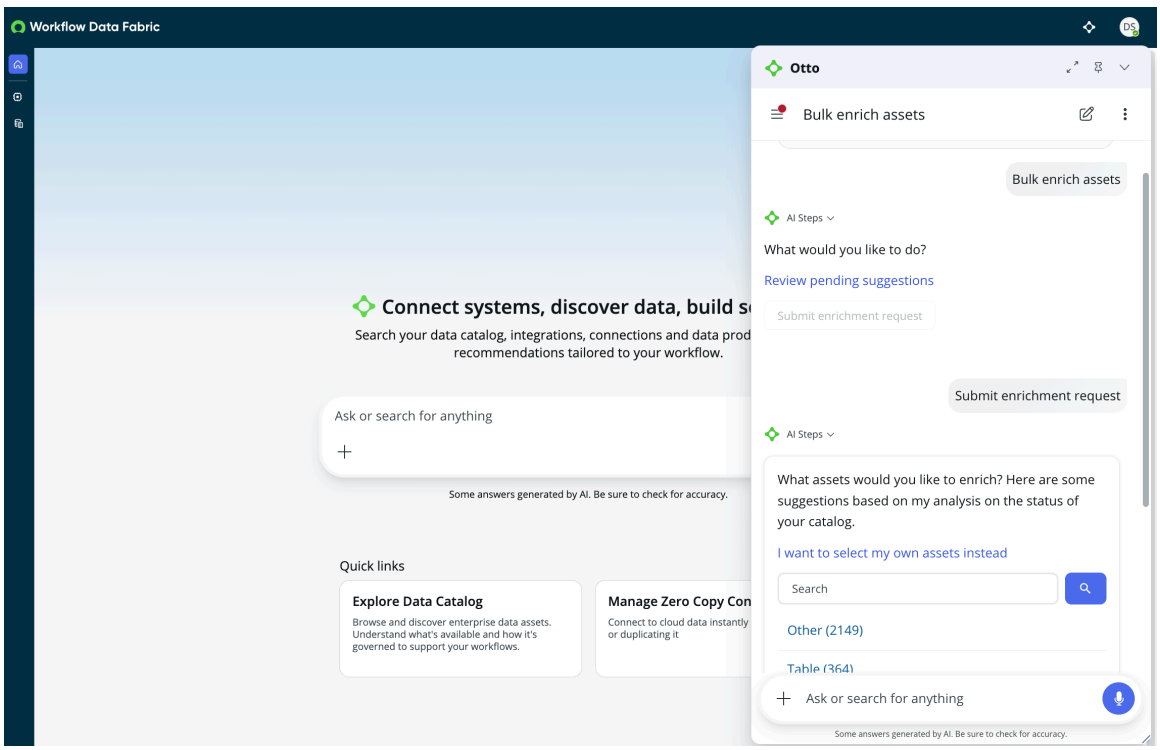
Example: Classify ServiceNow assets
The data privacy team wants data class recommendations for the ServiceNow columns in the Data Catalog. Select the promoted Classifying ServiceNow assets with Vault agents agentic workflow, if available on this panel, or ask Otto to classify the ServiceNow assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Example: Enrich metadata for data assets

A recent metadata collector run onboarded new assets to the Data Catalog, but their metadata is still incomplete. Select the promoted Bulk-enrich assets action, if available on this panel, or ask Otto to bulk enrich the assets.



© 2026 ServiceNow, Inc. All rights reserved.

Quicklink [sn_wdf_quicklink]	Contains quick link parameters for ServiceNow Otto for WDF.
Search Result Route Config [sn_wdf_search_results_route_config]	Contains routing configurations for search results for ServiceNow Otto for WDF.

Connect to external systems

Connect Hub is a unified workspace for discovering, building, and managing integrations between ServiceNow and external systems. It consolidates discovery, configuration, and management into a single interface.

Key capabilities of Connect Hub

Connect Hub provides a consolidated interface to accomplish key integration tasks :

Discover external systems and integration opportunities

Explore available external systems and identify connection methods for over 200 third-party systems like MS Teams, Jira, and Snowflake.

Build and manage connectors

Access prebuilt integration components including Spokes, Zero Copy Connectors, and custom connector types. Browse the connector library to select appropriate tools for your integration scenarios or integrate Model Context Protocol clients.

Configure connections and credentials

Set up and manage secure authentication details, endpoint URLs, and access controls for your integrations between ServiceNow and external systems.

Access specialized integration tools

Use Connect Hub as the entry point for building Spokes and setting up Model Context Protocol clients.

Understanding connectors and connections

Connect Hub distinguishes between two fundamental integration concepts: connectors and connections. Understanding this relationship is essential for effective integration development.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connectors

Prebuilt integration components that define communication with specific external applications. A connector acts as a translator between ServiceNow and the target system, providing actions, triggers, and data-mapping capabilities. For example, a Jira connector contains all the logic needed to interact with Jira's API, including available operations like creating issues or updating workflows. Connectors are reusable tools that you configure once and use across multiple connection instances.

Connections

Specific configuration instances that contain the credentials and endpoint details needed to establish communication with a particular external system. A connection holds authentication information such as API keys, OAuth tokens, or user name and password combinations, along with the target system's URL. You create a connection by selecting a connector and providing the specific credentials for your environment. For example, you might use the Jira connector to create separate connections for your development, staging, and production Jira instances.

The relationship between connectors and connections follows a one-to-many pattern. A single connector supports multiple connection instances, enabling you to reuse integration logic across different environments or system instances while maintaining separate credentials and configurations for each. For example, you can have one Jira spoke connector but have three different connections: one each for development, staging, and production respectively.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store.

Application version

Connect Hub v2.4.0 is the latest version.

Create external systems

Create a custom external system to organize integrations beyond the default systems.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click the **External Systems** card.
3. Click **Create** > **External System**.
4. In the **System** field, enter a descriptive name for your system.
5. **Optional:** Click the image area and upload an icon or logo.
6. Click **Add**.

Result

Your new system appears in the **Custom systems** section on the **External Systems** page.

Modify an external system

Change the name of an external system or the image depicting the system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Click the **External Systems** card.
2. In the **Custom systems** pane, click **Edit** next to the system name.
3. Change the system name or icon.
4. Click **Update**.

Explore external systems

Find and explore external systems through search and filtering.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Select the **External Systems** card.
   The **External Systems** tab displays the list of external systems (custom and default systems) currently available in Connect Hub.
3. Search for a system to narrow the list of systems.
4. Select a system to view the connectors and connections that are part of the external system.

Build integrations with connectors

Browse connector types to communicate with the external systems. Connectors move data, trigger actions, and automate tasks between platforms based on your workflow needs.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Select the **Connect Hub** icon from the left navigation.
3. Find the connector type you need:
   - **Spoke** - See Building spokes using Spoke Generator for full build and configuration details.
   - **Model Context Protocol (MCP)** - See MCP Integration Documentation for full configuration details.
4. Find your connector in the list.
5. Click the connector to configure it.

Map connector to system

After creating a connector, configure connectors with an external system.

About this task
Connectors must be mapped to an external system before they can be used. If you want to link a unmapped connector (spoke or MCP) to an external system, you must map it to an external system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click **Connectors**.
3. Click **Map System** in the System Name column.
4. Choose an existing system to map the connector to.

   To create an new external system, click  to add a new external system to map an existing connector.
5. Choose the connector type.
6. Click **Save** to complete the mapping.

View Connectors

View the list of connectors for an external system.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Select the **External Systems** card.
   The **External Systems** tab displays the list of external systems (custom and default systems) currently available in Connect Hub.
3. Select an external system and select **Connectors**.
   The list of connectors available for the external system are displayed as cards.
4. Click a connector card to display the connection settings in a new **Connector** tab.

Model Context Protocol connectors

Model Context Protocol (MCP) connectors in Connect Hub enable AI agents to access tools and data from external systems using a standardized communication protocol.

MCP is an open protocol that defines how AI agents communicate with external systems to discover and invoke tools, retrieve resources, and share context. By standardizing this communication layer, MCP allows AI agents to interact with a wide range of third-party applications without requiring custom integration logic for each one.

In Connect Hub, an MCP connector represents a configured connection between ServiceNow and an external system that exposes an MCP-compatible server. Once an MCP connector is set up, AI agents can use it to access the tools and capabilities that the external system provides, enabling coordinated, context-aware workflows across models and systems.

MCP Registry

ServiceNow MCP Registry is a private registry where large language models (LLMs), AI agents, and teams discover and connect to approved MCP servers, finding the best tool for every business problem, governed at every step. The Registry enables AI models and humans query available MCP servers and select the ones best suited to solve a business problem. Every server exposed to an LLM can obtain approval from AICT, helping to ensure autonomous decisions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

never bypass enterprise governance. It works with AI Agent Studio, Claude, and so on. For more information, see ServiceNow MCP Registry.

MCP connector registration methods for OAuth 2.1

Connect Hub supports two OAuth client registration methods for connecting to external systems: manual client registration and dynamic client registration. When the MCP registry does not include a connector for the system you need, you can define a custom connector. Connectors that are tested and approved by ServiceNow display a **Certified by ServiceNow** label in the registry.

Dynamic client registration automates the OAuth application setup between Connect Hub and the third-party provider. Instead of requiring you to create an OAuth application manually, the provider and Connect Hub negotiate the client credentials automatically as part of the connection flow. When a connector may probably require manual setup, the registry entry displays the label **Manual setup may be required** next to the connector name.

Dynamic client registration offers the following advantages over manual registration:

- Credentials are managed by the provider and rotated automatically, reducing the risk of credential exposure.
- The connection workflow is completed in fewer steps.

Manual client registration requires you to create and configure an OAuth application in the third-party system's developer settings before connecting the MCP connector. During this process, the third-party system issues Client ID and a Client secret, which you provide to Connect Hub to authorize the connection.

The MCP registry in Connect Hub includes connectors for a curated set of third-party systems. If the registry does not contain a connector for the system you need, you can define a custom connector by providing your own MCP endpoint URL and authentication configuration.

Authentication methods for custom connectors

When creating a custom MCP connector, you select an authentication method that matches the security requirements of your external MCP server. The following authentication methods are supported:

- **OAuth 2.1**: The recommended method for MCP connectors. Supports both Dynamic Client Registration, where the server auto-populates client details, and Manual Client Registration, where you supply the client credentials directly.
- **API key**: Uses a static key issued by the third-party application to authenticate requests to the MCP server.
- **Basic Authentication**: Authenticates using a username and password associated with the MCP server.

Dynamic client registration

Connect an MCP connector in Connect Hub to enable AI agents in Workflow Data Fabric to interact with an external system using automatic OAuth authorization.

Before you begin

- An account with the third-party system you want to connect to. Ensure that your account has the permissions required to authorize OAuth applications.
- Role required: wdf_builder or admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

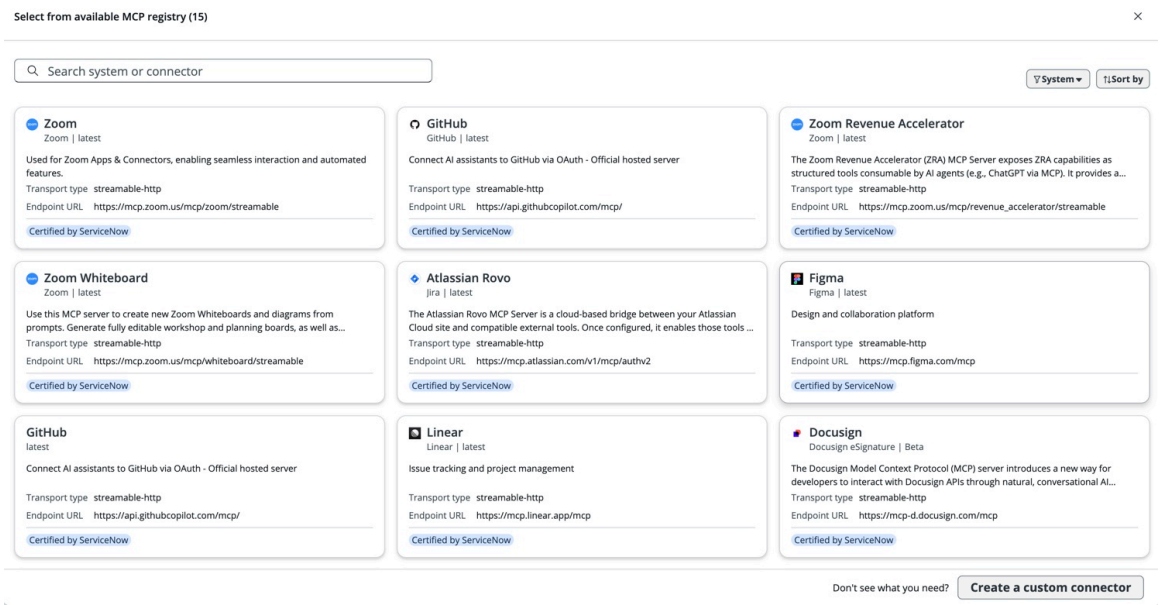
About this task

Dynamic client registration enables you to connect an MCP connector that supports automatic OAuth authorization, such as Linear. In this, Connect Hub redirects you to the third-party provider's authorization page, where you approve the connection. No Client ID or Client secret is required. If the connector you want to use requires manual setup with a Client ID and Client secret, see Manual client registration.

For the list of available MCP connectors, see Available Enterprise MCP Registries.

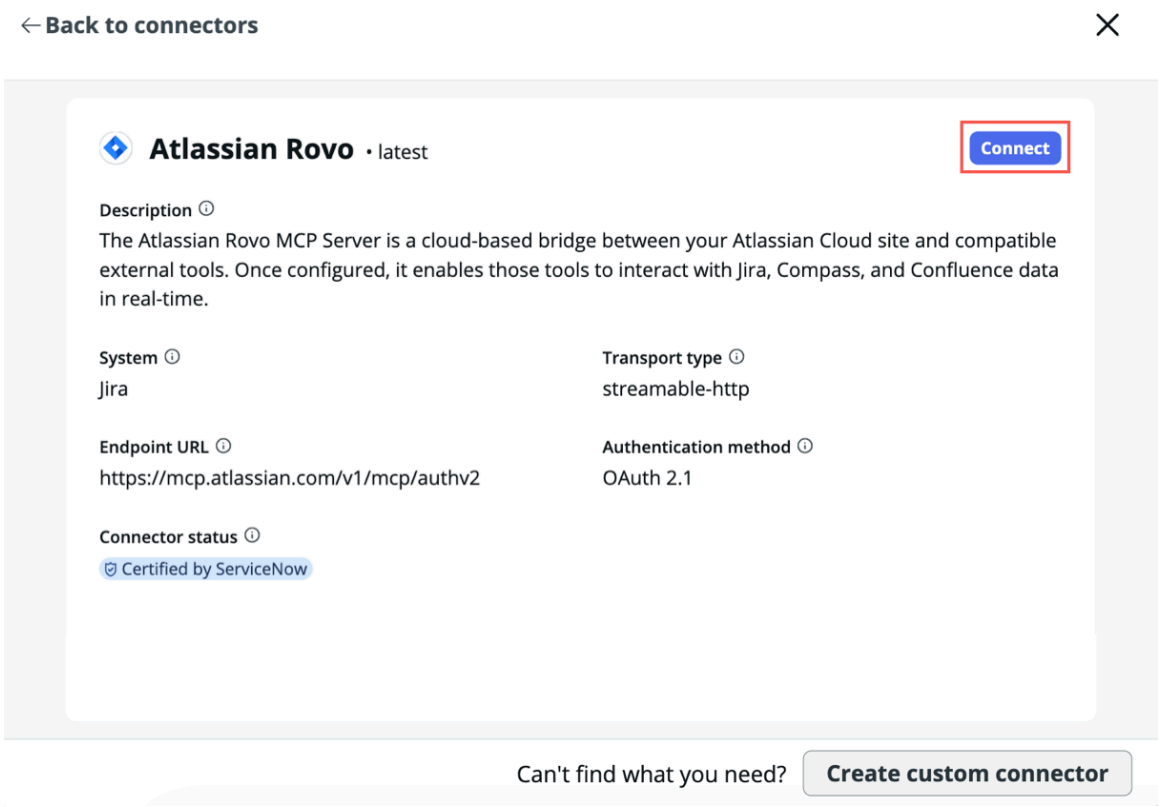
Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click **Create** and select **Model Context Protocol**.
   The list of all available MCP connectors is displayed.



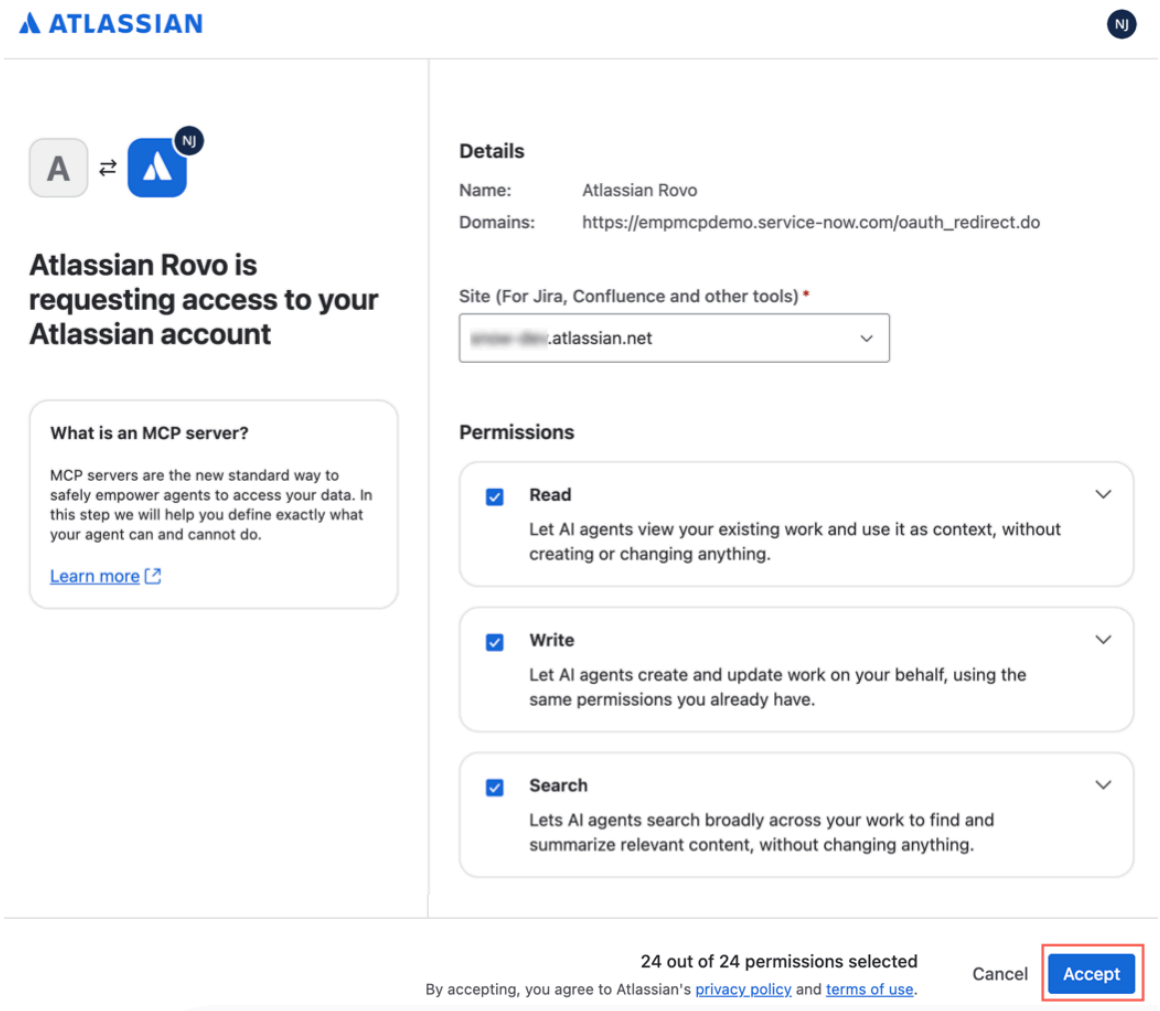
3. Locate the connector you want to use.
   - To search for a connector by name, enter the connector or system name in the **Search system or connector** field.
   - To filter by system, select **System**, select one or more systems from the list, and then select **Apply**.
   - To change the sort order, select **Sort by** and choose the preferred option.
4. Select the connector card.
   A details panel opens on the right, displaying the connector's description, system, type, endpoint URL, and certification status. If multiple connectors are available for the same system, they are listed under **Other connectors** in the panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Connect**.
   Connect Hub initiates the OAuth authorization flow and redirects you to the third-party provider's authorization page in a new browser window or tab. The dialog in Connect Hub shows the status message.
6. In the third-party provider's authorization page, review the requested permissions and select **Approve**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Provide the credentials when prompted.
   After authorization completes, the Edit MCP Connector page is displayed with the connection record details. A **Connected** label is displayed next to the connection name when the connector is ready for use.

Result
The MCP connector is connected to Connect Hub and available for use in AI agent configurations and automation flows.

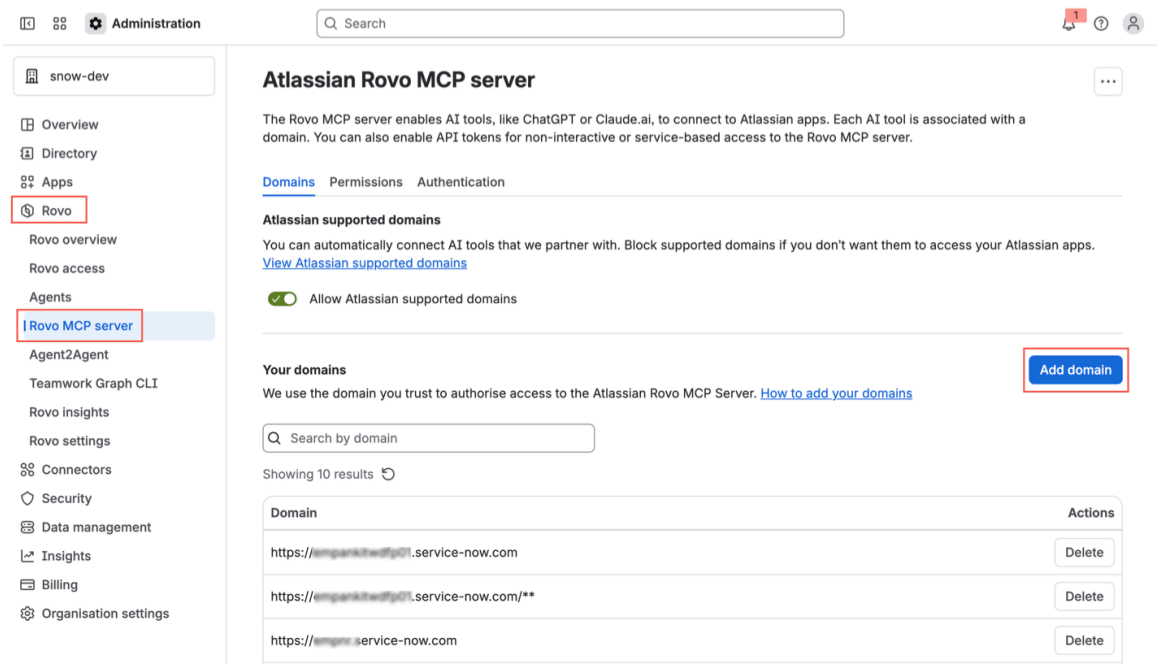
Dynamic client registration use case: Jira

This use case illustrates manual client registration for Jira.

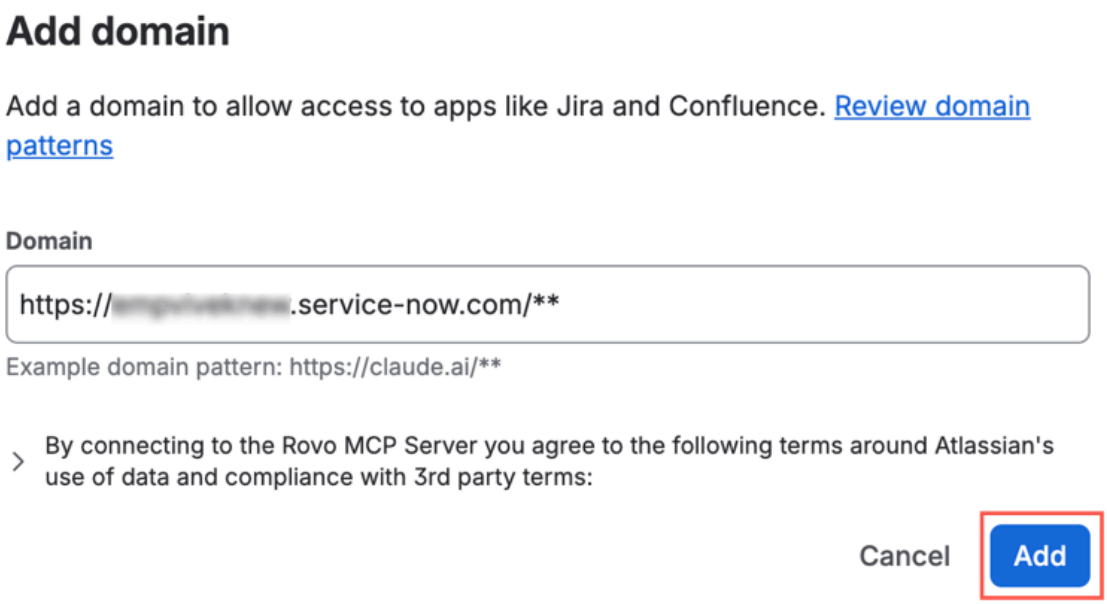
Before you begin
Role required: admin

Procedure
1. Log in to your Atlassian Administration account.
2. Navigate to **Settings** > **Billing**.
3. Navigate to **Rovo** > **Rovo MCP server**.
4. Click **Add domain**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In **Domain**, provide the ServiceNow instance URL in this format: `https://<ServiceNow-Instance-Name>.service-now.com/**`.



6. Click **Add**.

What to do next

Navigate to **All** > **Workflow Data Fabric** > **Connect Hub** to dynamically register the client in your ServiceNow instance. For instructions, see Dynamic client registration.

Manual client registration

Connect to an MCP connector in Connect Hub by providing OAuth 2.1 credentials from the third-party provider, for connectors such as GitHub and Figma that require a registered OAuth application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

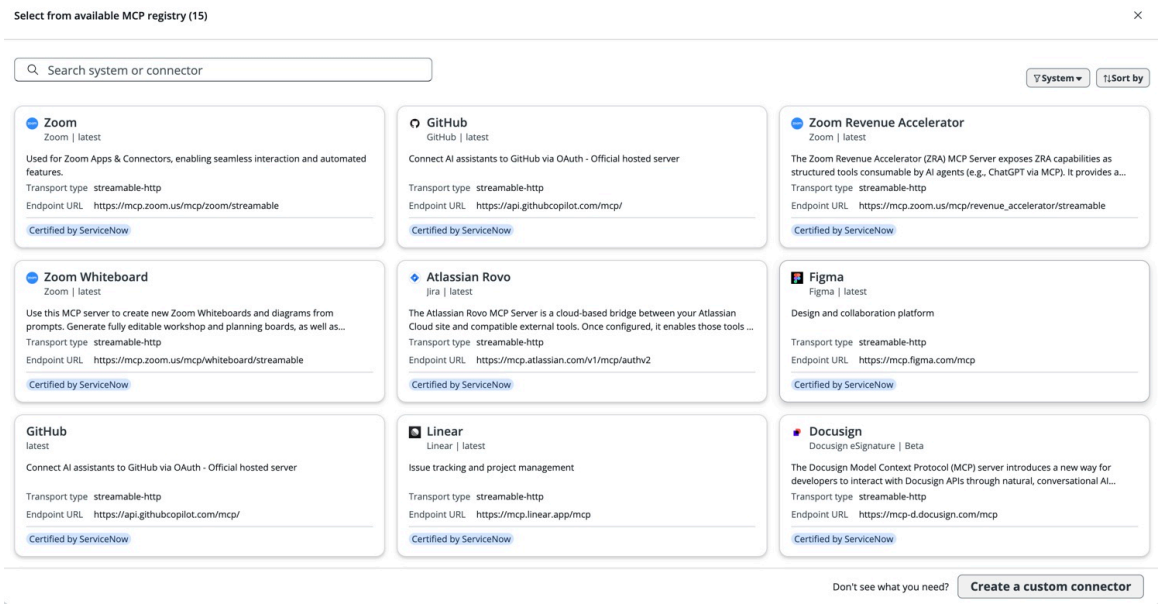
- Note the **Client ID** and **Client secret** generated for your OAuth application. You must provide these values during the connection setup.
- Some connectors may require additional configurations. See Additional connector configurations for the list of supported connectors that require additional configurations. If your connector is listed, perform the required configurations before registering the client manually.
- Role required: wdf_builder or admin.

About this task

Some MCP connectors require you to manually supply OAuth 2.1 credentials instead of using an automatic authorization redirect. Connect Hub displays the label **Manual setup may be required** next to connectors that use this method.

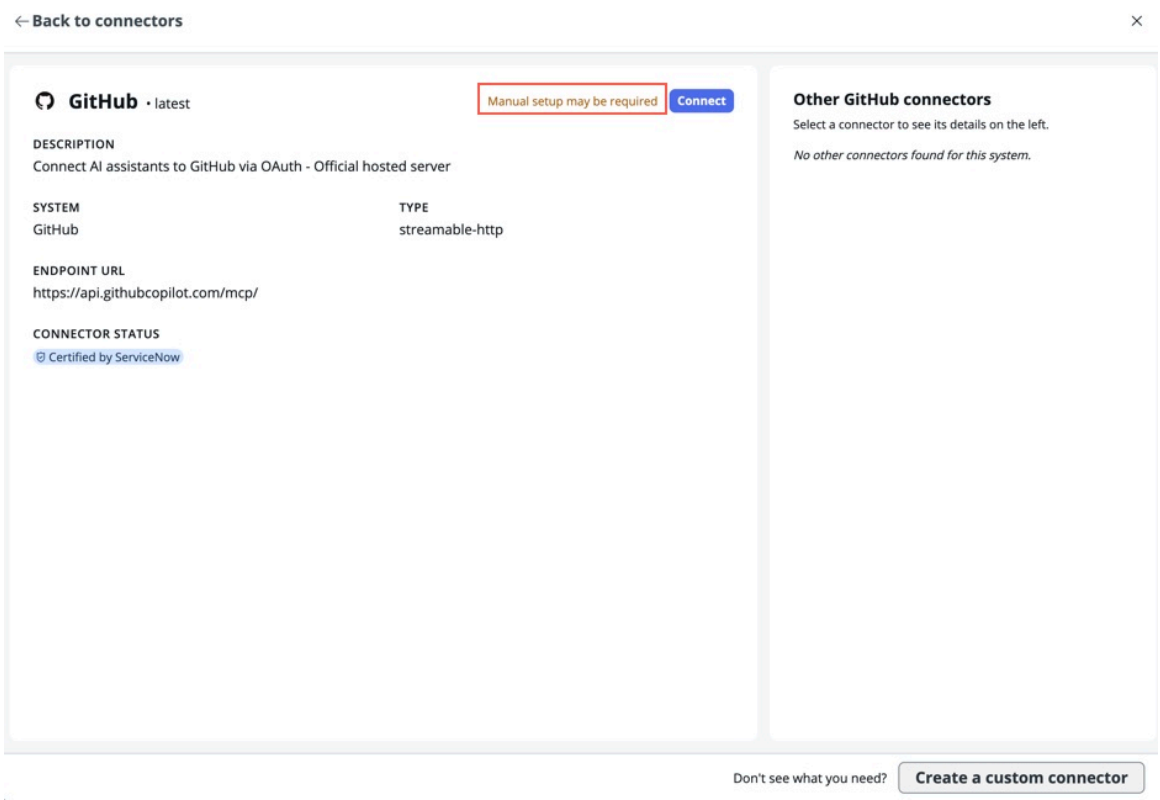
Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click **Create** and select **Model Context Protocol**.
   The list of all available MCP connectors is displayed.



3. Locate the connector you want to use.
   - To search for a connector by name, enter the connector or system name in the **Search system or connector** field.
   - To filter by system, select **System**, select one or more systems from the list, and then select **Apply**.
   - To change the sort order, select **Sort by** and choose the preferred option.
4. Select the connector card for the system you want to connect.
   A details panel opens showing the connector description, system, type, endpoint URL, and the label **Manual setup may be required**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



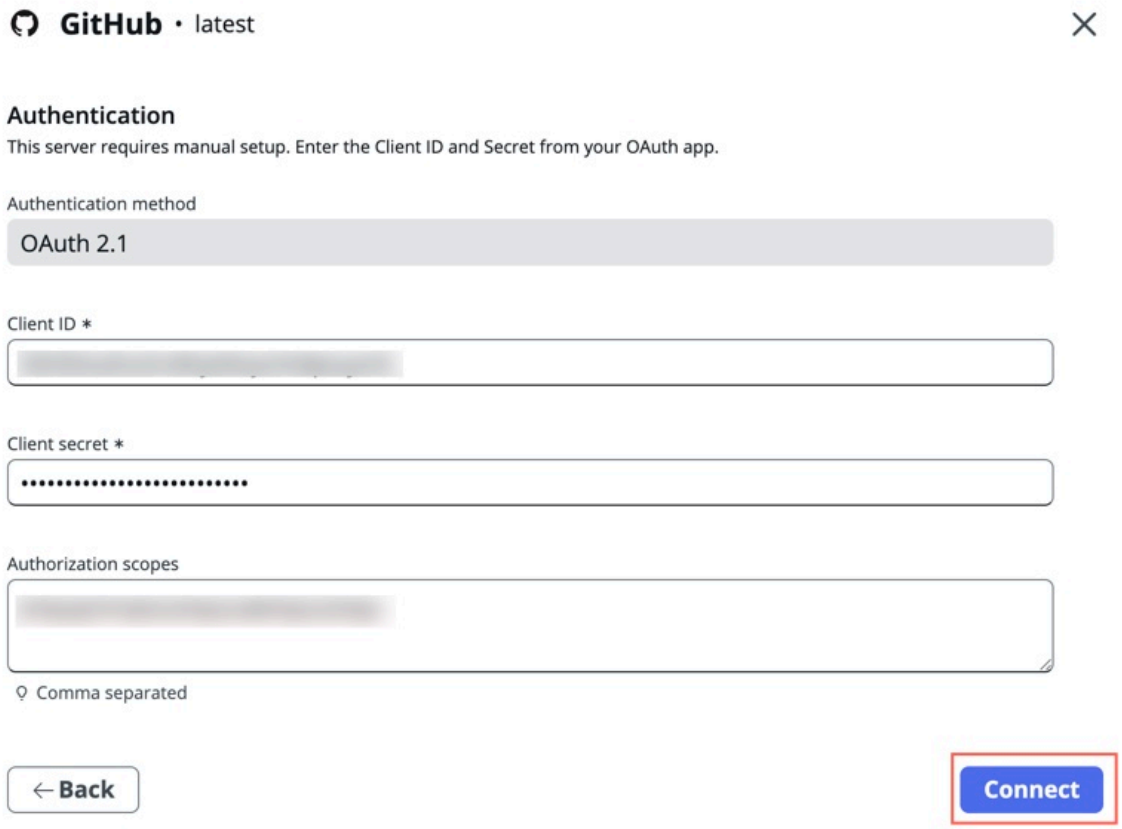
5. Select **Connect**.
   The Authentication dialog opens for the selected connector. The dialog shows the authentication method as **OAuth 2.1** and includes fields for authentication..
6. On the form, fill these values.

Field	Description
Client ID	Client ID from your OAuth application in the third-party system.
Client secret	Client secret from your OAuth application in the third-party system.
Authorization scopes	Optional OAuth scopes as a comma-separated list.

> **Note:** Refer to the third-party system's OAuth documentation for the list of supported scopes. For example, the Figma connector uses the scope `mcp:connect`. If no scopes are required, leave the field empty.

7. Select **Connect**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Connect Hub processes the OAuth credentials and creates the connection record. The Edit MCP Connector page is displayed with the connection record details. A **Connected** label is displayed next to the connection name when the connector is ready for use.

Result

The MCP connector is connected to Connect Hub using the OAuth 2.1 credentials you provided. The connector is available for use in AI agent configurations and automation flows.

Manual client registration use case: GitHub

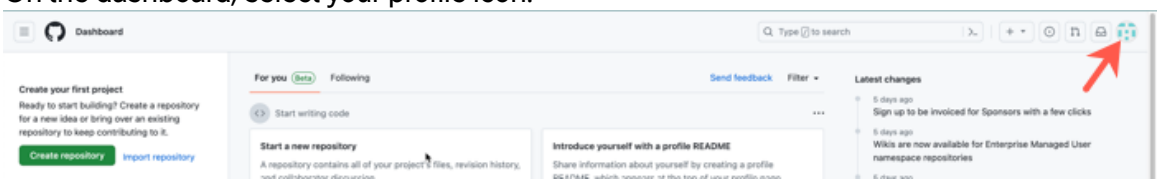
This use case illustrates manual client registration for GitHub. For this, the **Client ID** and **Client secret** must be generated for your OAuth application in GitHub account.

Before you begin

Role required: admin

Procedure

1. Log in to https://github.com/.
2. On the dashboard, select your profile icon.



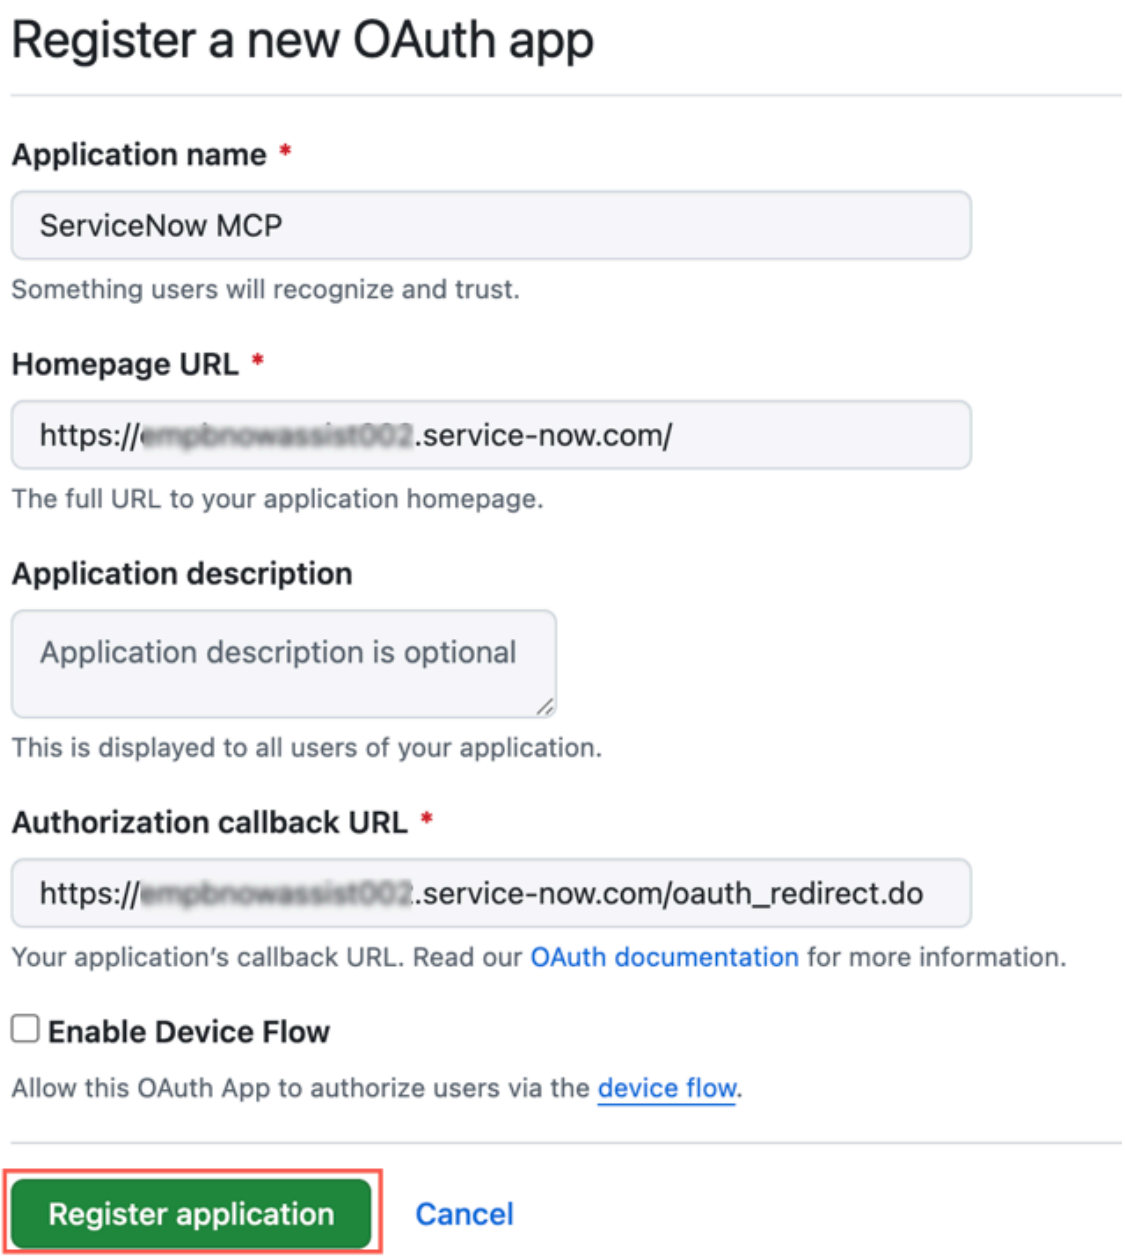
3. Select **Settings**.
4. In the Settings page, on the left panel, select **Developer settings**.
5. Click **OAuth Apps** and click **New OAuth app**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the firm, fill these fields.

Field	Description
Application name	Name to identify the application.
Homepage URL	URL of your ServiceNow instance.
Authorization callback URL	Callback URL of your ServiceNow instance in this format: `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.

7. Click **Register Application**.

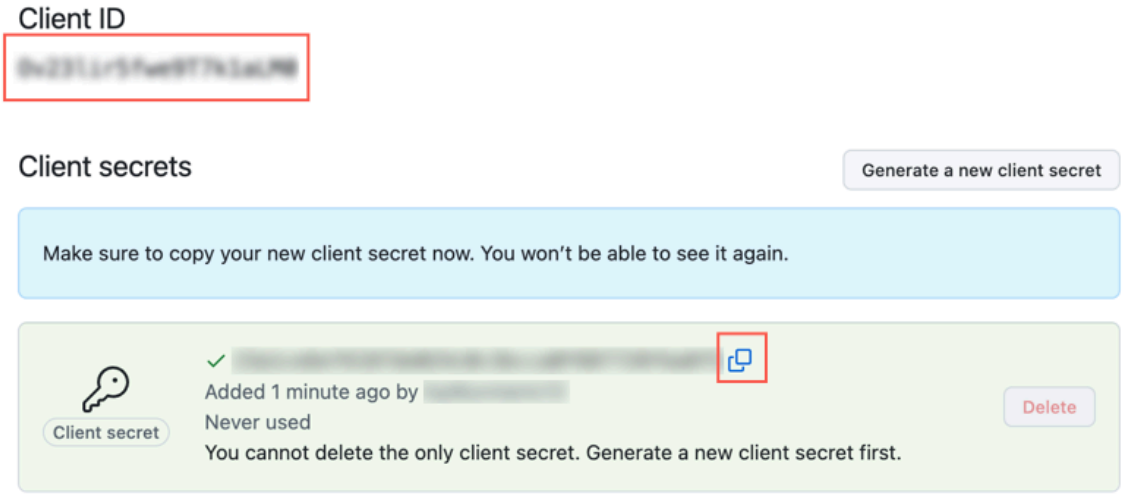


The developer settings for the application are displayed.

8. Click **Generate a new client secret**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

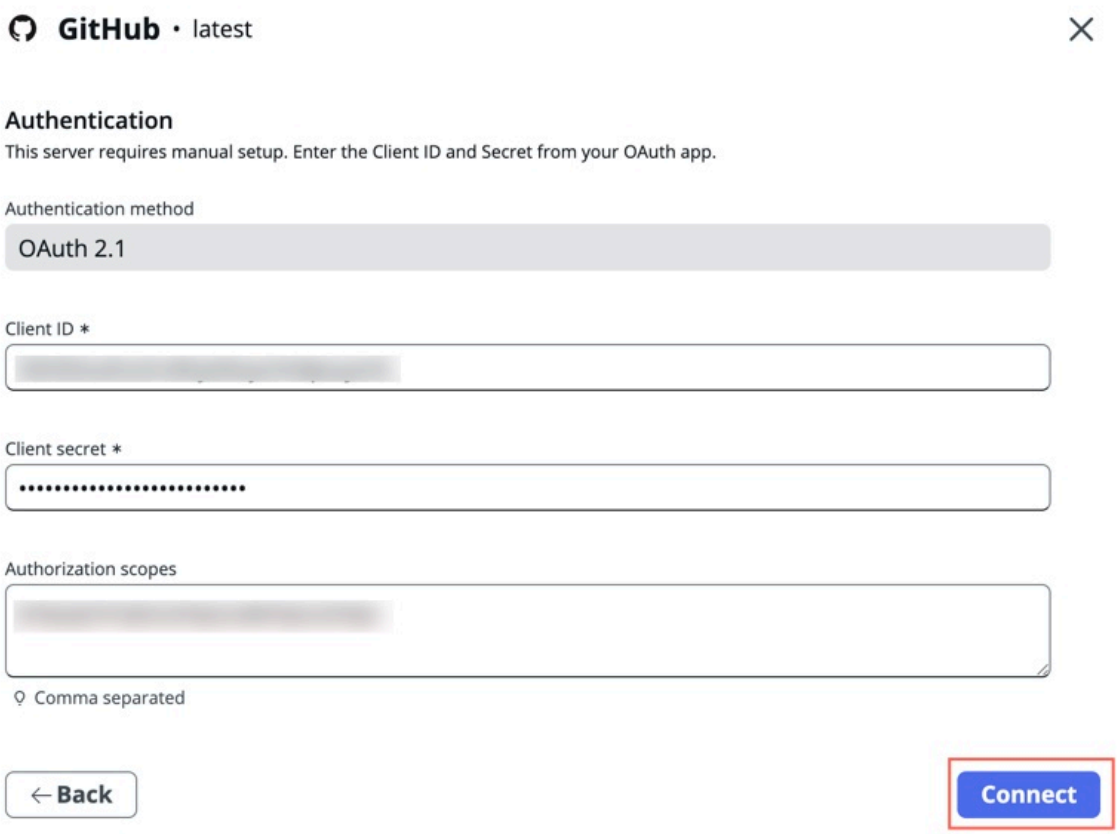
Values of **Client ID** and **Client secret** are displayed.



9. Copy and record the values of **Client ID** and **Client secret** for later use.

What to do next

Navigate to **All** > **Workflow Data Fabric** > **Connect Hub** to manually register the client in your ServiceNow instance. During the client registration, provide the values of **Client ID** and **Client secret**. For instructions, see Manual client registration.



Client registration using custom connector

Define a custom connector by providing your own MCP endpoint URL and authentication configuration if the registry does not contain a connector for the system you need.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: wdf_builder or admin.

About this task
Use a custom connector in the following situations:

- The third-party system exposes an MCP-compatible endpoint, but no certified or community connector exists in the registry for it.
- You are connecting to an internal or proprietary system within your organization that is not listed in the registry.
- You need to override the endpoint URL or authentication settings of an existing registry connector for a specific environment or configuration.

Custom connectors support both manual and dynamic client registration, depending on the capabilities of the target system. Custom connectors are scoped to the instance and are not added to the shared MCP registry.

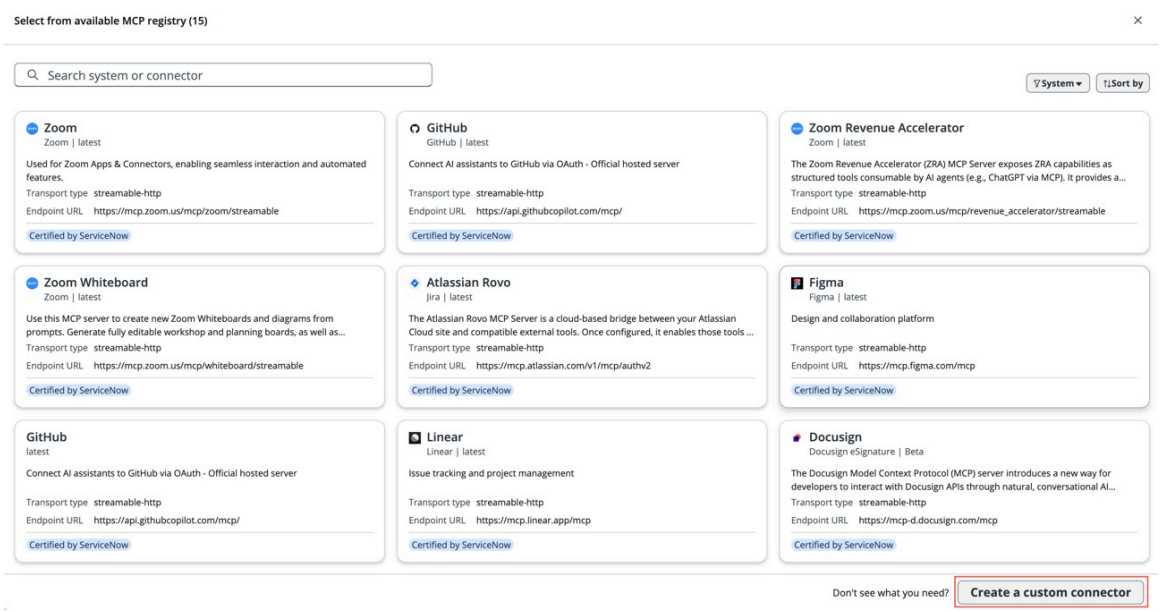
Create an MCP Connector with OAuth 2.1

Create an MCP Connector with OAuth 2.1 for connecting to external systems or applications that support MCP.

Before you begin
Role required: sn_mcp_client.admin

About this task
OAuth 2.1 provides the most secure and flexible authentication for MCP connectors. If your MCP server supports it, select OAuth 2.1 as the authentication method. You can choose between Dynamic Client Registration, where the server auto-populates client details, or Manual Client Registration, where you provide the client details yourself.

Procedure
1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click **Create** and select **Model Context Protocol**.
   The list of all available MCP connectors is displayed.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Create a custom connector**.
4. On the form, fill in the fields.

System Details

Field	Description
Server name	Name of the MCP server. For example, Linear MCP server.
System	Search for the external system you want to integrate.
Add system (Optional)	Click the + icon to add an external system. For more information, see Create external systems. **Note:** If you already have an existing system, you can use that system for the MCP connector.
Connection name	Select **New connection** and enter a name to uniquely identify the connection. For example, Linear Connection.

Connection Configuration

Field	Description
Endpoint name	This field is auto-populated with the Connection name.
Endpoint URL	Connection URL for the MCP server.
Authentication Method	Select **OAuth 2.1**.

Select the registration type based on your MCP server's capabilities.

Manual Client Registration

Field	Description
Authorization method	Select the grant type to be used for requesting tokens from the authorization server. ○ **Authorization Code**: A system-generated code used for granting access to an application or resource. ○ **Client Credentials**: Access token provided by the administrator to access the application directly.
Client ID	Client ID of the OAuth provider.
Client Secret	Client secret of the OAuth provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client Authentication	Specifies how the client credentials are sent to the OAuth token endpoint when requesting an access token. ○ **Client Secret Post**: Sends the client ID and client secret in the request body as form-encoded parameters when calling the token endpoint. ○ **Client Secret Basic**: Sends the client ID and client secret in the HTTP Authorization header using Basic authentication when calling the token endpoint.
Access permissions	Select the required scopes. These scopes determine the permissions of this OAuth client.
OAuth Auth URL	URL of the OAuth authorization server.
OAuth Token URL	OAuth server endpoint used to obtain access tokens.
Token revocation URL	OAuth server endpoint used to revoke previously issued tokens.

Dynamic Client Registration

Field	Description
Authorization method	Select the grant type to be used for requesting tokens from the authorization server. ○ **Authorization Code**: A system-generated code used for granting access to an application or resource. ○ **Client Credentials**: Access token provided by the administrator to access the application directly.
Client Authentication	Select how the client credentials are sent when requesting tokens from the authorization server. ○ **Basic Authorization Header** ○ **Request Body Parameter** ○ **Private Key Jwt**
Access permissions	Select the required scopes. These scopes determine the permissions of this OAuth client.
Authorization URL	URL of the OAuth authorization server.
Token URL	OAuth server endpoint used to obtain access tokens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token revocation URL	OAuth server endpoint used to revoke previously issued tokens.
Client registration token	Token used to authenticate requests to the OAuth client registration endpoint.
Value	Token for dynamic client registration. Leave this value blank if the server supports unauthenticated registration.

5. Click **Save**.

   For example:

   You are redirected to the third-party page requesting authorization for the MCP client.

6. Click **Approve**.
   The MCP client for your application is created and appears in the **Model Context Protocol** list.

Create an MCP Connector with API Key

Create an MCP Connector with API key for connecting to external systems or applications that support MCP.

Before you begin
Role required: sn_mcp_client.admin

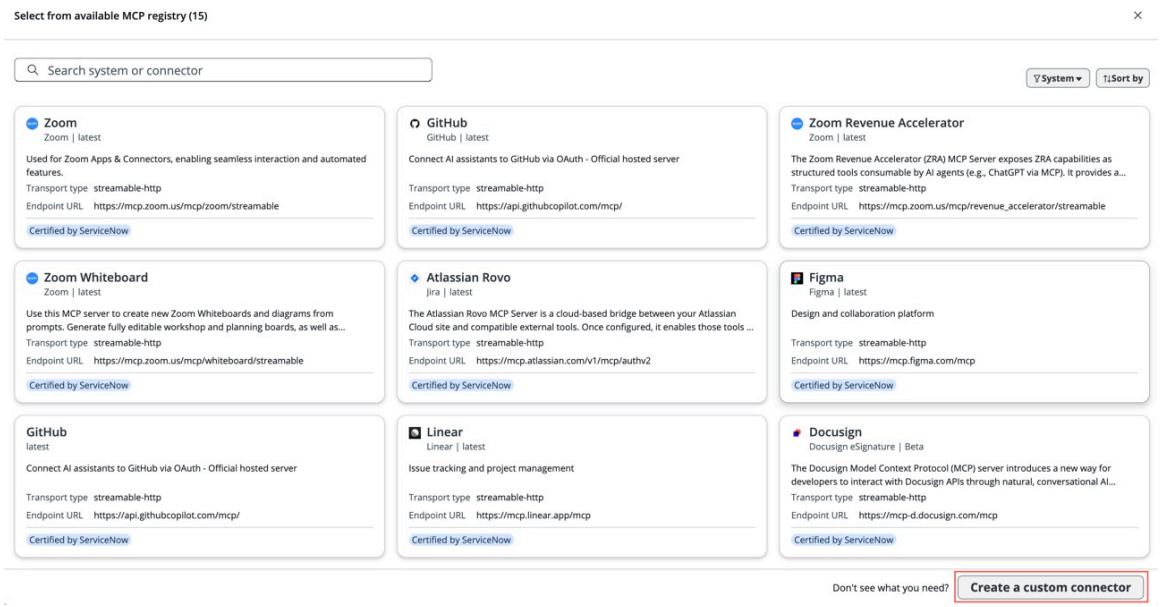
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Use API key authentication when your MCP server requires a static key for authorization. Obtain the API key from your third-party application before configuring the connector.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click **Create** and select **Model Context Protocol**.
   The list of all available MCP connectors is displayed.



3. Click **Create a custom connector**.
4. On the form, fill in the fields.

System Details

Field	Description
Server name	Name of the MCP server. For example, Figma MCP server.
System	Search for the external system you want to integrate.
Add system (Optional)	Click the + icon to add an external system. For more information, see Create external systems. **Note:** If you already have an existing system, you can use that system for the MCP connector.
Connection name	Select **New connection** and enter a name to uniquely identify the connection. For example, Figma Connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection Configuration

Field	Description
Endpoint name	This field is auto-populated with the Connection name.
Endpoint URL	Connection URL for the MCP server.
Authentication Method	Select **API key**.
API key	Enter the API key of the third-party application.

5. Click **Save**.
   You are redirected to the third-party page requesting authorization for the MCP client.
6. Click **Approve**.
   The MCP client for your application is created and appears in the **Model Context Protocol** list.

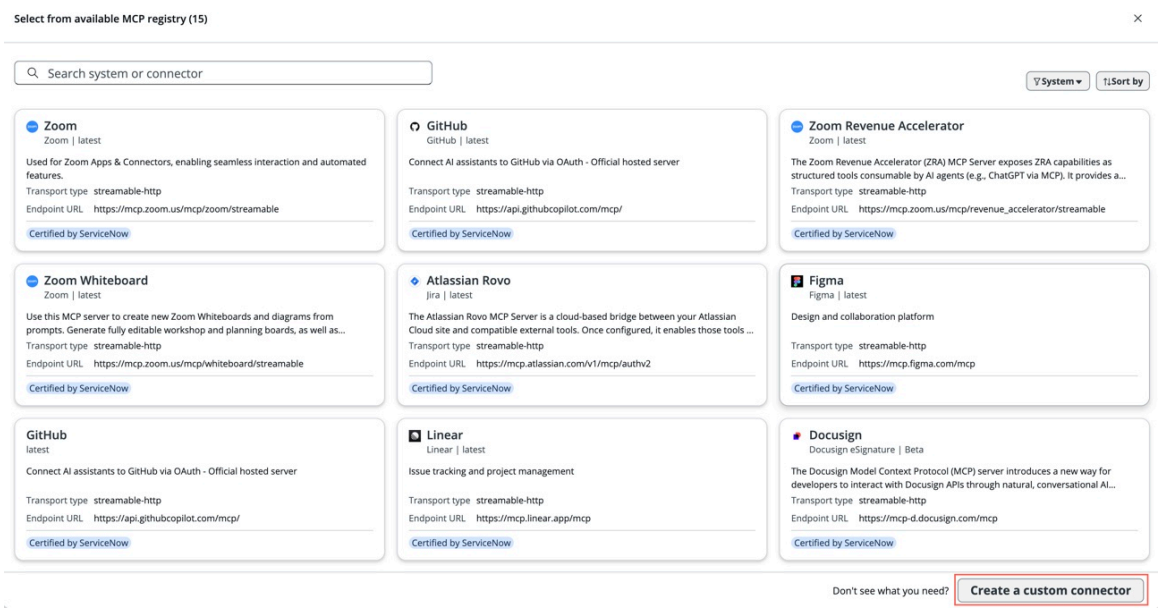
Create an MCP Connector with Basic Authentication

Create an MCP Connector with Basic Authentication for connecting to external systems or applications that support MCP.

Before you begin
Role required: sn_mcp_client.admin

About this task
Use Basic Authentication when your MCP server requires a username and password for access. Ensure that valid server credentials are available before configuring the connector.

Procedure
1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click **Create** and select **Model Context Protocol**.
   The list of all available MCP connectors is displayed.



3. Click **Create a custom connector**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

System Details

Field	Description
Server name	Name of the MCP server. For example, Figma MCP server.
System	Search for the external system you want to integrate.
Add system (Optional)	Click the + icon to add an external system. For more information, see Create external systems. **Note:** If you already have an existing system, you can use that system for the MCP connector.
Connection name	Select **New connection** and enter a name to uniquely identify the connection. For example, Figma Connection.

Connection Configuration

Field	Description
Endpoint name	This field is auto-populated with the Connection name.
Endpoint URL	Connection URL for the MCP server.
Authentication Method	Select **Basic Authentication**.
User name	User name of the MCP server.
Password	Password of the MCP server.

5. Click **Save**.
   You are redirected to the third-party page requesting authorization for the MCP client.
6. Click **Approve**.
   The MCP client for your application is created and appears in the **Model Context Protocol** list.

Additional connector configurations

Some connectors may require additional configurations while registering client manually. These connectors and their required configurations are listed here.

Zoom connector

User must create one app in Zoom account for each MCP server. For example, two separate apps must be created in Zoom account for Zoom Revenue Accelerator and Zoom Whiteboard. One Zoom app cannot be used for more than one MCP server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Figma connector

Ensure that you whitelist your account and then obtain the values of **Client ID** and **Client secret**. For the list of whitelisted MCP clients, see Figma MCP Catalog.

Miro connector

Obtain the values of **Client ID** and **Client secret**, and add the **Redirect URL** in Miro account. If you are unable to perform the required steps, run this curl command from your terminal. Replace `<ServiceNow-Instance-Name>` in *`client_uri`* and *`redirect_uris`* with your ServiceNow instance name:

```
curl --location 'https://mcp.miro.com/register' \
--header 'Content-Type: application/json' \
--data '{
    "client_uri":
 "https://<ServiceNow-Instance-Name>.service-now.com",
    "grant_types": [
        "authorization_code",
        "refresh_token"
    ],
    "redirect_uris": [

 "https://<ServiceNow-Instance-Name>.service-now.com/oauth_redir
ect.do",

 "https://<ServiceNow-Instance-Name>.service-now.com/mcp_redirec
t.do"
    ],
    "client_name": "AutoGen-1775150937195-OAuthProvider",
    "response_types": [
        "code"
    ]
}'
```

View Connections

View the inbound and outbound connections for an external system.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Select the **External Systems** card.
   The **External Systems** tab displays the list of external systems (custom and default systems) currently available in Connect Hub.
3. Select an external system and select **Connections**.
   The list of outbound connections available for the external system is displayed.

   Note:

   To view the inbound connections, click the **Inbound** tab,

4. Click a connection to display the connection settings in a new **Connection** tab.

© 2026 ServiceNow, Inc. All rights reserved.

Search and filter connections

Find and explore connections available in external systems through search and filtering.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Select the **External Systems** card.
   The **External Systems** tab displays the list of external systems (custom and default systems) currently available in Connect Hub.
3. Select an external system and select **Connections**.
   The list of outbound connections available for the external system is displayed.

   Note:

   To view the inbound connections, click the **Inbound** tab,

4. Use the search field to search for a connection.
5. Use the **Connectors** filter to filter the connections by connector type or use the **Status** filter to filter by status.

Connections and Credentials

The **Connections and Credentials** page is where you create, configure, and manage all connections between ServiceNow and external systems. This is where you store authentication credentials and establish the actual communication links.

Outbound connections

Outbound connections are integrations where ServiceNow initiates communication to an external system. ServiceNow calls the external system to read data, write data, or trigger actions.

When you create an outbound connection, you:

- Select the external system
- Choose a connector type
- Configure authentication credentials
- Set up endpoints for different environments
- Save the connection for use in workflows

See Set up outbound connections for detailed steps.

Inbound connections

Inbound connections are integrations where an external system initiates communication to ServiceNow. The external system sends data, events, or triggers actions in ServiceNow.

When you create an inbound connection, you:

- Select the external system
- Choose a spoke to handle the incoming data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure authentication credentials
- Activate the connection to generate an endpoint URL
- Share the endpoint URL with the external system

See Set up inbound connections for detailed steps.

Credentials and security

All credentials stored in Connections and Credentials are encrypted and securely managed by ServiceNow. Credentials include:

- Usernames and passwords
- API keys and tokens
- OAuth credentials

You can update credentials anytime without affecting the connection configuration. Changes apply immediately to new requests.

Connection status

Each connection displays a status indicating its health and readiness. Status values include:

- **Configured** - Connection is configured
- **Connected** - Connection is working and ready to use
- **Expired** - Authentication credentials have expired
- **Not Configured** - Connection is not configured yet
- **Deactivated** - Connection exists but is not active

Managing multiple connections

You can create multiple connections to the same external system for different environments or purposes. Each connection is independent with its own credentials and configuration.

For example, you might have:

- Jira Production connection
- Jira Staging connection
- Jira Development connection

Each connection can use different credentials and settings while using the same connector type.

Set up inbound connections

Inbound connections allow external systems to send data, events, or trigger actions in ServiceNow.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click the **Connections and Credentials** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Create** and select **Inbound Connection**.
4. In the **System** field, select the external system that will send data.
5. In the **Connector Type** field, select the type of connector that this incoming connection will use.
6. In the **Spoke** field, select the spoke that will process the incoming data.
7. In the **Endpoint Name** field, enter a name for the endpoint.
8. In the **Authentication Method** field, select an authentication method and enter the authentication details for your chosen method.
9. Click **Save**.

Set up outbound connections

Outbound connections enable ServiceNow to send data to, read data from, or trigger actions in external systems.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Connect Hub**.
2. Click the **Connections and Credentials** tab.
3. **Optional:** You can create a new external system.
4. Click **Create** and select **Outbound Connection**.
5. In the **System** field, select the external system.
6. In the **Connector Type** field, select the type of connector that this incoming connection will use.
7. On the form, fill in the fields.

System Details

Field	Description
Connection name	Name of the external system that you want to create an outbound connection to. For example, Jira.
Description	A description for the connection to the external system.
Protocol	The connection protocol to connect to the external system.
Retry Policy	Retry policy for the connection. For more information, see Retry policy.

8. Choose between using a configuration template or custom credentials for adding an endpoint.
9. **Optional:** Enable the **Configuration Template** option to choose a preexisting configuration.
10. Configure the **Endpoint 1** connection settings:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Details

Field	Description
Endpoint name	Name of the endpoint.
Endpoint URL	Connection URL for the server.
Authentication Method	Select an authentication method and provide the details for your chosen method.

11. **Optional:** Enable the MID server option and configure the server information. For more information, see Configure a MID Server cluster.
12. **Optional:** Click **Add Endpoint** to add additional endpoints for different environments.
13. Click **Save**.

ServiceNow MCP Registry

Model Context Protocol (MCP) enables AI agents to connect to external systems and perform the required actions without any human intervention. ServiceNow MCP Registry is a private registry where large language models (LLMs), AI agents, and teams discover and connect to approved MCP servers, finding the best tool for every business problem, governed at every step. With these configurations, you can use any generative AI assistant to perform the required actions in ServiceNow.

AI-native discovery

The Registry enables AI models and humans query available MCP servers and select the ones best suited to solve a business problem. Every server exposed to an LLM is pre-approved in AICT, helping to ensure autonomous decisions never bypass enterprise governance. It works with AI Agent Studio, Claude, and so on.

Governed server catalog

The Registry unifies three server types into a single trusted catalog:

- MCP servers built by business units or the WDF abstraction layer.
- Customer servers published through the MCP Server Console or discovered through the CMDB.
- Third-party certified servers for seamless business unit agentic workflow execution.

Agentic workflow support

Business unit agentic workflows need their MCP servers trusted and available before execution begins. Pre-requesting approvals for all servers through AICT and centralizing them in the registry eliminates per-run approval overhead and helps ensure every workflow runs without connectivity surprises.

Request apps on Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store.

Application version

ServiceNow MCP Registry v1.1.0 is the latest application version.

Supported APIs

APIs supported in this version of the ServiceNow MCP Registry application are listed here.

Get MCP Servers

Retrieves a paginated list of registered MCP servers.

The ServiceNow MCP Registry provides HTTP API endpoints for discovering and retrieving MCP server metadata. The list servers endpoint is the primary discovery interface for browsing the registry catalog.

Endpoint

HTTP Method: `GET`

Route: `/api/sn_mcp_registry/v1/servicenow_mcp_registry/servers`

Sample response

```
{
  "result": {
    "metadata": {
      "count": 8,
      "nextCursor": null
    },
    "servers": [
      {
        "_meta": {

Get all versions of an MCP server

Retrieve all available versions for a specific MCP server.

The list server versions endpoint retrieves all available versions for a specific MCP server.

Endpoint

HTTP Method: GET

Route: `/api/sn_mcp_registry/v1/servicenow_mcp_registry/servers/{mcp_server_name}/versions`

Path parameters

Parameter	Type	Required	Description
mcp_server_name	String	Yes	url encoded name of the mcp server. For example, `com.figma.mcp@mcp-server-remote`.

Sample response

```
{
  "result": {
    "serverName": "com.linear.app@mcp-server-remote",
    "totalVersions": 1,
    "versions": [
      {
        "version": "latest",
        "isLatest": true,
        "active": "1",
        "type": "servicenow",
        "description": "Issue tracking and project management",
        "publishedAt": "2026-02-15 18:06:59",

      ]
    }
}
```

Get specific MCP server version

Retrieve detailed configuration for a specific MCP server version, including complete package definitions, transport configurations, and metadata.

The endpoint retrieves detailed configuration for a specific MCP server version. This endpoint returns complete server metadata including package definitions, transport configurations, authentication requirements, and registry-managed metadata. Use the special version `latest` to get the latest version.

Endpoint

HTTP Method: GET

Route: `/api/sn_mcp_registry/v1/servicenow_mcp_registry/servers/{serverName}/versions/{version}`

Path parameters

Parameter	Type	Required	Description
serverName	String	Yes	URL-encoded server name. For example, `com.figma.mcp@mcp-server-remote`.
version	String	Yes	URL-encoded version string. For example, `1.0.0`. Use `latest` to retrieve the latest version.

Sample response

```
{
  "result": {
    "server": {
      "name": "com.linear.app@mcp-server-remote",
      "title": "Linear",
      "description": "Issue tracking and project management",
      "version": "latest",
      "remotes": [
        {
          "type": "sse",
          "url": "https://mcp.linear.app/sse"
        },
        {
          "type": "streamable-http",
          "url": "https://mcp.linear.app/mcp"
        }

Available Enterprise MCP Registries

Pre-configured connection information for a set of high-value MCP Servers are available as part of the Enterprise MCP Registry.

The available MCP Servers are:

Enterprise MCP servers

Server	URL/Endpoint	Services	Authentication	Notes
Zoom	`https://mcp.zoom.us/mcp/zoom/streamable`	• Meetings • Team Chat • Zoom Docs (search and retrieval)	• OAuth 2.0 registered via Zoom App Marketplace.	Enables natural-language retrieval of meeting assets including AI summaries, docs, recordings, and whiteboards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enterprise MCP servers (continued)

Server	URL/Endpoint	Services	Authentication	Notes
		• AI summaries • Recordings and transcripts	• Server-to-Server OAuth supported for headless use.	
Zoom Revenue Accelerator	`https://mcp.zoom.us/mcp/revenue_accelerator/streamable`	• Conversation intelligence • Deal insights • Sales activity • CRM data • Coaching signals	OAuth 2.0 registered via Zoom App Marketplace.	• Focused MCP surface for sales insights and deal intelligence. • Supports reviewing customer interactions and preparing follow-up notes. • Requires a Zoom Revenue Accelerator license.
Zoom Whiteboard	`https://mcp.zoom.us/mcp/whiteboard/streamable`	• Whiteboard creation and management • Diagram generation	OAuth 2.0 registered via Zoom App Marketplace.	• Provides MCP tools for creating editable whiteboards and diagrams from prompts and locating existing boards. • Intended for workshop planning, visual collaboration, and diagram-generation use cases. • Exposes only boards the authenticated user can access.
Zoom Docs	`https://mcp.zoom.us/mcp/docs/streamable`	• Document creation • Document retrieval • Notes in Markdown	OAuth 2.0 registered via Zoom App Marketplace.	• Supports creating new Zoom Docs from Markdown content and retrieving existing Zoom Docs or notes. • Designed for structured document

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enterprise MCP servers (continued)

Server	URL/Endpoint	Services	Authentication	Notes
				generation and read-back flows. • Does not expose update or delete operations.
Zoom Chat	`https://mcp.zoom.us/mcp/team_chat/streamable`	• Team chat channels • Messages • Contacts • Collaboration context	OAuth 2.0 registered via Zoom App Marketplace.	• Focused MCP surface for chat channels, messages, contacts, and collaboration context. • Supports locating chat history, preparing summaries, and generating follow-ups. • Separate from the Zoom Workspace server; exposes write and update tools for messages and channels.
Atlassian Rovo	`https://mcp.atlassian.com/v1/mcp` Legacy SSE endpoint (`/v1/sse`) deprecated after June 30, 2026.	• Jira • Confluence • Compass	• OAuth 2.1. • API token supported for headless or machine-to-machine use if enabled by org admin.	• Cloud-based bridge between an Atlassian Cloud site and compatible external tools. • All actions respect existing user permissions. Exposes 46+ tools across product areas.
DocuSign	`https://mcp.docusign.com/mcp`	• e-Signature • Envelope management • Agreement workflows • Maestro • Navigator	OAuth 2.0 access token is required per interaction.	• Enables natural-language interaction with DocuSign APIs, including authentication, API testing, and envelope creation. • Production connectors support seven API

Enterprise MCP servers (continued)

Server	URL/Endpoint	Services	Authentication	Notes
				groups; additional endpoints accessible in developer mode.
Miro	`https://mcp.miro.com/`	• Whiteboard and board content • Sticky notes, shapes, frames • Diagram generation • Comments	OAuth 2.1 with dynamic client registration	• Supports content summarization, board creation, diagram generation, and comment resolution. • Users must supply a board URL in prompts; agents cannot discover or access boards not explicitly referenced.
Figma	• Remote: `https://mcp.figma.com/mcp` • Desktop/local: `http://127.0.0.1:3845/sse`	• Design files and nodes • Components and variables • Styles • Code Connect • FigJam • Code-to-canvas capture	OAuth 2.0 (browser-based; `mcp:connect` scope required; access limited to clients in the Figma MCP Catalog)	Enables design context extraction, native Figma content creation, and live UI capture as design layers.
Linear	• Streamable HTTP (recommended): `https://mcp.linear.app/mcp` • SSE (deprecated): `https://mcp.linear.app/sse`	• Issues • Projects • Cycles • Comments • Teams and labels	OAuth 2.1 with dynamic client registration (no API key required; browser OAuth flow)	Provides 25+ tools covering the full project management workflow.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enterprise MCP servers (continued)

Server	URL/Endpoint	Services	Authentication	Notes
Prisma	• Remote: `https://mcp.prisma.io/mcp` • Local: `npx prisma mcp` (CLI)	• Prisma Postgres database provisioning • Schema migrations • Backups • Connection strings • SQL query execution • Database recovery	OAuth (browser-based authentication via Prisma Console on first use)	Dual-mode architecture: local server handles development workflows (migrations, schema, queries); remote server manages Prisma Postgres infrastructure.
Box	`https://mcp.box.com`	• File management and operations • Folder operations and navigation • Content search and retrieval • Metadata extraction • Sharing and permissions • Collaboration context • Comments and workflows	OAuth 2.1	Cloud-based bridge for Box file content access. All actions respect existing user permissions. Supports natural-language file discovery, content summarization, and document retrieval. Users must have appropriate Box folder/file permissions.

Note: Some connectors may require additional configurations. See Additional connector configurations for the list of supported connectors that require additional configurations. If your connector is listed, perform the required configurations before registering the client manually.

Workflow Data Fabric Home Reference

Reference topics provide additional information about the terms, forms, and concepts that you use for Workflow Data Fabric Home.

Workflow Data Fabric key terms

Key terms used in Workflow Data Fabric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow Data Fabric key terms

Term	Description
Workflow Data Fabric	Workflow Data Fabric is a unified data foundation that connects to enterprise data across systems, contextualizes it with metadata and stable contracts, making it available to workflows, analytics, and AI agents.
Workflow Data Fabric Home	The AI-guided entry point and parent interface for Workflow Data Fabric, powered by ServiceNow Otto for WDF. It provides natural language search across the catalog, recommendations on reuse versus building new, and navigation to specific tasks like Connect Hub.
Data fabric table	A ServiceNow projection of an external data object that makes external data accessible as if it were a local ServiceNow table, without physically copying the data.
Connectors	Prebuilt integration components that define communication with specific external applications. A connector acts as a translator between ServiceNow and the target system, providing actions, triggers, and data-mapping capabilities.
Connection	A secure, governed access path between ServiceNow and an external data source, such as a database, SaaS application, REST API, event stream, or another ServiceNow instance.
Spoke	A packaged, reusable integration available from the ServiceNow Store that provides prebuilt actions for common third-party systems (such as Azure DevOps, Salesforce, or Jira), enabling quick connectivity without custom development.
Connect Hub	The interface in Workflow Data Fabric Home where Connection Admins create and manage connections to external systems. From Connect Hub, admins configure credentials and authentication, set up metadata collectors, and grant Data Stewards access to work with connected data.
Zero Copy Connector (ZCC)	An integration mechanism that provides real-time query access to external data without moving or copying it into ServiceNow. Zero Copy Connectors are best suited for large data volumes and analytics use cases where data freshness matters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow Data Fabric Home roles

Several user roles are installed with activation of the ServiceNow WDF Unified Hub plugin.

Roles installed

Role title [name]	Description	Contains roles
Connection Admin [connection_admin]	Create and manage connections, configure credentials, set up metadata collectors, and grant Data Stewards access to connections.	• [df_data_steward] • [external_app_install_admin] • [agent_admin] • [credential_admin] • [web_service_admin] • [sn_nowassist_wdf.creator_admin]
Data Steward [df_data_steward]	Create and own all Data products and Data interfaces. Responsibilities include schema design, governance, metadata management, backward compatibility enforcement, and lifecycle management of all data contracts.	• [sn_nowassist_wdf.creator_admin] • [wdf_consumer]
WDF Builder [wdf_builder]	Create connectors, spokes, and MCP servers to extend the connectivity layer without owning or modifying data contracts.	• [wdf_consumer] • [sn_nowassist_wdf.creator_admin] • [connection_admin] • [template_editor_global] • [action_designer] • [sn_appclient.app_client_user] • [sn_g_app_creator.app_creator]

Workflow Data Fabric Credits

Workflow Data Fabric Credits let you monitor and track Workflow Data Fabric product usage through a dashboard showing credit usage, usage measurements, and thresholds that trigger alerts.

For more information about Workflow Data Fabric benefits, the workflow for the solution, and requirements for integrating the solution, see .

Exploring Workflow Data Fabric Credits

Workflow Data Fabric lets organizations connect, manage, and automate their data workflows across different systems, through various product solutions.

Workflow Data Fabric Credits measure the usage of Workflow Data Fabric subscriptions. Each credit represents a unit of consumption under a unified meter. For example, depending on the underlying product a credit can represent a record, an API call, a megabyte of data throughput, or a minute of runtime.

For more information about Workflow Data Fabric products, meters, and reproducibility, see the Fabric Credits - WDF Products and Meter Sources to trace and reproduce [KB2276348] article in the Now Support Knowledge Base.

For more information about Workflow Data Fabric Credits, see the Count of Workflow Data Fabric Credits consumed in the last 367 Days [KB2239792] article in the Now Support Knowledge Base.

Configure Workflow Data Fabric Credits

You must have Workflow Data Fabric license to use Workflow Data Fabric Credits.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the WDF Tokenization application (sn_wdf_token) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can’t find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Measuring usage

Credit usage is measured for each account. The number of credits you use for a feature is determined by the terms of the Workflow Data Fabric license.

Credit measurements

Measurement category	Description
Transactions	Measured in API calls, assets, records, or transactions.
Data volume	Measured in MB/GB.
Usage	Measured in runtime.

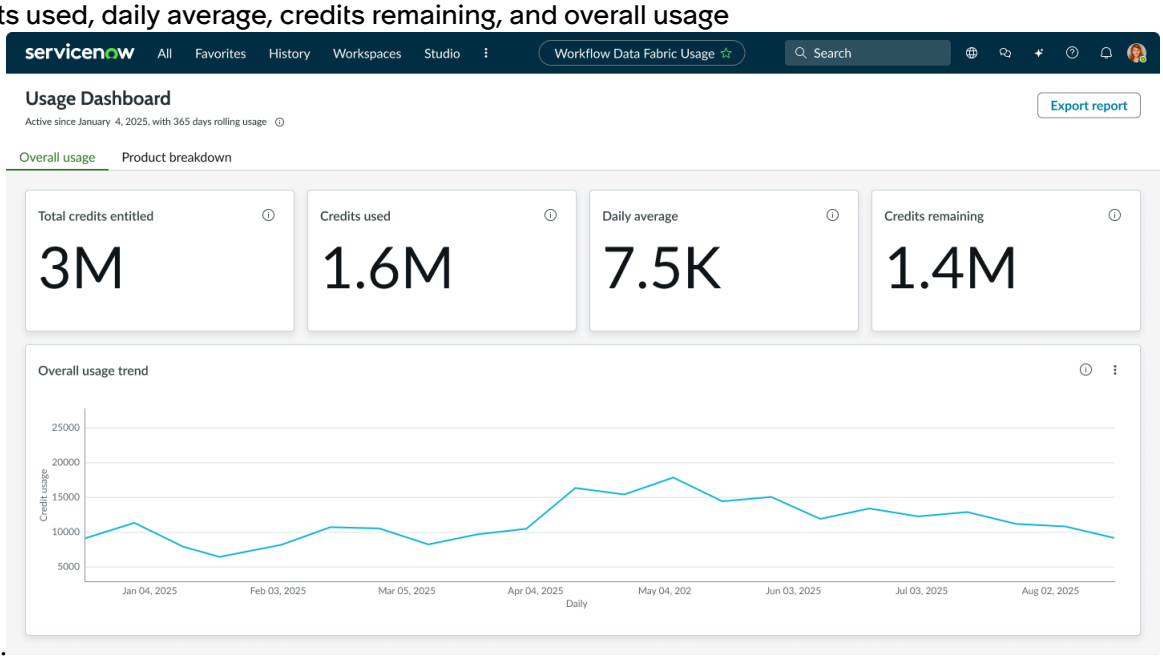
Usage Dashboard

The Usage Dashboard shows credit usage, usage measurements, and thresholds that trigger alerts.

Access the Usage Dashboard by navigating to **All** > *Workflow Data Fabric* **Usage** > **Usage Dashboard**. The Credit Dashboard has two tabs: **Overall usage** and **Product breakdown**.

Overall usage tab

Provides a detailed analysis of credit usage with specific KPIs and a usage trend chart. View data by total credits entitled, credits used, daily average, credits remaining, and overall usage trend.



Product breakdown tab

Provides an overview of credit usage by product. You can filter the data that is displayed by date range and selected

Integration Hub - Orchestration	64,000	4%	2025-06-01

metrics.

Data Catalog

The Data Catalog module within the Workflow Data Fabric application helps you discover, understand, and manage your organization's data assets. Use the Data Catalog to search for data across multiple systems, view comprehensive metadata and relationships, track data lineage, and connect to data sources for analysis.

Get started

Explore	Configure	**Configure metadata collectors**
Learn about the data catalog	Plan and configure your implementation	Create and run metadata collectors

Explore Data Catalog

The Data Catalog is the self-service discovery layer for finding, evaluating, and accessing governed data assets.

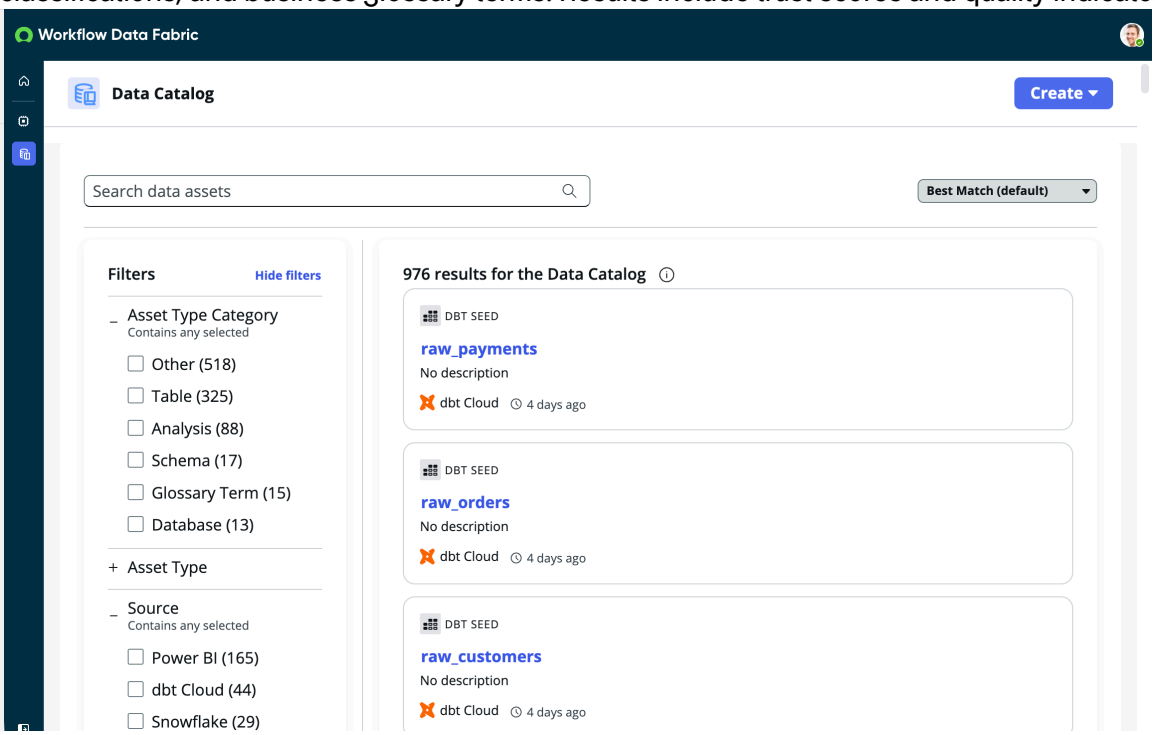
The Data Catalog provides a centralized discovery and governance layer where users search for data assets, understand their lineage and quality, and request access to governed data across the enterprise.

Data Catalog overview

The Data Catalog addresses a common enterprise challenge. Data exists across dozens of systems, but finding trustworthy, well-documented assets requires manual coordination across teams. The Data Catalog solves this by providing a unified discovery layer. Metadata collectors automatically harvest technical metadata, Data Stewards add business context, and consumers evaluate trust scores and lineage before requesting access.

Search and discovery:

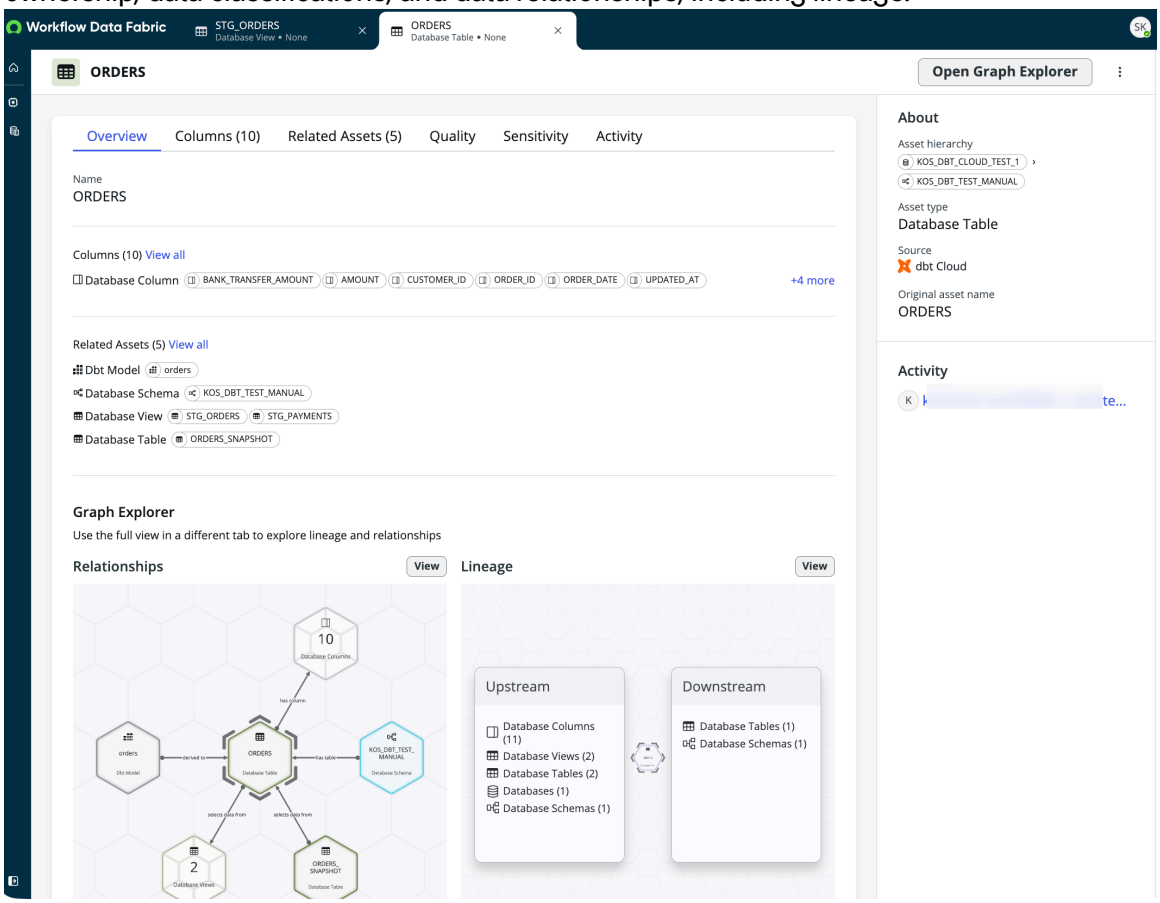
Find data assets through keyword search, faceted filtering, and browsing by source system, domain, or collection. Search looks across asset names, descriptions, tags, classifications, and business glossary terms. Results include trust scores and quality indicators.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset details and relationships:

View comprehensive details for each data asset including schema, field descriptions, ownership, data classifications, and data relationships, including lineage.

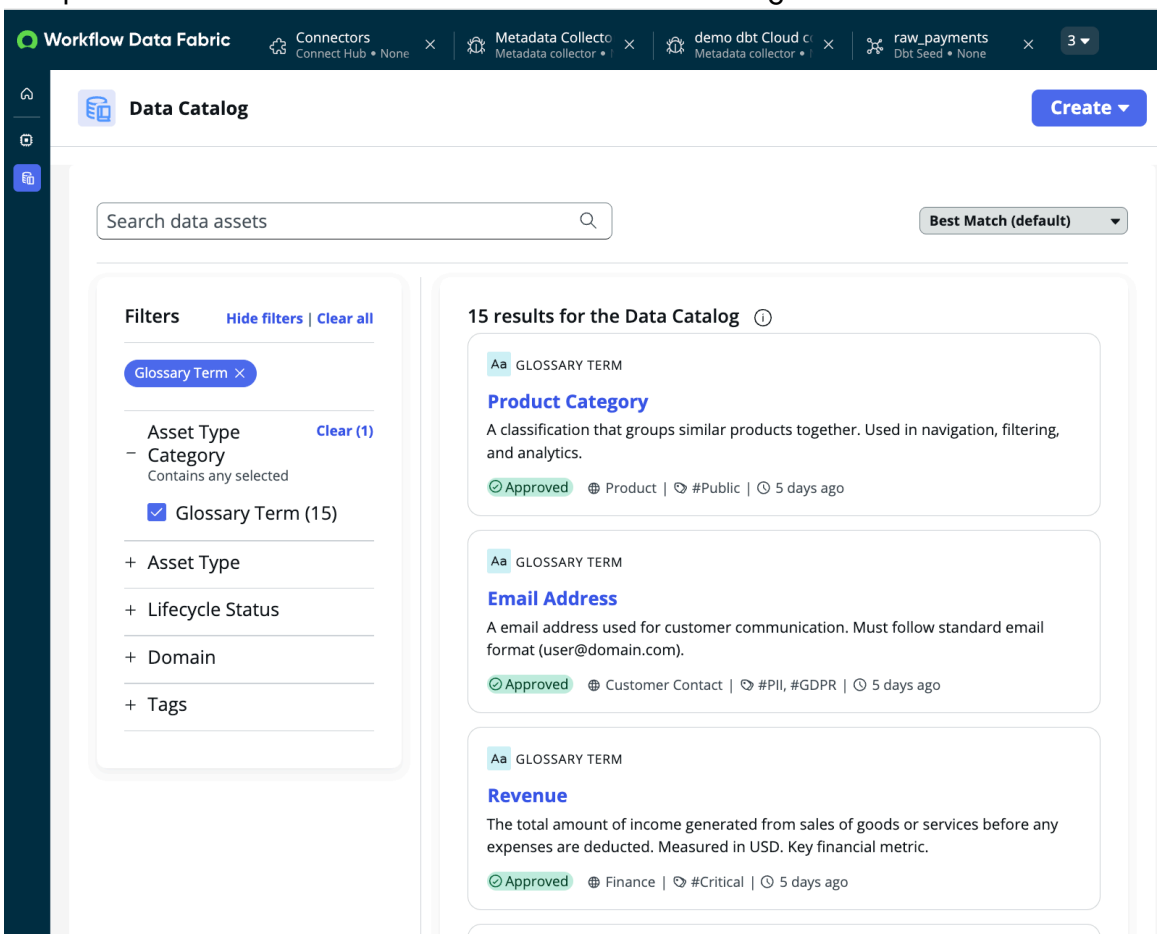


Business glossary:

Create and maintain business glossary terms that define enterprise data vocabulary. Link glossary terms to catalog assets to provide business context.

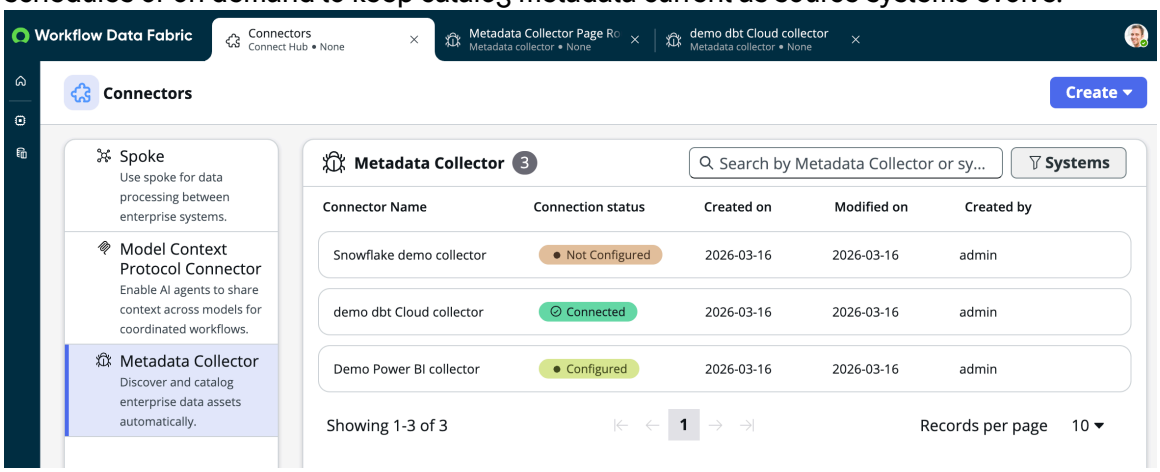
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This promotes consistent use of data definitions across the organization.



Metadata collectors:

Automated scanners that connect to source systems, discover schemas, and build lineage relationships. They populate the Data Catalog with technical metadata. Collectors run on schedules or on demand to keep catalog metadata current as source systems evolve.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Catalog users

Users

User	Description
Connection admin	Creates and manages connections to external systems and configures metadata collectors. Schedules collector runs and monitors collection execution and logs.
Data Steward	Enriches catalog assets with business context and creates and maintains business glossary terms. Links terms to assets, assigns ownership, manages tags and classifications, organizes assets into domains and collections, and tracks asset lifecycle status.
Catalog Viewer	Searches and browses the Data Catalog to discover data assets. Views asset details and lineage, evaluates trust scores and quality indicators, previews sample data, and identifies assets for use in analytics, workflows, or AI applications.

Data Catalog workflow

This lifecycle shows the distinct phases of discovery, governance, and consumption in the Data Catalog:

1. Connect: Connection Admins create connections to external data sources and configure metadata collectors. These harvest technical metadata including schemas, tables, columns, relationships, and lineage.
2. Harvest: Metadata collectors run on schedules or on demand to discover assets and build lineage relationships. They populate the catalog with up-to-date technical metadata from connected source systems.
3. Enrich: Data Stewards add business context by creating glossary terms, linking terms to assets, adding descriptions, assigning ownership, applying classifications, and organizing assets into domains and collections
4. Discover: Catalog Viewers search and browse to find relevant data assets. They review metadata and lineage, evaluate trust scores, preview sample data, and identify assets that meet their requirements.
5. Access: Users request access to discovered assets through governance workflows. After approval, they consume governed data through Data Fabric tables, APIs, analytics dashboards, or AI agents.

Data Catalog benefits

Data Catalog benefits

Benefit	Feature	Users
Find data assets across enterprise systems without manual coordination	Search, browse, faceted filtering	All users
Understand data quality and	Trust scores, quality indicators, sample data preview	Catalog Viewer

Automatically discover and catalog metadata as source systems evolve	Metadata collectors, scheduled harvesting	Connection admin
Provide business context and shared vocabulary for enterprise data	Business glossary terms, asset descriptions	Data Steward
Organize and classify assets for improved discoverability and governance	Domains, collections, tags, classifications	Data Steward
Establish accountability through ownership and stewardship assignments	Owner and steward assignment, lifecycle management	Data Steward

What to explore next

To learn more about using the Data Catalog, see:

- Configuring metadata collectors
- Finding and accessing data assets
- Governing the Data Catalog

Data catalog navigation

Access Connect Hub to manage metadata collectors and the Data Catalog to discover and govern data assets.

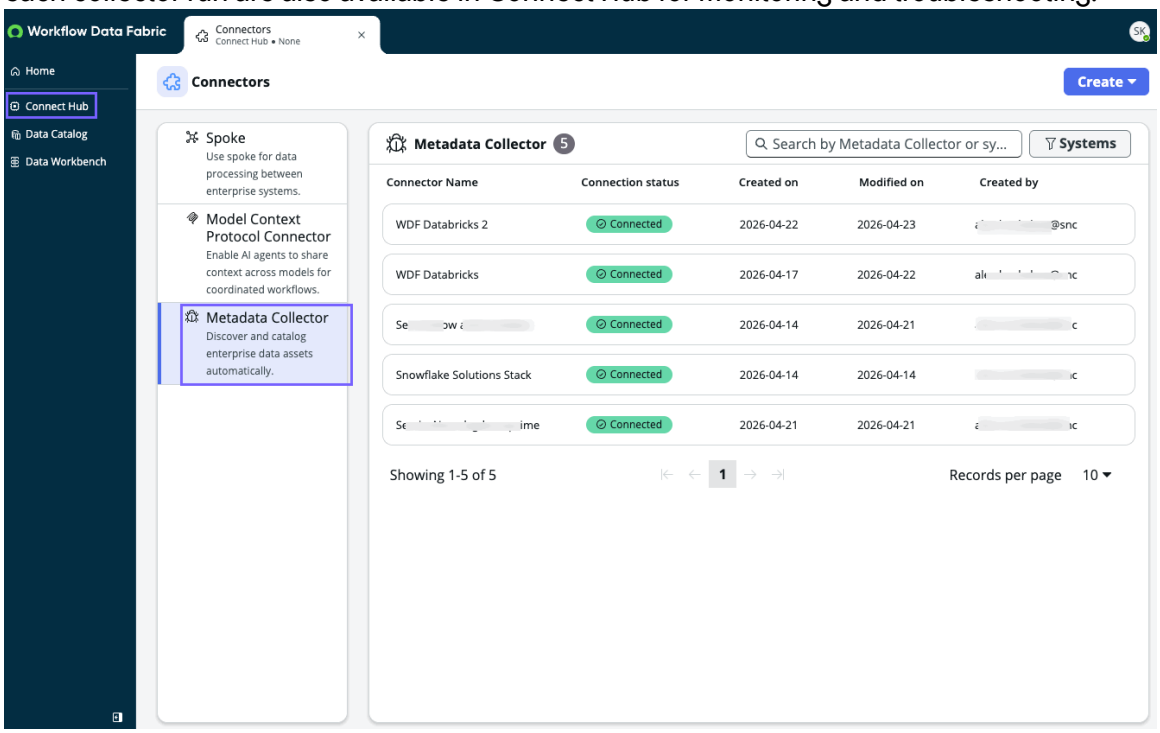
Both areas are accessed from the same starting point: navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**, then select the relevant icon in the sidebar. Connection Admins work in Connect Hub to bring data into the catalog. Data Stewards and Catalog Viewers work in the Data Catalog to manage and discover it.

Connect Hub

Connect Hub is accessed from **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home** by selecting the Connect Hub icon in the sidebar. Connection Admins create and manage metadata collectors in Connect Hub. These automated scanners connect to external data sources, harvest table schemas, column definitions, lineage, and other metadata, and publish them to the Data Catalog. Collectors can be run on demand or scheduled to keep catalog content current as source systems evolve. Runtime logs for

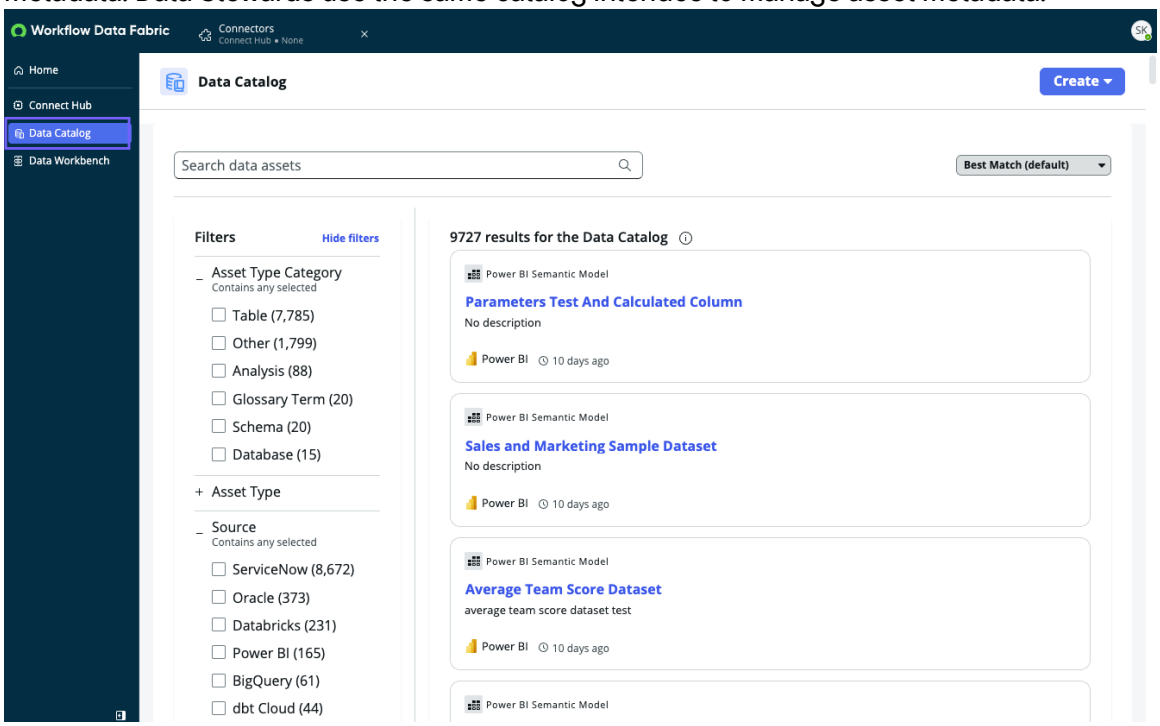
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

each collector run are also available in Connect Hub for monitoring and troubleshooting.



Data Catalog

The Data Catalog is accessed from **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home** by selecting the Data Catalog icon in the sidebar. This is the primary workspace for both Data Stewards and Catalog Viewers. Catalog Viewers search and browse published data assets and open asset detail pages to review schemas, lineage, and governance metadata. Data Stewards use the same catalog interface to manage asset metadata.



Configure data catalog

You can plan and configure a Data Catalog implementation in your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Data Catalog store applications

You can install the Data Catalog application (sn_dcg_app) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application .
- Review the Data Catalog application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Ensure that the AI Search application is enabled on your instance by navigating to **All** > **AI Search** > **AI Search Status**. If AI search is not enabled, select **Request AI Search**.

Role required: admin

About this task

The following items are installed with Data Catalog:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ServiceNow Data Catalog (sn_dcg_app) store application using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   A list of the versions available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Assign roles to Data Catalog users

Assign roles to control access to features, capabilities, and data in Data Catalog .

Before you begin

Role required: admin

About this task

For detailed information about roles that are installed with Data Catalog, see Data catalog roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

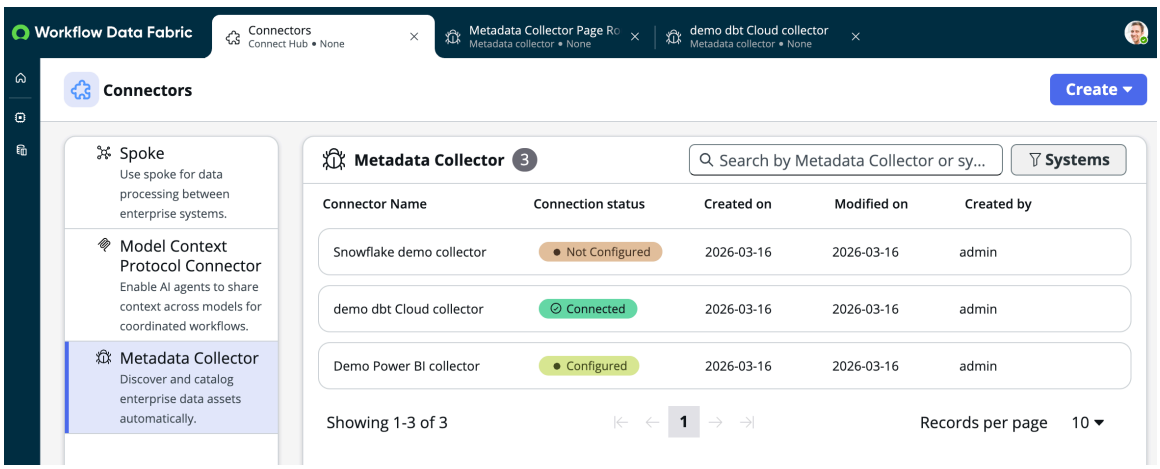
Assign roles to users and groups using the Data Catalog feature.

- Assign a role to a user
- Assign a role to a group

Configuring metadata collectors

Metadata collectors automatically import data asset information from external systems into Data Catalog.

Metadata collectors provide read-only access to external data systems and harvest information about data assets, making them searchable and discoverable in the catalog. Each collector type is designed for a specific platform and processes that platform's metadata structure. Configuration involves setting up source-system prerequisites and creating a collector record for each platform.



Connection states

Metadata collectors progress through the following states as you configure and validate them:

Not configured

The collector has been created but required fields are incomplete. Complete all mandatory fields including system details, connection credentials, and at least one endpoint configuration to move to the next state.

Configured

All required information has been provided, but credentials have not yet been validated. The collector moves to Connected status after credentials are successfully verified when the collector runs successfully.

Connected

Credentials have been validated and the connection is working. The collector is ready to harvest metadata from the source system.

Expired

The connection is broken due to expired authentication details. It is only applicable for authentication methods where this information can be retrieved.

Metadata collector deployment models

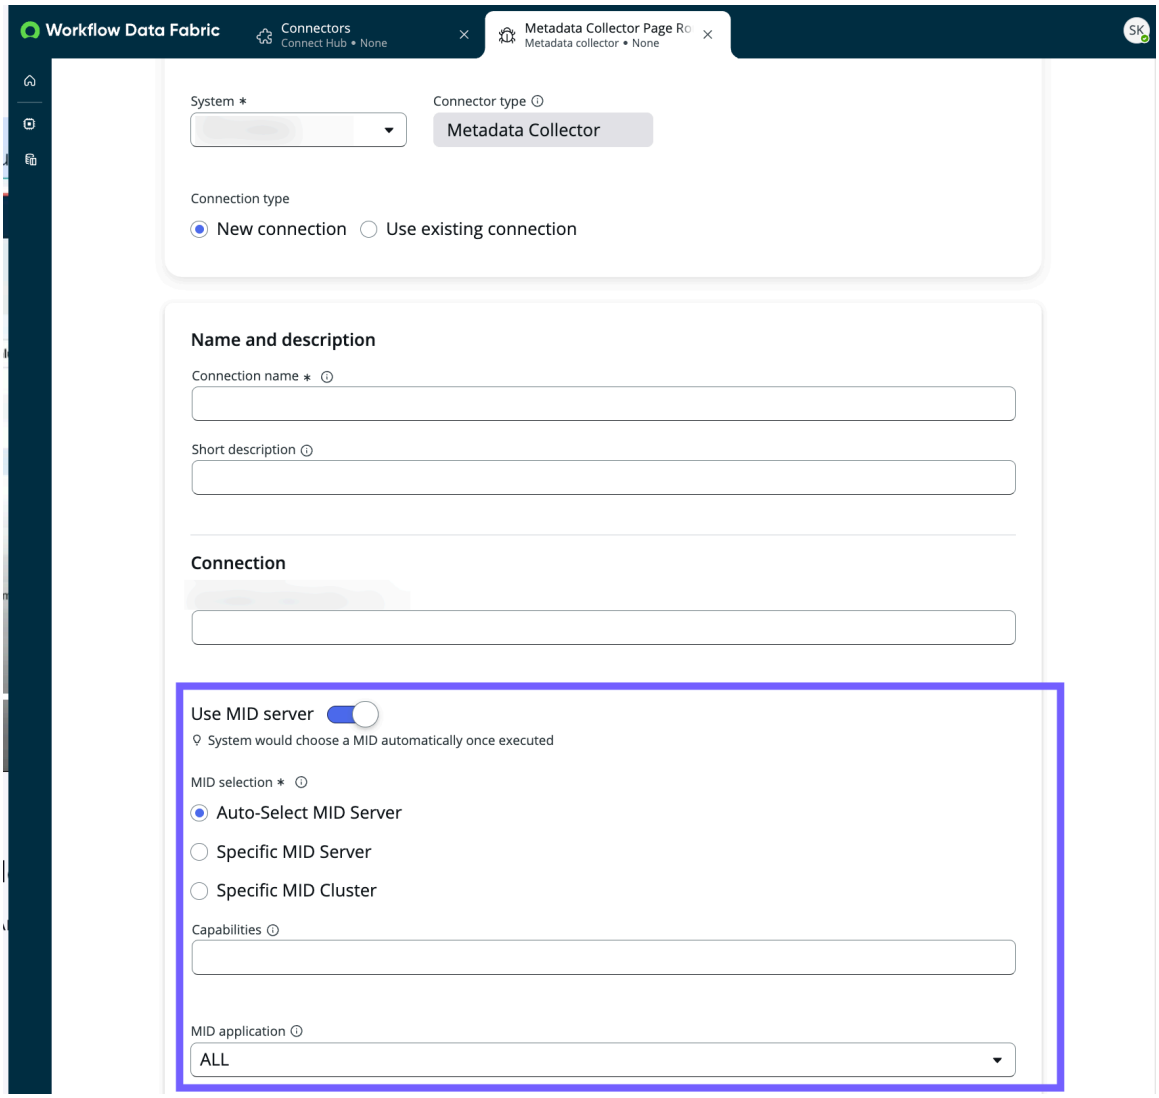
Choose how to deploy metadata collectors based on your network accessibility and security needs. Deploy on a MID Server you host, or use ServiceNow-managed cloud infrastructure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata collectors harvest metadata — schemas, tables, columns, and lineage — from your data sources and upload it to your ServiceNow instance for cataloging and governance. You can deploy collectors in two ways: on a MID Server within your network, or in ServiceNow-managed cloud infrastructure. The choice depends on your source's network accessibility and whether you want to manage your own infrastructure.

Deployment model selection

Select a deployment model using the **Use MID server** toggle on the metadata collector configuration form.



When a collector is configured to run on a MID Server, three routing models control how the system assigns a MID Server to the collection job. For details on each routing model, see MID Server for metadata collectors.

MID Server collectors (on-premises)

The collector runs as a job on a MID Server you host, inside your network. The MID Server reaches the source directly, then pushes the harvested metadata back to your ServiceNow instance over the existing MID Server connection.

For system requirements and configuration guidelines, see MID Server for metadata collectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow-hosted collectors (cloud)

The collector runs in ServiceNow-managed infrastructure. There is no host to provision or patch on your side. You register the connection and credentials, and ServiceNow runs the collector job.

Use this option if you do not want to provision or maintain a MID Server just for cataloging.

Requirements:

- Source system reachable from ServiceNow's cloud through direct internet access.
- Service account credentials with read access to the source's metadata APIs or system catalogs
- No local infrastructure to size or maintain

Deployment model comparison

MID Server versus ServiceNow-hosted collectors

Consideration	MID Server (on-premises)	ServiceNow-hosted (cloud)
Who runs the process	You, on your infrastructure	ServiceNow
Network exposure needed	None inbound; MID Server reaches out	Source must be reachable from ServiceNow's cloud
Best for	Sources behind a firewall or VPN, strict data residency requirements	Internet-reachable or cloud-native sources, no appetite for hosting infrastructure
Ongoing maintenance	You patch and size the MID Server	None

What gets harvested

The deployment model doesn't change what's cataloged. Either way, the collector harvests schemas, tables, columns, and lineage from the source, then uploads them to the ServiceNow instance for cataloging, governance, and AI-ready workflows.

MID Server for metadata collectors

When your source is behind a firewall or requires on-premises handling, deploy metadata collectors on a MID Server you host to harvest metadata from on-premises and privately networked data sources.

To harvest metadata from on-premises and privately networked data sources, you deploy metadata collectors on a MID Server within your network. This is one of two deployment models available for metadata collectors.

The Management, Instrumentation, and Discovery (MID) Server facilitates secure communication and data movement between your ServiceNow instance and external data sources. A configured and validated MID Server is required to connect to the data source. For more information, see the MID Server documentation.

System requirements

The host running the MID Server must meet the following minimum hardware requirements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Requirement
RAM	8 GB
CPU	4 GHz processor

MID Server configuration guidelines

The following guidelines apply when sizing and configuring the MID Server for metadata collectors:

- Dedicated MID Server: Use a dedicated MID Server for metadata collectors that connect to external data sources to avoid resource contention with other applications.
- Minimum memory guidance: Start with a minimum of 8 GB JVM memory. Actual requirements vary based on data volume and complexity.
- Size-based planning: Estimate data volume in advance and size MID Server resources accordingly.

Consider your data volume and processing requirements when configuring your MID Server. Depending on your environment, you can adjust memory allocation to support your workload.

Note: If you experience out-of-memory errors or performance issues, refer to the MID Server system requirements documentation for guidance on adjusting your configuration.

MID Server routing models

When a metadata collector is deployed on a MID Server, a routing model determines which MID Server or cluster executes each collection job. The routing model applies to all runs and can be changed by an administrator at any time.

Auto-select

The system selects any available MID Server at job execution time. This is the default routing model. Auto-select supports two optional constraints: selection can be restricted to MID Servers that advertise specific capabilities, or narrowed to MID Servers running a particular application.

Designated MID Server

The collection job always runs on a single, named MID Server. If that MID Server is unavailable at job execution time, the job fails with an error identifying it by name. This model is suited for sources that require a specific network path, credential set, or capability that only one MID Server in the environment provides.

Designated MID cluster

The collection job runs on any available MID Server within a named cluster. This model supports load distribution and failover across MID Servers that share access to the source.

Enable Vault classification for a metadata collector

Enable a metadata collector to classify harvested columns using ServiceNow Vault.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- The metadata collector is created and saved. This option is available only from the connection details of a saved collector.
- An active entitlement to ServiceNow Vault is required. If the entitlement isn't present, the **Enable vault classification** toggle is disabled.

Role required: connection-admin

About this task

The following metadata collector types support Vault classification: Snowflake, Amazon Redshift, Databricks, Oracle, PostgreSQL, Teradata, MySQL, Microsoft SQL Server, and SAP HANA.

ServiceNow Vault uses Data Classification to organize data into data classes, such as Personally Identifiable Information (PII), so it can be governed at the class level. Enabling this option extends Data Classification to the columns that a collector harvests from an external database. For more information, see Data Classification.

To identify the type of data in a column, the metadata collector reads a small sample of values from each harvested column in the source database. The collector sends the sample over an encrypted (HTTPS) connection to the Vault Discovery service on your ServiceNow instance. Vault scans the sample for sensitive data patterns, such as email addresses or Social Security numbers, and returns the classification result. Sample values aren't stored. Neither the Data Catalog nor Vault persists them. Only the resulting classification labels are saved and displayed in the Data Catalog.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Connectors**.
4. Select **Metadata collector**.
5. Select a saved collector to open its connection details.
6. Select the **Classification** tab.
7. Enable the **Enable vault classification** toggle and complete the form.

   Note: An active entitlement to ServiceNow Vault is required. If the entitlement isn't present, the Enable vault classification toggle is disabled.

Classification tab fields

Field	Description
Username	Username for the ServiceNow instance.
Password	Password for the user.

8. Select **Save**.

Result

Vault classification is applied to columns the collector harvests. When the **Enable vault classification** toggle is cleared, columns aren't classified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Amazon Redshift metadata collector

Amazon Redshift metadata collector provides read-only access to metadata from an Amazon Redshift database.

The Amazon Redshift collector harvests metadata for Redshift tables and columns.

Metadata cataloged

The Amazon Redshift collector catalogs the following information.

Note: All versions of overloaded functions and stored procedures are cataloged. Each version has its own title in the catalog but a distinct identifier.

Metadata harvested

Object	Information cataloged
Columns	Name, Description, JDBC type, Column Type, Is Nullable, Default Value, Key type (Primary, foreign), column size, column index
Table	Name, description, primary key, schema
Views	Name, description, SQL definition
Schema	Identifier, Name
Database	Type, name, identifier, server, port, environment, JDBC URL
Function	Name, Description, Function Type
Stored Procedure	Name, Description, Stored Procedure Type

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between harvested data assets

Data asset page	Relationship
Table	Columns
Columns	Table
Schema	Database that contains Schema, Table that is part of Schema
Database	Schema contained in Database

Lineage for Redshift

The following lineage information is collected by the Redshift collector:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage availability by object

Object	Lineage available
View (column-level)	The collector traces data flow from view columns to source table columns across SQL expressions and sub queries. View → Table column relationships The collector captures lineage when views: • Sort rows (ORDER BY) • Filter rows (WHERE, HAVING) • Aggregate rows (GROUP BY)

Stored Procedure	The collector identifies:
	• The associated column in an upstream view or table:
	  ○ Where the data is sourced from
	  ○ That sort the rows via ORDER BY
	  ○ That filter the rows via WHERE/HAVING
	  ○ That aggregates the rows via GROUP BY
	• The downstream table that has its tables updated.
	
	The following stored procedures aren't supported:
	• Stored procedures with multitable inserts. However, multiple separate insert statements that insert into one table are supported.
	• Stored procedure with multiple SELECT and INSERT statements not separated by a semicolon delimiter

Authentication supported

The collector supports username and password authentication to Redshift.

Prepare to run the Amazon Redshift collector

Create a Redshift user and configure permissions before running the collector.

Before you begin
Role required: admin

About this task
Run the following SQL statements to set up a new user with appropriate permissions to harvest from Redshift. For information about Redshift permissions, see the Redshift GRANT documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a user.

```
CREATE USER ddw_user PASSWORD '<password>';
```

   Replace `<password>` with a secure password.

2. Grant permissions to the user.

   Run these commands for each schema you want to collect. Replace `<schemaName>` with your schema name.

```
-- Grant USAGE access to the target schema
             GRANT USAGE ON SCHEMA <schemaName> TO ddw_user;
          -- Grant USAGE access to pg_catalog schema for stored
 procedures and extended metadata
             GRANT USAGE ON SCHEMA pg_catalog TO ddw_user;
          -- Grant SELECT access on all tables in the target
 schema
             GRANT SELECT ON ALL TABLES IN SCHEMA <schemaName>
 TO ddw_user;
          -- Grant SELECT access on all tables in pg_catalog
 schema for stored procedures and extended metadata
             GRANT SELECT ON ALL TABLES IN SCHEMA pg_catalog
 TO ddw_user;
```

Create an Amazon Redshift metadata collector

Create a collector to import metadata from Amazon Redshift.

Before you begin

Before you begin, verify the following:

- All prerequisite tasks are completed. For more information, see Prepare to run the Amazon Redshift collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Redshift**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Complete the form.

Redshift metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Username	Username to use to connect to the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Password of the databsase user.

9. Configure the databases information.

Databases information

Field	Description
Database	Name of the database to connect to. Specify multiple databases by adding one value per line.
Excluded database	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

10. From the schema collection options, select one of the following: **Collect all schemas** or **Specify which schema to collect**.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.
Include Information Schema	Include the database's Information Schema in catalog collection.
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

11. Configure the harvesting scope and limits options.

Harvesting scope and limits options

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (that is, data profiling). **Note:** Enabling profiling can increase the collector's runtime, as the collector must read table data to generate profiling metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Target sample size for column statistics	Number of rows sampled for computation of column statistics and string-value histograms. For example, to sample 1000 rows, set the parameter as: 1000. Default: 100000
Disable Lineage collection	Skip harvesting of intra-database lineage metadata.
Disable Extended Metadata collection	Skip harvesting of extended metadata for data asset types such as database, schema, table, columns functions, stored procedures, user-defined types, synonyms. Basic metadata for these data asset types is still harvested.
Enable Sample String Values collection	Enable harvesting of sample values and histograms for columns containing string data.
Exclude system functions	Exclude system functions from metadata collection.

12. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Server environment	Friendly name for the environment in which your database server runs when the server name is localhost. Used to differentiate it from other environments.
Database ID	Unique identifier for this database. Used to generate the database ID when the database name is not sufficiently unique.
JDBC properties	JDBC driver properties to pass through to driver connection.
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection. Default: 60

13. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a **Configured** status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Amazon S3 metadata collector

The Amazon S3 metadata collector harvests read-only metadata from an AWS S3 account.

The collector harvests metadata from AWS S3, including buckets, objects, and their associated metadata.

Authentication supported

The collector supports the following authentication methods. For details, see Credentials and authentication in the AWS documentation.

- Authentication details supplied through an AWS credentials file
- Access Key ID and AWS Secret Access Key

Metadata cataloged

Amazon S3 metadata cataloged by object type

Object	Information cataloged
Bucket	• ARN (Amazon Resource Name) • Region • Name • Version state • Creation date • ACL (access control list) owner ID • ACL grantee ID • ACL grant permission
Object	• Key • ARN (Amazon Resource Name) • Region • Size • Last modified date

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Amazon S3 metadata cataloged by object type (continued)

Object	Information cataloged
	• ACL (access control list) owner ID • ACL grantee ID • ACL grant permission • Metadata

Relationships between objects

By default, the harvested metadata includes catalog pages for the following resource types. Each catalog page has a relationship to the other related resource types. If the metadata presentation for this data source has been customized, you might see other resource pages and relationships.

Amazon S3 resource page relationships

Resource page	Relationship
S3 Bucket	S3 Object
S3 Object	S3 Bucket

Limits for S3 buckets

The collector has a default limit of 10,000 objects per bucket. If a bucket exceeds this limit, the collector skips the bucket, harvests no metadata for it, and logs a warning message.

To increase the limit beyond the default, set the `--max-resources` parameter in your collector command. The maximum value for this parameter is 10,000,000 (ten million). If the total contents across all buckets and objects exceed this limit, the collector stops cataloging additional buckets and logs a warning message.

Prepare to run the Amazon S3 collector

Create an AWS IAM user with the permissions required for the metadata collector to harvest metadata from Amazon S3 buckets and objects.

Before you begin

Role required: admin

About this task

The collector authenticates to Amazon S3 using either an AWS credentials file or an access key ID and secret access key. Complete the following steps to create a dedicated IAM user, assign the required permissions, obtain an access key, and set up a credentials file.

Procedure

1. Create an IAM user for running the collector.
   a. Log in to the AWS portal and navigate to the IAM service.
   b. Under **Users**, select **Add users**.
   c. Enter a name for the user and complete the user creation workflow.
2. Assign the following permissions to the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required IAM permissions for the Amazon S3 collector

Permission	AWS API	Object cataloged using the permission
`s3:ListAllMyBuckets`	`ListBuckets`	List of all buckets owned by the user
`s3:GetBucketLocation`	`GetBucketLocation`	The region the bucket resides in
`s3:ListBucket`	`ListObjectsV2Paginator`	The list of objects within included buckets
`s3:GetBucketVersioning`	`GetBucketVersioning`	The versioning state of the bucket
`s3:GetBucketAcl`	`GetBucketAcl`	The ACL (access control list) of the bucket
`s3:GetObjectAcl`	`GetObjectAcl`	The ACL (access control list) of the object
`s3:GetObject`	`HeadObject`	The metadata of an object

3. Obtain an access key for the user.

   If you already have an access key for the user, skip this step. Detailed AWS documentation on this topic is available in the AWS Tools for PowerShell documentation.

   a. In the IAM service, under **Users**, select the user.

   b. On the **Security credentials** tab, select **Create access key**.

   c. Select **Application running outside AWS**, then select **Next**.

   d. Enter an optional description tag, then select **Create access key**.

   e. Copy the **Access key ID** and **Secret access key** values. You need these values when configuring the collector.

4. Set up an AWS credentials file.

   If you already have the AWS CLI installed and a credentials profile file configured, skip this step.

   a. Install the AWS CLI. For details, see the AWS CLI installation documentation.

   b. From the command line, run `aws configure`.

      This command stores the credentials in `~/.aws/credentials`.

Result

The IAM user has the permissions required to run the Amazon S3 metadata collector.

What to do next

Use these credentials when configuring the collector. See Create an Amazon S3 metadata collector.

Create an Amazon S3 metadata collector

Use a metadata collector to import Amazon S3 bucket and object metadata into the data catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- All prerequisite tasks must be complete. For more information, see Prepare to run the Amazon S3 collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.

Role required: connection-admin.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Amazon S3**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

Amazon S3 metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.
AWS Region	The AWS region used to start the S3 client.

8. Configure the authentication options.

Authentication options

Field	Description
Authenticate using AWS Key/Secret	Specify the **AWS Access Key ID** and **AWS Secret Access Key**.
Authenticate using IAM role	Specify the **AWS IAM role ARN** and **AWS Role External ID**.

9. Configure the bucket and objects options.

Configuration options

Field	Description
Excluded bucket	Specify the buckets to exclude. You can provide the bucket name or a regular expression to match. Use the parameter multiple times for multiple specific buckets. If multiple regular expressions are specified, the collector excludes buckets that match any of them. If both **Include bucket** and **Excluded bucket** are specified, **Include bucket** takes precedence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the bucket name includes special characters [. , + , * , ? , ^ , $, (,) , [,] , { , } ,	, \], use a backslash (\) before the special character to escape it. For example, \[
Included bucket	Specify the buckets to collect. You can provide the bucket name or a regular expression to match. Use the parameter multiple times for multiple specific buckets. If multiple regular expressions are specified, the collector harvests buckets that match any of them. **Note:** If the bucket name includes special characters [. , + , * , ? , ^ , $, (,) , [,] , { , } ,	, \], use a backslash (\) before the special character to escape it. For example, \[
Include object prefix	Specify the object prefix to harvest objects that begin with the specified prefix.
Included object	Specify the objects to collect, using either an object name or a regular expression to match. Use the parameter multiple times for multiple specific objects. If multiple regular expressions are specified, the collector harvests objects that match any of them. If both **Included object** and **Excluded object** are specified, **Included object** takes precedence. **Note:** If the object name includes special characters [. , + , * , ? , ^ , $, (,) , [,] , { , } ,	, \], use a backslash (\) before the special character to escape it. For example, \[
Excluded object	Specify the objects not to collect, using either an object name or a regular expression to match. Use the parameter multiple times for multiple specific objects. If multiple regular expressions are specified, the collector excludes objects that match any of them. If both **Included object** and **Excluded object** are specified, **Included object** takes precedence.

Field	Description
	Note: If the object name includes special characters [. , + , * , ? , ^ , $, (,) , [,] , { , } , | , \], use a backslash (\) before the special character to escape it. For example, \[

10. Configure the advanced options.

Advanced options

Field	Description
Max objects per run	Maximum resources the collector will harvest, up to 10 million. If not specified, by default the collector will harvest a maximum of 10,000 resource.

11. Select **Save**.

Result

The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next

After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Azure Data Factory metadata collector

The Azure Data Factory metadata collector provides read-only access to metadata from an external Azure Data Factory account.

Use this collector to harvest metadata from ADF, including pipelines, datasets, dataflows, linked services, triggers, integration runtimes, and global parameters. It gathers lineage information between ADF datasets and between ADF and external sources such as Snowflake.

Metadata cataloged

The Azure Data Factory collector catalogs the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested

Object	Information cataloged
Factory	ID, Name, ETag, Location, Create Time, Provisioning State, Version, Public Network Access, Factory Tags, Repository configuration (Account name, Collaboration Branch, Repository Name, Disable Publish, Root Folder, Host Name, Client ID, Project Name, Last Commit ID, Tenant ID, Repo Configuration Type).
Pipeline	ID, Name, Description, Etag, Concurrency, Folder, Parameters, Metric Policy Duration, Variables
Pipeline Activity	Name, Description, Type, Inactivity Status, State, User Properties, Activity Policy (Retry, Timeout, Retry Interval In Secs, Secure Input, Secure Output)
Linked Service	ID, Name, Description, Type, Etag, Connection String, Domain, Parameters **Note:** Harvesting of Connection String for SFTP Linked Services is not supported.
Dataset	ID, Name, Etag, Type, Database, Schema, Table, Folder, Container, File Name, Parameters
Dataflow	ID, Name, Etag, Type, Description, Folder
Trigger	ID, Name, Etag, Type, State, Description, Frequency, Interval, Start time, End time
Integration Runtime	ID, Etag, Name, Type, Description, State Compute Properties (Node Size, Number of Nodes, Max Parallel Execution Per Node, Core Count, Compute Type, Clean up, Number of External Nodes, Number of Pipeline Nodes), SSIS properties (Catalog Server Endpoint, Catalog Admin Username, Catalog Pricing Tier, License Type, Dual Standby PairName, Edition)
Global Parameter	ID, Name, Value, Type
ADF Table	ID, Name
ADF Column	ID, Name, Type, Precision, Scale
Pipeline Activity	Query

Relationships between objects

Catalog pages show relationships between the following data asset types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between harvested data asset pages

Data asset page	Relationship
Factory	Contains Global Parameter, Contains Pipeline, Contains Dataset, Contains Dataflow, Contains Trigger, Contains Integration Runtime
Pipeline	Has Tag (also known as Annotation), Contains Activity
Activity	Belongs to Pipeline, Contains Activity, Depends on Activity, uses Linked Service, uses Integration Runtime, uses Dataset
Linked Service	Uses Integration Runtime, Has Tag (also known as Annotation), Connects to database
Dataset	Uses Linked Service, Has Tabular Datasource, Has Tag (also known as Annotation)
Dataflow	Uses Dataflow, Imports Data From Linked Service, Exports Data From Linked Service, Imports Data From Dataset, Exports Data From Dataset, has Tag (also known as Annotation)
Integration Runtime	Uses Integration Runtime, Uses Linked Service
Trigger	Triggers Pipeline, Has Tag (also known as Annotation)

Lineage for Azure Data Factory

Collected lineage information:

Lineage availability by object

Object	Lineage available
Dataset	The collector identifies the source or sink of the dataset: • when the source/sink is Snowflake, Databricks, PostgreSQL, MySQL, Oracle, Teradata, DB2, and SQLServer. • when there is a Copy Activity Run copying data between two datasets.
ADF table	The collector identifies the associated table in an upstream table where the data is sourced from/sinked to.
ADF column	The collector identifies the associated table in an upstream column where the data is sourced from/sinked to.

Supported data sources for cross-system lineage:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Snowflake
- Databricks

Authentication types supported

The Azure Data Factory collector authenticates using Azure Service Principal.

Prepare to run the Azure Data Factory collector

Set up Azure data assets, authentication, and permissions before running the collector.

Before you begin
Role required: admin

About this task
The collector uses Azure Service Principal for authentication. You must register an application, obtain Azure IDs, and grant subscription-level access. You can also prepare datasets for lineage harvesting.

Procedure

1. Register an application in Azure Active Directory and create credentials.

   See Register application and create client secret.

2. Obtain required Azure IDs.

   See Obtain subscription and tenant IDs.

3. Grant Service Principal access to Data Factory data assets.

   See Grant Service Principal access to Data Factory.

4. **Optional:** Prepare datasets for lineage harvesting.

   (Optional) See Prepare to harvest lineage.

Register application and create client secret

Register an Azure application and create a client secret for Service Principal authentication.

Before you begin
Role required: admin

About this task
Register an application in Azure Active Directory and create credentials for the collector.

Procedure

1. Register a new application.

   a. Navigate to **Azure Portal** > **Azure Active Directory**.

   b. Select **App Registrations**.

   c. Select **New Registration**.

   d. Enter the application name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: DataDotWorldADFApplication.

e. For **Supported account types**, select **Accounts in this organizational directory only**.

f. Select **Register**.

2. Create a client secret.
   a. On the application page, select **Certificates and Secrets** > **Client secrets**.
   b. Select **New client secret**.
   c. Add a description and set the expiration date.
   d. Select **Add**.
   e. Copy and save the secret value.
3. Obtain the Client ID.
   a. Select the **Overview** tab.
   b. Copy the Application (Client) ID from the Essentials section.

Obtain subscription and tenant IDs

Obtain Azure subscription and tenant IDs for collector configuration.

Before you begin
Role required: admin

About this task
You will use these IDs when configuring the collector.

Procedure
1. Obtain the Tenant ID.

   a. Navigate to the application page that you created.

   b. Copy and save the Directory (tenant) ID.

      You will use this value for the Tenant ID field in the collector configuration.

2. Obtain the Subscription ID.

   a. Navigate to a storage account that you want to harvest from.

   b. On the Overview page, copy the Subscription ID.

      You will use this value for the Subscription ID field in the collector configuration.

Grant Service Principal access to Data Factory

Grant Reader role to the Service Principal for Azure Data Factory access.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The Service Principal does not require explicit permission for each Data Factory. If the Data Factories you want to catalog were created within a specific subscription, add the Service Principal to that subscription with the Reader role.

Procedure
1. Navigate to the Subscriptions page in Azure Portal.
2. Select the subscription containing your Data Factories.
3. Select the **Access Control (IAM)** tab.
4. Select **Add** > **Add Role Assignment**.
5. Under **Job Function Roles**, search for and select **Reader**.
6. Select the **Members** tab.
7. Select **Select Members**.
8. Search for and select `DataDotWorldADFApplication`.
9. Select **Review + assign**.

Prepare to harvest lineage

Import dataset schemas to enable column and lineage harvesting.

Before you begin
Role required: admin

About this task
Complete this task if you want to harvest columns and the associated lineage.

Procedure
1. Navigate to the dataset you want to harvest columns and lineage from.
2. Select the **Schema** tab.
3. Select **Import Schema**.
4. Publish the dataset.

Create an Azure Data Factory metadata collector

Create a collector to import metadata from Azure Data Factory.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Azure Data Factory collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure
1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Create** > **Metadata collector**.
4. From the System list, select **Azure Data Factory**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. On the form, fill in the fields.

Azure Data Factory metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.

Field	Description
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Enter the Azure Data Factory authentication details.

Azure Data Factory authentication details

Field	Description
Microsoft Entra client ID	Azure Active Directory application client ID for the Azure Data Factory app.
Microsoft Entra client secret	Azure Active Directory application client secret for the Azure Data Factory app.
Azure subscription ID	The subscription ID in which the data factories are available.
Microsoft Entra Tenant ID	Azure Active Directory application tenant ID for the Azure Data Factory app.

9. Enter the Azure Data Factory configuration details.

Azure Data Factory configuration details

Field	Description
Include Data Factory name(s)	Names of data factories to catalog. Enter either the exact name or a regular expression to match. List one data factory name per line.
Exclude Data Factory name(s)	Names of data factories to exclude from cataloging. Enter either the exact name or a regular expression to match. List one data factory name per line.

10. Configure the advanced options.

Advanced options

Field	Description
Max retries	The number of times the system retries a failed API call. Default: 5
Retry delay	The number of seconds to wait between retry attempts for a failed API call. Default: 2 seconds

11. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

BigQuery metadata collector

The BigQuery metadata collector provides read-only access to metadata from an external BigQuery account.

The collector harvests metadata for BigQuery datasets, projects, tables, and columns in a BigQuery instance and make it searchable and discoverable in the data catalog. The collector also harvests column-level lineage relationships between tables and views.

Metadata cataloged

The BigQuery collector catalogs the following information.

Metadata harvested

Object	Information cataloged
Datasets	ID, name, description, labels (note these are key/value pairs), created date, last modified date, default table expiry, default partition expiry, data location
Projects	Name
Tables	Name, Description, Created date, Last modified date, Default table expiration, Data location, Labels, Type (Standard, External, Snapshot, Model), Partitioned on field, Clustered by columns for standard and snapshot tables, Partition type (range or time) requires partition filter - Range (Start, end, interval) Time (Partition type (hour, day, month, year), expiration)
Columns	Name, Description, Data Type, Is Nullable, Column size
View	Name, description, created date, default table expiration, last modified date, data location, default collation, labels, view SQL, clustered by columns for materialized

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between harvested data assets

Data asset page	Relationships
Datasets	Tables, Views
Projects	Dataset
Tables	Column, Labels
Columns	Table, View
Views	Column
Label Value	Table, View, Project, Dataset

Lineage for BigQuery

The following lineage information is collected by the BigQuery collector.

Object lineage availability

Object	Lineage available
View Column	The collector identifies the associated column in an upstream view or table: • Where the data is sourced from • That sort the rows via ORDER BY • That filter the rows via WHERE/HAVING • That aggregate the rows via GROUP BY

Prepare to run the BigQuery collector

Create a service account and configure authentication before running the collector.

Before you begin
Role required: admin

About this task
The collector connects to BigQuery using a service account associated with your project.

Procedure

1. Create a service account.

   Assign the following roles to the service account:

   - BigQuery Data Viewer
   - BigQuery User
2. Create a key for the service account and download the JSON key file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See the Creating and managing service account keys documentation for details.

3. Place the key file on the machine where you plan to run the collector.

   You need this file when configuring the collector.

What to do next

See the Google Cloud Platform predefined roles and permissions documentation for additional information.

Create a BigQuery metadata collector

Create a collector to import metadata from BigQuery.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the BigQuery collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **BigQuery**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

BigQuery metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Enter the BigQuery authentication details.

BigQuery authentication details

Field	Description
BigQuery Credential File Path	Upload the credentials file you generated for authentication.

9. Enter the BigQuery configuration details.

BigQuery configuration details

Field	Description
BigQuery Project	BigQuery project that contains the datasets to catalog.
BigQuery Datasets to Catalog	BigQuery datasets to catalog in the project. By default, all datasets in a project are cataloged. When multiple projects are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	specified, the dataset filter applies to all projects.

10. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Databricks metadata collector

The Databricks metadata collector provides read-only access to metadata from an external Databricks account.

The collector harvests metadata from data assets in Databricks Hive Metadata, Unity Catalog (including Delta Lake), Workflows, and Notebooks.

Metadata cataloged

The Databricks collector catalogs the following information.

Metadata harvested

Object	Information cataloged
Columns	Name, Description, JDBC type, Column Type, Is Nullable, Default Value, Column size, Column index Extended metadata: Tags **Note:** Deprecated columns and any lineage related to these deprecated columns are not cataloged.
Table	Name, Description, Schema, Primary key, Foreign key Extended metadata: Tags, Owner, Type, Creation date, Last Modified, Location,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested (continued)

Object	Information cataloged
	Provider, Version, Size, File Count, Partition Columns, Properties
Model	Name, Owner, Description, Created By, Created At, Last Modified By, Last Modified At, Securable Kind, Securable Type
Views	Name, Description, SQL definition, Tags
Schema	Name Extended metadata: Tags
Database	Type, Name, Server, Port, Environment, JDBC URL Extended metadata: Tags
Notebook	Notebook ID, Path, Language Type (SQL, Python, Scala, R)
Function	Name, Description, Function Type
Job	Title, Description, Creator, Created At, Job run as, Format, Max Concurrent Runs, Notification On Start, Timeouts (sec), Notification On Success, Schedule, Git Source, Notification on Failure, Tags, List of tasks, List of clusters
Cluster	Name, Description, Node Type ID, Driver Node Type ID, Spark Version, Number of Workers, Autoscale Max Workers, Autoscale Min Workers, AWS Attributes, Tags
Task	Task Key, Type of Task (Notebook, dbt, Spark jar, Python script, Python wheel, Pipeline task, SQL), Task timeout, Retry interval, Cluster used by the task, Max retries, Depends on, Libraries, Notifications (On start, On success, On failure), Notebook File Path, Notebook Source, Notebook Parameters, Spark Jar Main Class Name, Spark Jar Parameters, Python Script File path, Python Script Parameters, Spark Submit Parameters, Pipeline ID, Pipeline Full Refresh, Python Wheel Package Name, Python Wheel Entry Point, Python Wheel

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested (continued)

Object	Information cataloged
	Parameters, SQL Warehouse, SQL Query ID, SQL Dashboard ID, SQL Alert ID, Dbt Project Directory, Dbt Profiles Directory, Dbt warehouse, Dbt catalog, Dbt schema, Dbt commands
External Location	Name, External URL, Description, Data Source Type, Created Date, Created By, Owner
Storage Credential	Name, Description, Credential, Created Date, Created By, Owner
Volume	Name, Description, Type, Owner, Created By, Created At, Last Modified By, Last Modified At, Metastore ID
Materialized View	Name, SQL Definition, Created, Last Modified
Metric View	Name, Description, YAML Definition, Source Table, Source Table Type, Filter, Created, Last Modified

Following additional information is cataloged when you run the collector with the **Enable Governance Metadata Collection** option.

Cataloging Databricks Governance Policies

Object	Information Cataloged
Row Filter Access Control	Name
Column Mask Access Control	Name
Attribute Based Access Control	Name, Description, Created by, Created at, Modified by, Modified at, On securable type, For securable type, To principals, Except principals
Workspace bindings	Workspace ID, Binding type
Privileges	Granted to, Granted by, Privilege type, Granted on object, Inherited from

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between objects

The harvested metadata includes catalog pages for the following data asset types. Each catalog page has a relationship to the other related data asset types.

Relationships between harvested data asset pages

Data asset page	Relationships
Table	• Columns contained in Table • Table Indexes • Has privileges Columns contained in Table
Schema	• Database that contains Schema • Table that is part of Schema • Has privileges
Database	Schema contained in Database
Columns	• Table Indexes • Table containing Column
Table Indexes	Columns
Job	• Clusters used by tasks in Job • Tasks contained within Job
Cluster	• Cluster contained in job • Task using Cluster
Task	• Job containing Task • Cluster used by Task • Tasks depending on Task
Notebook	• Folder containing Notebook • Task sourcing data from Notebook
Folder	• Folders contained in Folder • Notebooks contained in Folder

Relationships between harvested data asset pages (continued)

Data asset page	Relationships
Attribute Based Access Control	• Applies to catalog, schema and table • Defined on catalog, schema and table • Uses function
Catalog	• Has workspace bindings • Has privileges

Lineage for Databricks

The following lineage information is collected by the Databricks collector.

Note: The collector does not support lineage for SQL statements defined via variable statements.

Object Lineage Availability

Object	Lineage available
Column in view	The collector identifies the associated column in an upstream view or table for both Hive metastore and Unity Catalog: • Where the data is sourced from • That sort the rows via ORDER BY • That filter the rows via WHERE/HAVING • That aggregate the rows via GROUP BY **Note:** Deprecated columns and any lineage related to these deprecated columns are not cataloged.
Notebook	Tasks that reference Notebook. (Only if Databricks Unity Catalog is enabled).
Table	• The collector identifies the upstream and downstream tables and their external locations (S3 and ADLS Gen2 data assets) along with the intermediate Job. • The collector harvests the Databricks table lineage to S3 object.

Authentication supported

The Databricks collector supports Personal access token authentication and Oauth service principal authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prepare to run the Databricks collector

Complete authentication and permission configuration tasks before running the Databricks metadata collector.

Before you begin

Role required: admin

Procedure

1. Generate Databricks credentials.

   For detailed instructions, see Generate credentials.

2. Configure permissions.

   For detailed instructions, see Configure permissions.

Generate credentials

Generate a personal access token or service principal secret to authenticate the Databricks connection.

Before you begin

Role required: account admin

Important: You must be an Account Admin in Databricks to create and manage service principals.

About this task

Configure these credentials to enable authentication for the Databricks collector. You can use either a Personal Access Token (PAT) or an OAuth service principal.

Procedure

Generate the required credentials based on your authentication method.

- To generate a Personal Access Token (PAT):

  a. In the Databricks workspace, select your username in the top bar and select **Settings**.

  b. Select **Developer**.

  c. Next to **Access tokens**, select **Manage**.

  d. Select **Generate New Token**.

  e. Enter a comment to identify the token.

  f. Change the **Lifetime (days)** setting if required.

  Note: To create a token with the maximum lifetime of 730 days, leave the lifetime field empty.

  g. Select **Generate**.

  h. Copy the displayed token and select **Done**. Save this token securely for future use.

  i. Alternatively, use the token API to generate a PAT.

- To generate a Service Principal secret:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Databricks workspace, select your username in the top bar and select **Settings**.

b. Navigate to the **Identity and access** tab.

c. Next to **Service principals**, select **Manage**.

d. Select **Add service principal**.

e. Select **Add new**, provide a name for the service principal, and select **Add**.

f. Select the newly created service principal and navigate to the **Secrets** tab.

g. Select **Generate secret**.

h. Enter the lifetime for the secret and select **Generate**.

i. Copy the **Client ID** and **Client secret** from the dialog box.

Configure permissions

Grant necessary permissions for Unity Catalog, Jobs, and system tables.

Before you begin

Role required: admin

About this task

In Unity Catalog, data is secure by default. Grant permissions to the user running the collector to harvest resources. Securable objects in Unity Catalog are hierarchical, and privileges are inherited downward.

Procedure

1. Grant Unity Catalog permissions.
   The user requires **USE CATALOG**, **USE SCHEMA**, and **SELECT** permissions on the catalog to access data.

   Note: A user with **USE CATALOG** and **BROWSE** permissions can access data but can't retrieve column statistics, system functions, or certain additional table metadata. See the Databricks documentation for details about these permissions.

   a. Select the catalog to which you want to grant access.

   b. Select the **Permissions** tab and select **Grant**.

   c. Select the user and the appropriate permissions, then select **Grant**.

2. Grant compute resource permissions.
   The user must have **Can Use** permission on the existing cluster or SQL warehouse, or can create their own compute resources.

   a. Select the **More options** icon on the resource and select **Permissions**.

   b. Add the user and select the **Can Use** permission.

3. Grant permissions for Jobs.
   To harvest Jobs, the user running the collector must have **Can View** permissions on the target Jobs. For details about setting Job permissions, see the Databricks documentation.

4. Enable lineage harvesting from system tables.
   Work with your Databricks admin to enable the `system.access` schema.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Make a PUT request to the API to enable the schema.

```
curl -X PUT -H "Authorization: Bearer <PAT_Token>"
 https://<databricks-host>/api/2.1/unity-catalog/metastores/<
metastore_id>/systemschemas/access
```

To find the `metastore_id`, navigate to **Catalog** > **Settings** and view the Metastore info section.

b. Grant the following permissions to the user running the collector.

- **USE SCHEMA** on `system.access`
- **SELECT** on `system.access.table_lineage`
- **SELECT** on `system.access.column_lineage`

Example SQL commands:

```
GRANT USE SCHEMA ON SCHEMA system.access to `<userid>`;
          GRANT SELECT on TABLE system.access.table_lineage
 to `<userid>`;
          GRANT SELECT on TABLE system.access.column_lineage
 to `<userid>`;
```

Create a Databricks metadata collector

Create a collector to import metadata from Databricks.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Databricks collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Databricks**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Databricks metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Enter the Databricks connection details.

Connection details

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).
Databricks HTTP Path	Databricks compute resources URL. See Databricks documentation for details.
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication details

Field	Description
Authenticate using personal access token	Option to authenticate using the Databricks personal access token. For details, see Databricks documentation.
Authenticate using Databricks Service Principal	Option to authenticate using the Databricks service principal client ID and Databricks Service Principal Client Secret.

9. Configure the databases information.

Databases information

Field	Description
Include databases	Name of the database to connect to. Specify multiple databases by adding one value per line.
Excluded databases	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

10. Choose between **Collect all schemas** and **Specify which schema to collect** to configure the schema collection options.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Include Information Schema	Include the database's Information Schema in catalog collection.
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

11. Configure the statistics and sampling options.

Statistics and sampling options

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (data profiling). **Note:** Enabling profiling can increase the collector's runtime because the collector must read table data to generate profiling metadata.
Target sample size for column statistics	Number of rows sampled for computation of column statistics and string-value histograms. For example, to sample 1000 rows, set the parameter to 1000. Default: 100000
Disable Lineage collection	Skip harvesting of intra-database lineage metadata.
Disable Extended Metadata collection	Skip harvesting of extended metadata for data asset types such as database, schema, table, columns functions, stored procedures, user defined types, and synonyms. Basic metadata for these data asset types will still be harvested.

12. Configure the harvesting scope and limits options.

Harvesting scope and limits options

Field	Description
Disable Harvesting Workflows	Skip harvesting of Databricks workflows and their lineage metadata.
Harvest Lineage from Other Schemas	Harvest lineage from other schemas.
Enable Sample String Values collection	Enable sampling and storage of sample values for string-valued columns.
Exclude system functions	Exclude harvesting of built-in Databricks system functions.
Disable Harvesting Notebook Content	Skip harvesting notebook content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Page Size for Harvesting Queries	Specify the page size for harvesting queries. Default: 1000
Page Size for Databricks API Responses	Specify the page size for Databricks API response. Default: 100
Enable Metric Views Harvesting	Enable harvesting of metric views. Metric view information is extracted from a table's extended metadata and is available only when extended metadata harvesting is enabled.

13. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Server environment	Friendly name for the environment where your database server runs when the server name is localhost. Helps differentiate it from other environments.
Database ID	Unique identifier for this database. Used to generate the database ID when the database name isn't sufficiently unique.
JDBC properties	JDBC driver properties to pass through to driver connection.
Max retries	The number of times the system retries a failed API call. Default: 5
Retry delay	The number of seconds to wait between retry attempts for a failed API call. Default: 2 seconds
Disable model collection	Skip harvesting machine learning models.
Databricks account ID	The Databricks account ID for Unity Catalog access.
External workspace URL	The external workspace URL for cross-workspace access.
Enable governance metadata collection	Enable harvesting of governance metadata including privileges, workspace bindings, ABAC policies, row filters, and column masking policies
Workspace ID to URL Mapping	Specify workspace ID to workspace URL mapping. Provide the option multiple times for multiple mappings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection. Default: 60

14. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

dbt Cloud metadata collector

The dbt Cloud metadata collector provides read-only access to metadata from an external dbt Cloud account.

The dbt cloud collector connects to the dbt cloud project and harvests dbt assets and column-level lineage relationships from database views associated with dbt assets.

Metadata cataloged

The dbt Cloud collector catalogs the following information.

Metadata harvested

Object	Information cataloged
Analysis	Name, Description, Path, Root path, Package name, Unique ID, Alias, Meta, Raw SQL, Compiled SQL/Compiled Code, Enabled, Materialized, Resource type
Model	Name, Description, Path, Root path, Package name, Unique ID, Alias, Meta, Raw SQL, Compiled SQL/Compiled Code, Enabled, Materialized, Resource type
Model column	Column name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested (continued)

Object	Information cataloged
Project	Name, Project version
Snapshot	Name, Description, Path, Root path, Package name, Unique ID, Alias, Meta, Raw SQL/ Raw Code, Compiled SQL/Compiled Code, Enabled, Materialized, Resource type
Seed	Name, Description, Path, Root path, Package name, Unique ID, Alias, Meta, Raw SQL/ Raw Code, Compiled SQL/Compiled Code, Enabled, Materialized, Resource type
Source	Name, Description, Path, Root path, Package name, Unique ID, Alias, Meta, Raw SQL/ Raw Code, Compiled SQL/Compiled Code, Enabled, Source name, Resource type
Test	Name, Description, Path, Root path, Package name, Unique ID, Alias, Meta, Raw SQL/ Raw Code, Compiled SQL/Compiled Code, Enabled, Materialized, Resource type
Test result	Time the test was executed, Status, Count of failures (if any), Message emitted by the test (if any)
Semantic Models	Name, Description, Path, Package name, Unique ID, Enabled, Resource Type, Semantic Model Components, Primary Entity
Entities	Title, SQL Expression, Entity Type
Dimensions	Title, Dimension Type
Measures	Title, Description, Has Measure Aggregation
Metrics	Title, Description, Path, Package Name, Unique ID, Metric Type

Relationship between objects

Catalog pages show relationships between the following data asset types:

Relationships between harvested data asset pages

Data asset page	Relationship
Model	Project containing dbt model, Tests testing the integrity of model, dbt data assets (test, seed, model, snapshot, source) that are upstream of model, dbt data assets (Test, Seed, Model, Snapshot, Source) that are downstream of model
Semantic Model	Project containing the semantic model, dbt model related to the semantic model, dbt semantic model components (dimensions,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between harvested data asset pages (continued)

Data asset page	Relationship
	entities, measures), Metric that the semantic model provides context for
Model column	The database column in the manifested table or view
Project	dbt data assets (Test, Seed, Model, Snapshot, Source) contained within project
Snapshot	Project containing dbt project, dbt data assets (Test, Seed, Model, Source) that are upstream of snapshot, dbt data assets (Test, Seed, Model, Source) that are downstream of snapshot
Seed	Project containing dbt project, dbt data assets (Test, Seed, Model, Snapshot, Source) that are upstream of seed, dbt data assets (Test, Seed, Model, Snapshot, Source) that are downstream of seed
Source	Project containing dbt project, dbt data assets (Test, Seed, Model, Snapshot) that are downstream of seed, Database schema that the source represents
Test	Project containing dbt project, dbt model that has its integrity tested by this test
Test result	The dbt test that was executed to produce the result

Lineage for dbt

The following lineage information is collected by the dbt Cloud collector.

Object Lineage Availability

Object	Lineage available
dbt model materialized as view	Referenced database tables and columns in dbt model materialized as view
dbt resource	dbt data assets that are upstream and downstream (for example, seeds that are upstream of models, and tests that are downstream of models) of dbt data asset.

Snowflake is the currently supported data source for cross-system lineage.

Prepare to run the dbt Cloud collector

Configure dbt Cloud and create authentication tokens before running the collector.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Complete these preparation tasks before running the dbt Cloud collector.

Procedure
1. Obtain the required IDs from dbt Cloud.

   See Obtain account, project, job, and run IDs.

2. Create an API token based on your dbt Cloud plan.
   - Enterprise plan: See Create a service token
   - Team plan: See Create a user token
3. Enable documentation generation in job settings.

   See Update job execution settings.

Obtain account, project, job, and run IDs
Obtain required IDs from dbt Cloud URLs for collector configuration.

Before you begin
Role required: none

About this task
You'll use this information when configuring the collector for metadata harvesting.

Procedure
1. Obtain the Account ID and Project ID.

   a. Navigate to **Deploy** > **Jobs**.

   b. Copy the Account ID and Project ID from the URL.

   URL format:

   ```
   https://cloud.getdbt.com/deploy/<accountID>/projects/<project ID>/jobs
   ```

2. Obtain the Environment ID and Environment Name.

   a. Navigate to **Deploy** > **Environments**.

   b. Select the environment that you want to run the collector against.

   c. Copy the Environment ID from the URL or note the Environment Name from the page title.

   URL format:

   ```
   https://cloud.getdbt.com/deploy/<accountID>/projects/<project ID>/environments/<environmentID>
   ```

3. Obtain the Job ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the Jobs section, select the job associated with your environment.

b. Copy the Job ID from the URL or note the Job name from the page title.

URL format:

```
https://cloud.getdbt.com/deploy/<accountID>/projects/<project ID>/jobs/<jobID>
```

4. **Optional:** : Obtain a specific Job Run ID.

(Optional) By default, the collector harvests from the most recent successful job run. To harvest from a specific run, complete these steps.

a. From the Job page, select a specific job run.

b. Copy the Job Run ID from the URL.

(Optional) URL format:

```
https://cloud.getdbt.com/deploy/<accountID>/projects/<project ID>/runs/<jobRunID>
```

Create a user token

Create a personal access token for metadata harvesting.

Before you begin

Role required: admin

Plan required: Team.

About this task

The Team plan doesn't support service account tokens. You must create a personal access token using a dedicated user account.

Procedure

1. Create a dedicated user account for the collector.
2. Assign the Admin role to the user account.
3. Log in as the dedicated user.
4. Navigate to **Profile** > **Access Tokens**.
5. Generate a Personal Access Token.
6. Copy the token value.

You'll use this token value for the dbt Cloud API key when configuring the collector.

What to do next

See the dbt Cloud user tokens documentation for additional information.

Create a service token

Create a service account token with the required permissions for metadata harvesting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Plan required: Enterprise.

About this task
For Enterprise accounts, service account tokens are commonly used for production systems.

Procedure
1. Create a service account token.

   Follow the steps in the dbt Cloud service tokens documentation.
2. Assign roles to the service account token.
   - Account Viewer: Assigned at the account level
   - Job Viewer: Assigned at the project level for each project to collect metadata from
3. Copy the token value.

   You'll use this token value for the dbt Cloud API key when configuring the collector.

Update job execution settings

Enable documentation generation in dbt Cloud job settings. This setting must be enabled to successfully harvest dbt resources.

Before you begin
Role required: admin

This setting must be enabled to successfully harvest dbt resources.

Procedure
1. Navigate to **Deploy** > **Jobs**.
2. From the **Environment** list, select the environment you want to run the collector against.
3. Select the job associated with your environment.
4. Select **Settings**.
5. Under **Execution Settings**, select **Generate docs on run**.

Create a dbt Cloud metadata collector

Create a collector to import metadata from dbt Cloud.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the dbt Cloud collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **dbt Cloud**.
5. From the Connection type list, select one of the following:
   a. Select **New connection** to configure a new connection.
   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.
6. On the form, fill in the fields.

dbt Cloud metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
dbt Cloud host	The host for your organization's account on dbt cloud. If left unspecified, the default host is assumed as cloud.getdbt.com.
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Enter the dbt Cloud configuration details.

Configuration details

Field	Description
dbt Cloud API key	A dbt cloud-issued API key with permissions to access the specified account.
dbt cloud account	The dbt cloud account that owns the project from which to harvest dbt metadata artifacts.
dbt Cloud project	The name or numeric identifier of the project from which to harvest dbt metadata artifacts.
dbt cloud run ID	The numeric identifier of the run that produced the artifacts to be harvested. If not specified, the most recent successful run that produced artifacts within the project is harvested.
dbt Cloud environment	The dbt Cloud environment (ID or name) used to filter the job runs from which to harvest dbt metadata artifacts.
dbt Cloud job	The dbt Cloud job (ID or name) used to filter the job runs from which to harvest dbt metadata artifacts.

9. Enter the target database details.

Note: You must set the **Target database** to **Snowflake overrides** to harvest Snowflake lineage relationships between columns specified through views.

Target database details

Field	Description
Target database	Option to override the database connection information configured on the Project in dbt cloud

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **No Target database overrides**: Enables the collector to skip connecting to a data warehouse and only harvest dbt assets. No lineage is available for views ○ **Snowflake overrides**: Select to harvest Snowflake lineage relationships between columns specified through views
Authentication (Snowflake overrides)	
Authentication	Authentication method to use if **Snowflake overrides** is selected ○ **No Snowflake authentication overrides** ○ **Snowflake username and password overrides** ○ **Snowflake private key file overrides** **Note:** If you select Snowflake overrides and don't provide any authentication details, the collector obtains connection information (Snowflake account, role, and warehouse) from the identified dbt Cloud run.
Snowflake username and password overrides	
Database username	User credential to use in connecting to the target database
Database password	Password credential to use in connecting to the target database
Snowflake private key file overrides	
Database username	Username to use in connecting to the target database
Snowflake key file path	Private key file to use for authentication with Snowflake (for example rsa_key.p8). Use this option to override the dbt profile
Snowflake key file password	Password for the private key file if the key is encrypted and a password was set. Use this option to override the dbt profile or cloud configuration
Other optional settings	
Snowflake application	Application connection parameter to use in connecting to the target Snowflake database. Use this option to override the dbt profile or cloud configuration Default: datadotworld
Snowflake account	Snowflake account or tenant

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Snowflake role	Role to use in connecting to the target Snowflake database. Use this option to override the dbt profile or cloud configuration. This field is case-insensitive
Snowflake warehouse	Warehouse to use in connecting to the target Snowflake database. Use this option to override the dbt profile or cloud configuration. This field is case-insensitive

10. Enter the advanced options.

Advanced options

Field	Description
Max retries	The number of times the system retries a failed API call. Default: 5
Retry delay	The number of seconds to wait between retry attempts for a failed API call. Default: 2 seconds
API HTTP headers	Name-value pairs included as HTTP headers in API calls made by the collector. Add one value per line to specify multiple headers.
JDBC driver properties	JDBC driver properties to pass through to driver connection. Specify multiple JDBC driver properties by adding one value per line. If you are using the NTLM authentication, you must set two JDBC properties as: ○ integratedSecurity=true ○ authenticationScheme=NTLM

11. Select **Save**.

Result

The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next

After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Fivetran metadata collector

Provides read-only access to metadata from a Fivetran account.

The collector harvests metadata from Fivetran assets, including connectors, jobs, groups, sources, and destinations. Supports impact analysis to understand how changes to upstream Fivetran connectors affect downstream systems.

Metadata cataloged

The Fivetran collector catalogs the following information.

Metadata harvested

Object	Information cataloged
Groups	Name, Identifier, Creation date
Connectors	Identifier, Succeeded at datetime, Failed at datetime, Created at datetime, Sync frequency, Name, Version, Daily sync time, Schedule type, Setup state, Update state, Pause state, Sync state, Connector type, Connected by user identifier
Connector Jobs	Run state (Failed time, Success time)
Destination	Name, Setup status, Destination type, Identifier, Region
Data source	Data source configuration properties, as configuration key and value pairs.
Database tabular source	Database name, Server, Port, JDBC URL
Non-database tabular source	Datasource ID, Name
Database schema	Name
Destination database	Database name, Server, Port, JDBC URL
Columns	Name

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between cataloged objects

Data asset page	Relationship
Group	Destinations within group, Connectors within group

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between cataloged objects (continued)

Data asset page	Relationship
Connector	Source associated to connector, group that contains this connector, connector job which was initiated by this connector.
Connector Job	Connector
Fivetran Data Source	Tables that this Fivetran Data Source connects to via Source (file or database), Connector that connects to this Fivetran Data Source
Data Source	Tables within data source. For non-database sources, tabular sources connected via data source
Destination	Tables within destination, group that contains this destination
Table	Column within the table
Column	Table containing the column

Lineage for Fivetran

The collector identifies source columns from which destination columns derive their data through copy or load operations. Catalogs all database sources and destinations.

Supported data sources and connectors for cross-system lineage:

- PostgreSQL
- Salesforce
- SQL Server

Supported database destinations for cross-system lineage:

- Snowflake
- SQL Server

Lineage availability by object

Object	Lineage available
Source database columns and tables	Downstream destinations that source data from these columns and tables

Authentication supported

The collector authenticates using a Fivetran API key. The API key owner must have read access to destinations and connectors.

See the Fivetran role-based access control documentation for details on API keys and permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prepare to run the Fivetran collector

Create a Fivetran API key before running the collector.

Before you begin
Role required: admin

About this task
The collector authenticates using a Fivetran API key. The API key owner must have read access to destinations and connectors.

Procedure

1. Create a Fivetran API key with read access to destinations and connectors.

   See the Fivetran role-based access control documentation for details on creating API keys and assigning permissions.

2. Save the **API Key** and **API Secret**.

   You need these credentials when configuring the collector.

Create a Fivetran metadata collector

Create a collector to import metadata from Fivetran.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Fivetran collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Fivetran**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Enter the authentication details.

Authentication details

Field	Description
Fivetran API key	The Fivetran API key used to authenticate to the REST API.
Fivetran API secret	The Fivetran secret used to authenticate to the REST API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Enter the Fivetran configuration details.

Fivetran configuration details

Field	Description
Exclude groups	Exclude the specified Fivetran group's contents from the catalog.
Include groups	Include only the specified Fivetran group's contents in the catalog.

10. Configure the advanced options.

Advanced options

Field	Description
Max retries	The number of times the system retries a failed API call. Default: 5
Retry delay	The number of seconds to wait between retry attempts for a failed API call. Default: 2 seconds

11. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Microsoft Fabric metadata collector

Provides read-only access to metadata from a Microsoft Fabric account.

The collector harvests metadata from Microsoft Fabric workspaces and their child resources, including items commonly found in Power BI.

Metadata cataloged

The collector catalogs the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Fabric metadata catalog

Object	Information cataloged
Workspaces	ID, Name, Description
Warehouses	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, Collation Type, Connection String, JDBC URL, Endorsement (Certified By, Endorsement Badge)
Lakehouses	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, OneLake Tables Path, OneLake Files Path, Connection String, JDBC URL, Endorsement (Certified By, Endorsement Badge)
Fabric Data Pipelines	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, Parameters, Variables, Endorsement (Certified By, Endorsement Badge), Refresh Schedule
Eventhouses	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, Endorsement (Certified By, Endorsement Badge), Ingestion Service URI, Query Service URI, State
Dataflows	ID, Name, Description, Last Modified Date, Refresh Schedule, Created By, Last Modified By, Endorsement (Certified By, Endorsement Badge)
Dataflow Gen2	ID, Name, Description, Created By, Last Modified Date, Last Modified By, Endorsement (Certified By, Endorsement Badge), Refresh Schedule
Dataflow Gen2 CI/CD	ID, Name, Description, Created Date, Created By, Last Modified Date, Last Modified By, Endorsement (Certified By, Endorsement Badge), Refresh Schedule, State
Mirrored Databases	OneLake Tables Path, Mirroring Status
Fabric Mirrored Database Table	Name, Description, Table Mirroring Status Extended Metadata: Created Date, Modified Date
Fabric Delta Lakehouse Table	Name, Description, Created Date, Last Modified Date, ABFS File Path
Fabric Lakehouse Column	Name, Description, Column Type, Is Nullable, Column Size, Column Index, Decimal Digits, Partition Index
Notebooks	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, Definition, Endorsement (Certified By, Endorsement Badge), Refresh Schedule
Spark Job Definitions	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, Endorsement (Certified By, Endorsement Badge), Refresh Schedule
SQL Analytics Endpoints	ID, Name, Description, Last Modified Date, Created By, Modified By, Provisioning Status, Connection String, Endorsement (Certified By, Endorsement Badge)
Lakehouse Folders	ID, Name, Description, Created Date, Last Modified Date, ABFS File Path

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Fabric metadata catalog (continued)

Object	Information cataloged
Lakehouse Files	ID, Name, Description, Created Date, Last Modified Date, ABFS File Path
Schemas	Name Extended Metadata: Created Date, Modified Date
Fabric Database Tables	Name, Description, Primary Key, ABFS File Path Extended metadata: Created date, Modified date
Database Columns	Name, Description, JDBC Type, Column Type, Is Nullable, Default Value, Key Type (Primary, Foreign), Column Size, Column Index, Decimal Digits
Views	Name, Description, SQL Definition
Reports	ID, Name, Description, Type, Preview Image (supported for paginated reports), Created Date, Last Modified Date, Created by, Modified by, External URL, Embed URL, Endorsement (Certified By, Endorsement Badge)
Report Pages	Name, Is Hidden
Dashboards	ID, Name, External URL, Embed URL
Dashboard Tiles	Name, Embed URL
Semantic Models	ID, Title, Description, Created Date, Created By, External URL, Refresh Schedule
Data Sources	Name, Type, Connection Details
Fabric Logical Tables	Name, Description, Is Hidden, Is Entered Data, Expression
Fabric Calculated Tables	Name, Description, Is Hidden, Is Entered Data, Expression
Fabric Logical Columns	Name, Description, Data Type, Column Type, Is Hidden, Expression
Measures	Name, Description, Is Hidden, Expression
Data Pipeline Activity	Name, Description, Type, Inactivity Status, Activity Policy (Retry, Timeout, Retry Interval In Secs, Secure Input, Secure Output)
Data Pipeline Run	Start Time, End Time, Invoke Type, Run Status
Activity Run	Start Time, End Time, Run Status, Output Message, Error Message
Job Run	ID, Job Type, Start Time, End Time, Run Status, Invocation Type, Failure Reason
KQL Database	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, State, Endorsement (Certified By, Endorsement Badge)
App	ID, Name, Description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Fabric metadata catalog (continued)

Object	Information cataloged
Org App	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, Endorsement (Certified By, Endorsement Badge)
GraphQL API	ID, Name, Description, GraphQL Api Definition, Created Date, Last Modified Date, Created By, Modified By, Endorsement (Certified By, Endorsement Badge)
Refresh Schedule	ID, Frequency, Recurrence Interval, Time Of Day, Day Of Week, Day Of Month, Start Time, End Time, Enabled
Eventstreams	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, event throughput level, retention time in days, state, Endorsement (Certified By, Endorsement Badge)
Eventstream Source	ID, Name, Status, Type
Eventstream Destination	ID, Name, Status, Type
Environments	ID, Name, Description, Created Date, Last Modified Date, Created By, Modified By, State, Library Dependency (name, library version, library type), Publish State, Spark Compute (driver cores, driver memory, executor cores, executor memory), Dynamic Executor Allocation (dynamic executor allocation state, max executors, min executors) Instance Pool (Type, Id, Name), Spark Property (key, value), Run Time Version, Publish Start Time, Publish End Time, Spark Libraries Publish State, Spark Settings Publish State, Endorsement (Certified By, Endorsement Badge)
Database resource types from SQL Server	For a complete list of metadata harvested from SQL server, see the Microsoft SQL Server collector documentation.
Variable library	ID, Name, Description, Created Date, Last Modified Date, Created By, Last Modified By, Active Value Set Name, Variable (variable type, value, note)

The Microsoft Fabric collector supports the profiling and sampling specific parameters which the SQL Server collector supports and these apply to Warehouses and Lakehouses. When profiling and sampling parameters are enabled, the following additional column information is cataloged:

Profiling and sampling information

Object	Information cataloged
Column	• Average Length (sample) • Average Value (sample) • Data Distribution • Distinct Values • Estimated Distinct Values • Estimated Non-null Values • Maximum Length (sample)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Profiling and sampling information (continued)

Object	Information cataloged
	• Maximum Value (sample) sorted numerically or alphabetically (z-a) • Minimum Length (sample) • Minimum Value (sample) sorted numerically or alphabetically (a-z) • Non-null Values (sample) • Sample String Values (first 5 items in a column)
Table	• Row Count • Sample Count (Target sample size)

Relationship between objects

Catalog pages show relationships between the following data asset types:

Microsoft Fabric resource page relationships

Object	Relationship
Workspace	Warehouses, Lakehouses, Fabric Data Pipelines, Notebooks, Dataflows, Semantic Models, SQL Analytics Endpoints, Eventhouses, Spark Job Definitions, Reports, Dashboards, App, Org App, GraphQL API, Environments, Variable Library
App	Workspace
Org App	Workspace
GraphQL API	Workspace
Warehouses	Workspace, Schemas
Lakehouses	Workspace, Schemas, Lakehouse Folders, Fabric Delta Lakehouse Table
Fabric Data Pipelines	Workspace, Activities which belong to the Pipeline, Refresh Schedule, Variable Library, Data Pipeline Activities, Warehouses, Lakehouses, or SFTP files, Fabric Data Pipelines, Fabric Notebooks, Fabric Dataflows, or Fabric Spark Job Definitions executed by the Activity, Semantic Models refreshed by the Activity, Stored Procedures executed by the Activity
Eventhouses	Workspace, KQL Database
KQL Databases	Eventhouse

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Fabric resource page relationships (continued)

Object	Relationship
Dataflows	Workspace, Logical Tables, Data Sources
Notebooks	Workspace, Job Runs, Refresh Schedule, Environments
Spark Job Definitions	Workspace, Job Runs, Refresh Schedule, Environments
SQL Analytics Endpoints	Workspace, Lakehouse Folders, Lakehouse
Lakehouse Folders	Lakehouse, Child Folders, Lakehouse Files
Lakehouse Files	Lakehouse Folder
Schemas	Lakehouse/Warehouse/Database, Tables, Views
Fabric Database Tables	Schema, Columns
Fabric Mirrored Database Table	Schema, Columns, Source Database Table
Database Columns	Table or View
Views	Schema, Columns
Reports	Workspace, Dashboard Tile, Report Pages
Report Pages	Report
Dashboards	Workspace, Dashboard Tiles
Dashboard Tiles	Dashboard
Semantic Models	Workspace, Logical Tables, Data Sources
Data Sources	Semantic Models, Dataflows
Dataflow Gen2	Workspace, Logical Tables, Data Sources, Data Destinations, Refresh Schedule
Dataflow Gen2 CI/CD	Workspace, Logical Tables, Data Sources, Data Destinations, Refresh Schedule, Job Runs
Fabric Lakehouse Delta Tables	Column, Lakehouse, Lakehouse Folder
Eventstream	Workspace, Eventstream source, Eventstream destination
Eventstream Destination	Published data to lakehouse table, KQL database
Environments	Notebooks, Spark Job Definitions, Variable Library, Workspace, Data Pipeline
Notebooks	Environments
Spark	Job DefinitionsEnvironments
Variable Library	Workspace Data Pipeline

Lineage and dependencies for Microsoft Fabric

The following lineage information is collected by the Microsoft Fabric collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Fabric lineage

Object	Lineage available
Database View	The collector identifies the associated column in an upstream view or table: • Where the data is sourced from • That sort the rows via ORDER BY • That filter the rows via WHERE/HAVING • That aggregate the rows via GROUP BY **Note:** For views, the collector first tries to parse the view SQL to harvest lineage metadata. If the SQL parser cannot parse the view SQL, the collector catalogs some lineage relationships using the dm_sql_referencing_entities system function, when available. For each row in the referenced entities, if `is_selected` or `is_select_all` is true, the collector catalogs a relationship between the referencing entity and the database column.
Semantic Model	Dataflows and Semantic Models this Semantic Model uses data from.
Dataflow	Other Dataflows this Dataflow uses data from.
Logical Table	Associated tables that the table sources its data from. **Note:** The collector uses expressions returned by the Metadata Scan APIs to parse the lineage to the source columns and tables.
Calculated Table	Logical tables and columns from which the calculated table calculates its values.
Logical Column	Associated logical and database columns that the column sources its data from or calculates its values from.
Measure	Associated logical columns that the measure sources its data from.
Dashboard Tile	Associated Semantic Model.
Report	Associated Semantic Model and the Report this Report was published from.
Activity	Establishes lineage between tables or files an Activity copies data to and copies data from. For Copy Activities, see cross-system lineage for supported lineage.
Report Pages	Logical columns and measures from Semantic Model tables that the Report Page uses data from.
Fabric Delta Lakehouse Table	Sourced data from eventstream.
KQL Databases	Sourced data from eventstream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported cross-system lineage

The following data sources support cross-system lineage with Microsoft Fabric.

Note: While other data sources are not formally supported, running the collector for those sources may still enable you to view cross-system lineage between Microsoft Fabric and those sources.

Cross-system lineage data sources

Object	Supported data sources
Semantic Models and Dataflows	• Fabric Lakehouse • Fabric Warehouse • Oracle • Denodo • Snowflake • SQL Server • PostgreSQL • Redshift • Databricks • CSV documents
Fabric Data Pipelines	• Fabric Delta Lakehouse Tables • Fabric Lakehouse Files and Folders • Fabric Warehouse Tables • SFTP Server Files • SQL Server Tables • SQL Server Stored Procedures • Oracle Tables
Dataflow Gen2 and Dataflow Gen2 CI/CD	• Fabric Warehouses • Fabric Lakehouses

Supported Power Query (M) functions and expressions for lineage metadata

This section captures supported transformations, source expressions, calculated columns, and measure expressions when harvesting lineage metadata.

Note: Any table operations or transformations not listed in the following table as supported or unsupported are ignored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Power Query (M) functions and expressions

Category	Supported and unsupported objects
Supported parameterized expressions	The collector parses source expressions that use parameters in place of the following elements: full source value, server or host value, warehouse value, database name, schema name, table name, and SQL expressions that incorporate parameters.
Supported data functions	Csv.Document, Excel.Workbook, File.Contents, Folder.Contents, Folder.Files, Json.Document, Odbc.DataSource, Odbc.InferOptions, Odbc.Query, Xml.Document, Web.Contents, Web.Headers, Web.BrowserContents, AmazonRedshift.Database, Sql.Database, Sql.Databases, Snowflake.Databases, PostgreSQL.Database, Databricks.Catalogs, Oracle.Database, Denodo.Contents, Databricks.Query, Lakehouse.Contents, Fabric.Warehouse
Supported table functions	Table.AddColumn, Table.AddIndexColumn, Table.RenameColumns, Table.NestedJoin, Table.ExpandTableColumn, Table.SplitColumn, Table.DuplicateColumn, Table.CombineColumns
Unsupported table operations	Table.Pivot, Table.PromoteHeaders, Table.DemoteHeaders, Table.PrefixColumns, Table.TransformColumnNames, Table.Unpivot, Table.UnpivotOtherColumns, Table.AddFuzzyClusterColumn, Table.AddJoinColumn, Table.AggregateTableColumn, Table.Combine, Table.CombineColumnsToRecord, Table.ExpandRecordColumn, Table.Join, Table.Transpose **Note:** Contact support if you have expressions that use these unsupported table operations.
Supported dataflow functions	PowerPlatform.Dataflows, PowerBI.Dataflows
Supported value functions	Value.NativeQuery
Supported calculated columns	Lineage from calculated column expressions containing columns with and without table references. Columns or tables with alphanumeric characters, spaces, hyphens, and underscores are supported.
Supported measures	Lineage from measure expressions containing columns or tables with alphanumeric characters, spaces, hyphens, underscores, and surrounding quotes are supported.

Dependencies

Dependencies between Microsoft Fabric resources are cataloged from the Fabric metadata scan APIs. These relationships are visible in the Lineage Explorer.

Authentication supported

The collector supports Service principal authentication method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prepare to run the Microsoft Fabric collector

Set up access and authentication for your Fabric instance before running the collector.

Before you begin

A Fabric administrator is needed to enable settings in the Fabric Admin Portal.

The collector can only harvest metadata for Fabric workspaces to which the service principal has been given access.

The collector uses a JDBC connection to catalog database resources from Warehouses and Lakehouses with service principal authentication. The collector also uses the following APIs to catalog detailed metadata about Fabric resources: Fabric APIs, OneLake APIs, and Power BI APIs.

Role required: admin

Procedure

1. Register your application in the Azure Portal and obtain the required IDs.

   See Register application and get IDs for the Microsoft Fabric collector.

2. Set up service principal authentication.

   See Set up service principal authentication for the Microsoft Fabric collector.

3. Set up metadata scanning.

   See Set up metadata scanning for the Microsoft Fabric collector.

4. **Optional:** Configure report image harvesting.

   (Optional) See Configure report image harvesting for the Microsoft Fabric collector.

Register application and get IDs for the Microsoft Fabric collector

Register an application in the Azure Portal and obtain the Client ID, Tenant ID, and client secret for the Microsoft Fabric collector.

Before you begin

Role required: admin

Procedure

1. Go to the Azure Portal and select **App Registrations** in the Azure services.
2. Select **New Registration** and enter the following information.

Application registration fields

Field	Value
Application Name	For example, DataDotWorldFabricApplication
Supported account types	Accounts in this organizational directory only

3. Select **Register** to complete the registration.
4. Create a client secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the application page, select **Certificates and Secrets**.

b. Select **Secret** and add a description.

c. Select the desired expiration date.

d. Select **Create** and copy the secret value.

5. Obtain the Client ID and Tenant ID.

a. Select the **Overview** tab in the left sidebar of the App registration.

b. Copy the Client ID from the Essentials section.

c. Copy the Tenant ID from the Essentials section.

Set up service principal authentication for the Microsoft Fabric collector

Enable service principal access to Fabric APIs and grant workspace access for the Microsoft Fabric collector.

Before you begin

The service principal must have at least contributor access to the workspace.

Role required: admin

Procedure

1. Sign in to Fabric using a Fabric Admin account.
2. Navigate to **Settings** > **Admin Portal**.
3. Under developer settings, search for **Service principals can use Fabric APIs**.
4. Enable the setting and select whether it applies to the entire organization or a specific security group that includes the service principal.
5. Select **Apply** to save the changes.
   For more information, see the Microsoft documentation.
6. Open the workspace and select **Manage access**.
7. Search for the service principal or the security group the service principal belongs to.
   At a minimum, Contributor access is required.
8. Select **Add**.

Set up metadata scanning for the Microsoft Fabric collector

Enable metadata scanning to allow the collector to access detailed data source information and establish lineage.

Before you begin

A Fabric administrator must complete this setup before running metadata scanning on an organization's Fabric workspaces. Familiarize yourself with the limitations to the scanner APIs.

Role required: admin

About this task

The collector uses the Fabric Scanner APIs to establish lineage to source tables and columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Follow the Fabric documentation to enable service principal authentication for Fabric read-only APIs.
2. Follow the Fabric documentation to enable the following enhanced tenant settings for metadata scanning.
   - Enhance admin APIs responses with detailed metadata
   - Enhance admin APIs responses with DAX and mashup expressions

> **Warning:** When running under a service principal, no API permissions are required, and the registered app must have no admin-consent-required permissions set in the Azure portal. For more information, see Enable service principal authentication for read-only admin APIs.

Configure report image harvesting for the Microsoft Fabric collector

Enable report image harvesting to allow the collector to export Fabric reports as images.

Before you begin

Reports must be located in a workspace with Premium, Embedded, or Fabric capacity. For details, see the Fabric documentation.

Role required: admin

Procedure

1. Enable the **Export reports as image files** setting from the Admin settings.
2. Confirm that the reports to be exported are in a workspace with Premium, Embedded, or Fabric capacity.
3. **Optional:** If using non-Fabric database sources, set up a data source YAML file for lineage mapping.
   See the Power BI collector documentation for instructions. This can be used with the **Datasource Name Mapping File** option in the Microsoft Fabric collector.

Create a Microsoft fabric metadata collector

Create a collector to import metadata from Microsoft Fabric.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Microsoft Fabric collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Microsoft Fabric**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

Microsoft Fabric metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the authentication options.

Authentication options

Field	Description
Microsoft Entra Tenant ID	The tenant ID that identifies the organization in Microsoft Entra.
Client ID	The client ID of the registered application in Microsoft Entra.
Client secret	The client secret for the registered application in Microsoft Entra.

8. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

9. Configure the MID server options.

MID server options

Field	Description
Use MID server	Enable the **Use MID server** toggle to connect to the source system through a MID Server. The system automatically selects an available MID Server.

10. Configure the workspace options.

Workspace options

Field	Description
Include fabric workspaces	Match the workspaces to be collected. Use either a workspace name or a regular expression.
Exclude fabric workspaces	Match the workspaces and contents to exclude from cataloged. Use either a workspace name or a regular expression. If a workspace is specified in both Include Workspace and Exclude Workspace, Include Workspace takes precedence.

11. Select from **Collect all schemas** or **Specify which schema to collect** to configure the schema collection options.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.
Include Information Schema	Include the database's Information Schema in catalog collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

12. Configure the advanced options.

Advanced options

Field	Description
Collect extended properties for SQL database resources	Harvest information about extended properties from SQL Server type databases.
Disable harvesting notebook definition	Specify whether to skip harvesting notebook definition.
Disable harvesting GraphQL API definition	Specify whether to skip harvesting GraphQL API definition.
Exclude delta table internal files	Specify whether to exclude delta table internal files (parquet files and _delta_log folders) from lakehouse file cataloging. Delta tables themselves are still cataloged via the Table API.
OneLake API page size	Page size for OneLake API pagination. Default is 5000.
Exclude system functions	Specify to exclude harvesting of built-in system functions.
JDBC properties	JDBC driver properties to pass through to driver connection, as name=value. Use the parameter multiple times for multiple properties. By default the collector uses authentication=ActiveDirectoryServicePrincipal, and encrypt=true

13. Configure the statistics and sampling options.

Statistics and sampling options

Field	Description
Disable Lineage collection	Skip harvesting of intra-database lineage metadata.
Disable Extended Metadata collection	Skip harvesting of extended metadata for data asset types such as database, schema, table, columns functions, stored procedures, user defined types, synonyms. Basic metadata for these data asset types will still be harvested.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (that is, data profiling). **Note:** Enabling profiling can increase the collector's runtime, as the collector must read table data to generate profiling metadata.
Target sample size for column statistics	Number of rows sampled for computation of column statistics and string-value histograms. For example, to sample 1000 rows, set the parameter as: 1000. Default: 100000
SQL parsing timeout	Specify the timeout in seconds for SQL parsing during lineage collection. The default is 60.

14. Configure the Power BI options.

Power BI options

Field	Description
Maximum power BI expression length	Maximum number of characters in a Table expression (coming from Semantic Models and Dataflows) that will be parsed for lineage metadata. Expressions longer than this will be skipped. Default: 32000.
Datasource name mapping file	If you have configured source details in the datasources.yml file, upload the file.
Disable power BI expression lineage collection	Skip harvesting of intra-database lineage metadata. This applies only to database resources such as views.
Catalog report preview images	Specify if the collector should catalog preview images. The default setting is false. Ensure that you have met all pre-requisites for using this feature.
Disable max requests wait	Disable waiting up to an hour for the Power BI API endpoints to reset throttling limits (error code 429 - too many requests). When not disabled, the collector retries every 5 minutes for up to an hour. If this option is disabled, the Max retries and Retry delay options will be used instead.
Max retries	The number of times the system retries a failed API call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: 5
Retry delay	The number of seconds to wait between retry attempts for a failed API call. Default: 2 seconds

15. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Microsoft SQL Server metadata collector

Provides read-only access to metadata from a Microsoft SQL Server account.

The collector harvests metadata from Microsoft SQL Server databases, including tables, columns, views, schemas, stored procedures, functions, and Agent jobs, making them searchable and discoverable in the data catalog. Supports both self-hosted Microsoft SQL Server instances and managed instances, such as those hosted on AWS RDS or Azure SQL.

Metadata cataloged

The collector catalogs the following information.

Note: The collector harvests all versions of overloaded functions and stored procedures. Each version has its own title/name in the catalog, but a distinct identifier.

Cataloged metadata

Object	Information cataloged
Agent Job	Name, Description, Version, Enabled, Category, Server Name, Created Date, Last Modified Date, Owner, Starting Job Step, Email Notification Level, Page Notification

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cataloged metadata (continued)

Object	Information cataloged
	Level, Network Notification Level, Event Log Notification Level, Delete Notification Level, Email Notification Sent To, Page Notification Sent To, Network Notification Sent To
Agent Job Step	Name, Command, Subsystem, Flag, Additional Parameters, Server, Database, Database Username, Proxy ID, Output File, OS Run Priority, Retry Attempts, Retry Interval, Last Run Outcome, Last Run Duration, Last Run Date, Last Run Time, On Success Action, On Success Go To Step, On Failure Action, On Failure Go To Step
Columns	Name, JDBC type, Column Type, Is Nullable, Default Value, Key type (Primary, foreign), Column size, Column index Extended property: Description
Table	Name, Description, Primary key, Schema Extended metadata: Created date, Modified date
Table Index	Index Cardinality, Column name, Index Type, Index Name, is non Unique, Ordinal Position, Pages, Sort Sequence
Views	Name, Description, SQL definition
Materialized View	Name, description
Schema	Identifier, Name Extended metadata: Created date, Modified date
Database	Type, Name, Identifier, Server, Port, Environment, JDBC URL
Functions	Name, Description, Function Type
Stored Procedures	Name, Description, Stored Procedure Type Extended metadata: Definition, Created, Last modified
Publication	Name, Description, Status, Publication Type, Allow Push, Allow Pull, Allow Anonymous, Allow Subscription Copy, Retention, Enabled for Internet, Snapshot in Default Folder, Alternate Snapshot Folder, Pre Snapshot Script, Post Snapshot Script, Compress Snapshot, FTP Address, FTP Port, FTP Subdirectory, FTP Login, Active Directory Guid, Centralized Conflicts, Decentralized Conflicts, Conflict Retention, Backward Compatibility, Replicate DDL, Publication Sync Method, Immediate Sync, Immediate Sync Ready, Allow Queued Transaction, Allow Sync Transcation, Allow DTS, Options, Autogen Sync Procedure, Allow Initialize From Backup,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cataloged metadata (continued)

Object	Information cataloged
	Has Conflict Policy, Independent Agent, Is Filtered, Snapshot Status, Max Concurrent Merge, Allow Subscriber Initiated Snapshot, Allow Web Synchronization, Allow Sync To Alternate, Web SynchronizationUrl, Allow Partition Realignment, Generation Leveling Threshold, Automatic Reinitialization Policy
Article	Name, Description, Destination Object, Destination Owner, Source Object, Source Owner, Filter Clause, Creation Script, Delete Command, Insert Command, Update Command, Status, Type, Precreation command, Executes Trigger On Snapshot
Subscription	Description, Type, Sync Type, Status Server, Database, Queued Reinitialization, Login Name, Update Mode, Loopback Detection Send Back, No Sync Type, Subscriber Type, Datasource Type, Priority, Attempted Validate, Last Validated, Last Sync Date, Last Sync Status, Last Makegeneration Datetime, Replica Version, Cleanedup Unsent Changes
Synonym	Name

Note: All versions of overloaded functions and stored procedures are cataloged. Each version has its own title in the catalog but a distinct identifier.

When profiling and sampling parameters are enabled, the following additional column information is cataloged:

Profiling and sampling information

Object	Information cataloged
Column	• Average Length (sample) • Average Value (sample) • Data Distribution • Distinct Values • Estimated Distinct Values • Estimated Non-null Values • Maximum Length (sample) • Maximum Value (sample) sorted numerically or alphabetically (z-a) • Minimum Length (sample) • Minimum Value (sample) sorted numerically or alphabetically (a-z)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Profiling and sampling information (continued)

Object	Information cataloged
	• Non-null Values (sample) • Sample String Values (first 5 items in a column)
Table	• Row Count • Sample Count (Target sample size)

Relationship between objects

Catalog pages show relationships between the following data asset types:

Relationships between cataloged objects

Data asset page	Relationship
Agent Job	Agent Job contains Job Step
Job Step	Job Step command is executed in Database
Table	Columns, Table Indexes, Schema
View	Schema that contains Views, Columns that are part of Views
Materialized View	Schema that contains Materialized Views, Columns that are part of Materialized Views
Columns	Table
Schema	Database that contains Schema, Table that is part of Schema, View that is part of Schema, Materialized View that is part of Schema, Synonym
Database	Schema contained in Database
Publication	Contains Article, Has Parent Publication, Published by Publisher Database
Article	Refers Table
Subscription	Subscribes to Publication, Delivered To Subscriber Database, Delivery Executed By Distributor Database, Supplies Data to Table

Lineage and dependencies for Microsoft SQL Server

The following lineage information is collected by the Microsoft SQL Server collector. This lineage information is available only for the target server and databases specified while running the collector. Harvesting lineage from referenced objects located in another server is not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage availability by object

Object	Lineage available
View	Column-level lineage showing source columns for: • Data sourcing • Sorting (ORDER BY) • Filtering (WHERE/HAVING) • Aggregation (GROUP BY)
Stored Procedure	Column-level lineage showing source columns for data sourcing, sorting, filtering, and aggregation. Table-level lineage showing downstream tables updated by the procedure.

Note: The collector parses SQL to harvest lineage metadata. For Views, if SQL parsing fails, the collector uses the `dm_sql_referencing_entities` system function when available. For Stored Procedures, the collector parses INSERT, UPDATE, and SELECT statements and additionally uses the `dm_sql_referencing_entities`system function when available. Limitations:Multitable inserts are not supported.Multiple SELECT and INSERT statements must be separated by semicolon delimiters.

The collector catalogs dependencies between tables, views, and stored procedures using `sys.sql_expression_dependencies`. Dependencies are created when one entity appears by name in a persisted SQL expression of another entity. See the Microsoft SQL Server dependencies documentation for details.

Prepare to run the Microsoft SQL Server collector

Configure authentication and permissions before running the collector.

Before you begin
Role required: admin

About this task
The collector supports three authentication methods for Microsoft SQL Server. All methods require SELECT ON DATABASE permission for metadata access. VIEW DEFINITION permission is required for column-level lineage harvesting.

Procedure

1. Select an authentication method and complete the corresponding setup task.
   - Username and password authentication - See Set up username and password authentication
   - NTLM authentication- See Set up NTLM authentication
   - Microsoft Entra Service Principal authentication - See Set up Service Principal authentication
2. Grant SQLAgentReaderRole permissions to harvest Agent job metadata.
   See Set up permissions for harvesting SQL Server Agent jobs.

Set up NTLM authentication

Create a service account and grant permissions for NTLM authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

The computer running the collector must be attached to the Active Directory domain.

About this task
Configure NTLM authentication using an Active Directory service account with the minimum required permissions for metadata harvesting.

Procedure
1. Create a service account in Active Directory.
2. Grant SELECT ON DATABASE permission.

   This permission allows the collector to harvest catalog data assets such as tables, views, and columns.

   ```
   GRANT SELECT ON DATABASE :: <databaseName> TO <user>;
   ```

   Replace `<databaseName>` and `<user>` with your values.
3. Grant VIEW DEFINITION permission.

   This permission enables column-level lineage harvesting from views.

   ```
   GRANT VIEW DEFINITION ON DATABASE :: <databaseName> TO <user>;
   ```

   Replace `<databaseName>` and `<user>` with your values.
4. **Optional:** Assign the public role for table size information.

   (Optional) This allows the collector to run the sp_spaceused stored procedure.

   See the sp_spaceused documentation for details.

What to do next
When configuring the collector, set these JDBC properties: `integratedSecurity=true`, `authenticationScheme=NTLM`

Set up username and password authentication for SQL Server collector
Create a SQL Server login and grant permissions for username and password authentication.

Before you begin
Role required: admin

About this task
Configure a SQL Server login with the minimum required permissions for metadata harvesting.

Procedure
1. Create a login with password.

   ```
   CREATE LOGIN <loginName> WITH PASSWORD = '<password>';
   ```

   Replace `<loginName>` and `<password>` with your values.
2. Create a user for the login.

   ```
   CREATE USER <user> FOR LOGIN <loginName>;
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Replace `<user>` and `<loginNam>` with your values.

3. Grant SELECT ON DATABASE permission.

   This permission allows the collector to harvest catalog data assets such as tables, views, and columns.

   ```
   GRANT SELECT ON DATABASE :: <databaseName> TO <user>;
   ```

   Replace `<databaseName>` and `<user>` with your values.

4. Grant VIEW DEFINITION permission.

   This permission enables column-level lineage harvesting from views.

   ```
   GRANT VIEW DEFINITION ON DATABASE :: <databaseName> TO <user>;
   ```

   Replace `<databaseName>` and `<user>` with your values.

5. **Optional:** : Grant execute permission for sp_spaceused.

   (Optional) This permission allows the collector to harvest table size information.

   ```
   GRANT EXECUTE ON sp_spaceused TO <user>;
   ```

   Replace `<user>` with your value.

What to do next

See the Microsoft SQL Server permissions documentation for more information about database permissions.

Set up Service Principal authentication

Register an Azure application and grant permissions for Service Principal authentication.

Before you begin

Role required: admin

About this task

Configure Microsoft Entra Service Principal authentication by registering an Azure application and granting database access.

Procedure

1. Register a new application in Azure.

   a. Navigate to **Azure Portal** > **App Registrations**.

   b. Select **New Registration**.

   c. Enter the application name.

      Example: MySQLServerApplication.

   d. For **Supported account types**, select **Accounts in this organizational directory only**.

   e. Select **Register**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Create a client secret.
   a. On the application page, select **Certificates and Secrets** > **Client secrets**.
   b. Select **New client secret**.
   c. Add a description and set the expiration date.
   d. Select **Add**.
   e. Copy the secret value.
3. Grant the service principal access to SQL Server.
   a. In Azure Portal, navigate to your SQL Server instance.
   b. Select **Access control (IAM)** > **Add Role Assignment**.
   c. Select **Reader** under the **Job function roles** tab.
   d. Select **Next**.
   e. For **Assign access to**, verify that **User, group or service principal** is selected.
   f. Select **Select members**.
   g. Search for your registered application name and select it.
   h. Select **Review + assign**.
4. Grant the service principal access to the database.
   a. Connect to SQL Server using SQL Server Management Studio.
   b. Run this command:

```
CREATE USER [<service-principal>] FROM EXTERNAL PROVIDER;
```

   Replace `<service-principal>` with your service principal name.

   c. Grant SELECT ON DATABASE permission.

```
GRANT SELECT ON DATABASE :: <databaseName> TO
 [<service-principal>];
```

   Replace `<databaseName>` and `<service-principal>` with your values.

   d. Grant VIEW DEFINITION permission.

```
GRANT VIEW DEFINITION ON DATABASE :: <databaseName> TO
 [<service-principal>];
```

   Replace `<databaseName>` and `<service-principal>` with your values.

What to do next
See the Microsoft Entra authentication documentation for more information.

Set up permissions for harvesting SQL Server Agent jobs

Grant SQLAgentReaderRole permissions to harvest Agent job metadata.

Before you begin
Role required: sysadmin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
To harvest SQL Server Agent job metadata, assign the SQLAgentReaderRole in the msdb system database.

Procedure
1. Locate the user that is used for running the collector.
2. Grant SQLAgentReaderRole to the user.

```
USE msdb;
EXEC sp_addrolemember 'SQLAgentReaderRole', '<username>';
```

   Replace `<username>` with your user name.

Create a Microsoft SQL Server metadata collector

Create a collector to import metadata from Microsoft SQL Server.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Microsoft SQL Server collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure
1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Microsoft SQL Server**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

Microsoft SQL Server metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Configure the connection options.

Connection options

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Username	Username to use to connect to the database.
Password	Password of the databsase user.

9. Configure the connection information.

Connection information

Field	Description
Include database	Name of the database to connect to. Specify multiple databases by adding one value per line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Excluded database	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

10. Select from **Collect all schemas** or **Specify which schema to collect** to configure the schema collection options.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.
Include Information Schema	Include the database's Information Schema in catalog collection.
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

11. Configure the statistics and sampling options.

Statistics and sampling options

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (that is, data profiling). **Note:** Enabling profiling can increase the collector's runtime, as the collector must read table data to generate profiling metadata.
Target sample size for column statistics	Number of rows sampled for computation of column statistics and string-value histograms. For example, to sample 1000 rows, set the parameter as: 1000. Default: 100000
Disable Lineage collection	Skip harvesting of intra-database lineage metadata.
Disable Extended Metadata collection	Skip harvesting of extended metadata for data asset types such as database,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	schema, table, columns functions, stored procedures, user defined types, synonyms. Basic metadata for these data asset types will still be harvested.

12. Configure the harvesting scope and limits options.

Harvesting scope and limits options

Field	Description
Collect extended properties	Harvest information about extended properties from SQL Server. For example, column descriptions.
Disable replication collection	Skip harvesting of replication metadata.
Enable Sample String Values collection	Enable harvesting of sample values and histograms for columns containing string data.
Exclude system functions	Exclude system functions from metadata collection.

13. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Server environment	Friendly name for the environment in which your database server runs when the server name is localhost. Helps differentiate it from other environments.
Database ID	Unique identifier for this database. Used to generate the database ID when the database name is not sufficiently unique.
Disable agent job collection	Skip harvesting of agent jobs metadata.
JDBC properties	JDBC driver properties to pass through to driver connection.
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection. Default: 60

14. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

MongoDB metadata collector

MongoDB metadata collector provides read-only access to metadata from a MongoDB account.

The MongoDB collector harvests metadata from MongoDB instances (clusters), databases, collections, indexes, search indexes, and document fields. The collector supports harvesting nested fields for Document and Object field types. The collector captures relationship information between instances, databases, collections, document fields, search indexes, and indexes.

Authentication supported

The MongoDB collector supports the following authentication methods:

- Username and password authentication (SCRAM)
- X.509 authentication
- AWS Authentication

Metadata cataloged

The MongoDB collector catalogs the following information:

Cataloged metadata

Object	Information cataloged
MongoDB	MongoDB (instance, cluster) name, MongoDB (instance, cluster) version, Is Debug Mode
MongoDB Database	Database Name, Size On Disk, Is Empty, Views Number, Collections Number, Average Database Object Size, Data Size, Storage Size, Total Free Storage Size, Database Indexes Number, Database Indexes Size
MongoDB Collection (including Materialized View)	Collection Name, Documents Count, Collection Size, Average Object Size, Orphan Documents Number, Storage Size, Collection Free Storage Size, Total Index Size, Index Number, Collection Total Size, Is Capped, Capped Collection Maximum Size, Capped Documents Maximum Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cataloged metadata (continued)

Object	Information cataloged
MongoDB View	View Name
MongoDB Collection Field	Field Name
MongoDB Index	Index Name, Index Size, Is Unique, Default Language
MongoDB Search Index	Index Name, Type, Status, Is Queryable, Is Dynamic, Creation Time

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between cataloged objects

Data asset page	Relationship
MongoDB	MongoDB Databases
MongoDB Database	• MongoDB Collections • MongoDB instance • MongoDB Views
MongoDB Collection	• MongoDB Database • MongoDB Collection Fields • MongoDB Indexes • MongoDB Search Indexes
MongoDB View	MongoDB Collection Field
MongoDB Collection Field Note: The Analysis samples count parameter specifies the number of documents sampled from a collection to determine collection field types. This value must be a non-negative integer, with a default of 1000. Sampling is performed using the $sample aggregation. For more information, see the MongoDB sampling documentation.	• Nested MongoDB Collection Fields • MongoDB Collection • MongoDB View
MongoDB Index	MongoDB Collection
MongoDB Search Index	MongoDB Collection

Prepare to run the MongoDB collector

Create a MongoDB user and configure authentication before running the collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **MongoDB Project properties** > **Database Access**.
2. Select **Add new database user**.
3. Select an authentication method:
   - User-password (SCRAM) authentication
   - X.509 authentication
   - AWS authentication
4. Configure user permissions.
   - For built-in roles: Assign the Read any database role.
   - For specific privileges: Assign Read permission for every database that you want to collect.

Create a MongoDB metadata collector

Create a collector to import metadata from MongoDB.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the MongoDB collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure
1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **MongoDB**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MongoDB metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Enter the MongoDB connection details.

MongoDB connection details

Field	Description
Connection String	Connection string for your MongoDB cluster or instance. Make sure that any option parameters in the connection string are URL-encoded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Enter the MongoDB configuration details.

MongoDB configuration details

Field	Description
Included Databases	Databases to collect. Provide database names or regular expressions. List only one database per line. Databases matching any specified expression are collected.
Excluded Databases	Databases to exclude from collection. Provide database names or regular expressions. List only one database per line. Databases matching any specified expression are excluded. Included databases take precedence over excluded databases.

10. Configure the advanced options.

Advanced options

Name	Description
Analysis samples count	Number of documents sampled from each collection for field type analysis. This field must be a non-negative integer. Default: 1000.

11. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

MySQL metadata collector

The MySQL metadata collector provides read-only access to metadata from an external MySQL database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This collector is designed to directly harvest metadata from your MySQL server. It is suitable for both self-hosted MySQL instances and managed MySQL instances, such as those hosted on AWS RDS. This collector also works with MariaDB instances.

Metadata cataloged

The collector catalogs the following information.

Metadata harvested

Object	Information cataloged
Columns	Name, Description, JDBC type, Column Type, Is Nullable, Default Value, Key type (Primary, foreign), column size, column index
Table	Name, description, primary key, schema
Table Index	Index Cardinality, Column name, Index Type, Index Name, is non Unique, Ordinal Position, Pages, Sort Sequence
Views	Name, description, SQL definition
Schema	Identifier, Name
Database	Type, name, identifier, server, port, environment, JDBC URL
Function	Name, Description, Function Type
Stored Procedure	Name, Description, Stored Procedure Type

If you include the profiling and sampling specific parameters while running the collector, the following additional information is harvested for Columns.

Note: The user/role must have read access to data to be able to harvest profiling information (column statistics).

Profiling and sampling specific information

Object	Information cataloged
Column	• Average Length (sample) • Average Value (sample) • Data Distribution • Distinct Values • Estimated Distinct Values • Estimated Non-null Values • Maximum Length (sample) • Maximum Value (sample) sorted numerically or alphabetically (z-a) • Minimum Length (sample) • Minimum Value (sample) sorted numerically or alphabetically (a-z)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Profiling and sampling specific information (continued)

Object	Information cataloged
	• Non-null Values (sample) • Sample String Values (first 5 items in a column)
Table	• Row Count • Sample Count (Target sample size)

Relationships between objects

The harvested metadata includes catalog pages for the following data asset types. Each catalog page has a relationship to the other related data asset types.

Relationships between harvested data asset pages

Data asset page	Relationship
Table	Columns, Table Indexes
Columns	Table
Schema	Database that contains Schema, Table that is part of Schema
Database	Schema contained in Database

Authentication supported

The MySQL collector supports username/password authentication to MySQL.

Prepare to run the MySQL collector

Create a MySQL user and grant permissions before running the collector.

Before you begin
Role required: admin

About this task
Configure a MySQL user with the minimum required permissions for metadata harvesting.

Procedure

1. Create a user.

```
CREATE USER 'catalog_user'@'%' IDENTIFIED BY '<password>';
```

   Replace `<password>` with a secure password.

2. Grant permissions to the user.

```
GRANT SELECT, SHOW VIEW, EXECUTE ON *.* TO 'catalog_user'@'%';
```

   This grants the following permissions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SELECT: Read access to tables and views
- SHOW VIEW: View definition access
- EXECUTE: Stored procedure and function access

Create a MySQL metadata collector

Create a collector to import metadata from MySQL.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the MySQL collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **MySQL**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

MySQL Server metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Username	Username to use to connect to the database.
Password	Password of the databsase user.

9. Configure the connection information.

Connection information

Field	Description
Database	Name of the database to connect to. Specify multiple databases by adding one value per line.
Excluded database	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Configure the statistics and sampling options.

Statistics and sampling options

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (that is, data profiling). **Note:** Enabling profiling can increase the collector's runtime, as the collector must read table data to generate profiling metadata.
Target sample size for column statistics	Number of rows sampled for computation of column statistics and string-value histograms. For example, to sample 1000 rows, set the parameter as: 1000. Default: 100000
Disable Lineage collection	Skip harvesting of intra-database lineage metadata.
Disable Extended Metadata collection	Skip harvesting of extended metadata for data asset types such as database, schema, table, columns functions, stored procedures, user defined types, synonyms. Basic metadata for these data asset types will still be harvested.
Enable Sample String Values collection	Enable sampling and storage of sample values for string-valued columns.
Exclude system functions	Exclude harvesting of built-in system functions.

11. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Server environment	Friendly name for the environment in which your database server runs when the server name is localhost. Helps differentiate it from other environments.
Database ID	Unique identifier for this database. Used to generate the database ID when the database name is not sufficiently unique.
JDBC properties	JDBC driver properties to pass through to driver connection.
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: 60

12. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Oracle metadata collector

The Oracle metadata collector provides read-only access to metadata from an external Oracle account.

The collector harvests metadata for Oracle objects, such as tables and columns, from an Oracle database, making them searchable and discoverable in the data catalog. It is suitable for both self-hosted Oracle instances and managed Oracle instances, like those hosted on AWS RDS.

Metadata cataloged

The Oracle collector catalogs the following information.

Note: The collector harvests all versions of overloaded functions and stored procedures. Each version has its own title/name in the catalog, but a distinct identifier.

Metadata harvested

Object	Information cataloged
Columns	Name, JDBC type, Column Type, Is Nullable, Default Value, Key type (Primary, Foreign), Column size, Column index Extended metadata: Comment
Table	Name, Primary key, Schema Extended metadata: Comment
Table Index	Index Cardinality, Column name, Index Type, Index Name, is non Unique, Ordinal Position, Pages, Sort Sequence
Views	Name, Definitions, SQL Definition Extended metadata: Description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested (continued)

Object	Information cataloged
Schema	Identifier, Name
Database	Type, Name, Identifier, Server, Port, Environment, JDBC URL
Function	Name, Description, Function Type Extended metadata: Function definition, Package Name
Stored Procedure	Name, Description, Stored Procedure Type Extended metadata: Procedure Definition, Package Name
Synonym	Identifier Extended metadata: Name
Package	Name, Specification Extended metadata: Body definition, Package Body
Public Synonym (accessible to all users in database)	Identifier, Name

If you include the profiling and sampling specific parameters while running the collector, the following additional information is harvested for Columns.

Note: The user/role must have read access to data to be able to harvest profiling information (column statistics).

Profiling and sampling specific information

Object	Information cataloged
Column	• Average Length (sample) • Average Value (sample) • Data Distribution • Distinct Values • Estimated Distinct Values • Estimated Non-null Values • Maximum Length (sample) • Maximum Value (sample) sorted numerically or alphabetically (z-a) • Minimum Length (sample) • Minimum Value (sample) sorted numerically or alphabetically (a-z) • Non-null Values (sample) • Sample String Values (first 5 items in a column)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Profiling and sampling specific information (continued)

Object	Information cataloged
Table	• Row Count • Sample Count (Target sample size)

Relationships between objects

The harvested metadata includes catalog pages for the following data asset types. Each catalog page has a relationship to the other related data asset types.

Relationships between harvested data asset pages

Data asset page	Relationship
Table	Columns, Table Indexes
Columns	Table
Schema	Database that contains Schema, Table that is part of Schema
Database	Schema contained in Database
Synonym	The schema which contains the synonym, The table, view, function, procedure, or package the synonym is for
Package	Schema that contains package Extended metadata: Stored Procedures contained in package, Functions contained in package
Database	Public synonym contained in database

Lineage for Oracle

The following lineage information is collected by the Oracle collector. To harvest lineage from referenced objects located in another server, you must set up the Linked host parameter while running the collector.

Note:

Any lineage for SQL Statements defined via variable statements are not supported.

Lineage for Oracle

Object	Lineage available

Column in View	The collector identifies:
	• The associated column in an upstream view or table
	  ○ Where the data is sourced from
	  ○ That sort the rows via ORDER BY

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage for Oracle (continued)

Object	Lineage available
	○ That filter the rows via WHERE/HAVING ○ That aggregate the rows via GROUP BY • The downstream table that has its data updated by this function.
User-defined function	A Function and: • Views referenced in Function • Tables referenced in Function • Functions referenced in Function • Stored procedures referenced in function A View and: • Function referencing View The collector identifies: • The associated column in an upstream view or table ○ Where the data is sourced from ○ That sort the rows via ORDER BYThat filter the rows via WHERE/HAVING ○ That aggregate the rows via GROUP BY • The downstream table that has its data updated by this Stored Procedure.
Stored Procedure	A Stored Procedure and: • Views referenced in Stored Procedure • Tables referenced in Stored Procedure • Functions referenced in Stored Procedure • Stored procedures referenced in Stored Procedure A View and: • Stored Procedure referencing View The collector identifies: • The associated column in an upstream view or table ○ Where the data is sourced from ○ That sort the rows via ORDER BY

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage for Oracle (continued)

Object	Lineage available
	○ That filter the rows via WHERE/HAVING ○ That aggregate the rows via GROUP BY • The downstream table that has its data updated by this Stored Procedure. The following stored procedures are not supported: • Stored procedures with multitable inserts. However, multiple separate insert statements that insert into one table are supported. • Stored procedure with multiple SELECT and INSERT statements not separated by a semicolon delimiter. • Stored procedures used to create tables or any transient tables created during the execution scope of a stored procedure.

Oracle version supported

The collector supports Oracle database version 19.0.0.0.

Authentication supported

The Oracle collector supports username/password authentication to Oracle.

Prepare to run the Oracle collector

Set up database user permissions and configure advanced features before running the collector.

Before you begin
Role required: admin

About this task
The collector requires a dedicated Oracle database user with SELECT and EXECUTE permissions. You must create the database user and grant appropriate permissions to catalog schemas, tables, views, procedures, functions, and packages.

Procedure

1. Create Oracle user and grant permissions.

   See Set up user permissions.

2. **Optional:** Prepare to harvest cross-server lineage.

   (Optional) See Set up AWR permissions for lineage extraction.

3. **Optional:** Prepare to harvest from autonomous databases.

   (Optional) See Prepare to harvest cross-server lineage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up user permissions

Create a dedicated Oracle user and grant permissions for metadata harvesting.

Before you begin

Role required: admin

About this task

To harvest data from an Oracle database, create a dedicated user with the required permissions. Grant this user SELECT and EXECUTE privileges on the necessary schemas, tables, views, procedures, functions, and packages. Alternatively, you can grant broader access using DBA views or catalog roles to ensure full data harvesting capabilities.

These steps configure a user with the permissions required for efficient data harvesting.

Procedure

1. Create a user.

```
CREATE USER ddw_user IDENTIFIED BY <password>;
```

   Replace <password> with a secure password.

2. Grant SELECT and EXECUTE permissions to the user.

   Primary approach: Grant permissions on specific objects.

```
GRANT CREATE SESSION, SELECT_CATALOG_ROLE TO ddw_user;

                        -- Update <schemaName> and <tableName>
for each schema, table, or view you want to harvest.
                        GRANT SELECT ON
"<schemaName>"."<tableName>" TO ddw_user;

                        -- Update <schemaName> and
<procedureName> for each schema and procedure, function, or
package you want to harvest.
                        GRANT EXECUTE ON
"<schemaName>"."<procedureName>" TO ddw_user;
```

   - In the SELECT command, update <schemaName> and <tableName> for each schema, table, or view you want to harvest.
   - In the EXECUTE command, update <schemaName> and <procedureName> for each schema and procedure, function, or package you want to harvest.

   Alternate approach for EXECUTE permissions: Grant SELECT permission on the following DBA views, or give the user the SELECT_CATALOG_ROLE role, which grants SELECT privileges on all DBA static data dictionary views:

   - DBA_PROCEDURES
   - DBA_ARGUMENTS
   - DBA_SOURCE
   - DBA_DEPENDENCIES
   - DBA_OBJECTS
   - DBA_SYNONYMS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternative approach for SELECT permissions: Grant SELECT permission on the following DBA views, or give the user the SELECT_CATALOG_ROLE role, which grants SELECT permission on all DBA static data dictionary views:

> **Important:** If SELECT privileges aren't granted for the tables, the collector is unable to catalog column statistics.

- DBA_VIEWS
- DBA_MVIEWS
- DBA_OBJECTS
- DBA_CONS_COLUMNS
- DBA_CONSTRAINTS
- DBA_COL_COMMENTS
- DBA_TAB_COMMENTS
- DBA_SOURCE
- DBA_DEPENDENCIES
- DBA_SYNONYMS

Grant comprehensive permissions: If you want to grant the user permission to catalog any object in any schema, use the following commands:

```
GRANT SELECT ANY TABLE TO ddw_user;
                        GRANT EXECUTE ANY PROCEDURE TO
 ddw_user;
```

Set up AWR permissions for lineage extraction

Grant AWR view permissions to enable historical lineage extraction from CREATE TABLE statements.

Before you begin

Role required: admin

License required: Oracle Diagnostics Pack license.

About this task

The Oracle collector queries AWR (Automatic Workload Repository) views to extract lineage from historical CREATE TABLE statements. Grant SELECT permissions on DBA_HIST_* views to enable this capability.

Procedure

Grant AWR view permissions.

```
GRANT SELECT ON DBA_HIST_SQLTEXT TO ddw_user;
           GRANT SELECT ON DBA_HIST_SQLSTAT TO ddw_user;
           GRANT SELECT ON DBA_HIST_SNAPSHOT TO ddw_user;
```

Prepare to harvest cross-server lineage

Configure database links and gather connection information for cross-server lineage harvesting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
If your Oracle database includes objects with SQL definitions that reference another server, follow these steps to capture cross-server lineage. In Oracle, these references are called database links (DB links). To resolve lineage for SQL that uses DB links, the collector requires the host and port information for each linked database.

Procedure
1. Find all database links.

   Use ALL_DB_LINKS or DBA_DB_LINKS to find the full list of DB links.

   See the Oracle database links documentation for details.

2. Gather connection information for each DB link.

   For each DB link entry, work with your Oracle Admin to find:

   - Hostname
   - Database name
   - Port information

3. Record the information for collector configuration.

   This information is passed to the collector using the Linked host parameter.

Create an Oracle metadata collector

Create a collector to import metadata from Oracle.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Oracle collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure
1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Oracle**.
5. From the Connection type list, select one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New connection** to configure a new connection.

b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

Microsoft SQL Server metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Configure the authentication options.

Authentication options

Field	Description
Username	Username to use to connect to the database.
Password	Password of the databsase user.

9. Select from **Collect all schemas** or **Specify which schema to collect** to configure the schema collection options.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.
Include Information Schema	Include the database's Information Schema in catalog collection.
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

10. Configure the connection information.

Connection information

Field	Description
Include database	Name of the database to connect to. Specify multiple databases by adding one value per line. If not specified, the collector harvests metadata from all databases.
Excluded database	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

11. Configure the statistics and sampling options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Statistics and sampling options

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (that is, data profiling). **Note:** Enabling profiling can increase the collector's runtime, as the collector must read table data to generate profiling metadata.
Target sample size for column statistics	Number of rows sampled for computation of column statistics and string-value histograms. For example, to sample 1000 rows, set the parameter as: 1000. Default: 100000
Disable Lineage collection	Skip harvesting of intra-database lineage metadata.
Disable Extended Metadata collection	Skip harvesting of extended metadata for data asset types such as database, schema, table, columns functions, stored procedures, user defined types, synonyms. Basic metadata for these data asset types will still be harvested.

12. Configure the harvesting scope and limits options.

Harvesting scope and limits options

Field	Description
Database is an Oracle SID	Indicate that the database is actually an Oracle SID.
Oracle JDBC Connection Timezone	Specify whether the default timezone of JVM should be used as the Oracle JDBC connection timezone.
Enable Sample String Values collection	Enable harvesting of sample values and histograms for columns containing string data.
Exclude system functions	Exclude system functions from metadata collection.

13. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Server environment	Friendly name for the environment in which your database server runs when the server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	name is localhost. Helps differentiate it from other environments.
Database ID	Unique identifier for this database. Used to generate the database ID when the database name is not sufficiently unique.
Use Oracle Autonomous Database	Option to connect to an Autonomous Database. When this option is enabled: ○ Enter the service name as the value for the Database parameter. For example, g0404_ktest_high.adb.oraclecloud.com ○ Enter the host name as the value for the Server parameter. For example, adb.us-chicago-1.oraclecloud.com
Oracle Autonomous Database Connection String	The connection string for an Autonomous Database. The connection string should be in the format: jdbc:oracle:thin:@<host>:<port>/<service_name> or jdbc:oracle:thin:@(address=(protocol=tcps)(port=<port>) (host:<host>))(connect_data=(service_name=<service_name>))(security=(ssl_server_dn_match=yes))). **Note:** The collector connects to the Oracle Cloud instance using the value in the Oracle Autonomous Database Connection String field. However, the server, port, and database parameters are still required—they are used for IRI coining and to uniquely identify the database data assets within your catalog.
JDBC properties	JDBC driver properties to pass through to driver connection.
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection. Default: 60

14. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

PostgreSQL metadata collector

Provides read-only access to metadata from a PostgreSQL database.

The collector harvests metadata for PostgreSQL tables and columns, making them searchable and discoverable in the data catalog. Supports both self-hosted PostgreSQL instances and managed PostgreSQL instances, such as those hosted on AWS RDS.

Authentication supported

Username and password authentication and AWS IAM authentication.

Metadata cataloged

The PostgreSQL collector catalogs the following information.

Note: All versions of overloaded functions and stored procedures are cataloged. Each version has its own title in the catalog but a distinct identifier.

Cataloged metadata

Object	Information cataloged
Columns	Name, Description, JDBC type, Column Type, Is Nullable, Default Value, Key type (Primary, foreign), column size, column index
Table	Name, description, primary key, schema
Table Index	Index Cardinality, Column name, Index Type, Index Name, is non Unique, Ordinal Position, Pages, Sort Sequence
Views	Name, description, SQL definition
Materialized View	Name, description, SQL definition
Schema	Identifier, Name
Database	Type, name, identifier, server, port, environment, JDBC URL
Function	Name, Description, Function Type
Stored Procedure	Name, Description, Stored Procedure Type

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When profiling and sampling parameters are enabled, the following additional column information is cataloged:

Note: The user/role must have read access to data to be able to harvest profiling information (column statistics).

Profiling and sampling specific information

Object	Information cataloged
Column	• Average Length (sample) • Average Value (sample) • Data Distribution • Distinct Values • Estimated Distinct Values • Estimated Non-null Values • Maximum Length (sample) • Maximum Value (sample) sorted numerically or alphabetically (z-a) • Minimum Length (sample) • Minimum Value (sample) sorted numerically or alphabetically (a-z) • Non-null Values (sample) • Sample String Values (first 5 items in a column)
Table	• Row Count • Sample Count (Target sample size)

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between harvested data asset pages

Data asset page	Relationship
Table	Columns, Table Indexes
Columns	Table
Schema	• Database that contains Schema • Table that is part of Schema • View that is part of Schema • Materialized View that is part of Schema

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between harvested data asset pages (continued)

Data asset page	Relationship
View	• Schema that contains Views • Columns that are part of Views
Materialized View	• Schema that contains Materialized Views • Columns that are part of Materialized Views

Lineage for PostgreSQL

The collector identifies column-level lineage for Views and Materialized Views, tracing data sources from view columns to source table columns across SQL expressions and subqueries.

Establishes relationships between Views and source Table columns that:

- Sort rows (SQL ORDER BY)
- Filter rows (SQL WHERE and HAVING clauses)
- Aggregate rows (SQL GROUP BY)

Note: View-to-table relationships can be established transitively through column-level relationships. Variable statement lineage isn't supported.

Prepare to run the PostgreSQL collector

Create a PostgreSQL user and configure permissions before running the collector.

Before you begin

Role required: admin

Procedure

1. Create a new role.

```
CREATE ROLE ddw_role;
```

2. Grant metadata harvesting permissions to the role.

```
GRANT SELECT ON ALL TABLES IN SCHEMA information_schema TO
 ddw_role;
GRANT SELECT ON ALL TABLES IN SCHEMA "<schemaName>" TO
 ddw_role;
GRANT SELECT ON TABLE pg_namespace TO ddw_role;
GRANT SELECT ON TABLE pg_class TO ddw_role;
GRANT SELECT ON TABLE pg_description TO ddw_role;
GRANT SELECT ON TABLE pg_attribute TO ddw_role;
GRANT SELECT ON TABLE pg_type TO ddw_role;
GRANT SELECT ON TABLE pg_attrdef TO ddw_role;
GRANT SELECT ON TABLE pg_index TO ddw_role;
GRANT SELECT ON TABLE pg_proc TO ddw_role;
GRANT SELECT ON TABLE pg_database TO ddw_role;
GRANT SELECT ON TABLE pg_matviews TO ddw_role;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Replace `<schemaName>` with your schema name.

3. **Optional:** Grant permissions for column statistics harvesting.

   (Optional) Run these commands for each database and schema you want to collect statistics from:

   ```
   GRANT USAGE ON SCHEMA "<schemaName>" TO ddw_role;
    GRANT SELECT ON ALL TABLES IN SCHEMA "<schemaName>" TO
    ddw_role;
   ```

   Replace `<schemaName>` with your schema name.

4. Create a user and assign the role.

   ```
   CREATE USER ddw_user PASSWORD '<password>';
   GRANT ddw_role TO ddw_user;
   ```

   Replace `<password>` with a secure password.

5. **Optional:** Configure IAM authentication.

   (Optional) See the AWS IAM authentication documentation for setup instructions.

Create a PostgreSQL metadata collector

Create a collector to import metadata from PostgreSQL.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the PostgreSQL collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **PostgeSQL**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgeSQL metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Authenticate using username and password	Option to authenticate using username and password to connect to the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authenticate using AWS IAM (Explicit credentials)	Option to authenticate using the AWS access key ID and AWS secret access key.

9. Select from **Collect all schemas** and **Specify which schema to collect**.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.
Include Information Schema	Include the database's Information Schema in catalog collection.
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

10. Configure the connection information.

Connection information

Field	Description
Database	Name of the database to connect to. Specify multiple databases by adding one value per line.
Excluded database	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

11. Configure the statistics and sampling options.

Statistics and sampling options

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (that is, data profiling). **Note:** Enabling profiling can increase the collector's runtime, as the collector must read table data to generate profiling metadata.

	Default: 60

14. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

PowerBI metadata collector

The PowerBI metadata collector provides read-only access to metadata from a PowerBI account.

Power BI is a collection of software services, apps, and connectors that work together to transform unrelated data sources into coherent, visually immersive, and interactive insights. Data sources can include Excel spreadsheets, cloud-based data warehouses, or on-premises hybrid data warehouses. Power BI enables you to connect to data sources, visualize and discover important information, and share insights across the organization.

The Power BI collector harvests metadata from Power BI service workspaces. Use harvested metadata to discover reports and dashboards across workspaces and perform impact analysis to understand how changes to upstream data sources affect Power BI reports.

Version supported

The collector supports Power BI Cloud API v 1.0.

Authentication supported

Power BI supports two authentication methods:

- Service principal
- User and password

The collector harvests metadata for all Power BI apps and workspaces the authenticated account has access to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata cataloged

The Power BI collector catalogs the following information:

Metadata harvested

Object	Information collected
Workspaces	Title, Description
Apps	Title, Description
Power BI measures	Title, Description, Is hidden, Expression
Reports	Title, Reports type, External URL, Embed URL, Preview Image (not supported for paginated report types), Created date, Last modified, Created by, Last modified by, Descriptions
Report pages	Title Note: Report pages within Apps can't be cataloged when using Service Principal authentication due to restrictions in the Power BI APIs.
Dashboards	Title, External URL, Embed URL
Dashboard tiles	Title, Embed URL
Data Sources	Title, Data source type, Connection Details (kind and path)
Semantic model	Title, External URL, Description, Created date, Created by, Refresh Schedule
Dataflows	Title, Last modified, Description, Created by, Refresh Schedule
Power BI tables (Semantic model and Dataflows)	Title, Is hidden, Is Entered Data, Description, Source expression
Power BI calculated table	Title, Is hidden, Is Entered Data, Description, Source expression
Power BI columns	Title, Descriptions, Data type, Column type, Is hidden, Expression
Tabular file	File path, File name
File directory	Directory path
Database	Title, Type, Identifier, Server, Port
Database schema	Title
Database table	Title
Database column	Title
Table	Title, Description
Column	Title, Type
Calculation group	Title, Description
Calculation item	Title, Description, Expression

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between cataloged objects

Data asset page	Relationship
App	Report, Dashboard, Workspace
Power BI Column	Power BI Table
Data source	Semantic model, Dataflow, Tabular Data source (Database, Tabular File)
Tile	Dashboard, Report, Semantic model
Dashboard	Tile, Workspace
Dashboard Tile	Associated Semantic model
Semantic model	Dashboard Tile, Report
Report	Tile, Workspace, Report pages (not applicable for paginated report types), Semantic model (not applicable for paginated report types), Report **Note:** In Power BI, app reports and their associated workspace reports are two separate reports with unique report IDs. The collector catalogs the relationship between them.
Report Pages	Report (not applicable for paginated report types)
Semantic model	Tile, Workspace, Report, Table, Data source, Semantic model, Dataflow
Workspace	Report, Semantic model, Dataflow, Dashboard, App
Dataflow	Workspace, Table, Data source, Dataflow
Power BI Table	Semantic model, Dataflow, Power BI Column, Power BI Measure
Power BI Measure	Power BI Table
Tabular Data source (Database, Tabular File)	Data source
Calculation Group	Power BI Table
Calculation Item	Calculation Group

Lineage for PowerBI

The following lineage information is collected by the Power BI collector. The collector uses the Power BI Scanner APIs to establish lineage to source tables and columns. Be sure to familiarize yourself with the limitations to the scanner APIs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage availability by object

Object	Lineage available
Dashboard Tile	Associated Semantic model
Semantic model	Associated Dataflow, Semantic model
Dataflow	Dataflow
Power BI Column	Associated columns that the column sources its data from or calculates its values from. **Note:** Lineage can be harvested from Power BI expressions that use parameters in place of server, schema, table, or database names. Table-level and column-level lineage and catalog relationships aren't available between tables or columns and reports through the Power BI API.
Power BI table	Associated tables that the table sources its data from Note: **Note:** The collector uses Power BI expressions returned by the APIs to parse the lineage to the source columns/ tables.
Power BI calculated table	Power BI tables and columns from which the calculated table derives its values.
Power BI Measure	Associated columns that the measure sources it data from

The following table lists supported and unsupported table operations and transformations. This includes source expressions, calculated columns, and measure expressions used in lineage metadata harvesting. Unlisted operations are not harvested.

Supported transformations and expressions for harvesting lineage metadata

Category	Category
Supported Parameterized Expressions	The collector parses source expressions that use parameters in place of the following values: full source, server or host, warehouse, database name, schema name, table name, and SQL expressions.
Supported data functions	Csv.Document, Excel.Workbook, File.Contents, Folder.Contents, Folder.Files, Json.Document, Odbc.DataSource, Odbc.InferOptions, Odbc.Query, Xml.Document, Web.Contents, Web.Headers, Web.BrowserContents, AmazonRedshift.Database, Sql.Database, Sql.Databases, Snowflake.Databases, PostgreSQL.Database,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported transformations and expressions for harvesting lineage metadata (continued)

Category	Category
	Databricks.Catalogs, Oracle.Database, Denodo.Contents, Databricks.Query, DatabricksMultiCloud.Catalogs, AnalysisServices.Database, GoogleBigQuery.Database
Supported table functions	Table.AddColumn, Table.AddIndexColumn, Table.RenameColumns, Table.NestedJoin, Table.ExpandTableColumn, Table.SplitColumn, Table.DuplicateColumn, Table.CombineColumns
Unsupported table operations	Table.Pivot, Table.PromoteHeaders, Table.DemoteHeaders, Table.PrefixColumns, Table.TransformColumnNames, Table.Unpivot, Table.UnpivotOtherColumns, Table.AddFuzzyClusterColumn, Table.AddJoinColumn, Table.AggregateTableColumn, Table.Combine, Table.CombineColumnsToRecord, Table.ExpandRecordColumn, Table.Join, Table.Transpose
Supported dataflow functions	PowerPlatform.Dataflows, PowerBI.Dataflows
Supported value functions	Value.NativeQuery
Supported calculated columns	Lineage from calculated column expressions containing columns with and without table references, Columns or tables with alphanumeric characters, Spaces, Hyphens, and Underscore are supported
Supported measures	Lineage from measure expressions containing columns or tables with alphanumeric characters, Spaces, Hyphens, Underscore, Surrounding quotes are supported

Prepare to run the PowerBI collector

Set up Azure application registration, authentication, and permissions before running the collector.

Before you begin

Role required: admin

Important: A Power BI Administrator is needed to enable settings in the Power BI Admin Portal.

About this task

The collector uses Azure application registration and supports two authentication methods: service principal or username and password. You must register an application, configure authentication, enable metadata scanning, and retrieve the tenant ID. Optionally, configure report image harvesting and lineage mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Register an application in Azure and create client credentials.

   See Register Power BI application.

2. Configure authentication based on your preferred method.

   - For service principal authentication, see Configure Power BI service principal authentication.
   - For username and password authentication, see Configure Power BI username and password authentication.

3. Enable metadata scanning to access detailed data source information.

   See Configure Power BI metadata scanning.

4. Get the Power BI tenant ID.

   See Get Power BI tenant ID.

5. **Optional:** Configure report image harvesting to collect preview images from Power BI reports.

   (Optional) See Configure Power BI report image harvesting.

6. **Optional:** Configure lineage mapping for ODBC connections, server aliases, or custom SQL statements.

   (Optional) See Configure Power BI lineage mapping .

Register Power BI application

Register an application in Azure and create client credentials for Power BI collector authentication.

Before you begin

Role required: admin

You must have permissions to register applications in Azure Active Directory.

About this task

Register an application in Azure to obtain the client ID and client secret needed for Power BI collector authentication.

Procedure

1. Register a new application in Azure.

   a. Navigate to the Azure Portal.

   b. Select **App Registrations** from Azure services.

   c. Select **New Registration**.

   d. Enter the registration information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application Name: DataDotWorldPowerBIApplication
- Supported account types: Accounts in this organizational directory only

e. Select **Register** to complete the registration.

2. Create a client secret.

a. On the application page, select **Certificates and Secrets**.

b. Select **New client secret**.

c. Add a description for the secret.

d. Select the desired expiration date.

e. Select **Add**.

f. Copy the secret value.

Save this value securely. You will use it when configuring the Power BI collector.

3. Get the client ID.

a. Select the **Overview** tab in the left sidebar of the application page.

b. Copy the Client ID from the Essentials section.

Save this value. You will use it when configuring the Power BI collector.

Configure Power BI service principal authentication

Set up service principal authentication to enable Power BI metadata collection.

Before you begin

Role required: admin

You must be a Power BI administrator to enable service principal settings.

Important: When running under a service principal, there must be no Power BI admin-consent-required permissions set on your app. For more information, see the Microsoft documentation.

About this task

When using service principal authentication, the collector harvests all objects except personal workspaces, user workspaces, and report pages. To harvest all apps and workspaces in the tenant, enable Catalog all workspaces and apps in the tenant. To include personal and user workspaces, enable Catalog contents of user's My Workspace.

Note: To harvest report pages, grant the service principal access to each workspace. The admin API doesn't have an endpoint for report pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Sign in to Power BI using a Power BI Admin account.
2. Navigate to **Settings** > **Admin Portal**.
3. Enable service principal API access.
   a. Under **Developer settings**, locate **Service principals can use Fabric APIs**.
   b. Enable the setting.
   c. Select whether the setting applies to the entire organization or specific security groups.
      If using specific security groups, confirm that the group includes the service principal.
   d. Select **Apply** to save the changes.
4. **Optional:** Add the service principal to workspaces for dataflow and report page access.
   (Optional) Dataflows require the service principal to have at least Contributor access to the workspace. For report pages, the service principal also needs workspace access because the admin API doesn't provide an endpoint for report pages.
   a. Open the workspace.
   b. Select **Manage access**.
   c. Search for the service principal or the security group the service principal belongs to.
   d. Select the appropriate access level.
      (Optional) If dataflows are used, select at least Contributor access. Otherwise, select Viewer.
   e. Select **Add**.

Configure Power BI username and password authentication

Set up API permissions for username and password authentication to enable Power BI metadata collection.

Before you begin

Role required: admin

You must have permissions to configure API permissions in Azure Active Directory.

Note: Only administrators of the tenant can grant admin consent.

About this task

When using user authentication, the collector harvests all objects except personal workspaces, user workspaces, and report pages. To harvest all apps and workspaces in the tenant, enable Catalog all workspaces and apps in tenant. To include personal and user workspaces, enable Catalog contents of user's My Workspace.

To harvest report pages, grant the user access to each workspace. The admin API doesn't have an endpoint for report pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Catalog all workspaces and apps in the tenant requires the user to have Microsoft 365 Global Administrator or Power BI Service Administrator rights for metadata scanning. For details, see the Power BI documentation.

Procedure

1. Navigate to the Azure Portal and open the application registration.
2. Select **API Permissions**.
3. Add Microsoft Graph permissions.
   a. Select **Add a permission**.
   b. Search for and select **Microsoft Graph**.
   c. Add the following permissions.
      - Application permission: Application.Read.All
      - Delegated permission: User.Read (assigned by default)
4. Add Power BI service permissions.
   a. Select **Add a permission**.
   b. Search for and select **Power BI service**.
   c. Select **Delegated permissions**.
   d. Add the following permissions.
      - App.Read.All
      - Dashboard.Read.All
      - Dataflow.Read.All
      - Dataset.Read.All
      - Report.Read.All
      - Tenant.Read.All
      - Workspace.Read.All
5. Select the **Grant admin consent** button located next to the **Add a permission** button.

   This permission enables the collector to run without asking you for permission on every run.

Configure Power BI metadata scanning

Enable metadata scanning to access detailed data source information including tables and columns.

Before you begin

Role required: admin

You must be a Power BI administrator to enable metadata scanning settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Metadata scanning provides access to detailed data source information, such as tables and columns, through Power BI read-only admin APIs. The collector uses the Power BI Scanner APIs to establish lineage to source tables and columns. Review the limitations to the scanner APIs before configuring the collector.

Procedure

Enable metadata scanning based on your authentication method.

- For service principal authentication:
  a. Follow the Power BI documentation to enable service principal authentication for Power BI read-only APIs
  b. Enable the following enhanced tenant settings for metadata scanning:
     - Enhance admin APIs responses with detailed metadata
     - Enhance admin APIs responses with DAX and mashup expressions
- For username and password authentication, enable the following enhanced tenant settings for metadata scanning:

  Important: The user must have administrator rights (Microsoft 365 Global Administrator or Power BI Service Administrator) to use metadata scanning. For details, see the Power BI documentation.

  - Enhance admin APIs responses with detailed metadata
  - Enhance admin APIs responses with DAX and mashup expressions

Get Power BI tenant ID

Retrieve the tenant ID from the Power BI application.

Before you begin

Role required: admin

About this task

The tenant ID is required when configuring the Power BI collector. Retrieve this value from the Power BI application.

Procedure

1. In the Power BI application, select the question mark icon.
2. Select **About Power BI**.
3. Copy the tenant ID from the end of the Tenant URL.

   Save this value. You will use it when configuring the Power BI collector.

Configure Power BI report image harvesting

Enable report image harvesting to collect preview images from Power BI reports.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Report image harvesting isn't supported for Power BI Apps.

About this task
Enable report image harvesting to collect preview images from Power BI reports for display in the Data Catalog.

Procedure
1. Enable the export setting in the Power BI Admin Portal.
   a. Sign in to Power BI using a Power BI Admin account.
   b. Navigate to **Settings** > **Admin Portal**.
   c. Locate and enable the **Export reports as image files** setting from the Admin settings.
2. Verify workspace capacity.

   Confirm that the reports to be exported are located in a workspace with Premium, Embedded, or Fabric capacity. For details, see the Power BI documentation.

Configure Power BI lineage mapping

Create a YAML file to map data sources for lineage harvesting.

Before you begin
Role required: admin

About this task
This is an optional task for harvesting lineage information. Create a YAML file and pass it using the Datasource name mapping file option when running the collector.

Set up a YAML file in the following scenarios:

Lineage mapping scenarios

Scenario	Details	Action
ODBC Connections in Power BI	You have a data source in Power BI that uses an ODBC connection. In these instances, Power BI doesn't provide the host or database type of the source	In the YAML file, map the DSN to a specific database host and type. If the database name is missing in the Power BI data source, add the defaultDatabaseName option to the data source in the YAML file
Multiple Server Name Aliases	You have multiple server names (aliases) for the same database instance (host) and the database collector uses a different alias than the one defined in the Power BI connection	Use the YAML file to map the database host to user-specified aliases
Custom SQL Statements	Custom SQL statements are used in Power BI table source definitions. The Power BI collector currently supports connecting to the following database types to resolve lineage from SQL statements: Snowflake, SQL Server, PostgreSQL, Redshift, Oracle, Databricks, Denodo, BigQuery. Lineage resolution for	Configure databases specified in custom SQL statements by including datasourceKey, host, and secure credentials using environment variables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage mapping scenarios (continued)

Scenario	Details	Action
	table sources using SQL statements only supports SQL consisting of a single SELECT statement	

Note: You can use environment variables in the file for sensitive information such as passwords.

Procedure

1. Create a YAML file named datasources.yml.
2. Configure the YAML file based on your scenario.

   - For multiple server name aliases:

     Add the following to map a host alias:

     ```
     datasources:
      - datasourceKey: "<host or data source key in Power BI
     source>"
       host: <my-datasource-host>
     ```

     For example, if your Power BI table source is:

     ```
     let Source =
      Snowflake.Database("host-alias.snowflakecomputing.com",
      "KOS_TEST"),
     PowerBiTest_Test_Table =
      Source{[Schema="POWERBI_TEST",Item="TEST_TABLE"]}[Data]
     in PowerBiTest_Test_Table
     ```

     Then the datasourceKey will be host-alias.snowflakecomputing.com. Your datasources.yml file will look like:

     ```
     datasources:
     - datasourceKey: host-alias.snowflakecomputing.com
     host: host-actual.snowflakecomputing.com
     ```

   - For custom SQL statements:

     Add the following for databases specified in custom SQL statements. Environment variables are supported:

     ```
     datasources:
       - datasourceKey: "<host or data source key in Power BI
      source>"
       OR
      - name: <data source name>
      host: <my-datasource-host>
      databaseUsername: <username> # recommend setting up env
      variable
      databasePassword: <password> # recommend setting up env
      variable
     ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the following option to specify which databases a datasource configuration applies to. If not provided, it's assumed that the datasource settings apply to all databases on the given host:

```
applicableDatabases:
  - <database_name>
```

For example:

```
datasources:
- datasourceKey:
 "example.cpcnqsn422gx.us-east-1.rds.amazonaws.com, 1433"
 host: example.cpcnqsn422gx.us-east-1.rds.amazonaws.com
 databaseUsername: ${DB_USERNAME}
 databasePassword: ${DB_PASSWORD}
 applicableDatabases:
 - 8bank_database
```

- For ODBC connections:

  Map the DSN to a specific database host and type. For ODBC connections, list data sources with their corresponding host and database type. If ODBC connections use Odbc.Query, specify the user name and password. If ODBC connections specify the database name, include defaultDatabaseName:

  ```
  datasources:
  - name: "Name-for-datasource"
  host: <my-datasource-host>
  databaseType: <type-of-database>
  databaseUsername: <username> # optional
  databasePassword: <password> # optional
  defaultDatabaseName: <database name> # optional
  ```

  The list of possible databaseTypes are: postgres, redshift, bigquery, oracle, mysql, netezza, snowflake, sqlanywhere, sqlserver, databricks, denodo. Types aren't case-sensitive but should be a single word with no spaces.

  For example:

  ```
  datasources:
  - name: "SQL Server DSN Production"
  databaseType: sqlserver
  host: 8bank-sqlserver.cpetgx.us-east-1.rds.amazonaws.com
  ```

3. **Optional:** Add database-specific configuration options if necessary.

   (Optional) JDBC properties options:

   JDBC properties

Option	Description
jdbcProperties	Multiple JDBC properties can be specified using a YAML list. The expected format is jdbcProperties: key=value (Optional) For example: jdbcProperties: encrypt=true For multiple values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	jdbcProperties: - encrypt=true - readOnly=true

Snowflake database credentials options:

Snowflake options

Option	Description
databaseUsername: ${DB_USERNAME}	Required if custom SQL queries are used in Power BI database sources
databasePassword: ${DB_PASSWORD}	Required if SQL queries are used and if a private key isn't used for authentication to Snowflake
snowflakePrivateKeyFile: privateKeyFile	Required if SQL queries are used and if a private key is used for authentication to Snowflake
snowflakePrivateKeyFilePassword: ${privateKeyFilePassword}	Required if SQL queries are used and if a private key is used for authentication to Snowflake
snowflakeRole: role	Required if SQL queries are used
snowflakeWarehouse: warehouse	Use to override warehouses used in Power BI expressions in the database connection

Databricks database credentials options:

Databricks options

Option	Description
databricksHttpPath	Required if the source database is Databricks

Oracle Autonomous Database options:

Oracle Autonomous Database options

Option	Description
oracleAutonomousDbConnectionString	Required if the source is an Oracle Autonomous Database. The connection string should be in the format: jdbc:oracle:thin:<host>:<port>/<service_name>, jdbc:oracle:thin:@(address=(protocol=tcps)(port=<port>)(host:<host>)) (connect_data=(service_name=<service_name>)) (security=(ssl_server_dn_match=yes)), or jdbc:oracle:thin:@alias_name?TNS_ADMIN=/path/to/wallet

BigQuery options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BigQuery options

Option	Description
project	Required if the source is a BigQuery table
bigQueryCredentialJsonString	Required for supplying BigQuery credentials

Example for BigQuery database:

```
datasources:
 - project: "project-name"
databaseType: bigquery
bigQueryCredentialJsonString: '{"key": "value","key": "value"}'
```

4. Save the datasources.yml file.
5. Pass the YAML file to the collector using the --datasource-mapping-file parameter when running the collector.

Create a PowerBI metadata collector

Create a collector to import metadata from PowerBI.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the PowerBI collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **PowerBI**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PowerBI metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Authenticate using Azure username and password	Azure Active Directory username and password. Set the Azure Tenant ID if you want to specify the Azure tenant ID while using the user name and password authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authenticate using Azure Service principal	Azure Active Directory application tenant ID for Power BI app. To find the tenant ID, select the question mark in the Power BI app and then choose About Power BI. The tenant ID is found at the end of the Tenant URL.

9. Configure the client ID and client secret details.

Configuration details

Field	Description
Microsoft Entra client ID	Application client ID for the PowerBI app.
Microsoft Entra client secret	Application client secret for the PowerBI app.

10. Configure the workspace scope and filters options.

Workspace scope and filters options

Field	Description
Disable Lineage collection	Option to skip harvesting lineage metadata from Power BI source expressions.
Catalog contents of user's My Workspace	Option to catalog the contents of a user's My Workspace in Power BI. Default: Skip the user's workspace.
Catalog all workspaces and apps in tenant	Option to catalog all workspaces and apps in a tenant, rather than only the workspaces and apps the credentials have explicit access to. Admin privileges are required for the credentials used.
Include Power BI workspace(s)	Workspaces to collect. Enter the exact workspace name or a regular expression to match. **Note:** If a workspace name includes special characters [. , + , * , ? , ^ , $, (,) , [,] , { , } , | , \], escape each special character with a backslash (\). For example, enter Workspace \(Dev\) for Workspace (Dev).
Exclude Power BI Workspaces	Power BI workspaces and their contents to exclude from cataloging. Enter the exact workspace name or a regular expression to match. If both Include Workspaces and Exclude Workspaces are configured, Include Workspaces takes precedence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If a workspace name includes special characters [. , + , * , ? , ^ , $, (,) , [,] , { , } , | , \], escape each special character with a backslash (\). For example, enter Workspace \(Dev\) for Workspace (Dev).

11. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Maximum Power BI Expression Length	Maximum number of characters in a Power BI expression that is parsed for lineage metadata. Expressions longer than this value are skipped. Default: 32000
Datasource Name Mapping File	File that maps ODBC source details configured in the datasources.yml file. Upload the file if you have configured ODBC source details.
Catalog report preview images	Option to catalog preview images. Default: false
Disable max requests wait	Option to disable waiting for the Power BI API to reset throttling limits (error code 429). When not selected, the collector retries every 5 minutes for up to an hour. When selected, the Max retries and Retry delay settings are used instead.
Max retries	Number of times the system retries a failed API call. Default: 5
Retry delay	Number of seconds to wait between retry attempts for a failed API call. Default: 2 seconds

12. Select **Save**.

Result

The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next

After creating the collector, you can perform any of the following tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

SAP HANA metadata collector

Provides read-only access to metadata from a SAP HANA instance.

Use this collector to harvest database, schema, tables, columns, views, stored procedures, and functions from SAP HANA.

Metadata cataloged

The collector catalogs the following information.

Cataloged metadata

Object	Information cataloged
Database	Name, Database Type, Connection Info (Database Name, Port, Server, JDBC URL), Associated Schema
Schema	Name, Associated Database, Associated Functions, Associated Stored Procedures, Associated Tables Extended Metadata: Owner, Created
Tables	Name, Associated Columns, Primary Key (Key Name, Key Columns), Foreign Keys (Key Name, Source Columns, Target Columns), Sample rows (if data sampling is enabled)
Table Index	Index Cardinality, Column name, Index Type, Index Name, is non Unique, Ordinal Position, Pages, Sort Sequence
Columns	Index Cardinality, Column name, Index Type, Index Name, is non Unique, Column Ordinal Position, Pages, Column Sort Sequence
Views	Name, SQL Definition, Associated Columns, Rows Filtered By, Rows Ordered By
Functions	Name, Description, Function Type Extended Metadata: Function Definition, Owner, Created
Stored Procedures	Name, Description, Stored Procedure Type, Rows Filtered By, Sourced Data From

Cataloged metadata (continued)

Object	Information cataloged
	Extended Metadata: Procedure Definition, Owner, Created

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between harvested data asset pages

Object	Relationship
Database	Has schema
Schema	Part of database, Has functions and stored procedures, Has tables
Tables	Has Columns
Table Indexes	Part of schema, Was generated by Stored Procedures
Columns	Part of tables or views
Table Indexes	Table Indexes, Columns
Views	Has columns

Lineage for SAP HANA

The following lineage information is collected by the collector.

Lineage availability by object

Object	Lineage available
Views	Has rows filtered by, Has rows ordered by, Has rows aggregated by
Functions	Has rows filtered by, Has rows ordered by, Has rows aggregated by, Sourced data from
Stored Procedures	Has rows filtered by, Has rows ordered by, Has rows aggregated by, Sourced data from

SAP HANA version supported

The collector supports SAP HANA version 2.00.076.00.20240701.1.

Authentication supported

The SAP HANA collector supports username and password authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prepare to run the SAP HANA collector

Set up authentication and configure the necessary privileges before you run the SAP HANA metadata collector.

Before you begin
Role required: admin

About this task
An account is required with a role that has SELECT privileges on the resources that you want the collector to harvest metadata from. See SAP HANA Database Roles.

Procedure

1. Log in to the SAP HANA instance.
2. Set up a role with either of the following privileges:
   a. System privileges (CATALOG READ)
   b. Object privileges (SELECT METADATA)

Create an SAP HANA metadata collector

Create a collector to import metadata from SAP HANA.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the SAP HANA collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **SAP HANA**.
5. From the Connection type list, select one of the following:
   a. Select **New connection** to configure a new connection.
   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.
6. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAP HANA metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).

8. Configure the authentication options.

Authentication options

Field	Description
Username	Username to use to connect to the database.
Password	Password of the databsase user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Configure the connection information.

Connection information

Field	Description
Include database	Name of the database to connect to. Specify multiple databases by adding one value per line.
Excluded database	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

10. Select from **Collect all schemas** or **Specify which schema to collect** to configure the schema collection options.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.
Include Information Schema	Include the database's Information Schema in catalog collection.
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

11. Configure the statistics and sampling options.

Statistics and sampling options

Field	Description
Enable column statistics collection	Enable harvesting of column statistics (that is, data profiling). **Note:** Enabling profiling can increase the collector's runtime, as the collector must read table data to generate profiling metadata.
Target sample size for column statistics	Number of rows sampled for computation of column statistics and string-value histograms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, to sample 1000 rows, set the parameter as: 1000. Default: 100000
Disable Lineage collection	Skip harvesting of intra-database lineage metadata.
Disable Extended Metadata collection	Skip harvesting of extended metadata for data asset types such as database, schema, table, columns functions, stored procedures, user defined types, synonyms. Basic metadata for these data asset types will still be harvested.
Exclude system functions	Specify to exclude system functions.

12. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Server environment	Friendly name for the environment in which your database server runs when the server name is localhost. Helps differentiate it from other environments.
Database ID	Unique identifier for this database. Used to generate the database ID when the database name is not sufficiently unique.
JDBC properties	JDBC driver properties to pass through to driver connection.
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection. Default: 60

13. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Salesforce metadata collector

Salesforce metadata collector provides read-only access to metadata from a Salesforce instance.

The collector harvests metadata for Salesforce Objects and Fields, Reports, and Dashboards in a Salesforce instance and make it searchable and discoverable in the data catalog.

Metadata cataloged

The collector catalogs the following information.

Cataloged metadata

Object	Information cataloged
Object	Name, Description, Custom Object (true or false), Mergeable Object (true or false), Queryable Object (true or false)
Field	Name, Description, Field Type, Security Classification, Compliance Group, Inline Help Text, Length, Default Value, Formula (calculated fields), Allowed Values (picklist fields), Created Date, Created By, Last Modified Date, Last Modified By
Summary field	Summarized object, Aggregation type, Aggregated field, Any filters on the summarization (filter field, filter operation, and filter value)
Dashboard	Name, Type, External URL
Report	Name, Type, Format
Detail column	Name, Fully-Qualified Name
Grouping column	Name, Fully-Qualified Name, Grouping level
Aggregation column	Name, Formula

Following additional information is cataloged when you run the collector with the Enable Governance Metadata Collection parameter.

Cataloged governance policies

Object	Information cataloged
Row Filter Access Control	Name
Column Mask Access Control	Name
Attribute Based Access Control	Name, Description, Created by, Created at, Modified by, Modified at, On securable type,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cataloged governance policies (continued)

Object	Information cataloged
	For securable type, To principals, Except principals
Workspace bindings	Workspace ID, Binding type
Privileges	Granted to, Granted by, Privilege type, Granted on object, Inherited from

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between harvested data asset pages

Object	Relationship
Field	Object
Report	Detail Column, Grouping Column, Aggregate Column
Grouping Column	Report
Aggregation Column	Report
Detail Column	Report
Row Filter Access Control	Applies to table, Uses function, Using column, Contained within schema
Column Mask Access Control	Applies to column, Uses function, Contained within schema
Attribute Based Access Control	Applies to catalog, Schema and table, Defined on catalog, Schema and table, Uses function
Catalog	Has workspace bindings, Has privileges
Schema	Has privileges
Table	Has privileges
Storage credential	Has workspace bindings
External Location	Has workspace bindings

Lineage for Salesforce

The following lineage information is collected by the Salesforce collector:

Lineage available by object

Field	Report Column that uses data from the field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authentication supported

The collector uses username and password authentication to connect to Salesforce via connected applications.

Prepare to run the Salesforce collector

Set up access for cataloging Salesforce resources by configuring user credentials, security tokens, and connected applications.

Before you begin
Role required: admin

About this task
Before running the Salesforce collector, configure the necessary access credentials and permissions in Salesforce.

Procedure

1. Set up a user that the collector will use to connect to Salesforce.
2. **Optional:** Set up a security token.
3. Set up a connected application for OAuth.
   When setting up the connected application, confirm that the following scopes are enabled:
   - Access Lightning applications
   - Manage user data via APIs
   - Perform requests at any time
4. Follow the Salesforce documentation to get the client credentials.
5. Confirm that the user set up for running the collector has authorization to use APIs and the connected application.

Create a Salesforce metadata collector

Create a collector to import metadata from Salesforce.

Before you begin
Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Salesforce collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Salesforce**.
5. From the Connection type list, select one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New connection** to configure a new connection.

b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

Salesforce metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Salesforce Hostname	The host name of the Salesforce instance using the following format: <organization_domain><--optional-sandbox_name.sandbox>.my.salesforce.com. Do not include the protocol https. For example, for a production environment, it might look like acme.my.salesforce.com, and for a sandbox environment, it could be acme--dev.sandbox.my.salesforce.com

8. Configure the authentication options.

Authentication options

Field	Description
Connected app client ID	OAuth client ID for the Salesforce connected app on the instance.
Connected app client secret	OAuth client secret for the Salesforce connected app on the instance.
Username	The username to use to make the JDBC connection.
Password	The password of the user.
Security Token	Personal security token for the provided Salesforce credentials.

9. Configure the connection and reliability options.

Connection and reliability options

Query batch size	Number of Salesforce objects to query as a batch. Default: 20
Related object depth	Number of related (parent-child) object relationships to navigate. Default is to navigate all relationships.
Include objects	Specify one or more regular expressions to match Salesforce objects that should be included. Default is to include all objects.
Max retries	Number of times the system retries a failed API call. Default: 5
Retry delay	Number of seconds to wait between retry attempts for a failed API call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	Default: 2 seconds

10. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

ServiceNow metadata collector

Provides read-only access to metadata from a ServiceNow instance.

The collector harvests metadata from ServiceNow instances including system applications, application scopes, tables, fields, views, and Data Fabric tables. Catalogs ServiceNow Data Fabric metadata for virtualized data integration.

Metadata cataloged

The collector catalogs the following information.

Cataloged metadata

Object	Information cataloged
ServiceNow Instance	Instance URL, Connection metadata
System Application	App Name, Vendor, Version, Active status, Short Description, Source Table
Application Scope	Scope Name, Scope Identifier, Vendor, Version, Active status, Source Table
Table	Table Name, Description, Is Extendable, sys_updated_on (timestamp), Source Table, Parent Table (for table inheritance)
Data Fabric Table	Inherits all Table properties, Plus: Association with external DatabaseTable
View	Inherits all Table properties, Plus: View Definition (SQL definition including source tables and join conditions)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cataloged metadata (continued)

Object	Information cataloged
Field	Field Name, Description, Column Label, Reference Table (for reference fields), Mandatory, Is Primary (for Data Fabric fields), SQL Type (for Data Fabric fields) Enhanced metadata: Field type, Field size, Max length, Nullable (true/false), Default value, Internal Type
View Table Mapping	Maps To Table, WHERE clause conditions, Is Left Join, Variable Prefix, Mapping Order
Transform Map	Map Name, Source Table, Target Table, Active status
Transform Entry	Source Field, Target Field, Coalesce, Transform Map (parent)
Data Product	Data Product Name, Description, State (lifecycle status), Tags, Created By, Created On, Updated On, Source Table
Data Interfaces	Table Name, Is Extendable, sys_updated_on (timestamp), Source Table, Parent Table (for table inheritance)
Vault Data Classification	Classification Name, Description, Classification Type, Parent Classification (for hierarchical relationships), Source Table
Dashboard	Name, Description, Active, Certified, UI Generation (Next Experience or Core UI), Workspace Visible In, Categories, Users Granted To, Owner, Created By, Last Modified By, Requested By, Created At, Last Modified At
Visualization	Name, Description, Active, Certified, UI Generation, Created By, Last Modified By, Created At, Last Modified At, Granted To, Requested By, Owner
Indicator	Name, Description, Active, Type (Automated/ Formula/Manual/External), Collection Frequency, Unit, Granted To, Created By, Modified By, Created At, Last Modified At
Indicator Source	Name, Description, Facts Table, Conditions, Collection Frequency, Created By, Last Modified By, Created At, Last Modified At
Dashboard Tab	Name, Display Order, UI Generation
Breakdown	Name, Description, Type (Automated/Manual/ External), Created By, Last Modified By, Created At, Last Modified At

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cataloged metadata (continued)

Object	Information cataloged
Breakdown Source	Name, Active, Conditions, Facts Table, Facts Field, Created By, Last Modified By, Created At, Last Modified At
Data Collection Job	Name, Description, Active, Run Type, Run Time, Collect Scope (scores only, text indexes only, or both), Created By, Modified By, Created At, Last Modified At

Note: ServiceNow Vault data classifications can be generated automatically for ServiceNow assets using the Classifying ServiceNow assets with Vault agents agentic workflow. Classifications produced by the agent are written to Vault's classification tables and are picked up by the metadata collector on its next run. Avoid running the agent and the collector at the same time to prevent a mismatch between source data and the catalog.

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between harvested data asset pages

Data asset page	Relationship
ServiceNow Instance	Contains Application Scopes, System Applications, Tables, Data Interfaces
System Application	Contained within Application Scope
Application Scope	Contains System Applications and Tables (via has scoped data asset), Data Interfaces
Table	Contained within Application Scope, Has Fields, May extend another Table (via extends table), May be extended by child Tables, Has Inherited Field
Data Fabric Table	Inherits all Table relationships, Plus: Derived from external DatabaseTable (via prov:wasDerivedFrom)
View	Inherits all Table relationships, Has View Table Mappings
Field	Belongs to a Table (via has field), May reference another Field (for reference/foreign key fields)
Transform Map	Has Source Table, Has Target Table, Has Transform Entries
Transform Entry	Belongs to a Transform Map (via has transform entry), Maps Source Field to Target Field
View Table Mapping	Belongs to a View (via has view table mapping), Maps To Table (via maps to table), Selects data from Table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between harvested data asset pages (continued)

Data asset page	Relationship
Data Product	Contained within Application Scope, Has Data Content (contains Tables and Views)
Data Interface	Contained within Application Scope, Has Fields, May extend another Table (via extends table), May be extended by child Tables
Vault Data Classification	May have Parent Classification (via parent classification), May have Child Classifications, Classifies Fields and Tables (via has classification)
Dashboard	Contained within Application Scope, Tabs contained in the Dashboard
Dashboard Tab	Dashboard the Tab is contained within
Data Collection Job	Contained within Application Scope, Indicators the Data Collection Job collects
Indicator	Contained within Application Scope, Data Collection Jobs that collect this Indicator
Indicator Source	Contained within Application Scope
Visualization	Contained within Application Scope
Breakdown	Contained within Application Scope
Breakdown Source	Contained within Application Scope

Lineage for ServiceNow

The following lineage information is collected by the ServiceNow collector:

Lineage availability by object

Object	Lineage available
View	View Table Mappings show: • JOIN conditions and WHERE clauses • Tables from which the view selects data • Variable prefixes and mapping order
Table	Table inheritance lineage: • Parent table (via extends table relationship) • Child tables that extend this table
Field	Reference field lineage:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage availability by object (continued)

Object	Lineage available
	• Fields in other tables that this field references • Indicates foreign key relationships
Data Fabric Table	External data source lineage: • External DatabaseTable from which data is virtualized (via prov:wasDerivedFrom)
Data Interfaces	Table inheritance lineage: • Parent table (via extends table relationship) • Child tables that extend this table • The tables whose structure and attributes this Data Interface governs
Dashboard	Visualizations embedded in the Dashboard, Tables and Fields the Dashboard uses data from, Indicators the Dashboard uses
Dashboard Tab	Visualizations embedded in the Dashboard Tab
Indicator	Indicator Sources the Indicator uses data from, Fields or Tables the Indicator uses data from, Indicators the Indicator calculates values from, Breakdowns that segment Indicator values, Dashboards that use the Indicator, Visualizations that use the Indicator
Indicator Source	Indicators that use the Indicator Source, Table the Indicator Source sourced data from
Breakdown	Breakdown Sources that define segment values for the Breakdown, Tables and Fields the Breakdown segments its values from, Indicators whose values are segmented by the Breakdown
Visualization	Dashboards that embed the Visualization, Dashboard Tabs that embed the Visualization, Indicators the Visualization uses data from, Tables or Fields the Visualization uses data from
Breakdown Source	Breakdowns which the Breakdown Source defines segment values for, Fields it derives elements from
Data Snapshot Source	Snapshot indicator backed by this source
Data Snapshot Source	Table the source data comes from, snapshot indicator backed by this source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage availability by object (continued)

Object	Lineage available
Transform map	Tables this table transforms into (as source in an active transform map), tables this table is populated from (as target in an active transform map) Only harvested for active transform maps.
Transform field	Fields this field maps into (as source in an active transform map entry), fields this field is populated from (as target in an active transform map entry)

ServiceNow version supported

Supports ServiceNow instances that expose the Table API. Tested with ServiceNow Zurich and Australia releases.

Authentication supported

The collector authenticates to ServiceNow using Basic Authentication (User name and Password).

Prepare to run the ServiceNow collector

Create a ServiceNow user and configure permissions before running the collector.

Before you begin
Role required: admin

About this task
The collector uses Basic Authentication with username and password. ServiceNow determines authorization based on roles.

Procedure

1. Log in to the ServiceNow instance.
2. Navigate to **All** > **System Security** > **Users and Groups** > **User**.
3. Create a new user.
   a. Select **New**.
   b. Complete the required fields.
   c. Select **Save**.
4. Set a password for the user.
5. Assign roles to the user.

   Assign these roles:

   - rest_api_explorer
   - admin

   These roles provide read access to the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard metadata tables:

- sys_app (System Applications)
- sys_scope (Application Scopes)
- sys_db_object (Tables)
- sys_dictionary (Fields)
- sys_db_view (Views)
- sys_db_view_table (View Table Mappings)
- sys_user (Users - for connection testing)

Data Fabric tables:

- sn_df_connector (Data Fabric Connectors)
- sys_df_connection_metadata (Connection Metadata)
- sys_df_data_dictionary (Data Dictionary)
- sys_df_connection_data (Connection Data)
- sn_df_connection_attributes (Connection Attributes)
- sys_variable_value (Variable Values)

Create a ServiceNow metadata collector

Create a collector to import metadata from ServiceNow.

Before you begin

Verify the following:

- All prerequisite tasks are completed. For more information, see Prepare to run the ServiceNow collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **ServiceNow**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
ServiceNow Instance URL	Base URL of your ServiceNow instance, such as `https://your-instance.service-now.com`. Do not include a trailing slash.
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Username	ServiceNow username to use for authentication.
Password	Password for the specified username.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Configure the advanced options.

Advanced options

Field	Description
ServiceNow API Page Size	Number of records to request per page from the ServiceNow Table API. Default is 1000.
Skip Glide Tables, Fields, and Views	Select to skip harvesting of Glide tables, fields, and views.

10. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
You can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.
- After the first collector run, serviceNow Vault data classifications can be generated automatically for ServiceNow assets using the Classifying ServiceNow assets with Vault agents agentic workflow. Classifications produced by the agent are written to Vault's classification tables and are picked up by the metadata collector on its next run. Avoid running the agent and the collector at the same time to prevent a mismatch between source data and the catalog.

Snowflake metadata collector

The Snowflake metadata collector provides read-only access to metadata from an external Snowflake account.

The collector harvests metadata from Snowflake Data Cloud. It collects tabular objects, Horizon objects such as policies and tags, and Snowflake data quality artifacts. It also harvests functions and stored procedures. The collector can gather column statistics and table query counts. In addition, it can harvest metadata for Streamlit applications.

Metadata cataloged

The Snowflake collector catalogs the following information.

Note: The collector harvests all versions of overloaded functions and stored procedures. Each version has its own title/name in the catalog, but a distinct identifier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested

Object	Information cataloged
Column	Name, Comments, Data Type, Is Nullable, Default Value, Key type (Primary, foreign)
Table	Name, Comments, Primary key, Schema, External URL (Snowsight) Extended metadata: Is Iceberg, Is dynamic, Is transient, Created Date, Last Modified Date, Last Updated By (Snowflake LAST_DDL_BY), Owner (Snowflake role that owns table), Definition Altered Date, Table Size
View	Name, Comments, Schema, External URL (Snowsight), Definition Altered Date, Last Modified By (Snowflake LAST_DDL_BY), Is Iceberg, Is dynamic, Is temporary, Created Date, Last Modified Date, Owner (Snowflake role that owns table), SQL definition
Materialized View	Name, Comments, Schema, External URL (Snowsight), Definition Altered Date, Last Modified By (Snowflake LAST_DDL_BY), Is Iceberg, Is dynamic, Is temporary, Created Date, Last Modified Date, Owner (Snowflake role that owns table)
Schema	Identifier, Name Extended metadata: Comments, Created date, Updated
Database	Type, Name, Identifier, Server, Port, Environment, JDBC URL Extended metadata: Comments
User-defined function (this includes User-defined functions created in Snowpark)	Name Extended metadata: Function Definition, Comments, Created Date, Owner (Snowflake Role), Snowflake Function Type (Return Type), Function Signature, Function Language, Packages, Runtime version, Updated
Stored Procedure (this includes Stored Procedures created in Snowpark)	Name Extended metadata: Function Definition, Owner (Snowflake Role), Comments, Return Type, Function Language, Packages, Created Date, Function signature, Snowflake Function Type, Runtime Version, Updated, Stored Procedure Type

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between objects

The harvested metadata includes catalog pages for the following data asset types. Each catalog page has a relationship to the other related data asset types.

Relationships between harvested data asset pages

Data asset page	Relationships
Snowflake Row access policies	Tables
Snowflake Masking Policies	Columns, Tag value
Table	Columns, Tag value, Data Metric Function that analyzes, Views, Tables, or Functions which the Table depends on
Snowflake Tags	Tag value
Columns	Table, Tag Value, System Tag Value
View	Schema that contains Views, Columns that are part of Views, Data Metric Function that analyzes View, Views, Tables, or Functions which the View depends on
Materialized View	Schema that contains Materialized Views, Columns that are part of Materialized Views
Schema	Database that contains Schema, Table that is part of Schema, View that is part of Schema, Materialized View that is part of Schema, Streamlit app that is part of schema
Streamlit App	Schema that contains Streamlit App
Database	Schema contained in Database
Data Metric Function	Table or View analyzed by this Snowflake Data Metric Function, Table, Views, Tables, or Functions which the Function depends on

Lineage and dependencies for Snowflake

The following lineage information is collected by the Snowflake collector. Note that any lineage for SQL Statements defined via variable statements are not supported.

Important things to note:

- Any lineage for SQL Statements defined via variable statements are not supported.
- The collector traces these relationships from a View's columns to ultimate source Table columns across SQL expressions and subqueries.

Object Lineage Availability

Object	Lineage available
Column in View	The collector identifies the associated column in an upstream view or table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object Lineage Availability (continued)

Object	Lineage available
	• Where the data is sourced from • That sort the rows via ORDER BY • That filter the rows via WHERE/HAVING • That aggregate the rows via GROUP BY
User-defined function	A Function and: • Views referenced in Function • Tables referenced in Function • Functions referenced in Function A View and Function referencing View

Stored Procedure	The collector identifies:
	• The associated column in an upstream view or table
	  ○ Where the data is sourced from
	  ○ That sort the rows via ORDER BY
	  ○ That filter the rows via WHERE/HAVING
	  ○ That aggregate the rows via GROUP BY
	• The downstream table that has its data updated by this stored procedure.
	Note: The following stored procedures are not supported:
	• Stored procedures with multitable inserts. However, multiple separate insert statements that insert into one table are supported.
	• Stored procedure with multiple SELECT and INSERT statements not separated by a semicolon delimiter.
	• Stored procedures used to create tables or any transient tables created during the execution scope of a stored procedure.

Dependencies

The Snowflake collector catalogs dependencies between tables, views, and functions using the Snowflake Account Usage view OBJECT_DEPENDENCIES. See the Snowflake documentation for more information about the OBJECT_DEPENDENCIES view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you include the profiling and sampling specific parameters while running the collector, the following additional information is harvested for Columns.

Note: The user/role must have read access to data to be able to harvest profiling information (column statistics).

Profiling and sampling specific information

Object	Information cataloged
Column	• Average Length (sample) • Average Value (sample) • Data Distribution • Distinct Values • Estimated Distinct Values • Estimated Non-null Values • Maximum Length (sample) • Maximum Value (sample) sorted numerically or alphabetically (z-a) • Minimum Length (sample) • Minimum Value (sample) sorted numerically or alphabetically (a-z) • Non-null Values (sample) • Sample String Values (first 5 items in a column)
Table	• Row Count • Sample Count (Target sample size)

Following additional information is cataloged when you run the collector with the Collect Snowflake policy information and Collect Snowflake tag information options enabled.

Cataloged Snowflake tags and policies

Object	Information cataloged
Columns	Snowflake masking policies
Snowflake Tags	Name, Allowed Values, Comments
Snowflake Tag Values	Name, Value
Snowflake Masking Policies	Name, Comments , Date created, Snowflake tags, Owner, Type, Policy body, Schema, Database
Snowflake Row access policies	Name, Comments , Date created, Snowflake tags, Owner, Type, Policy body, Schema, Database

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Following additional information is cataloged when you run the collector with the Collect Snowflake table usage information and Table usage lookback days options enabled.

Cataloged Snowflake table query counts

Object	Information cataloged
Table	Query Count

Following additional information about data quality metrics is cataloged when you run the collector with the Collect data metric function information option enabled.

Cataloged Snowflake Data Metric Functions

Object	Information cataloged
Data Metric Function	• Identifier: Name of the function • Title: Name of the function • Description • Body Definition of the function
Table	• Schedule: cron expressions • Data metric function observations: function name, column arguments, most recent metric time, value

Following additional information is cataloged when you run the collector with theCollect Streamlit app information option enabled.

Cataloged Snowflake Streamlit Applications

Object	Information cataloged
Snowflake Streamlit App	• Identifier: App Name • Title: App Title • Description: App comments • Main file • Root location • Date Created • Owner

Prepare to run the Snowflake collector

Set up authentication and grant role permissions to enable Snowflake metadata collection.

Before you begin

Role required: ACCOUNTADMIN

You must have an ACCOUNTADMIN role in Snowflake to grant permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The collector supports username and key-pair authentication. For details, see the Snowflake documentation.

Snowflake determines authorization based on roles. A role must be specified when connecting to Snowflake. The ACCOUNTADMIN role is required to harvest the full range of metadata. Other roles provide access to basic metadata only, without extended metadata or lineage information. When using a role other than ACCOUNTADMIN, grant the role-specific permissions outlined in this task.

Some collector features require executing queries in Snowflake, which requires a warehouse. If the user credentials have a default warehouse configured, no additional warehouse configuration is needed. To use a different warehouse, or if no default warehouse is set, specify the warehouse using the Snowflake Warehouse configuration option.

Procedure

1. Create a role and grant warehouse permissions.

```
CREATE OR REPLACE ROLE DDW_ACCOUNT_ROLE;
                        GRANT OPERATE, USAGE ON WAREHOUSE
 <warehouse_name> TO ROLE DDW_ACCOUNT_ROLE;
```

2. Grant permissions to enable metadata harvesting for database, schema, tables, and views.

```
GRANT USAGE ON DATABASE <database_name> TO ROLE
 DDW_ACCOUNT_ROLE;
                        GRANT USAGE ON ALL SCHEMAS IN DATABASE
 <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                        GRANT SELECT ON ALL TABLES IN DATABASE
 <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                        GRANT SELECT ON ALL EXTERNAL TABLES IN
 DATABASE <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                        GRANT SELECT ON ALL VIEWS IN DATABASE
 <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                        GRANT USAGE ON FUTURE SCHEMAS IN
 DATABASE <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                        GRANT SELECT ON FUTURE TABLES IN
 DATABASE <database_name> TO ROLE DDW_ACCOUNT_ROLE;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you don't plan to use the Enable Sample String Values collection and Enable column statistics collection options, you can grant the REFERENCES permission instead of SELECT:

```
GRANT USAGE ON DATABASE <database_name> TO ROLE
 DDW_ACCOUNT_ROLE;
                              GRANT USAGE ON ALL SCHEMAS IN
 DATABASE <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                              GRANT REFERENCES ON ALL TABLES
 IN DATABASE <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                              GRANT REFERENCES ON ALL
 EXTERNAL TABLES IN DATABASE <database_name> TO ROLE
 DDW_ACCOUNT_ROLE;
                              GRANT REFERENCES ON ALL VIEWS
 IN DATABASE <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                              GRANT USAGE ON FUTURE SCHEMAS
 IN DATABASE <database_name> TO ROLE DDW_ACCOUNT_ROLE;
                              GRANT REFERENCES ON
 FUTURE TABLES IN DATABASE <database_name> TO ROLE
 DDW_ACCOUNT_ROLE;
```

3. Grant permissions to harvest the following: object dependency-based lineage, user-defined functions, data metric functions, stored procedures, tags and tag values, row access policies, masking policies, and table usage.

   Important: You need the ACCOUNTADMIN role to grant these permissions.

   There are two options for assigning these permissions:

   - Option 1: Use the ACCOUNTADMIN role to grant broad imported privileges across databases:

     ```
     USE ROLE ACCOUNTADMIN;
                                  GRANT IMPORTED PRIVILEGES ON
      DATABASE SNOWFLAKE TO ROLE DDW_ACCOUNT_ROLE;
     ```

   - Option 2: Assign specific database roles for targeted permission allocation:

     ```
     USE ROLE ACCOUNTADMIN;
                                  USE DATABASE SNOWFLAKE;
                                  GRANT DATABASE ROLE OBJECT_VIEWER
      TO ROLE DDW_ACCOUNT_ROLE;
                                  GRANT DATABASE ROLE
      GOVERNANCE_VIEWER TO ROLE DDW_ACCOUNT_ROLE;
     ```

     For more information about these database roles, see the Snowflake documentation.

4. **Optional:** Grant permissions for Streamlit apps.

   (Optional) These permissions are only required if you want to harvest metadata from Streamlit apps:

   ```
   GRANT USAGE ON STREAMLIT <streamlit_app_name> TO ROLE
    DDW_ACCOUNT_ROLE;
   ```

5. Create a dedicated Snowflake user for the collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To create key-pair authentication for this user, you need a minimum of SECURITYADMIN role to alter the user settings. See the Snowflake documentation.

```
CREATE USER DDW_ACCOUNT
                          RSA_PUBLIC_KEY = '<rsa_public_key>'
                          TYPE = SERVICE
                          DEFAULT_ROLE = DDW_ACCOUNT_ROLE
                          DEFAULT_WAREHOUSE = '<warehouse_name>'
                          DISPLAY_NAME = 'data.world';

                          GRANT ROLE DDW_ACCOUNT_ROLE TO USER
 DDW_ACCOUNT;
```

6. Grant user access to the warehouse.

```
GRANT USAGE ON WAREHOUSE <warehouse_name> TO ROLE
 DDW_ACCOUNT_ROLE;
```

7. Verify that the appropriate permissions are granted.

   Run the following query:

```
SHOW GRANTS TO ROLE DDW_ACCOUNT_ROLE;
```

Create a Snowflake metadata collector

Create a collector to import metadata from Snowflake.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Snowflake collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Snowflake**.
5. From the Connection type list, select one of the following:

   a. Select **New connection** to configure a new connection.

   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Snowflake metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection options.

Connection options

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server (if not the default).
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Authenticate using username and password	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Username	Username to use to make the JDBC connection.
Password	Password of the user.
Authenticate using a private key	
Username	Username to use to make the JDBC connection.
Snowflake private key file	Upload the private key file to use for authentication.
Private key file password	Password for the private key file, if the key is encrypted and a password is set.

9. Select from **Collect all schemas** and **Specify which schema to collect**.

Schema collection options

Field	Description
Collect all schemas	
Collect all schemas	Catalog all schemas to which the user has access.
Exclude Schema	Name or regular expression of the database schema to be excluded.
Include Information Schema	Include the database's Information Schema in catalog collection.
Specify which schema to collect	
Specify which schema to collect	Catalog only the specified schemas.
Schema	Name of the database schema to catalog.

10. Enter the Snowflake connection details.

Connection details

Field	Description
Database	Name of the database to connect to. Specify multiple databases by adding one value per line.
Snowflake Role	The role used to execute the query.
Excluded database	Name or regular expression indicating databases not to catalog when the Database field is empty. **Note:** This parameter is ignored if the Database field is specified.

11. Configure the statistics and sampling options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Harvesting scope and lineage options

Field	Description
Collect Data Metric Function Information	Option to harvest metadata about data metric functions and their associations to tables.
Data Metric Observation Count	Number of most recent data metric observations to harvest. Ignored unless Collect Data Metric Function Information is enabled. Default: 1
Enable column statistics collection	Option to harvest column statistics, that is, data profiling. **Note:** Activating this option may extend the collector running time because the collector reads table data to gather profiling metadata.
Target sample size for column statistics	Number of rows sampled for computing column statistics and string-value histograms. For example, to sample 1000 rows, set the value to 1000. Default: 100000 **Note:** Applies only if Enable column statistics collection is enabled.
Collect Snowflake Table Usage Information	Option to harvest metadata about Snowflake table usage in queries, including popularity. For each table in the database, calculates the percentage of tables queried no fewer times than the subject table.
Table Usage Lookback Days	Number of days in the past from which to begin harvesting table usage. Default: 7 days
Disable Lineage collection	Option to skip harvesting intra-database lineage metadata.
Disable Extended Metadata collection	Option to skip harvesting extended metadata for data asset types such as database, schema, table, columns, functions, stored procedures, user-defined types, and synonyms. Basic metadata for these data asset types is still harvested.

12. Configure the harvesting scope and limits options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Harvesting scope and limits options

Field	Description
Collect Snowflake Tag Information	Option to harvest metadata about Snowflake tags in or associated with the database specified in the database setting.
Collect All Snowflake Tag Information	Option to harvest metadata about Snowflake tags regardless of the database in which they reside.
Collect Snowflake Policy Information	Option to harvest metadata about Snowflake masking and row-access policies in or associated with the database specified in the database setting.
Collect All Snowflake Policy Information	Option to harvest metadata about Snowflake masking and row-access policies regardless of the database in which they reside.
Collect Streamlit App Information	Option to harvest metadata about Snowflake Streamlit applications.
Enable Sample String Values collection	Option to harvest sample values and histograms for columns containing string data. **Note:** Applies only if Enable column statistics collection is enabled.
Exclude system functions	Option to exclude built-in system functions from harvesting.

13. Configure the connection and reliability options.

Connection and reliability options

Field	Description
Snowflake Warehouse	Snowflake warehouse to use when connecting. Default: User's assigned default warehouse
Server environment	Friendly name for the environment in which your database server runs. Useful when the server name is localhost and you need to differentiate it from other environments.
Database ID	Unique identifier for this database, used to generate the database ID when the database name is not sufficiently unique.
JDBC properties	JDBC driver properties passed to the driver connection.
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: 60

14. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Tableau metadata collector

Tableau metadata collector provides read-only access to metadata from a Tableau account.

The Tableau collector harvests metadata from Tableau objects (such as workbooks and dashboards) in the Tableau Online or Tableau Server instances. Use harvested metadata to perform impact analysis and understand how changes to upstream data sources affect Tableau objects.

Tableau version supported

The collector supports Tableau Cloud and Tableau Server. Supports Tableau API versions 3.10 and above on Tableau Server v2022.1.

Authentication supported

The Tableau collector supports the following authentication methods:

- Personal Access Token
- Username and password

Metadata cataloged

The Tableau collector catalogs the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested

Object	Information cataloged
Databases	Name, Identifier, Description, Database Connection Type
Database Schemas	Name, Identifier
Database tables	Name, Identifier
Database columns	Name, Identifier
Tableau Databases	Name, Identifier, Connection Type
Tableau Database tables	Name, Identifier, Connection Type
Tableau Database columns	Name, Identifier
Projects	Name, Description
Workbooks	Name, Description, Creator Email, Creator Name, Creator Tableau User, Preview Image, and Workbook URL **Note:** Unpublished workbooks aren't cataloged because the Tableau REST APIs don't return unpublished objects.
Dashboards	Name, Creator Email, Creator Name, Creator Tableau User, Preview Image, Dashboard URL, Number of Favorites, and Number of Views **Note:** Unpublished dashboards aren't cataloged because the Tableau REST APIs don't return unpublished objects.
Views	Name, Creator Email, Creator Name, Creator Tableau User, Number of Views, Number of Favorites, Preview Image, and View URL **Note:** Unpublished views aren't cataloged because the Tableau REST APIs don't return unpublished objects.
Datasource fields	Name, Identifier, Description
Calculated fields	Name, Identifier, Description, Calculation Formula, Category, Role, Type
Group fields	Name, Identifier, Description, Category, Role, Type
Bin fields	Name, Identifier, Description, Category, Role, Type, Bin Size
Column fields	Name, Identifier, Description, Category, Role, Type
Metrics	Name, Identifier, Description, Creator Email, Creator Name, Creator Tableau User, Metric Url

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata harvested (continued)

Object	Information cataloged
Custom SQL tables	Name, Identifier, Description, SQL Query
Embedded data sources	Name, Identifier, Last refresh date
Published data sources	Name, Identifier, Description, Last refresh date

Relationships between objects

Catalog pages show relationships between the following data asset types:

Relationships between cataloged objects

Data asset page	Relationship
Databases	• Schemas contained within the database • Tables contained within the database
Database Schemas	Tables contained within the schema
Database tables	• Schema containing database table • Database containing the database table • Views using the database table as a data source • Column fields using the database table as a data source
Database columns	• Tables containing the database columns • Column fields referencing the database columns
Tableau Databases	Tableau Tableau Database table contained within the Tableau Database
Tableau Database tables	Tableau Column contained within the Tableau Database table
Tableau Database columns	Tableau Column Field referencing the Tableau Database Column
Projects	• Views contained within the project • Workbooks contained within the project • Dashboards contained within the project • Subprojects contained within the project • Published Data source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between cataloged objects (continued)

Data asset page	Relationship
Workbooks	• Projects that contain a workbook • Data sources embedded within the workbook • Views contained within the workbook • Custom SQL Tables embedded within the workbook
Dashboards	• Fields used by dashboard • Custom SQL tables used by dashboard • Projects containing dashboard • Tables used by dashboard • Workbooks containing dashboard • Views embedded in dashboard
Views	• Fields used by view • Custom SQL tables used by view • Projects containing view • Database Tab;es used by view • Workbooks containing view • Dashboards that embed the view • Metrics presenting the view
Datasource fields	• Views that use the datasource field • Dashboards that use the datasource field • Data source fields containing the datasource field
Calculated fields	• Views that use the calculated field • Dashboards that use the calculated field • Data sources containing the calculated field
Group fields	Data sources containing group field
Bin fields	Data sources containing group field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships between cataloged objects (continued)

Data asset page	Relationship
Column fields	• Data Source containing the column field • Views that use the column field • Dashboards that use the column field
Custom SQL tables	• Views using Custom SQL table • Dashboards using Custom SQL table • Workbooks using Custom SQL table
Embedded data sources	• Fields contained within the embedded data source • Workbook containing embedded data source
Published data sources	Fields contained within the published data source

Lineage for Tableau

Collected lineage information:

Lineage availability by object

Object	Lineage available
Database columns and tables	Fields that use database columns and tables
Projects	Databases, Database schemas, Database Tables, Database Columns, Workbooks, Views, Dashboards, custom SQL tables, and Data sources that projects contain
Dashboards	Fields and tables that dashboards source their data from
Views	Fields and tables that views source their data from
Fields	Columns, tables, and other fields that a field uses its data from
Tableau Database tables	Tableau Databases containing the Tableau Database table
Tableau Database columns	Fields that reference the Tableau Database column, Tableau Database tables containing the Tableau Database column
Published data sources	Embedded data sources that were derived from published data source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage availability by object (continued)

Object	Lineage available
Embedded data sources	Database tables and Database columns that the Embedded data source uses data from.
Custom SQL Tables	Database tables and Database columns that the Custom SQL Table uses data from. Note: Lineage isn't created between Custom SQL Tables and columns or tables that aren't available in the API.

Note: Cross-system lineage isn't supported for ODBC connections or when columns or tables are unavailable in the API.

Supported data sources for cross-system lineage:

- Postgresql
- Snowflake
- BigQuery
- Redshift

Prepare to run the Tableau collector

Set up API access, authentication, and permissions before running the collector.

Before you begin

Role required: admin

About this task

The collector uses the Tableau Metadata API to harvest metadata. You must enable the API (for Tableau Server), configure user permissions, and choose an authentication method. Optionally, configure hostname mapping for database aliases.

Procedure

1. Enable the Metadata API on Tableau Server.

   See Enable Tableau Metadata API.

   Note: The Metadata API is enabled by default for Tableau Cloud. This step applies only to Tableau Server.

2. Configure user permissions and create a Personal Access Token.

   See Configure Tableau user permissions.

3. **Optional:** Configure JWT authentication using a Connected App.

   (Optional) See Configure Tableau JWT authentication.

4. **Optional:** Configure hostname mapping for database aliases.

   (Optional) See Set up a YAML file for hostnames mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable Tableau Metadata API

Enable the Metadata API on Tableau Server to allow metadata collection.

Before you begin

Role required: admin

You must have:

- Tableau Server 2019.3 or later
- Account with Server Admin role in Tableau Server
- REST API enabled (not disabled)

Note: The Metadata API is enabled by default for Tableau Cloud. This procedure applies only to Tableau Server.

About this task

The Tableau collector uses the Metadata API to harvest metadata from Tableau Server. By default, this API is disabled on Tableau Server and must be enabled using the Tableau Services Manager (TSM) command line interface.

Procedure

1. Open a command prompt as an admin on the initial node where Tableau Services Manager (TSM) is installed in the cluster.
2. Run the following command to enable the Metadata API.

```
tsm maintenance metadata-services enable
```

3. Enable derived permissions if you do not have the Data Management license.

   Derived permissions allow you to see related external assets. For detailed instructions, see the Tableau documentation.

Result

The Metadata API is now enabled on Tableau Server and ready for metadata collection.

Configure Tableau user permissions

Create a Tableau user with admin permissions and generate a Personal Access Token.

Before you begin

Role required: admin

You must have permissions to create users and assign roles in Tableau Server or Tableau Cloud.

About this task

The Tableau collector requires a user account with administrative privileges to access and harvest metadata. Create a dedicated user account and generate a Personal Access Token (PAT) for authentication.

Procedure

1. Create a new user in Tableau with admin permissions.
   - For Tableau Server, assign the Server Admin role. See the Tableau documentation for details
   - For Tableau Cloud, assign the Site Admin role. See the Tableau documentation for details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Create a Personal Access Token (PAT) for the user.

   For detailed instructions on creating a PAT, see the Tableau documentation.

3. Save the Personal Access Token securely.

   You will need this token when configuring the Tableau metadata collector.

Configure Tableau JWT authentication

Set up a Connected App in Tableau for JWT authentication

Before you begin

Role required: admin

You must have permissions to create and manage Connected Apps in Tableau.

Important: The APIs to fetch workbook revisions and datasource revisions are not supported by JWT authentication.

About this task

Configure a Connected App to use JWT (JSON Web Token) authentication with the Tableau collector. The Connected App provides the client ID, secret ID, and secret value needed to generate JWT tokens.

Procedure

1. Log in to the Tableau instance.
2. Navigate to **Settings**.
3. Create a Connected App.

   For detailed instructions, see the Tableau documentation.

4. Enable the Connected App.
5. Generate a secret in the Connected App.
6. Save the Connected App credentials.

   Record the following values for use when configuring the Tableau collector:

   - Client ID
   - Secret ID
   - Secret value

   These credentials are used to generate JWT tokens for authentication.

Set up a YAML file for hostnames mapping

Create a YAML file to map database hostname aliases to canonical names.

Before you begin

Role required: admin

About this task

Use a hostname mapping file when you have multiple server names (aliases) for the same database instance and the database collector uses a different alias than the one defined in the Tableau connection. This optional configuration maps database hostnames to canonical names for consistent IRI coining.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a YAML file named hostnames.yml.
2. Add hostname mapping entries to the file.

   Use the following format:

```
mappingValues:
                          - originalHostname:
 "<Original_HostName>"
                          canonicalHostname:
 "<canonical_HostName>"
```

   Example: If your Tableau source uses db-server-01.company.local but you want to use db.company.com as the hostname during database object IRI coining:

```
mappingValues:
                          - originalHostname:
 "db-server-01.company.local"
                          canonicalHostname: "db.company.com"
```

   Note: You can use environment variables in the file for sensitive information such as passwords.

3. Save the hostnames.yml file.
4. Pass the YAML file to the collector using the Hostnames mapping file option.

   Use the Hostnames mapping file option when running the collector to upload the hostnames.yml file.

Result

The collector will use the canonical hostname in place of the original hostname when coining database object IRIs.

Create a Tableau metadata collector

Create a collector to import metadata from Tableau.

Before you begin

Before you begin, verify the following:

- All per-requisite tasks are completed. For more information, see Prepare to run the Tableau collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.
- Role required: connection-admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Tableau**.
5. From the Connection type list, select one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New connection** to configure a new connection.

b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.

6. Complete the form.

Tableau metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the API base URL and authentication options.

Configuration options

Field	Description
Tableau API base URL	Base URL for the Tableau API. For example: `https://8bank/api/3.10/`.
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Cluster is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

Field	Description
Authenticate using username and password	
Username	Tableau user name for authentication.
Password	Tableau password for authentication.
Authenticate using a private access token (PAT)	
Tableau personal access token name	Tableau personal access token name.
Personal Access Token Secret	Tableau personal access token secret.
Authenticate using JSON Web Tokens (JWT)	
username	Username associated with the connected app for JWT authentication.
Connected App Client ID	Client ID of the connected app required for JWT authentication.
Connected App secret ID	Secret ID of the connected app required for JWT authentication.
Connected App Secret Value	Secret value of the connected app required for JWT authentication.
JWT Token Expiration Minutes	Number of minutes the JWT token remains valid. Default: 5 minutes

9. Configure the harvesting scope and filtering options.

Harvesting scope and filtering options

Field	Description
Skip cataloging of preview images	Option to exclude preview images from cataloging.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Tableau site	ID or name of the Tableau site to catalog. Leave blank to catalog all accessible sites.
Tableau pagination size	Number of records per page for GraphQL queries.
Tableau project	ID or name of the Tableau project to catalog. Leave blank to catalog all projects. **Note:** Specify nested projects individually.
Exclude object types	Tableau object types to exclude from cataloging. Supported object types: ○ View ○ Dashboard ○ Database ○ PublishedDataSource ○ EmbeddedDataSource ○ CalculatedField ○ ColumnField ○ BinField ○ GroupField ○ DatasourceField ○ CustomSQLTable ○ Metric
Tableau project exclude	ID or name of a project to exclude from cataloging. This field overrides the **Tableau project** field.
Whether to include/exclude descendant projects	Option to apply project settings to descendant projects.

10. Configure the content and data source options

Content and data source options

Field	Description
Catalog personal space workbooks	Option to catalog personal space workbooks. Personal space workbooks are workbooks that are not associated with a project.
Convert Database Identifier	Option to convert database identifiers to the default case used by the target database (for example, lowercase for PostgresSQL, uppercase for Oracle).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Exclude Unpublished Views	Option to exclude unpublished views and dashboards from cataloging.
Hostname mapping file	If you have configured hostname mapping in the hostnames.yaml file, upload the file.
Exclude Hidden Fields	Option to exclude hidden fields within published data sources from cataloging.

11. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. It is now ready to connect to the source system and harvest metadata.

What to do next
After creating the collector, you can perform any of the following tasks:

- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

Teradata metadata collector

The Teradata metadata collector harvests read-only metadata from a Teradata account.

The collector harvests metadata from Teradata, including user defined functions, stored procedures, triggers, user defined types, and user defined methods.

Authentication supported

The collector authenticates to Teradata using username and password. Before running the collector, set up a dedicated database user with the required permissions. See Prepare to run the Teradata Collector.

Metadata cataloged

Teradata metadata cataloged by object type

Object	Information cataloged
Database	Type, Name, JDBC URL Extended metadata: Created By, Created At, Updated By, Updated At, Owner name, Space allocation (permanent, spool, temporary), Description
Table	Name, Description, Primary Key, Foreign Key, Sample rows (if data sampling is enabled)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Teradata metadata cataloged by object type (continued)

Object	Information cataloged
	Extended metadata: Created By, Created At, Updated By, Updated At, Size
Table index	Index Cardinality, Column name, Index Type, Index Name, Is Non Unique, Column Ordinal Position, Pages, Column Sort Sequence
Schema	Name
Column	Name, Description, Data Type, Is Nullable
View	Name, Description, SQL definition, Created By, Created At, Updated By, Updated At
User defined functions	Name, Function type Extended metadata: Definition, Deterministic characteristic, Null-call characteristic, Description, Number of parameters, Source file language, Data access, Parameter style, Execution protection mode, Platform type, Character type, Created, Created By, Last Modified, Last Modified By, External File Reference
SQL stored procedures	Name, Description, Stored procedure type, Definition Extended metadata: Created, Created By, Last Modified, Last Modified By
External stored procedures	Name, Stored procedure type Extended metadata: Definition, Application category, Description, Number of parameters, External file reference, Execution protection mode, Character type, Platform type, Source file language, Parameter style, Data access
Triggers	Name, Fired at instant Extended metadata: Created By, Created At, Updated By, Updated At, Name, Evaluation type, Fired on event, Trigger enabled, Order number, Definition, Trigger Comment, Subject Table Name, Action Time, Trigger Definition
User defined types	Extended metadata: Name, Type, Default transform group, Ordering form, Ordering Category, Default null specified for array, All operators supported, Encryption supported, Compression supported, Instantiable, Final
User defined methods	Name, Description, Number of parameters, Source file language, Data access, Parameter style, Deterministic characteristic, Null-call characteristic, Execution protection mode, Character type, Platform type

Profiling and sampling specific information.

If you include the profiling and sampling specific parameters while running the collector, the following additional information is harvested for columns.

Note: Users or roles must have read access to data to harvest profiling information (column statistics).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Profiling and sampling metadata cataloged by object type

Object	Information cataloged
Column	• Average Length (sample) • Average Value (sample) • Data Distribution • Distinct Values • Estimated Distinct Values • Estimated Non-null Values • Maximum Length (sample) • Maximum Value (sample) sorted numerically or alphabetically (z–a) • Minimum Length (sample) • Minimum Value (sample) sorted numerically or alphabetically (a–z) • Non-null Values (sample) • Sample String Values (first 5 items in a column)
Table	• Row Count • Sample Count (target sample size)

Relationships between objects

By default, the harvested metadata includes catalog pages for the following resource types. Each catalog page has a relationship to the other related resource types. If the metadata presentation for this data source has been customized, you might see other resource pages and relationships.

Teradata resource page relationships

Resource page	Relationship
Table	• Columns contained in tables • Table indexes
Columns	• Table • Table indexes
Table indexes	Columns
Trigger	Table triggers on tables
Schema	• Database that contains schema • Table that is part of schema
Database	Schema contained in database

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lineage for Teradata

The Teradata collector collects the following lineage information.

Note: Lineage for SQL statements defined via variable statements is not supported.

Teradata lineage by object type

Object	Lineage available
View	The collector identifies the associated column in an upstream view or table: • Where the data is sourced from • That sort the rows via ORDER BY • That filter the rows via WHERE/HAVING • That aggregate the rows via GROUP BY
Stored procedure	The collector identifies: • The associated column in an upstream view or table • Where the data is sourced from • That sort the rows via ORDER BY • That filter the rows via WHERE/HAVING • That aggregate the rows via GROUP BY • The downstream table that has its data updated Lineage is not available in the following cases: • The SQL statement in stored procedures contains the SELECT INTO clause • Stored procedures with multiple insert statements • Stored procedures used to create tables or transient tables created during the execution scope of a stored procedure

Prepare to run the Teradata Collector

Create a dedicated Teradata user with the permissions required for the metadata collector to harvest metadata from a target database.

Before you begin

Role required: admin

About this task

The collector authenticates to Teradata using username and password. For more information, see the Teradata documentation on Authentication Mechanisms.

Procedure

1. Create a Teradata user.

```
CREATE USER <user> AS PERM=60000000 BYTES, PASSWORD=<password>
```

2. Grant `SELECT` privileges on the target database and on DBC to the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These grants allow the collector to harvest extended metadata for databases, tables, views, user defined functions, stored procedures, triggers, and user defined types.

```
GRANT SELECT ON <database> TO <user>
GRANT SELECT ON DBC TO <user>
```

Result
The user has the permissions required to run the Teradata metadata collector.

What to do next
Use these credentials when configuring the collector parameters. See Create a Teradata metadata collector.

Create a Teradata metadata collector

Create a collector to import metadata from Teradata.

Before you begin

- All prerequisite tasks are complete. For more information, see Prepare to run the Teradata Collector.
- If you plan to run the collector on-premise, a MID Server is setup for the collector. For more information, see MID Server for metadata collectors.

Role required: connection-admin or admin.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub  icon in the left sidebar.
3. Select **Create** > **Metadata collector**.
4. From the System list, select **Teradata**.
5. From the Connection type list, select one of the following:
   a. Select **New connection** to configure a new connection.
   b. Select **Existing connection** to reuse an existing connection and select an existing connection from the **Connections** list.
   The configuration form is filled with details from the existing connection. The name is appended with the word Copy and sensitive details like password aren't copied.
6. Complete the form.

Teradata metadata collector form

Field	Description
Connection name	Unique identifier for the connection. This field can't be modified once the connection is established.
Short description	Purpose and details of the connection.

7. Configure the connection properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection options

Field	Description
Server	Hostname of the database server to connect to.
Server port	Port of the database server, if not the default.
Use MID server	Option to connect to the source system through a MID Server. When selected, the **MID selection** options appear.
MID selection	MID Server routing option for the collector job. This field appears only when **Use MID server** is selected. ○ **Auto-Select MID Server** — The system selects an available MID Server at job execution time. Default selection. ○ **Specific MID Server** — The collector job runs on the selected MID Server. If the MID Server is offline at job execution time, the job fails with an error identifying the MID Server by name. ○ **Specific MID Cluster** — The collector job runs on any available MID Server within the selected cluster.
MID Server	MID Server to use for the collector job. This field appears only when **Specific MID Server** is selected. The selected MID Server is saved on the collector record and used for all subsequent collection runs until changed.
MID Cluster	MID cluster to use for the collector job. This field appears only when **Specific MID Cluster** is selected. The selected cluster is saved on the collector record; any available MID Server within the cluster may serve the job.
Capabilities	One or more capability labels that restrict auto-selection to MID Servers advertising those capabilities. This field appears only when **Auto-Select MID Server** is selected.
MID application	MID Server application to use for the collector job. This field appears only when **Auto-Select MID Server** is selected.

8. Configure the authentication options.

Authentication options

User name	Username for authenticating with the database server.
Password	Password for authenticating with the database server.

9. Configure the database options.

Configuration options

Include databases	Name of the database to connect to. To add multiple databases, select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	Note: If this property is not specified, the collector harvests metadata from all databases. Use the optional **Excluded databases** parameter to exclude specific databases.
Excluded databases	Regular expressions indicating databases not to catalog. Use when the **Include databases** parameter is not set — the collector then harvests metadata from all databases, and this parameter excludes specific ones. **Note:** This parameter is ignored if the **Include databases** parameter is specified. To use **Excluded databases**, do not set the **Database** parameter.

10. Configure the advanced options.

Advanced options

Enable column statistics collection	Whether to enable harvesting of column statistics, that is, data profiling. **Note:** Enabling this feature may extend the running time of the collector because the collector requires access to table data to gather profiling metadata.
Target sample size for column statistics	Target number of rows to sample from tables.
Disable lineage collection	Whether to skip harvesting of intra-database lineage metadata.
Disable extended metadata collection	Whether to skip harvesting of extended metadata for resource types such as database, schema, table, columns, functions, stored procedures, user-defined types, and synonyms. Basic metadata for these resource types is still harvested.
Exclude system functions	Whether to exclude system functions.
Server environment	Friendly name for the environment in which the database server runs. Use this field when the server name is `localhost` to differentiate it from other environments.
Database ID	Unique identifier for this database, used to generate the ID for the database. Provide this value only if the database name used for the connection does not uniquely identify the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JDBC properties	JDBC driver properties to pass to the driver connection, in `name=value` format.
SQL parsing timeout	Timeout in seconds for SQL parsing during lineage collection. The default is 60.

11. Select **Save**.

Result
The metadata collector is created and appears on the Connectors page with a Configured status. The collector is ready to connect to the source system and harvest metadata.

What to do next
After the collector is created, perform any of the following tasks:

- Enable vault classification for columns harvested by the collector. This option is available only from the connection details of a saved collector. See Enable Vault classification for a metadata collector.
- Run the collector manually to harvest metadata immediately. See Run metadata collectors manually.
- Automate metadata collection by scheduling regular collector runs. See Schedule metadata collector runs.
- Monitor execution status and troubleshoot issues by viewing the runtime logs. See View runtime logs for collector runs.
- Discover and evaluate the harvested data assets in the Data Catalog. See Governing the Data Catalog.

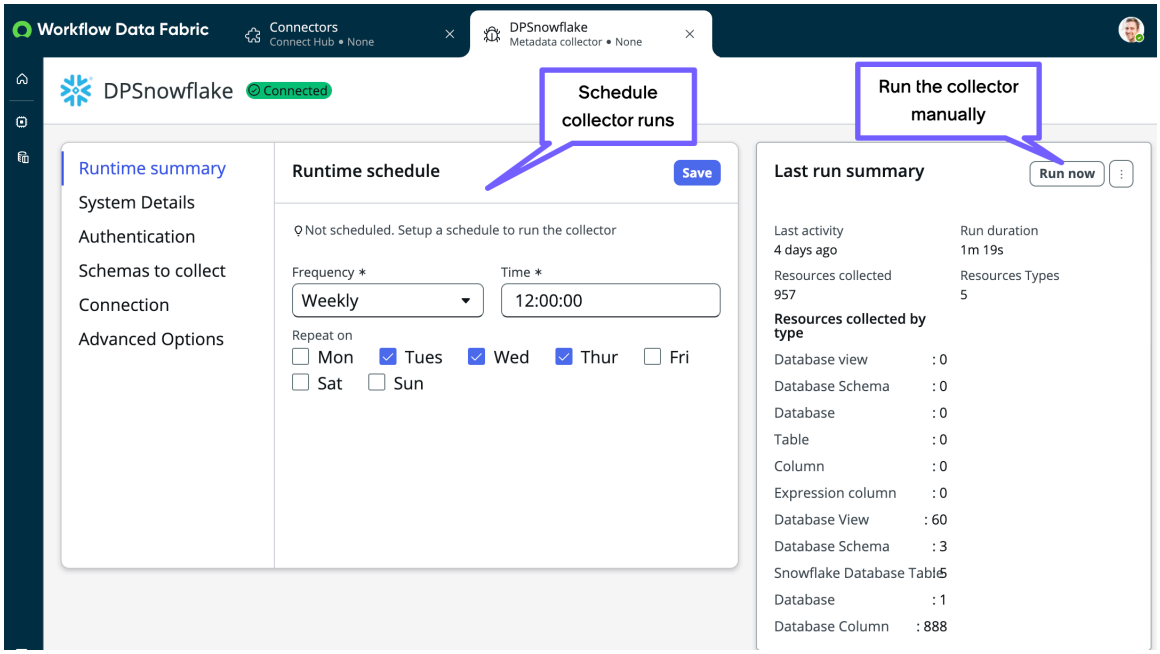
Running metadata collectors

A metadata collector run harvests technical metadata from the connected data platform and updates the Data Catalog. Collectors can run on demand or on a defined schedule. Runtime logs record the status and details of each run.

Collectors support two run modes:

- Manual: An immediate, on-demand run. Use this after initial setup to verify that the collector connects and collects expected metadata.
- Scheduled: A recurring run at a defined interval. Use this to keep catalog metadata current as the source system changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Run notifications

When a collector run completes or fails, the platform sends an email notification to the collector owner and any subscribers. Notifications use the ServiceNow Notification framework — no custom setup is required.

Notifications appear under the **Collector Run Notification** category in **Preferences** > **System notifications**, alongside other platform categories such as Connect. Two notifications are available:

- **DCG Metadata Collector Run Completed**: Sent when a collector run succeeds.
- **DCG Metadata Collector Run Failed**: Sent when a collector run fails.

Email is the only supported delivery channel. Opt in or out and manage your subscription through the standard Notification preferences UI. For steps, see Subscribe to metadata collector run notifications.

Run metadata collectors manually

Execute a metadata collector on-demand to import metadata immediately.

Before you begin

Role required: connection_admin

About this task

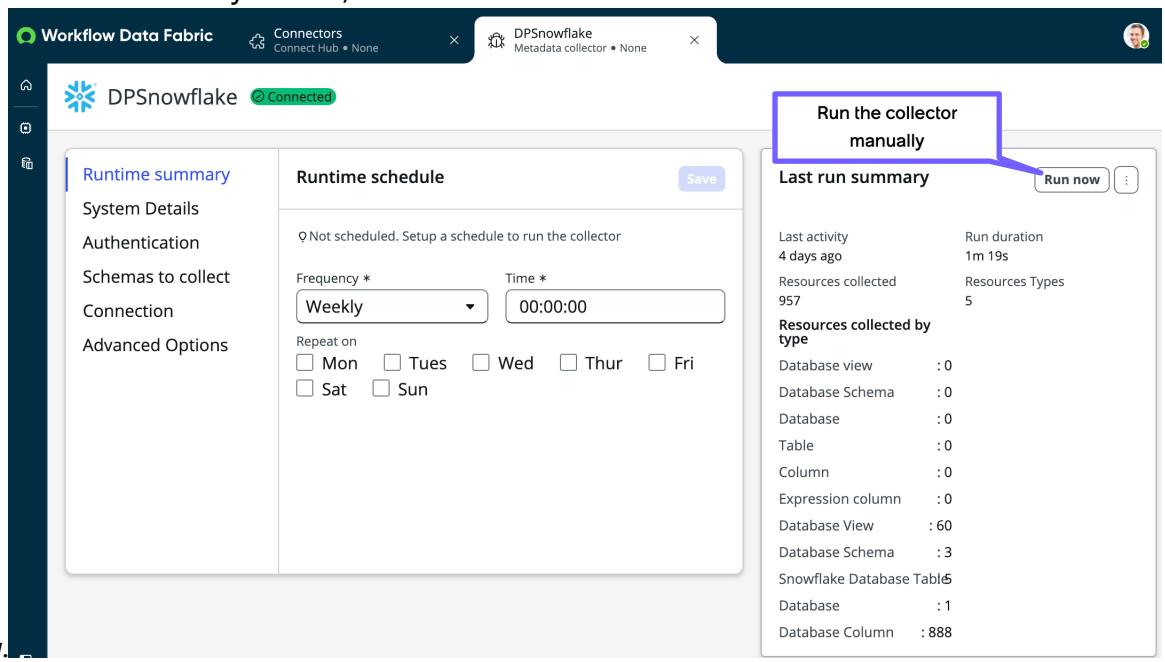
Running a collector manually initiates immediate metadata harvesting from the configured source system. Use manual execution to verify new collector configurations, refresh metadata after source system changes, or gather updated information outside the scheduled collection cycle. Collection duration varies based on the volume of metadata in the source system.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Connectors**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Metadata collector**.
5. Select the metadata collector you want to run manually.
6. In the Last run summary section, select **Run now**.



Schedule metadata collector runs

Schedule a metadata collector to run automatically at a specified frequency.

Before you begin

Role required: connection_admin

About this task

Configure collection schedules to maintain up-to-date catalog metadata without manual intervention. Scheduled runs execute automatically and refresh data assets with current information from source systems. Schedule frequency should balance freshness requirements against system load and source system availability.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Connectors**.
4. Select **Metadata collector**.
5. Select the metadata collector you want to schedule to run automatically.
6. In the **Runtime schedule** section, set the fields.

Runtime schedule form

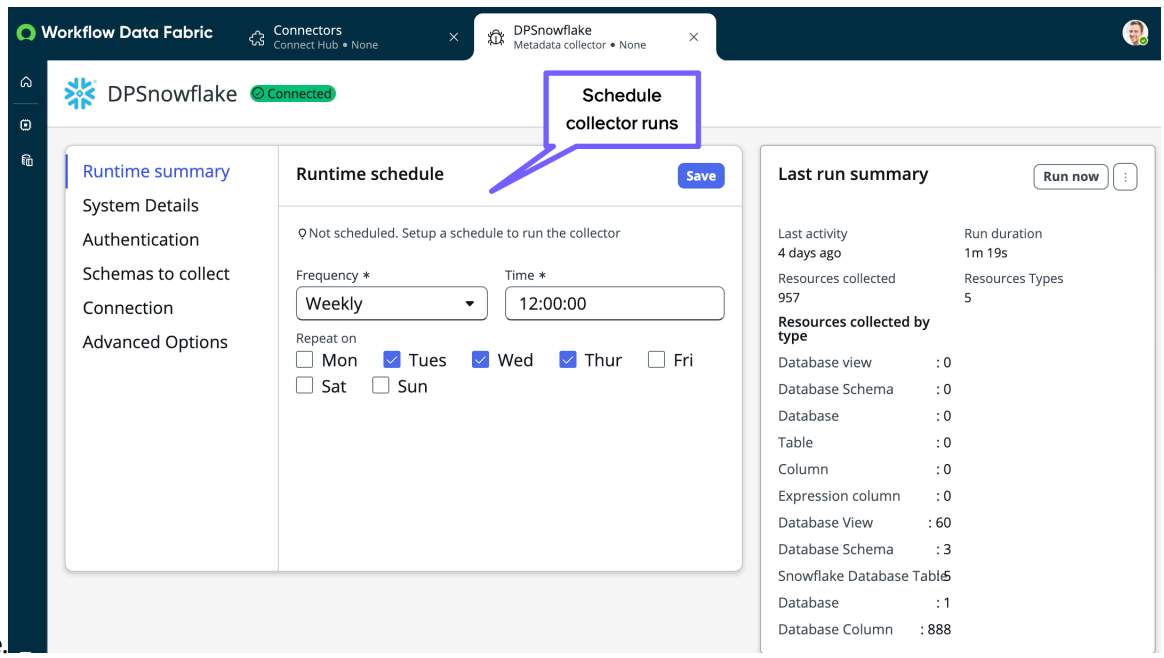
Field	Description
Frequency	How often the collector runs, such as daily or weekly.
Time	Time of day to run the collector, in 24-hour format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Repeat on	Days of the week on which the collector runs. Applies only when Frequency is set to Weekly.

Note: Schedule collections during low-usage periods to minimize impact on source systems.

7. Select Save.



View runtime logs for collector runs

Access execution logs and download detailed log files for metadata collector runs.

Before you begin

Role required: connection_admin

About this task

Runtime logs provide visibility into collector execution progress, discovered metadata, and any errors or warnings that occurred during the collection process. Use these logs to monitor collection health, troubleshoot failed runs, verify that expected data assets were discovered, and diagnose connectivity or permission issues.

The execution run page displays real-time status information and a searchable table of log entries organized by severity level (Info, Warning, Error). For advanced troubleshooting or detailed analysis, you can download complete log files containing granular execution details and the raw collected metadata in RDF format.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Connect Hub icon in the left sidebar.
3. Select **Connectors**.
4. Select **Metadata collector**.
5. Select a metadata collector for which you want to review the logs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Access the runtime logs.
   - To view the most recent run logs, select **Runtime logs** from the form context menu.
   - To view logs from previous runs, select **Previous runs** and then select a specific execution run from the list.
7. Review the execution details.

   The execution run page displays:
   - Current Phase: Status of the collector run (COMPLETED, FAILED, IN PROGRESS)
   - Start time and End time: Timestamp information
   - Percent Complete: Progress percentage
   - State: Overall execution state
   - Configuration: Associated collector configuration name
8. Review the execution logs table.

   Scroll to the **Execution logs** section to view log entries. The table displays:

Execution logs columns

Column	Description
Level	Log severity (Info, Warning, Error)
Logged At	Timestamp when the log entry was created
Message	Log message describing the event or issue
Exception Class Name	Type of exception if an error occurred
Exception Message	Detailed error message
Recommended Action	Suggested steps to resolve the issue

9. Download detailed log files for advanced troubleshooting.

   In the **Manage Attachments** section, select the download link next to the log file name. Two types of log files are available:

Log file types

File Type	Description
execution_projection_*.log	Detailed execution logs containing timestamped entries about: ○ Log projection start and completion status ○ Discovered data asset types and counts (for example, tables, columns, views) ○ Attribute projection processing for each data asset type ○ Mapping information between source metadata and catalog tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File Type	Description
	○ SPARQL queries used for data extraction ○ Processing statistics including error counts Use this file to understand what the collector discovered, how data assets were mapped, and identify processing issues
catalog-*-results.nt	Raw collected metadata in N-Triples RDF format containing: ○ Collector execution metadata (start time, end time, execution properties) ○ System environment information (OS, architecture, version) ○ Complete data asset definitions using Open KOS schema URIs ○ Relationships between discovered data assets ○ Technical metadata for all collected assets This machine-readable format is primarily for advanced troubleshooting and integration scenarios. Use RDF tools to parse and analyze this data

Result
Use the logs to identify collection issues, verify data asset discovery, and troubleshoot failed runs. Focus on Warning and Error level messages for troubleshooting. Download detailed log files when you need to share diagnostic information with support or perform deep analysis of collection behavior.

Subscribe to metadata collector run notifications

Opt in to email notifications for metadata collector run completion and failure through Notification preferences.

Before you begin
Role required: connection_admin

About this task
The platform sends an email when a metadata collector run completes or fails. You subscribe to these notifications through the standard Notification preferences UI. You can subscribe to run completion notifications, failure notifications, or both.

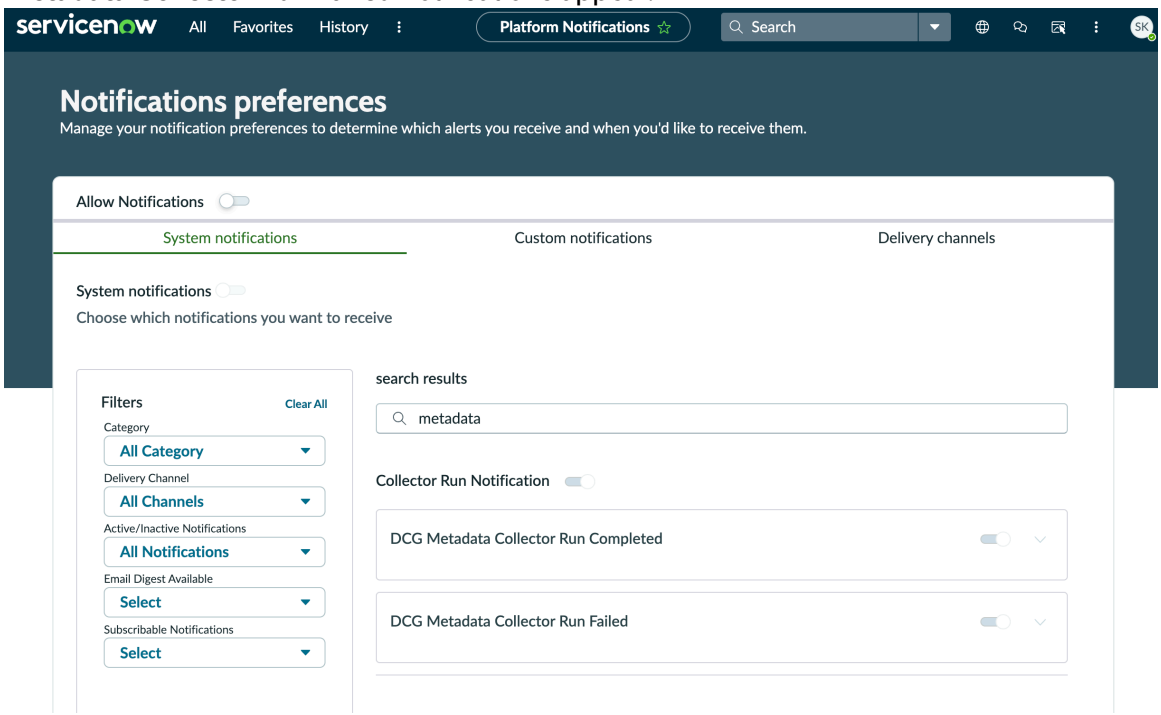
Procedure
1. Open Notification preferences.
   Select your profile icon, then select **Notification preferences**.
2. Enable the **Allow Notifications** toggle at the top of the page.

   ⚠ **Warning:** If **Allow Notifications** is off, no notifications are delivered regardless of individual subscription settings.

3. Select the **System notifications** tab.
4. Enable the **System notifications** toggle.
5. In the search field, enter `metadata` to filter to the **Collector Run Notification** category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **DCG Metadata Collector Run Completed** and **DCG Metadata Collector Run Failed** notifications appear.



6. Enable the toggle for each notification you want to receive.
   - Enable **DCG Metadata Collector Run Completed** to receive an email when a collector run succeeds.
   - Enable **DCG Metadata Collector Run Failed** to receive an email when a collector run fails.

Result

You receive an email within one minute of a collector run completing or failing. The email includes the collector name, source name, start and end times, and — for failures — an error summary with a link to the run log.

What to do next

To stop receiving notifications, return to Notification preferences and disable the relevant toggles.

Finding and accessing data assets

The Data Catalog provides a searchable view of data assets collected from connected systems. You can find assets by keyword, tag, domain, or glossary term, view metadata and lineage, and request access to data products and data interfaces.

The catalog aggregates metadata from multiple connected systems into a single location. Each asset record includes technical metadata collected automatically, along with any business context that data stewards have added — such as glossary terms, tags, and domain assignments.

When you find an asset, you can view its full details: schema, data lineage, related assets, and ownership information. For data products and data interfaces, you can submit an access request directly from the asset details page.

Explore data assets in the data catalog

Find and explore catalog assets through search, filtering, and browsing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

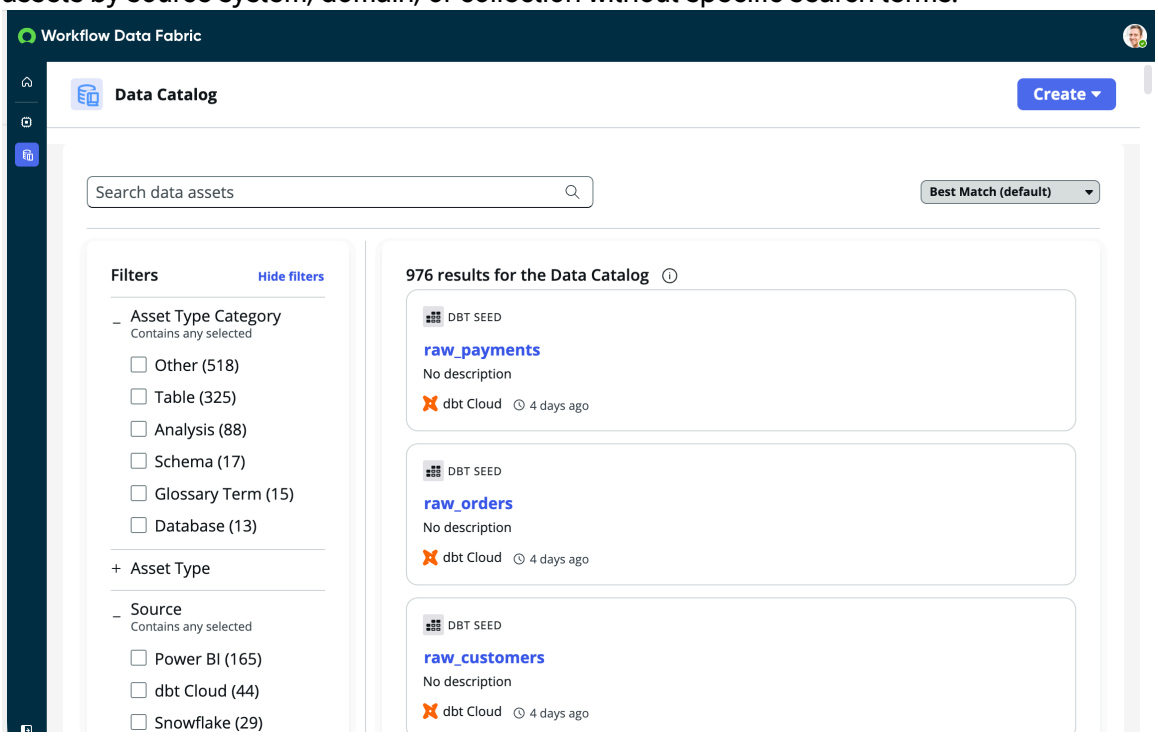
https://player.vimeo.com/video/1195705976?h=a6edac4cb6&badge=0&autopause=0&player_id=0&app_id=58479%22

Before you begin

Role required: WDF Consumer (wdf_consumer)

About this task

Discover data assets using search or browsing. Search looks across asset names, descriptions, tags, and other metadata fields. Browse lets you explore assets by source system, domain, or collection without specific search terms.



Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Data catalog icon in the left sidebar.
3. Browse the data assets available in the catalog.
4. Apply filters to narrow the list of data assets.

   Filters help narrow large result sets to the most relevant assets. Apply multiple filters to create precise searches combining different attributes.

   a. Review available filters in the left panel.

   b. Select filter options to refine the list.

      Common filters:

      - Asset Type: Table, Column, View, Dashboard, Report
      - Source System: Filter by the originating data platform
      - Domain: Organization or business area
      - Tags: Applied classification tags

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Owner: Data owner or steward
- Has Lineage: Yes or No

5. Change the sort order to organize the list by different criteria.

   From the sort dropdown menu, select a sort option:

   - Relevance: Best matches first based on search keywords (default)
   - Name: Alphabetical order (A-Z)
   - Last Modified: Most recently updated first

6. Find assets using search.
   a. Enter keywords in the search bar.
   b. Review suggested results as you type or press Enter to view all results.
   c. Select any asset to view full details.

   Search tips:

   - Use specific terms for better results (for example, "customer orders" instead of "data")
   - Search looks across multiple fields including names, descriptions, and business context
   - Results display with key information including asset type, source system, and description

View data asset details

The asset detail page organizes data asset information into tabs, including overview, columns, relationships, lineage, quality, and activity.

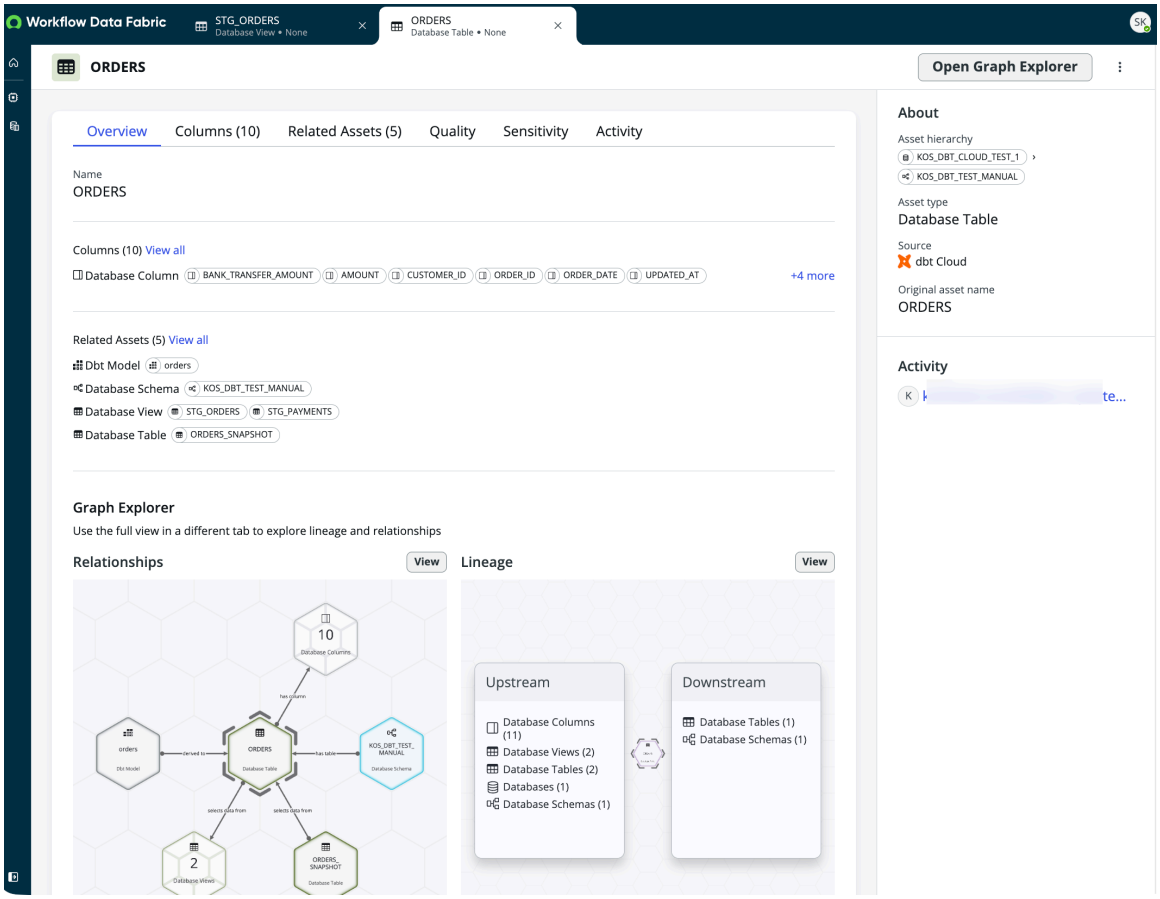
Before you begin

Role required: WDF Consumer (wdf_consumer)

About this task

Asset detail pages organize information into tabs for easy navigation. The Overview tab provides summary information, while additional tabs offer detailed views of specific aspects like columns, relationships, and lineage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Data catalog icon in the left sidebar.
3. Select the data asset you want to view.
4. On the Overview tab view the general details about the asset, such as, the name, source, columns included (if it is a table), the preview of relationships and lineage.
   General details include the name, source, and columns included (for table assets). The Overview tab also shows a preview of asset relationships and asset lineage. For table and column assets, the Overview tab also shows a Quality section with the overall data quality status, the number of rules, the number of passed rules, and when quality was last evaluated. Select **View all** to open the Quality tab.
5. On the Columns tab, view column information for tabular assets, such as tables.
   The tab displays details like Asset name, Relationship, Data type, etc. The Classifier field displays the classification assigned to the columns harvested by the ServiceNow collector. If classification has not run on the table, the Classifier column displays null.

   Check that you have the right roles (data_classification_admin or admin) to assign classifications to columns. For details, see Data Classification.

   Select a column name to browse to the details page of the column.
6. On the Related assets tab, view the list of connected catalog assets.
7. On the Quality tab, review data quality information for the asset.
   The Quality tab is available for table and column assets. The summary shows the overall data quality status, the total number of rules, and the number of passed rules. Quality badges awarded to the resource are also displayed here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Rules table lists each rule with its source, asset type, asset name, category, status, and last run time. External data quality tools submit rule results via the Data Quality API. Use filters and search to locate a specific rule. To control how long data quality audit and unmatched queue records are retained before they are purged, configure the retention property. For more information, see Data quality properties.

8. On the Sensitivity tab, view the sensitivity classification assigned to the columns of a table. This tab is populated for the ServiceNow collectors and for collectors for which Vault classification is enabled.

   Note: ServiceNow Vault data classifications can be generated automatically for ServiceNow assets using the Classifying ServiceNow assets with Vault agents agentic workflow. Classifications produced by the agent are written to Vault's classification tables and are picked up by the metadata collector on its next run. Avoid running the agent and the collector at the same time to prevent a mismatch between source data and the catalog.

9. On the Activity tab, review the activities performed on the data asset.
   The system stores the name of the user who made the change, the change details, and the timestamp. Use filters, search, and sort to locate the change you want to track.

Explore data asset relationships

See the data assets, business terms, and governance objects connected to a data asset. Open the relationships view in Graph Explorer to expand, hide, and rearrange the graph.

https://player.vimeo.com/video/1200468592?h=ec681db3b0&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

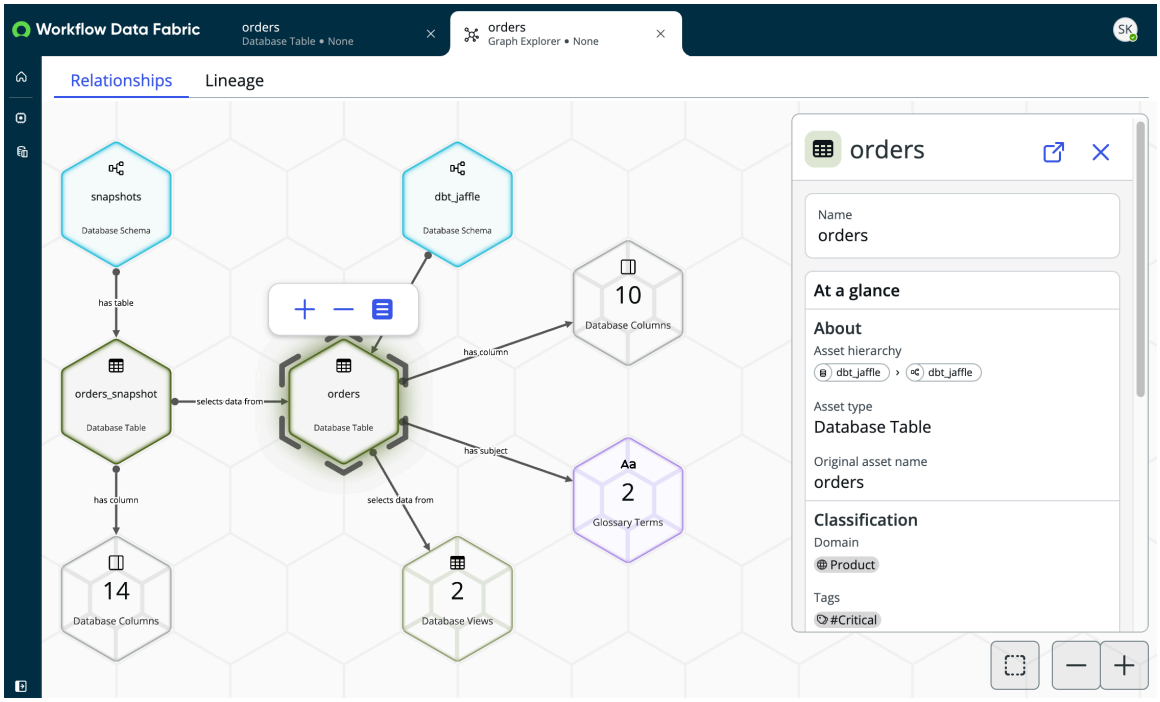
Role required: WDF Consumer (wdf_consumer)

About this task

Graph Explorer is a visual tool in the Data Catalog for exploring how data assets and business concepts are connected. Graph Explorer has two views: **Relationships** shows direct semantic, conceptual, and governance connections among assets; **Lineage** shows the directed upstream and downstream flow of data.

The relationships view in Graph Explorer shows how a data asset connects to other assets, business concepts, and governance objects in the Data Catalog. The view covers semantic, conceptual, and governance connections across tables, columns, dashboards, business terms, policies, and other catalog objects. It presents the same content as the Related Assets tab of the asset page, in a graph for visual exploration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Data catalog icon in the left sidebar.
3. In Data Catalog, open the asset whose relationships you want to explore.
4. On the **Overview** tab, locate the **Graph Explorer** section.

   The section contains side-by-side previews for **Relationships** and **Lineage**.

5. Open the full relationships view.
   - Select **View** on the **Relationships** preview.
   - Select **Open Graph Explorer** at the top of the asset page.

   The full visualization opens in a new tab. The Relationships view opens by default.

6. Interact with the visual representation of relationships.

   The central node represents the data asset from which you opened Graph Explorer . All connected nodes represent different types of related data assets, with arrows indicating the type of relationship. This is the same information shown in the Related assets tab of the data asset, but presented visually.

7. To expand or hide the connections of a related asset, select the node, then select **Show relationships** or **Hide relationships**.
8. To inspect a grouped node, select the node, then select **Unpack**.

   The group expands to show the individual assets it contains. To collapse the group again, select **Repack**.

9. To view the details of a related asset, select the node, then select **Show asset details**.

   The asset preview panel opens with the asset name, hierarchy, type, original name, and recent activity. To navigate to the asset's full page, select the link next to the asset name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. To customize the layout, drag nodes to new positions on the canvas.
11. Use the controls in the diagram toolbar to zoom in, zoom out, or recenter the visualization.

Explore data assets lineage

Trace the upstream sources and downstream consumers of a data asset. Open the lineage view in Graph Explorer to examine specific relationships, focus on a path, and review related asset details.

https://player.vimeo.com/video/1200457168?h=7eb98602b6&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: WDF Consumer (wdf_consumer)

About this task

Graph Explorer is a visual tool in the Data Catalog for exploring how data assets and business concepts are connected. Graph Explorer has two views: **Relationships** shows direct semantic, conceptual, and governance connections among assets; **Lineage** shows the directed upstream and downstream flow of data.

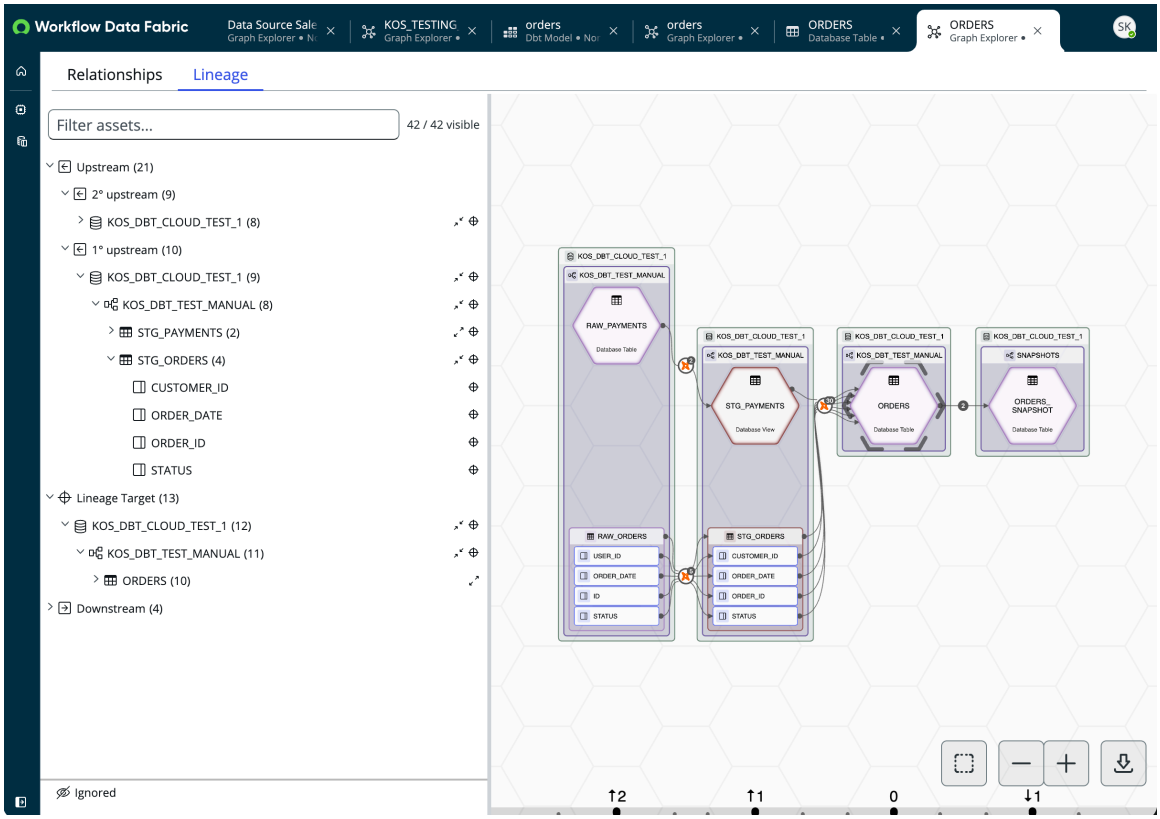
The lineage view displays upstream sources, downstream consumers, and the relationships that connect them, at both the table level and the column level. It supports four primary use cases:

- Impact analysis and change management. Identify the downstream reports, dashboards, models, and datasets that depend on a data asset before you modify or deprecate it.
- Root cause analysis. Trace upstream from a problematic asset to find where a data quality issue originated, whether in a source system, a transformation, or a join.
- Data discovery and understanding. Assess an asset's context and reliability by examining its sources and consumers.

Each asset's **Overview** tab includes a **Graph Explorer** section with side-by-side previews for **Relationships** and **Lineage**. The full visualization opens in a new tab and contains both views.

The lineage diagram has a sidebar that lists every asset, grouped by direction (**Upstream**, **Lineage Target**, **Downstream**, **Ignored**) and by degree of separation. The graph shows each asset as a node, with edges representing lineage relationships. An axis indicates the degree of separation for each column, from upstream to downstream. When multiple relationships connect the same two assets, the edge shows a numbered badge with the count of bundled relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. In the sidebar, select the Data Catalog icon.
3. In Data Catalog, open the asset whose lineage you want to explore.
4. On the **Overview** tab, locate the **Graph Explorer** section.

   The section contains side-by-side previews for **Relationships** and **Lineage**.
5. Open the full lineage view.
   - Select **View** on the **Lineage** preview.
   - Select **Open Graph Explorer** at the top of the asset page, then select the **Lineage** tab.

   The full visualization opens in a new tab.
6. Interact with the visual representation of lineage.

   The focused asset appears in the diagram with upstream sources and downstream consumers, organized by degree of separation. The sidebar lists every asset in the lineage. This is the same data flow that the asset participates in, presented visually so that you can trace dependencies in either direction.
7. Review the lineage tree in the sidebar.

   The sidebar groups assets by direction — **Upstream**, **Lineage Target**, **Downstream**, and **Ignored** — and by degree of separation within each direction. To narrow the list, enter text in the **Filter assets** field.
8. Select an edge in the diagram to inspect its lineage relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A numbered badge on the edge shows the count of bundled relationships. Selecting the edge reveals the table-level and column-level dependencies it represents.

9. Expand a container node to reveal the assets inside.

   Containers — such as databases that contain schemas, tables, and columns — appear as single nodes by default. Expanding a container reveals its nested assets so that you can examine the lineage in more detail.

10. Select a node to open the asset preview panel and view its details.

    The preview panel shows the asset name, hierarchy, type, original name, and recent activity. To navigate to the asset's full page, select the link next to the asset name.

11. Focus on a node to narrow the view to a specific path.

    Other assets are hidden and move to the **Ignored** group in the sidebar. To restore the hidden assets, select **Unignore**.

12. Use the controls in the diagram toolbar to zoom in, zoom out, or recenter the visualization.
13. **Optional:** Download the lineage data as a CSV file.

    a. Select **Download as CSV**.

    b. In the Download lineage of this resource window, configure the download options.

Download lineage form

Field	Description
Direction	Select from **Upstream and downstream**, **Upstream only**, **Downstream only**.
Upstream	Number of upstream levels to include. Select **All levels** or specify a number.
Downstream	Number of downstream levels to include. Select **All levels** or specify a number.

    c. Select **Download**.

Request access to data assets

Request access to data products and data interfaces in the Workflow Data Fabric to consume data for your workflows and applications.

Before you begin

Role required: WDF Consumer (wdf_consumer)

About this task

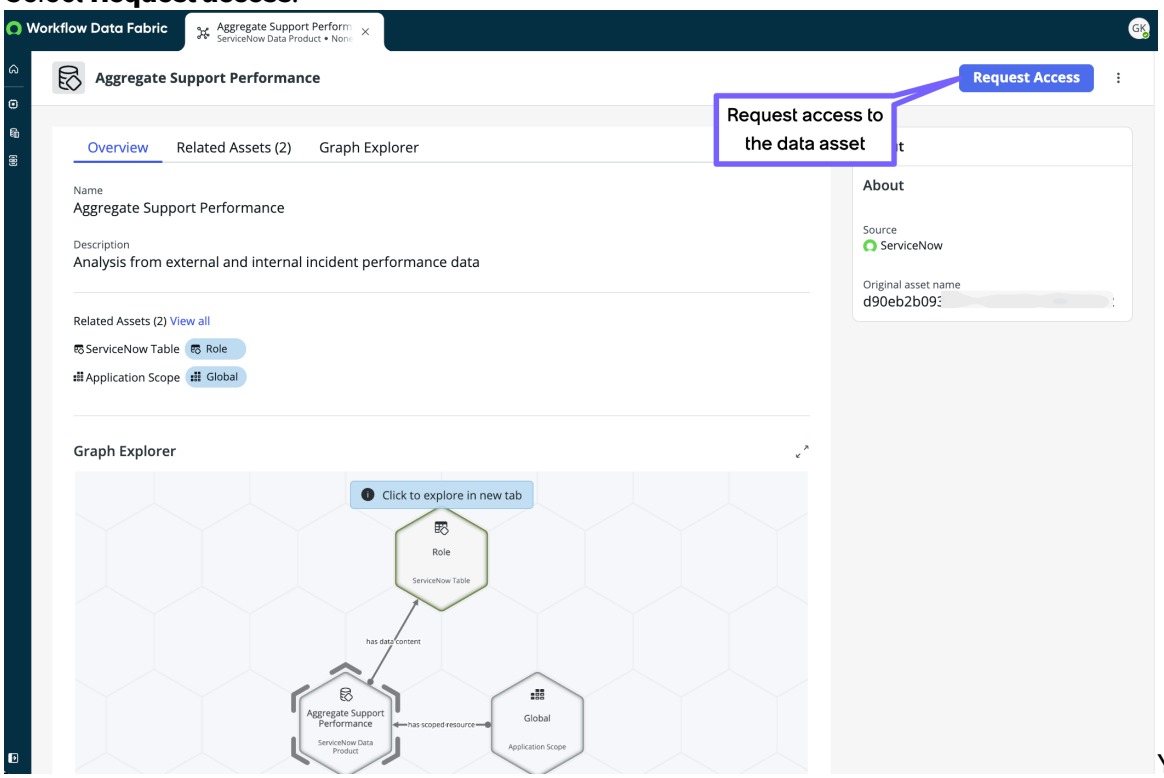
Use the data catalog to discover and request access to data products and data interfaces that contain the data you need for your workflows. Data stewards review and approve access requests based on data governance policies and business requirements.

Note: This feature is only available for data interfaces and data products and not other data assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Data catalog icon in the left sidebar.
   The data catalog displays all available data assets that you can browse and search.
3. Browse or search for the data product or data interface you want to access.
   You can filter by data domain, category, or use the search functionality to find specific data assets.
4. Select the data product or data interface you want to request access to.
   The data asset details page opens, displaying metadata, schema information, data lineage, and access controls.
5. Select **Request access**.



Your access request is submitted to the data steward for review and approval.

Result

The data steward receives a notification about your access request and can review, approve, or deny the request. You receive an email notification when the request status changes.

Governing the Data Catalog

Data stewards add business context to catalog assets, making them more discoverable for catalog consumers. Governance tools include glossary terms, tags, domains, and direct asset updates.

The catalog automatically collects technical metadata from connected external systems — identifying what data exists, its schema, source, and lineage. Data stewards add business context on top of that collected metadata.

Catalog governance tools include:

- Glossary terms to standardize business terminology and link it to relevant assets
- Tags to classify assets by topic, sensitivity, or use case

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Domains to group assets by business area or ownership
- Asset record updates to correct or supplement collected metadata

Update a data asset

Edit catalog asset metadata to add business context, improve discoverability, and provide additional information.

Before you begin

Role required: data steward (*df_data_steward*)

About this task

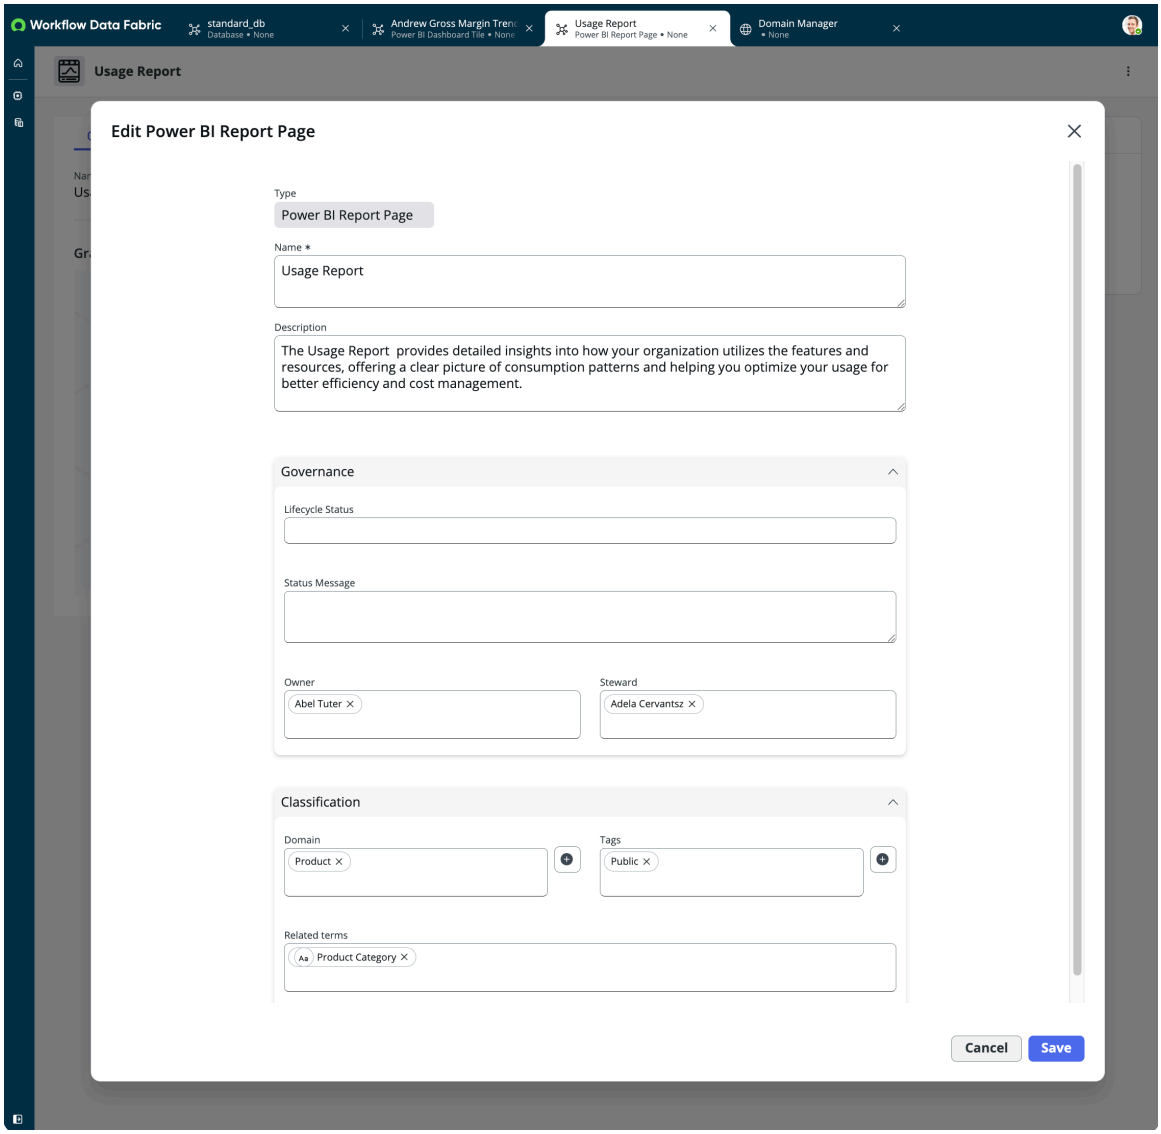
Enrich assets with descriptions, business context, and organizational metadata to help users understand what the data represents and how to use it. Some fields are auto-populated from source systems and are read-only to maintain data integrity with the source.

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the **Data catalog** icon.
3. Select a data asset to open its details page.
4. From the form context menu, select **Edit**.
5. Update the general details.
   - Name: Name of the data asset.
   - Description: Description of the asset. Use the rich text editor tools to format the content and add images, links, tables, etc.
6. Update the governance details.
   - Lifecycle status: Current state of the data asset. Possible values are: Approved, Deprecated, Draft, In review, Rejected.
   - Status message: Description of why the data asset is in its current status. Use the rich text editor tools to format the content and add images, links, tables, etc.
   - Owner: Person responsible for business decisions about the data. Adding or removing an owner sends the owner an email notification.
   - Steward: Person responsible for data quality and governance. Adding or removing a steward sends the steward an email notification.
7. Update the classification details.
   - Domain: Terms that represent the logical grouping of related data assets (like customer or product data). For details about creating domains, see Create catalog domains.
   - Tags: Non-hierarchical label or keyword that provides context and descriptive metadata, making data easier to organize, locate, and manage. For details about creating tags, see Create catalog tags.
   - Related terms: Glossary terms connected to this data asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Save**.



Create catalog tags

Create tags that can be applied to data assets for classification and categorization.

https://player.vimeo.com/video/1195433271?h=a260a01259&badge=0&autopause=0&player_id=0&app_id=58479%22

Before you begin

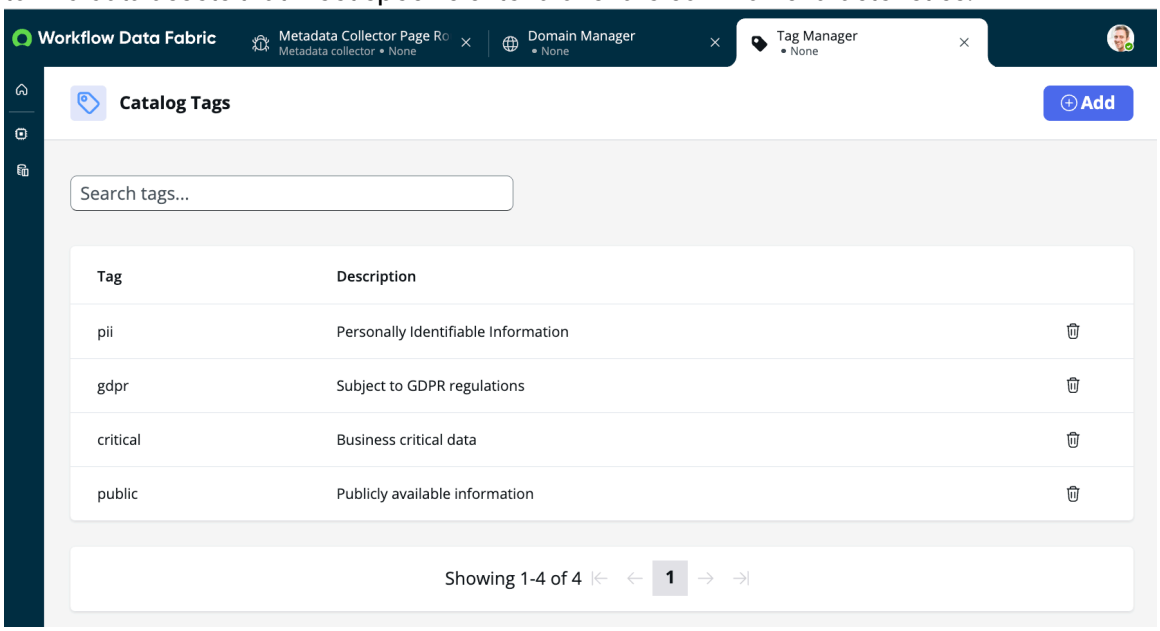
Role required: Data Steward (df_data _ steward)

About this task

Catalog tags are metadata labels that you can apply to data assets to enable classification, categorization, and discovery. Tags provide a flexible way to describe data characteristics, business context, data quality, sensitivity levels, or any other attributes relevant to your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search and filter data assets based on applied tags, making it easier to find data assets that meet specific criteria or share common characteristics.



Procedure

1. Navigate to **All > Workflow data Fabric > Data Catalog**.
2. Select a data asset to open its details page.
3. Select **Edit**.
4. In the Classification section, select the + icon next to Tags.
   The Tag Manager opens.
5. Select **Add**.
6. Complete the tag form with the tag name and description.
   The tag name can't be edited once it is saved.
7. Select **Create**.
   The tag is created and appears in the Tag Manager list. From here, you can edit the tag description or delete the tag.
8. Select the tag in the tag manager list to edit its description.
9. Locate the tag that you want to delete and select the delete icon.
   The system displays whether the tag is applied to any assets before allowing deletion.

Result

The tag is created and appears in the Tag Manager list. The tag is now available to apply to any data asset in the catalog.

What to do next

After creating tags, apply them to data assets in the Tags field of the Classification section when editing a data asset. For details, see Update a data asset.

Create catalog domains

Organize data assets by creating hierarchical domain structures that represent business areas, departments, or data categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

https://player.vimeo.com/video/1195409837?h=145d4c1b81&badge=0&autopause=0&player_id=0&app_id=58479%22

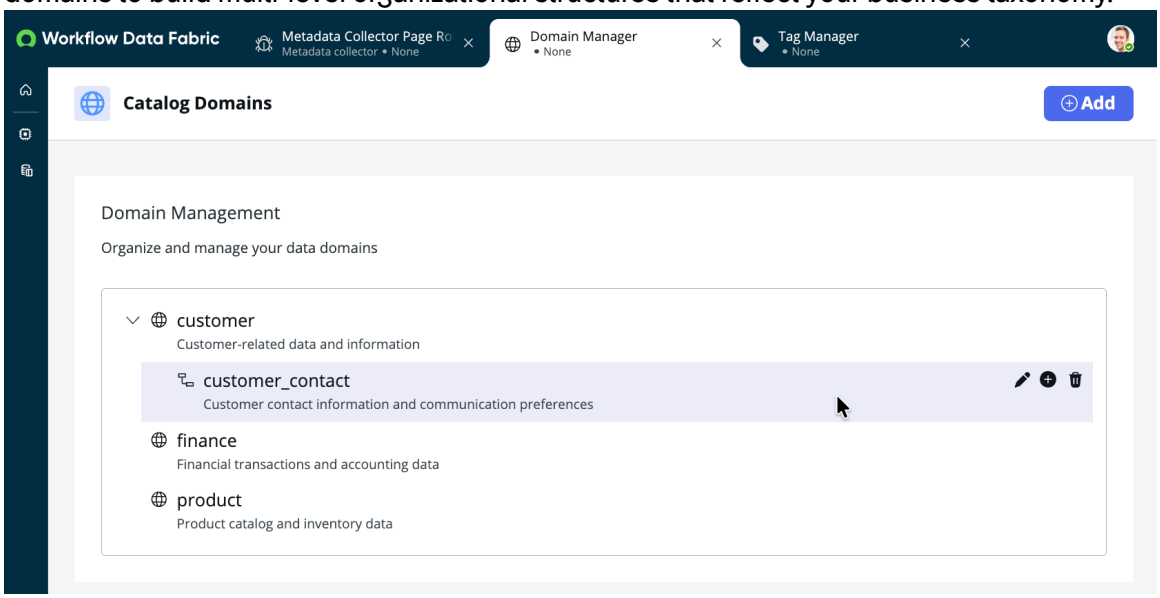
Before you begin

Role required: Data Steward (df_data _ steward)

About this task

Catalog domains help you organize data assets into logical groupings based on business areas, departments, or data types. Domains provide a hierarchical classification system that makes it easier for users to discover and navigate related data assets.

You can create root domains at the top level and subdomains (child domains) under existing domains to build multi-level organizational structures that reflect your business taxonomy.



Procedure

1. Navigate to **All > Workflow data Fabric > Data Catalog**.
2. Select a data asset to open its details page.
3. Select **Edit**.
4. In the Classification section, select the + icon next to Domains.
   The Domain Manager opens.
5. Select **Add**.
6. Complete the domain form.
   - Name: Enter the domain name.
   - Description: Enter a description (maximum 1000 characters).
   - Parent Domain: Select None (root domain) to create a root domain, or select an existing domain to create a subdomain.
7. Select **Create**.
   The domain is created and appears in the Domain Manager list. From here, you can add child domains and edit or delete a domain.
8. Locate the domain for which you want to create child domains and select **Add child domains**
9. Locate the domain that you want to edit and select **Edit domain**.
   Changing the parent domain moves the domain and all its subdomains to a new location in the hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Locate the domain that you want to delete and select **Delete domain**.
    Before deleting a domain, you must first remove all of its child domains.

What to do next

After creating domain, apply them to data assets in the Domains field of the Classification section when editing a data asset. For details, see Update a data asset.

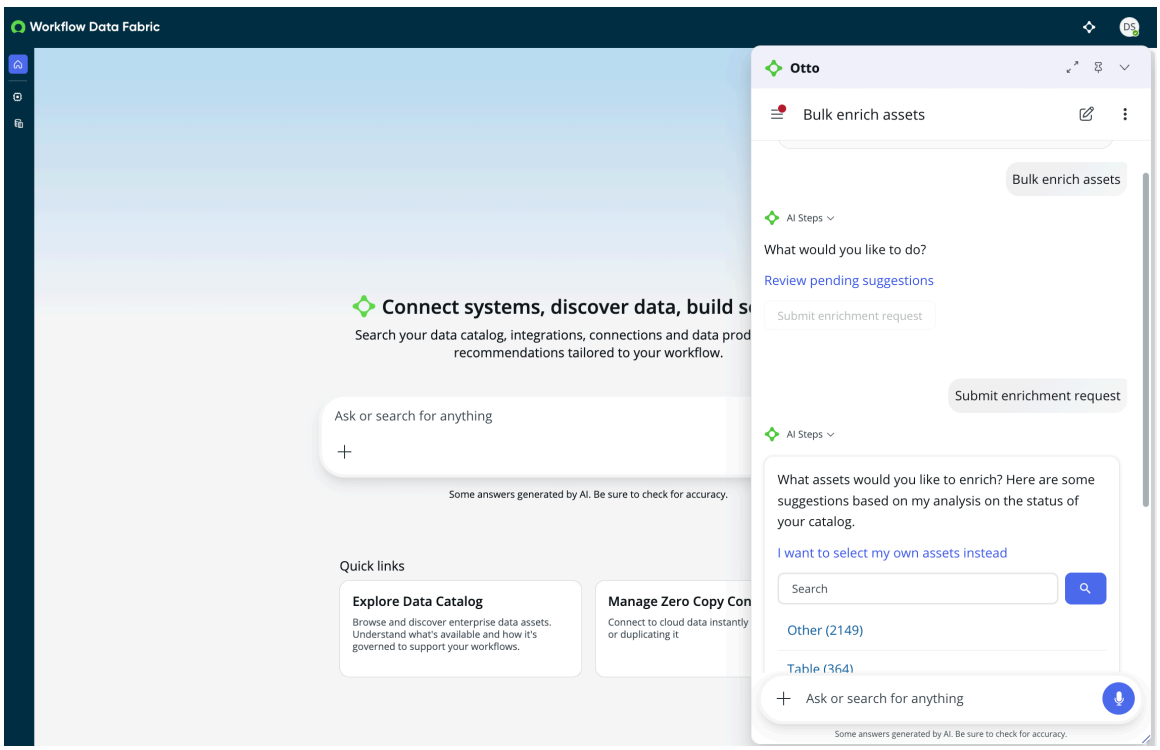
Metadata enrichment with ServiceNow Otto

ServiceNow Otto can generate AI-suggested metadata for a batch of Data Catalog assets for a data steward to review and publish.

Data Catalog assets accumulate incomplete or missing metadata over time —domains, tags, and glossary-term associations— especially as new sources are onboarded through metadata collectors. Filling this in one asset at a time is not practical. ServiceNow Otto can generate suggested metadata for many assets at once, as a tracked, asynchronous job. Nothing changes in the catalog until a data steward reviews the suggestions and chooses to publish them.

Entry points

Start a bulk enrichment job two ways — from ServiceNow Otto, using the assistant icon available in the Workflow Data Fabric header, or directly from the Data Catalog page. Both entry points create the same kind of job and route to the same review workspace. For step-by-step instructions, see Bulk-enrich assets with ServiceNow Otto and Bulk-enrich assets from the Data Catalog.



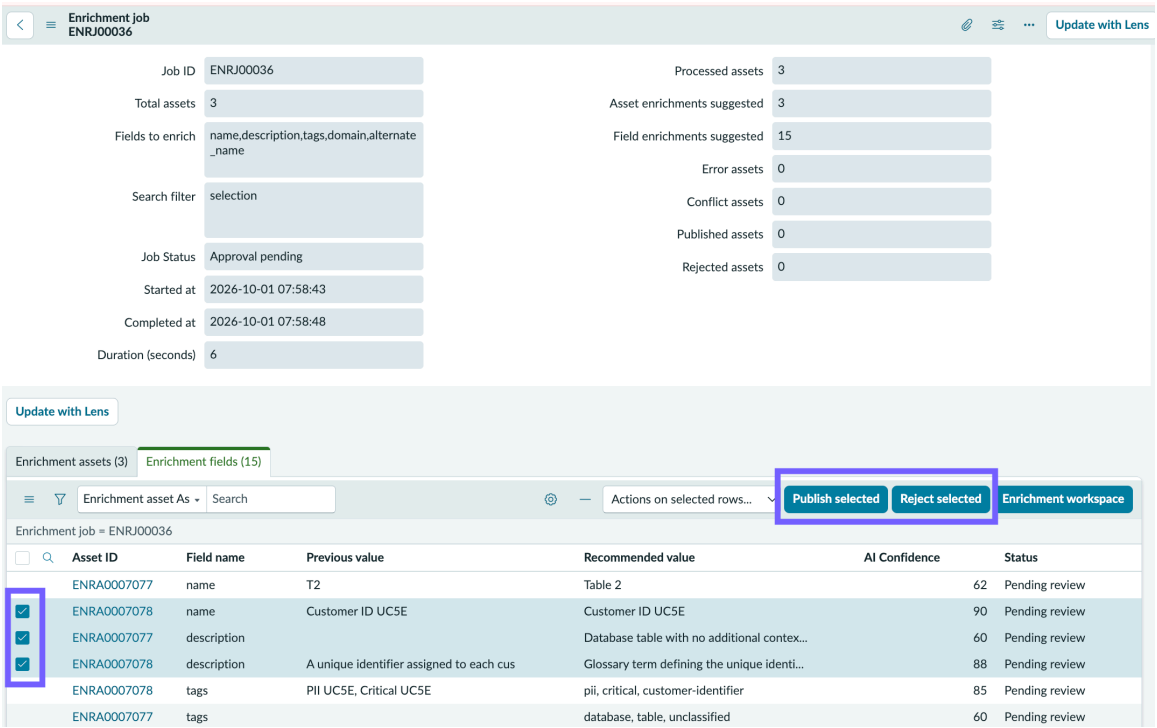
How it works

Enrichment jobs run asynchronously, in the background, and can take from a few minutes to a few hours depending on the number of assets and fields included. You're notified by email when the job finishes.

Every suggestion includes an AI confidence score and stays in a pending state. Submitting a job doesn't enrich assets immediately — a suggestion has no effect on the actual asset

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

until a data steward reviews and either publishes or rejects it. For a list of job statuses and their meanings, see Data assets enrichment statuses and AI confidence scores.



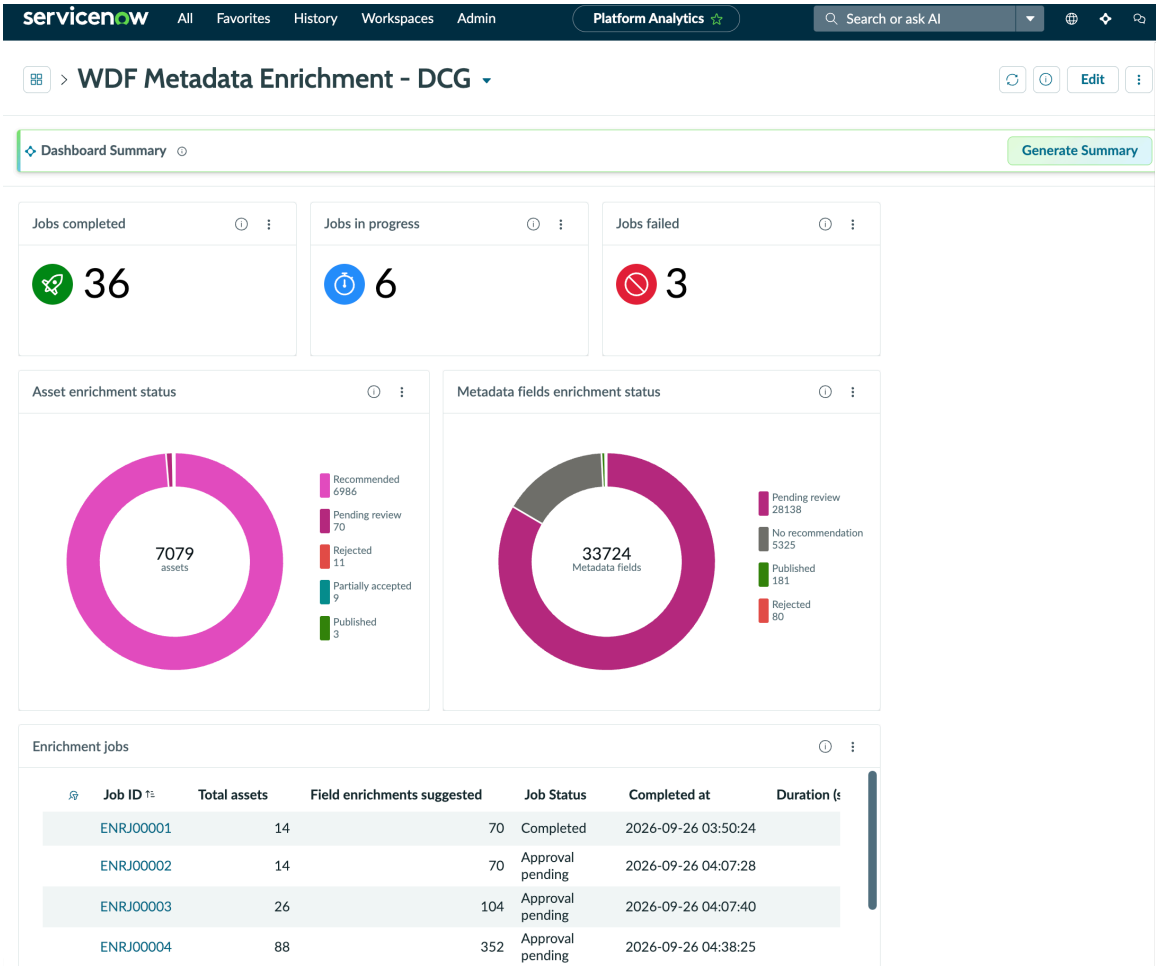
Metadata Enrichment workspace

The Metadata Enrichment workspace gives a consolidated view of all enrichment activity across jobs. Use it to track the overall enrichment program rather than a single job.

The workspace includes:

- A dashboard summary showing the number of jobs completed, in progress, and failed
- Asset enrichment status and metadata field enrichment status charts, showing counts across all jobs
- An enrichment jobs list with job status, asset counts, and duration for each job
- An enrichment assets and fields list, grouped by job, where you can select a job ID, asset ID, or field ID to review enrichments at the level of detail you need

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Prerequisites

This capability requires ServiceNow Otto to be configured and Data Catalog to be installed.

Metadata enrichment with ServiceNow Otto setup

Before running AI enrichment jobs, activate the enrichment launcher and configure data steward role access.

To use Metadata enrichment with ServiceNow Otto, complete the following setup tasks:

- Activate the enrichment launcher: Add the *DCGEnrichLauncher* script include to the Global application scope to activate the enrichment review experience.
- Grant data steward access to the enrichment workspace: Configure the *bulk_enrich.default_dashboard_sys_id* system property so that users with the data steward role can open the enrichment workspace.

For system properties that control enrichment batch size, parallel lanes, and lane timeouts, see Data assets enrichment system properties. These properties are optional. The default values work for most implementations. Adjust them only if enrichment jobs are running slower than expected or you are tuning performance.

Activate the enrichment launcher

Add the *DCGEnrichLauncher* script include to the Global application scope to activate the enrichment review experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
The following applications must be installed:

- Otto for Workflow Data Fabric (sn_nowassist_wdf) version 2.1.4 or later

Role required: admin

About this task
The *DCGEnrichLauncher* script include activates the enrichment review experience.

Procedure
1. Set the **Application scope** to **Global**.
2. Navigate to **All** > **Script Includes**.
3. Filter the list by **Scope** = `ServiceNow Data Catalog`, then open *DCGEnrichLauncher*.
4. Select **Insert and Stay** to add *DCGEnrichLauncher* to Global application scope.
   The newly inserted script is in the Global application scope.

Grant data steward access to the enrichment workspace

Configure the *bulk_enrich.default_dashboard_sys_id* system property to allow users with the data steward role to open the enrichment workspace.

Before you begin
Role required: admin

About this task
The *bulk_enrich.default_dashboard_sys_id* system property controls who can open the enrichment workspace that monitor-progress links lead to.

Procedure
1. Navigate to **All** > **System Properties**.
2. Filter the list by **Scope** = `ServiceNow Data Catalog`, then open the *bulk_enrich.default_dashboard_sys_id* property record.
3. In the **Read roles** field, add `df_data_steward`.
4. Save the property record.

Result
Users with the df_data_steward role can open the enrichment workspace from monitor-progress links and the job-completion email.

Enriching data assets with AI

Use ServiceNow Otto to generate and publish AI-suggested metadata for Data Catalog assets in bulk.

ServiceNow Otto can generate suggested metadata — names, descriptions, tags, and domains — for Data Catalog assets and glossary terms in bulk. A data steward reviews and publishes the suggestions before any changes take effect in the catalog.

For an overview of how bulk enrichment works, see Metadata enrichment with ServiceNow Otto.

© 2026 ServiceNow, Inc. All rights reserved.

Bulk-enrich assets with ServiceNow Otto

Ask ServiceNow Otto to bulk-enrich a batch of Data Catalog assets from anywhere in Workflow Data Fabric.

Before you begin

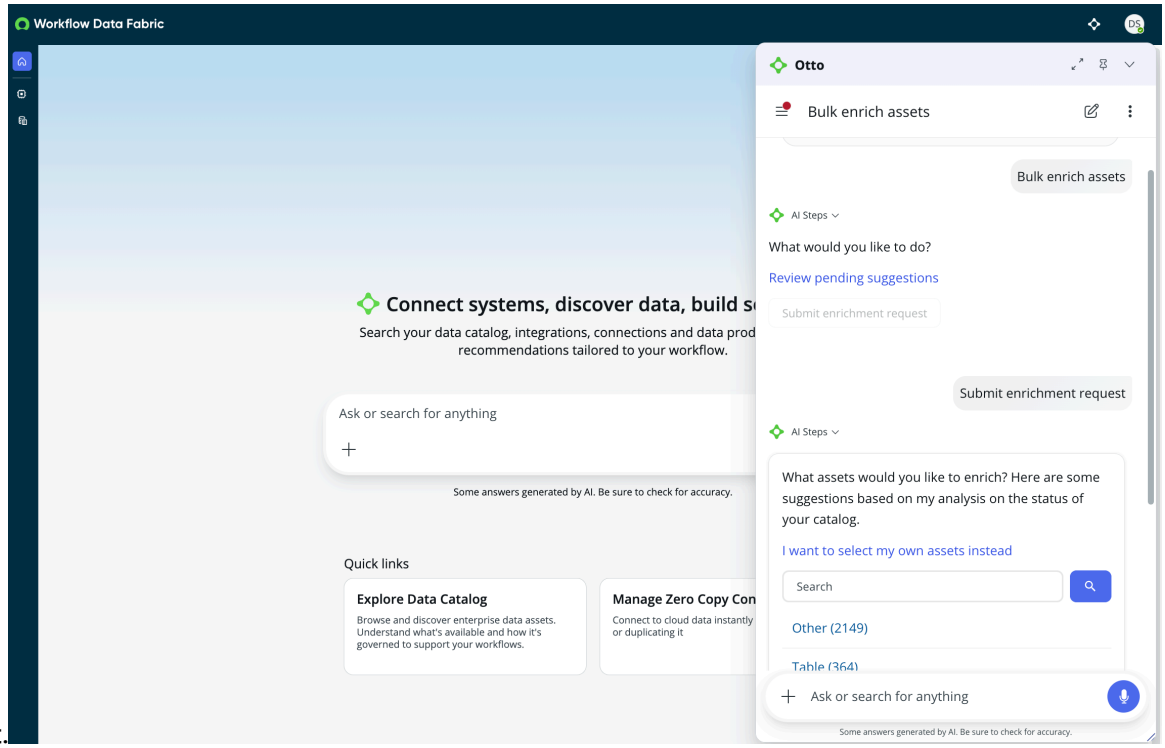
Role required: df_data_steward

Procedure

1. In the Workflow Data Fabric header, select the ServiceNow Otto icon.
   You can access this from any Workflow Data Fabric page, including Data Catalog.
2. In the panel that opens, select the bulk-enrich promoted topic, or type a request such as `bulk enrich assets`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Choose whether to review pending suggestions from a previously submitted request, or start a new request.

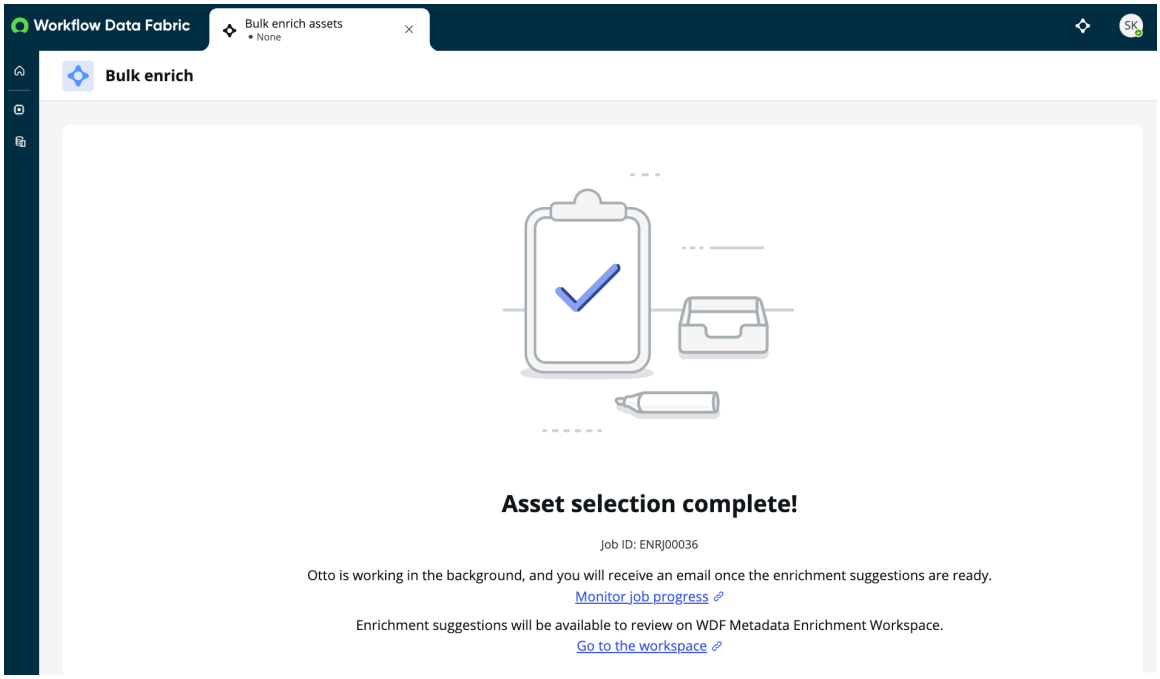


4. If starting a new request, select an asset type from the list to enrich.
   ServiceNow Otto suggests asset types based on the assets available in your catalog. Use the search field to find a specific asset type.
5. If you want to select specific assets, select **I want to select my own assets instead**.
   The Select assets to enrich page opens. Use the search field and filters to find assets, then select the assets to add to the enrichment request.
   Select **Confirm selection** to return to the panel with your selected assets queued.
6. Select **Confirm** to submit the request.

Result

ServiceNow Otto creates the job and returns a job ID, plus links to monitor progress and open the review workspace. See Monitor an enrichment job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Bulk-enrich assets from the Data Catalog

Select specific assets directly from the Data Catalog page and submit them for bulk enrichment by AI agents.

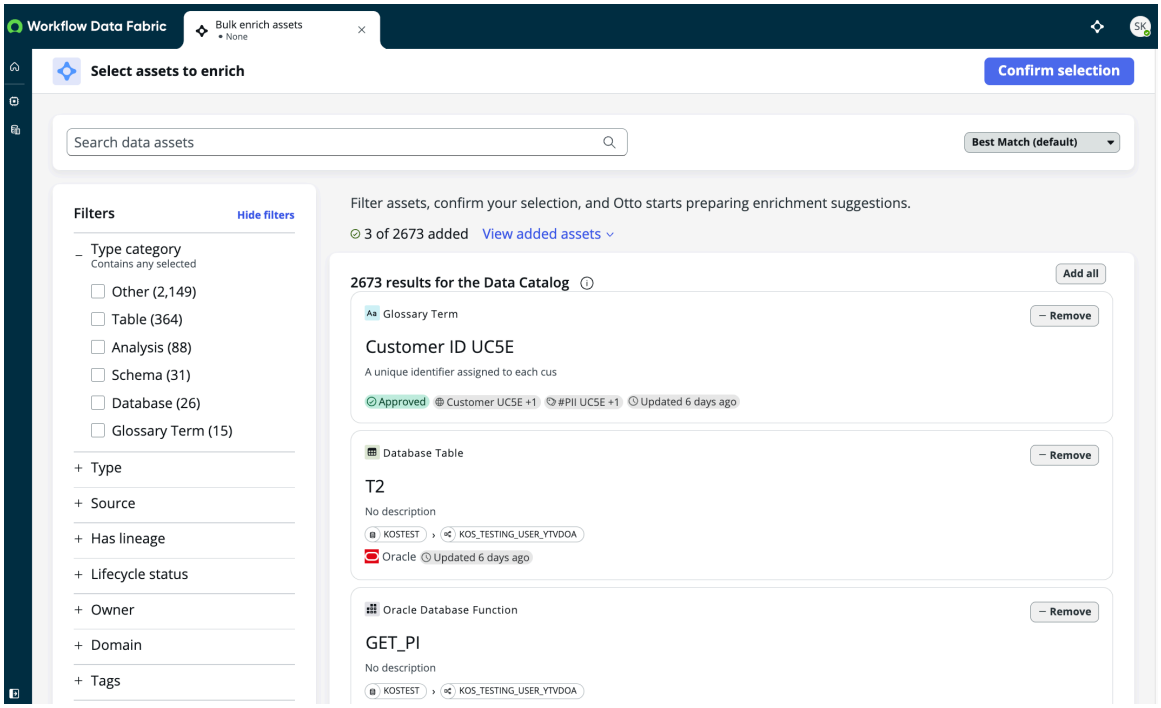
Before you begin

Role required: df_data_steward

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. In the left sidebar, select the Data Catalog icon.
3. Open the three-dot menu and select **Bulk Enrich Assets**.
4. Select data assets to bulk enrich.
   a. In the asset-selection view, search, filter, or browse to narrow down the assets to enrich.
   b. Use the **Add all** button to select all data assets, or select **Add** next to each asset to select them individually.

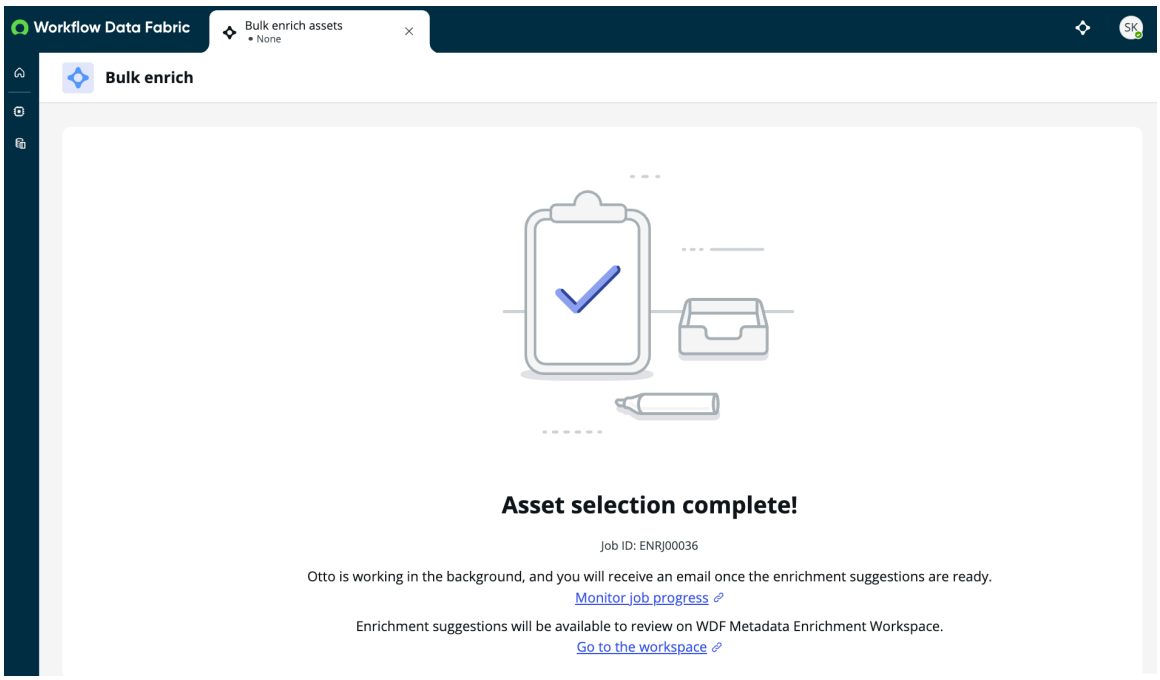
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Confirm the selection.

Result

Workflow Data Fabric creates the job and shows a selection-completion screen with a job ID, plus links to monitor progress and open the review workspace. See Monitor an enrichment job.



Monitor an enrichment job

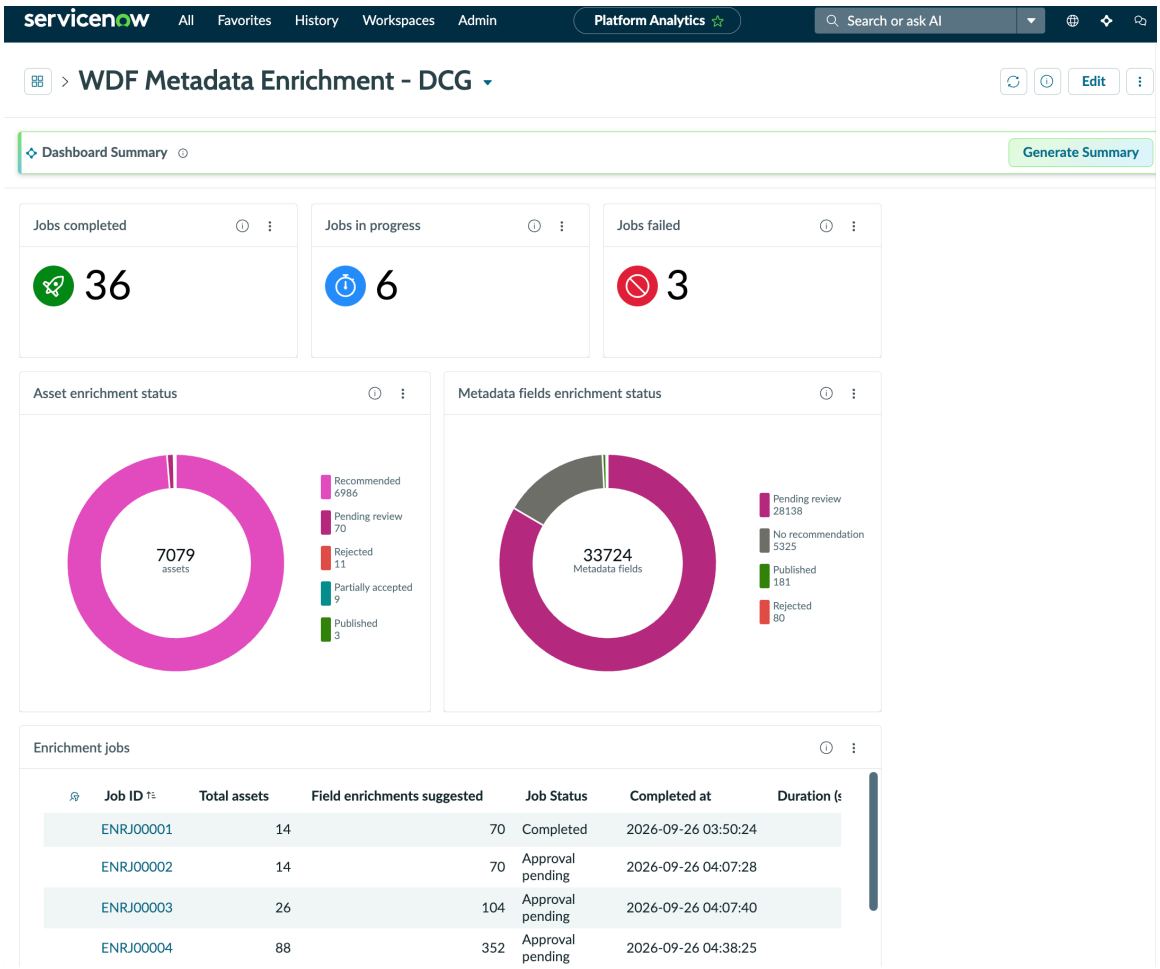
Open a submitted enrichment job to see its progress and how many suggestions are pending review, published to catalog, or rejected.

About this task

The Metadata Enrichment workspace provides a consolidated view of all enrichment activity. It includes a dashboard summary of jobs completed, in progress, and failed, along with enrichment

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

status charts and a cross-job list of assets and fields. From the workspace, select a job ID to open and monitor a specific job.



Before you begin

A bulk enrichment job has already been submitted from either ServiceNow Otto or Data Catalog. See Bulk-enrich assets with ServiceNow Otto or Bulk-enrich assets from the Data Catalog.

Role required: df_data_steward

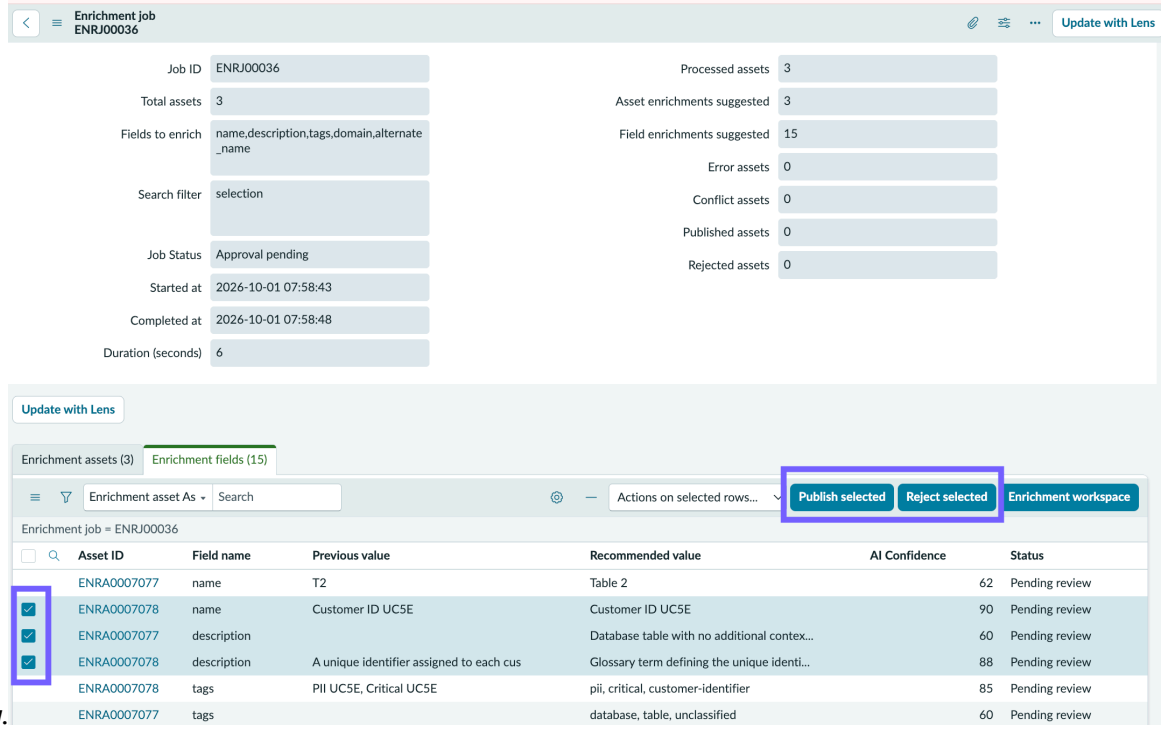
Procedure

1. Open the monitor job progress link returned when the job was created.
2. From the enrichment job page, review the job details and suggestion counts.
   The page shows:
   - Job details: The number of assets included, when the job started and finished, and how long it took
   - Suggestion counts by status: The number of assets processed and how many suggestions are pending, published, or rejected
   - Asset and field list: Each asset included in the job and the fields that were enriched

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of each status, see Data assets enrichment statuses and AI confidence scores.

3. Select a job to open its detailed view.



Result

The job's detail view opens, listing every processed asset and field. To act on the suggestions, see Review and publish suggested metadata.

Review and publish suggested metadata

Compare ServiceNow Otto's suggested values against previous values, correct anything that needs it, then publish or reject the suggestions.

Before you begin

Role required: df_data_steward

About this task

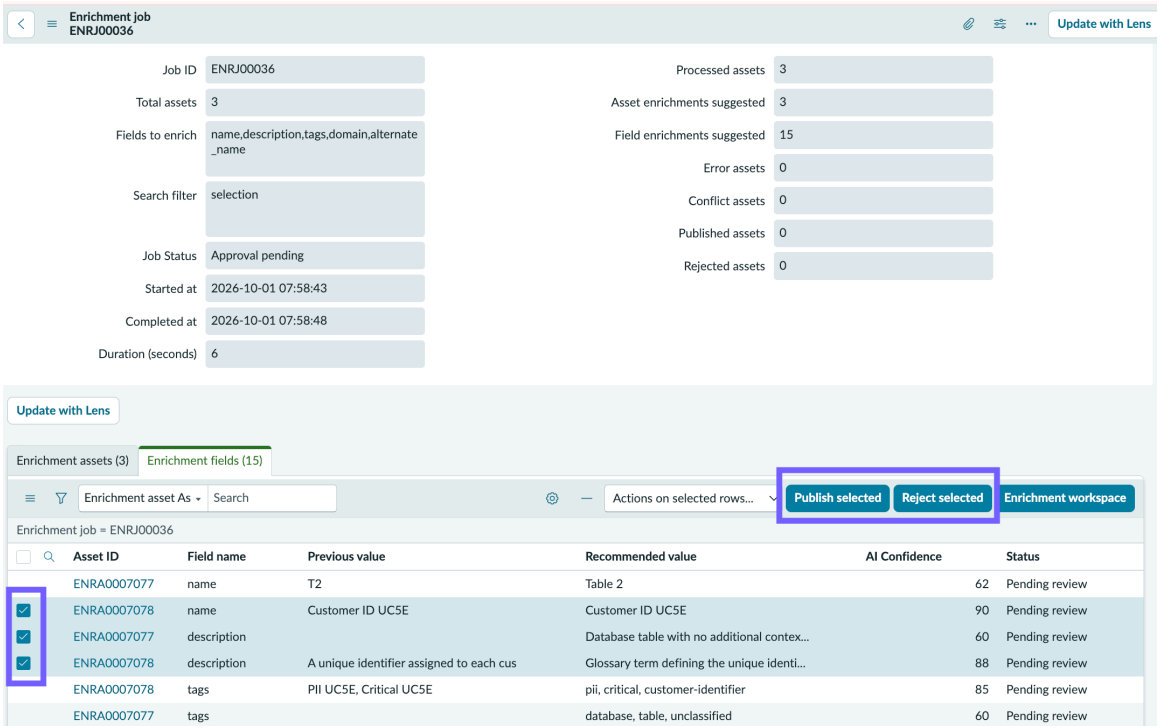
Every row in the job's field list shows an asset, a field name, the field's previous value (if they exist), the suggested value, and an AI confidence score. You can review at the job level, or drill into a single asset or a single field for the same information and the same actions. You can also reach individual job, asset, and field records directly from the Metadata Enrichment workspace, which provides a consolidated view across all jobs.

⚠ **Warning:** AI-generated suggestions may be inaccurate. Review each suggestion carefully before publishing. Published suggestions update Data Catalog assets immediately.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open an enrichment job.



2. From the Enrichment fields tab, review the suggested values against the previous values and the AI confidence score.
3. **Optional:** To see the full asset details before accepting or rejecting a suggestion, select an asset ID to open the enrichment asset record, then select **View asset in catalog**.

   The asset opens in the Data Catalog in a new tab.
4. **Optional:** If a suggestion needs a change, select it, edit the value inline, and save.
5. Select the suggestions you want to act on.
6. Choose one of the following actions.
   - Select **Publish selected** to write the selected values to their Data Catalog assets.
   - Select **Reject selected** to discard the selected suggestions without changing the catalog.

Result

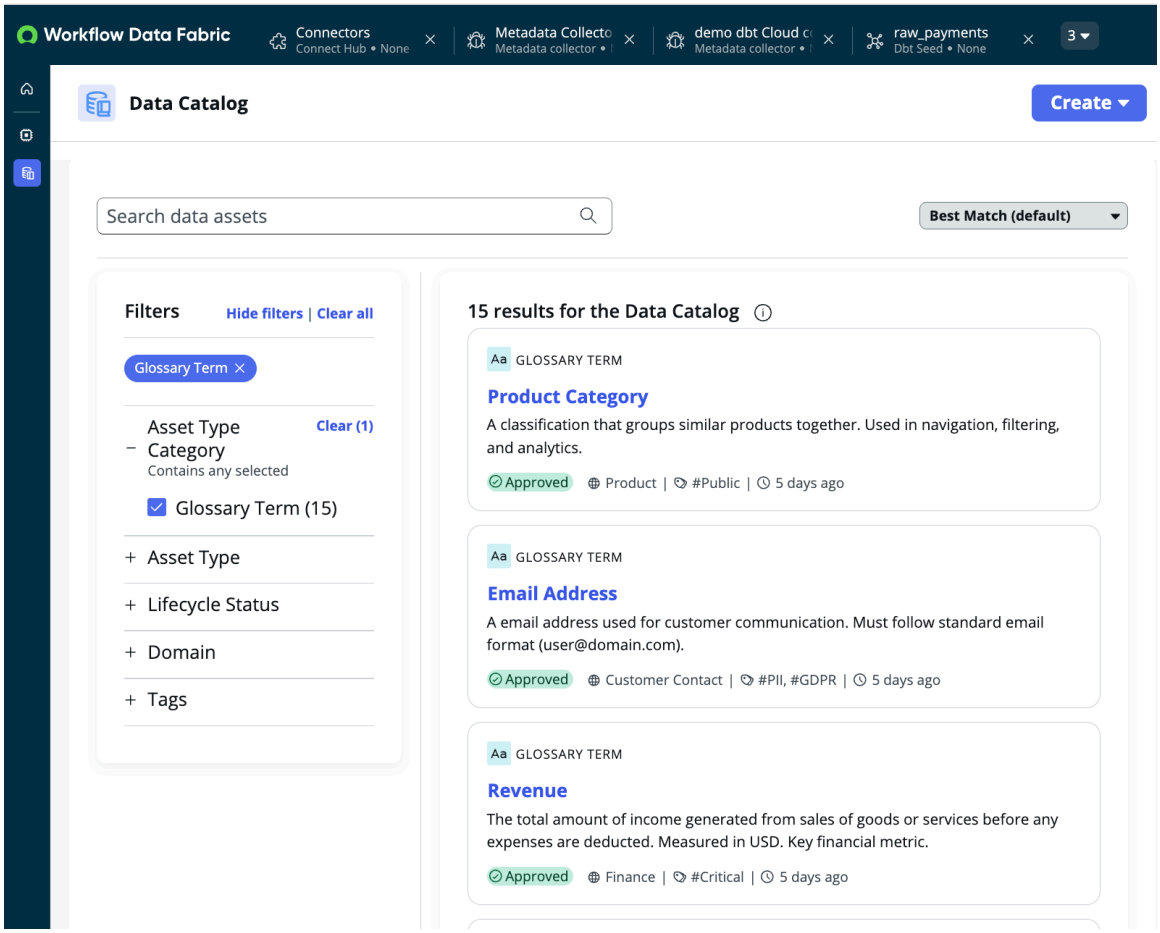
Published suggestions update their Data Catalog assets and drop off the pending list. See Data assets enrichment statuses and AI confidence scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing glossary terms

Glossary terms define business concepts and provide business context for catalog assets through definitions, synonyms, related concepts, and ownership information.

Link glossary terms to catalog assets to provide business context and help users understand data meaning and usage. Terms include definitions, synonyms, related concepts, and ownership information. Use glossary terms to bridge the gap between technical data structures and business understanding.



Bulk operations

Bulk upload glossary terms using spreadsheets. You can also download and edit existing glossary terms.

Note: Use the bulk download and upload feature to manage the business glossary within an instance only. This feature is not intended for downloading the glossary from one instance and uploading it to another instance.

- If this is the first time you are adding a glossary to an organization, download the template from the application. Follow the instructions in the spreadsheet, and upload your glossary to the application.
- If you are working in an instance that already has a glossary, download the existing glossary as a spreadsheet and make edits to it or add new terms. After you are done, upload the updated glossary to the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The spreadsheet has guidelines on how to make edits and set field values. Follow those instructions carefully to ensure successful upload.
- You cannot use the bulk feature to delete business terms.

Create a glossary term

Create glossary terms to define business concepts and provide context for data assets.

Before you begin

Role required: Data Steward (df_data_steward)

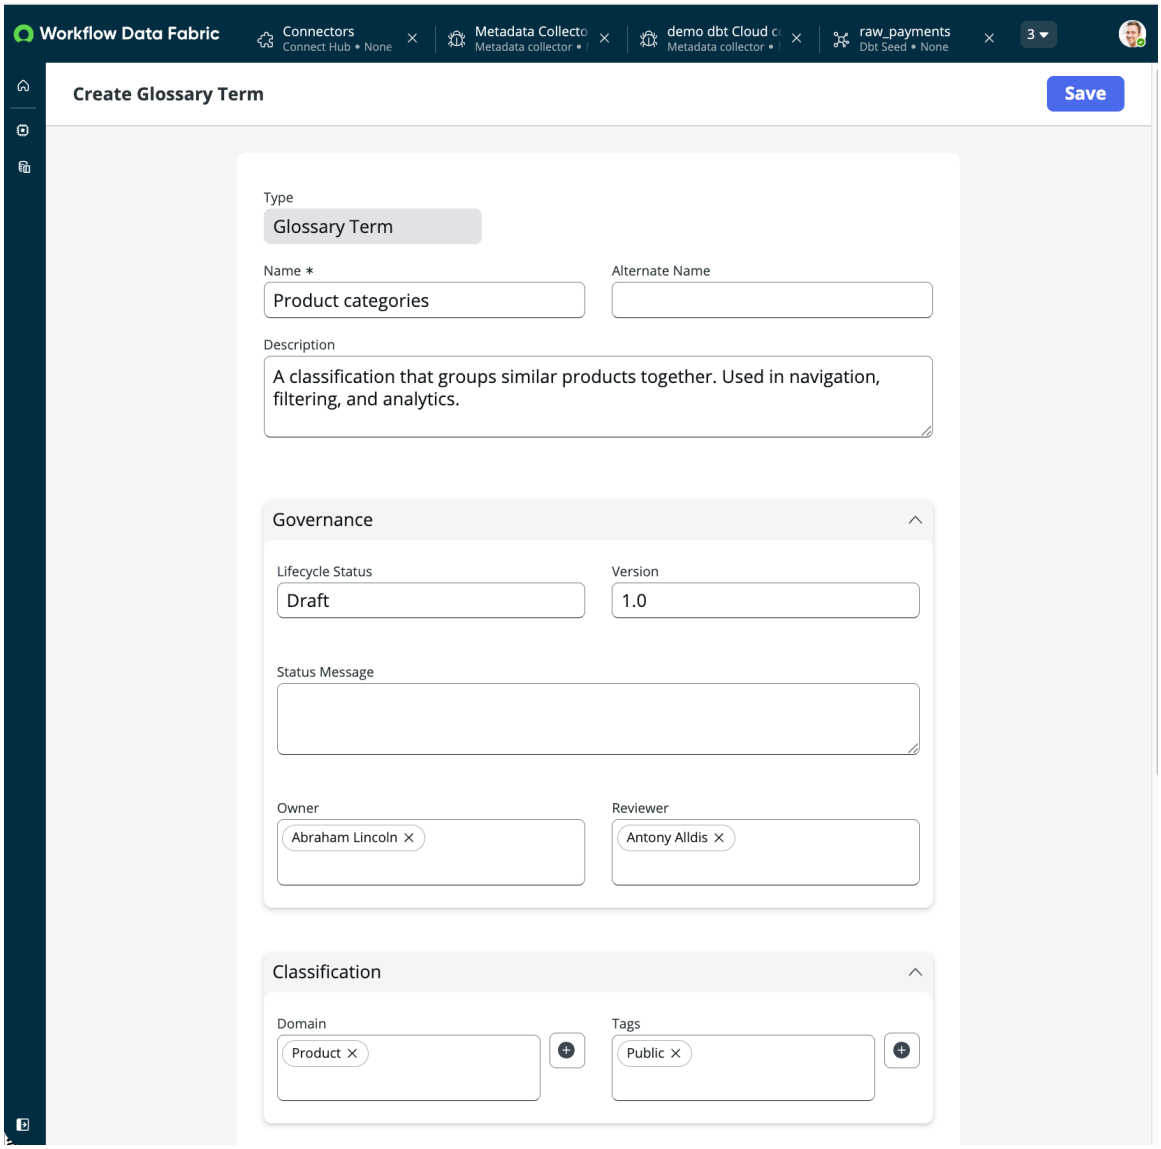
Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Data catalog icon in the left sidebar.
3. Select **Create** > **Glossary term**.
4. Complete the general details:
   - **Name**: The name of the business term. For example, Customer Lifetime Value.
   - **Alternate name**: Alternative names for the same concept.
   - **Description**: A clear explanation of what the term means. Use the rich text editor tools to format the content and add images, links, tables, and other elements.
5. Complete the governance details:
   - **Lifecycle status**: Current state of the glossary term. Possible values are: **Approved**, **Deprecated**, **Draft**, **In review**, **Rejected**.
   - **Version**: Version number or label for the term.
   - **Status message**: Description of why the glossary term is in its status. Use the rich text editor tools to format the content and add images, links, tables, and other elements.
   - **Owner**: Person responsible for the term definition.
   - **Reviewer**: Person responsible for reviewing the glossary term.
6. Complete the classification details:
   - **Domain**: Select from the list of available domains. Domains organize data assets into logical groupings based on business areas, departments, or data types. For details about creating domains, see Create catalog domains.
   - **Tags**: Select from the list of available tags. Catalog tags are metadata labels for classifying, categorizing, and discovering data assets. For details about creating tags, see Create catalog tags.
7. Complete the context details:
   - **Related terms**: Other glossary terms connected to this concept.
   - **Related assets**: Link the glossary term to a collected data asset (non-glossary term) to provide further context to the data asset.
   - **Parent Term**: Relationship with a broader or more general term or concept that provides context and disambiguation of the child term.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Child Term**: Relationship with a narrower or more specific term or concept that provides context and helps disambiguate child terms.
- **Reference URL**: URLs where the term is defined or more context is accessed.

8. Select **Save**.



Bulk export glossary terms

Download existing glossary terms to an XLSX file for offline review and editing, or download an empty template to create new glossary terms with properly formatted fields.

Before you begin

Role required: Data Steward (df_data_steward)

Procedure

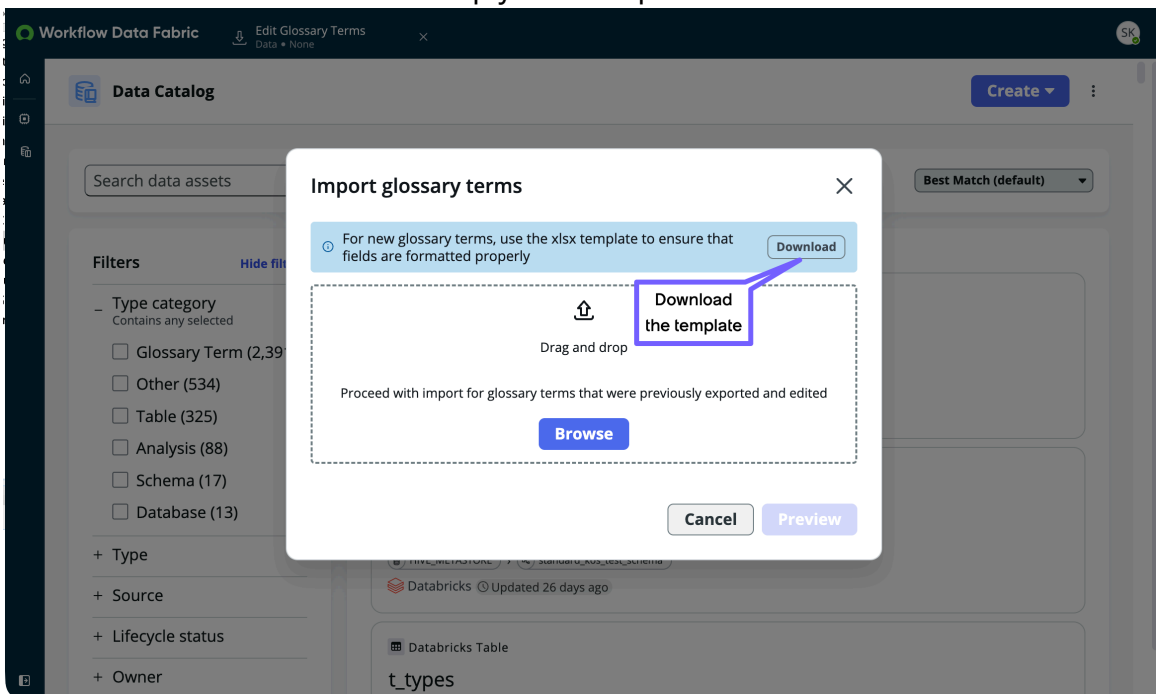
1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the **Data Catalog** icon.
3. Download a glossary terms template or export existing terms:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To download an empty template for creating new glossary terms:

i. Select the three-dot menu and select **Import glossary terms**.

ii. Select **Download** to download the empty XLSX template.



A blank glossary terms template is downloaded in XLSX format with properly formatted fields.

b. To export existing glossary terms for review or editing:

i. Select the three-dot menu and select **Bulk edit glossary terms**.

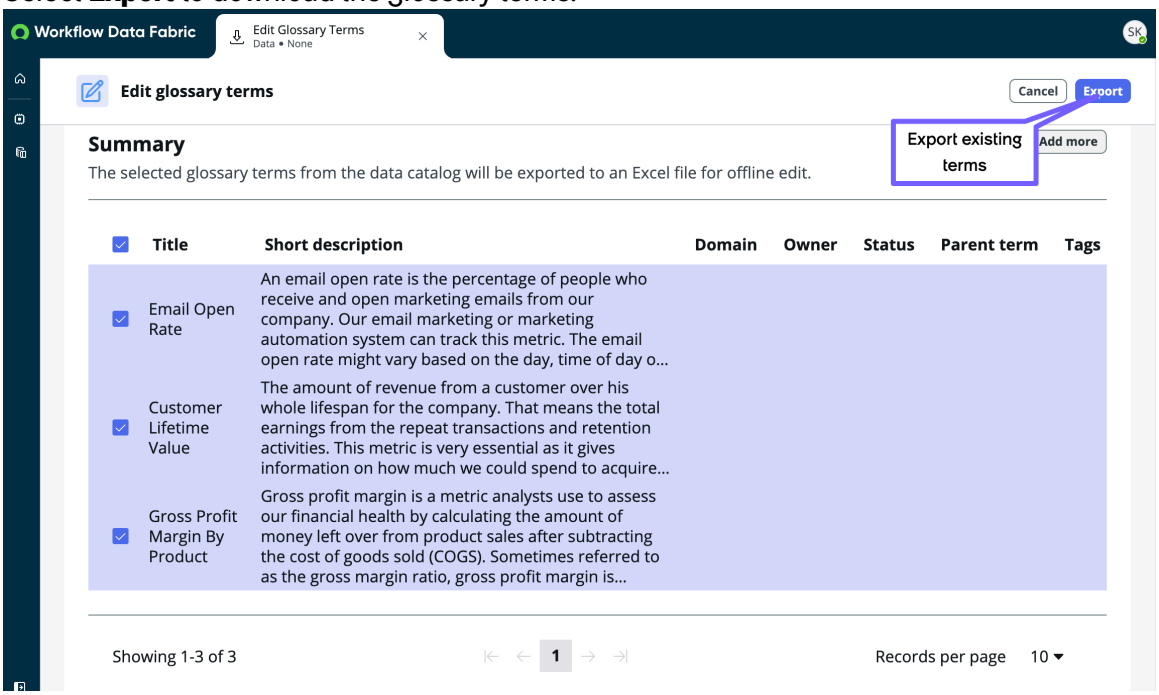
ii. Select glossary terms to export. Use the **Add all** button to select all terms, or select **Add** next to each term to select them individually. Use the filters to narrow the list. You can select up to 2000 glossary terms.

iii. Select **Done** to proceed to the summary screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iv. Review the list of glossary terms. If needed, select **Add more** to return to the previous screen and adjust your selection.

v. Select **Export** to download the glossary terms.



The glossary terms are exported in an XLSX file.

Result

The downloaded XLSX file has a set structure with all the sheets you need to add and edit the business glossary. Before editing the file, read the instructions in the Overview tab carefully. See Edit glossary spreadsheet for detailed guidance on editing the spreadsheet.

Edit glossary spreadsheet

Edit the downloaded glossary spreadsheet to add or update glossary terms before importing them back into the Data Catalog.

Before you begin

Export glossary terms to generate the XLSX template file.

Role required: Data Steward (df_data_steward)

About this task

You can obtain the glossary spreadsheet by exporting existing glossary terms or downloading an empty template. The exported spreadsheet contains two sheets: Instructions and Export Template (glossary terms). The Instructions sheet provides detailed guidance on column formatting, field requirements, and editing rules.

Procedure

1. Open the downloaded XLSX file in Microsoft Excel or Apple Numbers.

> ⚠ **Warning:** If you use Apple Numbers, you must export the file to Excel format (.xlsx) before importing it back into the Data Catalog. The import process accepts only XLSX files.

2. Review the Instructions sheet to understand the column color coding and field requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Gray columns are read-only: **Sys ID**, **IRI**, **Parent Term**
- Yellow columns are required for new terms: **Title**
- Blue columns are editable: **Short Description**, **Domain**, **Owner**, **Status**, **Tags**

3. Navigate to the Glossary terms sheet to edit glossary terms.
4. Edit existing glossary terms or add new terms based on your needs.

   a. To update an existing term, edit the values in the blue columns for that row. Leave a cell empty to leave that field unchanged.

   b. To add a new term, insert a new row and enter values in the required and editable columns. The **Title** field is required for new terms. Leave the Sys ID, IRI, and Parent Term columns empty for new terms.

5. Format multi-select fields using comma-separated values.
   For fields that accept multiple values (such as Tags and Domain), separate each value with a comma. For example: Customer,Finance,Sales
6. Verify that user account fields contain valid usernames from your ServiceNow instance.
   Fields such as **Owner** must reference existing user accounts. Invalid usernames cause import errors.
7. Verify that Status values match the options listed in the Status values sheet.
   Valid status values are: draft, in_review, approved, deprecated, rejected
8. Save the file in XLSX format.

> ⚠ **Warning:** Do not change the file structure, sheet names, or column headers. Changes to the template structure cause import failures.

Result

The edited spreadsheet is ready to import back into the Data Catalog. Import the glossary terms to add or update them in the Data Catalog.

Bulk import glossary terms

Import multiple glossary terms at once using an XLSX file to quickly populate your data catalog with business terminology and definitions.

Before you begin

Role required: Data Steward (df_data_steward)

About this task

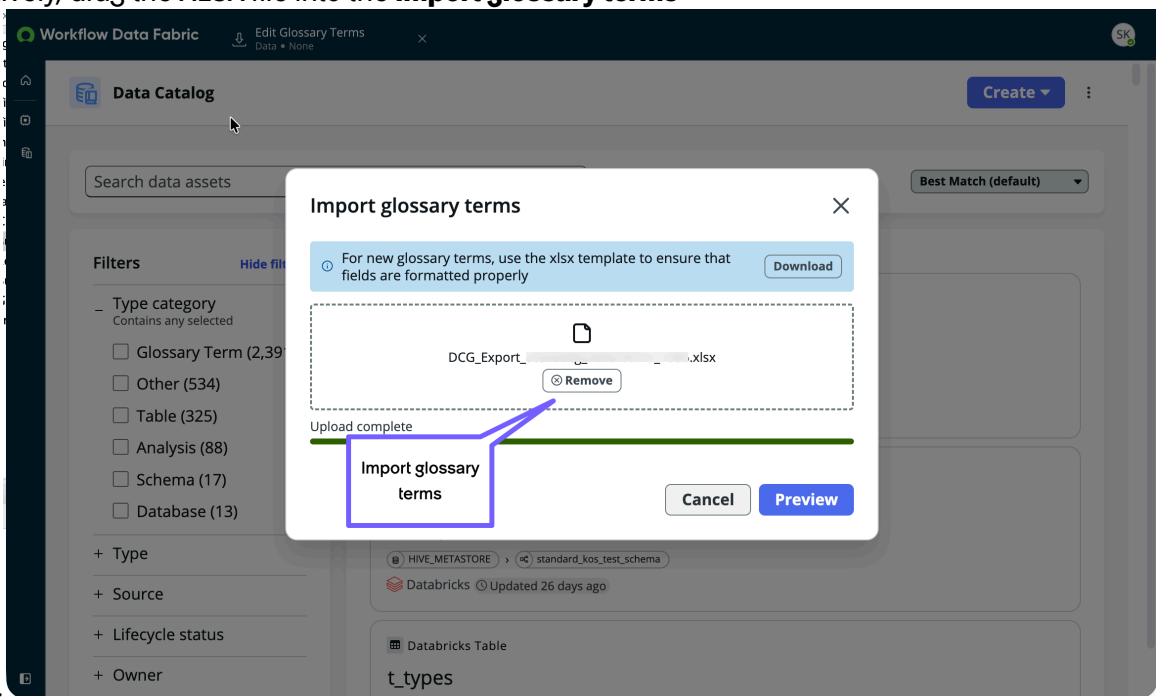
Before importing, export glossary terms to obtain the XLSX template, then edit the spreadsheet to add or update glossary terms.

Procedure

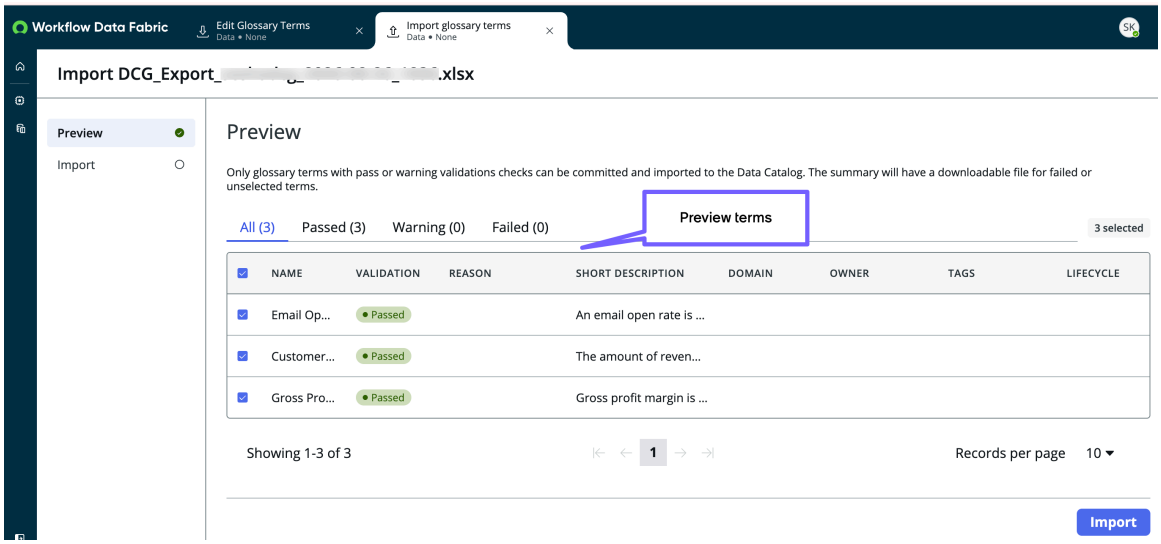
1. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home**.
2. Select the Data catalog icon in the left sidebar.
3. Select the three-dot menu and select **Import glossary terms**.
4. Select **Browse** and upload the XLSX file with glossary terms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, drag the XLSX file into the **Import glossary terms** window.



5. Select **Preview**.
6. Review all the terms selected for import in the Preview window.
   If there are any warnings or validation failures for the terms, they are tagged as such. To fix the errors, abort the import, make fixes in the file, and initiate the import again.
7. Select **Import**.
   The import process begins and the system displays the status of the import. If any terms are not imported, you can download a file that includes the list of terms that aren't imported and the reason for failure.



8. Select **Done**.
   The glossary terms are imported in the data catalog.

Result

After the import completes, the system displays one of the following status values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- COMMITTED — All rows imported successfully
- PARTIAL — Some rows imported; others failed
- FAILED — No rows imported

Glossary import error scenarios

Glossary import error scenarios

Error and warning messages that can occur when uploading glossary term files, and their impact on the import process.

An error state indicates that the file cannot be uploaded without fixing the issue. A warning state means the specific field or value with the warning is skipped, but the rest of your data imports successfully.

File-level errors

File-level error scenarios

Scenario	Type	Will import succeed?
The file format is incorrect. Only XLSX files are supported.	Error	NO
The file size exceeds the maximum allowed limit.	Error	NO
The file contains more rows than allowed. Consider splitting your upload into smaller files.	Error	NO
The file structure is invalid.	Error	NO
A system error occurred while processing your file.	Error	NO

Row-level errors

Row-level error scenarios

Scenario	Type	Will import succeed?
The required **Title** field is empty for a new row.	Error	Partial — row is skipped
The **Title** field has been removed from an existing row. Title is required.	Error	Partial — row is skipped
The record cannot be found or you don't have permission to access it.	Error	Partial — row is skipped

Row-level warnings

Row-level warning scenarios

Scenario	Type	Will import succeed?
The domain does not exist in the system.	Warning	YES — domain field is skipped

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Row-level warning scenarios (continued)

Scenario	Type	Will import succeed?
The owner email does not match any user in the system.	Warning	YES — owner field is skipped
The status value is not valid for this field.	Warning	YES — status field is skipped
One or more tag names do not exist in the system.	Warning	YES — invalid tags are skipped; valid tags are applied
The title already exists in the system.	Warning	YES — row imports as a duplicate
A field value is too long and will be automatically shortened.	Warning	YES — value is truncated and applied
You attempted to change a system-managed field. The original value is retained.	Warning	YES — field is unchanged

Commit-time errors

Commit-time error scenarios

Scenario	Type	Will import succeed?
The record was modified by another user after your preview was generated.	Error	Partial — row fails; others may succeed
The record could not be updated due to a system error.	Error	Partial — row fails; others may succeed

Final import status

After the import completes, the system displays one of the following status values:

- `COMMITTED` — All rows imported successfully
- `PARTIAL` — Some rows imported; others failed
- `FAILED` — No rows imported

Data catalog reference

Reference topics provide information about roles and key terms.

Data catalog key terms

Key terms used in Data catalog.

Data catalog key terms

Term	Description
Metadata Collector	An automated scanner that runs against a connected data source to discover schemas, build lineage relationships, and populate governance metadata into the Data Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data catalog key terms (continued)

Term	Description
Data Catalog	The self-service discovery layer where consumers browse and evaluate Data Products, Data Interfaces, and other cataloged assets. The Data Catalog displays trust scores, lineage, and governance metadata, enabling consumers to request access and confirm data usability before building on it.
Data assets	A cataloged data object in the Data Catalog, such as a table, column, view, dashboard, report, database, or schema. Data assets are discovered through metadata collectors and enriched with business context, lineage, classifications, and governance metadata. Assets can be searched, browsed, filtered, and explored by consumers to understand their structure, purpose, and relationships before requesting access.
Workflow Data Fabric Home	The main landing page and navigation hub for the Workflow Data Fabric application. From this interface, users access the Data Catalog, Connect hub, metadata collectors, business glossary, and other data governance capabilities.
Glossary term	Business glossary terms define business concepts and can be linked to catalog assets to provide business context. Terms include definitions, synonyms, related concepts, and ownership information. Use glossary terms to bridge the gap between technical data structures and business understanding.
Connect Hub	The interface in Workflow Data Fabric Home where Connection Admins create and manage connections to external systems. From Connect Hub, admins configure credentials and authentication and set up metadata collectors.

Data catalog roles

Assign roles to specify what different users can see and do.

Roles

For more information about managing and assigning roles, see Managing roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data catalog roles

Role	Description	Role inherited
Connection Admin (connection_admin)	Configures and manages metadata collectors that import data from external systems. Schedules data collection, monitors integration health, and verifies collected assets. Cannot create or edit catalog assets directly.	• df_data_steward • external_app_install_admin • agent_admin • wdf_operator • credential_admin • web_service_admin • sn_nowassist_wdf.creator_admin • df_connection_admin
Data Steward [df_data_steward]	Creates and manages catalog assets, business glossary terms, tags, domains, and metadata. Has full edit permissions for organizing and enriching catalog content. Can perform bulk operations and manage asset lifecycle.	• sn_nowassist_wdf.creator_admin • wdf_consumer
WDF Consumer [wdf_consumer]	Searches and views catalog assets, explores relationships and lineage, and connects to data sources for analysis. Has read-only access to catalog content.	sn_nowassist_wdf.creator_admin

Data assets enrichment statuses and AI confidence scores

Enrichment statuses track the state of AI-generated suggestions at the field, asset, and enrichment run levels. Each suggestion also carries a confidence score that reflects how certain ServiceNow Otto is about that suggestion.

Enrichment job statuses

Enrichment job statuses

Status	Description
Processing	Number of jobs currently generating enrichment recommendations.
Completed	Number of jobs where review is finished with nothing published — every field was rejected or had no recommendation.
Cancelled	Number of jobs stopped by a Data Steward before completion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data asset enrichment statuses

Data asset enrichment statuses

Status	Description
Recommended	Enrichment recommendations have been generated for the requested fields on this asset.
Error	Enrichment generation failed for one or more fields on this asset.
Pending review	One or more field recommendations on this asset are awaiting Data Steward or Asset Owner review.
Partially accepted	Some field recommendations on this asset were accepted and published to the data catalog; the remainder were rejected.
Rejected	All AI-generated field recommendations on this asset were rejected by the Data Steward or Asset Owner.
Published	All AI-generated field recommendations on this asset were published to the data catalog.

Field enrichment statuses

Field enrichment statuses

Status	Description
Pending review	AI-generated enrichment suggestions are awaiting validation by the Data Steward or Asset Owner.
Published	AI-generated enrichment recommendations have been reviewed, approved, and published to the data catalog.
Rejected	AI-generated enrichment suggestions rejected by the Data Steward or Asset Owner.
No recommendation	No enrichment recommendations were generated for this field due to insufficient information or context.

AI confidence scores

Every suggestion carries a confidence score, shown alongside its previous and suggested values, so a data steward can judge how much to trust it before publishing or rejecting.

Data assets enrichment system properties

System properties that control how the AI enrichment process batches assets, runs parallel enrichment lanes, and manages lane timeouts.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the filter navigator.

These properties are optional. The default values work for most implementations. Adjust them only if enrichment jobs are running slower than expected or you are tuning performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for AI enrichment

Property	Description
sn_dcg_app.dcg.enrichment.batch_size	Number of assets sent to the AI at a time. • Type: integer • Default value: 50 • Who can change: Admin, Data Steward • When to change: Rarely. Leave as is unless enrichment jobs are running slower or failing more than expected.
sn_dcg_app.dcg.enrichment.max_lanes	Number of asset groups enriched in parallel. More lanes means more work happening at the same time. • Type: integer • Default value: 10 • Who can change: Admin, Data Steward • When to change: Only between jobs, never while a job is running.
sn_dcg_app.dcg.enrichment.deadline_ms	Duration in milliseconds that one lane keeps working before it hands off and restarts itself. For example, 270000 equals 4.5 minutes. • Type: integer • Default value: 270000 • Who can change: Admin, Data Steward • When to change: Rarely. Only when tuning performance with platform support.

Data quality properties

System property that controls how long data quality records are retained in the data quality audit and unmatched resource queue tables.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the filter navigator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Data Quality

Property	Description
sn_dcg_core.dq.purge_retention_days	Number of days that records in the data quality audit [sn_dcg_core_dq_audit] and unmatched resource queue [sn_dcg_core_dq_unmatched_resource_queue] tables are retained before the *DCG Core - DQ Daily Maintenance* scheduled job deletes them. Values that are empty, non-numeric, or outside the valid range fall back to the default of 7, and the job records a warning in the system log. • Type: integer • Default value: 7 • Other possible values: Any integer from 1 to 90

Data Products

Create and manage data products and data interfaces to enable data sharing and consumption across your organization.

Learn how data products enable you to package and share data assets as reusable products, making data discovery and consumption easier for your organization.

Get started

Explore  Learn about data products and data interfaces	Configure  Plan and configure your implementation	**Manage data interfaces**  Create data interfaces
Manage data products  Create and publish data products

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data products provide a framework for packaging, sharing, and governing data assets within your organization. Creating data products makes data more discoverable, reusable, and accessible to teams across your enterprise. Data interfaces define how external systems access and consume your data products, enabling integration and data sharing workflows.

Explore data products

Data products package data interfaces with metadata and governance to provide reusable, discoverable data for workflows, AI agents, and analytics.

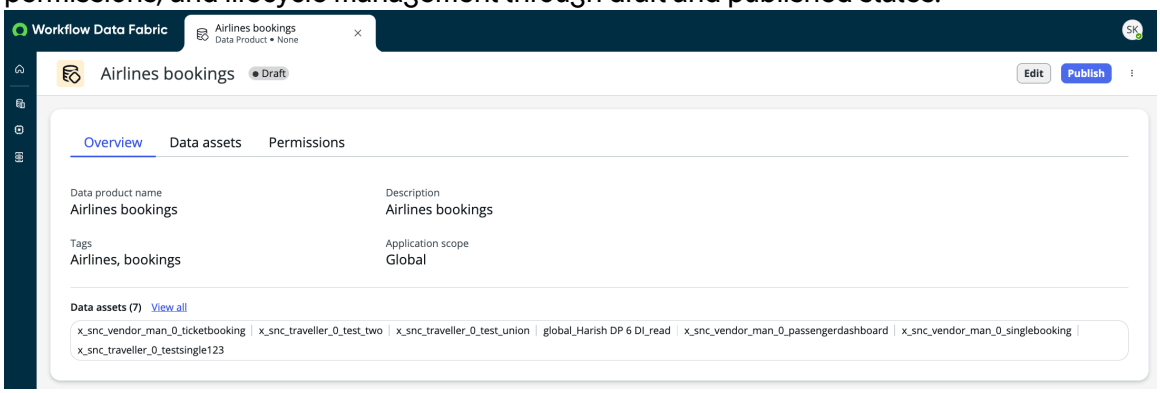
A data product is a governed collection of data interfaces that represents a business concept or use case. Data products combine one or more data interfaces. Teams discover data products and data interfaces in the Data Catalog, request access through governance workflows, and query data through stable interfaces.

Data product components

Data interfaces define the schema, field names, and data types that consumers use to access data. A data product can include multiple interfaces that provide different views of related business entities. Interfaces act as stable contracts between data providers and consumers.

Metadata makes data products discoverable and understandable. This includes business descriptions, tags, ownership information, usage guidelines, and documentation that help consumers evaluate whether the data product meets their requirements.

Governance controls provide data quality and managed access. Each data product has defined ownership, access controls through role-based permissions, and lifecycle management through draft and published states.



How data products work

Data products expose business entities exclusively through data interfaces. When you create a data product, you select existing data interfaces and package them with metadata and access controls.

The data interfaces enable to read data from source systems, whether ServiceNow tables or external systems, for example, Snowflake, Databricks, Oracle, and other supported data sources. Consumers query the data interfaces without requiring knowledge about underlying source systems, connection details, or data mapping logic.

When source systems change, the data interface schema remains stable. Dashboards, workflows, and applications built on data products continue working when source tables are upgraded, fields are renamed, or data sources are replaced.

Data product users

Users

User	Description
Data Steward	Creates and maintains data interfaces. Packages data interfaces into data products with metadata and documentation. Configures access controls and publishes data products to the Data Catalog. Manages data product lifecycle.
Security Administrator	Reviews and approves access control configurations for data products. Manages parent data product roles and validates appropriate reader role assignments to underlying data interfaces.
Data Consumer	Discovers data products in the Data Catalog. Reviews metadata and documentation to understand available data. Requests access with business justification. Queries data through data interfaces using Flow Designer, Dashboard Builder, APIs.

Data product workflow

This workflow shows the lifecycle from creation to consumption:

1. Build: A Data Steward creates data interfaces in Data Workbench, using zero-copy connectors configured in Connect Hub to connect to external source tables. Data Stewards create data interfaces by entering basic details, selecting source tables, defining table structure, verifying source connections, and setting permissions.
2. Package: Data Stewards select data interfaces and combine them into a data product with metadata, documentation, and usage guidelines.
3. Secure: Data Stewards work with Security Administrators to configure parent data product roles and validate access controls.
4. Publish: Data Stewards publish the data product and data interfaces. After the metadata collector runs, the data product and data interfaces appears in the Data Catalog.
5. Discover: Data Consumers search the Data Catalog to find data products and data interfaces that meet their requirements. They review metadata, documentation, and sample data.
6. Access: Data Consumers request access to data products. After Security Administrator approval, they receive role assignments granting access to all product data interfaces.
7. Consume: Data Consumers query data through data interfaces in workflows, dashboards, APIs, or AI applications.

Data products and external data

Data products can expose data from external systems without moving data into ServiceNow. Supported external sources include Snowflake, Databricks, Oracle, PostgreSQL, MySQL, MongoDB, Redshift, BigQuery, SAP HANA, and Teradata. Data interfaces built on external sources can be packaged into data products, providing governed access through the same contract model used for ServiceNow data.

Data product lifecycle

Data products support two lifecycle states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Draft state is for authoring and testing. Draft products are not visible to consumers in the Data Catalog. Data Stewards build data interfaces, package them into products, and validate functionality.
- Published state makes data products visible in the Data Catalog where teams can discover and request access. Published products have completed governance review.

Access control model

Data products use a parent-child role model. The data product has a parent role that grants access to all included data interfaces. Each data interface has its own reader role controlling access to underlying data.

When consumers request access to a data product, they receive the parent role. This automatically grants access to all data interface reader roles included in the product. Consumers don't request access to individual data interfaces.

Security Administrators validate that parent role configuration includes appropriate data interface roles before approving data product publication.

What to explore next

To learn more about data products, see:

- Data products use cases
- Managing data products
- Data interfaces

Data interfaces

Data interfaces provide stable contracts for accessing data from single tables or combined sources through JOIN or UNION operations.

A data interface defines the schema, field names, and data types that consumers use to query data. Interfaces act as stable access layers between consumers and underlying data sources. When source systems change, the data interface schema remains consistent and protects dashboards, workflows, and applications from breaking changes.

How data interfaces work

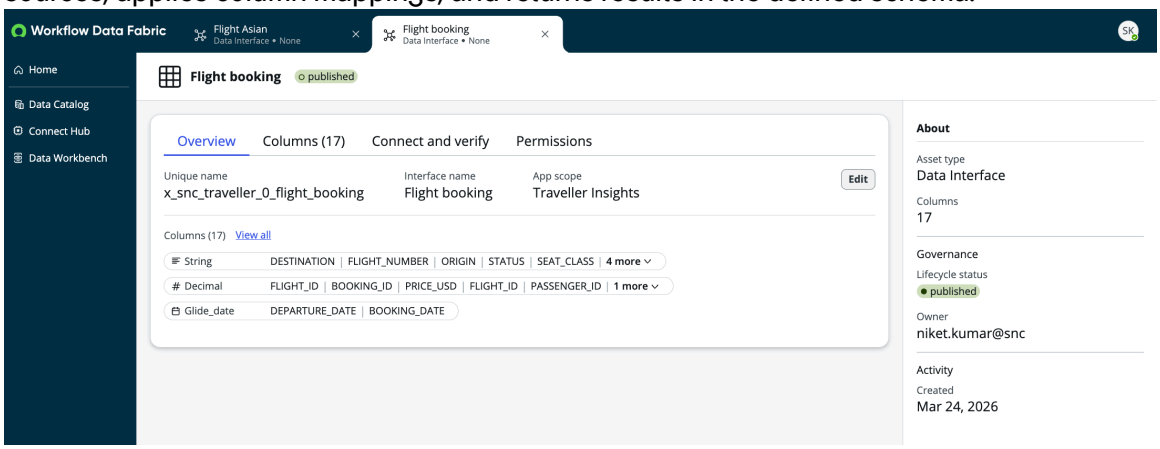
Data interfaces map source data to a target schema that consumers query. The data interface defines which columns appear, their names, and their data types.

A data interface can expose data from a single ServiceNow table, a single Data Fabric Table connected to an external system, or multiple sources combined through JOIN or UNION operations.

Consumers query the data interface without requiring knowledge about which source systems provide the data. The data interface handles connections to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sources, applies column mappings, and returns results in the defined schema.



Combination methods

Combination methods

Method	Description	When to use
Single table	Exposes one source table through a governed interface with consistent naming and documentation.	Provide controlled access to a ServiceNow tables or external tables when no combination is required.
JOIN	Combines related data from multiple tables based on matching column values. The current release supports INNER JOIN operations.	Merge customer data with order data, match purchase orders with approval records, or create comprehensive entity views across systems.
UNION	Stacks rows from multiple tables with similar structures into one unified result. The current release supports UNION operations.	Combine data from multiple regions, aggregate similar data across systems, or consolidate records from different sources.

Schema stability

Data interfaces provide schema permanency. After publication, the data interface maintains its structure even when underlying source tables change.

This stability protects consumers from breaking changes. A dashboard built on a data interface continues working when you upgrade or replace a source system. Workflows that query a data interface don't break when column names change in source tables.

When you extend a data interface by adding new columns, existing queries continue working. Consumers retrieve only the columns they originally queried, plus any new columns they choose to include.

Data interfaces and data products

You can query data interfaces directly from workflows or dashboards. More commonly, data products package interfaces and provide additional metadata, documentation, and access controls.

Multiple data products can include a single interface. For example, a Customer Profile interface might be part of a Customer 360 data product and also included in a Sales Analytics data product.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data interfaces and external sources

Data interfaces can access external data through Data Fabric Tables. These tables provide zero-copy access to external databases such as Snowflake, Databricks, and Oracle. Data stays in the source system but can be queried through ServiceNow.

When you create a data interface using JOIN or UNION with Data Fabric Tables, the system generates intermediate tables for the operation. These intermediate tables are implementation details that remain hidden from the Data Catalog. Consumers interact only with the published interface.

Querying data interfaces

Consumers access data interfaces through multiple channels:

- Flow Designer for building automated workflows
- Dashboard Builder for creating visualizations and reports
- APIs for programmatic access from applications and scripts
- AI Data Explorer for natural language queries

What to explore next

To learn more about data interfaces, see:

- Managing data interfaces
- Managing data products

Data products use cases

Explore common scenarios for publishing data products and learn which pattern fits your data and your consumers' needs.

A data product is built on one or more data interfaces, each of which determines how source data is accessed and combined. The right data interface type depends on where your data lives, how it is structured, and what consumers want to do with it.

A travel company's loyalty analytics team is seeing a clear trend: Gold Star members are flying less. The central question driving the investigation is: on which routes are Gold members booking less, and is it getting worse? The data lives in Snowflake — flight segments, a points ledger, and member profiles. No analyst has direct warehouse access, and the data is too sensitive to export. The team needs a way to query live Snowflake data from within ServiceNow, with access controls they can manage.

The team breaks the investigation into four specific questions, each answered by a dedicated data interface:

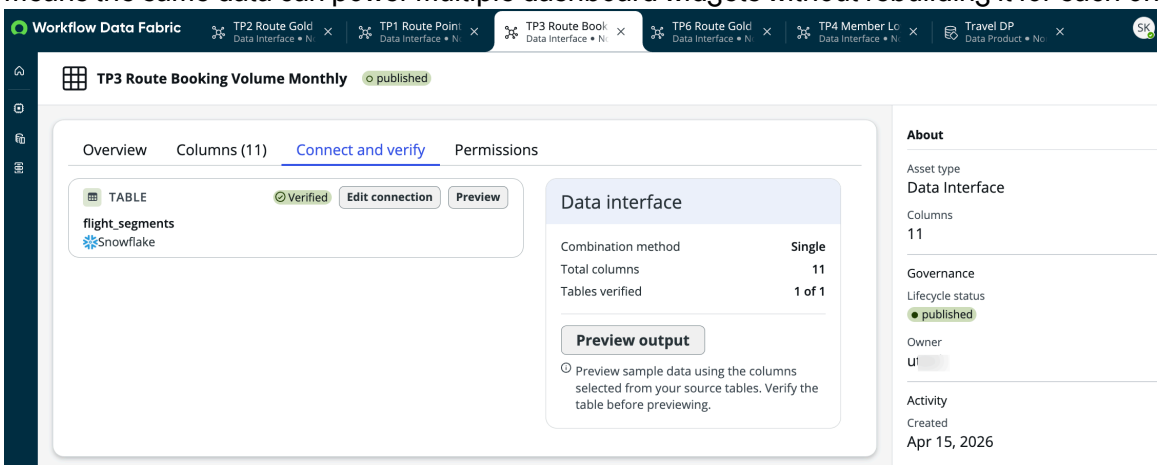
- Which routes generate the most points-earning activity?
- How many unique Gold members booked each route last quarter?
- Which routes are seeing declining booking volume over time?
- How many long-tenured Gold members are currently inactive?

Tracking booking trends across routes and cabin classes

To track booking volume over time, the team needs route, month, and cabin class. All of this data lives in a single Snowflake table, FLIGHT_SEGMENTS. A single-table data interface over

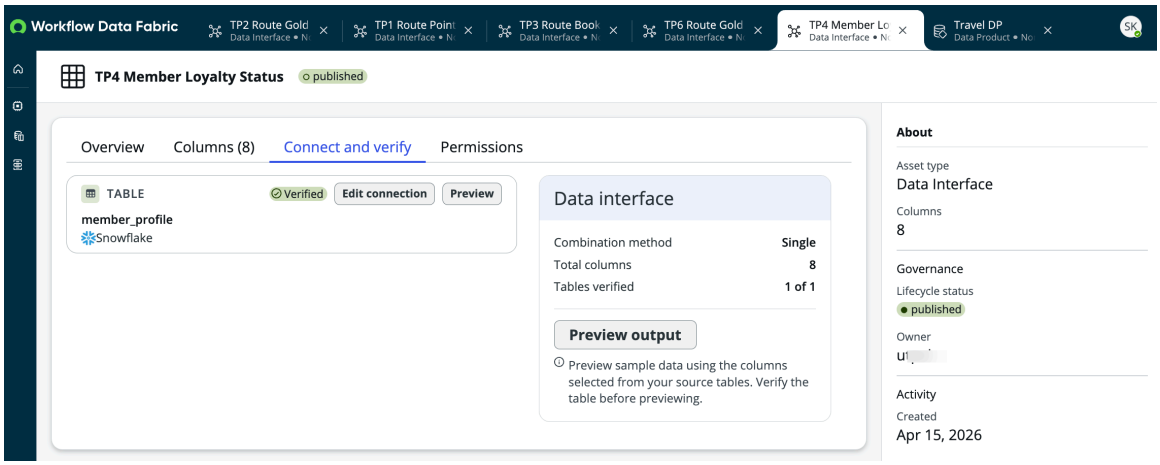
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

FLIGHT_SEGMENTS exposes the raw segment data, and the Platform Analytics dashboard applies date filters and top-route rankings at query time. Keeping the interface general-purpose means the same data can power multiple dashboard widgets without rebuilding it for each one.



Identifying long-tenured members who have gone quiet

Everything needed to answer the inactive member question — loyalty tier, tenure length, active or inactive status — lives in MEMBER_PROFILE. A single-table interface filters for Gold members with five or more years of tenure and inactive status. That interface powers both the KPI widget showing 10 inactive high-tenure Gold members and the drop-off chart broken down by hub airport.

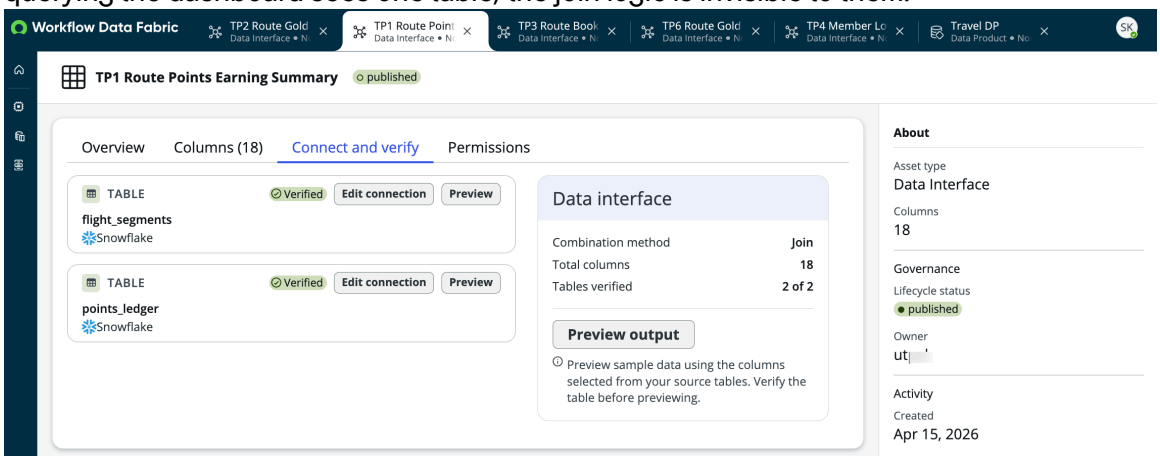


Connecting points earnings to the routes where they happen

Knowing which routes drive the most points-earning activity requires connecting two tables. Points transactions live in POINTS_LEDGER, but the route information — origin, destination — lives in FLIGHT_SEGMENTS. The two tables share a booking_id. A JOIN data interface links them on that key, filters for EARN transactions only, and produces a flat result showing total points earned per route. The analyst

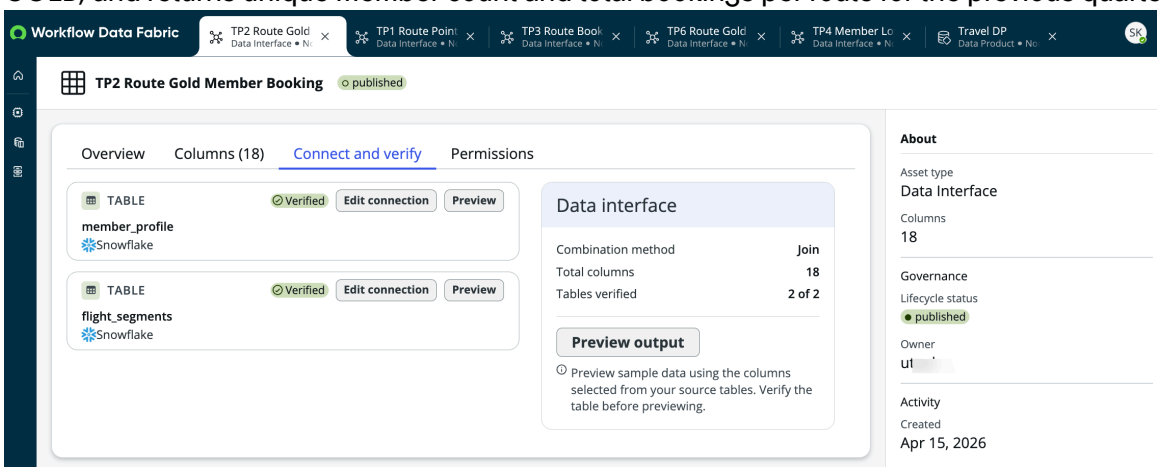
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

querying the dashboard sees one table; the join logic is invisible to them.



Measuring Gold member engagement route by route

The fourth question — how many Gold members are booking each route — requires connecting flight data to member data. FLIGHT_SEGMENTS holds the route and booking records; MEMBER_PROFILE holds the loyalty tier. A JOIN interface links the two tables, filters for tier = GOLD, and returns unique member count and total bookings per route for the previous quarter.

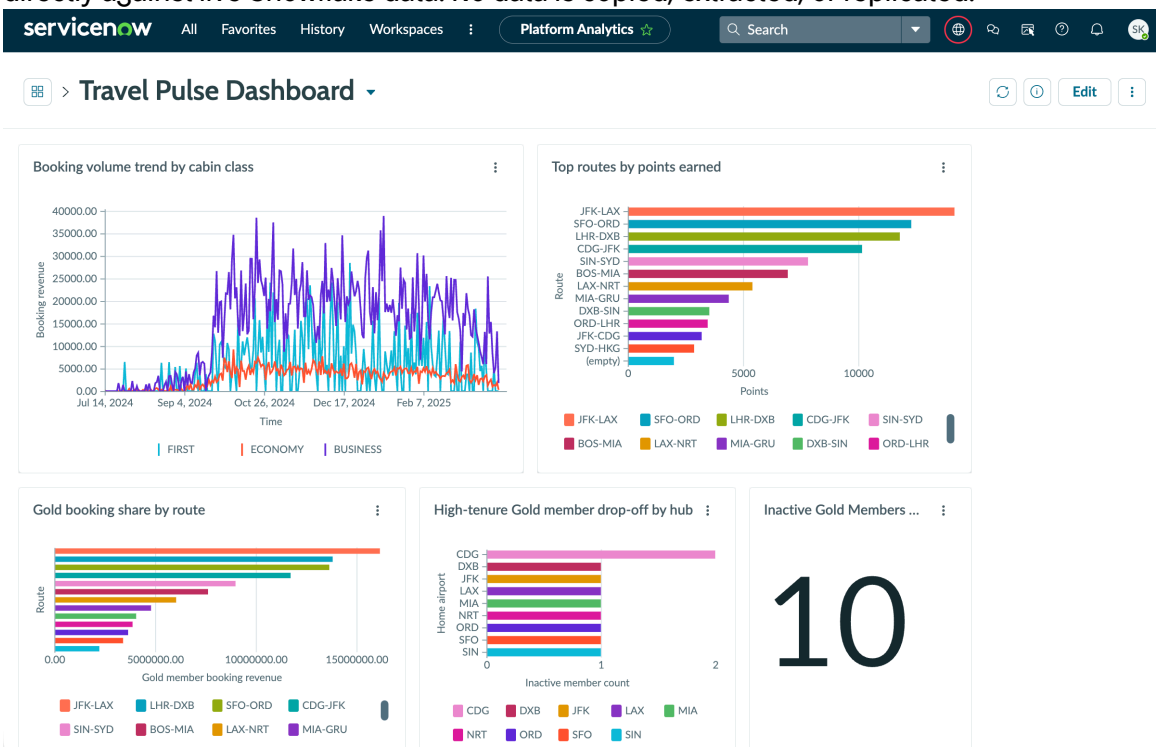


The outcome: Travel Pulse Dashboard

The Data Steward packages all four data interfaces into a single data product. The steward publishes it to the Data Catalog. The loyalty analyst — who has no warehouse access — discovers the product, requests access, and builds the Travel Pulse Dashboard in Platform Analytics. Each widget queries one interface

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

directly against live Snowflake data. No data is copied, extracted, or replicated.



Extending the pattern: combining data from multiple sources

If the team later needs to include booking data from a partner airline, they can use a UNION data interface. The partner data is stored in a separate Snowflake table with the same schema as FLIGHT_SEGMENTS. A UNION data interface stacks both tables into a single queryable view. Consumers query one unified dataset. No existing interfaces change.

This pattern fits whenever the same kind of record is tracked in multiple systems. Records such as bookings, orders, transactions, or events may be divided by region, time period, or business unit. The reporting need is to cover all of them at once.

Data products navigation

Navigate to four areas to build, publish, and manage data products from data ingestion through consumer access.

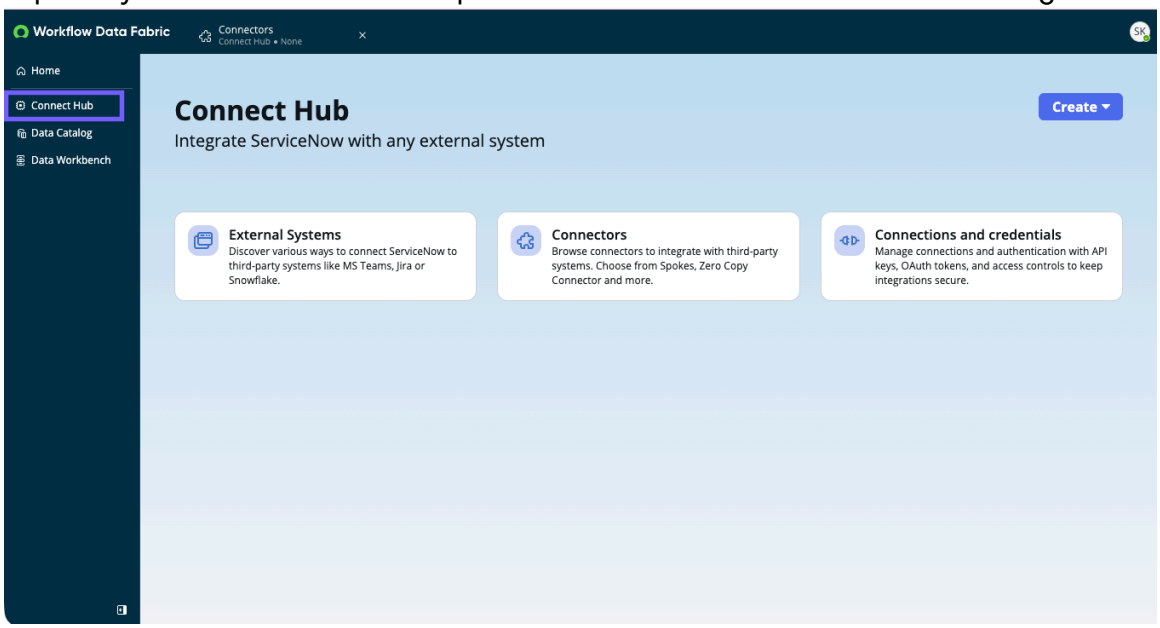
The data products workflow spans four platform areas, each serving a specific stage from data ingestion to consumer access. Navigate to **All** > **Workflow Data Fabric** > **Workflow Data Fabric Home** to access all areas from the sidebar.

Connect Hub

Connect Hub is where zero-copy connectors and metadata collectors are configured. Zero-copy connectors establish the live data pathway between ServiceNow and external systems such as Snowflake, Databricks, and Oracle. Metadata collectors are configured

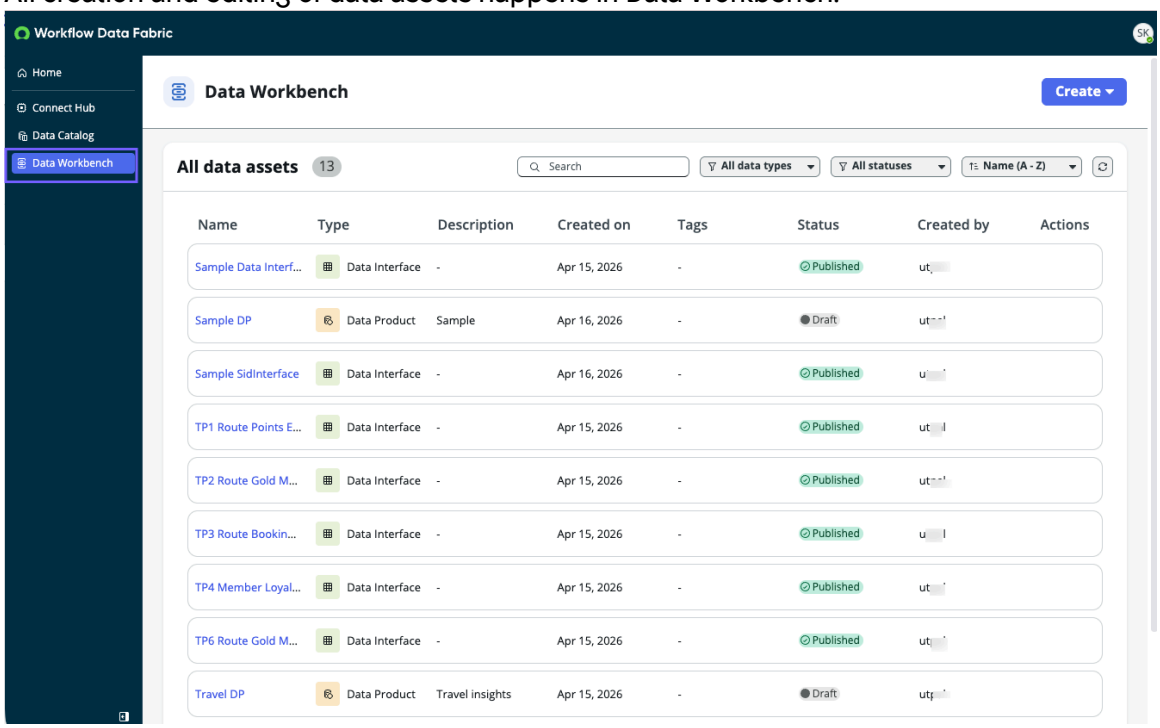
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

separately and run on a schedule to publish data asset metadata to the Data Catalog.



Data Workbench

Data Workbench is the authoring environment where Data Stewards create, configure, and manage data interfaces and data products. It provides a list of all draft and published assets, with filtering by type and status. All creation and editing of data assets happens in Data Workbench.

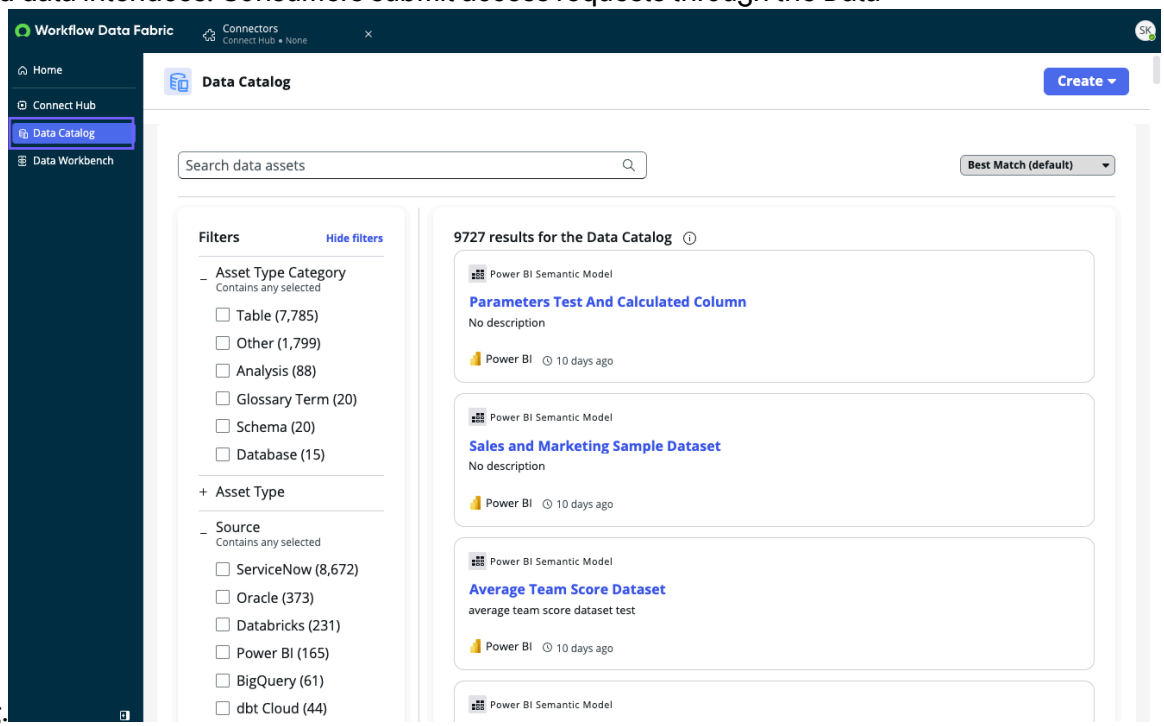


Data Catalog

The Data Catalog is where consumers discover published data products and request access. After a data product is published and the metadata collector runs, it is set to visible in the Data Catalog with its name, description, tags, and

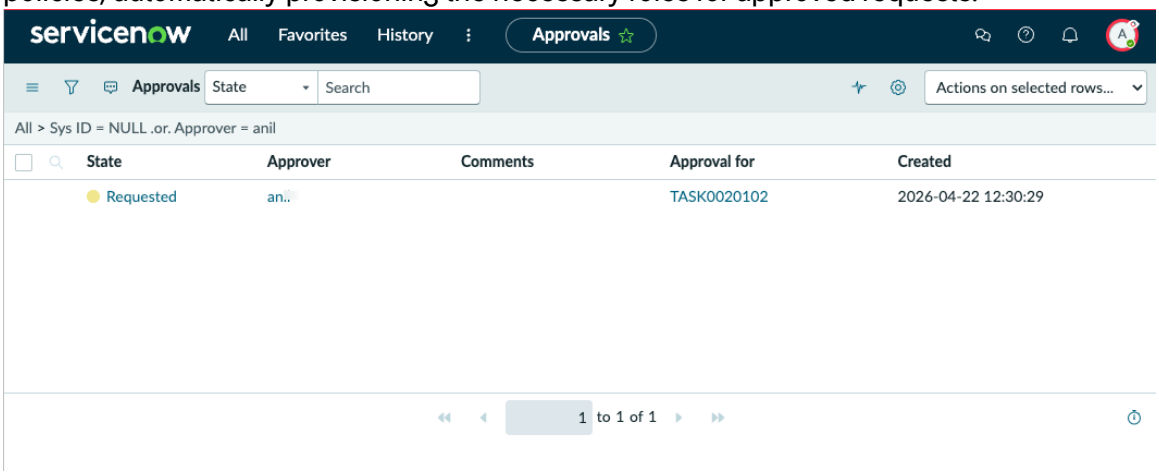
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

included data interfaces. Consumers submit access requests through the Data Catalog.



Approval Center

Approval Center is where approvers review and process access requests for data products. When consumers request access to a data product, approval tasks are routed here for review. Approvers can grant or deny access based on governance policies, automatically provisioning the necessary roles for approved requests.



Configure data products

You can plan and configure a Data Products implementation in your organization.

Install data products store application

You can install the Data Products application (sn_data_product) if you have the admin role. The application include installs related ServiceNow® Store applications and plugins if they are not already installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Data products application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

Installing Data products automatically installs the Data Catalog application as a dependency.

The following items are installed with Data products:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Data Products application (sn_data_product) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   A list of the versions available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Assign roles to data product users

Assign roles to control access to features, capabilities, and data in data products.

Before you begin

Role required: admin

About this task

For detailed information about roles that are installed with Data Products, see Prerequisites and setup.

Procedure

Assign roles to users and groups using the Data Products feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Assign a role to a user
- Assign a role to a group

Prerequisites and setup

Before creating data interfaces and data products, confirm that the required plugin is activated, roles are assigned, and external data sources are connected.

Note:

Build and test data interfaces and data products in a development or subproduction instance first. When you're ready for production, use a ServiceNow update set to move your assets. See Move data interfaces and data products to production

Required roles

The following roles are required to work with data products:

- df_data_steward: Required to create and manage data interfaces in Data Workbench.
- data_product_admin: Required to create, update, and publish data products.
- data_product_user: Read-only access. Required for consumers who query published data products.

Contact your system administrator to have these roles assigned to your account.

Zero-copy connectors for external data sources

If your data interfaces will use tables from external systems such as Snowflake, Databricks, or Oracle, a zero-copy connector for each system must be configured in Connect Hub before you begin. If your data interfaces use only ServiceNow tables, no connector is required.

A zero-copy connector establishes a live data pathway between ServiceNow and the external system. When a consumer queries a data interface built on an external table, ServiceNow uses the connector to retrieve data directly from the source. No data is copied into ServiceNow — the source system remains authoritative.

Zero-copy connectors and metadata collectors serve different purposes and are both required for external sources:

- A zero-copy connector provides the live data pathway used when querying a data interface or verifying a connection during data interface creation.
- A metadata collector reads schema information from the source system and publishes it to the Data Catalog. It makes source tables discoverable when building data interfaces, and makes published data products visible to consumers. It does not provide access to live data.

The zero-copy connector must be tested and verified as operational before creating data interfaces. Connection failures during data interface creation indicate that the connector is not properly configured or the external system is unavailable.

For setup instructions, see Zero Copy Connectors.

Metadata collectors and Data Catalog visibility

Metadata collectors read schema information — table names, column names, and data types — from a source system and publish it to the Data Catalog. They do not move or copy data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Two points in the workflow depend on a metadata collector having run:

- **Before creating a data interface:** Source tables must be discoverable in the Data Catalog before you can select them in the data interface wizard. If a table is not appearing in search, the metadata collector for that source has not run or has not been configured. Ask your administrator to run it manually from Connect Hub.
- **After publishing a data interface or data product:** There is a delay between publishing and the asset appearing in the Data Catalog. The metadata collector must run before consumers can discover the published product. If you cannot wait for the scheduled run, ask your administrator to run the collector manually from Connect Hub.

Metadata collectors typically run on a scheduled basis, but can be triggered manually when immediate catalog updates are required. The collection process may take several minutes to complete depending on the size and complexity of the source system schema.

For setup instructions, see metadata collector documentation in the ServiceNow product documentation.

Application scope

Data interfaces and data products are created within an application scope. Confirm that the correct scope is active in your instance before you begin. Assets created in one scope are not editable from a different scope.

Managing data interfaces

Create a data interface to control how source data is filtered, combined, and exposed to consumers as a stable, governed schema.

When you create a data interface, you select a combination method that determines how data from source tables is structured. The method you choose depends on where your data lives and what consumers want to query.

If you select one source table, the combination method is automatically set to Single table. If you select two or more tables, you choose between JOIN and UNION in the combination method step. The method cannot be changed after the target table is created.

Single table

Exposes a subset of columns from one source table. Use this when all the data consumers need comes from a single table and you want to control which columns are visible.

JOIN

Combines related data from multiple tables that share a common key, using INNER JOIN. Use this when consumer data is split across tables and you want to correlate records by a shared identifier. Only records with matching values in all joined tables are included.

UNION

Stacks rows from multiple source tables with compatible schemas into a single view. Use this when the same type of data is distributed across systems or regions and consumers need a consolidated view. All rows from all tables are included.

Create a data interface from a single table

Create a governed data interface on a single source table and publish it to the Data Catalog so consumers can access the data through a stable schema.

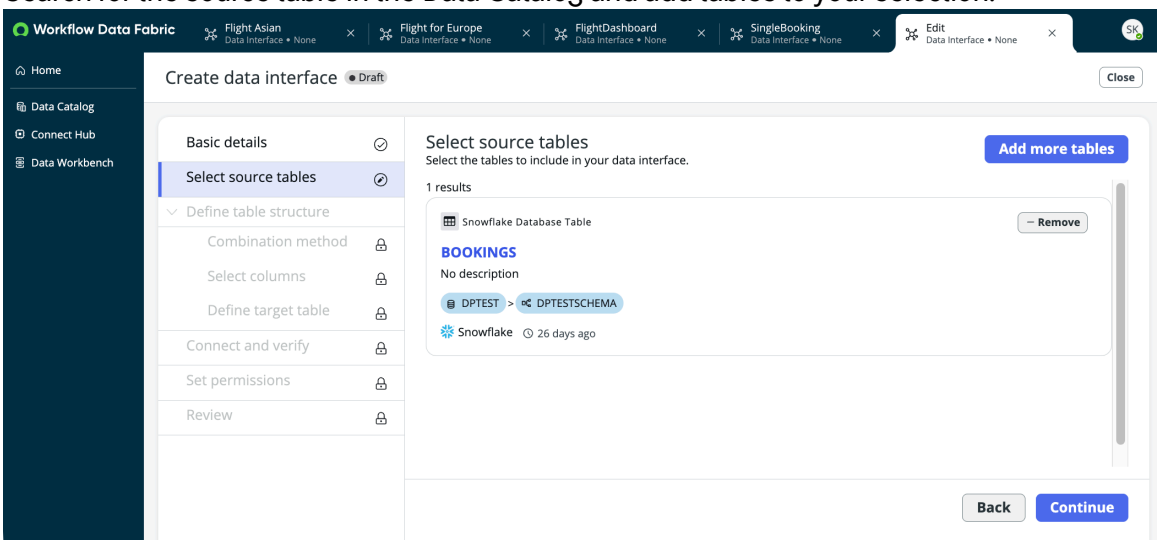
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: data_product_admin, df_data_steward, delegated_developer, df_data_steward, and delegatedadmin (scope admin)

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Data Workbench**.
2. Select **Create** > **Create data interface**.
   The data interface wizard opens to the **Basic details** step.
3. Enter the basic details for the data interface and select **Continue**.
   - **Interface label**: Enter a name for the data interface. This label identifies the data interface in the Data Catalog.
   - **Unique name**: Auto-generated from the data interface label.
   - **Application scope**: Select the scope in which to create the data interface.
4. On the Select source tables page, select **Add**.
5. Search for the source table in the Data Catalog and add tables to your selection.



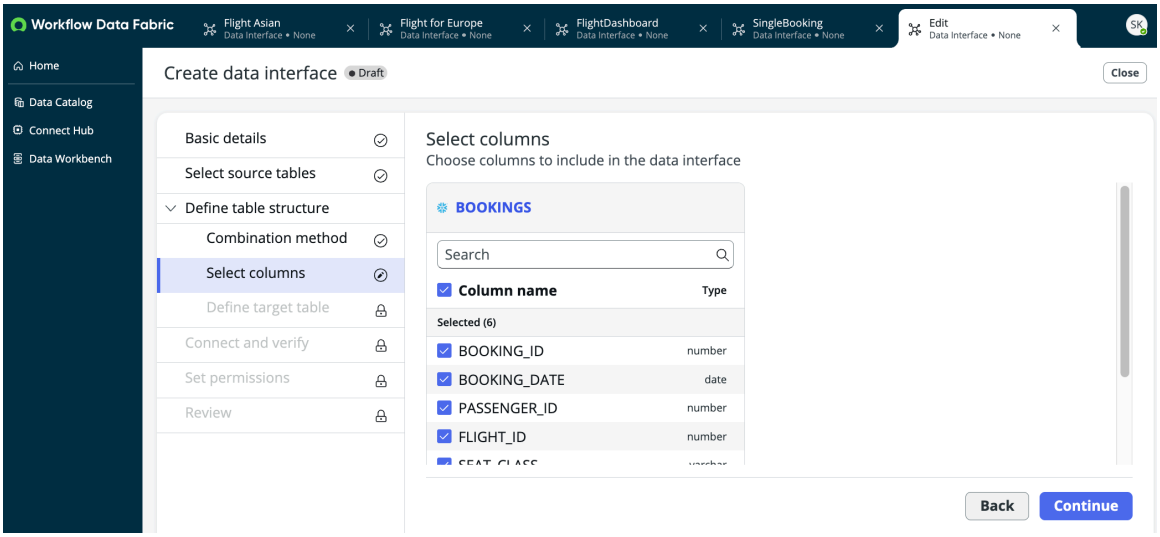
Note: The following platform table types are not supported as source tables:

- Tables with names that begin with `sys_`
- Child tables

6. Review the list of tables and select **Continue**.
   Because one table is selected, no combination method is required. The wizard advances to column selection.
7. Select the columns to include in the data interface and select **Continue**.

   Select only the columns that consumers require. Limiting columns reduces the impact of future schema changes in the source table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Review the target table column mapping and select **Create table**.

   The **Define target table** step shows the selected columns with their auto-mapped target names and data types. You can adjust column labels and types before creating the table.

   The system creates the data interface table and the underlying Data Fabric Table. The wizard advances to the **Connect and verify** step.

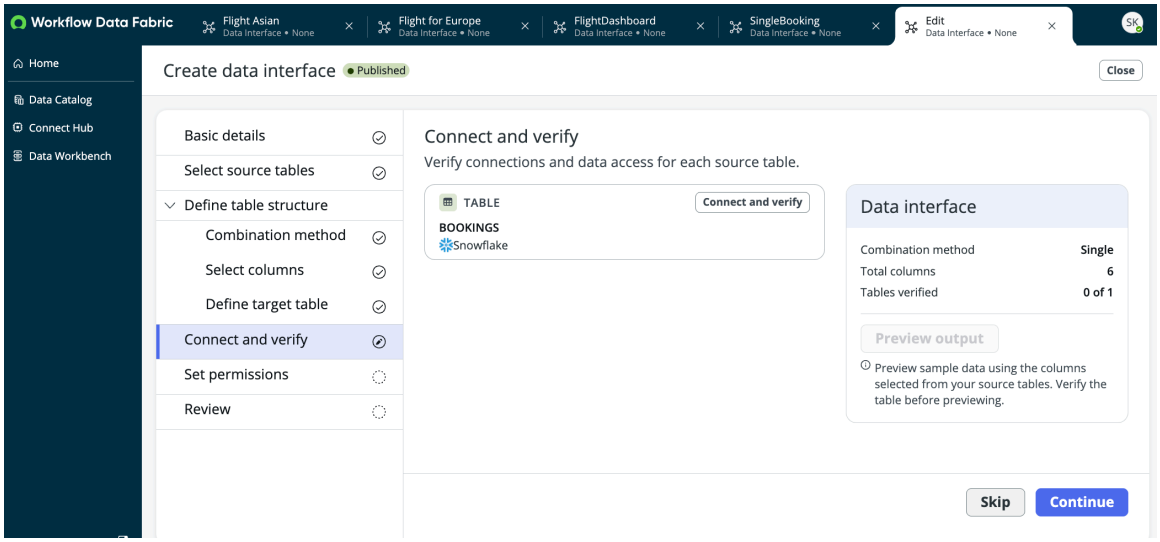
9. Connect and verify the source table.

   a. Select **Connect and verify** next to the source table.

   b. Select the connector for your source system from the list of available connections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Verify**.
The table shows a **Verified** status when the connection is confirmed.



10. **Optional:** Select **Preview** to review sample data from the data interface.

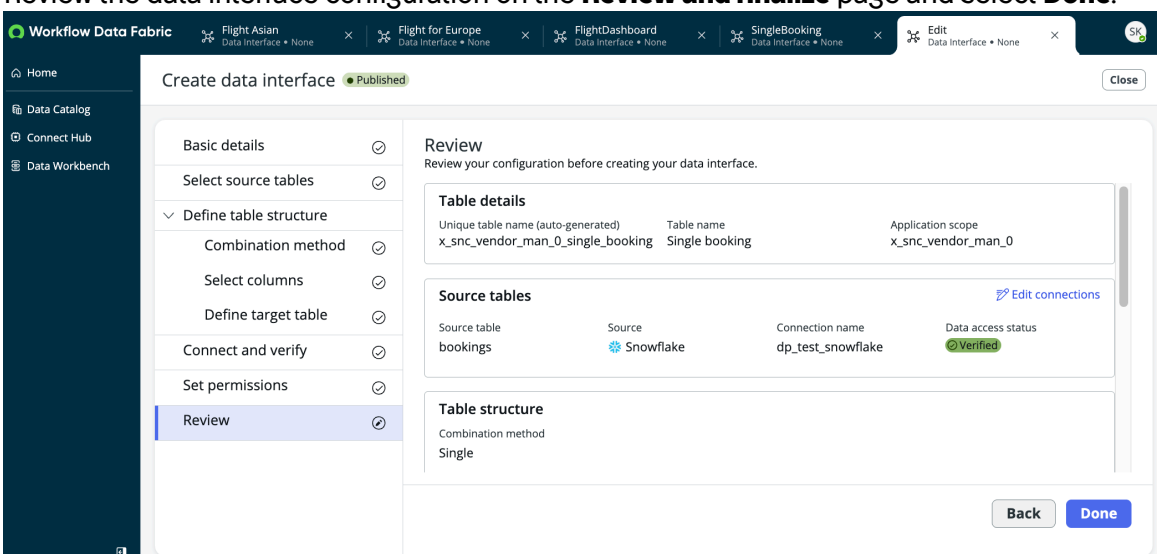
    (Optional) The preview shows the top 10 live records from the combined output. Verify the columns and data match what consumers expect before continuing.

11. Review the permissions and select **Continue**.

    For data interfaces built entirely on external source tables, the system automatically configures the required access roles.

    Note: If the data interface includes any ServiceNow tables, this step requires a manual permissions request. Copy the provided email template and send it to the security administrator. The security administrator must add the correct read roles to the composite role generated for the data interface. Select the confirmation check box before continuing.

12. Review the data interface configuration on the **Review and finalize** page and select **Done**.



The data interface is published and the overview page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The data interface is published and visible in Data Workbench. After the metadata collector runs, the data interface appears in the Data Catalog where consumers can discover and request access to it.

Note: A delay occurs between publishing a data interface and its appearance in the Data Catalog. The metadata collector must run before the data interface is discoverable. To make the data interface available without waiting for the scheduled run, ask the administrator to run the collector manually from Connect Hub.

What to do next
To package this data interface into a data product, see Create a data product.

Create a data interface using UNION

Create a governed data interface that consolidates rows from two or more source tables with compatible schemas using UNION. Publish it to the Data Catalog so consumers can access an aggregated view through a stable schema.

Before you begin
Before you begin, verify the following:

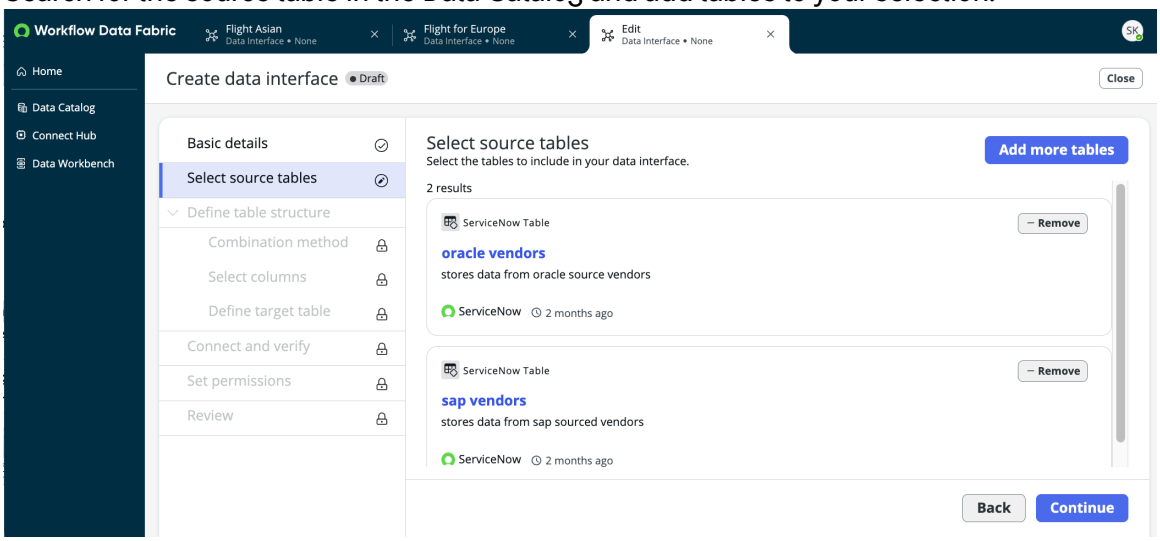
- All source tables are discoverable in the Data Catalog.
- The source tables have compatible schemas. Columns that you map to the same target column must have compatible data types.
- For tables in external systems, a zero copy connector for each system is configured in Connect Hub. For setup instructions, see the Zero copy connectors documentation.
- Role required: data_product_admin, df_data_steward, delegated_developer, df_data_steward, and delegatedadmin (scope admin)

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Data Workbench**.
2. Select **Create** > **Create data interface**.
   The data interface wizard opens to the **Basic details** step.
3. Enter the basic details for the data interface and select **Continue**.
   - **Interface label**: Enter a name for the data interface. This label identifies the interface in the Data Catalog.
   - **Unique name**: Auto-generated from the data interface label.
   - **Application scope**: Select the scope in which to create the data interface.
4. On the Select source tables page, select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Search for the source table in the Data Catalog and add tables to your selection.



Note: The following platform table types are not supported as source tables:

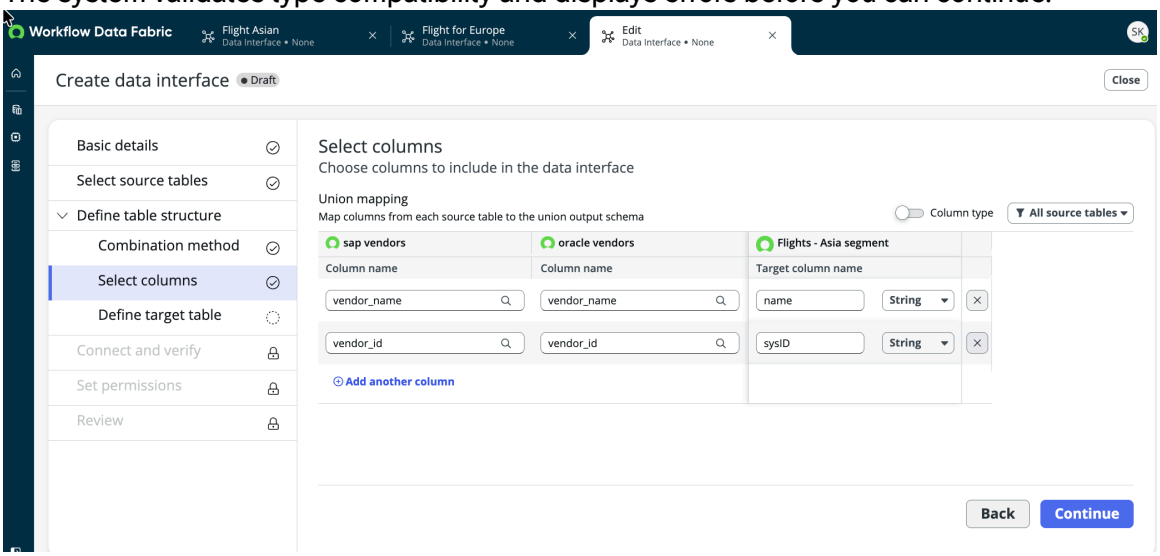
- Tables with names that begin with `sys_`
- Child tables

6. Review the list of tables and select **Continue**.
   The wizard advances to the combination method step.
7. Select **Union** as the combination method and select **Continue**.
8. Map source columns from each table to the union output schema and select **Continue**.

   The **Union mapping** step shows a row for each output column. For each row:

   - Select the source column from each table that maps to this output column.
   - Enter a target column name.
   - Select the target column type.

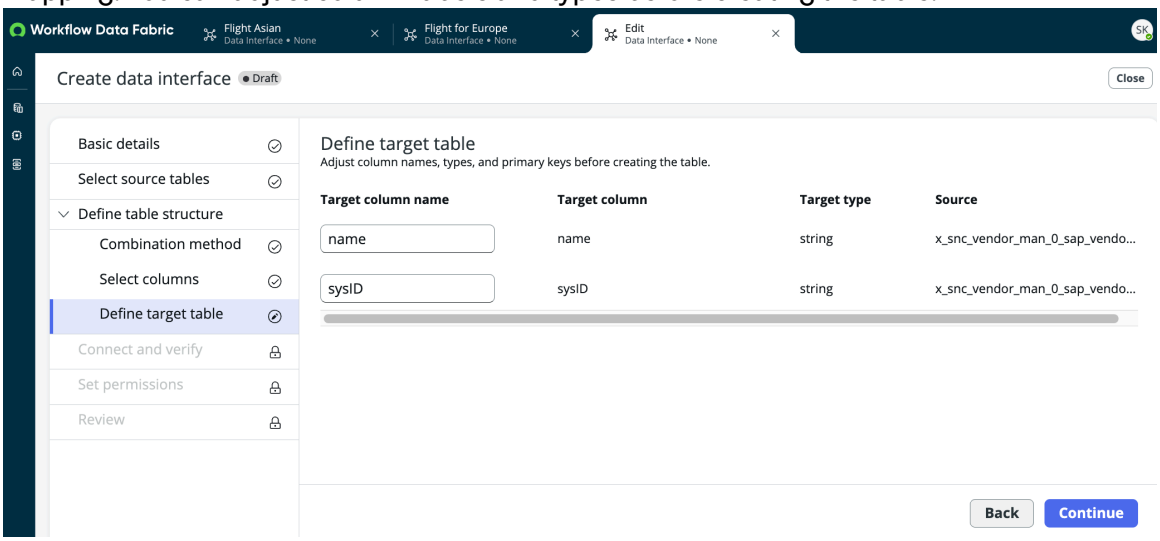
   All source columns mapped to the same output column must have compatible data types. The system validates type compatibility and displays errors before you can continue.



9. Review the target table column mapping and select **Create table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Define target table** step shows the output schema based on your union mapping. You can adjust column labels and types before creating the table.



The system creates the data interface table and the underlying Data Fabric Tables. The wizard advances to the **Connect and verify** step.

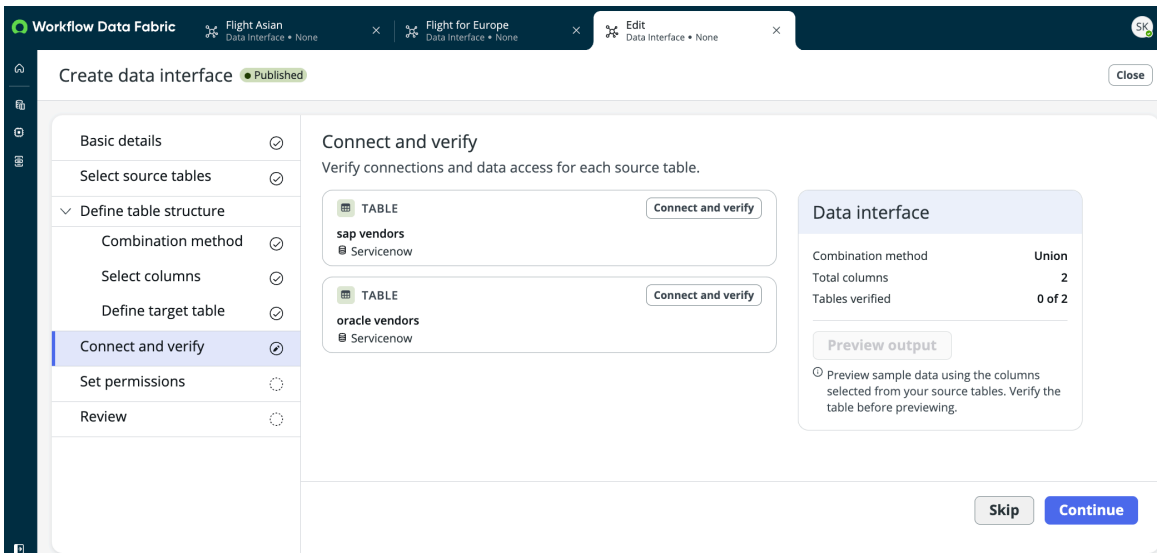
10. Connect and verify each source table.

    Repeat the following substeps for each source table.

    a. Select **Connect and verify** next to the source table.

    b. Select the connector for your source system from the list of available connections.

    c. Select **Verify**.
    The table shows a **Verified** status when the connection is verified.



11. **Optional:** Select **Preview** to review sample data from the data interface.

    (Optional) The preview shows the top 10 live records from the combined output. Verify the columns and data match what consumers expect before continuing.

12. Review the permissions and select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For data interfaces built entirely on external source tables, the system automatically configures the required access roles.

Note: If the data interface includes any ServiceNow tables, this step requires a manual permissions request. Copy the email template provided and send it to your Security Administrator. The Security Administrator must add the correct read roles to the composite role generated for the data interface. Select the confirmation check box before continuing.

13. Review the data interface configuration on the **Review and finalize** page and select **Done**.
    The data interface is published and the overview page opens.

Result

The data interface is published and visible in Data Workbench. After the metadata collector runs, the data interface appears in the Data Catalog where consumers can discover and request access to it.

Important: There is a delay between publishing a data interface and its appearance in the Data Catalog. The metadata collector must run before the data interface is discoverable. To make the data interface available without waiting for the scheduled run, ask your administrator to run the collector manually from Connect Hub.

What to do next

To package this data interface into a data product, see Create a data product.

Create a data interface using JOIN

Create a governed data interface that combines rows from two or more source tables using an INNER JOIN and publish it to the Data Catalog. Consumers can access a unified view through a stable schema.

Before you begin

Role required: data_product_admin, df_data_steward, delegated_developer, df_data_steward, and delegatedadmin (scope admin)

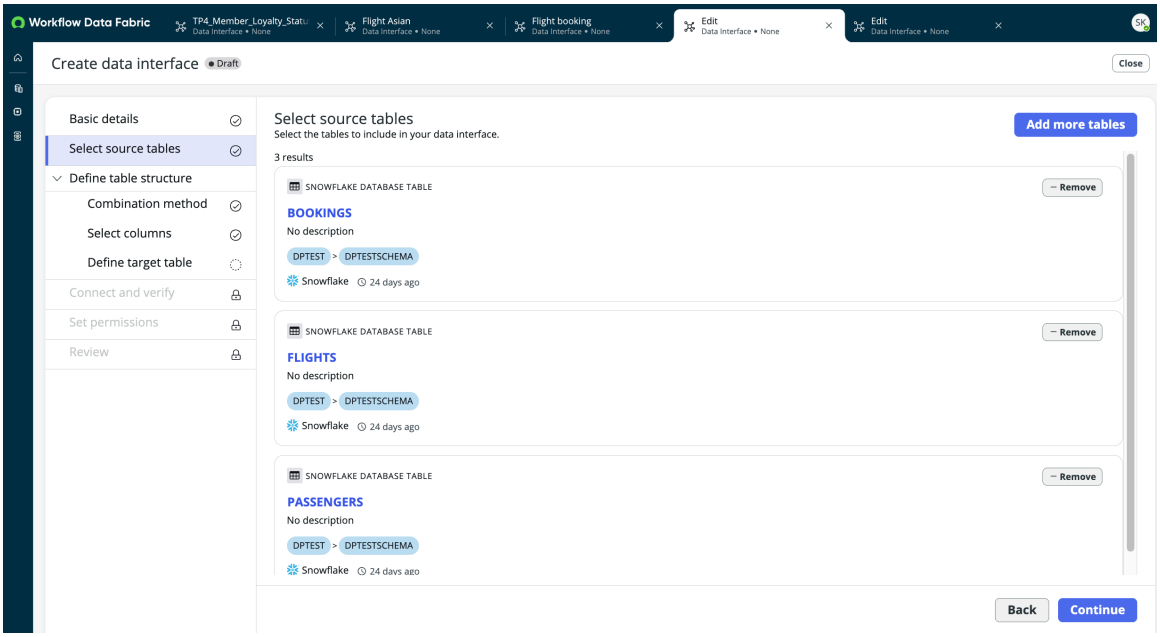
Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Data Workbench**.
2. Select **Create** > **Create data interface**.
   The data interface wizard opens to the **Basic details** step.
3. Enter the basic details for the data interface and select **Continue**.
   - **Interface label**: Enter a name for the data interface. This label identifies the data interface in the Data Catalog.
   - **Unique name**: Auto-generated from the data interface label.
   - **Application scope**: Select the scope in which to create the data interface.
4. On the Select source tables page, select **Add**.
5. Search for the source table in the Data Catalog and add tables to your selection.

   Note: The following platform table types are not supported as source tables:
   - Tables with names that begin with `sys_`
   - Child tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Review the list of tables and select **Continue**



The wizard advances to the combination method step.

7. Select **Join** as the combination method and select **Continue**.

   Under **Define join sequence**, the selected tables are listed in the order they are joined. The first table in the list acts as the primary source. Drag the tables to reorder them before continuing.

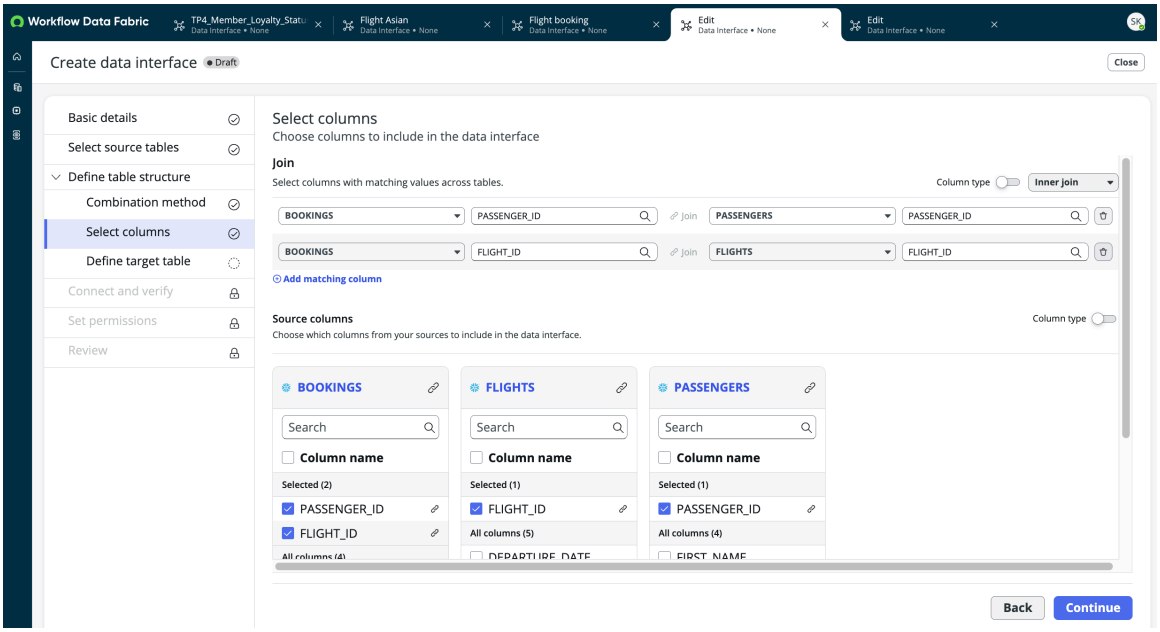
8. Define the join conditions and select **Continue**.

   For each join condition, select a column from one table and the matching column from another table. The columns must have compatible data types. Select **Add matching column** to add more conditions.

   You must define at least one join condition to continue. If any selected table has no join condition, the system prompts you to confirm before proceeding. Columns from unjoined tables are excluded from the output.

   Note: This data interface uses INNER JOIN. Only records that have a matching value in all joined tables appear in the output. Records with no match in any joined table are excluded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Review the target table column mapping and select **Create table**.

   The **Define target table** step shows the selected columns with their auto-mapped target names and data types. You can adjust column labels and types before creating the table.

   The system creates the data interface table, the underlying Data Fabric Tables, and the database view that represents the JOIN. The wizard advances to the **Connect and verify** step.

10. Connect and verify each source table.

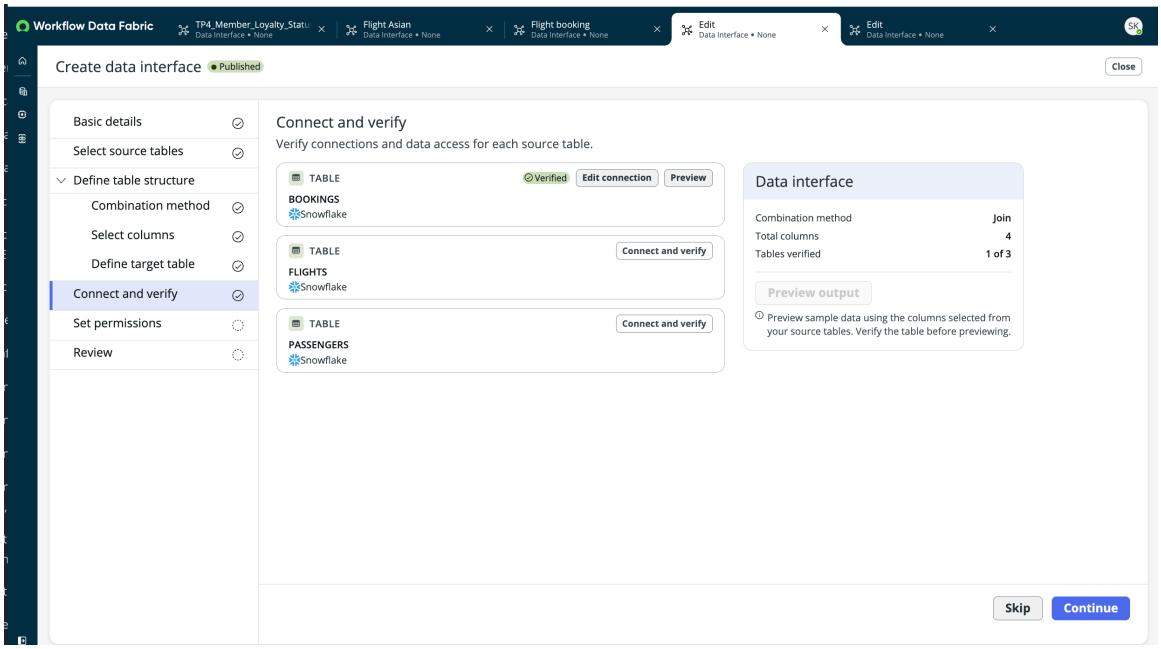
    Repeat the following substeps for each source table.

    a. Select **Connect and verify** next to the source table.

    b. Select the connector for your source system from the list of available connections.

    c. Select **Verify**.
    The table shows a **Verified** status when the connection is confirmed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. **Optional:** Select **Preview** to review sample data from the data interface.

    (Optional) The preview shows the top 10 live records from the combined output. Verify the columns and data match what consumers expect before continuing.

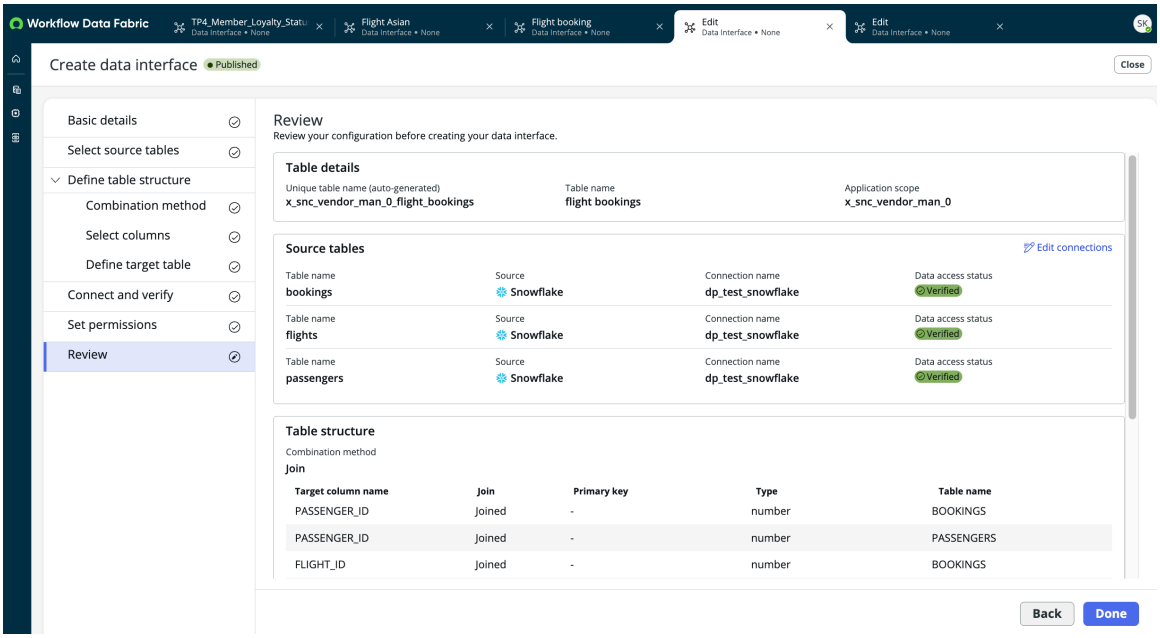
12. Review the permissions and select **Continue**.

    For data interfaces built entirely on external source tables, the system automatically configures the required access roles.

    Note: If the data interface includes any ServiceNow tables, this step requires a manual permissions request. Copy the email template provided and send it to your Security Administrator. The Security Administrator must add the correct read roles to the composite role generated for the data interface. Select the confirmation check box before continuing.

13. Review the data interface configuration on the **Review and finalize** page and select **Done**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The data interface is published and the overview page opens.

Result

The data interface is published and visible in Data Workbench. After the metadata collector runs, the data interface appears in the Data Catalog where consumers can discover and request access to it.

> **Important:** There is a delay between publishing a data interface and its appearance in the Data Catalog. The metadata collector must run before the data interface is discoverable. To make the data interface available without waiting for the scheduled run, ask your administrator to run the collector manually from Connect Hub.

What to do next

To package this data interface into a data product, see Create a data product.

Edit a data interface

Update a published data interface in place when source data or consumer requirements change, without unpublishing or recreating the interface.

Before you begin

The data interface must be in the Published state.

Role required: data_product_admin, df_data_steward, delegated_developer, df_data_steward, and delegatedadmin (scope admin)

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Data Workbench**.
2. Open the published data interface and select **Edit**.

   An edit mode banner appears at the top of the wizard and remains visible throughout the edit session as a reminder that table, column, and combination changes affect consumers and that consumers aren't notified automatically.

3. Update the interface label and select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Unique name** field is locked because downstream consumers reference the data interface by name.

4. On the **Select source tables** page, add or remove source tables and select **Continue**.

   Note: You can't remove a source table that is referenced by a join condition. Remove the join condition first.

5. On the **Combination method** step, keep or change the combination method and select **Continue**.

   If you select a different combination method, the Change combination method dialog opens. Select **Change method** to restructure the target table, remove the current column mappings, and clear any saved join configurations. This action can't be undone.

6. On the **Select columns** step, update the column selection and select **Continue**.
7. On the **Define target table** step, review the column mappings, adjust target column labels and types as needed, and select **Create table**.

   For target columns that were part of the published interface, the column name is locked. The target column label and type remain editable. If you select a target type that doesn't match the source type, the field shows a type-mismatch warning.

   If you made structural changes — added or removed source tables, changed the combination method, or changed join conditions — the Confirm structure changes dialog opens. The dialog lists the structural changes that will be applied. Select **Confirm changes** to apply them. The earlier wizard steps lock and the wizard advances to the **Connect and verify** step. All source tables must be re-verified and permissions reviewed before you can save.

8. On the **Connect and verify** step, verify each source table.

   The **Tables verified** count on the Data interface summary panel tracks progress. The **Preview output** button remains inactive until all tables are verified.

   a. Select **Connect and verify** next to a source table.

   b. Select the connector for your source system from the list of available connections.

   c. Select **Verify**.

      The table shows a Verified status when the connection is confirmed.

9. **Optional:** Review sample data from the updated interface by selecting **Preview output**.

   (Optional) The preview shows the top 10 live records from the combined output. Confirm the columns and data match what consumers expect before continuing.

10. Review the permissions and select **Continue**.

    For data interfaces built on external source tables such as Snowflake, the access roles required are configured automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For data interfaces that includes any ServiceNow tables, this step requires a manual permissions request. Copy the email template provided and send it to your security administrator. The security administrator must add the correct read roles to the composite role generated for the data interface. Select the confirmation check box before continuing.

11. Review the updated data interface configuration on the **Review** page and select **Save changes**.

    The edits are applied and the data interface overview page opens. The data interface remains in the Published state.

Result
The published data interface reflects your updates. Existing consumers continue to use the data interface but must reconnect and verify their tables to pick up structural changes such as added or removed source tables, a changed combination method, or new target columns.

Important: There is a delay between saving an edit and its appearance in the Data Catalog. The metadata collector must run before consumers see the changes. To make the changes available without waiting for the scheduled run, ask your administrator to run the collector manually from Connect Hub.

Managing data products

Create, publish, and promote data products to make governed data available to consumers in your organization.

A data product groups one or more data interfaces into a governed, publishable collection. Once published, consumers can discover the data product in the Data Catalog and request access. When your data product is ready for production use, you promote it from your development instance using a ServiceNow update set.

Create a data product

Create a data product to group one or more data interfaces into a governed, publishable collection that consumers can discover and access through the Data Catalog.

Before you begin
Role required: data_product_admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Data Workbench**.
2. Select **Create** > **Create data product**.
   The data product wizard opens to the **Basic details** step.
3. Complete the basic details for the data product, then select **Continue**.
   - **Data product name**: Enter a name for the data product.
   - **Description**: Describe the data product and its intended use.
   - **Tags**: Optionally add tags separated by commas to make the data product easier to find in the Data Catalog.
   - **Application scope**: Auto-populated from your current application scope.
4. Select **Add assets**, select the data interfaces to include, and select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The data product inherits access permissions from each data interface you add. There is no separate permissions configuration at the data product level.

5. Review the inherited permissions and select **Continue**.

   The Set permissions step lists each data interface with its role and configuration status. Permissions are read-only at this level. To change access, update the roles on the individual data interfaces.

6. Review the data product configuration and select **Done**.
   The data product details page opens. The data product is in draft state and is not yet available to consumers.

Result
The data product is created in draft state and visible in Data Workbench. Publish it to make it available to consumers in the Data Catalog.

What to do next
To make the data product available to consumers, see Publish a data product

Publish a data product

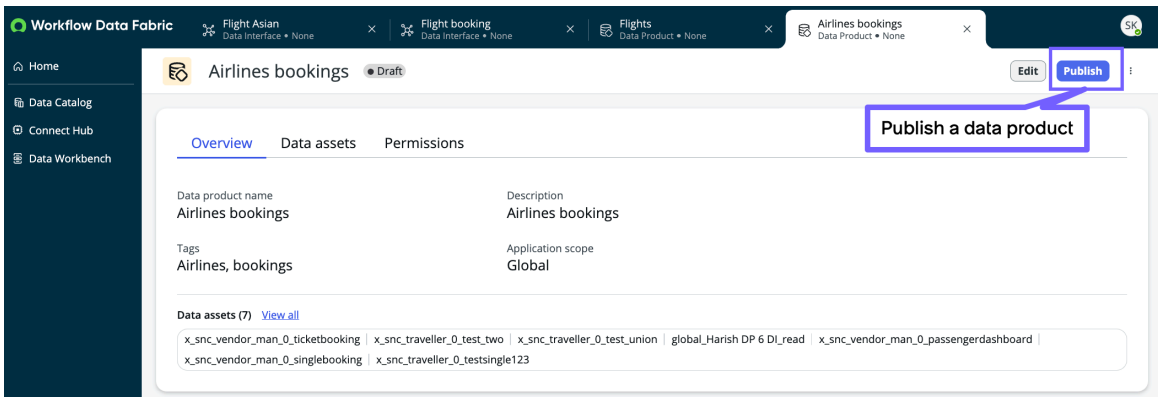
Publish a data product to make it available to consumers in the Data Catalog.

Before you begin
Role required: data_product_admin

Procedure

1. Navigate to **All** > **Workflow Data Fabric** > **Data Workbench**.
2. In Data Workbench, open the data product and select **Publish**.

   The **Publish** button is available only when the data product is in draft state.



3. Review the confirmation and select **Publish**.
   The data product state updates to **Published**.
4. To make changes to a published data product, select **Edit** on the details page.

   This returns the data product to draft state. You can republish it when your changes are complete.

Result
The data product is published. After the metadata collector runs, it appears in the Data Catalog. Consumers can discover and request access to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: A delay occurs between publishing a data product and its appearance in the Data Catalog. The metadata collector must run before the data product is discoverable. To make it available without waiting for the scheduled run, ask your administrator to run the collector manually from Connect Hub.

What to do next

To move the data product to production instance, see Move data interfaces and data products to production

Move data interfaces and data products to production

Use a local update set to move data interfaces and data products from a subproduction instance to production.

Before you begin

Before you begin, verify the following:

- A local update set is active in the subproduction instance with the same application scope as your data interfaces and data products.
- All data interfaces and data products you want to move are published in the subproduction instance.
- Zero-copy connectors for all source systems are configured in the production instance. For setup instructions, see Zero copy connectors documentation.
- Role required: Admin

About this task

Data interfaces and data products are captured in the active update set as you create and publish them. Exporting and installing the update set in production recreates the assets, including all data interface tables and column mappings. After installation, you must verify the connections again in production because connector names and credentials differ between instances.

For detailed instructions on update sets, see Working with update sets.

Procedure

1. In the subproduction instance, export the update set that contains your data interfaces and data products.
2. In the production instance, retrieve and install the exported update set.
3. Navigate to **All** > **Workflow Data Fabric** > **Data Workbench** and open each data interface.
4. For each source table, select **Connect and verify**, select the production connector for your source system, and select **Verify**.
   The table shows a **Verified** status when the connection to the production source is verified.

Result

The data interfaces and data products are available in the production instance. After the metadata collector runs, the data interfaces appear in the Data Catalog where consumers can discover and request access to them.

Review and approve data access requests

Review and act on requests from consumers who need access to a data product or data interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must be a member of the Data Catalog approvers group. An administrator manages group membership.

Roles required: approval_user and dcg_catalog_readable

About this task

When a consumer requests access to a data product or data interface, a task is created. The task is routed to the Data Catalog approvers group. Any member of the group can approve or reject the request — only one approval is required. After approval, the requesting user is automatically granted the role needed to query the data asset and the task closes.

Note: Access requests are only available for data products and data interfaces, not other data asset types.

Procedure

1. Navigate to **All** > **Self-Service** > **My Approvals**.
   The Approval Center opens, listing all pending approvals assigned to you or your group.
2. Find and open the pending Data Catalog access request.

   The short description identifies the requesting user and the data asset they need to access, for example: `User requesting access to resource: Travel Analytics`.
3. Review the request details to verify the user and data asset.

   The request record shows the requesting user, the data product or data interface name, and the current approval state. Use this information to evaluate whether to grant access.
4. Select **Approve** or **Reject**.
   - Approve: The requesting user is automatically granted the role required to query the data asset. The access request task closes.
   - Reject: Access is not granted. The requesting user is notified and the task closes.

Result

After approval, the requesting user can query the data product or data interface through workflows, dashboards, or APIs. No further action is required — role assignment and task closure happen automatically.

Automation Center

Use the ServiceNow® Automation Center application to govern your end-to-end multi-vendor automation life cycles from one place. By using real-time dashboards, you can manage and measure the health of the automation and prevent automation failures across multiple vendors.

In the Automation Center application dashboard, you can view real-time metrics and analytics.

Automation Center integrates with ServiceNow® Robotic Process Automation (RPA) Hub, ServiceNow® flows, and any third-party applications.

Integration with ServiceNow® flows

Automation Center integrates with ServiceNow® flows enabling you to track any ServiceNow® flow as automations. For more information, see Track ServiceNow flows and actions as automations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration with ServiceNow® Robotic Process Automation (RPA) Hub

Automation Center provides an integration with the ServiceNow® RPA Hub application. This integration enables you to integrate ServiceNow robots and bot processes. For more information about RPA Hub, see Robotic Process Automation (RPA) Hub.

Integration with Document Intelligence

Automation Center integrates with Document Intelligence enabling you to get the Document Intelligence data into ServiceNow® instance. You can analyze the data from Document Intelligence using Automation Center. For more information, see .

Integration with UiPath

Automation Center integrates with UiPath enabling you to get the UiPath data into ServiceNow® instance via UiPath spoke. You can analyze the data from UiPath using Automation Center. For more information, see Configuring UiPath with Automation Center.

Integration with third-party vendors

Automation Center integrates with third-party vendors enabling you to get their data into ServiceNow® instance. You can do that using *Automation Center* API.

Automation Center API

The *Automation Center* API enables you to create and update processes, robots, and execution jobs. For more information, see Automation Center API .

Integration with Task Mining

Automation Center integrates with Task Mining enabling you to create automations from Task Mining workspace. For more information, see Task Mining .

Exploring Automation Center

Learn about the Automation Center application key features, architecture, and workspace.

Key features

- Discover, prioritize, and manage automation requests from different sources through the full life cycle in Automation Center workspace.
- Oversee and optimize automation performance versus business goals across multiple vendors.
- Monitor and manage the health of the automation and prevent automation failures across multiple vendors.

Explore the following topics to learn more about Automation Center architecture and Workspace.

Automation Center architecture

Learn about the Automation Center architecture.

High-level architecture

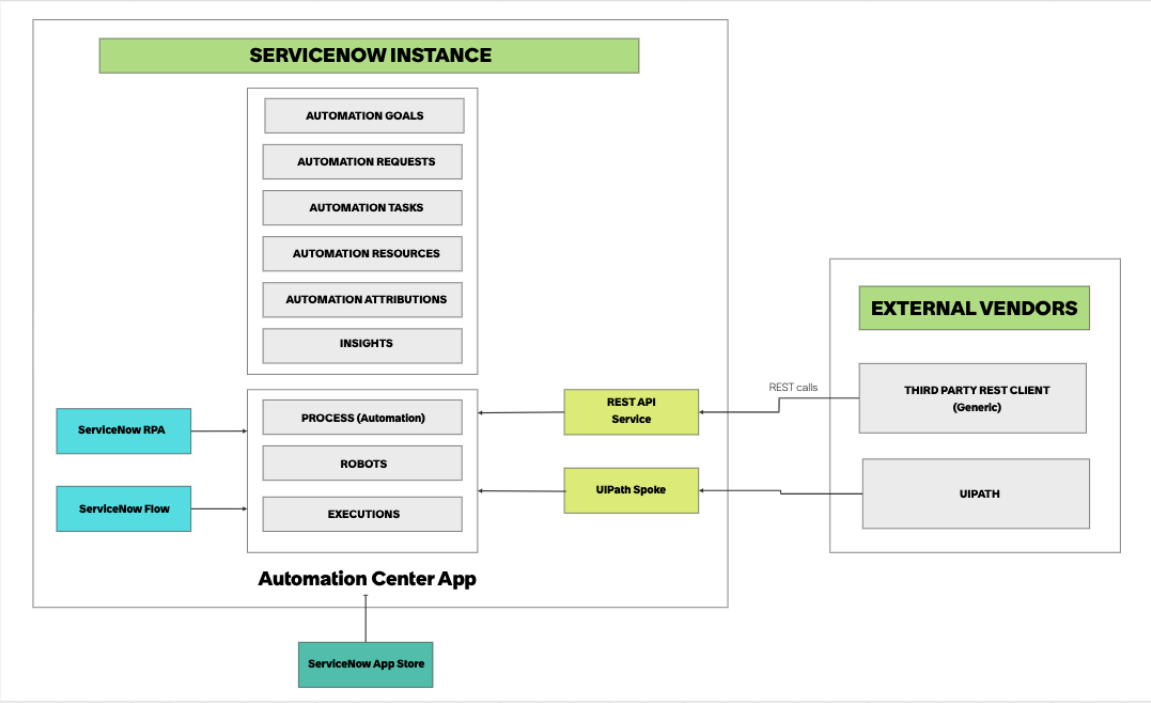
Various components make up the architecture of the Automation Center application:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You install the Automation Center application from the ServiceNow Store.
- Automation Center is a scoped application in the ServiceNow instance. It's the command and control center for managing the automation goals, requests, tasks, resources, attributes, insights, automation, robots, and executions.
- The automations, robots, and executions are populated from various sources such as ServiceNow® RPA Hub via flow and external vendors via REST calls.

The following diagram shows the high-level architecture of the Automation Center application.

High-level architecture of the Automation Center application



Automation Center Workspace

Automation Center Workspace provides an overall view of the performance and value of the KPIs for existing automations, executions, and new automation requests.

ServiceNow® Automation Center Workspace is a web-based platform with three dashboards: Overview, Executions, and Value.

- The Overview dashboard includes the basic score cards, lists, and reports. It's the default landing page of the Automation Center Workspace.
- The Executions dashboard enables you to manage the health of automations in one central place.
- The Value dashboard provides summary information about the states of business goals and automations.

Automation Center Overview dashboard

The Automation Center Workspace landing page is the Overview dashboard, which contains basic score cards, lists, and reports.

You can access the Overview dashboard in either of two ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- By navigating to **All** > **Automation Center** > **Automation Center Home** > **Overview**.
- By navigating to **Workspaces** > **Automation Center Workspace** > **Overview**.

Active automations

Active automations provides details of all the active automations from different sources and their business criticality. You can filter the data to view information within a specific date range, for a specific automation, or for a specific department. After you set the filter, the results will be displayed only for the specified filter. If you don't set any filter, then data for all active automations is displayed.

The Active automations section provides reports with the following details in the form of chart.

Active automations

Section	Description
Deployed automations by business criticality	This chart displays data about all active automations. It also provides details about the business criticality of each of the automation. This helps you in understanding how many automations are highly critical and how many aren't. 
Executions summaries by source	Automation Center supports data from several sources, such as ServiceNow Flow, ServiceNow RPA, and other third-party sources. This chart provides execution summary details of all active automations along with their sources. This information helps you in evaluating from which sources you're getting data and how many automations from each of the sources are active. Robotic Process Automation (RPA) by source	This chart displays the automations for all RPAs grouped by sources. The graph gives details of the time lines when the RPA data was sent to Automation Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	Automations by ServiceNow Flow	This chart provides details of the ServiceNow flow automations with the time lines. Document Intelligence (DocIntel)	This chart provides details of the Document Intelligence automations with the time lines. Top 10 applications used	This graph provides a vertical bar report of the top 10 business applications used. For more information on associating business applications to your automations, see . 
Spokes & Transactions

Spokes & Transactions section provides details about the spokes and the transactions that are available on your instance.

Note: To view the data in the Spokes & Transactions section, you need to have the sn_ac.automation_technical_user or sn_ac.automation_admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spokes & Transactions

Section	Description
Total entitled spokes	Displays the number of spokes that you are entitled and installed in your instance. Installed spokes	Displays the number of spokes that are installed in your instance. 
Configured spokes	Displays the number of spokes for which connections are configured in your instance. 
Total entitled transactions	Displays the number of transactions that are available for use. Consumed transactions	Displays the number of transactions that you have used. Applications with most transactions	Displays the applications (scope applications) with most transactions. You can filter the results for specific time period. By default, the last one month's data is displayed. Spokes with most transactions	Displays the spokes with most transactions. You can filter the results for specific time period. By default, the last one month's data is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Spokes & Transactions (continued)

Section	Description
	

Future automations

The Future automations section provides details about all active automations that are planned for the future.

You can filter the data by department. If no department is selected, the data is displayed for all departments.

Future automations

Section	Description
New requests	Displays all automation requests that are in the New state. Requests by intake source	Displays all automation requests grouped by intake source, such as Web, Process Mining, or Service Request. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Future automations (continued)

Section	Description
Requests to be deployed	Displays the automation requests ready to be deployed. Most recent requests	Lists the automation requests sorted from most recent to oldest. 

Automation Center Executions dashboard

The Automation Center Executions dashboard helps you manage the health of automations in one central place. You can also import automation metrics and data from third-party providers regardless of the technology used.

Executions refer to the times each automation runs.

You can access the Executions dashboard in either of two ways:

- By navigating to **All** > **Automation Center** > **Automation Center Home** and then selecting the **Executions** tab.
- By navigating to **Workspaces** > **Automation Center Workspace** > **Executions**.

Executions dashboard details

The Executions dashboard provides the details about the automation executions in the form of charts and tables. These charts give an overview of the entire execution process.

You can filter all data that is displayed on this page using the four filters available:

- Department
- Automation
- Source
- Application

If you don't specify any filter, then all available data is displayed.

Note: To view the Automation incidents, Automation changes, and Business application changes widgets, in addition to the Automation Center roles you need to have the itil or sn_incident_read and sn_change_read roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution summary

Section	Description
Execution summary by state	This chart displays the execution status of automations in different states. This information helps in understanding the status of the automations. 
Automation incidents	This chart provides information about any incidents that have a direct impact on the automations. For example, if five automations are on hold, this chart lets you know about those five automations. This information enables you to manage the automations better. Automation changes	This chart focuses on any change that has a direct impact on the automations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution summary (continued)

Section	Description
	Business application changes	This chart provides information about any change to the business applications that are associated with the automations. Execution state over time	This chart provides information about the state of the executions for a time period. There's a date range filter for this chart. If you select a date range, the data is limited to the selected date range, or else the default date range is selected, which is last one week. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution summary (continued)

Section	Description
Execution summary	This chart displays the number of executions and their respective states sorted by automation name. 
Transaction summary

The Transaction summary section displays execution details of the spokes for the last 24 hours.

Execution summary

Section	Description
Active applications	Displays the number of active applications running in your instance for the last 24 hours. Actions in use	Displays the number of actions that are used in your instance in the last 24 hours. Total transactions	Displays the total number of transactions in your instance in the last 24 hours. In progress and failed transactions by flow	Displays all the in progress and failed transactions by flow in your instance in the last 24 hours. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution summary (continued)

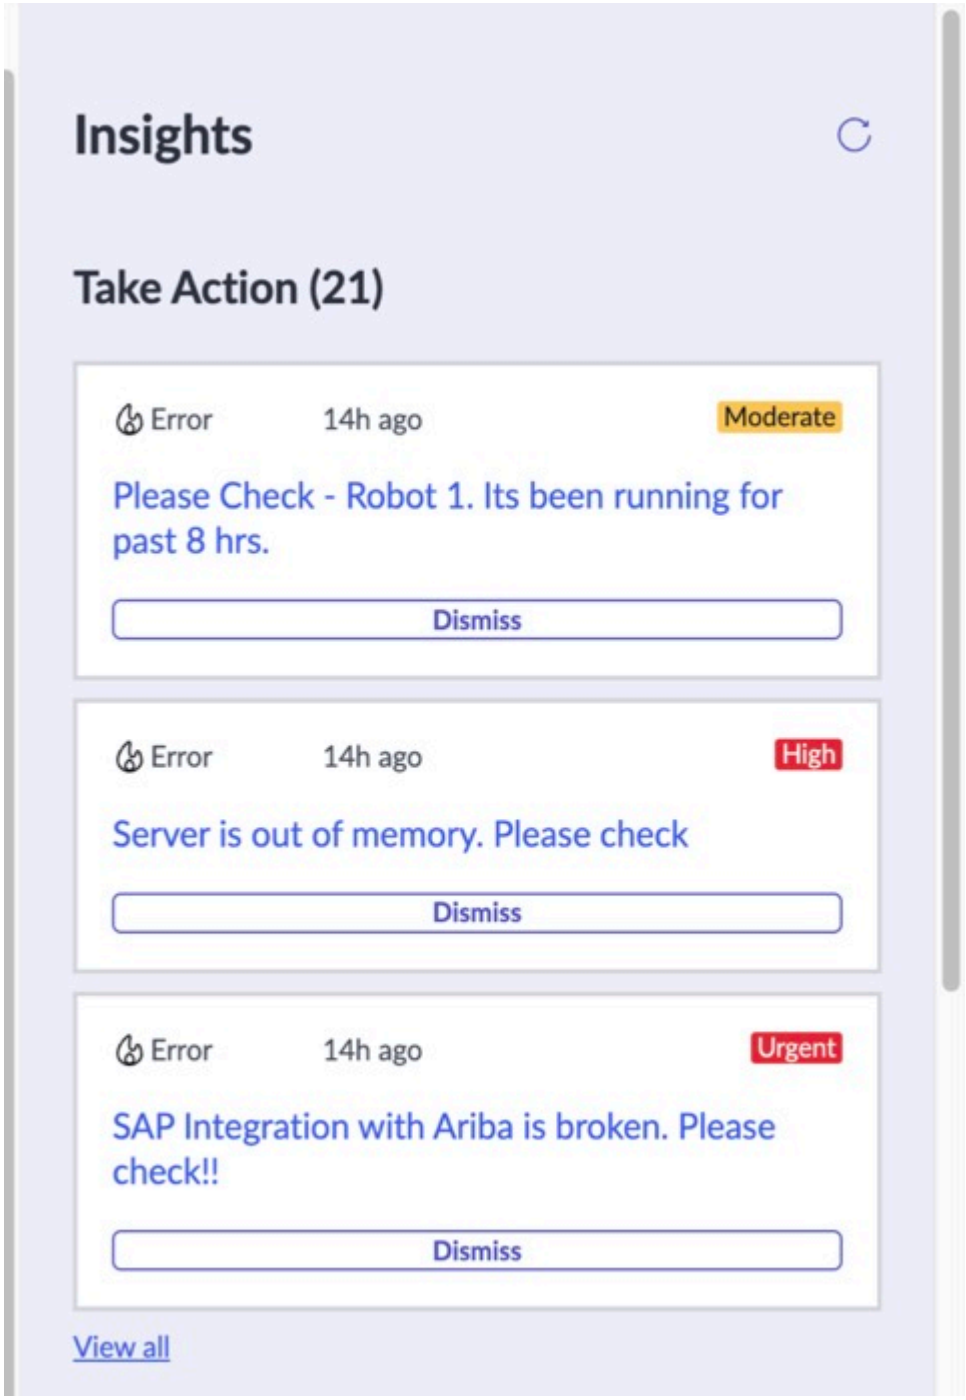
Section	Description
Flow execution status trends	Displays the flow execution trend for all states in your instance in the last 24 hours. 

Insights panel

The Insights panel provides information about insights, which draw your attention to any issues within Automation Center. You can fix the issues or choose to ignore them. If you delay fixing issues, some automations might not behave as expected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insights example



Automation Center Value dashboard

The Automation Center Value dashboard provides summary information about the states of goals and automations along with the actual and estimated cost and time saved for all active and future automations.

All widgets under the following sections are available only if the you have the sn_ac.automation_technical_user role:

- Goals chart
- Number of deployed automations under Active automations
- Future automations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access all other widgets in the Active automations section, you must associate a domain configuration with a data collection job. For more information see https://www.servicenow.com/docs/bundle/zurich-now-intelligence/page/use/performance-analytics/task/associate-domain-config-dc-job.html.

You can access the Value dashboard in either of two ways:

- By navigating to **All** > **Automation Center** > **Automation Center Home** and then selecting the **Value** tab.
- By navigating to **Workspaces** > **Automation Center Workspace** > **Value**.

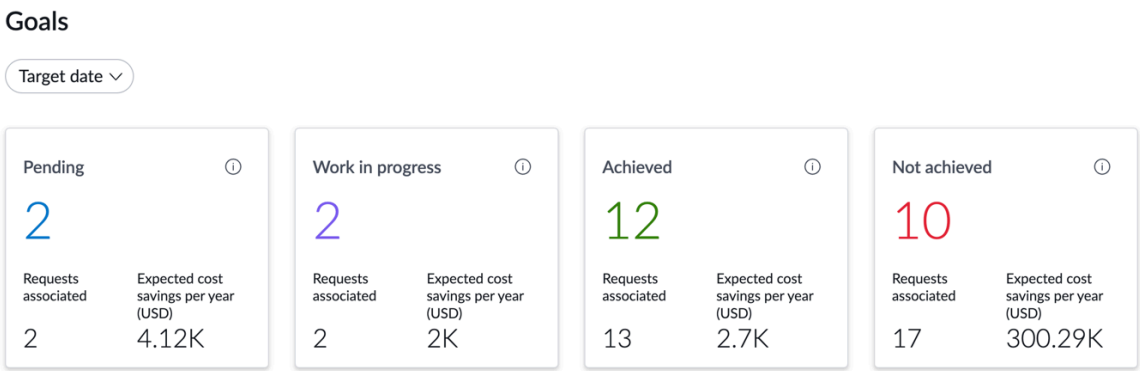
Goals chart

The Goals chart displays the summary of automation goals categorized by their state along with the estimated cost saved per year.

For information about automation goals, see Create an automation goal.

By default, the Goals chart provides details of all automation goals with associated active automation requests for the day you're viewing the data.

Use the **Target date** drop-down list to view goals for a specific period. When you select the **Target date** filter, you can view the calendar of the current and the next month. Date filters are available for Custom range, Last 12 months, Last 6 months, and so on.



Active automations

The Active automations chart displays data for active automations. You can filter the data by date, department, and automation. If no filter is set, the data is displayed for all the data.

Active automations

Section	Description
Total cost saved	This chart displays the total cost saved for the selected date range, department, and automation. **Note:** Selecting the Total cost saved widget opens the Analytics Hub KPI Details widget in a new tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	Total time saved	his chart displays the total time saved for the selected date range, department, and automation. **Note:** Selecting the Total time saved widget opens the Analytics Hub KPI Details widget in a new tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	Number of deployed automations	This chart displays the total number of deployed automations for the selected date range, department, and automation. It also compares the data with the previous cycle. The previous cycle has the same duration as the current cycle. For example, if the current cycle is January 1, 2021, to March 31, 2021, the previous cycle would be October 1, 2020, to December 31, 2020. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
Average process success rate	This chart displays the average process success rate for the selected date range, department, and automation. The success rate is calculated from the total executions within the selected date range that have the states Complete, Error, and canceled divided by the executions that completed with no errors. It also compares the data with the previous cycle. The previous cycle has the same duration as the current cycle. For example, if the current cycle is January 1, 2021, to March 31, 2021, then the previous cycle would be October 1, 2020, to December 31, 2020. Automation performance by sources	This chart displays automation performance by sources, such as ServiceNow RPA, flows, and other third-party automation vendors for the selected date range, department, and automation. **Note:** You can get data for a maximum of 20 sources. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
Total cost saved by department	This chart displays the cost savings per run per department for the selected date range. Total time saved by department	This chart displays the time savings per run per department for the selected date range.

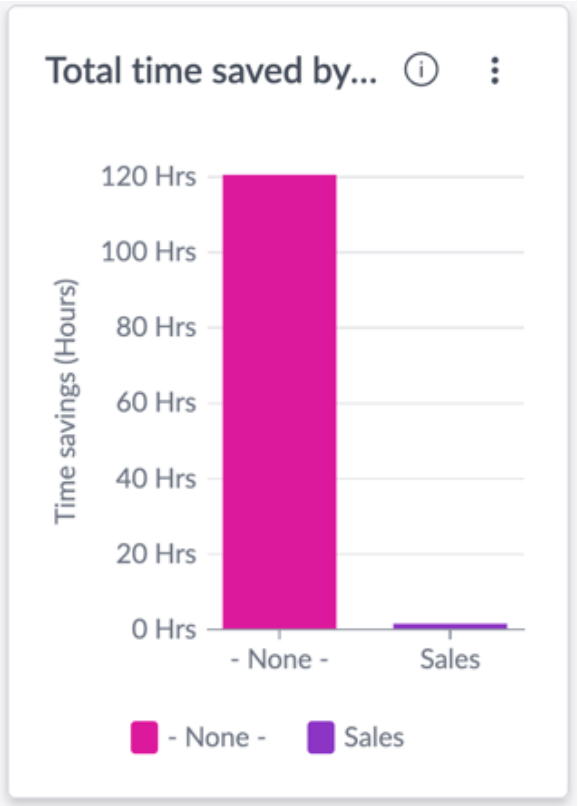
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active automations (continued)

Section	Description
	


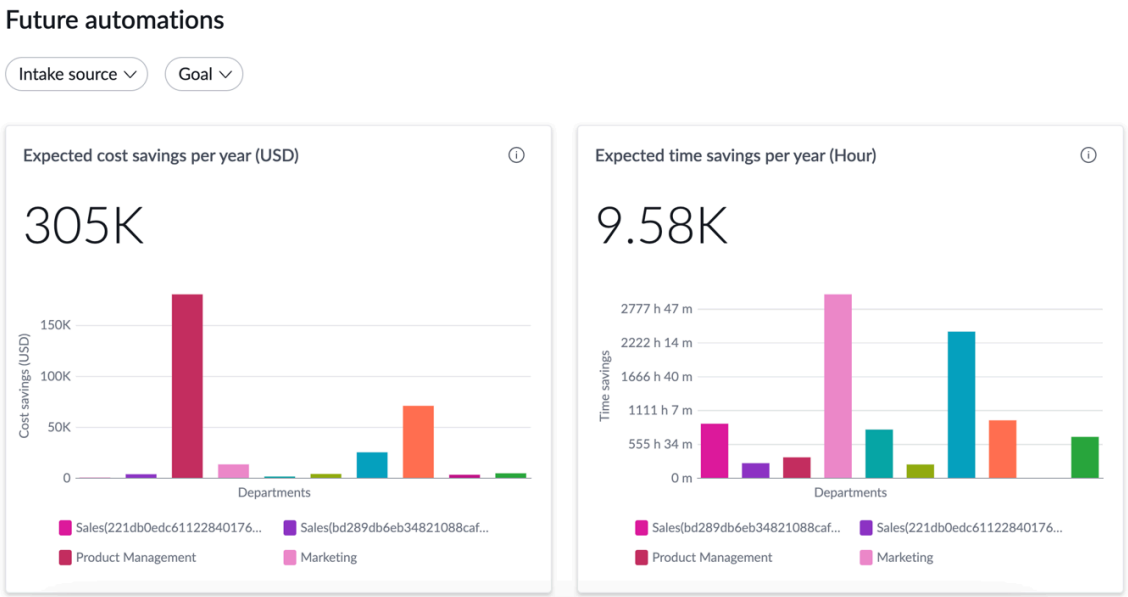
Note: A lag in the Performance Analytics data collection could cause a delay in the date that is displayed in the Analytics Hub.

Future automations

The Future automations section displays the estimated cost savings and time savings of future requests per year.

Use the **Intake source** and **Goal** filters to limit your results to a specific intake source or goal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Automation Center Kanban board

The Automation Center Kanban board provides an easy access to view and manage automation requests and automation tasks.

The Automation Center Kanban board provides the following benefits:

- Viewing all automation requests and automation tasks of all states in one place.
- Ease of updating the state of an automation request or automation task.
- Create a task for an automation request.

Manage automation requests

Manage all automation requests from one location from the Request Board in the Automation Center Kanban board.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Note: Kanban board does not display any automation request from demo data. If you want to view the demo data in Kanban board, then you must run the fix script. For more information, see Run fix script to view demo data on Kanban board.

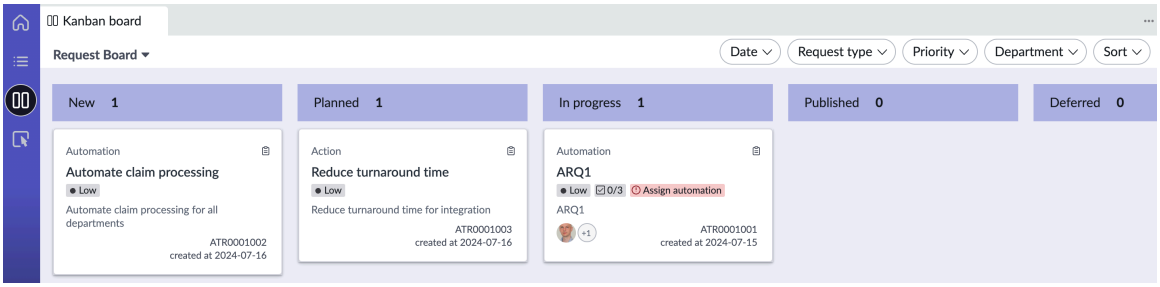
Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Kanban board icon .
   The Kanban board is displayed with the Request Board in view. You can view all the available automation requests with their states.

   Note: A maximum of 200 automation requests are available on the Request Board. This value can be changed only by someone with the sn_ac.automation_admin or sn_ac.automation_technical_user role.

   Also, anyone with the sn_ac.automation_admin or sn_ac.automation_technical_user role can reorder different states (columns) on the Request Board to set the lifecycle or process flow direction according to their requirement by editing the vtb_board table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. You can do multiple actions on the Request Board.

- Filter the automation requests to match your need.

  Filter the automation requests based on the following:

  - **Date**: Select any date range to view automation requests created during that period.
  - **Request type**: Select the type of request you want to view. You can choose to view automation requests, action requests, or review requests.
  - **Priority**: Select one or more priority values to view automation requests with those priority value.
  - **Department**: Select one or more departments to view automation requests that belong to the selected departments.

- Sort the automation requests for ease of use.

  Select **Name**, **Priority**, or **Score** from the **Sort by** field.

  Select **Ascending** or **Descending** from the **Sort Direction** field.

  The automation requests are sorted based on the selected sorting options.

- Change the state of an automation request.

  To move an automation request from one state to another, drag the card to the required state column.

  When you don’t follow the happy path, error messages are displayed and you're guided to fix the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a sorting is applied, the automation request card is placed according to the sorting. If no sorting is applied, the automation request card is placed based on the creation date.

- Create a task from the automation request card.

  a. Select the task icon ( ) from the automation task card.

  The Task Board for the automation request is displayed.

  b. Select the **Add Task** icon.

  The **Create New Automation Task** form is displayed. For more information, see Automation task form.

  Verify that the associated automation request is either in the **Planned** or **In Progress** state.

- View if an automation request has a task assigned to it. If yes, then how many tasks have been completed.
- View if an automation request has automations associated with it.
- View details of the automation request and create tasks.

  a. Double-click a request that is in **Planned** state or any state after that.

  The contextual panel opens to the right of the screen.

  b. View any details or comments in the **Details** and **Comments** tab of the contextual panel.

  c. In the **Tasks** tab, select the **Add Task** button.

  The **Create New Automation Task** form is displayed. Provide the details. For more information, see Automation task form.

Run fix script to view demo data on Kanban board

To view automation requests from the demo data in your Kanban board, you must run the fix script.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **System Definition** > **Fix Scripts**.
2. Open the Sync VTB Board.
3. Select **Run Fix Script**.
   You can run the fix script in the background or just proceed. After the fix script is run, you can view the demo data automation requests in the Kanban board.

Manage automation tasks

Manage all tasks associated with the automation requests from one location from the Task Board in the Automation Center Kanban board.

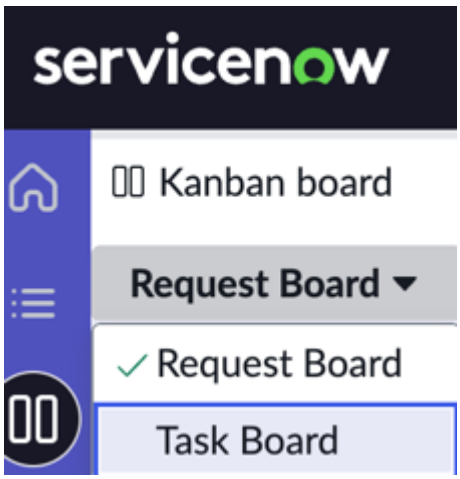
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

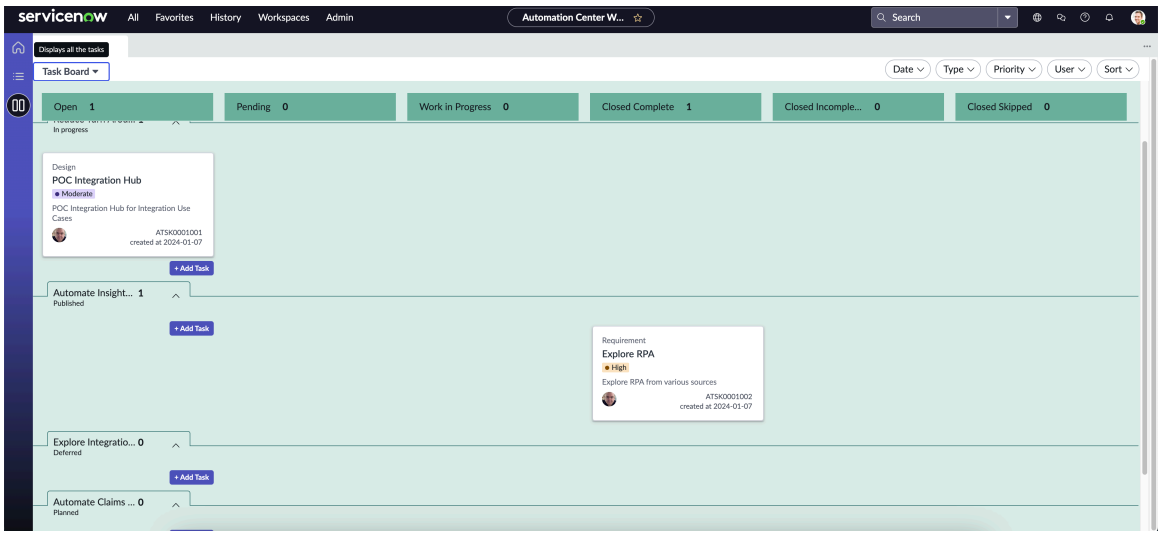
1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Kanban board icon .
   The Kanban board is displayed with the Request Board in view.
3. Select **Task Board** from the list view.



The Task Board is displayed with all available tasks and their states.

Note: A maximum of 2000 tasks are available on the Task Board. This value can be changed only by the System Administrator.

Also, anyone with the sn_ac.automation_admin or sn_ac.automation_technical_user role can reorder different states (columns) on the Task Board to set the lifecycle or process flow direction according to their requirement by editing the vtb_board table.



4. You can do multiple actions on the Task Board.
   - Filter the tasks to match your need.

     Filter the tasks based on the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Date**: Select any date range to view tasks created during that period.
- **Type**: Select one or more types of tasks to view tasks that belong to the selected types.
- **Priority**: Select one or more priority values to view tasks with those priority values.
- **User**: Select one or more users to view tasks assigned to only those users. Only users who have been assigned a task are available for selection.

- Sort the tasks for ease of use.

  Select **Name**, **Priority**, or **Score** from the **Sort by** field.

  Select **Ascending** or **Descending** from the **Sort Direction** field.

  The tasks are sorted based on the selected sorting options.

- Change the state of a task.

  To move a task from one state to another, drag the card to the required state column.

  If a sorting is applied, the task card is placed according to the sorting. If no sorting is applied, the task card is placed based on the creation date.

- Create a task from the automation task card.

  Select the **Add Task** icon.

  The **Create New Automation Task** form is displayed. Provide the details. For more information, see Automation task form.

  Verify that the associated automation request is either in the **Planned** or **In Progress** state.

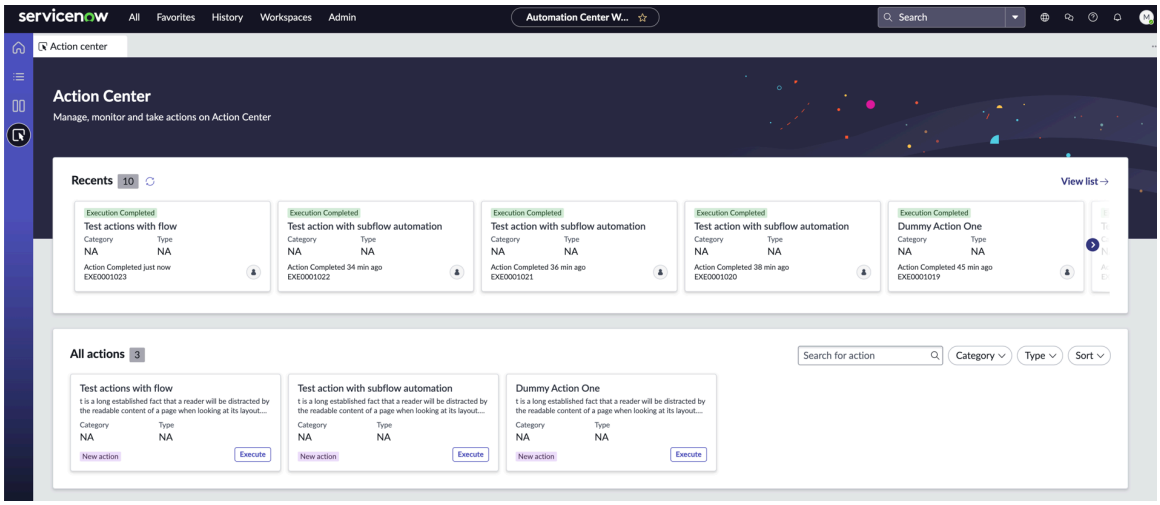
Action Center

Action Center provides an easy way to fix repeated issues that cause automations to fail in Automation Center.

Action Center provides the following benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Manage and execute actions to solve issues that cause automations to fail.
- Fix common repeated issues without any dependence on the administrator.
- Business users can initiate actions to fix issues directly from Action Center without navigating to other technology platforms, such as Workflow Studio, ServiceNow® Robotic Process Automation, or UiPath.



For detailed information, see Working with actions.

Connection Manager

Connection Manager enables you to add data from a third-party tool into Automation Center tables by correctly mapping and testing the data import.

Connection Manager helps you to add data from a third-party tool into Automation Center tables efficiently and in a few clicks.

For detailed information, see Working with Connection Manager.

Migration accelerator

Migration accelerator enables seamless, low-effort, cost-efficient migration of UiPath, Blue Prism, and Automation Anywhere automations to ServiceNow RPA Hub. It's a solution that minimizes downtime, maximizes reuse, and accelerates time-to-value.

For detailed information, see Migrating automations from third-party applications to RPA Hub.

Configuring Automation Center

You can plan and configure an Automation Center implementation in your organization.

Install Automation Center

If you have the admin role, you can install the Automation Center application (sn_ac). The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Automation Center application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Automation Center:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Automation Center.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Automation Center application (sn_ac) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you're displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

What to do next

The data in Automation Center Value dashboard is derived from the Performance Analytics (PA) tables. The PA jobs are scheduled to run at a specific time in the day. If you want to view the data immediately after the installation and before the scheduled run, then you have to manually run the PA jobs.

Configuring automation summary execution

Configure the execution summary of automation to specify how automation data is aggregated and presented on the Automation Center dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can import and configure data from various sources, such as RPA, ServiceNow flows, Document Intelligence (DocIntel), and others to view in the Automation Center dashboard.

Earlier, for data of different data sources different types of summarization was required. It was time-consuming. However, now there's a generic way to make updates to automation summary execution for data from different sources.

Create automation source type

Define the kind of source type that you want to import and use in Automation Center.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Administration** > **Automation Center** > **Automation Source Type**.
   The Automation source types page is displayed with a list of existing automation source types.
2. Select **New**.
   The Automation source types page is displayed.
3. Provide a name and description.
4. Select **Submit**.
   The Automation source types page is displayed with the newly created automation source type along with the other automation source types.

What to do next

Create automation source

Create automation source

Associate a data source for the selected source type.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Admininstration** > **Automation Center** > **Automation Source Type**.
   The Automation source types page is displayed with a list of existing automation source types.
2. Select the source type for which you want to create a source.
   The Automation source type page is displayed with the details of the source type.
3. Select **New** in the Automation Sources section.
   The Automation Source form is displayed.
4. On the form, fill in the fields.

Automation Source form

Field	Description
Name	Display name of the automation source. This name is displayed in the Automation Center dashboard.
Application	The associated application or the application scope in which the source is being created, such as Automation Center or RPA Hub. This is auto-populated.
Source Type	The source type for which you are creating the source. You can edit this field if required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Internal name	Automation source internal name. You can edit this field. Ensure that there are no spaces when you enter a value. This field is auto-generated.
Description	Description of the automation source.

5. Select **Submit**.

Note: One automation source type can have multiple sources associated with it.

What to do next

Configure execution summary

Configure execution summary

Configure the execution summary with the appropriate conditions.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Administration** > **Automation Center** > **Automation Sources**.
   The Automation sources page is displayed with a list of existing automation sources.
2. Select the source for which you want to configure the execution summary.
   The Automation source page is displayed with the details of the source.
3. Select **New** in the Execution Summary Configurations section.
   The Execution summary configuration form is displayed.
4. On the form, fill in the fields.

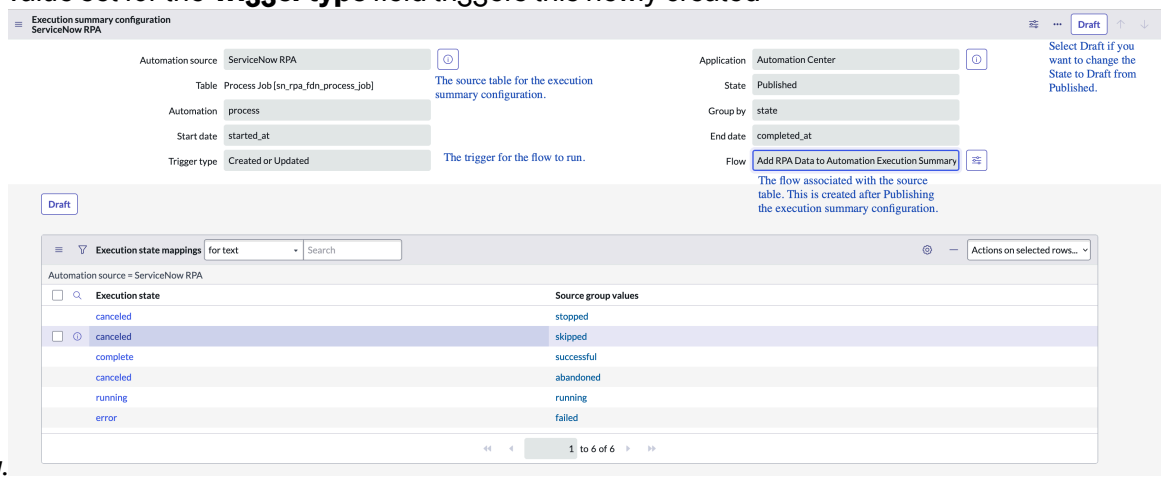
Execution summary configuration form

Field	Description
Automation source	The automation source that you've selected. This field is auto-populated.
Application	The associated application or the application scope in which the source is being created, such as Automation Center or RPA Hub. This field is auto-populated.
Table	The table from where you must import data.
State	The state of the execution summary configuration. This field is auto-populated.
Automation	The automation field from the selected table.
Group by	A field from the chosen table that you want to use to group the records.
Start date	Start time of the summary configuration.
End date	End time of the summary configuration.
Trigger type	An action that triggers the flow. The following values are available for trigger:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Created: Every time a record in the source table is created. ○ Updated: Every time a record in the source table is updated. ○ Created or Updated: Every time a record in the source table is created or updated. ○ Daily: Scheduled to run daily. ○ Weekly: Scheduled to run weekly. ○ Run once: Scheduled to run only once. ○ Monthly: Scheduled to run monthly. These triggers can be set in the associated flow.

5. Select **Submit**.
   You're taken to the previous page. When an execution summary configuration is created, a flow is automatically created to match the configuration. The value set for the **Trigger type** field triggers this newly created flow.



6. Select the summary configuration in the Execution Summary Configurations section.

   Note: One automation source can have only one execution summary configuration.

7. Select **Update**.

   Note: If you want to change the state of the execution summary from **Published** to **Draft**, select **Draft** at the top right of the page.

What to do next

Create execution state mapping

Create execution state mapping

Define the mapping for the source and target tables for the configuration to work as expected.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Automation Sources**.
   The Automation sources page is displayed with a list of existing automation sources.
2. Select the source for which you want to create the execution state mapping.
3. Select the execution summary configuration for which you want to create the execution state mapping.
4. Select **New** in the Execution state mappings section.
   The Execute state mapping page is displayed.
5. On the form, fill in the fields:

Execute state mapping form

Field	Description
Execution state	Options for the **State** field of the Automation Execution Summary table. The following values are available: ○ Canceled ○ Complete ○ Error ○ Queued ○ Running
Application	The associated application or the application scope in which the source is being created, such as Automation Center or RPA Hub. This field is auto-populated.
Source group values	Options for the "group by" field of the source.
Automation source	Name of the automation source that you've selected for this execution state mapping.

6. Select **Submit**.
   You're taken to the Execution summary configuration page.
7. Select **Publish**.

Result

The automation summary execution configuration is complete.

Track ServiceNow flows and actions as automations

Track ServiceNow flows and actions as automations so you can view summary and detailed information of the flows and actions in the Automation Center Workspace.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Automation Tracker**.
2. On the Automation Tracker page, select **New**.
3. On the form, specify the flow or action that you want to track as automation.
4. Select **Submit**.

Result

Refresh the Automation Trackers list to view the newly created automations.

Configuring UiPath with Automation Center

Easily view and analyze UiPath data from Automation Center.

You can view and analyze UiPath data in Automation Center using the *Automation Center* API and UiPath spoke. However, using UiPath spoke is more efficient and less time-consuming.

Before configuring UiPath with Automation Center, you must install the UiPath spoke on your instance. For more details, see UiPath spoke.

After the UiPath spoke is installed, the following two options are available:

- UiPath Webhook Registries
- UiPath WebHook Routing Policies

If an issue occurs while processing the UiPath data, an error message along with the actual payload is inserted as a record in the Import Error Log [sn_ac_import_error_log] table.

Note: The number of days the error records will be stored in the table is defined in the Automation Center purge system property (sn_ac.purge_automation_data_in_days).

Create UiPath webhook registry

Create UiPath webhook registries to establish a connection between UiPath and Automation Center.

Before you begin

Role required: none

Procedure

1. Navigate to **All** > **UiPath** > **UiPath Webhook Registries**.
2. On the UiPath Webhook Registries form, select **New**.
3. On the form, fill in the fields.
4. Select **Submit**.
   The record is created.
5. Open the record, select **Generate Callback URL** and **Secret**.
6. Copy the URL and secret and paste it in the Webhook section of the UiPath Orchestrator.
7. In the UiPath Orchestrator interface, select the events that you want to track.
   Currently, only **Job**, **Robot**, and **Process** events are supported.
8. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The connection is set between UiPath and Automation Center. Whenever you send UiPath data to the instance, it happens via the URL provided. UiPath spoke validates the secret and accepts the data.

Set UiPath WebHook routing policies

Set the UiPath WebHook routing policies to enable the data to get populated in the ServiceNow tables, and then used by Automation Center.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **UiPath** > **UiPath WebHook Routing Policies**.
2. Turn the **Active** flag for the routing policy to **True**.
   When UiPath data comes to the ServiceNow instance, these routing policies take care of triggering the corresponding flows to store data in ServiceNow tables. By default, the flag is set to **False**.

Tracking third-party automations

Track any third-party automations in Automation Center.

In Automation Center you can track any third-party automations. You can do that by using the `Automation Center` API.

For more information, see Automation Center API .

Customize the layout for an automation request form

Change the layout of the automation request form from the Service Catalog to meet the requirements of your organization requirements.

Before you begin
Role required: sn_ac.automation_admin

About this task
In this task, you can change the layout of the automation request form generated by navigating to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Modify catalog for Automation Request**.
2. **Optional:** On the form, if Global is the current application, select **here** in **To edit this record click here**.
3. Make the required changes.
   For example, in the Variables related list, if you want to change the **Process Name** field to **Process**, double-click the **Process Name** field, make changes, and then select **Save**.
4. Select **Update**.

Set Automation Center Properties

You must set the properties to define the default settings that are required for Automation Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

You must be in the same scope in which the record exists.

Procedure
1. Navigate to **All** > **Automation Center** > **Administration** > **Automation Properties**.
2. **Optional:** If the form isn't editable, ensure that the Application scope you are in is same as the one where the record is.
   If the form isn't editable, a message is displayed. Follow the message to change the Application scope.
3. On the form, fill in the fields.
   For a description of the field values, see Automation Center properties.
4. Select **Save**.

Configuring the Recommended Actions application with Automation Center

Configuring the Recommended Actions application to work with Automation Center enables you to reuse an existing request or plan your automation request based on an existing request.

Configuring the Recommended Actions application with Automation Center involves the following tasks:

Install Recommended Actions application

Install the Recommended Actions application to use its capabilities.

Before you begin
Role required: admin

Procedure
1. Find the#ServiceNow Recommended Actions application in store.
   Available in store with name - **Recommended Actions** and **Recommended Actions - Advanced**. You must install **Recommended Actions - Advanced** to get ML capabilities.
2. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
3. Select **Install**.

Set the Recommended Actions application system properties

Set the system properties for the Recommended Actions application to view the recommendations in the contextual panel of the Automation Center Workspace.

Before you begin
Note: In the recommendations list, only automations that are in Published and In-maintenance state are displayed and automation requests in all states except Publish state are displayed.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

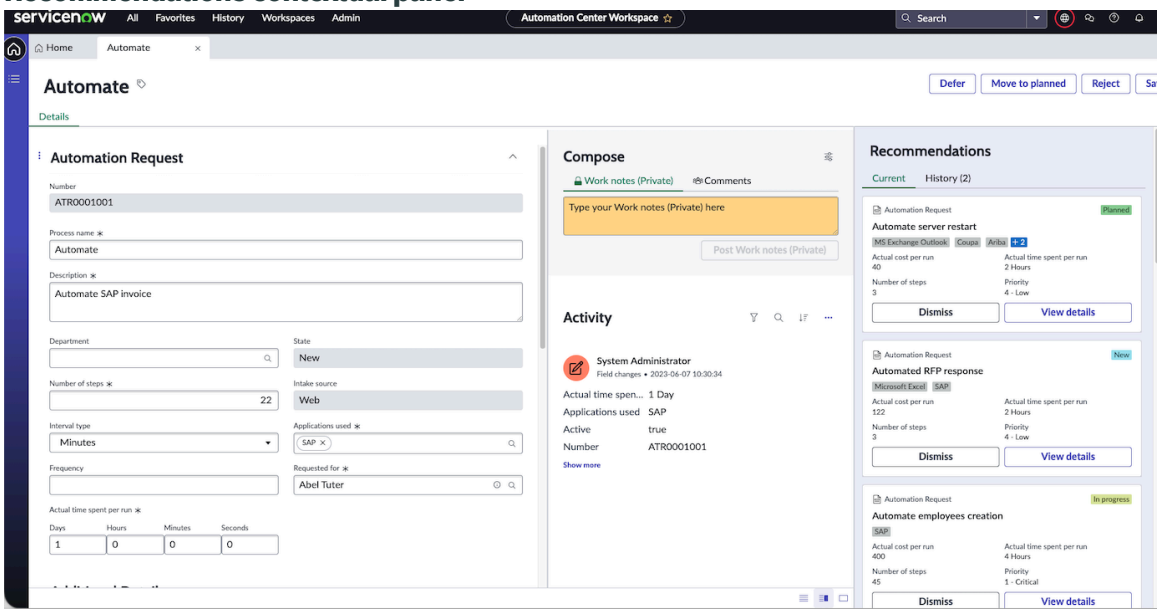
Procedure

Set the system property, **sn_ac.use_recommended_actions**, to **True**.

Result

The Recommendations contextual panel is displayed in the Automation Center Workspace.

Recommendations contextual panel



- Recommendations will be displayed in the contextual panel of the automation request record.
- Select **Dismiss** to remove the recommendation from the list.
- Select **View details** to view the details of the recommendation.
- If more than three applications are used for an automation request, then three are listed, and the rest are displayed as numbers. When you select **View details**, you can see all the applications used.
- All other details of the recommended automations and automation requests, such as state, actual cost, and actual time are also displayed.

Select option for Recommended Actions application

There are two options for the Recommended Actions application: String-based and ML-based. These options decide the kind of data that you get for your search. It displays data about automations in all states except the **Published** state.

Before you begin

Install the Recommended Actions application. For more information, see Install Recommended Actions application.

Recommended Actions searches for matching string in **Process name**, **Description**, and **Applications used** fields of the Automation requests form, and **Automation name**, **Description**, and **Source** in the Automation Attribute table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- String-based: Searches for the exact string in the same order as in the search criteria.

  This is a good option if you want to use short phrases or single words as your search criteria. By default, this option is enabled.

- ML-based: This is helpful if you have too much data and your search criteria is long. To use the ML-based recommendations, you need at least 10 records in Automation Center.

Role required: sn_ac.automation_technical_user and sn_nb_action.next_best_action_author

Procedure

1. Navigate to **All** > **Recommended Actions** > **Recommendations**.
2. Mark the **Active** flag to **true** for the required options.

   Note: To identify the options, check the names. The names that have **ML** appended at the end are for ML-based recommendations.

3. If you have chosen ML-based option, then perform the following steps:
   a. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution** > **Definition**.
   b. Open **Automation request process name similarity** and **Automation attribute automation name** separately.
   c. Select **Update & Retrain** for each one of them.
   After selecting **Update & Retrain**, the training will start in the scheduler. After it's complete, it displays **Solution complete**.

Working with ServiceNow Spotlight feature

Use the ServiceNow Spotlight feature to auto-calculate automation request scores. Scores define the execution priority of the automation request. The higher the score, the higher the priority of the automation request.

ServiceNow Spotlight calculates scores when an automation request is created or updated. It's calculated only when the automation request is in the **New** or **Deferred** state.

If there's any special need to have a different score than the auto-computed score, you can manually update the **Score** field. When you do that:

- The flag **Score manually altered** is turned on.
- The Spotlight score is computed and calculated in the **Score auto calculated** field.

You can switch over to using computed score by emptying the **Score** field or setting it to 0. After you save the request record, the system will populate the Spotlight score (if any) in the **Score** field.

Configuration Settings for ServiceNow Spotlight

To use the ServiceNow Spotlight feature, set the configuration settings.

If ServiceNow Spotlight and Automation Center are installed, you get the following system properties, scheduled job, and Spotlight group:

- System properties: sn_ac.use.spotlight.score.for.requests, sn_ac.use.spotlight.group.for.requests

  For detailed description of the system properties, see Automation Center properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Scheduled job: **Automation Center: Copy spotlight score into request**

  For detailed description, see Components installed with Automation Center.

- Spotlight Group: If ServiceNow Spotlight is enabled, you have the Spotlight group named "Automation request group" with default Spotlight criteria set up.

  ```
  /spotlight_groups.do?sys_id=e037711dc3a11110995486d91840dd03
  ```

  If you need a different criteria than the default criteria to set your execution priority, then you can customize the criteria to meet your requirements and create a new Spotlight group. For more information, see Create a Spotlight group

  For details about the default Spotlight criteria, see Default criteria.

Default criteria

ServiceNow Spotlight is available with default criteria. Each field provides a score based on the default criteria.

The default ServiceNow Spotlight criteria are given in the following tables.

Actual cost per run

Criteria	Score
Greater than 5000	500
Greater than 2500, and less than 5000	150
Greater than 0, and less than 2500	30

Users benefited

Criteria	Score
Greater than 500	500
Greater than 250, and less than 500	60
Greater than 0, and less than 250	25

Priority

Criteria	Score
Critical	1500
High	800
Moderate	45
Low	20

Manual steps (%)

Criteria	Score
76%-100%	150

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manual steps (%) (continued)

Criteria	Score
51%-75%	100
26%-50%	80
1%-25%	40

Business criticality declared

Criteria	Score
1-most critical	750
2-somewhat critical	450
3-ess critical	80
4-not critical	20

Set up ServiceNow Spotlight

Set up ServiceNow Spotlight to start using and getting the benefits of this feature. The Spotlight feature automatically calculates the execution priority of the automation requests.

Before you begin

Install ServiceNow® Spotlight. For more information, see the ServiceNow Spotlight documentation.

Role required: admin, pa_spotlight

Procedure

1. Turn on the usage of ServiceNow Spotlight by setting the system property, *sn_ac.use.spotlight.score.for.requests*, to **True**.
   /sys_properties.do?sys_id=2df8d6a3c3651110995486d91840dd65
2. If there are existing automation requests, execute the fix script: Initial setup of Automation Request Rank.
   /sys_script_fix_list.do?sysparm_query=nameLIKEsetup%20of%20automation%20request

   Note: At the end of this step, ideally there should be no records in this URL: /sn_ac_automation_request_list.do?sysparm_query=rankISNOTEMPTY%5EstateNOT%20IN3000%2C6000
3. Execute the Spotlight group: **Automation request group**.
   To do so, select the **Execute Now** button in the Spotlight group page. This action populates the Spotlights related list at the bottom of that Spotlight group page. /spotlight_groups.do?sys_id=e037711dc3a11110995486d91840dd03
4. Copy the initially computed scores to the requests using the scheduled script execution: **Automation Center: Copy spotlight score into request**.
   To do so, select the **Execute Now** button in the Scheduled Script Execution page. /sysauto_script.do?sys_id=d361d79dc3a11110995486d91840dd37

Applying Common Service Data Model guidelines to Automation Center

Apply Common Service Data Model (CSDM) to Automation Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSDM is the data framework that you follow when you set up ServiceNow products and applications. You adhere to the CSDM guidelines when you define configuration items (CIs) and relationships between CIs in the CMDB. This process ensures that your data resides in the appropriate CMDB tables for maximum value from your ServiceNow AI Platform applications.

CSDM is the data model standard for all products that use the Configuration Management Database (CMDB).

- The CSDM guidelines ensure unified data access for ServiceNow AI Platform products.
- The CSDM gives you clear direct prescriptive guidelines for service modeling within the CMDB.
- CSDM terms and definitions ensure consistent and accurate service reporting.
- The CSDM data model supports multiple configuration strategies and includes guidelines for using base-system tables and relationships.
- You can use the CMDB query builder to create reports showing CMDB configuration items (CIs) and their relationships.

For more information, see Common Service Data Model.

Automation Center product view

Use the ServiceNow® Automation Center application to govern your end-to-end multi-vendor automation life cycles from one place. By using real-time dashboards, you can manage and measure the health of the automation and prevent automation failures across multiple vendors.

- Discover, prioritize, and manage automation requests from different sources through the full life cycle in Automation Center workspace.
- Oversee and optimize automation performance versus business goals across multiple vendors.
- Monitor and manage the health of the automation and prevent automation failures across multiple vendors.

Automation Center and CSDM tables

Automation Center uses CSDM tables. Several ServiceNow products benefit from and add value to Automation Center.

CSDM tables used by Automation Center

- cmdb_ci: Stores all automations before they are displayed in the Automation Center dashboard.
- cmdb_ci_automation: Stores automations from cmdb_ci_flow_automation, cmdb_ci_base_rpa_process, and cmdb_ci_rpa_process.
- cmdb_ci_flow_automation: Stores flows that are tracked as automations.
- cmdb_ci_base_rpa_process: Stores third-party Robotic Process Automation data.
- cmdb_ci_rpa_process: Stores ServiceNow Robotic Process Automation data.
- cmdb_ci_base_rpa_robot: Stores third-party robot data.
- cmdb_ci_rpa_robot: Stores ServiceNow robot data.

Products that add value to Automation Center

When you use Automation Center with any of the following ServiceNow products, you increase the value you get from Automation Center:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Robotic Process Automation
- Integration Hub
- Document Intelligence

Automation Center use cases

Automation Center enables you to manage your automations from one central place.

You can create automations in the following ways:

- Using Automation Center.
- Using ServiceNow flows as automations.
- Using third-party automations.

All automations irrespective of where they're created are stored in the cmdb_ci table before being displayed in the Automation Center dashboard.

When flows are tracked as automations, the data is populated in the cmdb_ci_flow_automation table. From the cmdb_ci_flow_automation table, it's reflected in the cmdb_ci_automation table. This data is then reflected in the automation_attribute table. The automation field in the automation_attribute table is referenced in the cmdb_ci table. It is from here that the data is displayed in the Automation Center dashboard.

ServiceNow Robotic Process Automation data is populated in the cmdb_ci_rpa_process table. All third-party Robotic Process Automation data is stored in the cmdb_ci_base_rpa_process table. The data from these two tables is then reflected in the automation_attribute table. The automation field in the automation_attribute table is referenced in the cmdb_ci table. It is from here that the data is displayed in the Automation Center dashboard.

ServiceNow robot data is populated in the cmdb_ci_rpa_robot table. All third-party robot data is stored in the cmdb_ci_base_rpa_robot table. The data from these two tables is then reflected in the automation_attribute table. The automation field in the automation_attribute table is referenced in the cmdb_ci table. It is from here that the data is displayed in the Automation Center dashboard.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Automation Center

If you're an automation business user, technical user, or administrator, you can use the Automation Center application to create an automation task, resource, insight rule, and insight trigger. You can also move an automation request to different life cycle stages.

Working with automations

Create automations to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs.

You can create automation goals, automation requests, and the tasks associated with them.

Create an automation goal

Create an automation goal to manage the progress and estimate the outcomes of an automation request. One goal can be associated with multiple automation requests. But an automation request can be associated with only one goal.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Goals**.
4. Select **New**.
5. On the form, fill in the fields.
   For a description of the field values, see Automation goal form.
6. Select **Save**.

Related topics

Creating an automation request

Reinstate an automation goal

Reinstate an already achieved automation goal to restore and alter the scope of the automation.

Before you begin

Create an automation goal. For more information, see Create an automation goal.

Verify that the state of the automation goal is **Achieved**.

Role required: sn_ac.automation_business_user

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Goals**.
4. Open an achieved automation goal that you want to reinstate.
5. Select **Reinstate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the **Target date** field, specify the target date.

   Note: If you don't specify the target date and save the form, then when the goal is moved to the **Achieved** state, the target date is automatically set to one day later than the start date.

7. Select **Save**.

Creating an automation request

An automation request helps you to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs.

You can create an automation request in three ways. You can create a request by using the ServiceNow® Service Catalog, from Automation Center, or from Process Mining Workspace.

Submit an automation request from Service Catalog

Submit an automation request using the ServiceNow® Service Catalog form to automate your business processes to streamline, reduce time spent on manual activities, and reduce costs.

Before you begin

(Optional) Create an automation goal. For more information, see Create an automation goal.

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.
2. On the form, fill in the fields.
   For a description of the field values, see Submit an Automation Request form.
3. Select **Submit**.

What to do next

Move the automation request to **Planned** state. For more information, see Move an automation request to the Planned state.

Related topics

- Submit an Automation Request form
- Create an automation request from Automation Center

Create an automation request from Automation Center

Create an automation request from Automation Center to automatically streamline your business processes, reduce how much time is spent on manual activities, and reduce your costs.

Before you begin

(Optional) Create an automation goal. For more information, see Create an automation goal.

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **All Automation Requests**.
2. Select **New**.
3. On the form, fill in the fields.
4. Select **Submit**.
5. Complete the additional fields on the form, depending on your role.
6. Select **Save**.

> **Note:** If you have the sn_ac.automation_technical_user and sn_ac.automation_admin roles, you can view the Recommendations contextual panel. For more information, see Configuring the Recommended Actions application with Automation Center.

What to do next

Move the automation request to the planned state. For more information, see Move an automation request to the Planned state.

Related topics

- Automation request form from Automation Center
- Submit an automation request from Service Catalog
- Create an automation task
- Create an automation resource

Integration with Process Mining

Create an automation request from the Process Mining Workspace, which is outside of the Automation Center. If you have installed Process Mining and Automation Center, then you can create an automation request from the Process Mining Workspace.

If you have installed Process Mining and Automation Center, then you can create an automation request from the Process Mining Workspace.

You need the following roles:

- sn_ac.automation_business_user
- sn_ac.automation_technical_user
- sn_ac.automation_admin

For more information, see the Submit an automation idea .

Create an automation task

Create an automation task to effectively manage the activities associated with the automation request. However, this is an optional step.

Before you begin

Create an automation request. For more information, see Creating an automation request.

Verify that the associated automation request is either in the **Planned** or **In Progress** state.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

There are five types of automation tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Requirement
- Design
- Development
- Quality engineering
- Sign off

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to create and associate an automation task to.
5. On the **Automation Task** tab, select **New**.
6. On the form, fill in the fields.
   For a description of the field values, see Automation task form.
7. Select **Save**.
8. **Optional:** In the **Activity** and **Compose** fields, view the activity of the form, work notes, and additional comments.

What to do next

Create an automation resource for the automation task. For more information, see Create an automation resource.

Related topics

Automation task form

Create an automation resource

Create an automation resource

Create an automation resource to associate a resource to an automation task. However, this is an optional step.

Before you begin

Note: From the Washington DC release, this feature is deprecated.

Create an automation task. For more information, see Create an automation task.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

An automation resource is the person who is assigned to work on the automation task. One automation task can be associated with multiple automation resources.

Automation resource types:

- Development
- Quality engineering
- Product management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Tasks**.
4. Open the automation task that you want to create and associate an automation resource.
5. On the **Automation Resources** tab, select **New**.
6. On the form, fill in the fields.
   For a description of the field values, see Automation resource form.
7. Select **Save**.

What to do next
(Optional) Create an automation goal. For more information, see Create an automation goal.

Related topics

Automation resource form

Move an automation request to the Planned state

After creating an automation request, move it to the **Planned** state before you work on it or create associated automation tasks or resources.

Before you begin
Create an automation request. For more information, see Creating an automation request.

Verify that the state of the automation request is **New**.

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to move to the Planned state.
5. In the form header, select **Move to Planned**.

Result
After you move an automation request to the Planned state, it's ready for you to work on.

Move an automation request to the In progress state

As you begin the development for the automation request, move it to the **In progress** state. This state notifies anyone using Automation Center that the work for the automation is in progress.

Before you begin
Create an automation request. For more information, see Creating an automation request.

Verify that the state of the automation request is **Planned**.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to move to the In-progress state.
5. In the form header, select **Move to In progress**.

What to do next

Update the **Automation** field in the automation request form. This field is visible only when the state of the automation request is **In progress**. For more information, see Automation request form from Automation Center.

Defer an automation request

Defer an automation request from Automation Center if the priority of the request has changed and it is not urgent anymore.

Before you begin

Create an automation request. For more information, see Creating an automation request.

Verify that the state of the automation request is either **New** or **In Progress**.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

Deferring an automation request is one of the life-cycle stages of an automation request.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to defer.
5. In the form header, select **Defer**.

> ⚠ **Warning:** After you move an automation request to the Defer state, you can't change or delete the entries on the Automation request form, associated automation tasks, and resources.

What to do next

You can move the automation request to Planned state or reject the automation request. For more information, see Move an automation request to the Planned state and Reject an automation request.

Reject an automation request

Reject an automation request from Automation Center if it's a duplicate of an existing automation or if it doesn't meet the required criteria.

Before you begin

Create an automation request. For more information, see Creating an automation request.

After you reject an automation request, the life cycle of the automation request ends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task
Rejecting an automation request is one of the life-cycle stages of an automation request.

Procedure
1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to reject.
5. In the form header, select **Reject**.

> **Warning:** After you move an automation request to the Rejected state, you can't change or delete the entries on the Automation request form, associated automation tasks, and resources.

Result
The Rejected state is the end state of a request. There are no operations possible after that state.

Publish an automation request

Publish an automation request from Automation Center to make the request ready for execution.

Before you begin
Create an automation request. For more information, see Creating an automation request.

To publish an automation request, the associated automation tasks must be in one of the following states:

- **Closed complete**
- **Closed incomplete**
- **Closed skipped**

Verify that the state of the automation request is **In progress**, and map the required Automation CI records whose life-cycle stage status is **Published**. An automation CI record has details about an automation.

For details about mapping an automation request with automation CI record, see Map automations with automation request.

For all ServiceNow RPAs, an Automation CI record is available. For more details, see the RPA documentation.

For third-party RPAs, there are two scenarios:

- For historical data of process and robot, you must manually create records in the corresponding CMDB Base Process table (cmdb_ci_base-rpa_process) and CMBD Base Robot table (cmdb_ci_base_robot).
- For data of process and robot created after installing Automation Center, you must configure Rest API and send the process, robot, and execution details via Rest API and the records are created in the corresponding tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For further details, contact ServiceNow Customer Support.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request that you want to publish.
5. In the form header, select **Publish**.

> **Warning:** After you publish an automation request, you can't change or delete the entries in the automation request form, associated automation tasks, or resources.

Result

After you publish an automation request, the automation is ready for execution, which is the last stage in the automation request life cycle.

Create an agent for Task Mining requests

Create an automation request agent to efficiently manage the tasks of the Task Mining automation request without manual intervention.

Before you begin

Role required: sn_ac.automation_admin, sn_ac.automation_technical_user

Limitations and requirements

Consider the following when using this feature:

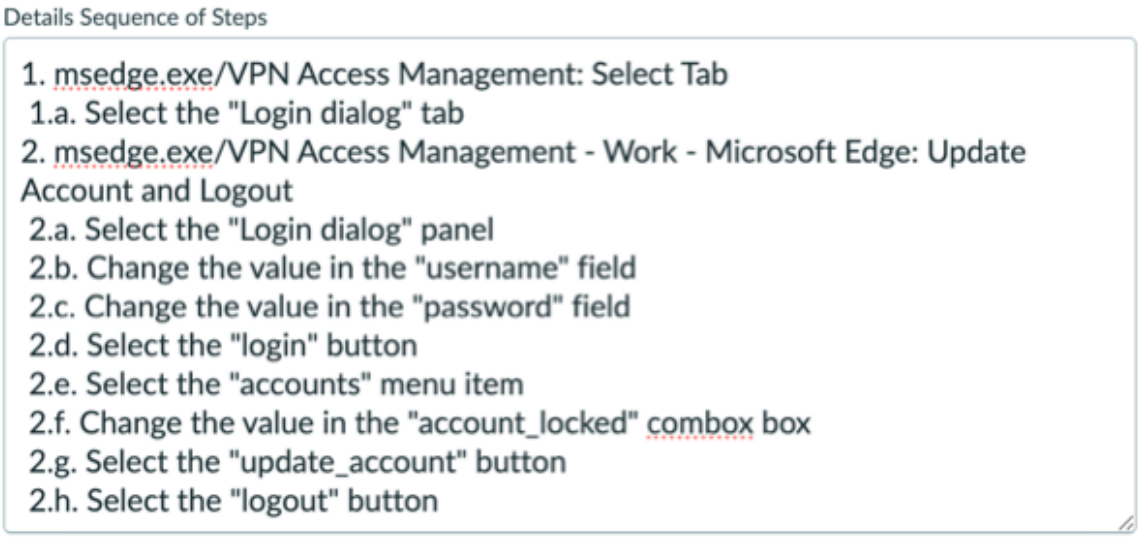
- Only requests created from Task Mining are supported. For more information, see Integration with Automation Center .
- User task step summarization skill must be activated and the automation request must be in **In progress** state. For more information about the skill, see Activate skills for ServiceNow Otto for Automation Center.

Procedure

1. Navigate to **Workspaces** > **Automation Center workspace**.
2. Select the list icon ( ).
3. Open an automation request.

   Verify that you have repeatable steps documented in the **Details Sequence of Steps** section of the form. This confirms that the agent can perform the tasks. If the steps are either missing or not appropriate, then an error message is displayed.

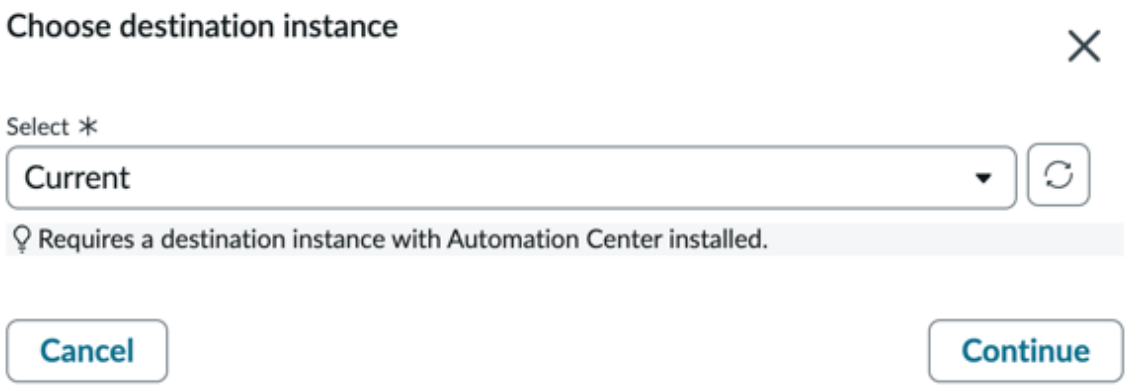
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Create agent** from the options at the top.

   Note: The **Create agent** option is available only if the User task step summarization skill is activated and the automation request is in **In progress** state.

   The **Choose destination instance** dialog box is displayed.



5. Choose an instance to create the agent in, and select **Continue**.
   You can select the current instance or any other instance. Verify that the instance you choose has Automation Center installed.

   To configure an instance, set the connection alias for the **AC Agent Enablement connection** alias. For information on configuring an instance, see Create a Connection & Credential alias.

   A summary of the agent that is in progress is displayed.

6. Select **Create agent in AI studio** after reviewing the content.
   For the detailed procedure to create an agent in AI Agent Studio, see Create an AI agent.

   The agent is created for the automation request.

Working with golive checklists

Create a golive checklist to automatically track items that must be reviewed before publishing the automation request. Every golive checklist is associated with an automation request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This section has the following subsections:

A checklist template is provided with the product. Here are the details.

Checklist Name: Automation Deployment Checklist

Task name	Task description
Business/Validation Sign-off	Confirm that the automation meets all business requirements and acceptance criteria. This involves a formal sign-off from the business owner or process SME, ensuring that the automation behaves as expected in staging/sub-production environments.
Development Sign-off	The development team must confirm that all development tasks are complete, including code review, peer review (if applicable), and all technical requirements have been implemented. The developer also ensures that environment-specific variables and hard-coded test values have been removed or appropriately managed through config files.
Testing/QE Sign-off	QA must validate that functional, regression, and negative testing is complete in sub-production (UAT or staging). A formal sign-off document or ticket must be attached to indicate readiness. Include validation of edge cases and exception scenarios, especially for business-critical automations.
Production Configuration Pre-check	Ensure that all required configuration elements are in place in the production environment: • Application URLs, credentials, and API endpoints are updated • Schedules, triggers, or event rules are properly set • Environment variables, secrets, and certificates are configured correctly
Monitoring, Logging & Alerting Setup in Production	Validate that all operational monitoring hooks are active in production: • Logging destinations (log servers, dashboards) are correctly pointed • Alerts (email/SMS/Slack/etc.) are routed to the correct stakeholders • Health checks are enabled, and baseline performance is captured for comparison
Automation Enablement & Final Readiness Review	A final checklist is completed jointly by Dev, QA, CoE, and Business SMEs. This includes:

Checklist Name: Automation Deployment Checklist (continued)

Task name	Task description
	• Setting the automation to “active/live” in production • Verifying all preconditions (input data, triggers, service availability) • Communicating go-live to impacted teams. This serves as the “green signal” to activate the automation in the production environment.

Create a checklist

Create a checklist to track the items for an automation request. A checklist is a list of tasks that you must track before publishing an automation request.

Before you begin

Role required: sn_ac.automation_admin

Note: The option to create a checklist is available only when the automation request is in the In progress state. For information about moving an automation request to the In progress state, see Move an automation request to the In progress state.

After the automation request is moved to the following states, the option to create a checklist isn’t available:

- Defer
- Publish
- Reject

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request for which you want to create a checklist.
   Ensure that the automation request is in the In progress state.
5. Select the Golive Checklist icon ( ) from the side panel.
6. Select **Create new** from the **Add checklist** list if you want to create a checklist.
   The Details form is displayed. A checklist is a list of tasks.

   You can create a template by yourself or use an available template. The available templates are listed in the drop-down.
7. Fill details in the Details form.

Field	Description
Name	Provide a name for the checklist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This is a mandatory field.
Description	Provide a description.
State	Provide a state. When a checklist is first created, the state is New. If you're updating an existing checklist, you can change the state manually.
Assignment group	Select an appropriate assignment group from the list.
Assigned to	Select a user who you want to view and re view the checklist. **Note:** The user must have the sn_ac.automation_technical_user role. Based on your choice in the **Assign ment group** field, this filed is populated.
Due date	Specify a due date in the provided format.

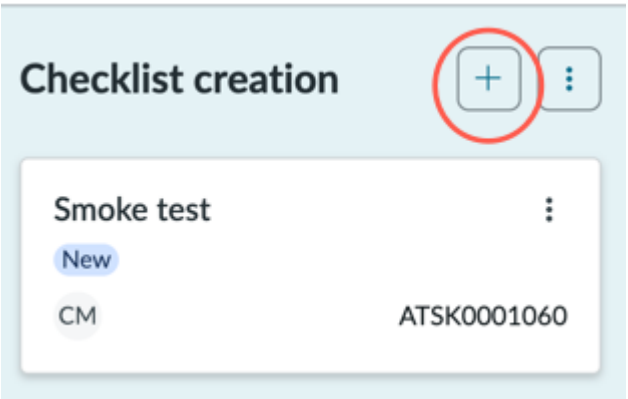
8. Select **Save**.

   On top of the task that you created, there's an arrow. Select the arrow to go to the main checklist window.

   You can also select the available checklist that is provided with the product. For information, see Working with golive checklists.

9. Select the + icon if you want to add more tasks to the checklist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Details form is displayed. Fill in the details.

Edit a task

Edit a task if you want to update the checklist.

Before you begin

Role required: sn_ac.automation_admin

After the automation request is moved to the following states, the option to edit a task isn't available:

- Defer
- Publish
- Reject

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request for which you want to delete a checklist.
   Ensure that the automation request already has a checklist.
5. Select the Golive Checklist icon ( ) from the side panel.
6. Select **Edit** or **Delete** from the details button for a task.

   If you select **Edit**, the Details form is displayed. Make the updates, and select **Save**.

   If you select **Delete**, select **Delete** on the confirmation window.

Clear a checklist

Clear a checklist if you no longer need the checklist for your automation request.

Before you begin

Role required: sn_ac.automation_admin

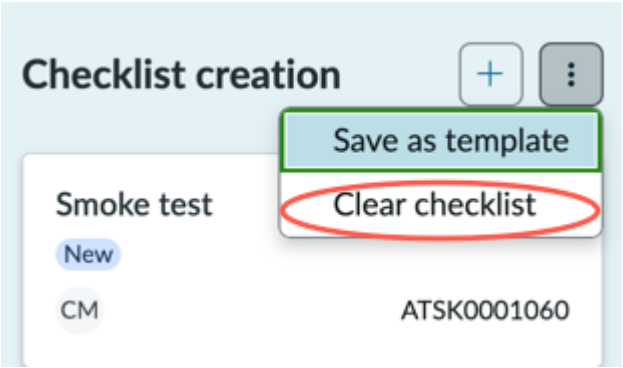
After the automation request is moved to the following states, the option to clear a checklist isn't available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Defer
- Publish
- Reject

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request for which you want to delete a checklist.
   Ensure that the automation request already has a checklist.
5. Select the Golive Checklist icon ( ) from the side panel.
6. Select **Clear checklist** from the details button.



7. Select **Clear** on the confirmation window.
   The checklist is deleted.

Create a template

Create a template when you think a golive checklist is useful for multiple automation requests.

Before you begin

Role required: sn_ac.automation_admin

After the automation request is moved to the following states, the option to create a template isn't available:

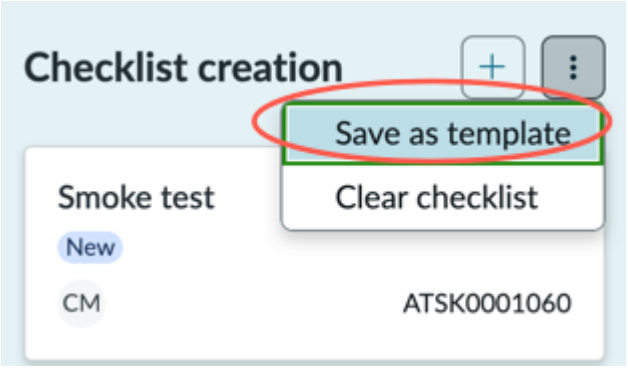
- Defer
- Publish
- Reject

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request for which you want to create a template.
   Ensure that the automation request has a checklist.
5. Select the Golive Checklist icon ( ) from the side panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Save as template** from the details button.



The **Save checklist as new template** form is displayed.

7. Provide a name.
The name must be unique in your domain.
8. Select **Save**.
The template is created. This template is available for others to add to their golive checklist. Now, this template is associated with the automation request.

Update a template

Update your template if you have changed the checklist and want those changes to reflect in your template.

Before you begin

Role required: sn_ac.automation_admin

After the automation request is moved to the following states, the option to update a template isn't available:

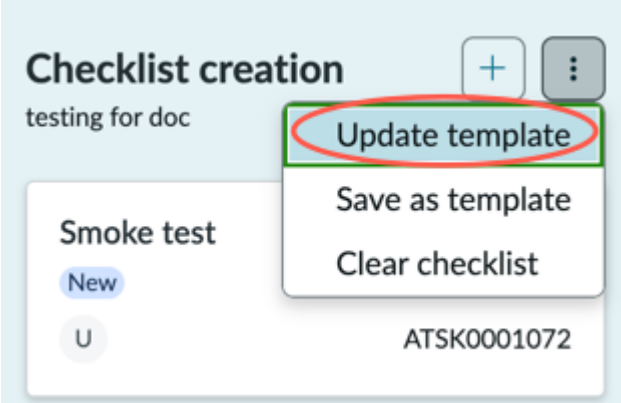
- Defer
- Publish
- Reject

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request for which you want to update a template.
Ensure that the automation request has a template.
5. Select the Golive Checklist icon ( ) from the side panel.
6. Make updates to the checklist.
You can add more tasks to the checklist or edit the existing tasks. To add more tasks, follow the same steps as creating a checklist in Create a checklist. To edit or delete a task, see Edit a task.
7. Select **Update template** from the details button to ensure that your changes are reflected in your template.

Note: The **Update template** option is available only for the templates that are created by you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The template is updated with your changes.

Update task status

Update the status of a task so that it's the latest and helps in the publishing of the automation request.

Before you begin

Role required: sn_ac.automation_admin or sn_ac.automation_technical_user

After the automation request is moved to the following states, the option to update a task isn't available:

- Defer
- Publish
- Reject

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.
4. Open the automation request for which you want to create a template.
   Ensure that the automation request has a checklist.
5. Select the Golive Checklist icon ( ) from the side panel.
6. Follow the steps in the Edit a task section to update the status of the task.

Map automations with automation request

Map automations in Published state with an automation request to publish the automation request.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Note: The cost saved and time saved values for an automation are calculated by moving average method. The moving average is controlled by the *sn_ac.savings_averaging_window* system property. For more information, see Automation Center properties.

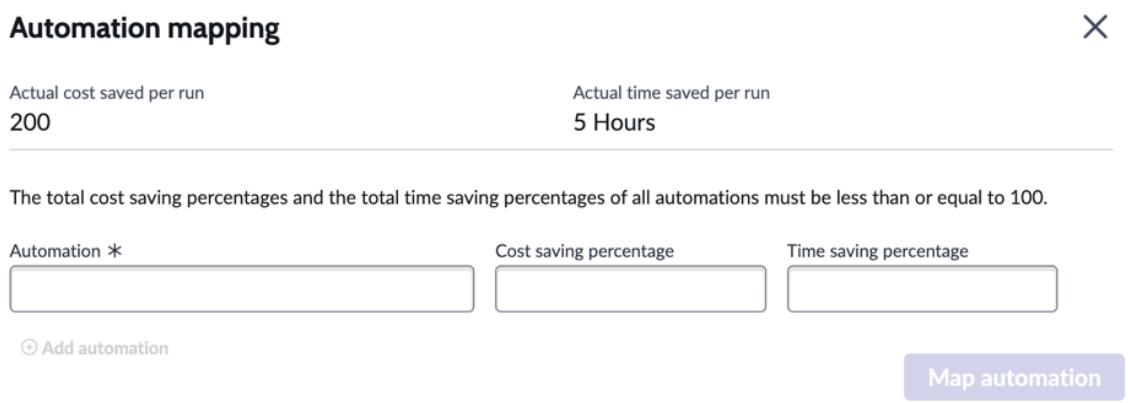
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Build**, select **All Automation Requests**.

   Note: Ensure that the automation request is in In Progress state.

4. Select the **Automation Mappings** tab.
5. Select **Map automation**.
   The Automation mapping window is displayed.



6. Provide the details.

Field	Description
Automation	Double-click to select an automation from the available list. For publishing an automation request, you must have at least one automation mapped to the request. Also, the mapped automations must be in the Published state.
Cost saving percentage	Specify the percentage of the cost that this automation saves for the automation request. If the actual cost saved per run is $200, and this automation saves 50%, then this automation saves $100.
Time saving percentage	Specify the percentage of the time that this automation saves for the automation request. If the actual time saved per run is 4 hours, and this automation saves 50%, then this automation saves 2 hours.

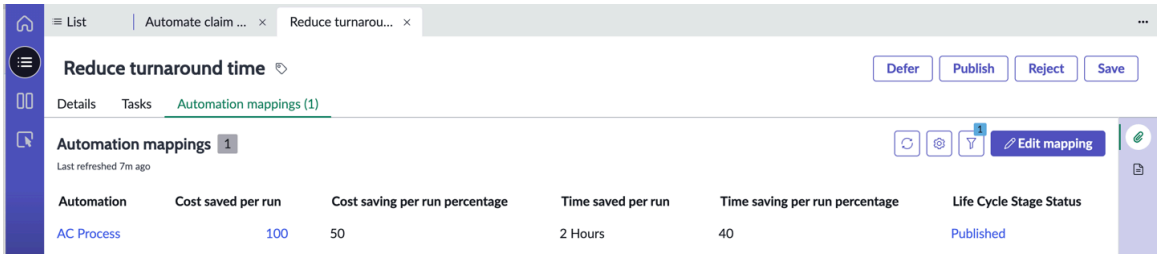
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

The total cost saving percentages and the total time saving percentages of all automations must be less than or equal to 100.

You can edit the cost and time savings percentage manually from the form view of the automation attribute record.

However, if the cost and time saved per run are manually updated, the **Cost saving percentage** and **Time saving percentage** fields in the Automation Mapping form are empty and non-editable. Also, the moving average is not calculated for the edited automation.



Example:

In the automation request, the actual cost saved per run was specified as $200 and the actual time saved per run was specified as 5 hours.

In the mapping, the Cost saving percentage was specified as 50% and the Time saving percentage was specified as 40%.

The values for the mapping are auto-calculated based on the input provided as shown in the Automation mappings screenshot.

7. **Optional:** Select **Add automation** to add multiple automations.
8. Select **Map automation**.
   The automation is mapped.
9. **Optional:** Select – beside a row, and select **Map automation** to delete the mapped automation.

   Note: You can't delete the first automation that you have mapped.

10. **Optional:** After creating the mapping, select **Edit mapping** to edit the existing mappings or add new mappings.

Update an automation attribute

Update an automation attribute to include the automation source and time savings information. This information is available in the Automation Center Value dashboard for analysis.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin.

About this task

When you create an automation request from Automation Center, you already provide the cost-saved and time-saved values. That information is displayed in the Automation Center Value dashboard. If required, you can update the values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When data is sent from ServiceNow RPA and flows or any third-party vendor, the cost-saved and time-saved fields must be updated manually.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Attributes**.
4. Select an automation attribute that you want to update, and then select **Edit**.
5. On the form, fill in the fields.

> **Note:** Only **Cost saved per run** and **Time saved per run** fields can be updated. The other fields are auto-generated.

Automation attribute form

Field	Description
Automation	Associated automation.
Cost saved per run	Cost saved after each run of the automation.
Published Date	Published date of the associated automation. You can edit this auto-generated field.
Source	Associated automation source.
Time saved per run	Time saved after each run of the automation.

6. Select **Update**.

Enable granular integration for automations

Enable granular integration for automations to capture cost saved and time saved at the transaction level. This feature makes the total cost-saved and total time-saved data analysis effective.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin.

> **Important:** This feature is available only for those automations that have ServiceNow® Robotic Process Automation version 10.0.0 and later.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Administration**, select **Automation Attributes**.
4. Select the link on the **Class** column for an automation with the source name as **ServiceNow RPA**.
   The details section is displayed.
5. From the ellipses on the right top, select **Enable Granular Integration**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A confirmation message is displayed.

6. Select **Enable Granular Integration** on the confirmation window.
   You're automatically taken to the **Granular Integration** tab.
7. Select **Add queues**.
   A window is displayed enabling you to add queues.

8. Provide the details.

Field	Description
RPA Work Queue	Select a queue from the list. If you don't see any queue in the list, you must add queues to the Bot Process. **a.** Navigate to **All** > **Automation center** > **Monitor** > **All Bot Processes**. **b.** Select the automation for which you're enabling the granular integration. **c.** Add queues from the **Related Links** section.
Cost saved per item	Specify the cost that is saved per work item.
Time saved per item	Specify the time that is saved per work item.

9. **Optional:** Select **Add queues** to add multiple queues.
10. Select **Map queues**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The queues are mapped for the automation and the granular integration is enabled. From the next execution after 24 hours, the data is displayed in the **Active automations** widget in the **Overview** dashboard. Granular data ensures that the cost-saved and time-saved data is displayed at item level making it more accurate.

The data of the granular integration can be seen in the Automation Transaction Summary table.

11. **Optional:** Select – beside a row to delete the mapped queue.

    Note: You can't delete the first queue that you have mapped.

12. **Optional:** To disable granular integration, from the ellipses on the right top, select **Disable Granular Integration**.
    The queue remains, however, granular data integration isn't used to calculate the time and cost saved.

Manage and review automation executions

Manage and review your automation executions, including their states, so that you can make sure that they are on track.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **Automation Executions**.
4. Open the automation execution that you want to view.
5. Review the information on the Automation Executions page.

Related topics

Automation execution form

Review the bot processes

Review a list of available bot processes in Automation Center, so that you can make sure that they are on track.

Before you begin

Roles required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin.

In addition to the Automation Center roles, you will also need the Robotic Process Automation (RPA) roles. For more information on RPA roles, see Components installed with RPA Hub.

About this task

A bot process is a configuration of the robot.

You can't create a bot process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **All Bot Processes**.
4. Open the bot process that you want to view.
5. Review the information on the bot process page.

View the available robots

View a list of available robots in Automation Center for reference purpose.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

In addition to the Automation Center roles, you will also need the Robotic Process Automation (RPA) roles. For more information on RPA roles, see Components installed with RPA Hub.

About this task

A robot is a software agent that runs a bot process.

You can't create a robot.

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **All Robots**.
4. Open the robot that you want to view.
5. Review the information on the robot page.

Create an insight rule

Create an insight rule to generate custom insights for an automation business process.

Before you begin

This task must be performed in the classic environment.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Select **New**.
3. On the form, fill in the fields.
4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Insight rule form

Create an insight trigger

Create an active insight trigger so that you can run the related insight rule.

Before you begin

This task must be performed in the classic environment.

Create an insight rule. For more information, see Create an insight rule.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

An insight trigger activates the associated insight rule to run.

An insight rule doesn't run unless it's mapped to an insight trigger.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Open the insight rule for which you want to create and associate an insight trigger to.
3. On the **Automation Insight Triggers** tab, select **New**.
4. **Optional:** If the **New** button is unavailable, ensure that the Application scope you are in is same as the one where the record is.
   A message is displayed if the **New** button is unavailable. Follow the message to change the Application scope.
5. Select the appropriate type of insight trigger that you want to create:
   - Map to an existing business rule
   - Map to a new scheduled script
   - Map to an existing scheduled job

Map an insight rule to an existing business rule

Map an insight rule to an existing business rule to define the type of insight trigger. This insight trigger activates the associated insight rule to run.

Before you begin

This task must be performed in the classic environment.

Create an insight rule. For more information, see Create an insight rule.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

An insight trigger activates the associated insight rule to run.

An insight rule does not run unless it is mapped to an insight trigger.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Open the insight rule that you want to create and associate an insight trigger to.
3. On the **Automation Insight Triggers** tab, select **New**.
4. Select **Map to an existing business rule**.
5. On the form, fill in the fields.

Automation CRUD Trigger form

Field	Description
Name	Name of the insight trigger.
Active	Option for ensuring the use of the insight trigger.
Business rule	Applicable business rule that is required to trigger the insight rule. The mapped business rule script field must contain the `new sn_ac.ACInsightTriggerUtil(current, previous).raiseInsightByBR(<Business Rule SysId>);` API to trigger the insight rule.
Application	Application that is associated with the insight trigger.
Automation insight rule	Associated automation insight rule.

6. Select **Submit**.

Map an insight rule to a new scheduled script

Map an insight rule to a new scheduled script to define the type of insight trigger. This insight trigger activates the associated insight rule to run.

Before you begin

This task must be performed in the classic environment.

Create an insight rule. For more information, see Create an insight rule.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

An insight trigger activates the associated insight rule to run.

An insight rule does not run unless it is mapped to an insight trigger.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Open the insight rule that you want to create and associate an insight trigger to.

Write a script for an automation message variable

Write JavaScript code input for variables that are added in the message of an insight rule.

Before you begin

This task must be performed in the classic environment.

Create an insight rule. For more information, see Create an insight rule.

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

About this task

When an insight rule is processed, it generates an insight. Insights appear on the Insights widget in the Executions dashboard of Automation Center Workspace.

An insight trigger activates the associated insight rule to run.

An insight rule doesn't run unless it's mapped to an insight trigger.

Procedure

1. Navigate to **All** > **Automation Center** > **Administration** > **Insight Rules**.
2. Open an insight rule that you want to write JavaScript code for the associated message variable.
3. On the **Automation Message Variables** tab, select a variable.
4. On the form, fill in the fields.

Automation message variable form

Field	Description
Name	Name of the automation message variable. This field is auto-generated.
Field	Qualifier for message variable. Values in this list appear depending on the entry that is selected in the **Applies to** field while you're creating an insight rule. This field appears only when the **Applies to** field is selected and when the **Threshold type** field is empty, while you're creating an insight rule. For more information, see Insight rule form.
Application	Name of the associated application. This field is auto-generated.
Automation insight rule	Name of the associated insight rule. This field is auto-generated.
Advanced	Advanced script. This field is auto-generated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Script	Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting. For example, to return a value, enter `return 100;`. This field doesn't appear when the **Applies to** field is selected and when the **Threshold type** field is empty, while you're creating an insight rule. For more information, see Insight rule form.

5. Select **Update**.

View automation insights

View automation insights to view the generated insights from the insight rules in Automation Center Executions dashboard.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Automation Center Home**.
2. Select the list icon ( ).
3. On the **Lists** tab, under **Monitor**, select **Insights**.
4. Open the insight that you want to view.
5. Review the information on the Automation insight page.

Insight rule form

Working with actions

Create actions to fix issues that cause automations to fail.

You can create action requests and actions.

Creating an action request

An action request helps you to automatically solve issues that cause automations to fail, improving efficiency and saving time and cost.

You can create an action request in two ways. You can create a request by using the ServiceNow® Service Catalog or from Automation Center.

Submit an action request from Service Catalog

Submit an action request using the ServiceNow® Service Catalog form to request for actions to resolve issues causing your automations to fail.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.
2. On the form, fill in the fields.
   For a description of the field values, see Submit an Automation Request form.
3. Select **Submit**.

Create an action request from Automation Center

Create an action request from Automation Center to request for actions to resolve issues causing your automations to fail.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **All Automation Requests**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Automation request form from Automation Center.
4. Select **Submit**.
5. Complete the additional fields on the form, depending on your role.
6. Select **Update**.

Creating an action

Create an action to empower users to fix issues automatically.

As a technical user or system administrator, you must create actions based on user requests.

If a user faces an issue due to which an automation is frequently failing, the user will create an action request. Based on the action request, you need to create an action.

Create a flow, subflow, or action in Workflow Studio

Create a flow in Workflow Studio to automate fixing repeated issues that cause automations to fail in Automation Center.

Before you begin

Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

Navigate to **All** > **Process Automation** > **Workflow Studio**.
For detailed information, see Create a flow in Workflow Studio.

Important: The flow, subflow, or action that you create must be client-callible. Create an ACL that can call this flow. This flow must be published.

© 2026 ServiceNow, Inc. All rights reserved.

What to do next
Create an action category

Create an action category

Create an action category to associate with an action. Action categories help users to categorize the actions into different categories, which would make selecting categories easier.

Before you begin
Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Action Categories**.
2. Select **New**.
3. On the Action Categories form, fill in the fields.

Action Categories form

Field	Description
Name	An intuitive name for the action category.
Application	Scope of the action category. This is auto-populated. Do not edit this field.
Description	Description of the action category.
Parent	Select an action category if you want to attach the new category with another one.

4. Select **Submit**.

Result
The action category is created.

What to do next
Create an action type

Create an action type

Create an action type to associate with an action category. Action types are a sub-set of action category. They are used for easier identification based on need.

Before you begin
Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation center** > **Build** > **Action Categories**.
2. From the list of action categories, select an action category for which you want to create an action type.
3. Select **New** from the **Action Type** area.
4. On the form, fill in the details.

Field	Description
Name	An intuitive name for the action type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	Scope of the action type. This is auto-populated. Do not edit this field.
Description	Description of the action type.
Parent	The action category that you have selected is automatically populated. Do not edit this field.

5. Select **Submit**.

What to do next
Create an action

Create an action

Create an action to view and execute in Action Center to fix issues that cause automations to fail in Automation Center.

Before you begin
Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Actions**.
2. Select **New**.
3. On the Action Details form, fill in the fields.

Action Details form

Field	Description
Number	Unique number that is auto-populated.
Application	Scope of the action.
Name	Intuitive name for the action.
Category	Select an action category that you want to associate with the action.
Type	Select the type of action category that you want to associate with the action.
Action Type	The type of action that is created in Flow designer. The available values are **Flow/Subflow** and **Action**.
Action	The action that you have created in Flow Designer. **Note:** You cannot map one flow, subflow, or action created in Flow Designer to multiple actions in Automation Center.
Active	This is a non-editable field.
Enable concurrent executions	Select this option if you want to execute the same action concurrently in Action Center.
Description	Description of the action.
Execution instructions	Any execution instructions that you want to provide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit** to save the action.
5. Select **Activate** only if there are no more changes expected for the associated action.
   If you select **Activate**, you cannot make any other changes to the action configuration, that is the **Action Type** and **Action** fields. The other fields can be updated.

Execute actions in Automation Center

Execute an action to fix common repeated issues efficiently.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Action Center icon ( ) on the left.

   - In the **Recents** section, all actions that have been executed are displayed.
   - You can view all the actions that have been executed by selecting the **View list** button in the **Recents** section.
   - In the **All actions** section, all available actions are displayed. You can search for any action or filter and sort your results.
3. In the **All actions** section, select **Execute** for any available action that you want to run.
   A new page is displayed with additional information.
4. Provide all required information, and select **Run**.
   The action is run and displayed in the **Recents** section.

Manage actions

Manage the actions to set permissions of who can access the actions and view any details or logs of the executed actions.

As an administrator or technical user, you must set permissions of who can access the actions available in Action Center. Setting permissions for actions makes Action Center less cluttered for users. Secondly, it ensures that users have only those actions that they require.

After the actions are executed, you can view the logs to understand details of the executions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create assigned groups

Create assigned groups to limit the availability of the action to a specific group.

Before you begin

Role required: sn_ac.automation_technical_user and sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the Action Center icon () on the left.
3. Select an action.
   The details are displayed
4. Select the **Assigned Groups** tab.
5. Select **New**.
6. Specify the group to which you want to assign permissions to view and execute the action.
7. Select **Save**.

View action logs

View action logs to see details of actions that are executed.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the Lists icon () on the left.
3. Select **Monitor** > **Action Logs**.
4. The logs of all executed actions is displayed.

Working with reviews

Reviews enable you to evaluate automations that have been created.

Create a review request when you want the COE team to review an automation and analyze if the automation is required.

Creating a review request

Review request enable you to review the automations.

You can create an action request in two ways. You can create a request by using the ServiceNow® Service Catalog or from Automation Center.

Submit a review request from Service Catalog

Submit a review request using the ServiceNow® Service Catalog form to request for reviews to review automations.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, catalog_admin, or sn_ac.automation_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **Submit an Automation Request**.
2. On the form, fill in the fields.
   For a description of the field values, see Submit an Automation Request form.
3. Select **Submit**.

Create a review request from Automation Center

Create a review request from Automation Center to request for reviews to review automations.

Before you begin
Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Automation Center** > **Build** > **All Automation Requests**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Automation request form from Automation Center.
4. Select **Submit**.
5. Complete the additional fields on the form, depending on your role.
6. Select **Update**.

Working with Connection Manager

Connection Manager enables you to add data from a third-party tool into Automation Center tables by correctly mapping and testing the data import.

Create an automation source

Create an automation source to start importing data from any third-party tool.

Before you begin
Role required: flow_designer, delegated_developer, sn_ac.automation_technical_user, or sn_ac.automation_admin

About this task
The following steps must be followed in the same order to create an automation source in Automation Center.

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Connection Manager icon () on the left.
3. Select **New source**.
   The Add automation source page is displayed. Perform the following steps in the same order.

Define source for automation

Define the source that you want to add for your automations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Provide details on the **Define source** form.

Define source form

Field	Description
Source name	Provide a unique and intuitive name for your automation source. **Note:** Source name can contain only underscores and alphanumeric characters.
Description	Provide a description that details the purpose of the automation source.
Source type	Provide the name of the source from where you want to import data. For example, ServiceNow® Robotic Process Automation. If you want to create your own source type, select Add source type. On the form, provide a name, select an icon, and then select **Add**. The source type is now available in the list of source types. Select it from the list.

2. Select **Save and continue**.
The **Configure data import** section is displayed with the **Schedule import** section made available to schedule the import of automation data.

Configuring data import

Configure the details of the data import, such as the kind of data, the schedule of the import, and so on.

Perform the following tasks in the same order to configure importing your automation data.

Schedule data import

Schedule the frequency for the data import to ensure that the automation data is updated as required.

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Define source** tab. For information on defining source, see Define source for automation.

Procedure

1. Provide the details on the form.

- **Daily**: Schedules the data import daily.

  Enter a time when the data must be imported daily.

  You can provide the time in 12-hour format or 24-hour format.

- **Weekly**: Schedules the data import weekly.

  a. Select a day of the week when the data must be imported from the **Select Day** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Enter a time when the data must be imported.

You can provide the time in 12-hour format or 24-hour format.

- **Monthly**: Schedules the data import monthly.

a. Select a specific date of the month when the data must be imported from the **Select Date** list.

b. Enter a time when the data must be imported daily.

You can provide the time in 12-hour format or 24-hour format.

- **Run once**: Schedules the data import only once.

Select the calendar icon on the Select Date field, and select a specific date and time when the data must be imported.

- **Repeat**: Schedules the data import at a custom frequency.

Select a custom frequency for your data import. Use this option if you want to import data in a frequency that does not match to any other frequency provided here, such as weekly, monthly, and so on. For example, you could set the frequency to bi-weekly or once in three months.

a. Provide a value in the **Days** field.

If you provide 20, the data import will happen once every 20 days.

b. Enter a time when the data must be imported.

You can provide the time in 12-hour format or 24-hour format.

2. Select **Save and continue**.
The **Select spoke** section is displayed.

Select a spoke

Choose a spoke to set up a connection. This is an optional step.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

If your spoke isn't already installed, ensure to install it first.

Proceed from the **Schedule data import** section. For information on scheduling data import, see Schedule data import.

Procedure

1. Select a spoke.
You can sort the available spokes alphabetically using the Sort by field. You can search a spoke by name in the Search field.
2. Select **Save and continue**.
If you want to skip this section, select **Skip**.

The **Select action** section is displayed.

Select an action

Select an action suitable for your data import into ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Select a spoke** section. For information on selecting a spoke, see Select a spoke.

Important:

- Only actions that include a REST step and that are active and published are listed.
- Select an action that has the output type as "array.output". Else, the data is not available for import.

Procedure

1. Select an action.
   If you want to create a new action, select **Create action**. For detailed information, see Creating an action.
   - Select a spoke from the **Spoke** list to view only those actions that are associated with the selected spoke.
   - Sort the list alphabetically using the **Sort** field.
   - Search an action by its name from the **Search** field.
2. Select **Save and continue**.
   The **Configure batch import** section is displayed.

Configure batch import for data

Configure batch import of data to specify the pagination method for importing large data sets.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Select an action** section. For information on selecting a spoke, see Select an action.

Procedure

1. Provide the details on the form.

Define source form

Field	Description
Action details	Review input and output details to customize the data flow for your specific needs.
Select output type	Select the output type value from the list. Only actions that have the output type as "array.output" have a value displayed here.
Select batch import method	Select a batch import method. The right batch import method helps to manage data efficiently. Batching can help improve performance, handle errors, and ensure data freshness in large imports. The following batch import methods are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **None**: Import data in a single request. Select this if you do not want to use the pagination method provided in Automation Center. ○ **Offset**: Import data in batches using an offset value. ○ **Time based**: Import data in batches based on time intervals. ○ **Token based**: Import data in batches using a continuation token.
Generate flow template	Select this button to generate a flow. After the flow is generated, edit it to set up input parameters and pagination for large imports. ○ Establish the necessary input parameters (static or dynamic): For example, when you import automation records from a third-party tool, send a dynamic value such as Automation Status, or a static value such as "Retry Limit = 3". ○ Link pagination for large data sets: For example, if you have 1,000 or more automation records, setup the pagination to process 100 records per page by indicating both the page number and page size.

The flow is generated and you are guided to edit the flow.

2. Select **Continue to edit flow**.

   The Workflow Studio page is displayed.

   Note: Edit the flow as per your requirement. For information on editing a flow, see Edit flow in Workflow Studio.

   Do not activate the flow at this point.

3. Select **Verify flow** to verify if the flow is correct.
   This step verifies if the selected action is available in the flow.
4. Select **Save and continue**.
   The **Verify and test** section is displayed.

Edit flow in Workflow Studio

Edit the flow to confirm that the pagination is implemented correctly. This confirms that the data is imported correctly.

There are four batch import methods:

- None
- Offset
- Time based
- Token based

None batch import

Select the none batch import method if you do not want to use the pagination method provided in Automation Center. There is no step required here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Offset-based batch import

Select the offset-based batch import method (pagination method) if you want to import data using a specific start point (offset) and a batch size (limit).

https://player.vimeo.com/video/1089874880?h=dc53f7fea9&badge=0&autopause=0&player_id=0&app_id=58479

- **Offset**: The starting point for importing data.
- **Total items**: The total number of records that you want to import.
- **Limit**: The number of records to import in each batch.

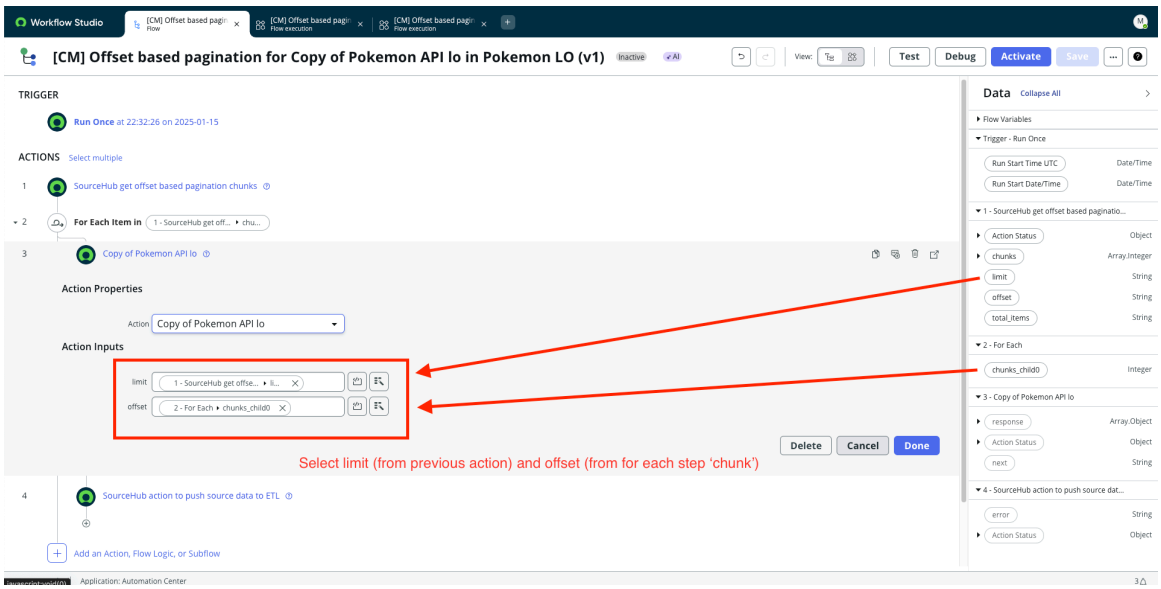
For example: If you set the offset to 20, total items to 200, and limit to 10, then the system will import data in batches of 10 records starting from record 20 and continuing until all 200 records are imported.

Steps to configure

1. In the **SourceHub get offset based pagination chunks** action, specify values for the offset, total items, and limit fields, and then select **Done**.

   After the values are defined, the **chunks_child0** field will be available in the right-hand panel (under **For Each**).

2. For the action you selected during the **Select Action** step, map the limit from **SourceHub get offset based pagination chunks** action and offset values using the **chunks_child0** field output generated by the **SourceHub get offset based pagination chunks** action.



Handling actions that don't support limit and offset

Map the limit and offset values in your action using the output returned by the SourceHub get offset based pagination chunks action.

If your selected action doesn't have predefined parameters for offset-based pagination but includes a filter that can accommodate these parameters, you can do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Option 1**: Add an action just before your selected action to handle the limit and offset. This action should generate a query that the primary action can use to fetch data.
- **Option 2**: Copy your primary action, modify it to include inputs for limit and offset, and process these inputs to create a query. Pass this query to the filter of your original action.

Note: If you choose Option 2, ensure that you create a copy of the original action first. After copying, reselect the copied action in the **Select Action** step and regenerate the flow. For information about selecting an action, see Select an action.

3. Select **Done** and **Test**.
4. Follow steps 3 onwards in Configure batch import for data.

Time-based batch import

Select the time-based batch import method if you want to import data for a specific date range.

https://player.vimeo.com/video/1089874860?h=192adc6f16&badge=0&autopause=0&player_id=0&app_id=58479

Steps to configure

1. In the **SourceHub get date based pagination chunks** action, specify the start date and end date, then click **Done**.

   After you values are defined, the **range** field in your right panel is available.

2. For the action you selected during the **Select Action** step, map the start date and end date values using the **range** field output generated by the **SourceHub get date based pagination chunks** action.

   Date format

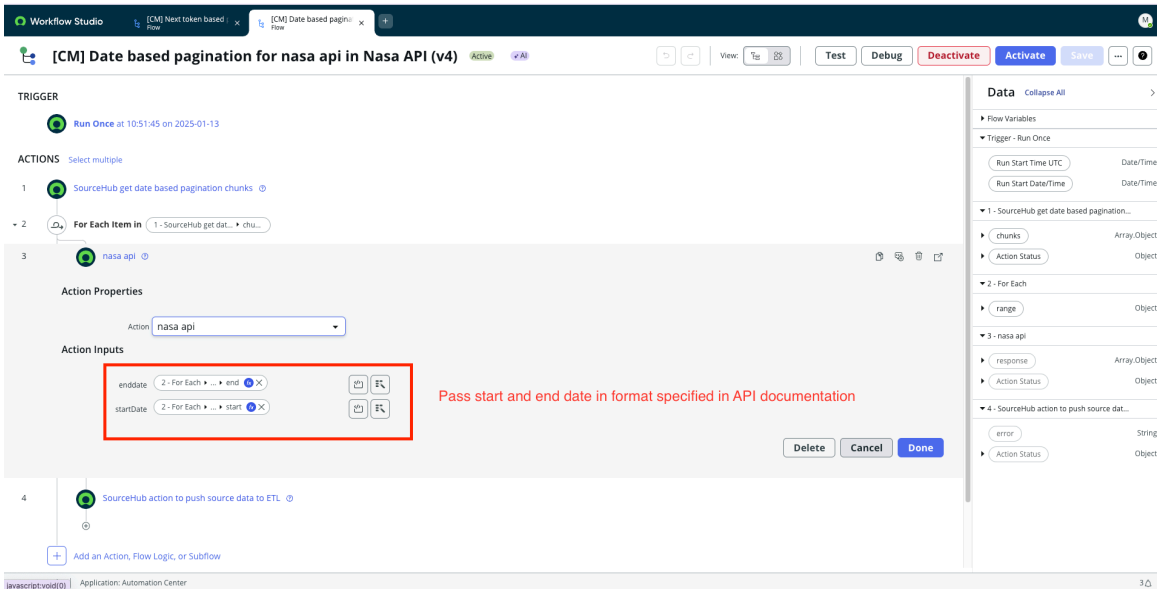
   The Connection Manager uses and returns dates in the format: YYYY:MM:DD:HH:MM:SS. If your Action supports date ranges, the format is automatically applied.

   Handling actions that don't support date ranges

   If your action doesn't automatically support date ranges but includes a filter for custom parameters, you can follow one of these approaches.

   - **Option 1**: Add an action before your selected action to handle the start date and end date. This action should generate a query that your primary action can use to fetch data.
   - **Option 2**: Copy your primary action and modify it to include inputs for start date and end date. Process these inputs within the action to create a query and pass it to the filter of your original action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: If you choose Option 2, ensure that you create a copy of the original action first. After copying, reselect the copied action in the **Select Action** step and regenerate the flow. For information about selecting an action, see Select an action.

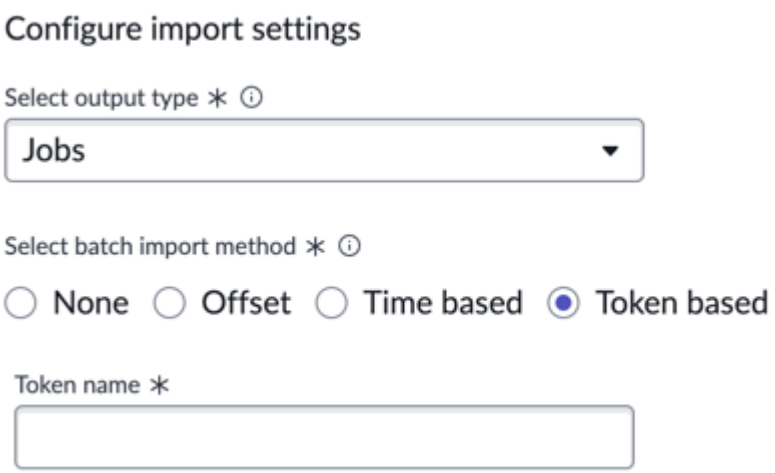
3. Select **Done** and **Test**.
4. Follow steps 3 onwards in Configure batch import for data.

Token-based batch import

Select the token-based batch import method if you want to import data using a continuation token.

https://player.vimeo.com/video/1089874895?h=7277577e12&badge=0&autopause=0&player_id=0&app_id=58479

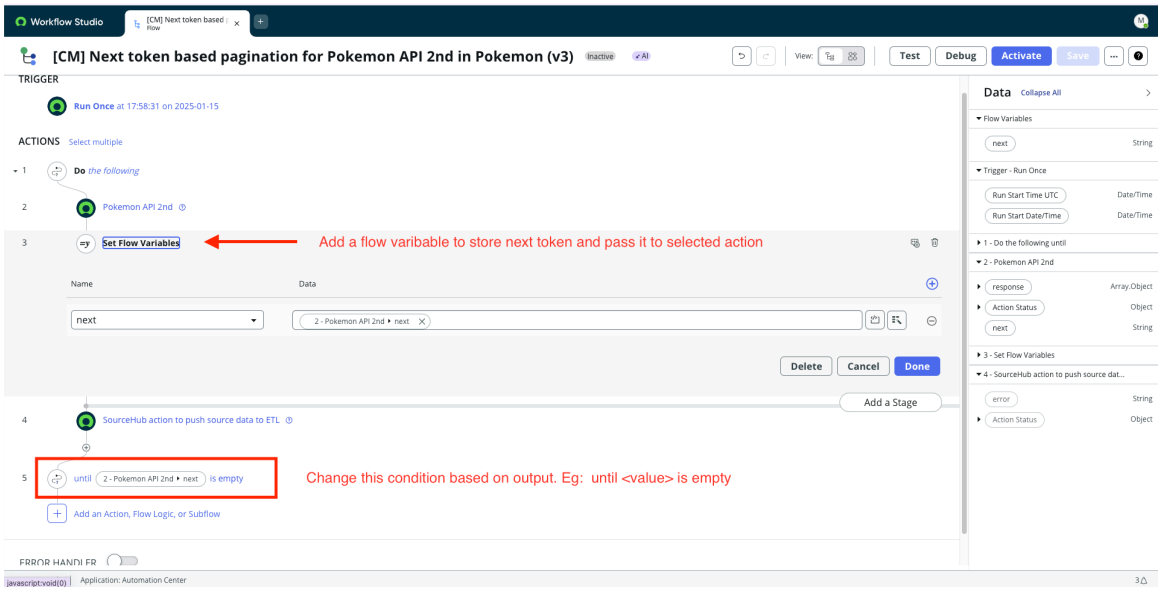
When you select the token-based batch import method on the **Configure batch import** page, you must provide a name for the token. This token represents the continuation value returned by your action (such as, next_url, next_token, or next). Ensure that the token name matches exactly as it is returned from the action, including spelling and capitalization.



Steps to configure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. If the provided token name is correct, the do-while condition will automatically map it. If it remains blank, manually drag the continuation token from your action's output into the condition field of the do-while logic.
2. Add a **Flow Variable** of type string to store the updated value of the token.
3. Save your changes, and click **Done**.
4. Insert a **Set Flow Variable** logic step after your selected action. In this step, set the value of the newly created flow variable to the continuation token returned by your action. Ensure this token matches the one mapped to the do-while condition.



5. Select **Done** and **Test**.
6. Follow steps 3 onwards in Configure batch import for data.

Verify and test

Verify and test all configuration details to ensure that the flow is generated correctly.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Configure batch import for data** section. For information on configuring batch import for data, see Configure batch import for data.

Procedure

1. Review all the details that you have configured for data import, such as scheduling data import, selecting a spoke, selecting an action, and configuring batch import.
   - If you want to change the data import schedule, then from the **Schedule import** section, you must open the flow and make changes in the flow.
   - If you make any changes to the selected spoke or action, you must redo the subsequent tasks.
2. Select **Test connection**.
   If any updates are required for the connection to be valid, you will be guided to do it. If there are any errors in the connection, you can view the log file, fix the issues, and run the test again.
3. Select **Save and continue**.
   The **Align fields** section is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Align source and destination fields

Align the source and destination fields to ensure that the selected output from the selected action align correctly with ServiceNow tables enabling accurate integration of automation data.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin with ihub_import

Proceed from the **Verify and test** section. For information on verifying and testing configuration settings, see Verify and test.

Procedure

1. Drag each source field to map with the destination field.
2. Select **Save and continue**.
   The **Add source values** sub-section of **Align values** section is displayed.

Aligning source and destination values

Align source and destination values for precise data representation in Automation Center.

Add source values

Manually add the status or state values of your automation from the source system.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Align source and destination fields** section. For information on aligning source and destination fields, see Align source and destination fields.

Procedure

1. Provide source values in the **Enter value** field.
2. Select **Add**.
   After one value is added, another field appears for the next value. You can remove a value by select the delete icon (-) beside the value field.
3. Select **Save and continue**.
   The **Map values** section is displayed.

Map source values

Map the source state values with the destination state values.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Add source values** section. For information on aligning source and destination fields, see Add source values.

Procedure

1. Drag each source value to map with the destination value.

   Note: Values can only be dragged and dropped. Hard coded values are not allowed. Also, one value cannot be mapped to multiple columns.

2. Select **Save and continue**.
   The **Review and activate** section is displayed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review and activate automation source

Review all configurations for the automation source, and then activate the automation source.

Before you begin

Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Proceed from the **Map source values** section. For information on aligning source and destination values, see Map source values.

Procedure

1. Review all details and make any edits required.
   If you change the spoke or action, you will need to redo all the subsequent tasks.
2. Select **Activate**.
   The **Automation sources** list is displayed with the newly created automation source.

Manage automation source

You can perform other actions for an automation source after creating it.

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
   The Automation Center dashboard is displayed.
2. Select the Connection Manager icon ( ) on the left.
   A list of available automation sources is displayed.
3. Select options for an automation source to manage the automation source.

   - Select **View details**. A new tab with the automation source is displayed.
   - Select **Import now**. The data is imported immediately.
   - Select **Deactivate source**. The automation source is deactivated.
   - Select **Activate source**. The automation source is activated.
4. Edit an automation source.
   a. Open an automation source.
   b. Select **Edit details**.

      You can edit the automation source.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrating automations from third-party applications to RPA Hub

Migrate UiPath, Blue Prism, Automation Anywhere automations to ServiceNow RPA Hub using Automation Center.

Generate report

Generate a report to view all the automations that you want to import.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the Migration Accelerator icon () on the sidebar.
3. Select **Generate migration report**.
   The Generate a migration report dialog is displayed.
4. Provide the details in the dialog box:
   - Provide a report name.
   - Select source details:
     - Select **UiPath**, **Blue Prism**, or **Automation Anywhere**.

       Note: Repository URL is available only for UiPath. For Blue Prism and Automation Anywhere you must upload a ZIP file.

     - **Repository URL** (only if you select UiPath as the source): This option enables you to get data from UiPath Orchestration. For information on using this option, see Generate report using repository URL.
     - **Upload ZIP (with XAML files)**: This option enables you to upload a local ZIP with .xaml files and automations. For information on using this option, see Generate a report using a ZIP file.

   Note: If the report generation takes longer than 300 seconds (5 minutes), it is marked as failed. This is controlled by a system property, `sn_ac.polling_timeout_migration_report`. A technical user (with the role sn_ac.automation_technical_user) can make changes to the value of the system property.

Generate report using repository URL

Generate a migration report using the repository URL that has all the automation files saved.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin, and connection_admin role

Note: This option is available only for connections connecting to cloud.uipath. You need the UiPath spoke to perform this task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Follow steps 1 through 4 in the Generate report section.
2. On step 4, select the **Repository URL** option.
3. Provide the following details in the Select repository connection section:
   a. **Connection alias**: Select a saved connection alias form the list.
   b. (Optional) Select **Create connection** to create a connection.

      For more information, see Configure an instance for migration.

   c. **Base URL**: This field auto-populates with the corresponding value when an alias is selected. This field is provided by the `sn_ac.rpamigration.base.url` system property. For more information about the system property, see Automation Center properties.
4. Select **Generate report**.
   A dialog box is displayed with details of the migration. You can choose to run it in the background.

   The report is generated.

Generate a report using a ZIP file

Generate a migration report using all the files that you have on your local system in a zip file.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Follow steps 1 through 4 in the Generate report section.
2. On step 4, select the **Upload ZIP (with XAML file)** option.
3. Select **Add file**.
   You can upload only one ZIP file at a time, and the maximum file size is 100 MB.

   Note: Select the ZIP file exported from the respective applications. If you use an UIPath orchestrator data for Blue Prism, it will show an error.

4. Select **Generate report**.
   A dialog box is displayed with details of the migration. You can choose to run it in the background.

   The report is generated.

View insights of the report

View the details of the reports generated by you.

Before you begin

Role required: sn_ac.automation_business_user, sn_ac.automation_technical_user, or sn_ac.automation_admin

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the Migration accelerator icon () on the sidebar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the report whose details you want to view.
4. The dashboard is displayed with insights and a list of automations.

Insights section

Description	Illustration
Time saved (days): The estimated time saved by automating the migration.	Cost saved: The estimated cost saved by automating the migration.	
Automations complexity levels: Displays the complexity levels of the automations. The higher the complexity, the lower the migration rate.	Attended and unattended Automations: The number of automations that require user input (attended) versus the automations that run independently (unattended). This information helps to plan deployment and testing.	Conversion rate (%): The percentage of automations that are ready for migration without significant changes. A higher rate means fewer manual adjustments.	
Conversion breakdown: Details about how each automation converts—from fully compatible to needing manual adjustments—so you can identify where additional effort is required. This field has two values. Total conversion % as 78%.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Description	Illustration
In Conversion breakdown area, you see two values for fully convertible. First is 60 and the other 76.92%. The first value means that out of 78, 60 were fully converted. The second value (%) is derived out of the box from UIB showing 60/78 *100 = 76.92%. 78 here came from two values in graph 60 (full convertible) + 18 (partially convertible) although that is the total value, but it isn't provided explicitly. There's no configuration available to show the value and not the %.	
Total integrations: The total number of integrations found in the automations. Useful for identifying potential migration challenges tied to external systems.	Top 20 integrations by app: Details about how integrations are distributed across different apps. Helps you to see which third-party platforms require additional planning or validation. You can select the type of integration in the **Integration type**. Select **View all integrations** to view the list of integrations.	
On the **All automations** tab, you can view the list of automations that you want to migrate with all the details.

You can select the automation that you want to migrate from this list.

Migrate automations to ServiceNow RPA Hub

Migrate automations to ServiceNow RPA Hub with reduced cost and effort of your migration and improving your enterprise's efficiency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

When a technical user tries to either upload a ZIP file or provide a URL when generating the migration report, an error message is displayed in the **All automations** tab. You can ignore this error message and proceed further.

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the Migration accelerator icon () on the side bar.
3. Select the report that has the automations you want to migrate.
4. From the **All automations** tab, select the automations that you want to migrate.
5. Select **Migrate**.
   The **Choose destination instance** dialog box is displayed.
6. Select an instance where you want to migrate the automations.

   You have two options:

   - Current Instance (shows by default): The logged-in user must have the rpa_developer role, and the current instance must have app-rpa-foundation version 15.0.0 or later.
   - Remote Instance (Configured via Connection and Credentials alias): The user with whom the credentials are associated must have the rpa_developer role and the remote instance must have app-rpa-foundation version 15.0.0 or later.

   For information on how to configure an instance, see Configure an instance for migration.
7. Select **Continue**.
8. Select **Start Migration** on the confirmation dialog box.

Result
The automations are migrated. If the automations are being migrated multiple times, multiple versions of the automations are created. The previous versions aren't overwritten.

The output from the migrated automations is attached to the migrated automation as a .zip file. It has two files: An excel file and an ibot file.

For every migrated automation, an automation request is created.

The automation conversion depends on the complexity of the automation. The more complex the automation, the lower the conversion rate. All manual tasks that are required to convert the automation completely must be done on the target instance.

Configure an instance for migration

Configure an instance to migrate your automations.

Before you begin
Role required: sn_ac.automation_technical_user or sn_ac.automation_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & credential aliases**.
2. Select `RPA Migrations` from the lists.
3. Edit the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the link that is displayed at the top of the page stating "To edit this record click here."

4. Select `OAuth Authorization Code Demo Configuration` in the **Configuration Template** field.
5. Select **Create New Connection & Credentials**.

For more information about OAuth authorization in connections and credentials, see Set up OAuth integration via MID Server.

ServiceNow Otto for Automation Center

Use ServiceNow Otto for Automation Center helps you use AI features in your ServiceNow instance using Automation Center.

Important:

- Some ServiceNow Otto products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base . Be sure to check for availability updates in future releases.
- Some ServiceNow Otto products/features are currently available only for customers in some regions. For more information, see the KB1699552 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.

Use Learn how to use ServiceNow Otto for Automation Center	**Reference** Get details about ServiceNow Otto for Automation Center.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about work notes in Process Mining. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

Exploring ServiceNow Otto for Automation Center

Explore the benefits of ServiceNow Otto for Automation Center.

ServiceNow Otto for Automation Center

ServiceNow Otto for Automation Center helps you use AI to ease your tasks in Automation Center.

Saving Estimator skill

ServiceNow Otto for Automation Center includes the Saving Estimator skill, which must be activated to explore and discover automations from your ServiceNow® instance. For information about activating the skill, see Activate skills for ServiceNow Otto for Automation Center. For information about how to explore automations, see Explore automations.

User task step summarization skill

ServiceNow Otto for Automation Center includes the User task step summarization skill. The User task step summarization skill uses the user interaction steps from Task Mining and produces a targeted summary of the intended business outcome, and a set of detailed steps derived from the original interactions. For more information about activating the skill, see Activate skills for ServiceNow Otto for Automation Center. For information about creating an automation request from Task Mining workspace, see Integration with Automation Center.

Configuring ServiceNow Otto for Automation Center

Configure ServiceNow Otto for Automation Center to use all the features.

ServiceNow Otto for Automation Center plugin

To work with generative AI capabilities, you need ServiceNow Otto for Automation Center plugin. You can install this plugin from the ServiceNow Store website.

The ServiceNow Otto for Automation Center plugin helps you to:

- Create an agent for your automation requests
- Explore all automations in your instance
- Automatically create automation requests from Task Mining Workspace
- Automate Task Mining recording to desktop actions

Activate skills for ServiceNow Otto for Automation Center

Activate the skills available for ServiceNow Otto for Automation Center to work with ease and reduce manual effort in creating automation requests and exploring automations.

Before you begin

Role required: sn_generative_ai.nsa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Admin Hub** > **Skills**.
2. Select **Other** under **Platform**.
3. Turn on the skill from the list.
   The skill is activated on your instance.
   - User task step summarization skill: Creates automation requests from the Task Mining Workspace and generate automations from Task Mining recordings. For more information, see Create an agent for Task Mining requests and .
   - Saving Estimator skill: Explores automations from your ServiceNow instance. For more information, see Explore automations.

Using ServiceNow Otto for Automation Center

Use ServiceNow Otto for Automation Center to explore available automations in your ServiceNow instance. You can also create an automation request from the Task Mining workspace.

Creating automation request from Task Mining

Use ServiceNow Otto for Automation Center to create an automation request from the Task Mining workspace.

With the ServiceNow Otto for Automation Center plugin, you can create automation requests directly from the Task Mining Workspace. To use this feature, you must also activate the User task step summarization skill. For information about creating an automation request from Task Mining workspace, see Integration with Automation Center .

Explore automations

Automation explorer enables you to scan your entire ServiceNow® instance and discover relevant automations based on a targeted query. You can filter by automation type, execution time period, and application scope, then onboard high-value automations directly to Automation Center for ROI tracking.

Before you begin

Role required: sn_ac.automation_technical_user

Run the fix script to be able to view the results of the Automation explorer. For information, see Run fix script to view results.

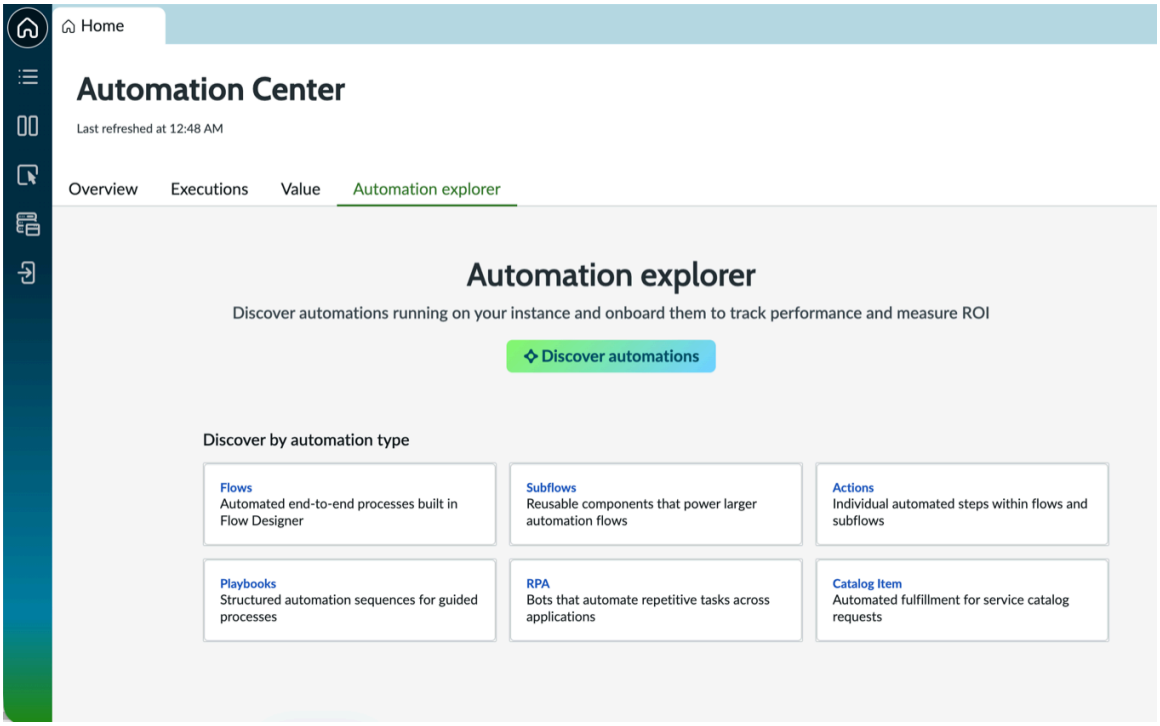
Note: You can control how catalog items are onboarded as automations using the sn_ac.auto_onboarding_catalog_items system property. Users with sn_ac.automation_admin can edit the system property.

- True (default): New catalog items are onboarded automatically and appear on the automation dashboard immediately. However, the time and cost savings aren't displayed.
- False: New catalog items are onboarded manually using the Automation Explorer feature. Generating this data takes longer, but the dashboard shows an expanded summary with time and cost savings for each catalog item.

Procedure

1. Navigate to **Workspaces** > **Automation Center Workspace**.
2. Select the **Automation explorer** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can select the automation type card at the outset or select **Discover automations** button. Both actions launch an agent-driven conversation via the ServiceNow Otto panel, which guides you through defining your search criteria step by step

3. Select your search method.

Option	Description
If you know the automation type	Select the relevant automation type card to begin a focused search.
If you don't know the automation type	Select the open-ended search button to launch the ServiceNow Otto panel and start an agent-guided conversation.

4. In the ServiceNow Otto panel, respond to the agent prompts to define your search criteria.

   The agent asks three questions to scope your search:

   a. Select the automation type you want to search for (for example, Flows).

   b. Select the time period in which the automations were executed (for example, Last 30 days).

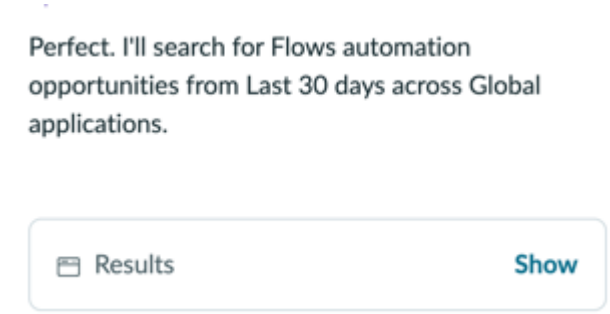
      You can also enter a custom time value if the predefined options don't meet your requirements.

   c. Select the application scope for the search (for example, All).

   The agent scans your instance within the defined scope and retrieves matching automations. This process may take a few minutes depending on the instance size and search scope.

5. Select **Show** to view the search results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

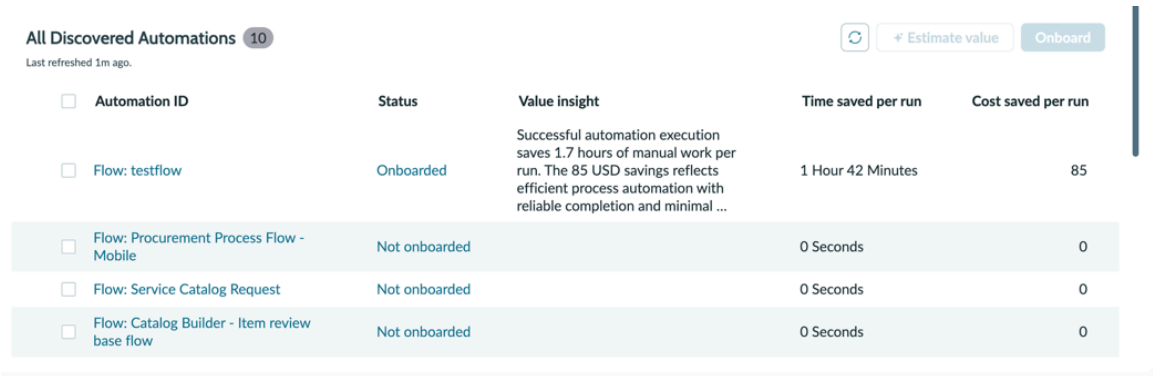


The results display all relevant automations on the instance against the search query, including:

- AI-estimated cost saving per run.
- AI-estimated time saving per run.
- An explanation for the AI-generated estimates.

6. Select one or more automations to estimate the value (time and cost saved) and then onboard.

   Use the check-boxes next to each automation, and select **Estimate value**, and **Onboard**. Review the cost and time saving estimates and the accompanying AI explanation to make your decision.



Result

The selected automations are onboarded to Automation Center. Their cost savings and time savings are now tracked and visible in the Automation Center Value dashboard.

What to do next

After onboarding, monitor the ROI of your automations in the Automation Center Value dashboard. You can return to Automation explorer at any time to discover additional automations or refine your search criteria.

Run fix script to view results

Run a fix script in ServiceNow to view the results of the automation explorer.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Definition** > **Fix Scripts**.
2. Locate the fix script with the following sys_id:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
21a11b363ba4321037da9f7e53e45a50
```

Use the list filter or the search bar to find the record by sys_id if it is not immediately visible.

3. Open the fix script record, and select **Run Fix Script**.
4. Review the output logs that appear after the execution completes.

   Confirm the following statistics are present in the output:

   - Total Processed — the total number of records evaluated by the script.
   - Records Created — the number of new records generated during processing.
   - Records Skipped — the number of records that did not meet processing criteria.
   - Errors — any errors encountered during execution. Investigate and resolve before re-running the script if errors are present.

Reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Now Assist for Automation Center.

Now Assist for Automation Center properties

You can access system properties for Now Assist for Automation Center by navigating to **All** > **System properties** > **All properties**. Then, filter the results by Now Assist for Automation Center.

Now Assist for Automation Center properties

Property	Description
sn_ac_assist.auto_calculate_savings	Defines the number of automations for which the time and cost savings will be automatically calculated. • Feature: **Automation Explorer** • Type: **integer** • Default value: **2**
sn_ac_assist.enterprise_dev_hourly_rate	Defines the value of development hourly rate for enterprise. • Feature: **Automation Explorer** • Type: **integer** • Default value: **50**
sn_ac_assist.max_calculate_savings	Defines the maximum number of automations that can be selected at once for calculation of the time and cost savings. • Feature: **Automation Explorer** • Type: **integer** • Default value: **10**

Automation Center reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Automation Center.

Components installed with Automation Center

Several types of components are installed with the activation of Automation Center, including tables, user roles, and scheduled jobs.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this plugin.

Roles installed

Note: To view the Robotic Process Automation (RPA) data, RPA roles are required. For more information about RPA roles, see Components installed with RPA Hub .

Role title	Description	Contains roles
Automation admin [sn_ac.automation_admin]	Sets up Automation Center application configurations. Performs all the actions in the Automation Center application. Possesses CRUD access for all tables.	• sn_ac.automation_business_user • sn_ac.automation_technical_user • sn_ac.automation_admin
Automation technical user [sn_ac.automation_technical_user]	Creates automation requests, automation sources, automation tasks, automation resources, automation goals, insight rules, and insight triggers. Modifies automation attributes.	sn_ac.automation_techincal_user
Automation business user [sn_ac.automation_business_user]	Creates automation requests, automation goals, and updates the automation request life-cycle stages.	sn_ac.automation_business_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed

Scheduled job	Description
Automation Center: Purge Executions Data	Deletes the data in the Automation Execution table only when the following conditions are met: • Records that were created 'X' days ago. X represents the value defined by the *sn_ac.purge_automation_data_in_days* system property. Users with the automation admin role can modify this property value. The default value of this property is **14**. • Records with a state of **Cancelled**, **Complete**, or **Error**.
Automation Center: Purge Insights Data	Deletes the data in the *sn_ac_insight* system property that was created 'X' days ago. X represents the value defined by the *sn_ac.purge_automation_data_in_days* system property. Users with the automation admin role can modify this property value. The default value provided of this property is **14**.
Automation Center: Copy spotlight score into request	**Note:** Available only if Spotlight is installed and enabled. Copies the spotlight score into the automation request's Score field. The **Schedule | Run to** is set to **On Demand**. It is recommended not to change this setting. **Note:** If you change the default spotlight criteria, then after saving the changes made, you must select the **Execute Now** button in this Spotlight group record to recompute the Spotlight score for the automation request records. And, then you must select the **Execute Now** button on the scheduled job to copy the score.

Tables installed

Table	Description
Automation Request [sn_ac_automation_request]	Contains the details of the automation request.
Automation Task [sn_ac_automation_task]	Contains information of tasks linked to a request.
Automation Goal [sn_sc_automation_goal]	Contains details of goals that can be mapped to multiple requests.
Base Robot [cmdb_ci_base_rpa_robot]	Contains the details of a software agent that runs a bot process.
Base Bot Process	Contains the configuration details of a robot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[cmdb_ci_base_rpa_process]	
Automation Execution [sn_ac_automation_execution]	Stores all execution processes information.
Automation Insight [sn_ac_insight]	Contains alerts data across Automation Center.
Automation Insight rule [sn_ac_insight_rule]	Contains rules that configure insights.
Automation Source [sn_ac_automation_source]	Stores vendor data.
Automation Attribute [sn_ac_ci_attribute]	Stores cost, time, source, and associated automation for processes and robot.
Automation Import [sn_ac_rpa_import]	Temporarily stores data that is imported from the REST API.

Automation Center properties

You can access system properties for Automation Center by navigating to **All** > **Automation Center** > **Administration** > **Automation Properties**.

Automation Center properties

Property	Description
sn_ac.workspace.date.default_num_of_days	Defines the default number of days that data is shown in the Automation Center workspace. • Type: **integer** • Default value: **7**
sn_ac.purge_automation_data_in_days	Defines the number of days the automation execution data, import error logs, action logs data, and automation insights information is retained. • Type: **integer** • Default value: **14**
sn_ac.reporting_currency	Defines the currency that is used in the Automation Center dashboards and reports.

© 2026 ServiceNow, Inc. All rights reserved.

Automation Center properties (continued)

Property	Description
	• Type: **integer** • Default value: **USD**
sn_ac.savings_averaging_window	Calculates the moving average for cost and time saved per run. • Type: **integer** • Default value: **4**

ServiceNow® Spotlight properties

Property	Description
sn_ac.use.spotlight.score.for.requests	When turned on (by setting the value to **True**), Spotlight feature is enabled in the Automation Center workspace. • Type: **True/False** • Default value: **True**
sn_ac.use.spotlight.group.for.requests	Stores the spotlight group sys_id to let the system know which spotlight group to use. • Type: **string** • Default value: **e037711dc3a11110995486d91840dd03**

ServiceNow® Recommended Actions properties

Property	Description
sn_ac.use_recommended_actions	When turned on (by setting the value to **True**), Recommended Actions application is enabled in the Automation Center workspace. • Type: **True | False** • Default value: **False**

Automation Explorer properties

Property	Description
sn_ac.auto_onboarding_catalog_items	Controls how catalog items are onboarded as automations. Users with sn_ac.automation_admin can edit the system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Explorer properties (continued)

Property	Description

	• Type: **True | False**
	• Default value: **True**
	  ○ **True (default)**: New catalog items are onboarded automatically and appear on the automation dashboard immediately. However, the time and cost savings aren't displayed.
	  ○ **False**: New catalog items are onboarded manually using the Automation Explorer feature. Generating this data takes longer, but the dashboard shows an expanded summary with time and cost savings for each catalog item.

Action Properties

Property	Description
sn_ac.max_number_of_actions	Sets the maximum number of actions to show in all actions section in action center. • Type: **True|False** • Default value: **False**
sn_ac.max_number_of_recent_executions	Controls the number of action log cards we want to show in the recent section in action center. • Type: **Integer** • Default value: **12**
sn_ac.new_action_threshold	Controls the number of days the "New action" tag should appear for the newly created actions. • Type: **Integer** • Default value: **12**

Migration accelerator properties

Property	Description
sn_ac.rpamigration.base.url	When you migrate UiPath automations to RPA Hub using Automation Center, this URL is used. When you generate a report using repository URL, in the **Base URL** field this value is populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migration accelerator properties (continued)

Property	Description
	• Type: **string** • Default value: **https://rpamigration-prod-default/**
sn_ac.polling_timeout_migration_report	Defines the maximum duration (in milliseconds/seconds) to wait while polling for the migration report status before the request times out. This ensures that long-running or stalled migration status checks do not block the process indefinitely. • Type: **Integer** • Default value: **300**

ServiceNow Otto for Automation Center properties

Property	Description
sn_ac_assist.auto_calculate_savings	Defines the number of automations for which the time and cost savings will be automatically calculated. • Feature: **Automation Explorer** • Type: **integer** • Default value: **2**
sn_ac_assist.enterprise_dev_hourly_rate	Defines the value of development hourly rate for enterprise. • Feature: **Automation Explorer** • Type: **integer** • Default value: **50**
sn_ac_assist.max_calculate_savings	Defines the maximum number of automations that can be selected at once for calculation of the time and cost savings. • Feature: **Automation Explorer** • Type: **integer** • Default value: **10**
sn_ac.pdi_instance_types	Controls which instance types are PDI (Personal Developer Instances). When creating an agent, you need an instance. When you create an instance, this property is used to decide which instance types are PDI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto for Automation Center properties (continued)

Property	Description
	• Type: **string** • Default value: **Demonstration, Shared-Demo, Developer, Subproduction**
sn_ac.lens_image_batch_size	Number of images sent per call to the lens skill for image processing. Suggested range is from 5 to 10. • Type: **integer** • Default value: **8**

Submit an Automation Request form

Use the Submit an Automation Request form to create an automation request in Service Catalog.

Submit an Automation Request form

Field	Description
What is the request type?	Select the type of request you want to create. • If you are creating an automation request, select **Automation**. Create automation requests when you want to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs. • If you are creating an action request, select **Action**. Create action requests when you want an automated solution to repeated issues that are causing the automations to fail. • If you are creating a review request, select **Review**. Create a review request when you want the COE team to review an automation and analyze if the automation is required.
Process name	Name of the process.
Provide a brief description of the process	Description of the automation process.
Department	Associated department of the automation request.
How many steps are involved in this process?	A step is considered any individual activity, action, or decision that contributes to the completion of the process.
What is the interval type of the business process execution?	Field that describes if the cadence of the business process execution is by minutes, hourly, daily, weekly, or monthly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Submit an Automation Request form (continued)

Field	Description
How frequently is the business process executed (for example every 90 minutes or every 2 hours)?	Number of times that the automation process is executed per interval.
Identify all applications/ systems involved in the process	Field used to edit all applications and systems involved in the automation process.
What is the actual time spent per run?	The time that the manual run takes to complete.
Do you perform this process?	Field that shows if the execution is performed by the person submitting this request.
Identify the process owner	Person responsible for designing an effective and efficient process.
Attach relevant files	Relevant documents that you attach to support the automation process.

Automation request form from Automation Center

Use the Automation request form to create an automation request, action request, or review request from Automation Center.

Automation request form

Field	Description
Request Type	Select the type of request you want to create. • If you are creating an automation request, select **Automation**. Create automation requests when you want to automatically streamline your business processes, reduce the time that you spend on manual activities, and reduce your costs. • If you are creating an action request, select **Action**. Create action requests when you want an automated solution to repeated issues that are causing the automations to fail. • If you are creating a review request, select **Review**. Create a review request when you want the COE team to review an automation and analyze if the automation is required.

Automation request form (continued)

Field	Description
Number	Auto-generated number of the request.
Process name	Name of the process.
Description	Description about the process.
Department	Associated department of the process.
Number of steps	Steps that are involved in the process. A step is an individual activity, action, or decision that contributes to the completion of the process.
Interval type	Interval type of the manual business process execution: • **Minutes**: The process executes every n minutes that you specify in the **Frequency** field. • **Hours**: The process executes every n hours that you specify in the **Frequency** field. • **Days**: The process executes every n days that you specify in the **Frequency** field. • **Weeks**: The process executes every n weeks that you specify in the **Frequency** field. • **Months**: The process executes every n months that you specify in the **Frequency** field.
Frequency	Number of times that the manual process must be executed per interval. For example, every 90 minutes or every 2 hours.
Actual time spent per run	Time that the manual process run takes to complete.
State	State of the automation request: • New • Deferred • Rejected • Planned • In progress • Published

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation request form (continued)

Field	Description
	For more information about these states, see Life-cycle stages of an automation request.
Intake source	Source type of the automation request, which refers to how the automation request is submitted: • **Web** • **Integration** • **Process Mining** **Note:** The default intake source type is **Web**. This field is visible only when you submit the form.
Applications used	Associated business applications of the process. For example, Ariba, Microsoft Excel, or Google Chrome.
Requested for	Person responsible for designing an effective and efficient process.
Additional Details	
Actual cost per run	Cost per process execution.
Goal	Desired goal of automating the process.
Priority	Complexity of the business process. Complexity is based on number of processes and applications involved, number of steps required, and human involvement.
Business criticality declared	Criticality of the business process. Criticality is based on your subjective assessment.
Number of users benefited	Number of users who would benefit with this process.
Number of transactions	Expected volume of transactions across the applications or systems.
Score	Execution priority of the request. The higher the score, the higher the priority of the request.
Process managers	Person responsible for the end-to-end execution of the process.
Assignment group	Name of the process group.
Manual steps %	Estimated percentage of steps that require human action to complete the process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation request form (continued)

Field	Description
Expected cost savings per year	Cost saved per process at the end of a year.
Expected time savings per year	Time saved per process at the end of a year.
Work notes	Work notes for the process.
Additional comments (Customer visible)	Notes that are visible to the customer.

Automation task form

Use the Automation task form to create an automation task in Automation Center.

Automation task form

Field	Description
Number	Number of the automation task. This number is auto-generated.
Automation request	Associated automation request. This request is auto-generated.
Name	Name of the automation task.
State	State of the automation task: • **Open** • **Pending** • **Work in progress** • **Closed complete** • **Closed incomplete** • **Closed skipped**
Description	Description of the automation task.
Due date	Date when the task is due.
Priority	Sequence in which an incident or problem must be resolved, based on impact and urgency.
Type	Type of automation task: • **Requirement** • **Design** • **Development** • **Quality engineering** • **Sign off**
Assignment group	Name of the automation task group.
Assigned to	Name of the user assigned to the automation task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation resource form

Use the Automation resource form to create an automation resource to associate a resource to an automation task.

Automation resource form

Field	Description
Number	Number of the automation resource. This field is auto-generated.
User	Name of the user assigned for the automation task.
Active	Option for ensuring the use of the automation resource.
Resource type	Role of the automation resource: • **Development** • **Quality engineering** • **Product management**
Automation task	Associated automation task. This field is auto-generated.
Automation request	Associated automation request. This field is auto-generated.

Automation execution form

Use the Automation execution form to view an automation execution from Automation Center.

Automation execution form

Field	Description
Number	Number of the automation execution.
Automation execution ID	Identification number of the automation execution.
Automation	Associated automation name.
Robot	Assigned robot that is running this automation.
Triggered by	Trigger mode of the assigned robot.
Start time	Start date and time of the automation execution.
End time	End date and time of the automation execution.
Duration	Time taken to complete the automation.
Cost saved per run	Cost saved after each run of the automation.
Time saved per run	Time saved after each run of the automation.
Source	Associated automation source.
Priority	Priority of the automation execution:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation execution form (continued)

Field	Description
	• Low • Moderate • Critical
State	State of the automation execution: • Running • Error • Queued • Canceled • Complete
Department	Associated department name.
Message	Any information or error message returned by the robot.

Insight rule form

Use the Insight rule form to create an insight rule from Automation Center.

Insight rule form

Field	Description
Name	Name of the insight rule.
Active	Option to verify the usability of the insight rule. On clearing this option, the notifications won't be generated from this insight rule.
Application	Field that indicates which applications can use this insight rule.
Severity	Priority of the insight rule: • **Urgent** • **High** • **Moderate** • **Low** The default value is set to **Moderate**.
Type	Level of insight rule: • **Info** • **Warning** • **Error**
Message	Custom message that describes the insight.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insight rule form (continued)

Field	Description
	For example, `Time to Cleanup Automation Tasks. The count is {0}.` To configure the variable, such as {0}, see Write a script for an automation message variable. **Note:** To enable localization of this message string, create the sys_ui_message update record. For more information, see Custom translations.
Applies to	Table that the insight rule is applied on. For example, Automation Request [sn_ac_automation_request].
When	Conditions at which the insights are triggered. Select a table from the Applies to list before modifying this field. This field appears only when an entry is selected from the Threshold type list. Select the **Set Condition** field to add a trigger condition. For example, you might want to generate an insight rule when the state of an automation request isn't published. In that case, select **State** from the field list, **is not** from the operator list, and **Published** from the value list. You can use **or** or **and** next to the condition. To add more conditions, select **New condition set**.
Threshold type	Type of threshold: • **Count** • **Percentage**
Threshold Count **Note:** This tab appears only when **Count** is selected from the Threshold type list.	
Operator	Qualifier to trigger insights: • **is** • **less than** • **greater than** • **less than or is** • **greater than or is** This field appears only when **Count** is selected from the Threshold type list.
Value	Value to determine if an insight rule must be triggered based on the qualifier that is selected in the **Operator** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insight rule form (continued)

Field	Description
	For example, an insight rule is triggered if a few automation requests get rejected in a day. To set a condition, select **Count** in the Threshold type list, **greater than** in the Operator list, and **10** in the Value list. This field appears only when **Count** is selected from the Threshold type list.
Threshold Percentage **Note:** This tab appears only when **Percentage** is selected from the Threshold type list.	
Percentage of	Denominator value for the resulted rule value.
Operator	Qualifier to trigger insights: • **is** • **less than** • **greater than** • **less than or is** • **greater than or is** This field appears only when **Percentage** is selected from the Threshold type list.
Value	Value to determine if an insight rule must be triggered based on the qualifier that is selected in the **Operator** field. For example, an insight rule is triggered if a few automation requests get rejected in a day. To set a condition, select **Percentage** in the Threshold type list, **greater than** in the Operator list, and **10%** in the Value list. This field appears only when **Percentage** is selected from the Threshold type list.

Automation Scheduled Trigger Execution form

Use the Automation Scheduled Trigger Execution form to define the type of insight trigger and map an insight rule to a new scheduled script in Automation Center.

Automation Scheduled Trigger Execution

Field	Description
Name	Name of the insight trigger.
Active	Option for ensuring the use of the insight trigger.
Application	The associated application or the application scope in which the trigger is being created, such as Automation Center or RPA Hub.
Run	Time interval to use for running the scheduled job: • **Daily**: Runs daily, at a designated time. • **Day and Month in Year**: Runs yearly on a specific day and month (for example, July 14), at a designated time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Scheduled Trigger Execution (continued)

Field	Description
	• **Day in Week in Month in Year**: Runs yearly on a specific day of the week in a specific week of a specific month (for example, the second Monday in October), at a designated time. • **Week in Month**: Runs monthly during a specific week of the month (for example, the third week of each month), on designated days and at a designated time. • **Weekly**: Runs on a weekly basis, at a designated time and day of the week. • **Monthly**: Runs on a monthly basis, at a designated time and day of the month. • **Periodically**: Runs on a designated repeating interval. • **Once**: Runs for a single occurrence only. • **On Demand**: Runs immediately on demand. • **Business Calendar: Entry Start**: Runs on the starting entry dates for the business calendar that you select in the **Business Calendar** field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month. • **Business Calendar: Entry End**: Runs for the ending date for the business calendar that you select in the **Business Calendar** field. This selection runs in the same manner as **Business Calendar: Entry Start**, but for the end dates of the associated business calendar entries. **Note:** When you select **Business Calendar: Entry Start** or **Business Calendar: Entry End**, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. If you select a business calendar and all its business calendar spans are in the past, the job would never run since that is an invalid configuration. To learn more, see the **Offset type** and **Offset** fields. To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.
Day	Day on which the scheduled job should run. • If **Run** is set to **Weekly**, select the day of the week. For example, select Wednesday. • If **Run** is set to **Monthly**, select the day of the month. For example, select 25 for the 25th day of the month. This field appears only if you select **Monthly** or **Weekly** in the **Run** field.
Repeat Interval	This field appears only if you select **Periodically** in the **Run** field. Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation Scheduled Trigger Execution (continued)

Field	Description
	• To run the scheduled job every four days, enter `04` in the **Days** field. • To run it every 26 hours, enter `26` in the **Hours** field. • If it should repeat at an interval of 13:30:25, enter `13` in the **Hours** field, and then enter `30` and `25` in the two unlabeled fields after it.
Time zone	Time zone to use with the **Time** field entry when you specify the time at which the scheduled job should run. Select a time zone entry: • **-None-**: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it's the user's assigned time zone, and you enter `16 : 45` into the **Time** field. • **Use System Time Zone**: Use the default system time zone that is specified for the instance in which it runs. For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter `22 : 15` in the **Time** field. • Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select **US/Eastern**, and enter `13 : 30` in the **Time** field.
Time	Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the **Time zone** field determines the time zone for this entry.
Starting	Allows you to define the beginning window of time when you would like your job to start running. The job will actually run at the time specified in **Run time**. Select the calendar date and time. The **Starting** field appears only if you select one of the following **Run** types in the **Run** field:
Business Calendar	Business calendar entry that you're using to determine the business calendar start or end date for the scheduled job. This field appears only if you select **Business Entry: Start Date** or **Business Entry: End Date** in the **Time** field.

Automation goal form

Use the Automation goal form to create an automation goal in Automation Center.

Automation goal form

Field	Description
Name	Name of the automation goal.
Start date	Start date of the automation goal.
Target date	Target date of the automation goal.
State	State of the automation goal:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation goal form (continued)

Field	Description
	• **Pending**: The associated requests are in "New", "Deferred", or "Rejected" state, or there are no associated requests. • **Work in progress**: The associated requests are in "Planned", "In progress", or "Published" state. • **Achieved**: The associated requests are in "Published" or "Rejected" state with at least one request in "Published" state. • **Not achieved**: The target date isn't met for the associated requests, and they are in "New", "Planned", "In progress", or "Published" state.
Owner	Owner of the automation goal.

Life-cycle stages of an automation request

The State transition of an automation request guides you through the stages of its life cycle.

Automation request life-cycle stages

Life-cycle stage status	Description
New	Default value for a new automation request.
Planned	Automation request that is moved to a planned state.
In Progress	Automation request that is picked up and work is in progress.
Published	Automation request that is ready to be active.
Deferred	Automation request that is postponed for a later date.
Rejected	Automation request that is rejected.

Domain separation and Automation Center

Domain separation is supported for Automation Center. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of domain separation in Automation Center

The goal of Automation Center is to govern the end-to-end multi-vendor life cycle from one place. Domain separation is enabled in all the features.

You should have either a flat hierarchy or a single-tier hierarchy and at least one primary or top-level domain.

To support domain separation for particular widgets in Automation Center, you must install and configure com.snc.pa.domain_support.

Note: Action Center and Connection Manager encounter challenges due to process separation in flows. In Action Center, the domain data from both global and current session domains is displayed. In Connection Manager, only current session's domain data is displayed.

Troubleshoot and get help

- Ask or answer questions in the ServiceNow AI Platform community forum
- Search the Known Error Portal for known error articles
- Learn how to build apps on the developer site.
- Contact Customer Service and Support

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

Exploring Integration Hub

ServiceNow® Integration Hub enables you to build reusable integrations with third-party systems and call them from anywhere in the ServiceNow AI Platform. For example, you can request Integration Hub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the ServiceNow® MID Server, and activate protocol steps like REST, SOAP, and PowerShell.

Inbound and outbound integration

The Integration Hub provides both inbound and outbound integration with third-party applications.

Inbound integration occurs when a flow that you set up on Workflow Studio responds to a conditional and event-driven external webhook from a third-party system and executes. For example, when you create a P1 issue on an issue-tracking application, its external webhook

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

triggers a flow in the ServiceNow instance and an incidence database table is updated in the ServiceNow instance. Here, the webhook is conditional and event-driven.

Outbound integration occurs when the Integration Hub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

Building integrations

Build reusable integrations with third-party systems and call them from anywhere in the ServiceNow AI Platform.

Create spokes

Build spokes using Spoke Generator to automate integration tasks by creating a sequence of reusable actions to develop custom integrations. For more information, see Building spokes using Spoke Generator.

Use spokes for base system integrations

Using Integration Hub actions in Workflow Studio, you can:

- Post messages and ServiceNow incident, problem, and change record details to Slack Spoke, or Microsoft Teams Spoke communications channels.
- Synchronize data across multiple production instances using Integration Hub Remote Process Sync.

Create custom integrations

Build custom integrations with Workflow Studio using a REST step or a Script step.

Automate inbound integrations with third-party applications

Set up a flow with external trigger definition on Workflow Studio by selecting base system external trigger definitions, and actions from the spokes or core actions. Then, Set up external trigger endpoints that the third-party application webhooks use to trigger the flow you had set up. Your ServiceNow instance authenticates the webhook before it triggers the flow.

Automate the administration of servers and applications in your network

Use custom actions to delegate Workflow Studio processes to a MID Server in your network. For example, actions that use the PowerShell step or REST step.

Import and stream data

Import data with Integration Hub - Import. Integration Hub - Import enables you to configure, run, and schedule your data imports all through a single simplified interface. It consolidates multiple data integration capabilities into a single environment, eliminating the need to create and manage several forms throughout the platform. Its step-by-step experience guides you through the configuration of data sources, target tables, and data mapping. You can schedule your data imports or run them on demand.

Stream data with Stream Connect for Apache Kafka. Stream Connect links your Kafka environment to your ServiceNow® instance, enabling you to stream data between your instance and your external systems. Stream Connect is integrated with Workflow Studio, so you can build flows that produce and consume Kafka events. Stream Connect also provides several consumers that enable you to stream and process data with scripts or by using your existing RTE or transform map configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage connections

Integration Hub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. Integration Hub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about credentials, connections, and aliases.

View and configure your connection and credential aliases with the Connections dashboard. The Connections dashboard enables you to manage multiple connections through a single interface, and provides simplified processes for adding, editing, and configuring connections. With the Connections dashboard, you can view details about an alias and all associated child connections in a single location.

Integration Hub supports multiple connections to a single integration provider. For example, you can have connections to several different Jira environments. In Workflow Studio, you can select which connection you want to use in a flow, and override preset connections for flows, subflows, and actions. When a flow is promoted to production, you can reestablish a connection to each account without needing to modify the flow.

Use your personal credentials to connect to third-party integrations with the Personal Authentication dashboard. View, authenticate, revoke, and renew your personal authentications through a simplified, consolidated interface.

Make outbound REST and SOAP calls through a MID Server using mTLS. Store mTLS credential and certificate information on the instance, in a configuration file, or in an external vault. The MID Server retrieves the credential and certificate information and makes outbound REST and SOAP calls using the mTLS protocol.

Benefits

Integration Hub provides process owners and developers these benefits.

- Consolidates multiple ServiceNow AI Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes and integrations from a single interface.
- Extends Workflow Studio content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Workflow Studio. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Build applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
   - Publish to the application repository for deployment on production instances.
   - Publish to the ServiceNow Store as an application that customers can request for their environments.
   - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Workflow Studio design considerations in the Architecture Overview.

Configuring Integration Hub

Review and select an Integration Hub subscription package. Activate Integration Hub plugins and review usage and transaction details.

Request Integration Hub

ServiceNow® Integration Hub enables you to build reusable integrations with third-party systems and call them from anywhere in the ServiceNow AI Platform. For example, you can request Integration Hub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the ServiceNow® MID Server, and activate protocol steps like REST, SOAP, and PowerShell.

Integration Hub is available as part of Workflow Data Fabric. For more information, see https://www.servicenow.com/now-platform/workflow-data-fabric.html.

Workflow Studio is a ServiceNow AI Platform feature that enables you to automate processes within a single instance. Without an Integration Hub subscription, you can use base system actions or steps, including the Script step, to manipulate records, send emails, trigger notifications, and perform operations within the instance. Request Integration Hub to automate and create integrations with external systems from the Workflow Studio interface.

You can preview Integration Hub on a Personal Development Instance (PDI).

Integration Hub usage and subscription

Choose a subscription package to build reusable integrations with third-party systems. Review the usage dashboard to determine the number of transactions used within your current subscription, and to view transaction details.

Entitlement to use spokes

The entitlement to download and use ServiceNow developed integrations (or spokes) requires an Integration Hub subscription (Integration Hub overview) or Subscription Product that includes spoke(s).

This spoke entitlement allows customers to download certain spokes from the ServiceNow Store and use the spoke in the production environment.

Protocols and spokes that are available in the Subscription Product are set forth in the then-current applicable Product Documentation. Use of protocols and spokes may consume Integration Hub transactions that may require purchase of Integration Hub or Workflow Data Fabric subscription at an additional fee. Customer may use the spoke(s) included in Subscription Product for use cases even beyond the Subscription Product. Integration Hub Transactions are not included in the Subscription Product.

Link to KB article for the actual overview of Spokes in BU products

We have documented the Spoke entitlements available with the specific Subscription Product in a KB Article on Now Support: Spoke entitlement per Subscription Product.

Integration Hub subscription notifications

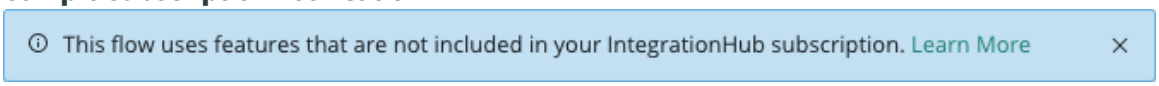
Integration Hub displays an information message whenever you use a spoke, protocol, entitlement, or feature that requires an Integration Hub subscription. You can use this information to identify possible gaps between your planned Integration Hub usage and your current subscription entitlements.

Subscription notifications do not restrict you from using any Integration Hub spoke, protocol, entitlement, or feature. Unlicensed features may be unavailable on your production instance.

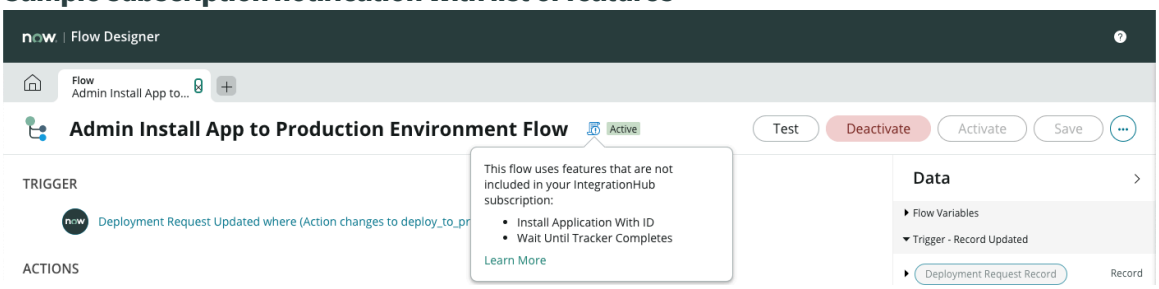
Subscription information available

Your instance attempts to access your Integration Hub subscription information online. When this information is available, the system displays an information message whenever you use a feature not included in your subscription. Flows and action titles also display an information icon for further details. Select the information icon to see a list of features not included in your subscription.

Sample subscription notification



Sample subscription notification with list of features



Subscription information unknown

When your instance cannot access your subscription information, it displays generic information messages. Whenever you use a feature that requires an Integration Hub subscription, the system displays a reminder information message. Verify that you have an appropriate Integration Hub subscription for the features you want to use.

Request an Integration Hub plugin

Integration Hub plugins require a separate subscription and must be activated by ServiceNow personnel.

Before you begin
Role required: admin.

About this task
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

For a list of Integration Hub plugins, see Integration Hub plugins.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Integration Hub Installer plugins

The following Integration Hub Installer plugins are the main plugins for the Starter, Professional, and Enterprise Integration Hub subscriptions. For a list of what's included in each subscription level, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Starter Pack Installer [com.glide.hub.integrations]
- ServiceNow IntegrationHub Standard Pack Installer [com.glide.hub.integrations.standard]
- ServiceNow IntegrationHub Professional Pack Installer [com.glide.hub.integrations.professional]
- ServiceNow IntegrationHub Enterprise Pack Installer [com.glide.hub.integrations.enterprise]

Other ServiceNow Integration Hub plugins

Plugin	Description
ServiceNow IntegrationHub Content - Deprecated [com.glide.hub.integration.content]	Workflow Studio actions to integrate with Slack, HipChat, Microsoft AD, Microsoft Azure, Microsoft Teams, and ServiceNow eBonding
Flow Designer Action Step - Payload Builder [com.glide.hub.action_step.payload]	Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.
ServiceNow IntegrationHub Action Step - JDBC [com.glide.hub.action_step.jdbc]	Create a reusable action to send SQL commands to a relational database.
ServiceNow IntegrationHub Action Step - REST [com.glide.hub.action_step.rest]	Enables the REST action step in Workflow Studio.
ServiceNow IntegrationHub Action Step - PowerShell [com.glide.hub.action_step.powershell]	Enables the PowerShell action step in Workflow Studio.
ServiceNow IntegrationHub Action Step - SOAP [com.glide.hub.action_step.soap]	Enables the SOAP action step in Workflow Studio.
ServiceNow IntegrationHub Action Step - SSH [com.glide.hub.action_step.ssh]	The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.
ServiceNow IntegrationHub Action Step - XML Parser [com.glide.hub.action_step.xmlparser]	Enables the XML parser action step in Workflow Studio.
ServiceNow IntegrationHub Action Template - Data Stream [com.glide.hub.action_type.datastream]	Send REST, SOAP, or JDBC requests from Workflow Studio to APIs that return a stream of response data larger than 10 MB, or that return paginated results. Parse stream data into a series of complex object outputs and use the data pills in other actions in a flow.
HipChat Spoke for ServiceNow IntegrationHub [com.sn.hipchat.ah]	The HipChat Spoke for ServiceNow IntegrationHub provides actions that a process analyst can use when designing flows. The actions allow them to automate the creation of conversations, add users to a conversation, and send messages to a conversation. **Note:** This integration is deprecated.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Other ServiceNow Integration Hub plugins (continued)

Plugin	Description
Slack Spoke for ServiceNow IntegrationHub [com.sn.slack.ahv2]	The Slack Spoke for ServiceNow IntegrationHub provides actions that a process analyst can use when designing flows. Send messages about incidents and problems to a channel.
Slack Webhooks Spoke for ServiceNow IntegrationHub [com.sn.slack.ah]	Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.
Microsoft SCCM Spoke for IntegrationHub [com.sn.sccm.spoke]	Provides actions that a process analyst can use to automate the management of user collections, device collections, and application deployments.
Microsoft Teams Spoke for ServiceNow IntegrationHub [com.sn.ms_teams.ah]	Provides actions that a process analyst can use when designing flows to automate sending messages about ServiceNow incident and problem records to a Microsoft Teams channel.
Microsoft Azure AD Spoke for IntegrationHub [com.sn.azure_ad.spoke]	Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.
ServiceNow eBonding Spoke for ServiceNow IntegrationHub [com.glide.sn.ebonding.ah]	The ServiceNow ebonding Spoke for the ServiceNow IntegrationHub provides Actions that enable process analysts to compose flows that help in ebonding with remote ServiceNow instances.
Integration Hub Designer Core [com.glide.ihub.designer.core]	Enables automation of data imports through the Integration Hub - Import environment. Installs with the ServiceNow Integration Hub Action Template - Data Stream [com.glide.hub.action_type.datastream] plugin.
ServiceNow Stream Connect Installer [com.glide.hub.stream_connect.installer]	Enables the licensed components for working with message-based streaming data in Stream Connect for Apache Kafka. Activating this plugin activates the following plugins. • ServiceNow IntegrationHub Flow Trigger - Kafka [com.glide.hub.flow_trigger.kafka]: Enables the ability to consume a Kafka message for a topic within a flow. • ServiceNow IntegrationHub Action Step - Kafka Producer [com.glide.hub.action_step.kafka]: Enables the ability to produce a Kafka message for a topic within a flow. • ServiceNow Integration Hub Kafka Consumer [com.glide.hub.kafka_consumer]: Provides IntegrationHub components for working with Kafka.

Other ServiceNow Integration Hub plugins (continued)

Plugin	Description
	• ServiceNow IntegrationHub ETL Consumer - Kafka [com.glide.hub.etl_consumer.kafka]: Enables the ability to consume Kafka messages from a topic using RTE, a transform map, or a script. • ServiceNow Stream Connect Replication - Kafka [com.glide.hub.stream_connect.replication.kafka]: Enables support for replicating Stream Connect topics via a MID Server with a customer Kafka cluster. • ServiceNow Integration Hub Stream Connect Schema [com.glide.hub.stream_connect.schema]: Enables importing and creating schemas to send and receive messages in an Apache Avro format. • ServiceNow Stream Producer [com.glide.hub.stream_connect.stream_producer]: Enables Stream Producer to automatically stream changes from ServiceNow tables to Kafka topics.
ServiceNow Stream Connect Common Core [com.glide.hub.stream_connect.common.core]	Provides the general Stream Connect capabilities across Hermes and Direct Kafka.
ServiceNow Stream Connect Direct Kafka [com.glide.hub.stream_connect.direct_kafka]	Adds the capability to connect the ServiceNow instance to Apache Kafka directly (not using Hermes Messaging Service).
ServiceNow Stream Connect Hermes [com.glide.hub.stream_connect.hermes]	Adds the capability for Stream Connect to connect to the Hermes Messaging Service.
ServiceNow Stream Connect Installer (Direct Kafka) [com.glide.hub.stream_connect.onprem_installer]	Installs the required plugins for Direct Kafka.
ServiceNow Stream Connect Kafka Connection [com.glide.hub.stream_connect.kafka_connection]	Adds the ability to use Kafka credentials for Direct Kafka and Message Replication.
ServiceNow Stream Connect Replication Certificates [com.sn_stream_connect.replication.cert]	Adds the capability to handle certificates to connect to the Hermes Messaging Service from the MID Server.
ServiceNow Stream Connect Replication Core [com.glide.hub.stream_connect.replication.core]	Adds capabilities to replicate data between a topic in the Hermes Messaging Service and a topic in a local Apache Kafka environment.
Stream Connect MID Hermes API [com.glide.mid.hermes_api]	Provides the capability to produce messages from the MID Server to a topic in the Hermes Messaging Service.

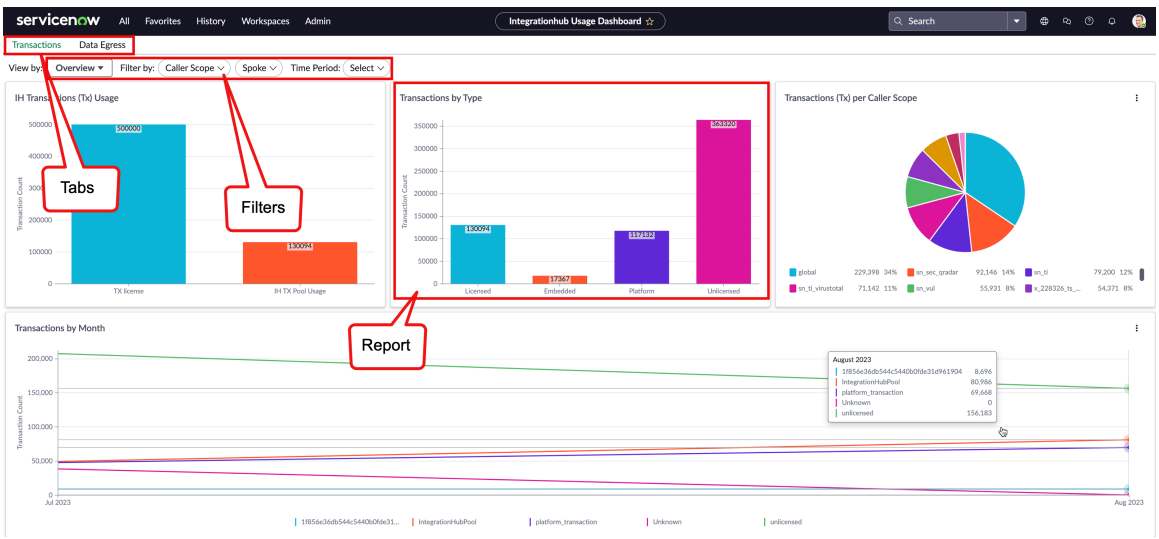
Integration Hub Usage Dashboard

Get insights on the usage of Integration Hub data from the Integration Hub Usage Dashboard. For example, view the average number of monthly transactions in the last year or the data egress from Integration Hub via REST and SOAP API protocols.

The Integration Hub Usage Dashboard gives insights in the form of reports. Access to the dashboard is role-based. The reports are available under various sections in the **Transactions** and **Data Egress** tabs. You can customize the data that you want to view by using filters or drilling down reports.

Note: The Integration Hub Usage Dashboard provides reports of usage by protocol. For more information about the service accounts contributing to each protocol, see Monitor inbound API integration usage.



Integration Hub Usage Dashboard version

Integration Hub Usage Dashboard v3.0.0 is the latest version.

Sections in the Transactions tab of the Integration Hub Usage Dashboard

The dashboard has these sections:

- Overview: View the usage data on the transactions from various perspectives and, if needed, drill down to view more details. For example, you could view the monthly transactions in the last year.
- Spokes: View the data on the transactions that were performed by the spokes and, if needed, drill down to view more details. For example, you can view the information on which spoke performed the highest number of transactions in the last year.
- Protocols and Features: View the usage data on the various protocols and features that were used to and, if needed, drill down to view more details. For example, you can view the number of transactions that were performed with the REST protocol in the last year.

Sections in the Data Egress tab of the Integration Hub Usage Dashboard

The dashboard has these sections. All sections have three common reports: Data Egress, Data Egress by source (API protocols or exports), and Data Egress Trends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

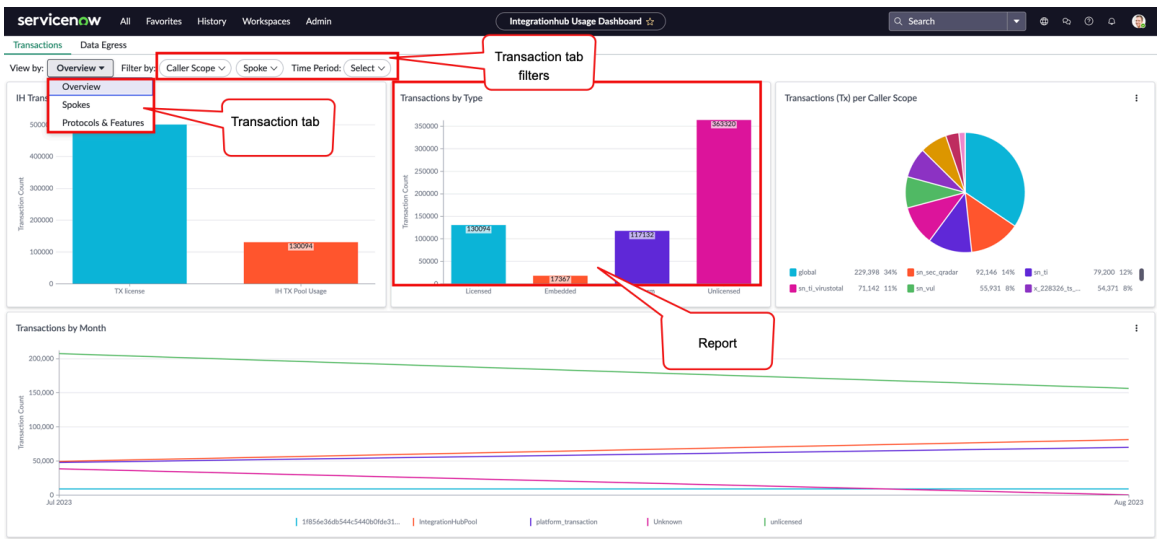
- Overview section: Gives an overview of the total data egress volume, data egress by REST and SOAP protocols, JSON, Export set, and URI from the ServiceNow instance, and the data egress across time periods.
- API section: Gives an overview of the total data egress volume by all sources, data egress by REST or SOAP protocols or JSON data from the ServiceNow instance, and the data egress across time periods.
- Export section: Gives an overview of the total data egress volume by all data export formats, data egress by export formats from the ServiceNow instance, and the data egress across time periods.

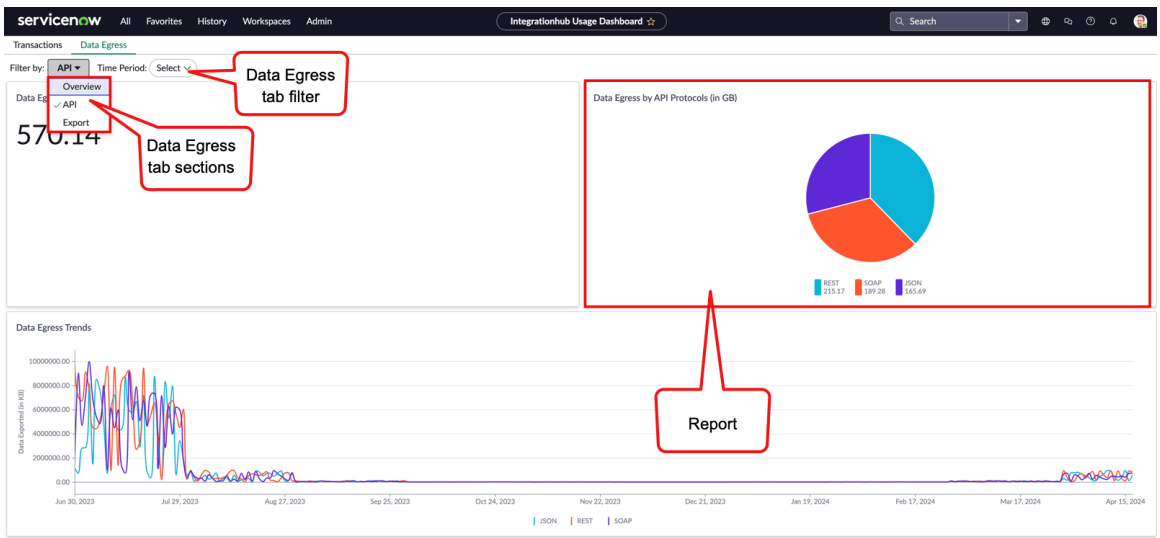
Note:

- There's no order in which you must view the reports, set the filters, or customize the columns in the report tables.
- All charts are adjusted to the nearest data metric starting with Bytes.

Data organization in the dashboard

The following images show how data is organized in the dashboard.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get insights from the Integration Hub Usage Dashboard

Use the Integration Hub Usage Dashboard to get insights on the Integration Hub transactions. For example, you can view which protocol was the most used in the transactions in the last year. You can also use filters and customize the layout and arrangement of the columns in the reports.

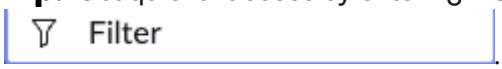
Before you begin

Role required: admin, flow designer, action_designer, usage_admin, or flow_operator

Procedure

1. To access the dashboard, navigate to **All** > **IntegrationHub** > **IntegrationHub Usage**.

   Tip: Get quicker access by entering **Integrationhub usage** in the filter search field

2. To view the reports, select **Spokes** or **Protocols & Features** in the **View by** list.

   
   Note: There's no order in which you must view the reports, set the filters, or customize the columns in the report tables. So, you can complete one or more of the following steps in any order. The Transactions tab is selected by default.

3. **Optional:** To drill down and view more details in a report, select the graph or chart.
4. **Optional:** To group transactions under a common parameter, do the following actions:

   a. Drill down the report.

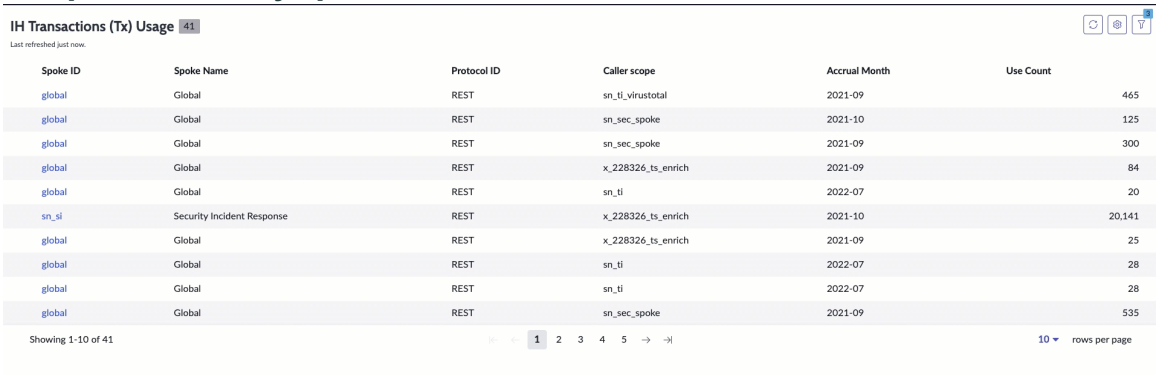
   b. In the desired column, move the mouse device to the row that contains the parameter and click the group transactions by parameter icon ( ) for the parameter under which you want to group the transactions.

   c. Click **Show Matching**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

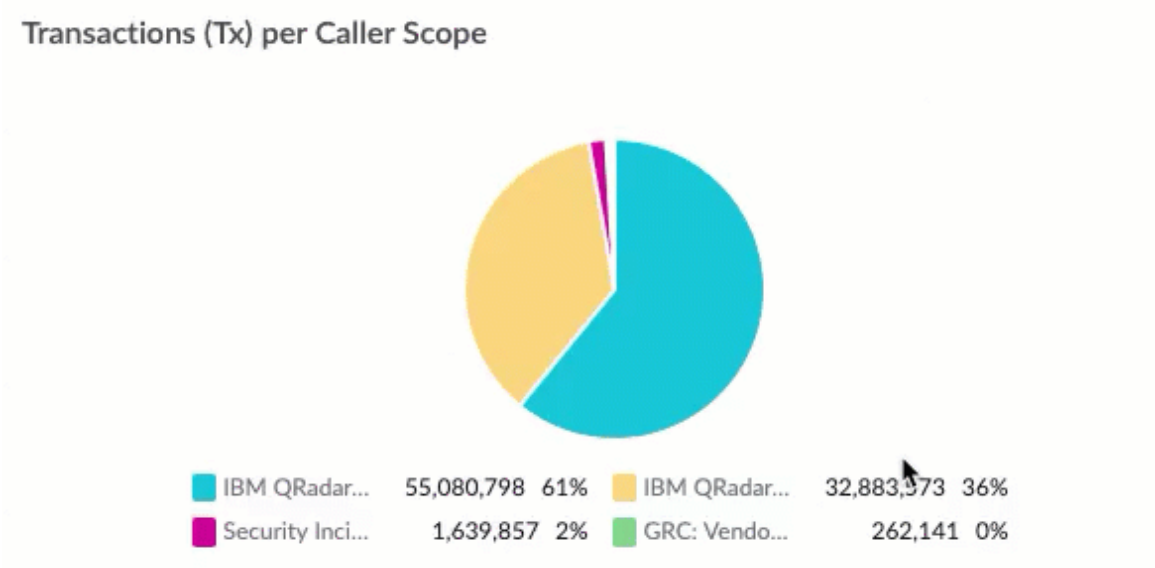
Alternatively, you can view the following animation by opening this topic on a browser.

Group transactions by a parameter



5. **Optional:** To hide or reveal the slices in a pie chart, do the following actions:
   Each slice in a pie chart represents a transaction usage insight. However, it might be difficult to view certain slices because they're obscured by fairly bigger slices.
   a. To hide a slice, click its colored legend.
   b. To reveal the slice back, click the colored legend again.
   Alternatively, you can view the following animation by opening this topic on a browser.

Hide or reveal pie chart slices



6. **Optional:** To customize the columns in the report table, do the following actions:
   a. Drill down the report.
   b. Click the column settings icon ( ).
   c. Click **Edit columns**.
   d. In the Available columns section, click the column name.
   e. To include a column, click the include column icon ( ).
   f. To exclude a column from the table, in the Selected columns section, click the remove column icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. To change the positions of the columns in the report table, in the Selected columns section, click and drag the drag column icon (⠿).

h. To apply the changes, click **OK**.

7. **Optional:** Filter the data in the reports by caller scopes, spokes, and date by doing the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

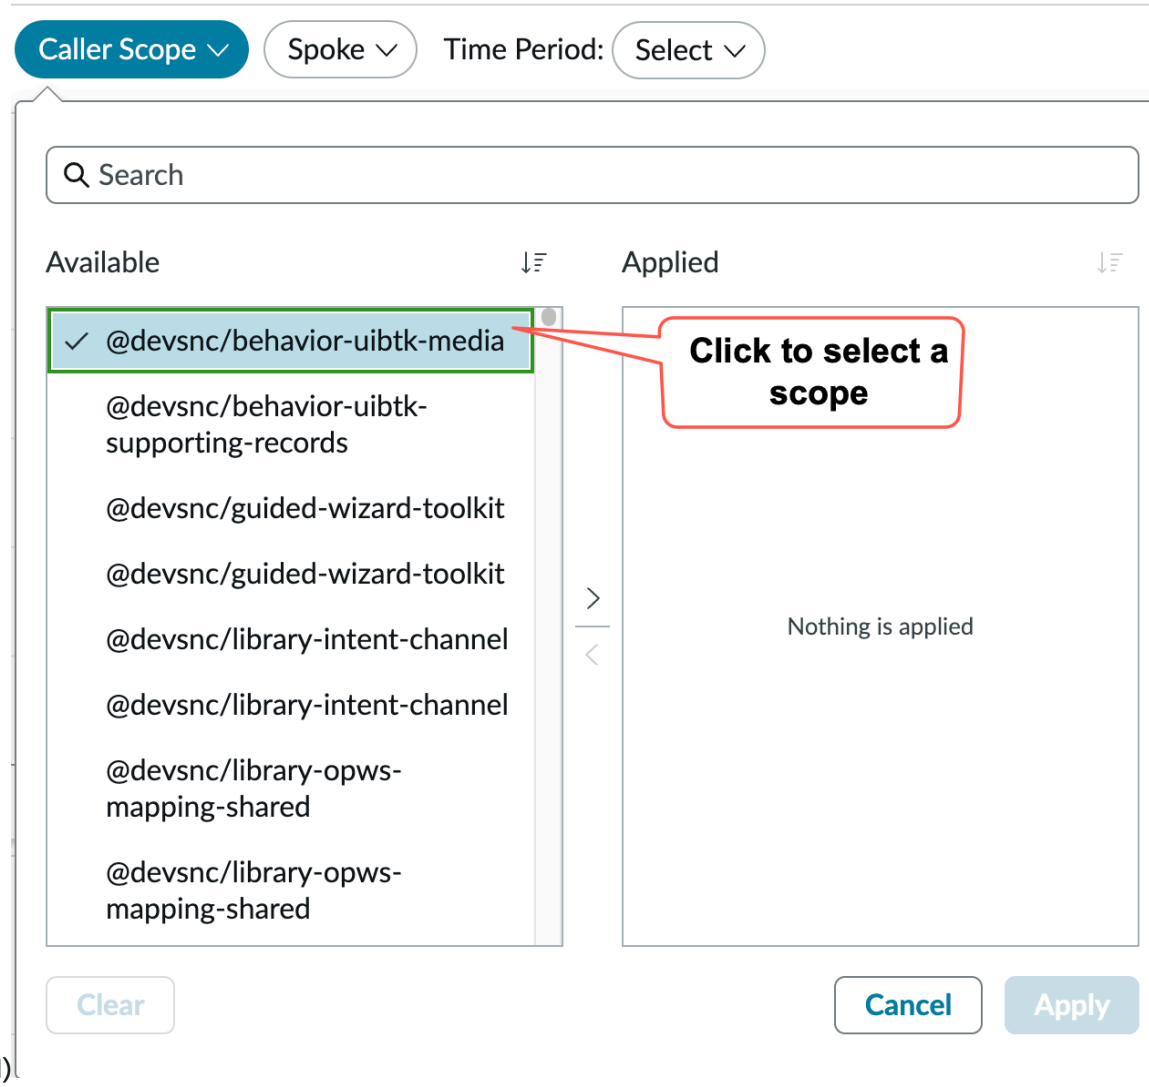
a. To filter by caller scope or spoke, click **Caller Scope** or **Spoke** and then select one or more values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: Select multiple caller scopes or spoke values by doing the following steps.

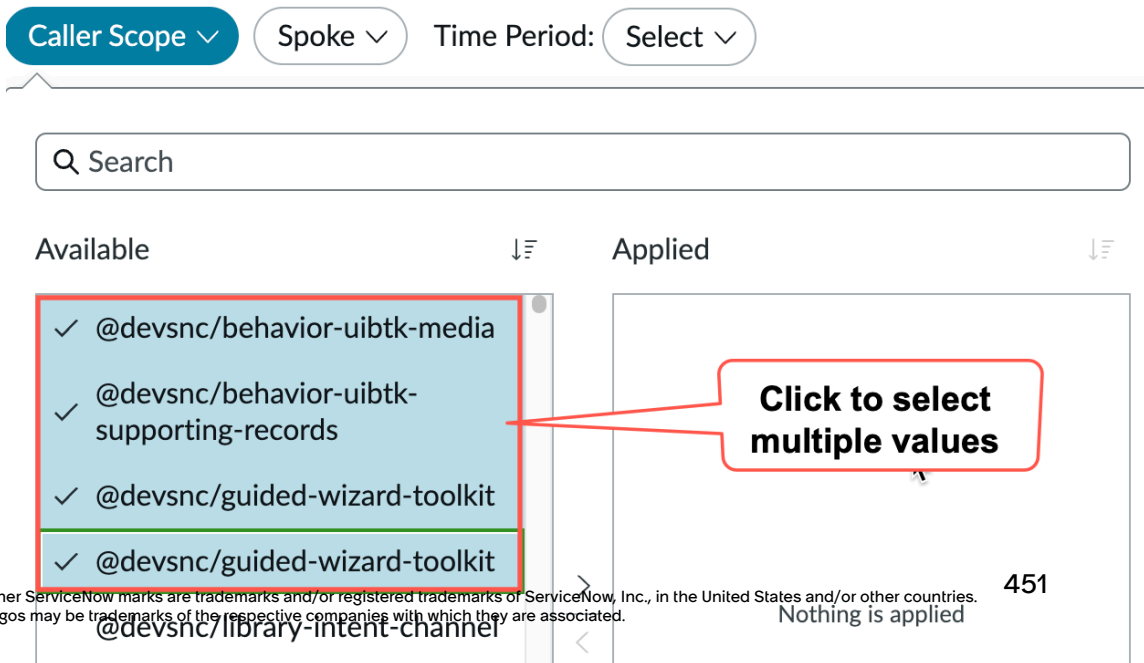
i. Select the **Caller Scope** or **Spoke** filter.

ii. Click to select the first value in the Available list.



(Optional)

iii. Click to select more values.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Click the Move selected items to the To be Applied list icon >

c. Click **Apply**.
The filter is applied.

d. To filter the report data by time period, select the Time Period filter.

e. Select the time period by which you want to filter the data.

f. Click **Apply**.

Transaction reports in Integration Hub Usage Dashboard

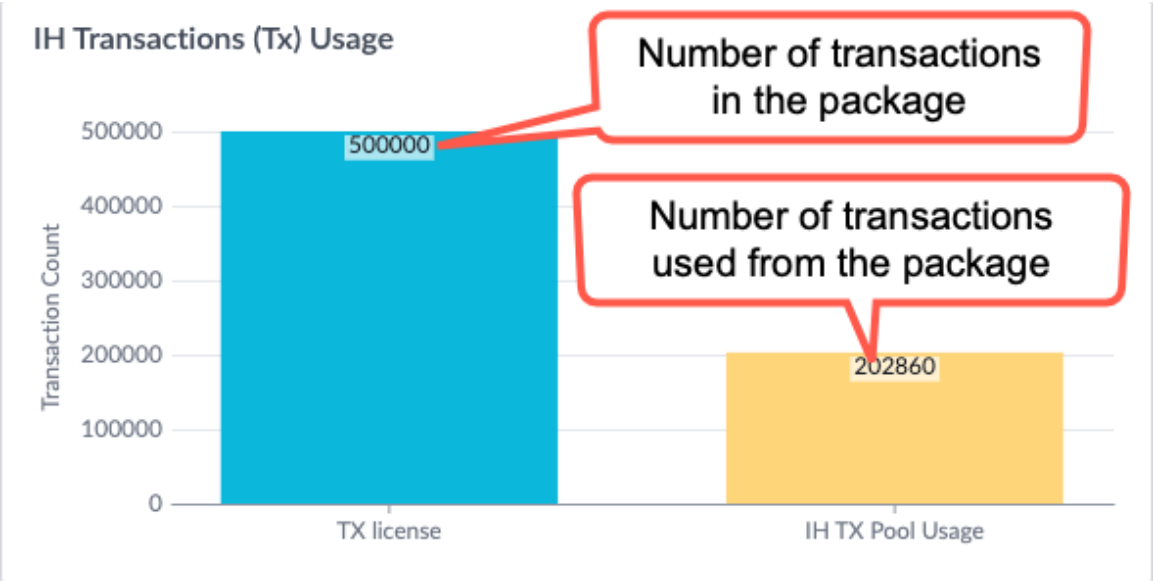
The transaction reports in Integration Hub Usage Dashboard help you to understand the Integration Hub usage transactions.

Overview section reports

IH Transactions (Tx) Usage report

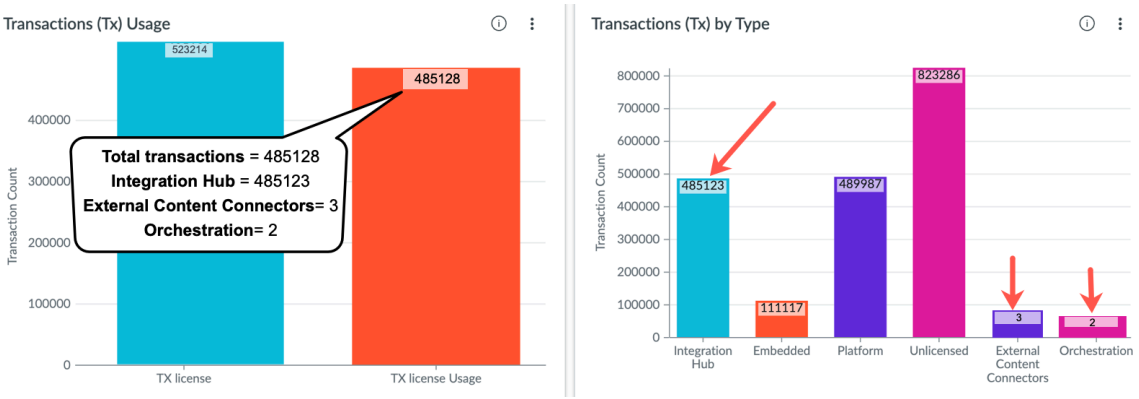
Depending on the package that your organization subscribes to, the Integration Hub subscription packages offer a certain number of transactions per year. See the details about the packages in Integration Hub usage and subscription. With this report, you can learn about the total usage of the Integration Hub transactions versus the subscribed package of transactions in the last year. The following diagram shows what you can learn from viewing the Integration Hub transactions usage.

Integration Hub Transactions (Tx) Usage report

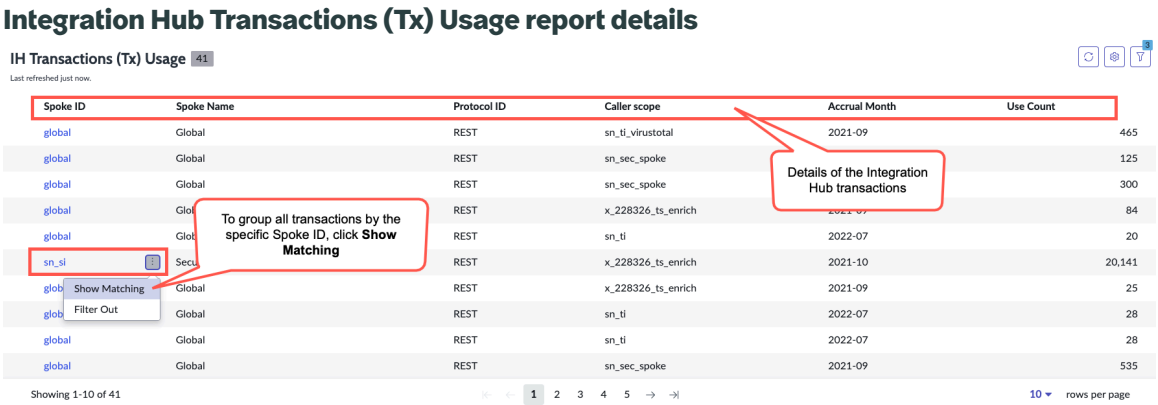


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The number of transactions you have used from the package is the sum of the transactions that you have performed in Integration Hub, External Content Connectors, and Orchestration. The Transactions (Tx) by Type report shows the transactions that you have performed in Integration Hub, External Content Connectors, and Orchestration. See the image.



As shown in the following example, you can click a graph to view more details about the transactions.



Transactions by Type report

As shown in the following diagram, you can use the Transactions by Type report to view the total transactions by their types.

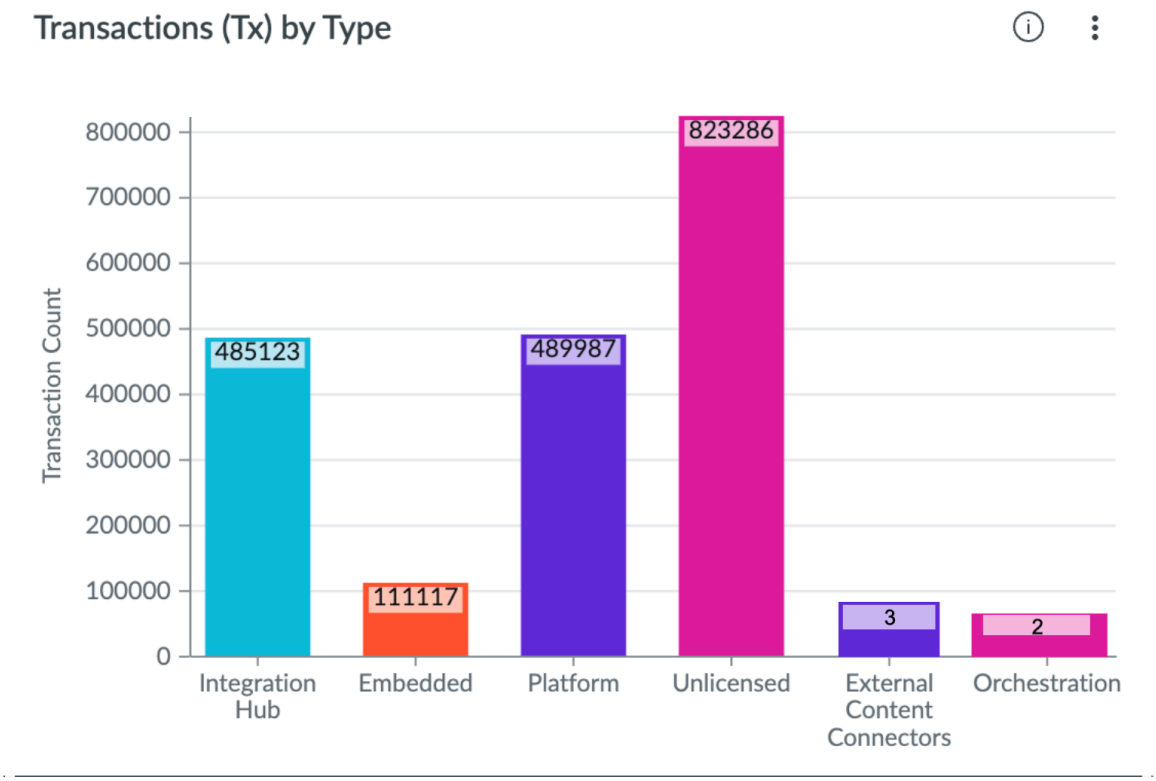
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transactions by Type report



Transactions (Tx) per Caller Scope report

The applications that perform the transactions are known as caller scopes. The Transactions (Tx) per Caller Scope report enables you to view the transactions per caller scope. As shown in the following diagram, you can also drill down and view the transactions that are performed by the spokes that are under different caller scopes.

Transactions (Tx) per Caller Scope report

As shown in the following example, you can click a graph to view more details such as the spoke transactions, what the caller scope of the spoke is, the total transaction count, and more. You can also group the transactions under a specific parameter in the table.

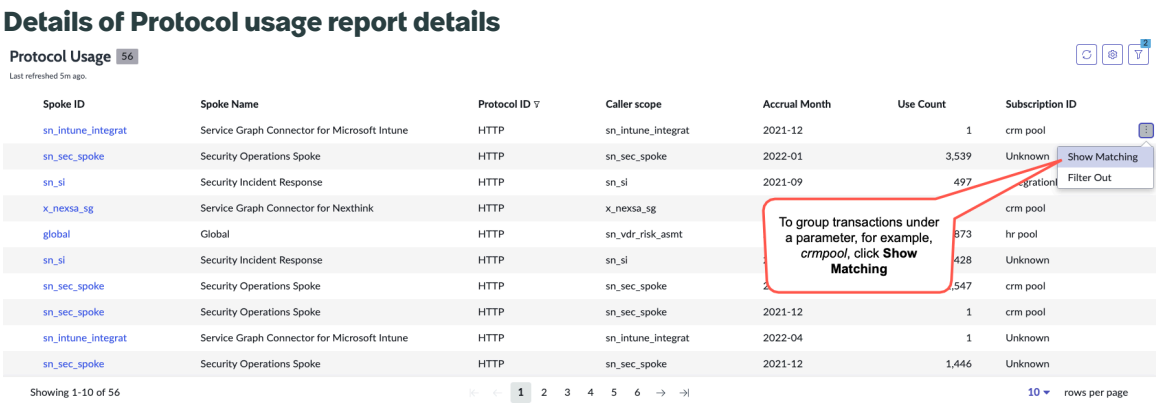
Protocols and Features reports

Protocol Usage report

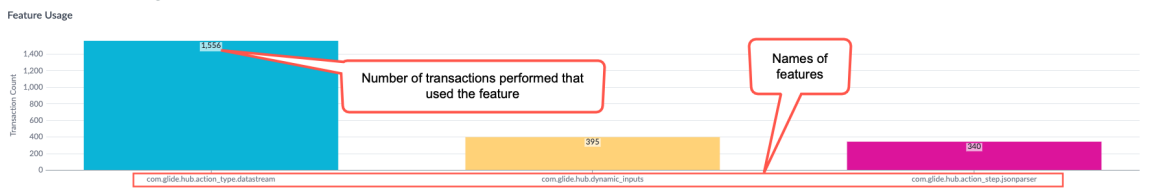
Spokes use different protocols while performing transactions. As shown in the following diagram, you can use the Protocol Usage report to view the usage of the various protocols. You can drill down to view more details.

As shown in the following example, you can drill down and view the details of transactions with a protocol by clicking the graph that represents a protocol.

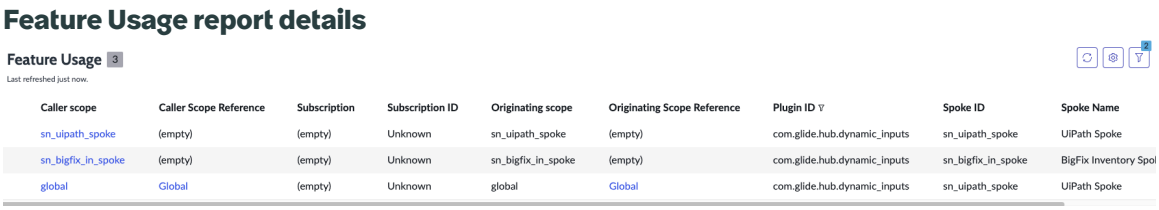


Feature Usage

The Spokes use different features while performing transactions. This report gives the usage of the various features. You can drill down to view more details.



To drill down, click the graph representing a feature.



Data egress reports in the Integration Hub Usage Dashboard

The Data egress reports give insights on data egress from the ServiceNow instance through API protocols or export sets. You can view more information when you select specific records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the reports

Do the following steps.

1. Select the **Data Egress** tab.
2. Select the API or Export section that you want to view from the **Filter by** list.

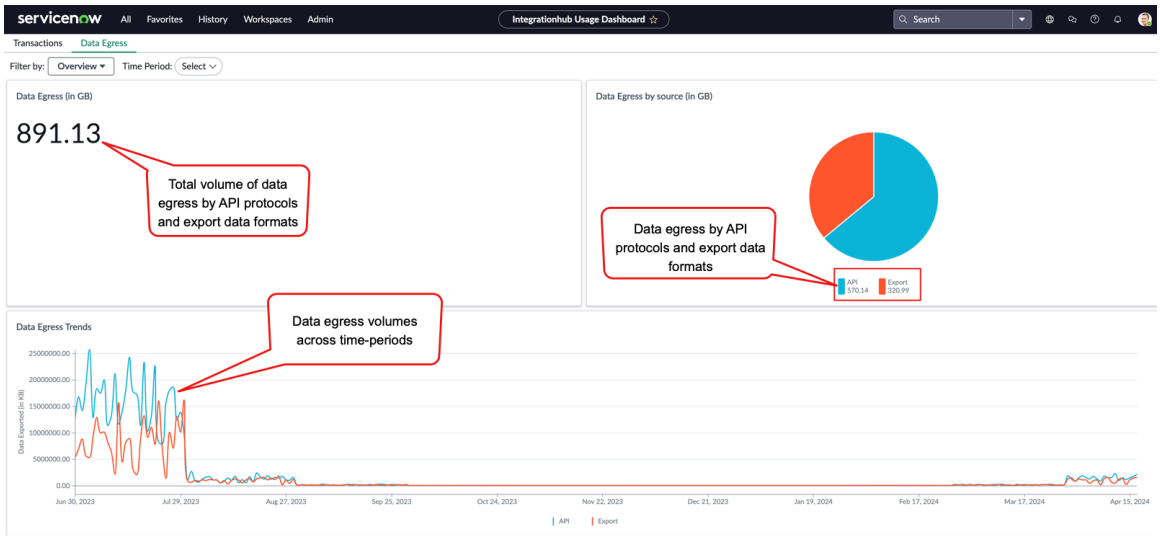
Note: The Overview section is selected by default.

Overview section reports

Data Egress: Total volume of data egress by all sources.

Data Egress by source: Data egress volume by API protocols and export.

Data Egress Trends: Trends in data egress across the time period.



Note: All charts are adjusted to the nearest data metric starting with Bytes.

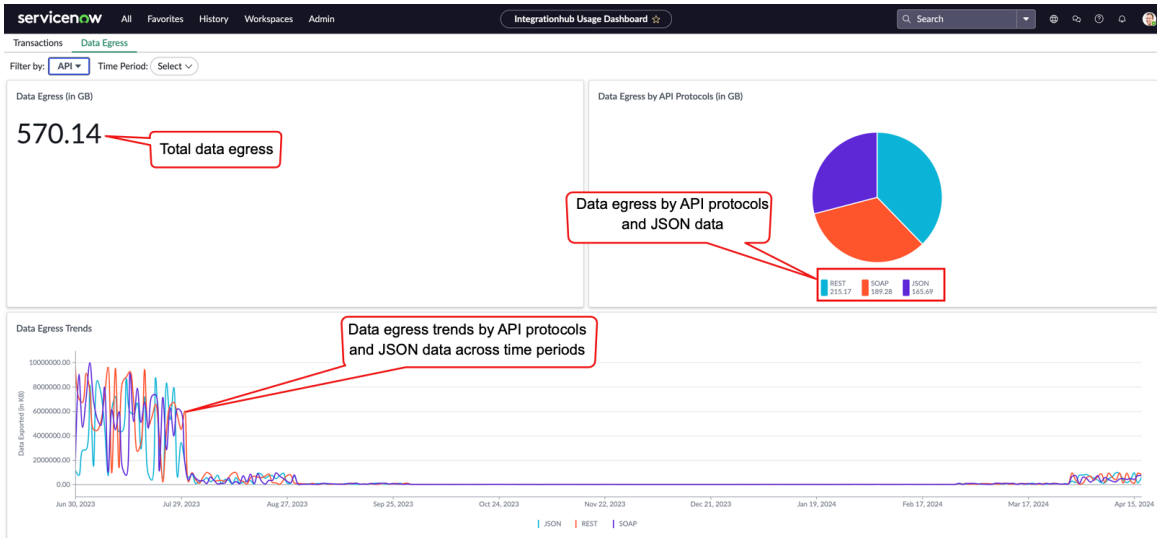
API section reports

Data Egress: Total volume of data egress by all API protocols.

Data Egress by API Protocols: Data egress volume by API protocols.

Data Egress Trends: Trends in data egress across the time period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: All charts are adjusted to the nearest data metric starting with Bytes.

Export section reports

Data Egress: Total volume of data egress by both the export sets and URI.

Data Egress by Exports: Data egress volume by URI.

Data Egress Trends: Trends in data egress across the time period.

Note: All charts are adjusted to the nearest data metric starting with Bytes.

Important: The amount of data is mentioned in bytes and the abbreviations are as described in the following table.

Orders of magnitude

Abbreviation	Number	Value
K	Thousand	10^3
M	Million	10^6
B	Billion	10^9
T	Trillion	10^12

That is, if the value displayed is **4.01M**, the amount of data transferred is 4.01 million bytes. In the preceding sample API Data Egress, the data amount of data transferred is 2.01 billion bytes.

Select the number to access details of the individual data transfers.

View data insights

View different insights on data going out of the ServiceNow instance. For example, view the data egress volume between a period that you specify. Do the actions given in the image.

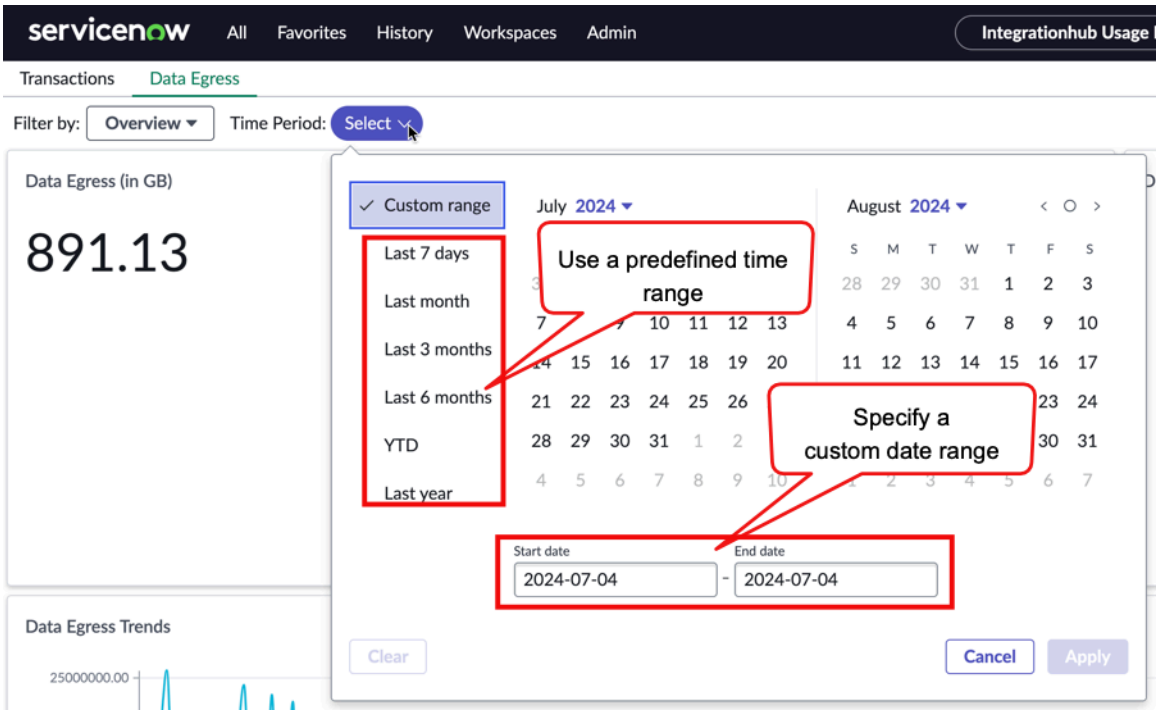
View egress data for a specified time period



Overview of data egress

View the total data egress, and the data egress by API protocols or exports.

Do the steps.

1. Select the **Data Egress** tab.

   Confirm that in the Filter by list, Overview is selected.

2. Select the data egress volume in the Data Egress report.

Page 2

View data egress by API protocols or exports on a specified date

Select a date and API protocol or exports and view the data egress by the source you specified on that date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Do the following steps.

1. Select the **Data Egress** tab.

   Confirm that in the Filter by list, Overview is selected.

2. On the Data Egress Trends report, move the pointer to a date and then select the source.

   All records of data egress by the date and source that you specified appears.

View data egress by API protocols

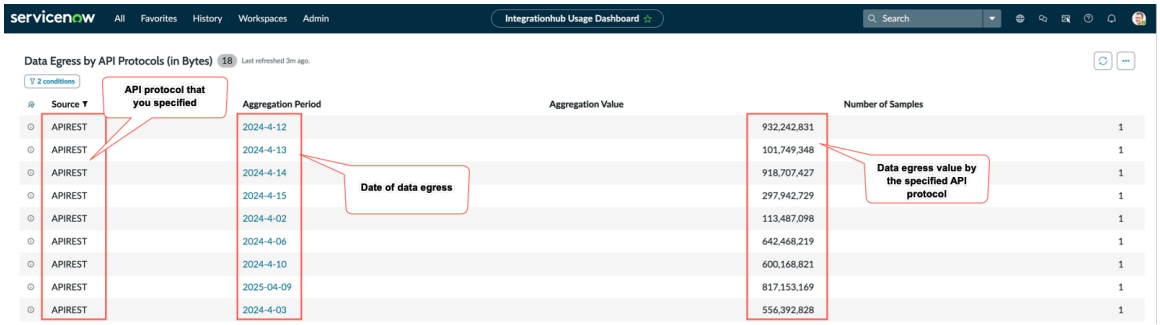
View data egress by JSON, REST, or SOAP protocols, and then select a record from the data to view more information.

Do the steps.

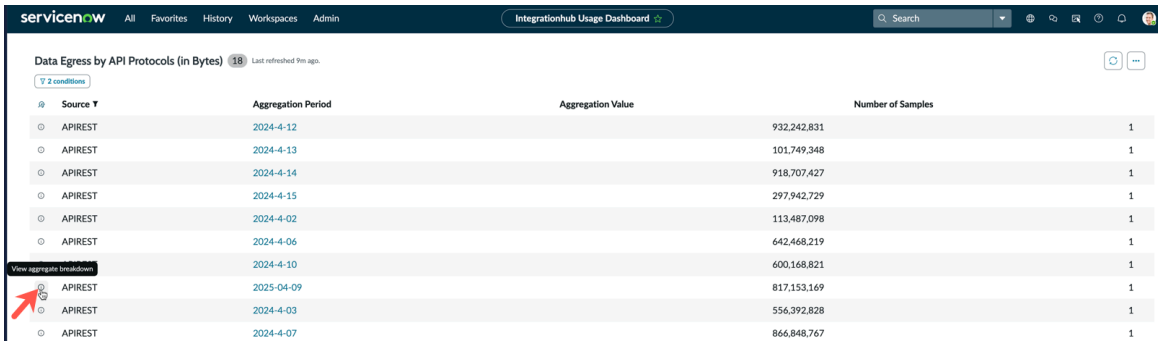
1. Select the **Data Egress** tab.
2. From the Filter by list, select **API**.
3. In the Data Egress by API Protocols report, select an API protocol, for example, REST.

   All records of data egress by the API protocol that you specified appears.

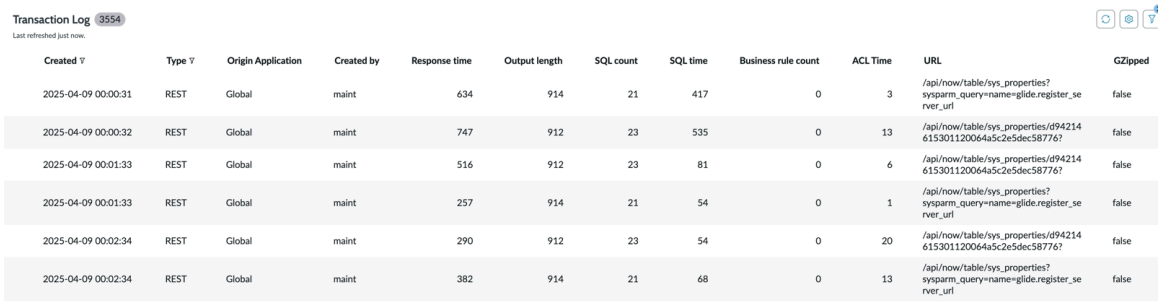
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. To view more data on a specific record, select the View Aggregate Breakdown icon .



The transaction log appears.



View data egress by API protocols on a specified date

Specify a date and view the data egress by JSON, REST, or SOAP protocols on that date. You can select a record from the data to view more information.

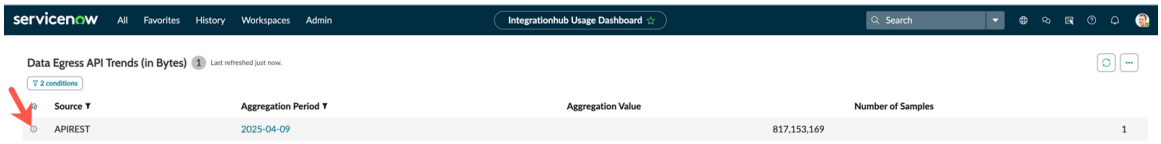
Do the steps.

1. Select the **Data Egress** tab.
2. From the Filter by list, select **API**.
3. Move the pointer to a date on the graph, and select an API protocol.

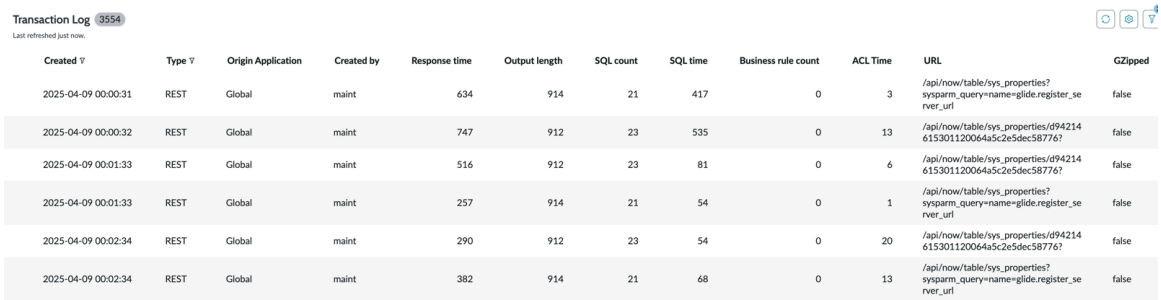
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The data egress by the selected API protocol on the selected date appears.

4. To view more data on a specific record, select the View Aggregate Breakdown icon .



The transaction log appears.



Reports on data egress by export

View information on the data egress from the ServiceNow instance by URI and export sets.

To access the reports, do the steps.

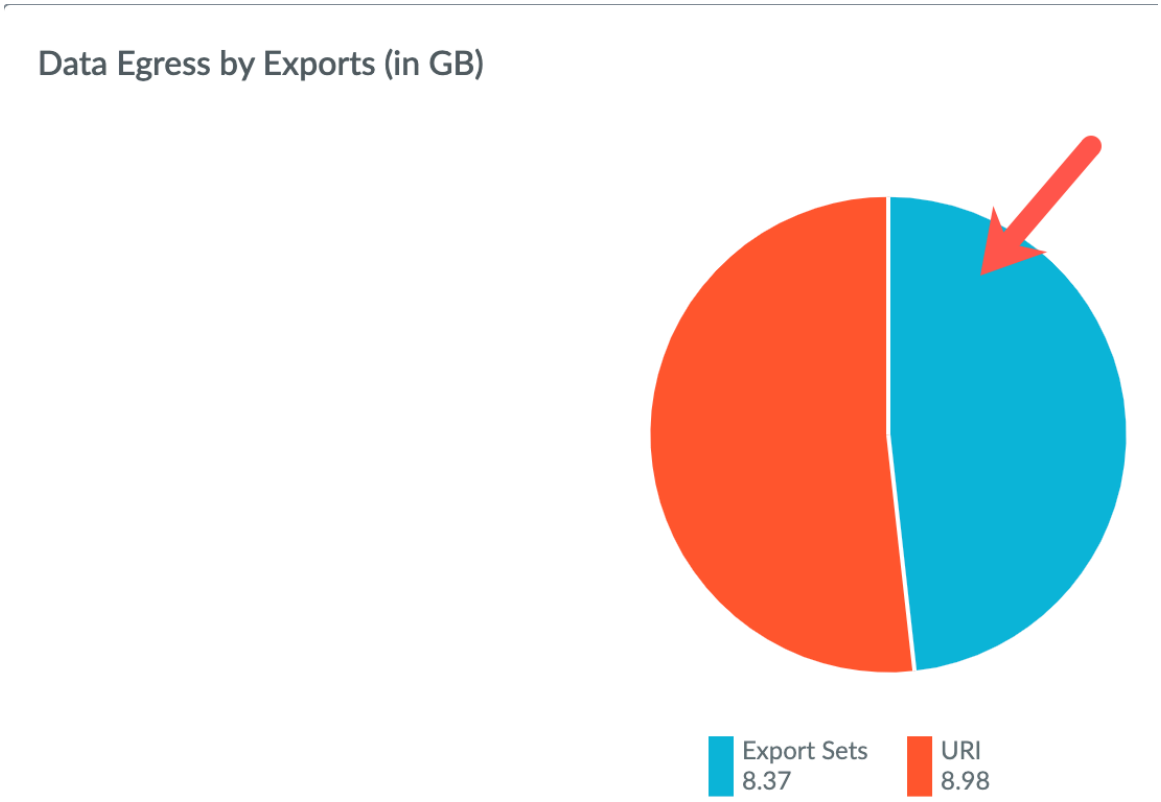
1. Select the **Data Egress** tab.
2. From the Filter by list, select **Export**.

Reports on data egress by export sets or URI

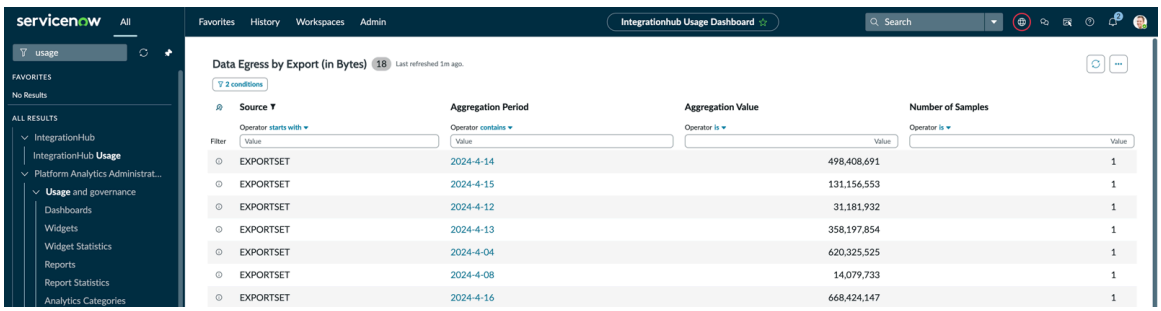
To access the reports on data egress by export sets or URI, do the steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

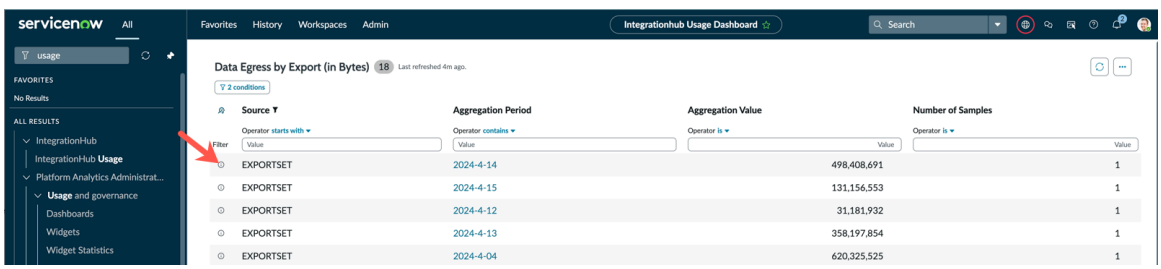
1. On the Data Egress by Exports report pie-chart, select the data export type. For example, export sets.



The date-wise data exports by the source you specified appears.



2. To view more information on an export set on a date, select the View Aggregate Breakdown icon .



The data appears.

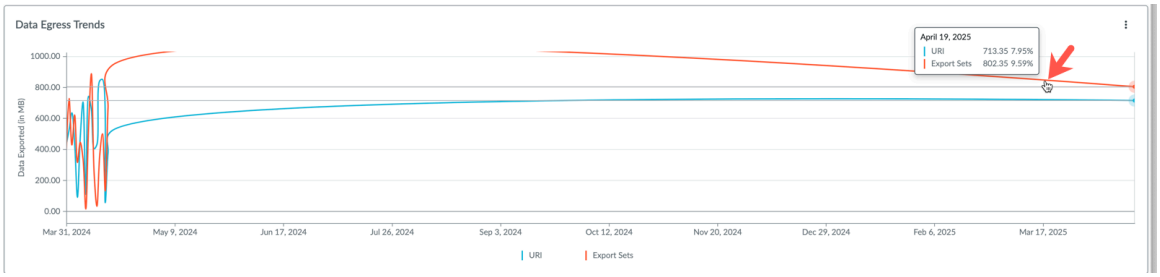
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Date-wise data egress by exports

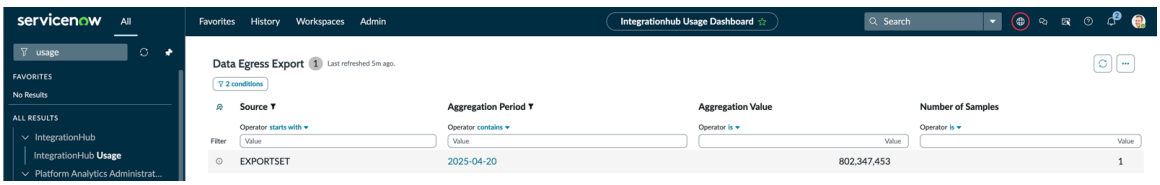
View data egress by exports on a date that you specify.

Do the following steps.

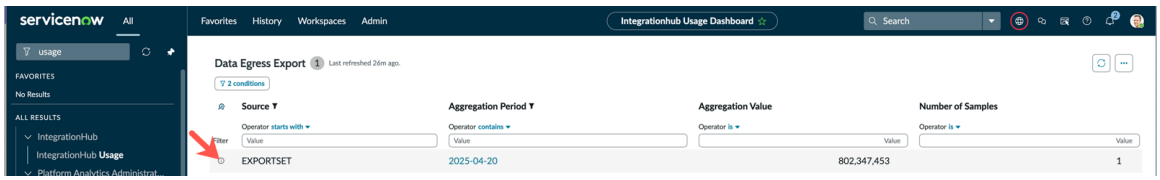
1. On the Data Egress Trends report, move the pointer to a date and then select the export type. For example, move the pointer to April 19, and then select Export Sets.



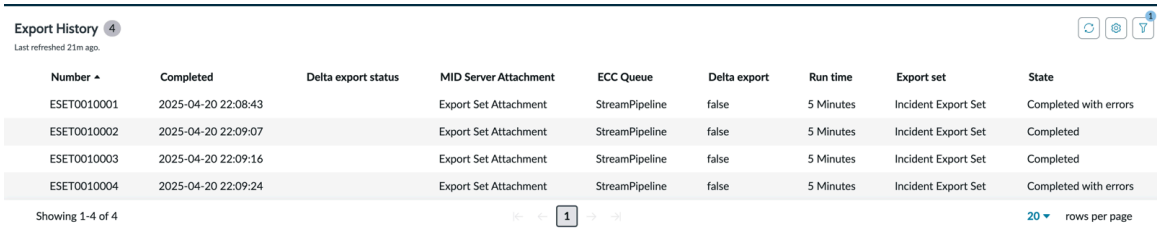
The egress data on the export type and date that you specified appears.



2. To view more data on a specific record, select the View Aggregate Breakdown icon .



The data appears.



Data generation in the reports

Data in the reports are generated from the `data_egress_count` table. View how data is populated in the `data_egress_count`.

Building integrations in Integration Hub

Create integrations with Integration Hub.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub spokes

Activate spokes to enhance your Workflow Studio experience with integration-specific content. Use prebuilt flows and actions to automate your integrations or create your own integration automation.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note: For information about which spokes are included with different Integration Hub subscriptions, see Legal schedules - IntegrationHub overview.

Note:

ServiceNow has partnered with Boomi to deliver Boomi API Management, a cloud-based platform that enables customers to discover, manage, secure, and monetize their APIs. Boomi supports full lifecycle API management, including governance, analytics, and API security.

Boomi provides documentation though their own portal, and customers requesting support with Boomi API Management will contact the Boomi support through their standard channels.

To get started, see the Boomi API Management listing on the ServiceNow® Store, which includes information about entitlements and required plugins, as well as a link to the Boomi API Management documentation.

Adobe Experience Platform Spoke

Automate the process of managing datasets and entities in Adobe Experience Platform from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Adobe Experience Platform spoke v2.1.1 is the latest version. For version history of the spoke, see Adobe Experience Platform release notes.

Supported versions

This spoke was built for Adobe Experience Platform released on September 10, 2019, but may be compatible with later versions.

Spoke requirements

- Registered Adobe ID account
- User with developer access
- Details such as API key and client secret

See the Adobe Experience Platform documentation for instructions on creating Adobe ID and adding developer.

Spoke actions

The Adobe Experience Platform spoke provides actions manage datasets and entities when events occur in ServiceNow. Available actions include:

Category	Action	Description
Dataset Management	Get All Data Inlets	Retrieves the details of all data inlets.
	Get All Datasets	Retrieves the details of all datasets.
	Get All Union Schemas	Retrieves the list of all schemas that are part of unions.
Entity Management	Get Entity Information	Retrieves the information of an entity as a dynamic object.
	Load Entity Data	Ingest the information of an entity to Adobe Experience Platform.
Metadata Retrieval	Get Metadata For All Attributes In A Schema	Retrieves all attributes for the selected union schema.
	Get All Sandboxes	Retrieves information about all active sandboxes.
	Get Metadata For All Data Inlets	Retrieves the metadata of all data inlets.
	Get Metadata For All Datasets	Retrieves the metadata of all datasets.
	Get Metadata For All Fields In A Union	Retrieves the metadata of all fields in the selected union.
	Get Metadata For All Identity Fields	Retrieves the metadata of all identity fields or namespaces.
	Get Metadata For All Union Schemas	Retrieves the list of all schemas that are part of unions.
	Get Metadata For All Unions	Retrieves the metadata of all union views.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Metadata For Union Schema	Retrieves schema for the selected fields of a union.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: Two connection and credential alias records are needed for the Adobe Experience Platform spoke; one for data inlet management and batch ingestion, and other for data collection. Each alias should be associated with the respective Adobe Experience Platform API.

For information about setting up the spoke, see Set up Adobe Experience Platform spoke.

Set up Adobe Experience Platform spoke

Integrate your Adobe Experience Platform account with your ServiceNow instance. Create a custom OAuth application in Adobe Experience Platform and authenticate requests from ServiceNow.

Before you begin

- Request Integration Hub subscription
- Activate Adobe Experience Platform spoke
- Role required: admin

About this task

The Adobe Experience Platform spoke can also be set up using the Connection & Credential configuration templates. However, using templates, only one set of alias records can be used at a time.

Attach a Java Key Store certificate to the Adobe Experience Platform spoke

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Adobe Experience Platform spoke.

Before you begin

- Valid Java KeyStore certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

X.509 Certificate form fields

Field	Description
Name	Name to uniquely identify the record. For example, `AEP Certificate`.
Expiration notification	Option to send a notification when the certificate is about to expire.
Notify on expiration	Users to be notified when the certificate expires.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to actively use the certificate.
Format	Certificate format. The instance supports the PEM and DER formats.
Type	Type of certificate. Select **Java Key Store**.
Valid from	Date from which the certificate is valid.
Expires	Date on which the certificate expires.
Expires in days	Number of days until the certificate expires.
Key store password	Password associated with the certificate.
Short description	Summary about the certificate.
PEM Certificate	Contents of the X509 certificate.

4. Click the attachments icon ( ) and attach a JKS certificate.
5. Click **Validate Stores/Certificates**.

Result
The JKS certificate is created and attached to the Adobe Experience Platform spoke.

Create a JWT signing key for the Adobe Experience Platform spoke

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Keys form fields

Field	Description
Name	Name to uniquely identify the JWT signing key. For example, `AEP JWT Keys`.
Signing Keystore	Valid JKS certificate attached in the previous task. For example, `AEP Certificate`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key Id	Key ID to identify which key is used when multiple keys are used to sign tokens.
Application	Application scope that contains this record. Select Adobe Experience Platform spoke.
Signing Algorithm	Algorithm to sign with the JWT key.
Signing Key Password	Password associated with the signing key.
Active	Option to actively use the certificate.

4. Click **Submit**.

Result
The JWT key is created and assigned to the JKS certificate.

Create a JWT provider for the Adobe Experience Platform spoke

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Nname to uniquely identify the JWT provider. For example, `AEP JWT Provider`.
Expiry Interval (sec)	Number in seconds to set the lifespan of JWT provider tokens.
Signing Configuration	JWT signing key from the previous step. For example, `AEP JWT Keys`.

4. Right-click the form header, and click **Save**.
   The Standard Claims and Custom Claims related lists are displayed.
5. Enter values for **iss**, **sub**, and **aud** in the Standard Claims related list.
   See the Adobe Experience Platform documentation for instructions.
6. Enter these values in the Custom Claims related list.

Field	Value
Claim Name	https://ims-na1.adobelogin com/s/entdataservices_sdk
Claim Value Type	true|false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Claim Value	true

7. Click **Update**.

Result
The JWT provider is added to your ServiceNow instance.

Register Adobe Experience Platform as OAuth Provider

Use the information generated during Adobe ID account creation and configuration to register Adobe Experience Platform as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `AEP OAuth`.
Client ID	Consumer key you generated during the Adobe ID account configuration.
Client Secret	Consumer secret you generated during the Adobe ID account configuration.
OAuth API Script	Script to customize the request and response. Select **OAuthUtilAEP**.
Default Grant type	Grant type used to establish the token. Select **JWT Bearer**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record. Select Adobe Experience Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Authorization URL	This field should be left blank.
Token URL	OAuth server token endpoint. Enter `https://ims-na1.adobelogin.com/ims/exchange/jwt/`.
Token Revocation URL	This field should be left blank.
Redirect URL	This field should be left blank.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.
Send Credentials	Client credentials in the request.

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **AEP default_profile**
6. Open the record of OAuth Entity Profile.
7. Select the JWT Provider record for **JWT Provider**, for example, `AEP JWT Provider`.
8. Click **Update**.

Result
The instance can request OAuth 2.0 tokens for the spoke.

Note: When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Create Credential records for the Adobe Experience Platform

Create Credential records to the Adobe ID account you created. The Adobe Experience Platform spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin

About this task
You must create two credential records; one for data inlet management and batch ingestion, and other for data collection.

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `AEP` for data inlet management and batch ingestion, and `AEP_Ingestion` for data collection.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile you created when you registered the Salesforce connected app as an OAuth provider. For example, select **AEP OAuth default_profile**.
Applies to	This field isn't applicable.
Order	Order to apply this credential. For example, enter `100`.

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

Result
The credential records for the Adobe Experience Platform spoke is created.

Create Connection records for the Adobe Experience Platform spoke

Create Connection records to your Adobe ID account. The Adobe Experience Platform spoke connection and credential alias uses these connections to perform actions in Adobe Experience Platform.

Before you begin
Role required: admin

About this task
Two connection and credential alias records are available by default; one for data inlet management and batch ingestion, and other for data collection. Perform these steps to associate each alias with the respective Adobe Experience Platform API.

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the required Adobe Experience Platform spoke record.

> **Note:** There are two connection and credential records; **AEP** and **AEP_Ingestion**. The **AEP** record is for data inlet management and batch ingestion, and **AEP_Ingestion** is for data collection.

3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `AEP Platform` for data inlet management and batch ingestion, and `AEP dcs` for data collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Credential	Credential record you created for Adobe Experience Platform. For example, select **AEP** and **AEP_Ingestion**.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	Base URL to connect to Adobe Experience Platform. ○ If the connection record is for data inlet management and batch ingestion, enter `https://platform.adobe.io/`. ○ If the connection record is for data collection, enter `https://dcs.adobedc.net`.
Use MID server	This field isn't applicable.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. In the**Attributes** tab enter these values.
   - Internal name of the sandbox in **Sandbox**.

     Note: Ensure that you provide the internal name of the required sandbox and not its label in **Sandbox**. To obtain the internal name of the required sandbox, use the Get All Sandboxes action.

   - If the connection record is for data inlet management and batch ingestion, enter **API Key** and **Organization ID**.
   - If the connection record is for streaming ingestion, enter **Organization ID**.
6. Right-click the form header and click **Save**.

Result
The Adobe Experience Platform spoke is set up and integrated with the ServiceNow instance.

Adobe Sign Spoke

Automate the process of sending a legal document to an individual or list of recipients for digital signature using Adobe Sign. For example, automate employee onboarding and offboarding, or sending non-disclosure agreements, legal agreements, and statements of work for digital signature. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Adobe Sign spoke v2.11.0 is the latest version. For version history of the spoke, see Adobe Acrobat Sign spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for Adobe Sign API version v6, but may be compatible with later versions.

Key features

Adobe Sign spoke enables a flow designer to:

- Automate the process of sending a legal document to an individual or list of recipients for digital signature.
- Copy and customize sample flows for sending transient documents or Adobe Sign library documents for digital signature.
- Discover and synchronize the Adobe Sign documents.
- Pause a flow until an agreement or document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Manage the life cycle of documents in Adobe Sign from the ServiceNow instance.

Spoke requirements

- Adobe Sign account
- Adobe Sign account admin credentials to perform the required account specific tasks in Adobe Sign
- Adobe Sign group admin credentials to perform the required group specific tasks in Adobe Sign.

  Note: Account admin or group admin can add users to the groups. These users can access information specific to their group only.

- Adobe Sign application configured to integrate with ServiceNow
- Adobe Sign application details such as application ID and client secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow admin credentials to create and synchronise the required Adobe Sign groups with ServiceNow.

  Note:

  - This is the default admin role that is created when the Adobe Sign spoke is activated.
  - ServiceNow admin has access to information about all Adobe Sign groups synchronized with ServiceNow and all tables part of the Adobe Sign spoke.
  - User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. Group users have access to information specific to their Adobe Sign groups only and can view only the group-specific data from the tables that are part of the Adobe Sign spoke.

- Integration Hub subscription

See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

Spoke flows

The Adobe Sign spoke provides sample flows to demonstrate automating the Adobe Sign tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

Flow	Description
Adobe Sign - Send NDA Demo	Sends a statement of work for digital signature using a Adobe Sign library document when a Service Catalog request is created by the **Adobe Sign - Statement of Work Demo** item. Before using this flow, activate the **Adobe Sign - Statement of Work Demo** catalog item.
Adobe Sign - Statement of Work Demo	Sends a non-disclosure agreement for digital signature using a Adobe Sign library document when a Service Catalog request is created by the **Adobe Sign - Statement of Work Demo** item. Before using this flow, activate the **Adobe Sign - Statement of Work Demo** catalog item.

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering an Adobe Sign spoke sample flow, activate these catalog items.

Catalog item	Description
Adobe Sign - Statement of Work Demo	Sends a statement of work for digital signature using a Adobe Sign library document.
Adobe Sign - Send NDA Demo	Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.

Spoke subflows

The Adobe Sign spoke provides a sample subflow to demonstrate automating Adobe Sign tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Documents Per Group. The subflow retrieves documents relevant to an Adobe Sign group and stores them in the AdobeSign Documents table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Adobe Sign spoke provides actions to automate Adobe Sign tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Document Management	Attach Agreement Audit Trail to ServiceNow Record	Downloads the agreement audit trail for the specified agreement from Adobe Sign and attaches it to a ServiceNow record.
	Attach Agreement Document to ServiceNow Record	Downloads the agreement document for the specified agreement from Adobe Sign and attaches it to a ServiceNow record.
	Attach Signed Agreement to a ServiceNow Record	Downloads an Adobe Sign document and attaches it to the relevant ServiceNow agreement record.
	Convert Transient to Library Document	Converts a transient document to a library document. Ensures that the document is available in the library for more than the stipulated transient 7-day purging period.
	Look up Agreement Documents	Retrieves the agreement documents for the specified agreement.
	Look up Agreement ID	Retrieves the agreement ID from the ServiceNow Agreement table.
	Look up Agreements Stream	Retrieves the list of agreements.
	Look up Library Document ID	Retrieves the library document ID from the ServiceNow Documents table.
	Look up Library Documents Stream	Retrieves the list of library documents.
	Set Agreement Field	Creates a list of fields for a draft agreement.
	Upload Attachment as Transient Document	Uploads an attachment to Adobe Sign as a transient document. The transient document is available for a period of 7 days.
MegaSigns Management	Cancel MegaSigns	Cancels a MegaSigns that are already out for signature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Check MegaSigns Status	Checks the status of a MegaSigns record.
	Create Draft MegaSigns	Creates a MegaSigns record in the draft state.
	Download Participants and Merge Fields for Document	Downloads a sample CSV file for a given library document that contains information about the MegaSigns participants and form fields.
	Look up MegaSigns Stream	Retrieves the list of all MegaSigns records.
	Send MegaSigns	Finalises the draft and sends the MegaSigns attachment out for signature.
	Wait for Signature of MegaSigns from Adobe Sign	Waits for the Adobe Sign webhook till all the participants sign or cancel the document.
Signature Management	Add Participant to Agreement	Builds a participant list iteratively over time and adds a participants to the local ServiceNow agreement record.
	Add Participant to Agreement with Email OTP Authentication	Adds a new participant to an agreement and verify their identity using an email one-time password (OTP). The participants will get the OTP in an email and need to enter it before they can sign or approve the document. This extra step keeps your agreements secure by making sure only the right people can access them.
	Add Participant to Agreement with Password Authentication	Adds a new participant to an agreement and verify their identity using a predefined password. The participant must enter the correct password before they can view, sign, or approve the document. This extra step keeps your agreements secure by making sure that only the person who knows the password can proceed with the agreement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: The Scheduler To Remove Participant Password scheduled job when activated will automatically delete the passwords that are stored for the last 30 days. For more information, see Spoke scheduled job section.
	Add Participant to Agreement with Phone Authentication	Adds a new participant to an agreement and verify their identity using a one-time password (OTP) in an SMS. The participants will get the OTP in an SMS to the specified phone number and need to enter it before they can sign or approve the document. This extra step keeps your agreements secure by making sure only the right people can access them.
	Add Participant Reminders to Agreement	Creates one or more reminders for the specified participants associated with the specified agreement.
	Cancel Agreement	Cancels an agreement that has been sent for signature.
	Check Agreement Status	Retrieves the status of an agreement.
	Create Draft Agreement	Creates an agreement in the draft state in Adobe Sign and draft record in the ServiceNow Agreement table.
	Finalize Draft and Send Agreement	Sends a draft agreement to the participant list for a signature. **Note:** You need to use the **Create Draft Agreement** and **Set Agreement Field** actions before using this action.
	Generate Embedded Sending URL	Generates a URL that enables you to embed the agreement sender view on Adobe Sign.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Agreement Events	Retrieves the events information for the specified agreement.
	Look up Draft Agreement	Retrieves the draft agreement's information and Etag details, which are required while finalising the draft agreement.
	Look up Form Field Value from an Agreement	Retrieves value of the required field from an existing agreement in Adobe Sign.
	Look up Signing URL	Retrieves an embedded signing URL. This is useful for scenarios involving in-person signing.
	Send Agreement	Sends one or more documents, along with its sequence, for signature to one or more participants.
	Update Form Fields and Send Agreement	Allows participants to update or modify the form fields on an agreement before sending it for signature.
	Wait for Signature from Adobe Sign	Waits for the participant to sign or reject the document in Adobe Sign. Then updates the signing status in ServiceNow.
	Wait for Signature from Adobe Sign	Waits for the Adobe Sign webhook until the participant has either signed or rejected the document. Updates the status in the ServiceNow Agreement table.
User Management	Activate a User	Activates an existing user in Adobe Sign.
	Deactivate a User	Deactivates an existing user in Adobe Sign.
	Look up User ID by Email	Retrieves the user ID of an existing user in Adobe Sign.
	Look up Users Stream	Retrieves the list of all users.
Webhook Management	Create Webhook	Creates a webhook to notify the signing events in Adobe Sign.
	Look up Webhooks Stream	Retrieves the list of webhooks.
	Remove Webhook	Removes a webhook from Adobe Sign.

Spoke module

The Adobe Sign spoke adds a Adobe Sign module to your ServiceNow instance. The Adobe Sign spoke synchronizes and stores information about groups, documents, and agreements in ServiceNow. The Adobe Sign spoke includes the these tables.

- Agreements [sn_adobesign_spoke_agreement]
- Documents [sn_adobesign_spoke_adobe_sign_documents]
- Groups [sn_adobesign_spoke_adobesign_group_details]
- Client Details [sn_adobesign_spoke_client_details]

Table	Description	Fields
Agreements	Adobe Sign agreements from the synchronized Adobe Sign groups and accounts. Records in the Agreements table are updated with the signing status only when webhook is configured for the Adobe Sign account.	• Name • Agreement ID • Declined Reason • Status • Participants Info • Form Fields Info • Next Signer • Group Name
Documents	Adobe Sign documents from the synchronized Adobe Sign groups and accounts. To synchronize accounts, see Synchronize Adobe Sign with ServiceNow. The Get Documents Per Group subflow retrieves a list of documents in each Adobe Sign group. **Note:** Access to the documents is based on the group user roles.	• Document ID • Document Owner • Document Last Modified • Group • Document Name • Document Type
Groups	Adobe Sign groups that are synchronized with ServiceNow. Administrator creates groups in the ServiceNow instance and provides the required details to synchronize with Adobe Sign.	• Group Name • Group ID • Connection Alias

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description	Fields
	Note: User role is created when an Adobe Sign group is created in the ServiceNow instance. Users with the group-specific role can access the documents and agreements relevant to the Adobe Sign group.	
Client Details	Credentials of the Adobe Sign groups that are synchronized with ServiceNow.	• Client ID • Name • Authentication Key
MegaSigns	Adobe Sign MegaSigns from the synchronized Adobe Sign groups and accounts. Records in the MegaSigns table are updated with the signing status only when webhook is configured for the Adobe Sign account.	• Status • Signed Participants • Number of Pending Signatures • Name • MegaSigns ID • Group Name

Spoke scheduled job

To delete the passwords related to Add Participant to Agreement with Password Authentication action which are stored over the last 30 days, you can use the Scheduler To Remove Participant Password scheduled job. You can also change when the scheduler runs.

To set this up, navigate to **All** > **System Definition** > **Scheduled Jobs** > **Scheduler To Remove Participant Password** and activate the scheduled job.

Groups and user roles

Create a group in your ServiceNow instance to synchronize the group with the corresponding group in Adobe Sign.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

To run flows and subflows, group users must also have these roles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

Adobe Acrobat Sign account requirements

The Adobe Sign spoke requires creating a custom app on your Adobe Sign account to generate OAuth 2.0 tokens.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: A connection and credential alias is specific to a group in Adobe Sign.

A sample connection and credential alias is provided for demonstration purpose. ServiceNow admin must create an alias for each Adobe Sign group to synchronize that group with the ServiceNow instance. For example, you can have different connection and credential alias records one for each BU in your organization such as HR, Legal, Finance and so on. For information about setting up the spoke, see Synchronize Adobe Sign group with ServiceNow.

Synchronize Adobe Sign group with ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign to access the group specific documents, and agreements from the Adobe Sign spoke.

Before you begin

- Request Integration Hub subscription
- Activate the Adobe Sign spoke
- Role required: admin

About this task

These steps are performed to synchronize only one Adobe Sign group. To synchronize another Adobe Sign group, repeat this process.

Create custom OAuth application in Adobe Sign account

Create a custom OAuth application from your Adobe Sign account to enable OAuth 2.0 authentication with the Adobe Sign spoke.

Before you begin

- Adobe Sign account
- Role required: Adobe Sign admin credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Complete these steps from your Adobe Sign account. See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

Procedure
1. From your Adobe Sign account, create an application.
2. Copy and record the Application ID and Application Secret for later use.
   These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

Result
The custom OAuth application from your Adobe Sign account is created and can be integrated with the ServiceNow instance.

Configure the webhook

Configure the webhook in your Adobe Sign application to enable Adobe Sign to send data to ServiceNow when a participant signs an agreement or document.

Before you begin
Role required: admin

About this task
If the scope of the Adobe Sign application is Account, use the same webhook for all the groups defined within the account scope. If the scope of the Adobe Sign application is Group, you must configure for each group.

Procedure
1. From your Adobe Sign account, create a webhook with these configurations.
   a. Enter the target URL in **URL** in this format: `https://<instance-name>.service-now.com/api/sn_adobesign_spoke/adobesign_webhook`.
   b. Enter `Agreement all events` and `Mega Sign all events` in **Events**.
   c. Select all the required agreement events in **Notification Parameters**.
   See the Adobe Sign development documentation for more information about creating webhooks in your Adobe Sign account.
2. In your ServiceNow instance, add the client details.
   a. Navigate to **Adobe Sign Spoke** > **Client Details**.
   b. Open the record, **Adobe Sign Client ID**.
   c. On the form, fill these values.

Field	Description
Authentication Key	Key to authenticate. Enter UB7E5BXCXY.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client ID	Application ID created during the Adobe Sign account configuration.

d. Click **Update**.

Result

Webhook is created in your Adobe Sign account and signing events in Adobe Sign are updated in the tables of the Adobe Sign spoke.

Configure a connection for the Adobe Sign spoke

Add and configure a Adobe Sign spoke connection to authenticate ServiceNow requests.

Before you begin

Role required: admin

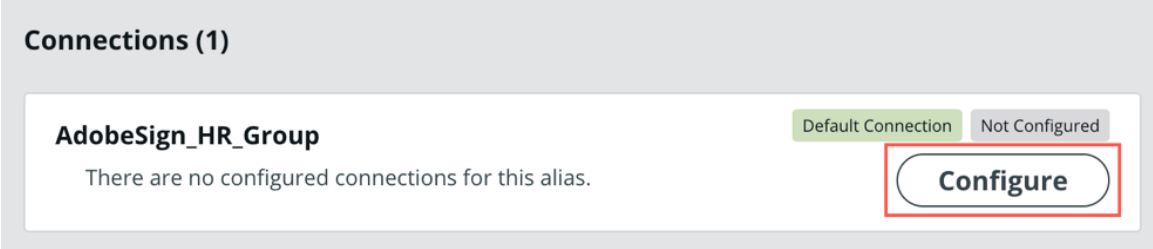
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **AdobeSign_HR_Group** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Adobe Sign spoke, click **View Details**.

   - To manage more than one Adobe Sign spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

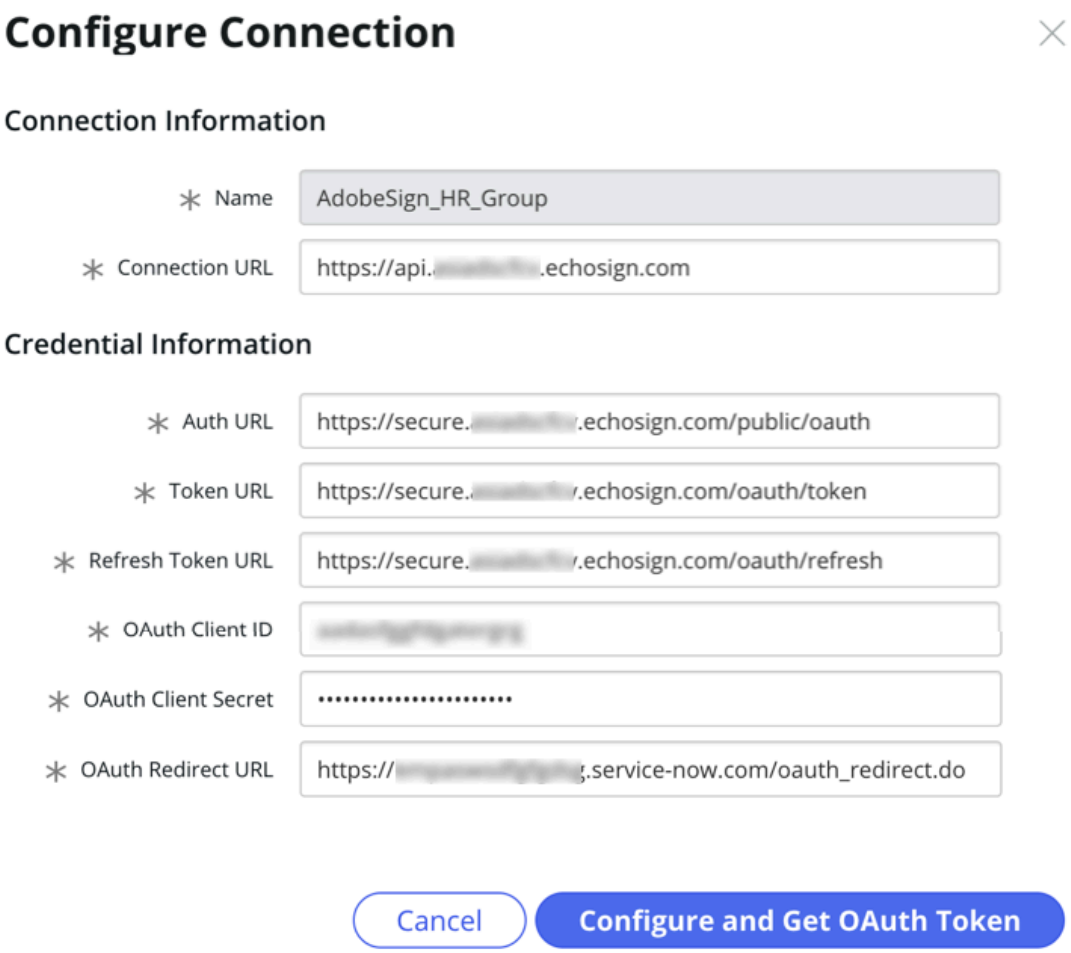
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. On the **Configure Connection** form, fill in the fields:

Field	Description
Connection Information	
Name	Name to uniquely identify the connection record. This is auto-populated.
Connection URL	URL to connection to the Adobe Sign account in this format: `https://api.<region>.echosign.com`.
Credential Information	
Auth URL	OAuth authorization code endpoint. For example, `https://secure.<region>.echosign.com/public/oauth/v2`.
Token URL	OAuth server token endpoint. For example, `https://secure.<region>.echosign.com/oauth/v2/token`.
Refresh Token URL	URL to refresh a token. For example, `https://secure.<region>.echosign.com/oauth/v2/refresh`.
OAuth Client ID	Application ID created during the Adobe Sign account configuration.
OAuth Client Secret	Application Secret created during the Adobe Sign account configuration.
OAuth Redirect URL	OAuth callback endpoint in this format: `https://<ServiceNow-instance-name>.service-now.com/oauth_redirect.do`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Configure and Get OAuth Token**.
   The spoke connection is configured.

Configure Application Access to ServiceNow tables

Allow Adobe Sign spoke to create group admin user role when an Adobe Sign group is synchronized with ServiceNow tables by configuring the application access of the required ServiceNow tables.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. For each of the following tables, ensure that the **Can read**,**Can create**, and **Can update** options are selected in the Application Access related list.

Label	Name
Role	sys_user_role
Access Control	sys_security_acl
Access Roles	sys_security_acl_role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Name
Application Menu	sys_app_application
Module	sys_app_module

3. Click **Update**.

Result
Application access of the required ServiceNow tables is configured.

Create Adobe Sign group in ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign by creating a record in the AdobeSign Group Details [sn_adobesign_spoke_adobesign_group_details] table.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Adobe Sign Spoke** > **Groups**.
2. Click **New**.
3. On the form, fill in the fields.

AdobeSign Group Details form

Group Name	Name to uniquely identify the Adobe Sign group. For example, `Legal`.
Group ID	Unique ID associated with the record.
Connection Alias	Connection alias created to synchronize the Adobe Sign group with ServiceNow.

Result
The required Adobe Sign group is created in ServiceNow and can be managed from the Adobe Sign spoke.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synchronize documents in Adobe Sign group with ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign to access the documents and agreements that are specific to the group, from the Adobe Sign spoke.

Before you begin
Role required: admin

About this task
Ensure that the groups are setup and configured with their respective connection and credential aliases before synchronizing the group documents.

Procedure

1. Navigate to **All** > **Adobe Sign Spoke** > **Documents**.
   The AdobeSign Documents [sn_adobesign_spoke_adobe_sign_documents] table opens.
2. Click the Get Documents related list.

Note:

- If you have logged in as an admin, you can synchronize the documents of all Adobe Sign groups.
- If you have logged in as a group admin, you can synchronize only those documents that are specific to your Adobe Sign groups.

Result
Details of all documents specific to the required Adobe Sign groups are synchronized with ServiceNow.

Activate Adobe Sign spoke catalog items

Trigger events in Adobe Sign when an item is requested in Service Catalog. For example, the Adobe Sign - Statement of Work Demo catalog item triggers a sample flow that sends a Adobe Sign document to a designated recipient.

Before you begin

- Synchronize Adobe Sign group with ServiceNow
- Role required: admin

About this task
The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering a sample flow, activate these catalog items.

Catalog item	Description
Adobe Sign - Statement of Work Demo	Sends a statement of work for digital signature using a Adobe Sign library document.
Adobe Sign - Send NDA Demo	Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.

Procedure

1. Navigate to **All** > **Self-Service** > **Service Catalog**.
2. Click the add content icon .
3. Search for and select **Adobe Sign - Statement of Work Demo**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Add here**.
5. Search for and select **Adobe Sign - Send NDA Demo**.
6. Click **Add here**.

Result

When one of these items is requested in the Service Catalog, the associated Adobe Sign spoke sample flow is triggered and necessary actions are performed in Adobe Sign.

Agent Client Collector Spoke

Automate the process of executing commands on agents or configuration items (CI) using the ServiceNow Agent Client Collector spoke. Agent Client Collector framework allows you to execute commands on the systems where it is installed and sends output data to the ServiceNow® instance through the MID Server.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Agent Client Collector spoke v1.2.0 is the latest version. For version history of the spoke, see Agent Client Collector Spoke release notes.

Supported versions

This spoke was built for Agent Client Collector framework v2.2.0, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ITOM Visibility License (com.snc.itom.vis.license)
- Agent Client Collector Framework v2.2.0 (sn_agent)

Note: To enable Agent Client Collector to execute commands, ensure that `ACC_ALLOW_LIST=0` for Linux environments or `ACC_ALLOW_LIST=False` for Windows environments.

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Agent Client Collector spoke provides sample subflows to demonstrate automating Agent Client Collector framework tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Managing Compliance for Remote Workers	Manages compliance for remote workers and sends an email to the system administrator when one or more specified compliance conditions are violated.
Restart Agent	Verifies the status of an agent and restarts the agent if the status is down.
SNH CyberAttack Detection	Applies SigHealth CyberAttack Detection for Windows server and send an email to the system administrator when a threat is detected.
Install Agent on Linux	Installs Agent Client Collector on a Linux hosts.
Install Agent on Windows	Installs Agent Client Collector framework on multiple windows hosts.

Spoke actions

The Agent Client Collector spoke provides actions to automate Agent Client Collector tasks when events occurs in your ServiceNow instance. Available actions include:

Action	Description
Get Agent Status	Get the status of an agent.
Get Logged on Users	Retrieves the list of all logged-in users and the related metadata for the specified host system.
Get Network Statistics	Retrieves the list of all network interfaces and the related metadata for the specified host system.
Get Running Processes	Retrieves the list of all running processes and the related metadata for the specified host system.
Get Running Services	Retrieves the list of all running services in Windows OS and the related data for the specified host system.
Get System Details	Retrieves the hardware and software details of the specified agent.
Restart Agent	Restarts an agent.
Run Command on Agent	Runs a command on a given agent host. **Note:** Use caution while executing commands.
Run Osquery on Agent	Runs the specified Osquery on the specified agent host.
Install Agent on Linux	Installs Agent Client Collector framework on a Linux host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Install Agent on Windows	Installs Agent Client Collector framework on windows host.

Note: To use the Install Agent on Linux and Install Agent on Windows spoke actions, navigate to **Agent Client Collector Spoke** > **CIDR Ranges**, create a record to specify the required IP address or range of IP addresses.

For information about setting up the spoke, see Set up the Agent Client Collector spoke.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For more information about the MID Server, see MID Server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Agent Client Collector spoke

Integrate the ServiceNow Agent Client Collector framework and Agent Client Collector spoke.

Before you begin

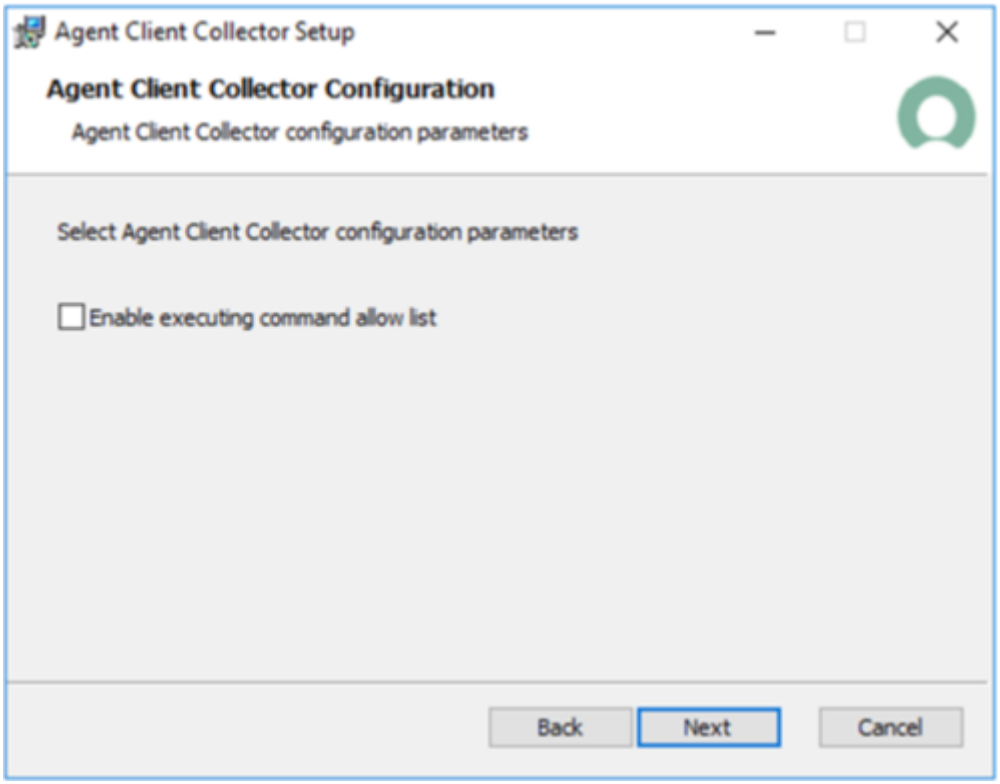
- Request an Integration Hub subscription.
- Activate the Agent Client Collector spoke.
- Role required: admin

About this task

1. Install the Agent Client Collector Framework v2.2.0 (sn_agent) plugin and the other dependant plugins. For more information, see Agent Client Collector installation.

   Note: To enable Agent Client Collector to execute commands, ensure that `ACC_ALLOW_LIST=0` for Linux environments or `ACC_ALLOW_LIST=False` for Windows environments. If you are using Windows guided installation, clear the **Enable executing command allow list** check-box. Otherwise, you cannot execute commands using the Agent Client Collector spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Installing the MID Server.
3. Configure the websocket server on the MID server.

Aha! Spoke

Manage Aha! accounts using your ServiceNow instance. Analyze data usage for Aha! and reclaim idle accounts.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Aha! spoke v1.9.1 is the latest version. For version history of the spoke, see Aha! spoke release notes.

Spoke requirements

Aha! admin role

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Aha! spoke provides a sample flow, Upsert Aha Ideas to:

- Check if an idea is created in the Aha Ideas [sn_aha_spoke_aha_ideas] table in ServiceNow instance. If an idea record is created, the flow creates the idea record in Aha! and updates the value of auto-generated ID ServiceNow instance.
- Check if an existing idea has been updated and synchronizes the details updates in Aha!.

You can also create a copy of the flow and customize it according to your requirement.

Spoke subflows

The Aha! spoke provides a sample subflow, Process Aha webhooks to create and update records in Aha!, and save the records' information in the Aha Feature [sn_aha_spoke_feature_aha] table.

Spoke actions

The Aha! spoke provides actions to automate Aha! tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Feature Management	Create Feature	Creates features in the specified release.
	Look up Features Associated with Objects Stream	Retrieves information about features within the specified objects.
	Look up Features Stream	Retrieves information about the required features.
	Update Feature	Updates details of the required feature.
Idea Management	Create Idea Vote	Creates an idea vote with the provided details.
	Create Idea	Creates an idea with the provided details.
	Look up Idea by ID	Retrieves information about the required idea.
	Look up Ideas Associated with Product Stream	Retrieves information about ideas in the specified product.
	Look up Ideas Stream	Retrieves information about the required ideas.
	Look up Ideas Votes Stream	Retrieves information about the required idea endorsements.
	Look up Ideas with String Stream	Retrieves information about the required ideas.
	Update Idea Vote	Updates details of the required idea vote.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Idea	Updates details of the required idea.
Product Management	Create Product	Creates a product.
	Create Task	Creates a task.
	Look up Personas Stream	Retrieves information about the required personas.
	Look up Product by ID	Retrieves information about the specified product.
	Look up Products Stream	Retrieves information about the required products.
	Look up Tasks Associated with Object Stream	Retrieves information about the tasks that are associated with the specified API.
	Look up Tasks Stream	Retrieves information about the tasks.
	Update Product	Updates details of the specified product.
	Update Task	Updates details of the required task.
Release Management	Create Epic	Creates epics in the required release.
	Create Release	Creates a release with the provided details.
	Create Release Phase	Creates a release phase in the specified release.
	Look up Epic Associated with Objects Stream	Retrieves information about the epics that are associated with the specified API.
	Look up Epics Stream	Retrieves information about the required epics.
	Look up Release Phases Stream	Retrieves information about the required release phases.
	Look up Release Phases With Releases Stream	Retrieves information about the releases phases in the specified release.
	Look up Releases Associated with Objects Stream	Retrieves information about the releases that are associated with the specified API.
	Update Epic	Updates details of the required epic.
	Update Release	Updates details of the required release.
	Update Release Phase	Updates details of the required release phase.
Strategy Management	Create Goal	Creates a goal with the provided details.
	Create Initiative	Creates an initiative with the provided details.
	Create Persona	Creates a persona with the provided details.
	Look up Goals Associated with Objects Stream	Retrieves information about the goals that are associated with the specified API.
	Look up Goals Stream	Retrieves information about the required goals.
	Look up Initiatives Associated with Objects Stream	Retrieves information about the initiatives that are associated with the specified API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Initiatives Stream	Retrieves information about the required initiatives.
	Update Goal	Updates details of the required goal.
	Update Initiative	Updates details of the required initiative.
	Update Persona	Updates details of the required persona.
User Management	Create Users	Creates a user in the specified product.
	Deactivate User	Deactivates the specified user account.
	Look up User Associated with Product Stream	Retrieves information about the users that are associated with the specified product.
	Look up Users Stream	Retrieves details of all members in an account.
	Update Users	Updates details of the specified user.

Note: This spoke has a Look up User action and Software Asset Management related actions only.

Spoke modules

The Aha! spoke adds the Aha! Spoke application to your ServiceNow instance. The Aha! Spoke application includes these modules:

Module	Description
Ideas	Contains details of the idea records and enables users to create ideas. When an idea is created here, the Upsert Aha Ideas flow is triggered. This flow creates an idea record with the provided details in Aha! and updates the value of auto-generated ID in ServiceNow instance. To create ideas from ServiceNow instance: **1.** Navigate to **Aha! Spoke** > **Ideas**. **2.** Click **New**. **3.** On the form, provide all the required details except **ID**. Value of **ID** is populated after this record in Aha!. **4.** Click **Submit**.
Webhook	
Feature Records	Contains details of the feature records in the Aha Remote Feature [sn_aha_spoke_st_aha_features_remote] table. Once the webhook is set up and configured, the feature records are retrieved from Aha! and saved in the Aha Remote Feature

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
	[sn_aha_spoke_st_aha_features_remote] table.
Webhook Registries	Contains details about the webhook registry records.
Webhook Routing Policies	Contains details about the webhook routing policy records. One routing policy is available with the spoke to create and update records in Aha!, and save the records' information in the Aha Feature [sn_aha_spoke_feature_aha] table.
Remote Table	
Features	Contains records about the Aha! features. Data displayed here is retrieved from the Aha Remote Feature [sn_aha_spoke_st_aha_features_remote] table.

Spoke triggers

Use triggers in the Aha! spoke to subscribe to the required events. The endpoint enables webhooks to connect with your ServiceNow instance. You can configure the flows to execute only when the specified trigger conditions are met. The supported events are:

Category	Trigger	Description
Default	Comment Added	Trigger initiates when a comment is added to a feature in Aha! workspace.
	Field Change	Trigger initiates when a field is changed in Aha! workspace.
Feature Management	Feature Created	Trigger initiates when a feature is created in Aha! Workspace.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Create an Aha! OAuth2 application and Set up ServiceNow instance for Aha!.

Create an Aha! OAuth2 application

Create an OAuth2 application in the Aha! account so that the application can authenticate access requests to the Aha! server from your ServiceNow instance.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure that you've signed up as an admin in the Aha! account.

Ensure that you've installed the Aha! spoke plugin.

Procedure

1. Go to OAuth2 Authentication.
2. Log in to the Aha! site using your admin credentials.
3. On the Features board page, click the settings icon ( ).
4. On the Personal settings page, click **Developer**.
5. Click the **OAuth applications** tab.
6. Click **Register OAuth application**.
7. On the Register new OAuth application form, enter `https://instance/oauth_redirect.do` as the Redirect URI, where *instance* is the name of your ServiceNow instance.
8. Click **Create**.
   The **OAuth applications** tab shows Client ID and Client Secret keys.
9. Note down the values in the Client ID and Client Secret fields.

Set up ServiceNow instance for Aha!

Set up your ServiceNow instance to add the Aha! Client ID and Client Secret keys.

Before you begin

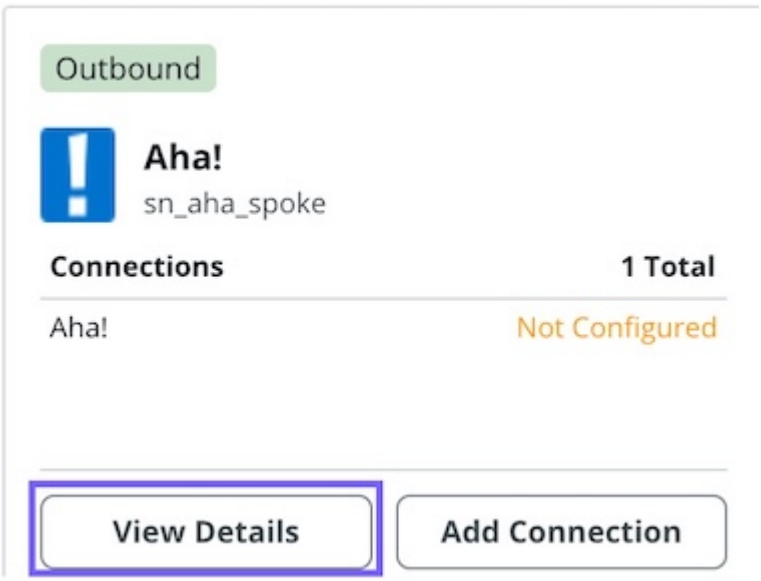
- Request an Integration Hub subscription.
- Activate the Aha! spoke.
- ServiceNow Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Aha!** and select **View Details**.

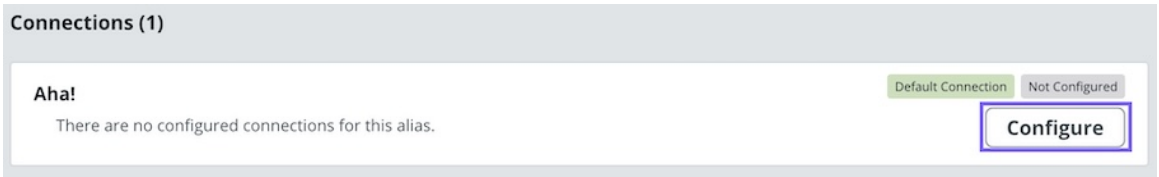
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Aha! spoke, select **View Details**.



- To manage more than one Aha! spoke connection records, you should create child alias record by selecting **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

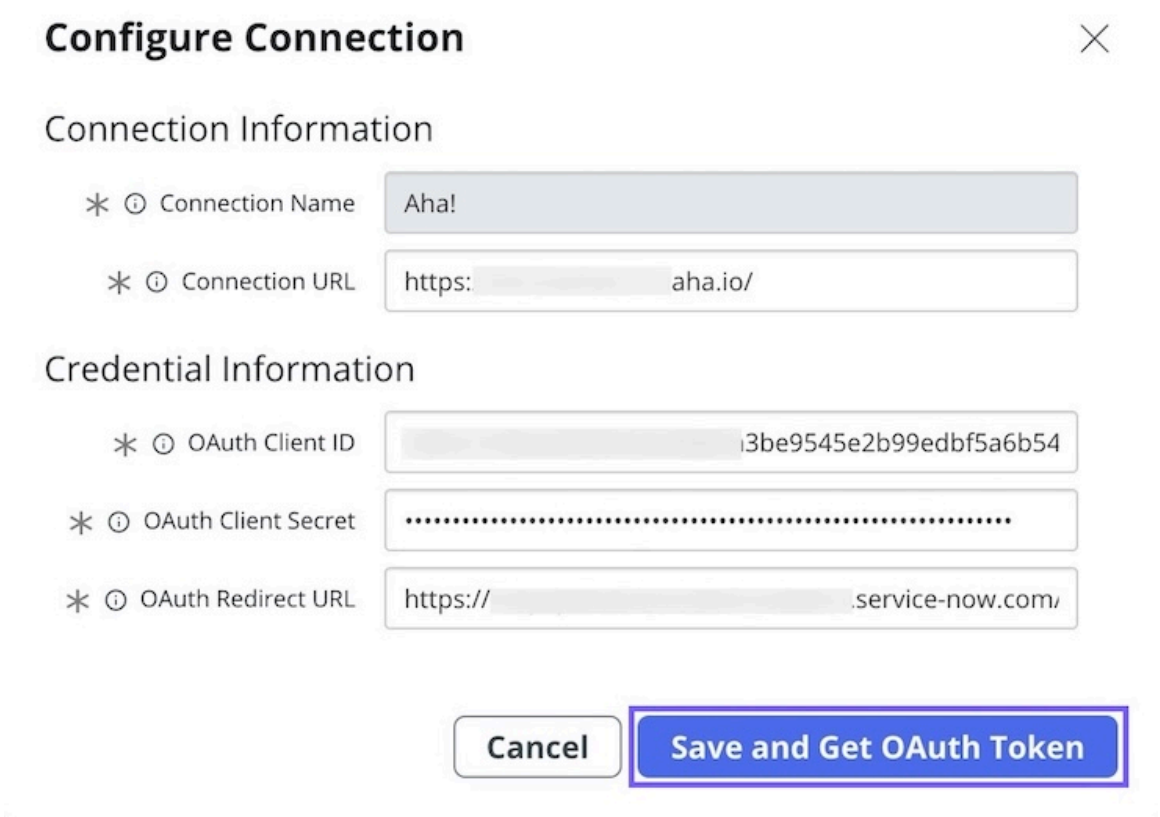
If you're configuring the spoke for the first time, select **Configure**. Otherwise, select **Edit**.



5. On the form, fill in the details.

Fields	Descriptions
Connection Name	Name of the integration profile.
Connection URL	Connection URL for Aha!.
OAuth Client ID	OAuth2 key that you received while creating an OAuth2 authentication from the Aha! site.
OAuth Client Secret	OAuth Client Secret key that you received while creating an OAuth2 authentication from the Aha! site.
OAuth Redirect URL	ServiceNow redirect URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Save and Get OAuth Token** and then select **Authorize**.

Result
The Aha! spoke is set up and Aha! account is integrated with your ServiceNow instance.

Set up a bi-directional webhook for the Aha! spoke

Configure a webhook to subscribe to events in the Aha! account with a ServiceNow callback URL.

Before you begin
Role required: admin

Create a Token

Create a token that will be embedded in the callback URL to Aha!.

Before you begin
Role required: admin

Procedure

1. In the navigation filter, enter `token_verification.list`.
   The system displays records in the Token Verifications table.
2. Select **New**.
3. On the form, fill the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Token Verification form

Field	Description
Name	Option to provide a unique name to identify the token. For example, `Aha! Callback URL token`.
Description	Option to provide a description of the token.
Token	Option to provide a unique authentication token. This token is encrypted and embedded in the URL.

4. Select **Submit**.

Create an Aha! Webhook in ServiceNow

Register an Aha! webhook in to notify the app when certain events occur in Aha!.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Aha! Spoke** > **Webhook** > **Webhook Registries.**
2. Select **New**.
3. Fill the form.

Aha! Webhook Registry

Field	Description
Name	Option to uniquely identify the record.
Path	Option to provide the webhook path. Enter `api/sn_aha_spoke/aha_webhook`.
Token	Option to specify the token you had created. See Create a Token.

4. Right-click the form header and click **Save**.
5. Select **Callback URL**.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Add callback URL to Aha!

Register the webhook callback URL to the Aha! account.

Before you begin
Role required: admin

Procedure

1. Log in to your Aha! account as an admin.
2. Navigate to **Settings** > **Account**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create an activity webhook by clicking **+** beside **Integrations**.
4. Click **+ Activity webhook** in the **Activity webhook** tile.
5. On the form, fill these values.

Field	Description
Hook URL	Webhook callback URL you had copied from the ServiceNow instance.
Selected Activities	Activities or events for which you want to subscribe.

6. Click **Add activity**.

Set webhook routing policy

Create a webhook routing policy and subflow as per your requirement.

Before you begin

Role required: admin

About this task

The default routing policy in the Aha Webhook Decision Policy module triggers the Process Aha webhooks subflow and notifies the ServiceNow app when certain events occur in Aha!. See Aha! Spoke for information about the fields that the default routing policy and subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure

1. Navigate to **All** > **Aha! Spoke** > **Webhook** > **Webhook Routing Policies.**
2. Select **New**.
3. Fill the form.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.
Condition	Conditions to be met when the required events occur in Aha!.
Answer	Subflow that must be triggered when the specified conditions are met. **a.** Click the lookup icon ( ). **b.** Select the required subflow from the **Document** list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up triggers for the Aha! spoke

Set up triggers for the Aha! spoke for the required events. The endpoint enables webhooks to connect with your ServiceNow instance.

Before you begin
Role required: admin

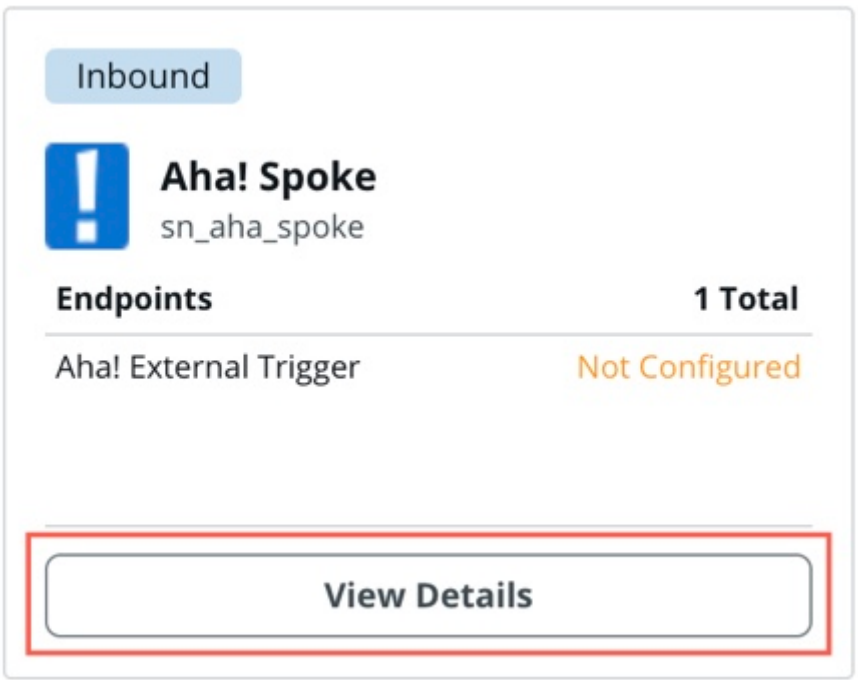
Configure triggers in ServiceNow instance

Configure endpoint for webhooks in the Aha! that support the token authentication.

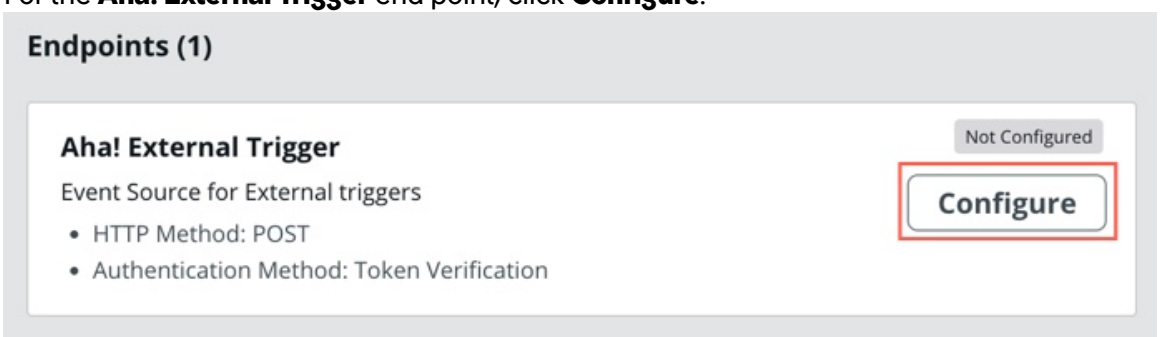
Before you begin
Role required: flow_designer and connection_admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Toggle and enable the **Inbound** connections.
4. Locate the **Aha! Spoke** endpoint and click **View Details**.

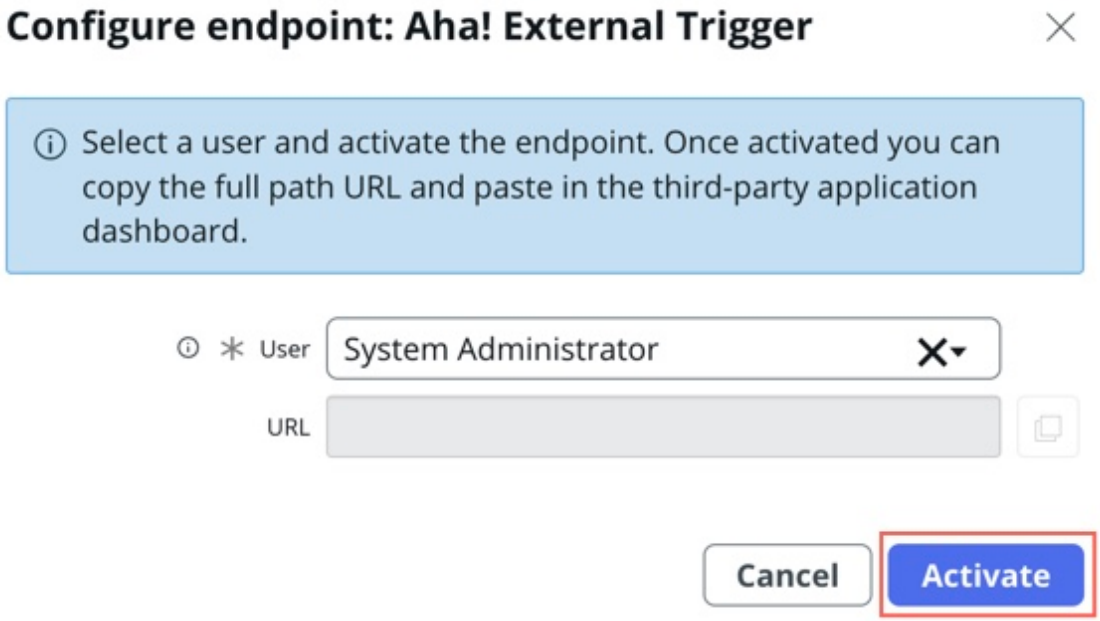


5. For the **Aha! External Trigger** end point, click **Configure**.

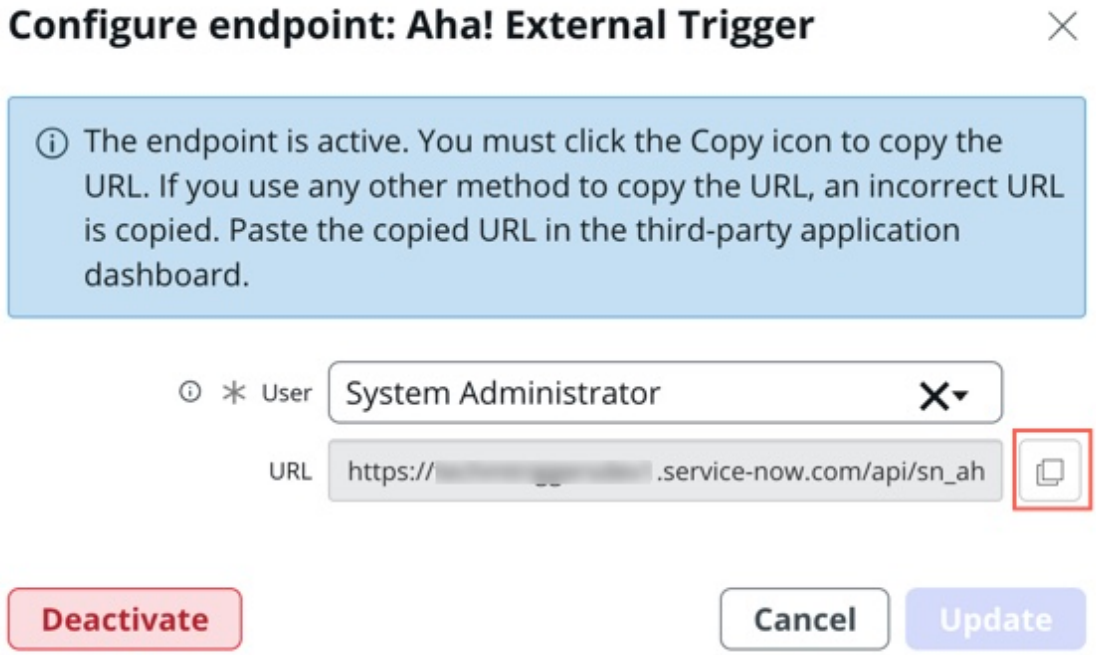


6. Select the user who can trigger the endpoint and click **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Copy the generated endpoint URL.



Add the endpoint URL in Aha!

Add the endpoint URL that is generated in your ServiceNow instance in the Aha! account to enable webhooks to connect with your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to Aha! Workspace as an admin.

2. Click user profile and navigate to **SETTINGS** > **Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Under **Integrations**, click **+** to add an integration.
4. Under **API**, click **+ Activity webhook**.
5. On the form, for **Hook URL** paste the generated endpoint URL that was generated after you configured triggers in the ServiceNow instance.

   For more information, see Configure triggers in ServiceNow instance.
6. Select the activities and users as per your requirement.

   For the list supported events, see the Spoke triggers section.
7. Select the **Valid certificate**, **Reduce webhook delay**, and **Enable** check boxes.
8. Click **Add activity**.

AI Search Spoke

Store data from the required third-party application in the AI Search server through Workflow Studio. Access data through the AI Search portal.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AI Search spoke v2.0.3 is the latest version. For version history of the spoke, see AI Search spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are activated:

- AI Search (com.glide.ais)
- External Content for AI Search (com.glide.ais.external_content)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AI Search spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

Action	Description
Commit Index	Commits queued documents in the batcher and indexes them. Synchronously returns feedback about the indexed content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Delete Document	Deletes a record from the AI Search content index.
Delete Documents	Deletes all records that use a specified external content schema table from the AI Search content index. You can optionally specify a Glide query to limit the set of documents deleted from the specified schema table.
Get Max File Size	Retrieves the maximum file size which can be ingested into AI Search.

Ingest Document	Ingests properties of the specified document into the batcher. In releases starting with Rome, you can optionally specify security principal access permissions for the document.
	
	Specify the document's properties as name-value pairs in a JSON object formatted as in the following example:
	
	`{ "title": "Report 2021-02-26", "author": "Abel Tuter", "url": "http://example.com/reports/2021/02/26/" }`
	
	You can specify the document's security principal access permissions as name-value pairs in a JSON object formatted as in the following example:
	
	`{ "everyone": false, "groups.deny": [ "report-users", "hr-users" ], "groups.read": [ "report-admins", "hr-admins" ], "none": false, "users.deny": [ "ad\bow-ruggeri", "don_goodliffe" ], "users.read": [ "ad\beth-anglin", "ad\abel-tuter", "carol.coughlin@sharepoint" ] }`
	
	For more details on security principal access permissions, see External content access permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description

Ingest Document Using Download URL	Downloads a document from a URL and ingests it into the batcher. In releases starting with Rome, you can optionally specify security principal access permissions for the document.
	
	Add the URL's domain to the AI Search spoke's list of trusted domains before you specify this action's **Download URL** input. For details on modifying the spoke's list of trusted domains, see Set up the AI Search spoke.
	
	This action doesn't support authentication session IDs or cookies, so the document URL must allow unauthenticated access.
	
	Specify the document's properties as name-value pairs in a JSON object formatted as in the following example:
	
	`{ "title": "Report 2021-02-26", "author": "Abel Tuter" }`
	
	The document's *url* property is automatically populated with the value of the **Download URL** input.
	
	You can specify the document's security principal access permissions as name-value pairs in a JSON object formatted as in the following example:
	
	`{ "everyone": false, "groups.deny": [ "report-users", "hr-users" ], "groups.read": [ "report-admins", "hr-admins" ], "none": false, "users.deny": [ "ad\bow-ruggeri", "don_goodliffe" ], "users.read": [ "ad\beth-anglin", "ad\abel-tuter", "carol.coughlin@sharepoint" ] }`
	
	For more details on security principal access permissions, see External content access permissions.

Initialize Batcher	Initializes a new batcher to queue documents for indexing.
Is AIS Available For Ingestion	Checks whether AI Search is available for ingestion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Look up Supported File Extensions	Retrieves file extensions supported by AI Search.
Release Batcher	Releases a used batcher from pool.
Update By Query	Updates all the records in the AI Search content index that match the specified query.

See Set up the AI Search spoke for information about setting up the AI Search spoke.

Set up the AI Search spoke

Configure the AI Search spoke to index content from a third-party application.

Before you begin

- Request an Integration Hub subscription
- Activate the AI Search spoke
- Role required: admin

Procedure

1. Create an external content schema table.
   To learn more about external content schema tables, see Indexing and searching external content in AI Search.

   a. Navigate to *AI Search* > **Create Schema**.

   b. In the field, provide the name of your schema table.
   For example, `My application schema table`.

   c. Select **Submit**.

2. Create an indexed source for content from your third-party application.
   To learn more about indexed sources, see Indexed sources in AI Search.

   a. Navigate to *AI Search* > **Indexed Sources**.

   b. Select **New**.

   c. On the form, fill these values.

Field	Description
Name	Name to identify the indexed source. For example, `My application indexed source`.
Source	External content schema table that you created for the third-party application. For

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	example, `My application schema table`.
Active	Option to enable the indexed source.

d. Select **Submit**.

Note: Ensure that the **Type** of the indexed source is **external**.

You can now use the AI Search spoke actions.

3. Add the third-party application's domain URL to the list of trusted domains.

a. Navigate to *AI Search* **Spoke** > **Trusted Domains**.

b. Select **New**.

c. On the form, fill these values.

Field	Description
Name	Name to identify the trusted domain record. For example, `My sample application's trusted domain`.
Domain	URL of the trusted domain. For example, `https://example.com`.

4. Create a search source for your new indexed source.
To learn more about search sources, see Search sources in AI Search.

a. Navigate to *AI Search* > **Search Experience** > **Search Sources**.

b. Select **New**.

c. On the form, fill these values.

Field	Description
Name	Name to identify the search source. For example, `My application search source`.
Application	Application scope. Select *AI Search* **Spoke**.
Indexed Source	Indexed source that you created for the third-party application. For example, `My application indexed source`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Conditions	Filter conditions that records must satisfy to be searchable.

d. Select **Submit**.

5. Create a search profile that includes your new search source.
   For more information about configuring and publishing search profiles, see Search profiles in AI Search.

   a. Navigate to *AI Search* > **Search Experience** > **Search Profiles**.

   b. Select **New**.

   c. Fill in a **Label** value to identify the search profile.
   For example, `My application search profile`.

   d. Right-click the form header and select **Save**.

   e. In the **Search Sources** tab, select **Link Existing**.

   f. In **Search Source**, select the search source that you created for the third-party application.
   For example, **My application search source**.

   g. Select **Submit**.

   h. Select **Publish**.

Result
You can now use the AI Search spoke actions to indexed content from the third-party application. To view the indexed content, you can use the Search Preview UI from the Advanced AI Search Management Tools application.

For details on the Search Preview UI, see Search Preview UI for *AI Search*. To learn more about the Advanced AI Search Management Tools application, see Analytics and Reporting Solution for Advanced *AI Search* Management Tools.

Amazon Alexa Spoke

Manage intents, skills, vendors, and slots in your Amazon Alexa account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for Amazon Alexa API version v1, but may be compatible with later versions.

Spoke version

Amazon Alexa v1.3.0 is the latest version. For version history of the spoke, see Amazon Alexa spoke release notes.

Spoke requirements

Admin access to Amazon Developer Portal and AWS Lambda.

Important security considerations

Be aware of these considerations to securely use Amazon Alexa:

- Amazon stores voice recordings of the Amazon Alexa smart assistant customers forever unless the Amazon Alexa account is configured to delete the recordings. For more information about deleting the voice recordings, see Delete Alexa Voice Recordings Automatically.
- To stop recording conversations, turn the microphone off on the Alexa enabled devices.
- To ensure safety and protect privacy when using Alexa devices, take measures such as, choosing a strong password and using a pin for voice purchases.
- Install or activate only the legitimate skills.
- Ensure proper credential management in AWS Lambda when invoking the ServiceNow Rest API.
- Ensure that your AWS Lambda function is accessible to only the required skills by adding the Alexa Skills Kit trigger to the required AWS Lambda function. Using these triggers, you can allow only the required skills to access your AWS Lambda function. For more information, see Configure the trigger for a Lambda function.

  Note: Use the AWS Lambda function as an endpoint of your skill. If your are using custom web service, validate the skills. For more information, see Host a Custom Skill as a Web Service.

- You can securely store your sensitive data in the AWS Lambda function using environment variables. For more information, see Using AWS Lambda environment variables.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Amazon Alexa spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Intent Management	Create Intent	Creates an intent for the specified skill and locale.
	Delete Intent	Deletes the specified intent from the specified skill.
	Look up Intents	Lists available intents for the specified skill and locale.
	Update Intent	Updates an intent for the specified skill and locale.
Interaction Model Management	Get Interaction Model	Gets the interaction model schema for the specified skill.
	Look up Interaction Model Versions	Lists the available versions of the interaction model for the specified skill.
	Update Interaction Model	Updates the interaction model for the specified skill and locale.
Skill Management	Create Skill	Submits a skill creation request for the specified Vendor ID.
	Delete Skill	Deletes the specified skill.
	Get Skill	Gets the details for the specified skill.
	Get Skill Status	Gets the status for the specified skill.
	Look up Skills	Lists the skills for the specified Vendor ID.
	Update Skill	Submits a request to update a skill for the specified Vendor ID.
Slot Type Management	Create Slot Type	Creates a slot type for the specified skill in the specified locale.
	Look up Slot Types	Lists available slot types for the specified skill and locale.
	Update Slot Type	Updates the specified slot type for the specified skill and locale.
Vendor Management	Look up Vendors	Lists details of all the available vendors.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Alexa spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Amazon Alexa spoke

Integrate the ServiceNow instance and Amazon Alexa account by creating a custom OAuth application in Amazon Alexa to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon Alexa spoke.
- Role required: admin

Create a security profile

Create and register a security profile through the Developer Console to use Login with Amazon on your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Log in to Amazon Developer Portal with admin credentials.
2. Create a security profile.
   For information about creating a security profile, see Create an LwA Security Profile in Amazon Developer Documentation.
3. Copy and record the values of Client ID and Client Secret for later use.
4. Configure the security profile and specify these values in **Web Settings**:

Field	Value
Allowed Origins	ServiceNow instance URL.
Allowed Return URLs	ServiceNow instance redirect URL in this format: `https://<Instance-Name>.com/oauth_redirect.do`

For more information about configuring the security policy, see Add your Website to your Security Profile in Amazon Developer Documentation.

Configure a connection for Amazon Alexa spoke

Add and configure a Amazon Alexa connection to authenticate ServiceNow requests in the Amazon Alexa spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **AmazonAlexa** connection alias and click **View Details**.
5. On the **Connection** form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection Information	
Connection Name	Name to uniquely identify the record. By default, the name is `AmazonAlexa`.
Connection URL	Base URL to connect to Amazon Alexa. Enter: `https://api.amazonalexa.com`
API Version	Required API version of Amazon Alexa. Enter `v1`.
Credential Information	
OAuth Entity Name	Name to identify the OAuth entity record. For example, `Amazon Alexa OAuth`.
OAuth Client ID	Client ID created during the configuration of the security profile.
OAuth Client Secret	Client Secret created during the configuration of the security profile.
OAuth Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. Replace `<instance>` with the ServiceNow instance name.

6. Click **Configure and Get OAuth Token**.

Setup webhook for the Amazon Alexa spoke

Authenticate the inbound requests from Amazon Alexa account to your ServiceNow instance by creating a webhook registry.

Before you begin

Role required: admin.

Procedure

1. In the filter navigator, enter `token_verification.list`.
   Records in the Token Verifications [token_verification] table are displayed.
2. Click **New**.
3. On the form, fill these values.

Token Verification form

Field	Description
Name	Name to identify the token record. For example, `Alexa token`.
Description	Brief description of the token.
Token	Value of token. This value is encrypted before it is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Submit**.
5. Navigate to **Alexa Webhooks** > **Alexa Webhook Registries**.
6. Click **New**.
7. On the form, fill these values.

Alexa Webhook Registry form

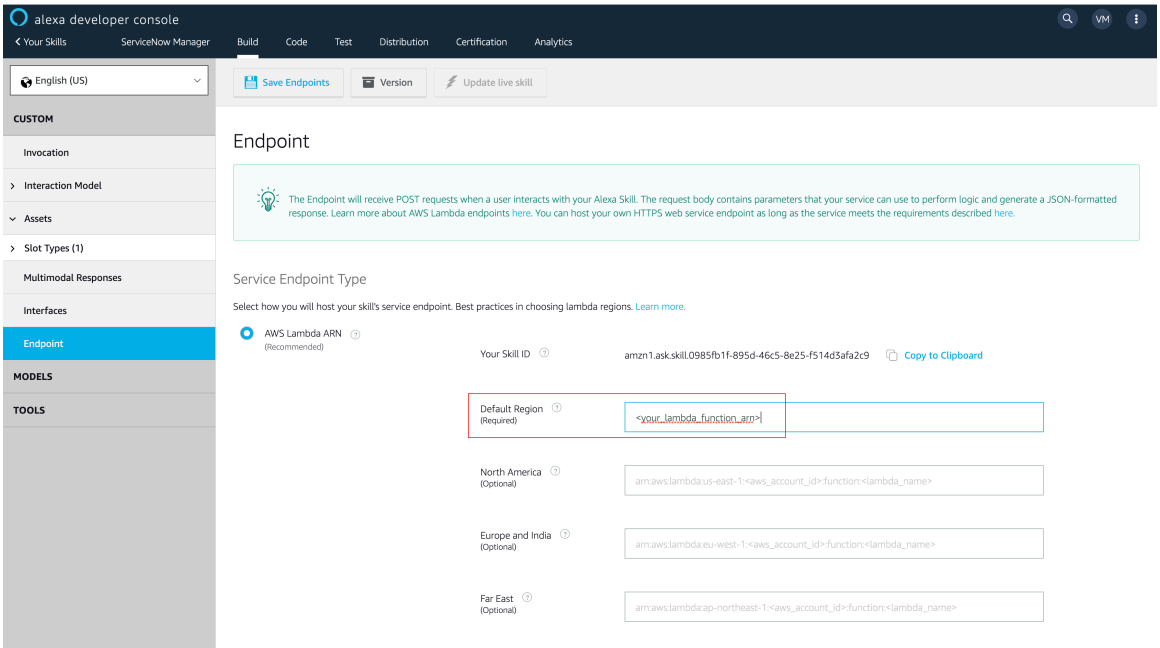
Field	Description
Name	Name to identify the webhook registry record. For example, `Alexa token`.
Description	Brief description of the webhook registry record.
Token	Token you have created. For example, `Alexa token`.
Path	Scripted REST endpoint. A default endpoint is available. You can change the default value as per your requirement.

8. Right-click the form header and click **Save**.
9. Click **Callback URL**.
   Webhook Callback URL is displayed in the confirmation message. Copy and record this value.
10. Log in to AWS Management Console.
11. In the AWS Lambda function, specify the Webhook Callback URL and save the changes.

12. Log in to Alexa Developer Console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. Navigate to **Build** > **CUSTOM** > **Endpoint** and specify ARN of the AWS Lambda function you had configured.



Amazon CloudWatch Spoke

Integrate ServiceNow instance with Amazon CloudWatch. Manage and monitor your Amazon Web Services (AWS) resources and applications from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Amazon CloudWatch version 2010-08-01, but may be compatible with later versions.

Spoke version

Amazon CloudWatch spoke v1.0.2 is the latest version. For version history of the spoke, see Amazon CloudWatch spoke release notes.

Spoke requirements

User with full access to Amazon CloudWatch account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon CloudWatch Spoke provides actions to automate Amazon Web Services (AWS) resource and application monitoring tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Alarm Management	Create Composite Alarm	Creates a composite alarm.
	Delete Composite Alarm	Deletes the specified alarms.
	Look Up Alarm	Retrieves a list of specified alarms.
	Set Alarm State	Assigns a temporary state to an alarm for testing.
Anomaly Management	Create Anomaly Detector	Creates an anomaly detection model for a CloudWatch metric.
	Delete Anomaly Detector	Deletes the specified anomaly detection model from an account.
Metric Management	Delete Metric Alarm	Deletes the specified alarms.
	Look up Metric Data	Retrieves different metrics in a single request.
	Upsert Metrics Alarm	Create a new alarm or updates an alarm and associates the alarm with the specified metric, metric math expression, or an anomaly detection model.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Amazon CloudWatch spoke.

Set up the Amazon CloudWatch spoke

Integrate the ServiceNow instance and Amazon CloudWatch by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon CloudWatch spoke.
- Role required: admin

Create a credential record for the Amazon CloudWatch spoke

Create a credential record for the Amazon CloudWatch account. The Amazon CloudWatch Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Amazon CloudWatch Cred.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of your AWS account. Access Key ID of the user with full access to Amazon CloudWatch.
Secret Access Key	Secret Access Key of your AWS account. Secret Access Key of the user with full access to Amazon CloudWatch.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonCloudWatchAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential alias	Credential alias associated with the spoke. `AWS_Cloud_Watch`

5. Right-click the form header and click **Submit**.

Amazon Connect Spoke

Manage and provide customer service across voice, chat, and tasks using your Amazon Connect account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon Connect spoke v1.2.0 is the latest version. For version history of the spoke, see Amazon Connect spoke release notes.

Supported versions

This spoke was built for Amazon Connect API Version 2017-08-08, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon Connect.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Connect spoke provides actions to automate Amazon Connect tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Contact Flow Management	Create Contact Flow	Creates a contact flow for the specified Amazon Connect instance.
	Get Contact Flow Details	Retrieves details of the specified contact flow.
	Look up Contact Flows	Retrieves a list of contact flows.
	Update Contact Flow Content	Updates content of the specified contact flow.
	Update Contact Flow Name	Updates name of the specified contact flow.
Contact Management	Resume Contact Recording	Resumes recording the call when a contact is being recorded and the recording has been suspended using suspend contact recording. Only voice recordings are supported at this time.
	Start Contact Recording	Starts recording the contact when an agent joins the call. Only voice recordings are supported at this time.
	Start Outbound Voice Contact	Places an outbound call to a contact and initiates the contact flow.
	Stop Contact	Ends the specified contact.
	Stop Contact Recording	Stops recording the call. If you use stop contact recording to stop recording an ongoing call, you can't use restart the contact recording. Only voice recordings are supported at this time.
	Suspend Contact Recording	Suspends recording the call when a contact is being recorded.
	Get Contact Attributes	Retrieves the contact attributes for the specified contact.
	Update Contact Attributes	Creates or updates user-defined contact attributes associated with the specified contact.
Instance Management	Create Instance	Initiates an Amazon Connect instance with all the supported channels enabled.
	Delete Instance	Deletes the specified instance.
	Get Instance Details	Retrieves details of the specified instance.
	Look up Hours of Operations	Retrieves a list of hours of operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Instances	Retrieves a list of instances.
	Look up Phone Numbers	Retrieves a list of phone numbers.
	Look up Prompts	Retrieves a list of prompts.
	Look up Queues	Retrieves a list of queues.
	Look up Security Profiles	Retrieves a list of security profiles.
Metric Management	Get Current Metrics Data	Retrieves the real-time metric data from the specified Amazon Connect instance.
	Get Metrics Data	Retrieves historical metric data from the specified Amazon Connect instance. **Note:** • The time must be specified using an interval of 5 minutes, such as 11:00, 11:05, and 11:10, and must be later than the start time timestamp. • The time range between the start and end time must be less than 24 hours.
Routing Policy Management	Associate Routing Profile Queues	Associates a set of queues with a routing profile.
	Create Routing Profile	Creates a routing profile.
	Disassociate Routing Profile Queues	Disassociates the specified set of queues from a routing profile.
	Get Routing Profile Details	Retrieves details of the specified routing profile.
	Look up Routing Profile Queues	Retrieves a list of routing profile queues.
	Look up Routing Profiles	Retrieves a list of routing profiles.
	Update Routing Profile Concurrency	Updates the specified routing profile concurrency.
	Update Routing Profile Default Outbound Queue	Updates the specified routing profile default outbound queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Routing Profile Name	Updates the specified routing profile name.
	Update Routing Profile Queues	Updates the properties associated with a set of queues for a routing profile.
Tag Management	Add Tags to Resource	Associates a set of tags with the specified resource.
	Look up Tags for Resource	Retrieves all tags that are associated with the specified resource.
	Remove Tag from Resource	Removes the association of tag from resource.
User Management	Create User	Creates a user account for the specified Amazon Connect instance.
	Delete User	Deletes the specified user.
	Get User Details	Retrieves details of the specified user.
	Get User Hierarchy Group	Retrieves details of the user hierarchy group.
	Get User Hierarchy Structure	Retrieves details of the user hierarchy structure.
	Look up User Hierarchy Groups	Retrieves a list of user hierarchy groups.
	Look up Users	Retrieves the list of users.
	Update User Hierarchy	Updates the specified user hierarchy.
	Update User Identity Information	Updates the specified user identify information.
	Update User Phone Configuration	Updates details of the specified user phone configuration.
	Update User Routing Profile	Updates the specified user routing profile.
	Update User Security Profiles	Updates details of the specified user security profiles.
	Look up Agent Status	Retrieves a list of agent statuses.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Connect spoke.

Set up the Amazon Connect spoke

Integrate the ServiceNow instance and Amazon Connect account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon Connect spoke
- Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon Connect**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Amazon Connect Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon Connect.
Secret Access Key	Secret Access Key of the user with full access to Amazon Connect.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon Connect**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result

The credential record the Amazon Connect spoke is created.

Amazon DynamoDB Spoke

Manage streams, tables, and tags in your Amazon DynamoDB database from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon DynamoDB spoke v1.0.1 is the latest version. For version history of the spoke, see Amazon DynamoDB spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for API version 2012-08-10, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon DynamoDB.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The Amazon DynamoDB spoke provides actions to automate Amazon DynamoDB tasks when events occurs in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Stream Management	Disable Stream	Disables the stream for the specified table.
	Enable Stream	Enables the stream for the specified table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Shard Iterator	Returns a shard iterator. Use the shard iterator in a subsequent Get Records request to read the stream records from the shard.
	Get Stream	Returns information about the specified stream.
	Look up Records	Retrieves the stream records from a given shard.
	Look up Streams	Returns the list of all the streams associated with the current account.
Table Management	Create Backup	Creates a backup for an existing table.
	Create Table	Creates a table in the account.
	Delete Backup	Deletes an existing backup of a table.
	Delete Table	Deletes the specified table.
	Get Backup	Retrieves the details of an existing backup.
	Get Continuous Backup	Retrieves the status of continuous backups and point in time recovery of the specified table.
	Get Table	Retrieves information about the table.
	Look up Backups	Retrieves the list of all the backups associated with the account or backups of the specified table.
	Look up Tables	Retrieves the list of table names.
	Restore Table From Backup	Creates a table from an existing backup.
	Restore Table To Point In Time	Restores the specified table to the specified point in time within Earliest Restorable Date Time and Latest Restorable Date Time.
	Update Continuous Backup	Enables or disables point in time recovery for the specified table.
	Update Table	Updates the specified table.
Tag Management	Add Tags To DynamoDB Resource	Adds tags to DynamoDB resource.
	Look up Tags Of DynamoDB Resource	Lists the tags of the DynamoDB resource.
	Remove Tags From DynamoDB Resource	Removes the tags from the DynamoDB resource.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Two Credential aliases are available for the Amazon DynamoDB spoke.

For information about setting up the spoke, see Set up the Amazon DynamoDB spoke.

Set up the Amazon DynamoDB spoke

Integrate the ServiceNow instance and Amazon DynamoDB account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon DynamoDB spoke
- Role required: admin

Create Credential records for the Amazon DynamoDB spoke

Create two Credential records for your Amazon DynamoDB account. The Amazon DynamoDB spoke connection and credential alias uses these credential records to perform actions in your Amazon DynamoDB account.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon DynamoDB**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Amazon DynamoDB Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon DynamoDB.
Secret Access Key	Secret Access Key of the user with full access to Amazon DynamoDB.
Credential alias	Associated Amazon DynamoDB credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon DynamoDB**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.
7. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Open for the record for **Amazon DynamoDB Streams**.
9. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
10. Select **AWS Credentials**.
11. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Amazon DynamoDB Streams Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon DynamoDB.
Secret Access Key	Secret Access Key of the user with full access to Amazon DynamoDB.
Credential alias	Associated Amazon DynamoDB Streams credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon DynamoDB Streams**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

12. Click **Submit**.

Amazon EBS Spoke

Manage block level storage volumes and snapshots in Amazon EBS from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke version

Amazon EBS spoke v1.0.2 is the latest version. For version history of the spoke, see Amazon EBS spoke release notes.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The Amazon EBS spoke provides actions to automate Amazon EBS tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Elastic Block Store Management	Attach Volume	Attaches an EBS volume to a running or stopped instance.
	Create Snapshot	Creates a snapshot of an EBS volume.
	Create Volume	Creates an EBS volume that can be attached to an instance in the same Availability Zone.
	Delete Snapshot	Deletes the specified snapshot.
	Delete Volume	Deletes the specified EBS volume.
	Detach Volume	Detaches an EBS volume from an instance.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon EBS spoke.

Set up the Amazon EBS spoke

Integrate the ServiceNow instance and Amazon EBS account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon EBS spoke
- Role required: admin

Create Credential record for the Amazon EBS spoke

Create Credential record for your Amazon EBS account. The Amazon EBS spoke connection and credential alias uses this credential to perform actions on Amazon EBS.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon EBS**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `EBS Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon EC2.
Secret Access Key	Secret Access Key of the user with full access to Amazon EC2.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonEBSAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result

The credential record for the Amazon EBS spoke is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Amazon EC2 Spoke

Integrate ServiceNow instance with Amazon Elastic Compute Cloud (EC2). Manage Amazon instances, Amazon Machine Images (AMIs), Key Pairs, and Tags from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon EC2 spoke v1.4.1 is the latest version. For version history of the spoke, see Amazon EC2 spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows

This spoke has no flows and subflows.

Available sample conversational subflows

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample conversational subflows

Conversational subflow	Description
Look up Images - Sample	Returns information on the specified images.
Run instances - Sample	Executes the specified instances.

Spoke actions

The Amazon EC2 spoke provides actions to automate Amazon EC2 tasks when events occurs in ServiceNow. Available actions include:

Spoke Actions

Category	Action	Description
Amazon Machine Image Management	Copy Image	Copies an Amazon Machine Image (AMI) from the specified source region to the current region.
	Create Image	Creates an Amazon EBS supported AMI from an Amazon EBS supported instance that is either running or stopped.
	Deregister Image	Deregisters the specified AMI.
	List Image Attribute	Retrieves the specified AMI attribute.
	List Images	Retrieves the specified AMIs.
Instance Management	Get Instance Attribute	Retrieves the specified attribute of the specified instance.
	Get Instances Status	Retrieves the status of the specified instance.
	Get Password Data	Retrieves the encrypted administrator password for an active Windows instance.
	List Instance Types	Retrieves the list of all instance types in an AWS region.
	List Instances	Retrieves a list of all instances.
	Monitor Instances	Enables monitoring for all active instances.
	Reboot Instances	Reboots the specified instances.
	Run Instances	Launches the specified number of instances using an AMI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
	Start Instances	Starts the specified instances.
	Stops Instances	Stops the specified instances.
	Terminate Instances	Shutdowns or terminates the specified instances.
	Unmonitor Instances	Disables monitoring for the specified running instances.
	Update Instance Attribute	Updates the specified attribute for the specified instance. **Note:** You can specify only one attribute at a time. Before you update an attribute, ensure that the instance is stopped.
Key Pair Management	Create Key Pair	Creates a 2048-bit SSH-2 RSA key pair.
	Delete Key Pair	Deletes the specified key pair.
	List Key Pair	Retrieves the specified key pair or a list of all key pairs.
Region and Availability Zone Management	Get Availability Zones	Retrieves the list of availability zones in the specified AWS region.
	List Regions	Retrieves the list of all AWS regions.
Tag Management	Create Tags	Adds or overwrites the specified set of tags from the specified set of resources.
	Delete Tags	Deletes the specified set of tags from the specified set of resources.
	List Tags	Retrieves the list of tags for the specified region.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon EC2 spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Amazon EC2 spoke

Integrate the ServiceNow instance and Amazon EC2 using AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon EC2 spoke
- Role required: admin

Create Credentials record for the Amazon EC2 spoke

Create Credential records for the Amazon EC2 instance. The Amazon EC2 spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for Amazon_EC2.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the connection record. For example, enter `AWS Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to EC2.
Secret Access Key	Secret Access Key of the user with full access to EC2.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for out bound signing requests. Select **Amazon EC2AuthAlgo**. **Note:** Do not directly modify the de fault authentication algorithm.

6. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Amazon Elastic Container Service Spoke

Manage clusters, instances, services and so on, in Amazon Elastic Container Service account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon Elastic Container Service spoke v1.0.2 is the latest version. For version history of the spoke, see Amazon Elastic Container Service spoke release notes.

Supported versions

This spoke was built for Amazon Elastic Container Service API version 2014-11-13, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon Elastic Container Service.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Elastic Container Service spoke provides actions to automate Amazon Elastic Container Service tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Cluster Management	Create Cluster	Creates an Amazon ECS cluster.
	Delete Cluster	Deletes the specified cluster.
	Look up Cluster	Retrieves the specified cluster.
	Look up Clusters	Retrieves the list of existing clusters.
	Update Cluster Settings	Updates settings of the specified cluster.
Instance Management	Deregister Container Instance	Deregisters an Amazon ECS container instance from the specified cluster.
	Look up Container Instances	Lists Amazon Elastic Container Service container instances.
	Register Container Instance	Registers an EC2 instance into the specified cluster.
Service Management	Create Service	Runs and maintains the desired number of tasks from the specified task definition.
	Delete Service	Deletes a specified service within a cluster.
	Look up Service	Retrieves the specified service running in your cluster.
	Look up Services	Retrieves the services that are running in a specified cluster.
	Update Service	Updates the parameters of a service.
Task Definition Management	Deregister Task Definition	Deletes the specified task set within a service.
	Look up Task Definition	Deregisters the specified task definition by family and revision.
	Look up Task Definitions	Deregisters the specified tasks definition by family and revision.
	Register Task Definition	Creates a task set in the specified cluster and service.
Task Management	Create Task Set	Creates a task set in the specified cluster and service.
	Delete Task Set	Deletes the specified task set within a service.
	Look up Task Set	Lists the task sets in the specified cluster and service.
	Run Task	Starts a task using the specified task definition.
	Start Task	Starts a task from the specified task definition on the specified container instance or instances.
	Stop Task	Stops the specified running task.
	Update Task Set	Modifies the specifies task set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Elastic Container Service spoke.

Set up the Amazon Elastic Container Service spoke

Integrate the ServiceNow instance and Amazon Elastic Container Service account by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon Elastic Container Service spoke.
- Role required: admin

Create a credential record for the Amazon Elastic Container Service spoke

Create a credential record for the Amazon Elastic Container Service account. The Amazon Elastic Container Service spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `Amazon ECS Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon Elastic Container Service.
Secret Access Key	Secret Access Key of the user with full access to Amazon Elastic Container Service.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonECSAuthAlgo**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Users are cautioned against directly modifying the default authentication algorithm.
Credential alias	Credential alias associated with the spoke.

5. Click **Submit**.

Amazon RDS Spoke

Integrate ServiceNow instance with Amazon Relational Database Service (RDS). Manage the process of performing various operations like set up, operate, and scale on Amazon RDS using this spoke.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon RDS spoke v1.0.5 is the latest version. For version history of the spoke, see Amazon RDS spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported Versions

This spoke was built for API version 2014-09-01 and 2014-10-31, but may be compatible with later versions.

Spoke Requirements

- User with full access to Amazon RDS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Amazon RDS spoke provides actions to automate Amazon RDS tasks when events occurs in ServiceNow. Available actions include:

Spoke Actions

Category	Action	Description
Account Management	List Account Attributes	Retrieves the list of attributes of an account.
	List Certificates	Retrieves the list of certificates of an account.
DB Engines Management	List DB Engines	Retrieves the list of available database (DB) engines.
Default	Generate Random Password	Generates a random password.
DB Instance Management	Create DB Instance	Creates an instance of DB.
	Create DB Instance Read Replica	Creates a read replica of a DB instance.
	Delete DB Instance	Deletes an existing provisioned DB instance. **Note:** When you delete a DB instance, all the automated backups of that instance are also deleted and cannot be recovered.
	List DB Instances	Retrieves the list of provisioned DB instances.
	List Reserved DB Instances	Retrieves the list of reserved DB instances.
	Promote DB Instance Read Replica	Promotes a read replica of a DB instance to standalone DB instance.
	Reboot DB Instance	Reboots a DB instance.
	Restore DB Instance From DB Snapshot	Creates a DB instance from a DB snapshot.
	Start DB Instance	Starts a DB instance.
	Stop DB Instance	Stops a DB instance.
DB Snapshots Management	Create DB Snapshot	Creates a snapshot of a DB instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
	Delete DB Snapshot	Deletes a snapshot of a DB instance.
	List DB Snapshots	Retrieves the list of snapshots of a DB instance.
	Update DB Snapshot	Updates a snapshot of a DB instance.
Event Management	Create Event Subscription	Creates an RDS event notification subscription.
	Delete Event Subscription	Deletes an event notification subscription.
	List Event Categories	Retrieves a list of categories for the specified or all event source types.
	List Event Subscriptions	Retrieves a list of all subscription descriptions of a customer account.
	List Events	Retrieves a list of events of the RDS resources.
	Update Event Subscription	Updates an existing event notification subscription.
Groups Management	Create DB Parameter Group	Creates a DB parameter group.
	Create DB Subnet Group	Creates a DB subnet group. **Note:** A DB subnet group must contain at least one subnet in at least two Availability Zones (AZ) in the Amazon Web Services (AWS) region.
	Create Option Group	Creates an option group.
	Delete DB Parameter Group	Deletes the specified DB parameter group. **Note:** Before deleting the DB parameter group, ensure that DB parameter group is not associated with any DB instances.
	Delete DB Subnet Group	Deletes a DB subnet group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
	Delete Option Group	Deletes an existing option group.
	List DB Parameter Groups	Retrieves a list of DB parameter groups.
	List DB Subnet Groups	Retrieves a list of DB subnet group descriptions. **Note:** If a DB subnet group name is specified, the list contains descriptions of only the specified DB subnet group.
	List Option Groups	Retrieves a list of option groups.
	Reset DB Parameter Group	Modifies the parameters of a DB parameter group to the engine or system default values.
	Update DB Parameter Group	Updates the parameters of the specified DB parameter group.
	Update DB Subnet Group	Updates an existing DB subnet group. **Note:** A DB subnet group must contain at least one subnet in at least twos availability zones (AZs) in the Amazon Web Services (AWS) region.
	Update Option Group	Updates an existing option group.
Logs Management	List DB Log Files	Retrieves a list of all the log files of a DB instance.
	View DB Log File	Displays a part of or an entire specified log file. **Note:** The size of the log file must not exceed 1 MB.
Tags Management	Add Tags To RDS Resource	Adds tags to RDS resource.
	List Tags For RDS Resource	Retrieves a list of tags of RDS resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke Actions (continued)

Category	Action	Description
	Remove Tags From RDS Resource	Removes the tags from an RDS resource.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon RDS spoke.

Set up the Amazon RDS spoke

Integrate the ServiceNow instance and Amazon RDS using AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon RDS spoke
- Role required: admin

Create Credentials records for the Amazon RDS spoke

Create Credential records for the Amazon RDS instance. The Amazon RDS spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credentials Aliases**.
2. Open for the record for Amazon RDS.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these fields.

Field	Description
Name	Name to uniquely identify the connection record. For example, enter `AWS Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon RDS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secret Access Key	Secret Access Key of the user with full access to Amazon RDS.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for out bound signing requests. Select **Amazon RDS Auth Algorithm**. **Note:** Do not directly modify the de fault authentication algorithm.

6. Click **Submit**.

Amazon Route 53 Spoke

Integrate ServiceNow instance with Amazon Route 53. Manage domain registrations, Domain Name System (DNS) routing, and health checking from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Amazon Route 53 API version 2013-04-01, but may be compatible with later versions.

Spoke version

Amazon Route 53 spoke v1.0.2 is the latest version. For version history of the spoke, see Amazon Route 53 spoke release notes.

Spoke requirements

- User with full access to Amazon Route 53 account.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Route 53 Spoke provides actions to automate Amazon Route 53 tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Domain Management	Check Domain Availability	Checks and returns the availability of a domain name. **Note:** If a domain name is in pending state, you must check the availability of the domain name again, until the status is processed
	Get Domain Details	Retrieves detailed information about a specified domain that is associated with the current AWS account.
	Look up Domain Suggestions	Retrieves a list of suggested domain names.
	Look up Domains	Retrieves all the domain names registered with Amazon Route 53 for the current AWS account.
	View Billing	Retrieves all the domain related billing records for the current AWS account for a specified period.
Hosted Zone Management	Create Hosted Zone	Creates a new public or private hosted zone.
	Delete Hosted Zone	Deletes a hosted zone.
	Get Change	Retrieves the current status of a change batch request.
	Get Hosted Zone	Retrieves information about a specified hosted zone.
	Get Hosted Zone Count	Retrieves total number of hosted zones for the account.
	Get Hosted Zone Limit	Retrieves the specified limit for a specified hosted zone.
	Look up Hosted Zones	Retrieves a list of associated public and private hosted zones.
	Look up Hosted Zones By Name	Retrieves a list of the hosted zones in alphabetical order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Hosted Zone Comment	Updates the comment for a specified hosted zone.
Record Set Management	Delete GeoLocation Record Set	Deletes a GeoLocation resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Delete Simple Record Set	Deletes a simple resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Delete Weighted Record Set	Deletes a weighted resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Look up Record Sets	Retrieves a list of resource record sets in a specified hosted zone.
	Test DNS Answer	Retrieves the value that Amazon Route 53 returns in response to a DNS request for a specified record name and type.
	Upsert Geolocation Record Set	Creates a GeoLocation resource record set or updates an existing GeoLocation resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Upsert Simple Record Set	Creates a simple reocord set or updates an existing simple resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
	Upsert Weighted Record Set	Creates a weighted resource record set or updates an existing weighted resource record set that contains authoritative DNS information for a specified domain name or subdomain name.
Tag Management	Add Tags For Domain	Assigns a set of tags to a domain.
	Add Tags For Hosted Zone	Assigns a set of tags to a hosted zone.
	Look up Tags For Domain	Retrieves a list of tags that are associated with the specified domain.
	Look up Tags For Hosted Zone	Retrieves a list of tags that are associated to the specified domain.
	Remove Tags From Domain	Removes tags that are associated to a domain.
	Remove Tags From Hosted Zone	Removes tags that are associated to a hosted zone.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon Route 53 spoke.

Set up the Amazon Route 53 spoke

Integrate the ServiceNow instance and Amazon Route 53 by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon Route 53 spoke
- Role required: admin

Create a credential record for the Amazon Route 53 spoke

Create a credential record for the Amazon Route 53 custom application. The Amazon Route 53 spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Amazon Route 53 Cred.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of your AWS account.
Secret Access Key	Secret Access Key of your AWS account.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Amazon Route53**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential alias	Credential alias associated with the spoke. **sn_amzn_rout53_spk.AmazonRoute53**

5. Right-click the form header and click **Submit**.

Amazon S3 Spoke

Integrate ServiceNow with Amazon S3. Manage buckets, objects, tags, and related ACLs in Amazon S3 from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon S3 spoke v1.3.2 is the latest version. For version history of the spoke, see Amazon S3 spoke release notes.

Supported version

This spoke was built for API version 2010-03-31, but may be compatible with later versions.

Supported regions

Currently, the spoke does not support the government or federal government regions.

Spoke requirements

- User with full access to Amazon S3.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

Spoke actions

The Amazon S3 spoke provides actions to automate Amazon S3 tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Bucket Management	Create Bucket	Creates a bucket in Amazon S3.
	Look up Buckets	List Amazon S3 buckets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Bucket Region	Retrieves the AWS region in which an Amazon S3 bucket was created.
Object Management	Copy Object	Copies object from source to destination.
	Delete Object	Deletes specified object from a bucket.
	Look up Objects by Bucket Stream	Lists the objects in the specified Amazon S3 bucket.
	Download S3 Object to ServiceNow Record	Downloads the requested object from Amazon S3 and attaches it to a record in ServiceNow.
	Upload ServiceNow Attachment to S3	Uploads file from the System Attachment Table (sys_attachment) to a specified Amazon S3 bucket.
Permission Management	Create ACL	Create new ACL for a bucket and delete the existing one.
	Look up ACL	Retrieves the ACL details for the requested resource.
Tag Management	Look up Tags	Lists tags of the specified Amazon S3 resource.
	Update Tags	Updates the tags of the specified Amazon S3 resource.

Note: Spoke actions can be used independently without subscribing to notifications from Amazon S3.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon S3 spoke.

MID Server requirements

This spoke can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Amazon S3 alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Amazon S3 spoke

Use Amazon S3 as file storage in place of attachments in ServiceNow. Adds Amazon S3 storage to your ServiceNow instance and enables users to reference Amazon S3 files in ServiceNow records.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon S3 spoke
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a connection for the Amazon S3 spoke

Configure a connection for the Amazon S3 spoke to enable the spoke to connect to the Amazon S3 host. After connecting, the spoke can perform various actions on Amazon S3.

Before you begin

Create the AWS access key ID and the secret access key. For more information, see create secret access key and key ID from AWS CLI.

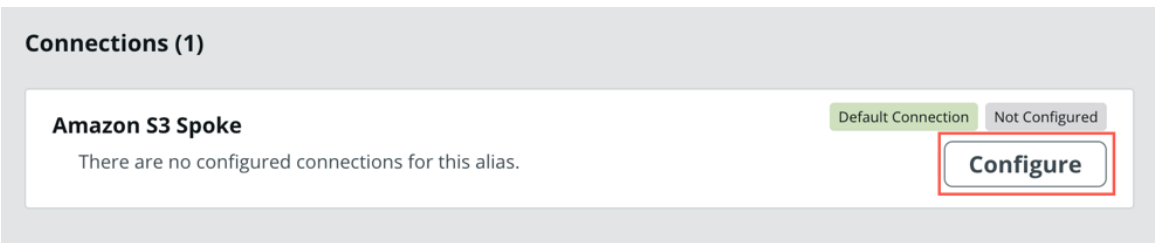
Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Amazon S3 Spoke** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Amazon S3 spoke, click **View Details**.

   - To manage more than one Amazon S3 spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

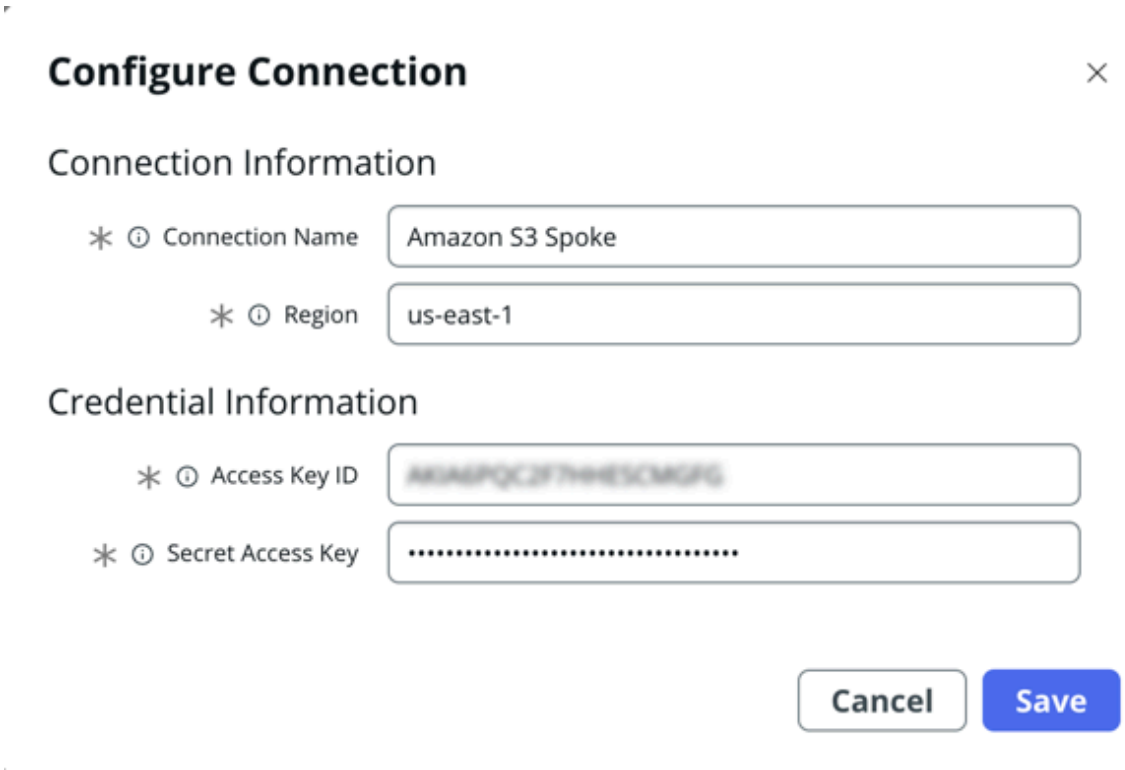
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Auto-generated name to identify the connection record.
Region	AWS region where your data resides.
Credential Information	
Access Key ID	Access Key ID of your AWS account.
Secret Access Key	Secret Access Key of your AWS account.



6. Click **Save**.

Result
The connection record for the Amazon S3 spoke is configured and the spoke actions can be used.

Amazon SNS Spoke

Integrate ServiceNow with Amazon SNS. Manage topics and subscriptions, and delegate roles in Amazon SNS from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon SNS spoke spoke v1.1.4 is the latest version. For version history of the spoke, see Amazon SNS spoke release notes.

Supported version

This spoke was built for API version 2010-03-31, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon SNS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

Spoke subflows

The Amazon SNS spoke provides a sample subflow to demonstrate automating Amazon SNS tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Amazon SNS Subscription. The subflow receives three types of messages; Notification, Subscription Confirmation, and Unsubscribe Confirmation. This subflow is triggered when you configure your ServiceNow instance to receive events from Amazon SNS. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Note: Spoke subflow can be used independently to subscribe for notifications from Amazon SNS. For more information about the configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Spoke actions

The Amazon SNS spoke provides actions to automate Amazon SNS tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Permission Management	Add Permission	Adds a statement to a topic's access control policy and grants access for the specified AWS accounts for the specified actions.
	Remove Permission	Removes a statement from a topic's access control policy and revokes access for the specified AWS accounts for the specified actions.
Subscription Management	Confirm Subscription	Verifies intent of endpoint owner to receive messages by validating the token sent to the endpoint through an earlier Subscribe action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Subscription	Creates a subscription on a topic.
	Delete Subscription	Deletes a subscription on a topic.
	Get Subscription Attributes	Retrieves all properties of a subscription.
	List Subscriptions	Retrieves a list of all subscriptions to a specific region. **Note:** In your flow, use the Get Subscription Attributes action before this action to populate the required records.
	List Subscriptions By Topic	Retrieves a list of the subscriptions to a specific topic. **Note:** In your flow, use the Get Subscription Attributes action before this action to populate the required records.
	Set Subscription Attributes	Enables a subscription owner to set an attribute of the subscription to a new value.
Topics Management	Create Topic	Creates a topic for which notifications can be published.
	Delete Topic	Deletes a topic and all its subscriptions.
	Get Topic Attributes	Retrieves all properties of a topic. Topic properties retrieved may differ based on the authorization of the user.
	List Topics	Retrieves a list of the requester's topics. **Note:** In your flow, use the Get Topic Attributes action before this action to populate the required records.
	Publish Batch Messages to Topic	Sends batch messages to an Amazon SNS topic.
	Publish Message to Topic	Sends a message to an Amazon SNS topic.
	Set Topic Delivery Policy	Enables a topic owner to set a delivery policy of the topic to a new value.
	Set Topic Display Name	Enables a topic owner to set a display name of the topic to a new value.

Note: Spoke actions can be used independently without subscribing to notifications from Amazon SNS.

Spoke module

The Amazon SNS spoke adds an AWS Configurations module to your ServiceNow instance. If you want receive events at your ServiceNow instance from Amazon SNS, you must specify the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

subflow internal name here. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon SNS spoke.

Set up the Amazon SNS spoke

Integrate the ServiceNow instance and Amazon SNS using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription
- Activate the Amazon SNS spoke
- Role required: admin

About this task

To receive events at your ServiceNow instance from Amazon SNS, see Receive events at your ServiceNow instance from Amazon SNS. Spoke set up described here enables you to use spoke subflow and actions.

Create Credential record for the Amazon SNS spoke

Create Credential record for your AWS account. The Amazon SNS spoke uses this credential to perform actions on Amazon SNS.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon SNS**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `SNS Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of your AWS account.
Secret Access Key	Secret Access Key of your AWS account.
Credential alias	Associated credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **SNS Algorithm**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record for the Amazon SNS spoke is created.

Receive events at your ServiceNow instance from Amazon SNS

Receive events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) from Amazon SNS at your ServiceNow instance.

Before you begin
- Request an Integration Hub subscription
- Activate the Amazon SNS spoke
- Role required: admin

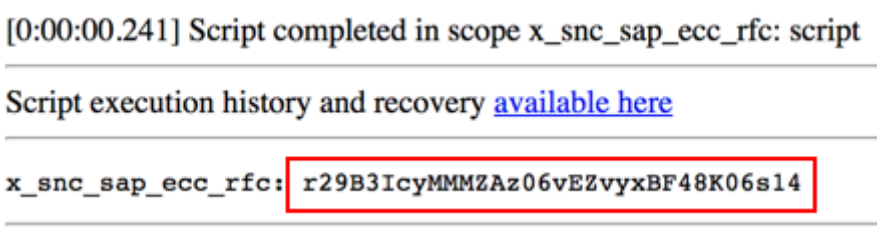
About this task
You can receive events at your ServiceNow instance from Amazon SNS even without setting up the Amazon SNS spoke. To set up the Amazon SNS spoke and use the spoke actions, see Set up the Amazon SNS spoke.

Create secret for the Amazon SNS spoke

Create a client secret to authorize requests from Amazon SNS.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
   `gs.info(GlideSecureRandomUtil.getSecureRandomString(32));`
3. Click **Run Script**.
4. Copy and record the generated value for later use.



Create a record in AWS Configurations

Create a record in AWS Configurations to authorise requests from Amazon SNS spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **AWS Configuration** > **All Configurations**.
2. Click **New**.
3. On the form, fill in the fields.

AWS Configurations form

Field	Description
Property Value	Internal name of the Amazon SNS Subscription subflow. For example, `amazon_sns_subscription`. **Note:** The Amazon SNS Subscription subflow is a sample subflow. You must create a copy of this subflow and use it to customize event management as per your requirement. In this case, specify the internal name of the customized subflow.
Property Name	Name to identify the record.
Client Secret	Client Secret generated by the script. For information about generating Client Secret see, Create secret for the Amazon SNS spoke.

4. Right-click the form header and click **Save**.
5. Right-click the form header and click **Copy sys_id**. Record this value for later use.

Record the Base API path of the Amazon SNS spoke

Record the Base API path of the Amazon SNS spoke to authorise requests from Amazon SNS.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **System Web Services** > **Scripted Web Services** > **Scripted REST APIs**.
2. Open the record for **Amazon SNS**.
3. Copy and record the value of **Base API path** for later use.

Create topic

Use the Create Topic spoke action to create a topic in Amazon SNS for your ServiceNow instance.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In Workflow Studio, create a flow and include the Create Topic spoke action.
   For information about creating flows in Workflow Studio, see Building flows.
2. Customize flow to provide these values as inputs to the Create Topic spoke action:

Field	Description
Region	AWS geographic area where the infrastructure is housed.
Topic Name	Name to identify the topic.

3. Test the flow and check the **Executions** tab to ensure that flow is executed as expected.

Create subscription

Use the Create Subscription spoke action to create subscription in Amazon SNS for your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. In Workflow Studio, create a flow and include the Create Subscription spoke action.
   For information about creating flows in Workflow Studio, see Building flows.
2. Customize flow to provide these values as inputs to the Create Subscription spoke action:

Field	Description
Region	AWS geographic area where the infrastructure is housed.
Topic ARN	ARN to uniquely identify the required topic. Subscriptions are created for this topic.
Protocol	**HTTPS**
Endpoint	Endpoint URL in this format: `https://<servicenow-instance>.service-now.com/<base-api-path>/<aws-configuration-sys_id>/<client-secret>`. **Note:** For information about obtaining the required values, see Record the Base API path of the Amazon SNS spoke, Create a record in AWS Configurations, and Create secret for the Amazon SNS spoke.

3. Test the flow.
   The flow internally triggers the default Amazon SNS Subscription subflow.
4. In the **Executions** tab, open the record associated with the subflow execution.

   Note: Ensure that you check the execution details of the default Amazon SNS Subscription subflow, not the flow you had created.

5. In the Execution Details page, click **RUNTIME VALUE**.
6. Copy and record the value of Token for later use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This confirmation token is needed to Confirm subscription.

Note: Ensure that you use the confirmation token to Confirm subscription within its validity period.

Result
Subscription for the required topic in Amazon SNS for your ServiceNow instance is created.

Confirm subscription

Use the Confirm Subscription spoke action to confirm subscription in Amazon SNS for your ServiceNow instance.

Before you begin
Role required: admin.

Procedure

1. In Workflow Studio, create a copy of the default Amazon SNS Subscription subflow. For information about using subflows in Workflow Studio, see Building subflows.
2. In Workflow Studio, create a flow that includes the copy of the default subflow. For information about creating flows in Workflow Studio, see Building flows.
3. Customize the subflow to include the Confirm Subscription spoke action.
4. Customize subflow to provide these values as inputs to the Confirm Subscription spoke action:

Field	Description
Region	AWS geographic area where the infrastructure is housed.
Topic ARN	ARN to uniquely identify the required topic. Subscriptions are created for this topic.
Token	Confirmation token generated after creating subscription. See Create subscription, for more information. **Note:** Ensure that you use the confirmation token to confirm subscription within its validity period.

5. Test the flow and check the **Executions** tab to ensure that flow is executed as expected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The Amazon SNS subscription for your ServiceNow instance is confirmed.

Customize event management

Customize the management of events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) you receive for your ServiceNow instance from Amazon SNS.

Before you begin
Role required: admin.

Procedure

1. In Workflow Studio, create a copy of the default subflow, Amazon SNS Subscription and customize the subflow as per your requirement.
   For more information about creating subflows, see Building subflows.
2. Copy and record the internal name of the customized subflow.
3. Navigate to **AWS Configuration** > **All Configurations**.
4. Open the record you had created to receive events.
   In this record, the internal name of the default Amazon SNS Subscription subflow is specified in **Property Value**.
5. Update this record by replacing the internal name of default subflow with the internal name of the customized subflow in **Property Value**.

   Note: Use the same **Client Secret**.

Result
The event management is customized as per your requirement.

Amazon SQS Spoke

Amazon SQS spoke automates various actions on the Amazon SQS based on a trigger in your ServiceNow instance. Set up a flow in the Workflow Studio using the actions and automate tasks on Amazon SQS. For example, you can set up a flow that automates sending messages to a queue.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription
This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Amazon SQS spoke v1.0.1

is the latest version. For version history of the spoke, see Amazon SQS Spoke release notes.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke actions

The Amazon SQS provides actions to automate tasks on the simple queue services when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Message Management	Change Visibility for Message	Changes the visibility of a message from a queue. You specify inputs such as the queue URL and the visibility timeout and the action returns the status of the execution.
	Change Visibility for Messages	Changes the visibility of up to 10 messages from a queue. You provide inputs such as the queue URL and the request that comprises the messages' list and the action returns the list of messages and the status of the action.
	Delete Message	Deletes a message from a queue. You provide the queue URL and the receipt handle and the action returns the status of the execution.
	Delete Messages	Deletes up to 10 messages from a queue. You provide the queue URL and the receipt handle and the action returns the status of the execution.
	Receive Message	Retrieves up to 10 messages from a queue. You provide the queue URL and the number of messages as inputs and the action returns the list of messages and the status of the execution.
	Send Message	Delivers a message to a queue. You provide inputs such as the queue URL and the message and the action returns outputs such as sequence number and message ID.
	Send Messages	Sends up to 10 messages to a queue. You provide inputs such as the queue URL and the message and the action returns outputs such as sequence number and message ID. **Note:** You can send messages with size up to 256 KB.
Permission Management	Add Permission	Adds a permission to a queue for a principal. You provide inputs such as the queue URL and the permission label and the action returns the status of the execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Remove Permission	Revokes permissions in the queue policy that matches a label. You provide inputs such as the queue URL and the permission label and the action returns the status of the execution.
Queue Management	Create FIFO Queue	Creates a FIFO queue. You can provide inputs such as region and queue name and the action returns the new queue URL and the status of the execution.
	Create Standard Queue	Creates a standard queue. You can specify inputs such as region and the queue name and the action returns the queue name and the status of the execution.
	Delete Queue	Deletes a queue. You can provide the queue URL and the action returns the estatus of the execution.
	Look up Queue Attributes	Retrieves the attributes of a queue. You can specify the queue URL and the action returns the queue attributes.
	Look up Queue URL	Retrieves the URL of the specified queue. You can specify inputs such as the region and queue name and the action returns the queue URL.
	Look up Queues Stream	Retrieves a list of queues in a region. You provide inputs such as region and page size and the action returns the details.
	Purge Queue	Deletes the messages in a queue. You specify the queue URL and the action returns the execution status code.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

To learn to set up the spoke, see Set up Amazon SQS spoke.

Set up Amazon SQS spoke

Set up outbound integration between your ServiceNow instance and Amazon SQS (Simple Queue Service). The integration enables automation of actions in Amazon SQS when an event occurs on your ServiceNow instance. For example, you can automate actions such as creating a standard queue or sending a message to a queue.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon SQS spoke.
- Ensure that you have access to the Amazon Web Services (AWS) account to create access keys and secure access keys.
- Role required: admin

Set up credential record for Amazon SQS

Create a credential record on your ServiceNow instance for accessing the Amazon AWS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

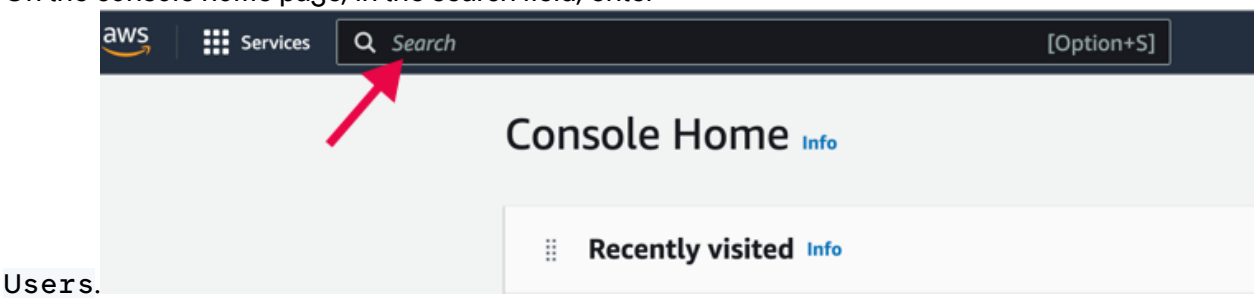
- Request an Integration Hub subscription.
- Activate the Amazon SQS spoke plugin.
- Ensure that you have access to the Amazon Web Services(AWS) account to create access keys and secure access keys.
- Role required: admin

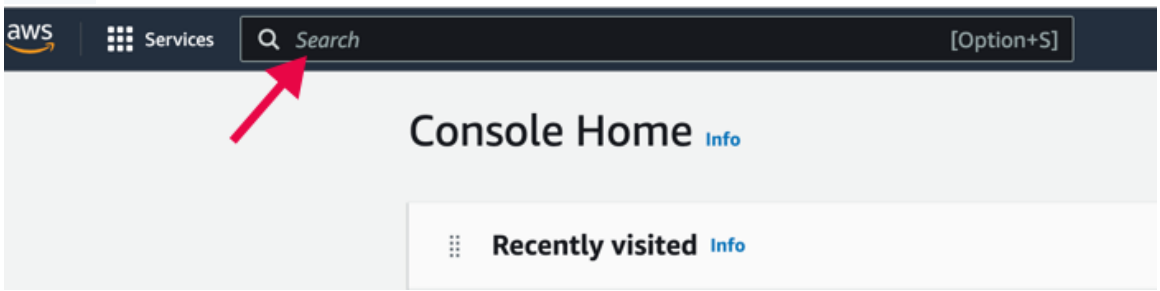
Procedure

1. Create an access key and a secure access key in the Amazon AWS.

   a. Log in to Amazon Web Services.

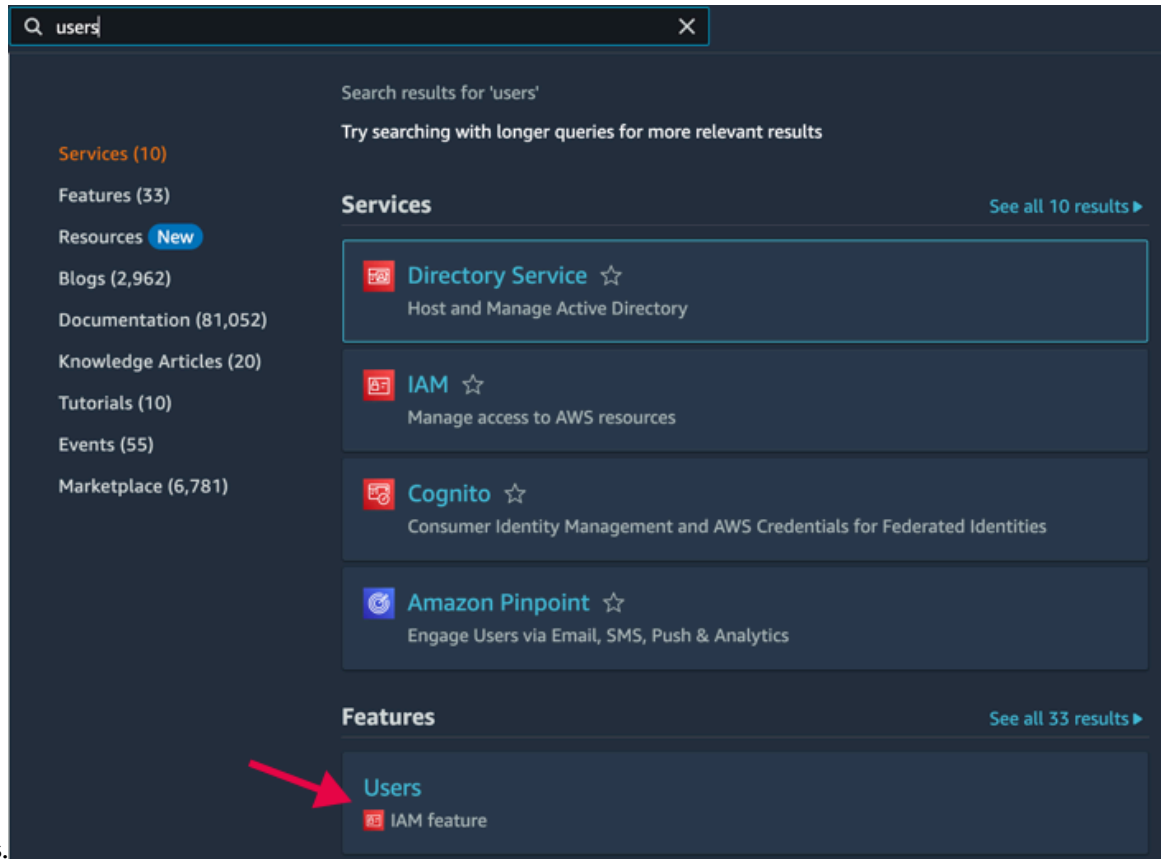
   b. On the console home page, in the search field, enter `Users`.

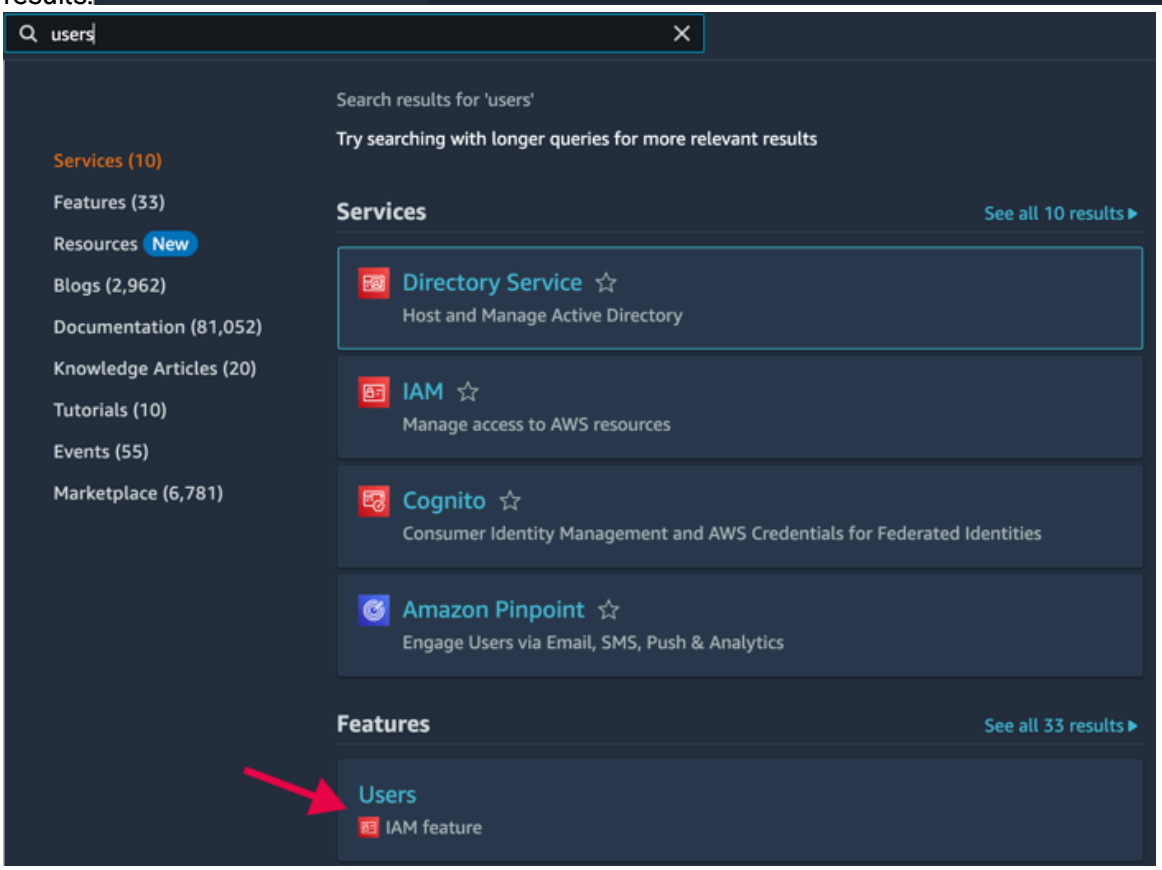




© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select Users from the search results.

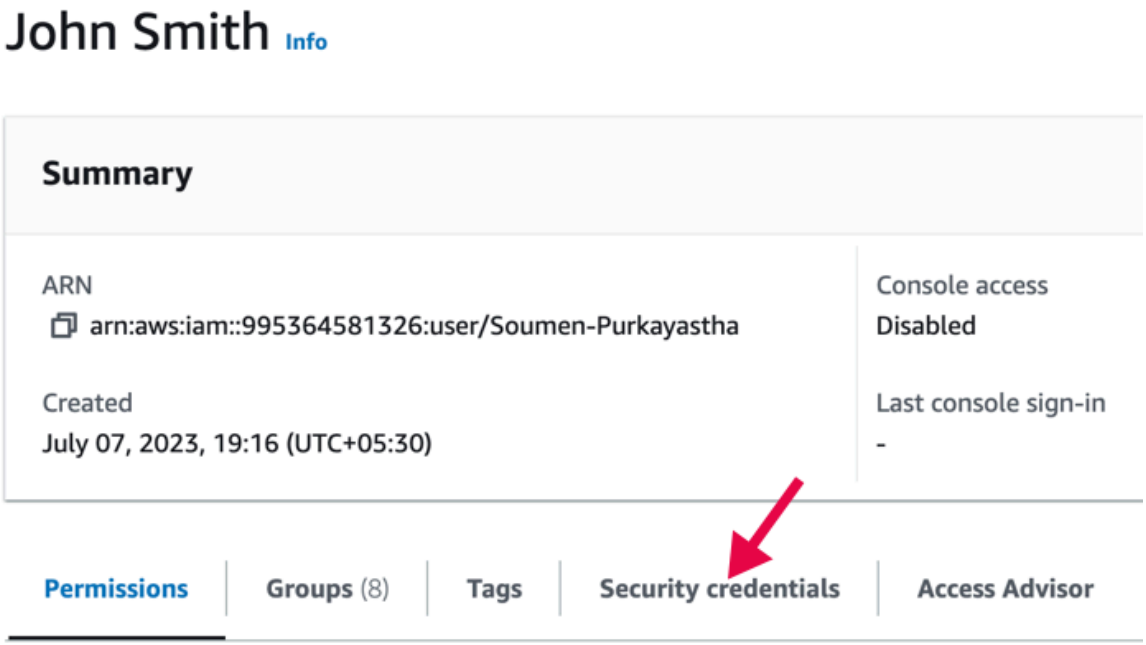




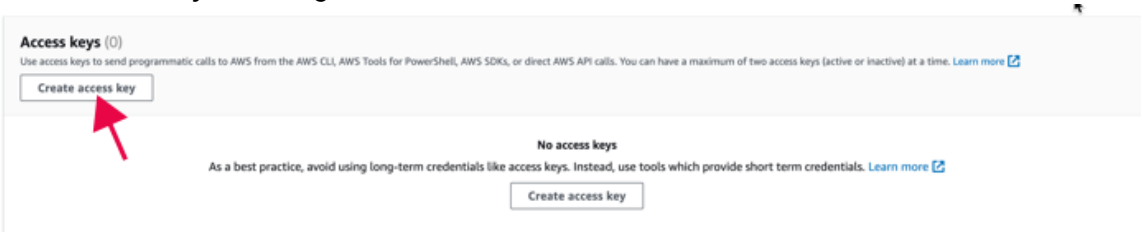
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the Users field, enter the user name under which you want to create the access and secret access keys or select a user name under the User name column.

e. Select the Security credentials tab.

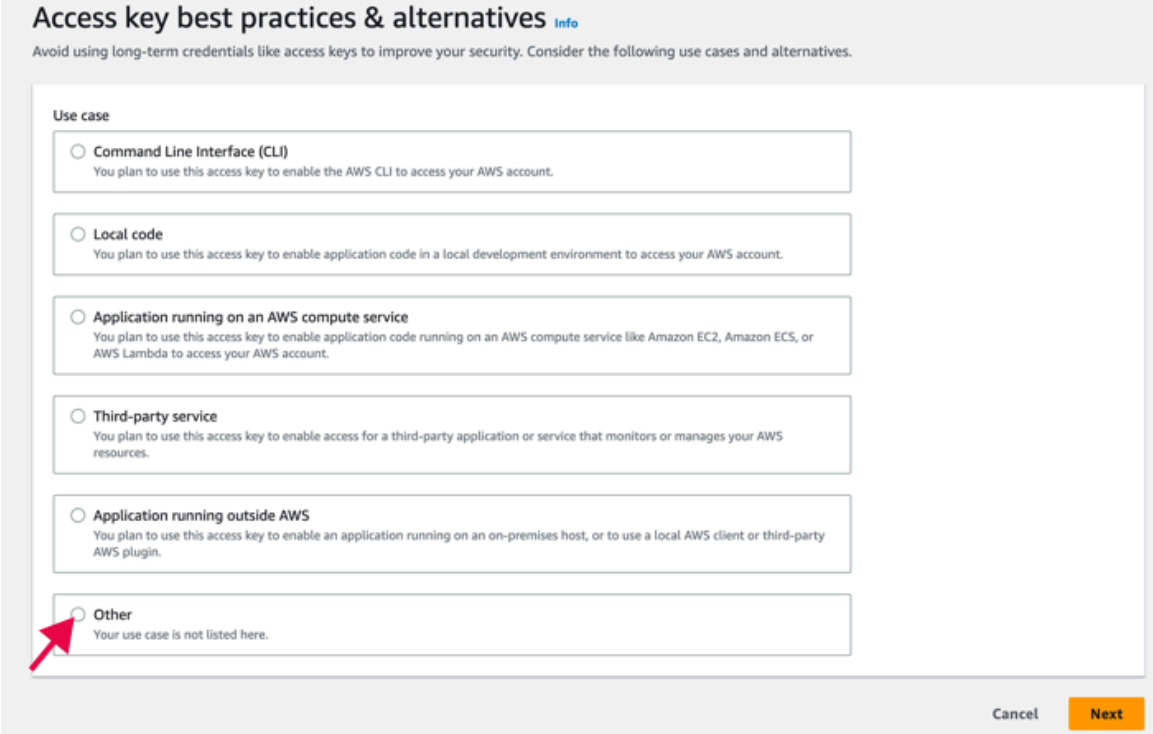


f. Under the Access keys heading, select **Create access key**.



g. Under the Access key best practices & alternatives heading, select Other.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

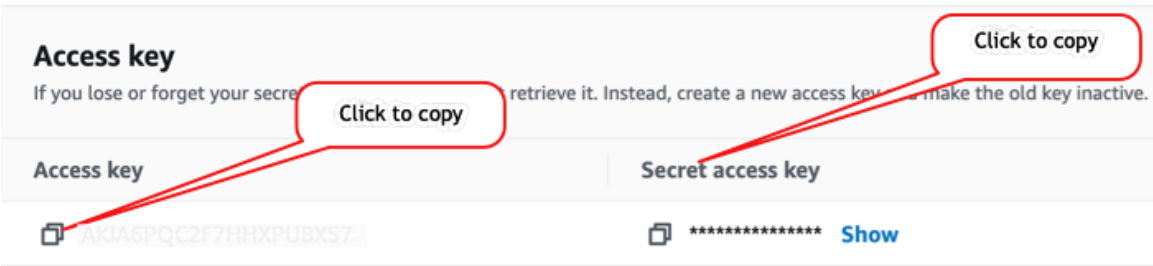


h. Select **Next**.

i. **Optional:** In the Description tag value field, enter a custom tag that describes the access key.

j. Select **Create access key**.

k. Copy the access key and the secret access key, and store at a secure place.
The credential record you set up on your ServiceNow instance requires the access and secret access keys.



l. To view the secret access key, select **Show**.

m. Select **Done**.

2. Create the credential record.

a. Log in to your ServiceNow instance.

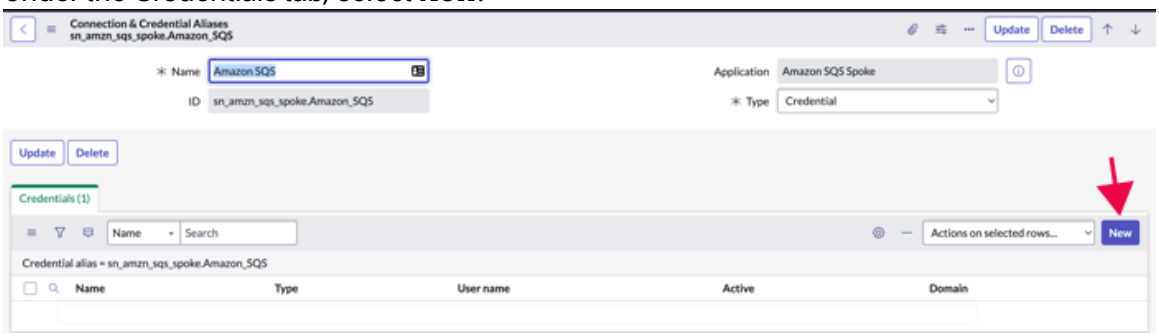
b. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.

c. Select the Amazon SQS connection and credential alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alias becomes available as a base system component when you install the Amazon SQS spoke plugin.

d. Under the Credentials tab, select **New**.



e. Under the heading What type of Credentials would you like to create?, select AWS Credentials.

f. Fill the form.

AWS credentials

Field	Description
Name	Custom name of the credential record.
Active	If the field is selected, you can use this record to access the Amazon SQS.
Access Key ID	Enter the access key you had generated on Amazon AWS.
Secret Access Key	Enter the secret access key you had generated on Amazon AWS.
Authentication Algorithm	Algorithm used to authenticate credential record. To select the algorithm, select and from the list, select Amazon SQS.

g. Select **Submit**.

Amazon VPC Spoke

Provision a logically isolated section of the AWS cloud using Amazon VPC and launch the required AWS resources in a virtual network, from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Amazon VPC spoke v1.0.3 is the latest version. For version history of the spoke, see Amazon VPC spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Amazon VPC.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke subflows

The Amazon VPC spoke provides sample subflows to demonstrate automating Amazon VPC tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Delete Subnet	Deletes the specified subnet. Before you delete the subnet, you must terminate all the running instances in the subnet.
Delete VPC	Deletes the specified VPC. Before you delete the VPC, you must terminate all the associated instances.

Spoke actions

The Amazon VPC spoke provides actions to automate Amazon VPC tasks when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Network & Security Group Management	Add Egress Rules To A Security Group	Adds the specified egress rules to a security group.
	Add Ingress Rules To A Security Group	Adds the specified ingress rules to a security group.
	Create Security Group	Creates a security group.
	Delete Egress Rules From Security Group	Removes the specified egress rules from security group. Values must match the existing rule's values exactly.
	Delete Ingress Rules From Security Group	Adds the specified ingress rules to a security group.
	Delete Security Group	Deletes a security group.
	List Security Groups	Lists the specified security groups or all of your security groups.
	Lookup Security Group	Retrieves the specified security group.
Virtual Private Cloud Management	Create Subnet	Creates a subnet in an existing VPC.
	Create VPC	Creates a VPC with the specified IPv4 CIDR block and can optionally request an IPv6 CIDR block for the VPC.
	Delete NAT Gateway	Deletes the specified NAT gateway. Deleting a NAT gateway disassociates its Elastic IP address, but does not release it.
	Delete Route Table	Deletes the specified route table. You must disassociate the route table from any subnets before you can delete it.
	Delete Subnet	Deletes the specified subnet. You must terminate all running instances in the subnet before you can delete the subnet.
	Delete VPC	Deletes the specified VPC. You must detach or delete all gateways and resources that are associated with the VPC before you can delete it or use Delete VPC subflow.
	Delete VPC Peering Connection	Deletes a VPC peering connection. Either the owner of the requester VPC or the owner of the accepter VPC can delete the VPC peering connection if it's in the active state.
	Detach Internet Gateway	Detaches an internet gateway from a VPC, disabling connectivity between the internet and the VPC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Detach Route Table	Disassociates a subnet from a route table.
	List Internet Gateways	Retrieves the details of the required internet gateways.
	List NAT Gateways	Retrieves the details of the required NAT gateways.
	List Route Tables	Retrieves the details of the required route tables.
	List Subnets	Retrieves the details of the required subnets in an existing VPC.
	List VPC Peering Connections	Retrieves the details of the required VPC peering connections.
Virtual Private Network Management	Detach VPN Gateway	Detaches a virtual private gateway from a VPC.
	List VPN Gateways	Retrieves the details of the required virtual private gateways.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Amazon VPC spoke.

Set up the Amazon VPC spoke

Integrate the ServiceNow instance and Amazon VPC using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Amazon VPC spoke.
- Role required: admin.

Create Credential record for the Amazon VPC spoke

Create Credential record for your Amazon VPC account. The Amazon VPC spoke connection and credential alias uses this credential to perform actions on Amazon VPC.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon VPC**.
3. From the **Credentials** tab, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays the message `What type of Credentials would you like to create?`.

4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `VPC Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to Amazon VPC.
Secret Access Key	Secret Access Key of the user with full access to Amazon VPC.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonVPCAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record the Amazon VPC spoke is created.

Ansible Spoke

Integrate your ServiceNow instance with Ansible Tower. Automate Ansible Tower tasks when events occur in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Ansible spoke v2.4.0 is the latest version. For version history of the spoke, see Ansible spoke release notes.

Note: Ansible spoke supports MID Server from v2.4.0 onwards. If you are using a previous version of the spoke and want to use MID Server, upgrade to the latest version of Ansible spoke, delete the existing connection and credential record, and create a new connection and credential record using authentication template. For more information, see Set up the Ansible spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported version

This spoke was built for Ansible Tower v2, but may be compatible with later versions.

Spoke requirements

- Ansible Tower
- If you are using custom OAuth application:
  - Ansible Tower administrator credentials to create a custom application
  - Application information such as Client ID and Client Secret
- If you are using basic authentication, credentials of the user with System Administrator role to log in to Ansible Tower.

Spoke actions

The Ansible spoke provides actions to automate Ansible Tower tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Adhoc Command Management	Look up Status From Ad-Hoc Command by ID	Retrieves the run status from the ad-hoc command.
	Run An Ad-Hoc Command	Runs an ad-hoc command on the target devices.
Credential Management	Look up Credential Details Stream	Retrieves the list of credentials from the Ansible Tower environment.
	Look up Credentials Details by ID	Retrieves details of the required credential in the Ansible Tower environment.
Credential Type Management	Look up Credential Type Details by ID	Retrieves details of the required credential type in the Ansible Tower environment.
	Look up Credential Type Details Stream	Retrieves the list of credentials in the Ansible Tower environment.
Inventory Management	Look up Hosts From Inventory by ID	Lists hosts from the inventory in Ansible Tower environment.
	Look up Instance Groups From Inventory by ID	Lists instance groups from inventory.
	Look up Inventory Details by ID	Retrieves details of the required inventory from Ansible Tower.
	Look up Inventory Details Stream	Retrieves inventory details from Ansible Tower.
Inventory Script Management	Look up Inventory Script Details Stream	Retrieves the list of inventory scripts from Ansible Tower.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Inventory Scripts Details by ID	Retrieves details of the required inventory script from Ansible Tower.
Inventory Source Management	Look up Inventory Source Details by ID	Retrieves details of the required inventory source from Ansible Tower.
	Look up Inventory Source Details Stream	Retrieves inventory source details stream from Ansible Tower.
Job Management	Cancel Job	Cancels the required job in the Ansible Tower environment.
	Look up Job Details by ID	Retrieves details of the specific job in the Ansible Tower environment.
	Look up Job Details Stream	Retrieves the list of job details.
	Look up Jobs Stream	Retrieves the list of jobs.
	Relaunch Job	Relaunches job in the Ansible Tower environment.
	Schedule Job	Schedules a job.
Metadata Retrieval	Get Credentials	Retrieves credentials in the Ansible Tower environment.
	Get Inventories	Retrieves inventories in the Ansible Tower environment.
	Get Projects	Retrieves projects in the Ansible Tower environment.
	Get Additional Input Fields	Retrieves list of fields that can be used as a dynamic template or dynamic object.
	Get Entity Data	Retrieves data from the required entity.
Organization Management	Look up Organization Details by ID	Retrieves details of the required organization from Ansible Tower.
	Look up Organization Stream	Retrieves details of organizations from Ansible Tower.
Project Management	Look up Project Details by ID	Retrieves details of the required project from Ansible Tower.
	Look up Projects Stream	Retrieves details of projects from Ansible Tower.
Record Management	Create Record	Creates a record in the Ansible Tower environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Record	Deletes the required record in the Ansible Tower environment.
	Update Record	Updates details of the required record in the Ansible Tower environment.
Role Management	Look up Role Details by ID	Retrieves details of the required role in Ansible Tower environment.
	Look up Roles Stream	Retrieves details of the roles in the Ansible Tower environment.
	Look up Teams by Role Stream	Retrieves details of the teams associated with the required role.
	Look up Users by Role Stream	Retrieves details of the users with the required role.
Team Management	Look up Team Details by ID	Retrieves details of the required team.
	Look up Teams Stream	Retrieves details of the teams in the Ansible Tower environment.
Template Management	Create Job Template	Creates a job template.
	Launch Job Template	Launches a job template.
	Look up Job Templates Stream	Retrieves the list of job templates.
User Management	Associate User to Organization	Associates or disassociates the required user to an organization.
	Associate User to Team	Associates or disassociates the required user to a team.
	Create User	Creates a user in the Ansible Tower environment.
	Delete User	Deletes user in the Ansible Tower environment.
	Look up User Details by ID	Retrieves details of the required user from Ansible Tower.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Ansible spoke.

MID Server requirements

This spoke can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Ansible alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Ansible spoke

Integrate your ServiceNow instance and Ansible Tower to automate Ansible spoke actions. For example, you can create a flow that retrieves a list of credentials from the Ansible Tower environment.

Before you begin

- Request an Integration Hub subscription.
- Activate the Ansible spoke.
- Role required: admin.

Note: Ansible spoke supports MID Server from v2.4.0 onwards. If you are using a previous version of the spoke and want to use MID Server, upgrade to the latest version of Ansible spoke and delete the existing connection and credential record.

To delete the existing connection and credential record:

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Search and open the default connection and credential record for the Ansible spoke. For example, **AnsibleTowerAlias**.
3. Under the **Connections** tab, open the default HTTP(s) Connection record. For example, **Ansible Spoke Connection**.
4. Click **Delete**. System prompts you confirm delete action.
5. Click **Delete**.
6. Navigate to **All** > **Connections & Credentials** > **Credentials**.
7. Search and open the default credential record for the Ansible spoke. For example, **Ansible credential**.
8. Click **Delete**. System prompts you confirm delete action.
9. Click **Delete**.

Create an OAuth application in the Ansible Tower

Create an OAuth application on the Ansible Tower to have the connection requests from your ServiceNow instance authenticated by the OAuth application.

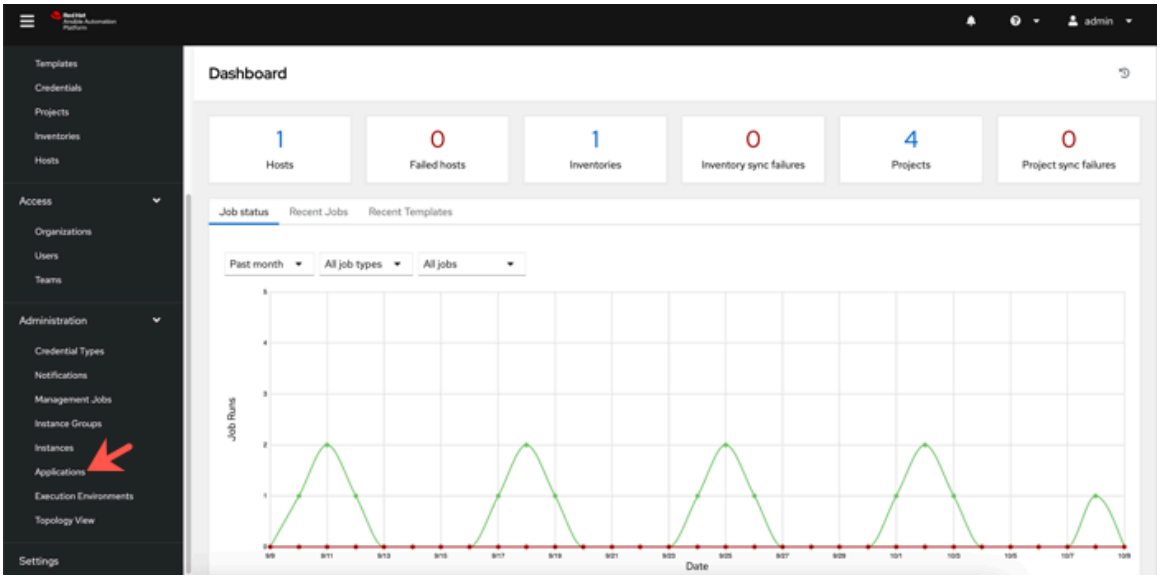
Before you begin

Role required: admin
Ensure that you have the administrator's access to the Ansible Tower instance.

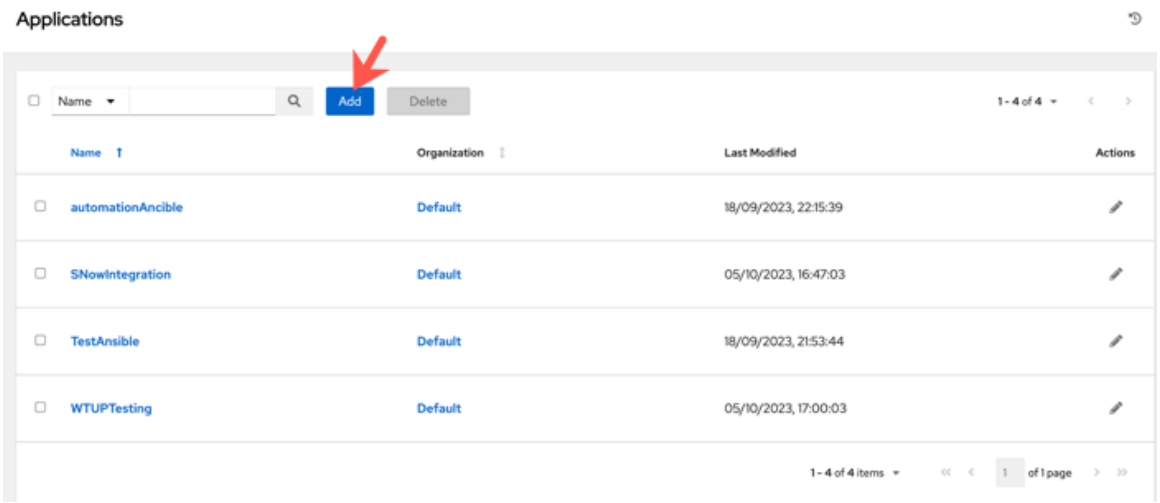
Procedure

1. Log in to the Ansible Tower application instance.
2. On the left panel, under Administration, select Applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the Applications page, select **Add**.



4. Fill the form.

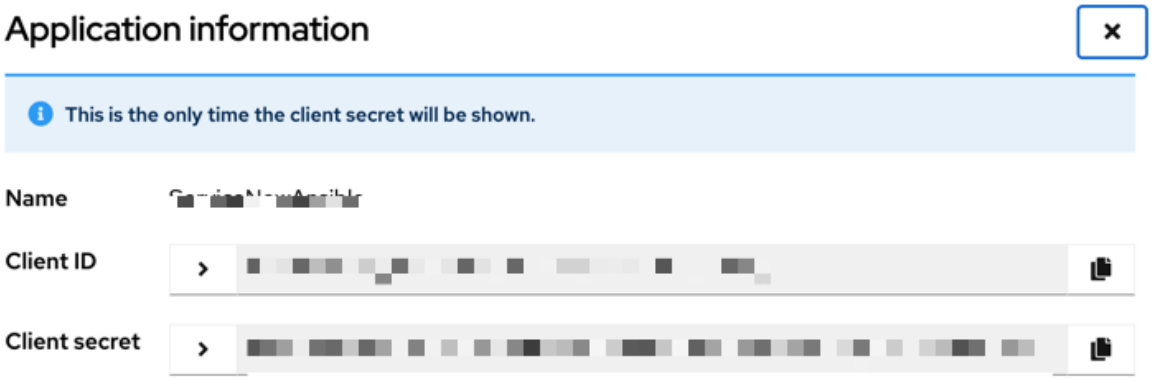
Create a New Application

Field	Description
Name	Unique name of the OAuth application.
Description	Description of the application. This field is optional.
Organization	Organization the OAuth application is associated with.
Authorization grant type	The basis of the OAuth application granting access to the client. The basis could be an authorization code given to the client or a resource-owner password.
Redirect URIs	Redirect the URI to the client after access is granted. Enter the redirect URI in the format `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.

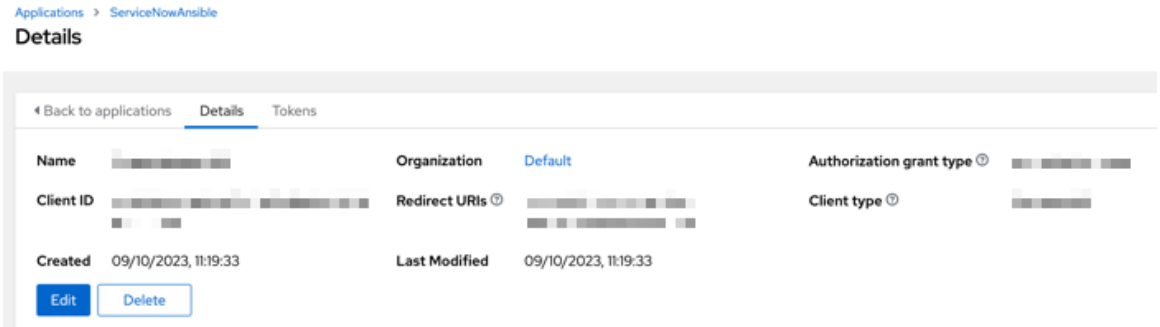
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client type	Type of client that requests authentication from the OAuth application.

5. Select **Save**.
6. Copy the Client ID and Client Secret and store them at a secure place.



You've created the OAuth application.



Set up the Ansible spoke connection record

Create the connection record that contains the information that enables your ServiceNow instance to send an authentication request to the Ansible Tower instance and get an OAuth token.

Before you begin

Role required: admin

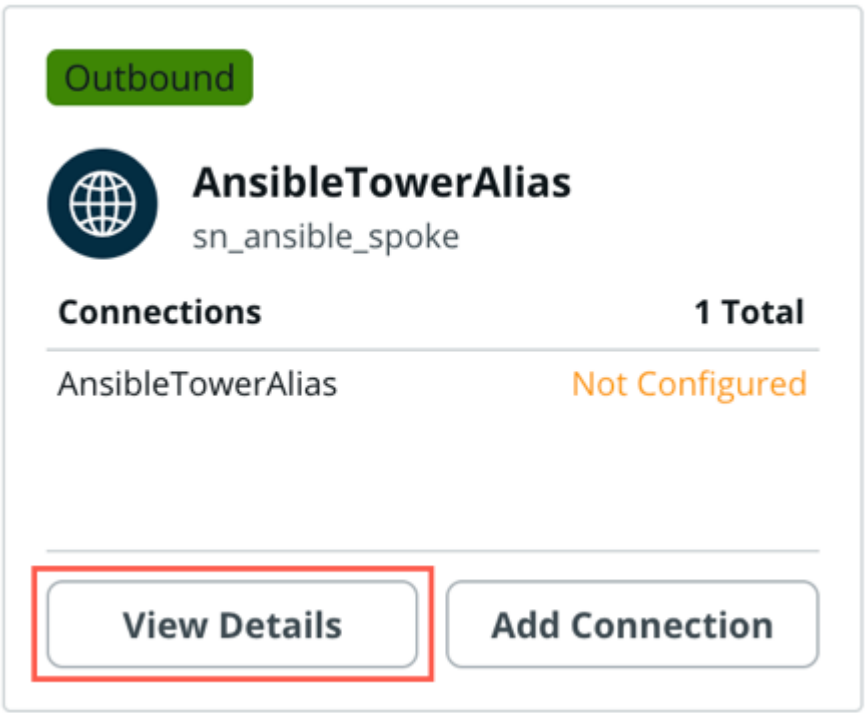
Ensure you have set up an OAuth application on the Ansible Tower instance.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **AnsibleTowerAlias** and click **View Details**.

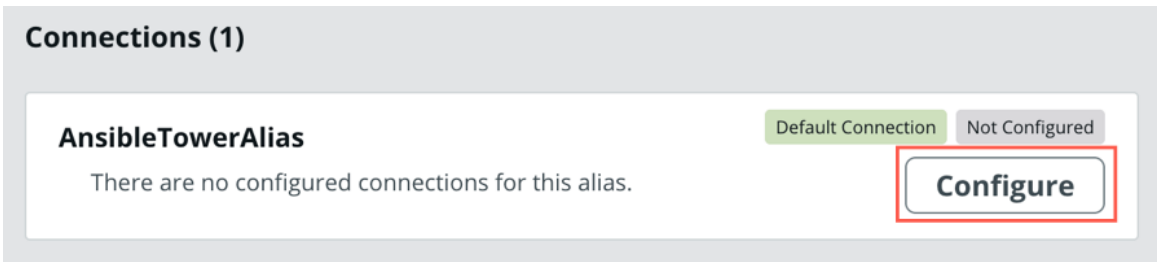
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Ansible spoke, click **View Details**.



- To manage more than one Ansible spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



5. On the form, fill in these fields:

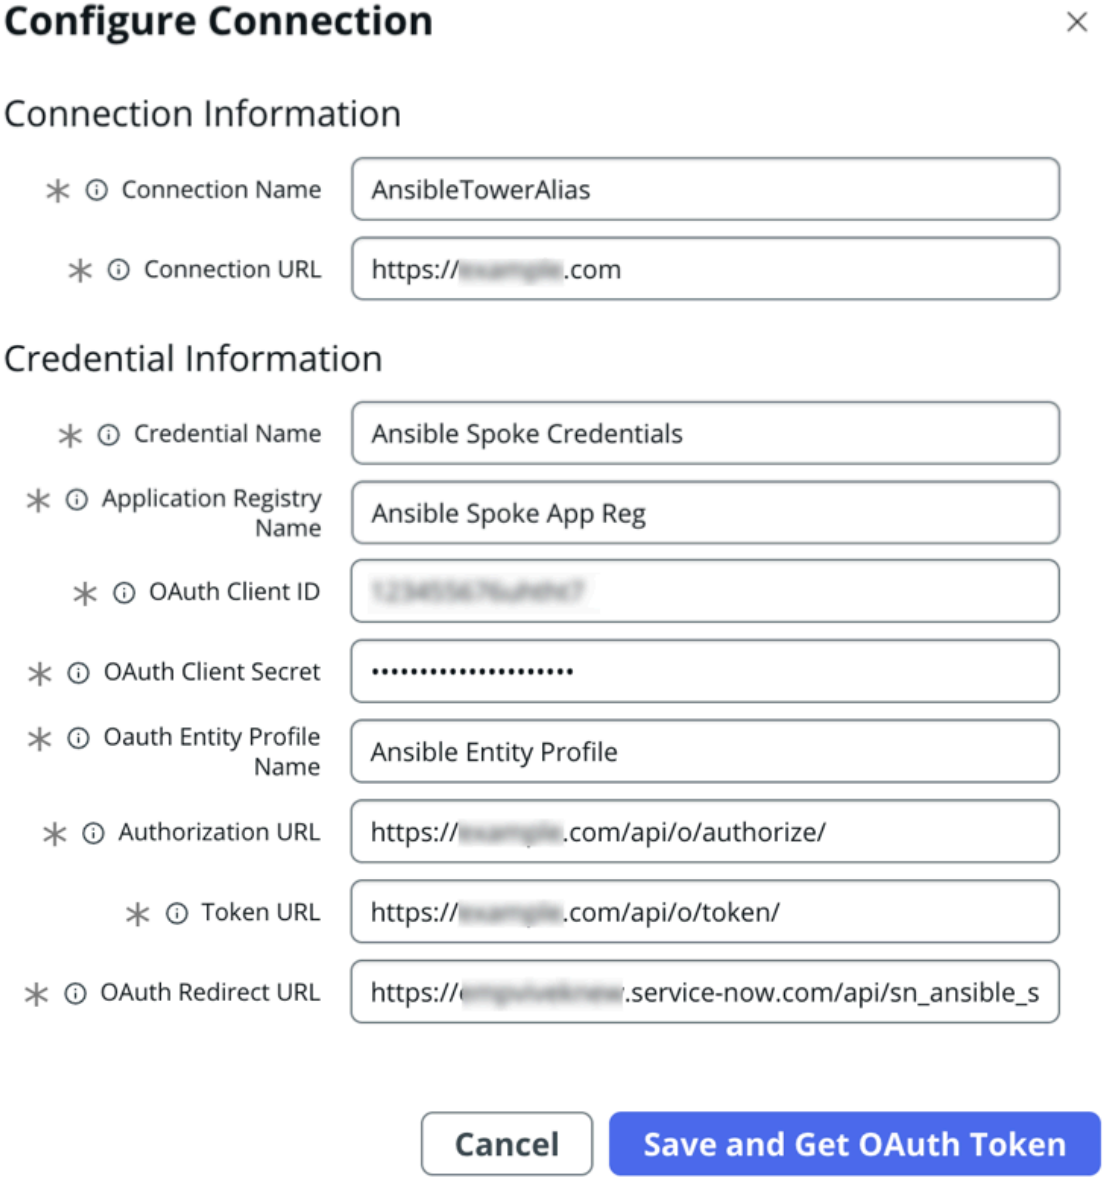
Configure Connection

Field	Description
Connection Name	Name of the connection established with the Ansible Tower instance.
Connection URL	The URL your ServiceNow instance uses to connect to the Ansible Tower instance.
Credential Name	Name to identify the credential record.
Application Registry Name	Name to identify the application registry record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Client ID	The client ID that you had generated while you set up the OAuth application.
OAuth Client Secret	The client secret that you had generated while you set up the OAuth application.
Oauth Entity Profile Name	Name to identify the OAuth application.
Authorization URL	The URL that the client uses to request access to the Ansible Tower instance. The URL format is `https://<ansible-tower-instancename>.com/api/o/authorize`.
Token URL	The URL that the client uses to request a token to access the Ansible Tower instance. The URL format is `https://<ansible-tower-instance-name>.com/api/o/token`.
OAuth Redirect URL	The redirect URL that the OAuth application uses to redirect to your ServiceNow instance. The URL must be in the format `https://<ServiceNow-Instance-Name>.service-now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Save and Get OAuth Token**.
   The OAuth application authenticates the connection request and provides a temporary token to access the Ansible Tower instance.

Asana Spoke

The Asana spoke provides actions to view and analyze meaningful usage data for Asana software subscriptions based on stories created by the user. Use this data to determine which licenses are stale so that you can reclaim these licenses and realize potential savings.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Asana spoke v1.0.2 is the latest version. For version history of the spoke, see Asana Spoke release notes.

Spoke requirements

Asana account with an Admin role.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream Inputs (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses if used outside the spoke implementation.

Spoke actions

The Asana spoke provides actions to automate Asana tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Workspace Management	Look up Workspaces	Retrieves details of all workspaces.
	Get Workspaces (metadata)	Retrieves the list of the workspaces for the user. This action is used to create dynamic choices for the input **Workspace** in other spoke actions.
Task Management	Look up Workspaces Tasks	Retrieves list of all workspace tasks.
	Look up Stories Stream	Retrieves details of the stories.
User Management	Look up Users Stream	Retrieves details of all users.
	Remove User from Workspace	Removes a user from a workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Asana spoke

Configure the Asana spoke to integrate your ServiceNow instance with the Asana instance. The integration enables you to set up a flow and, when a trigger occurs, automate actions on the Asana instance. For example, set a trigger that triggers a flow every day at 13:00 to get the meta data about a workspace.

Before you begin

- Request an Integration Hub subscription.
- Activate the Asana spoke.
- Access to the Asana developer's console.
- Role required: admin

Set up an OAuth application

Set up an OAuth application on the Asana developer's console to generate the client ID and secret that you use to set up the Asana spoke connection record later.

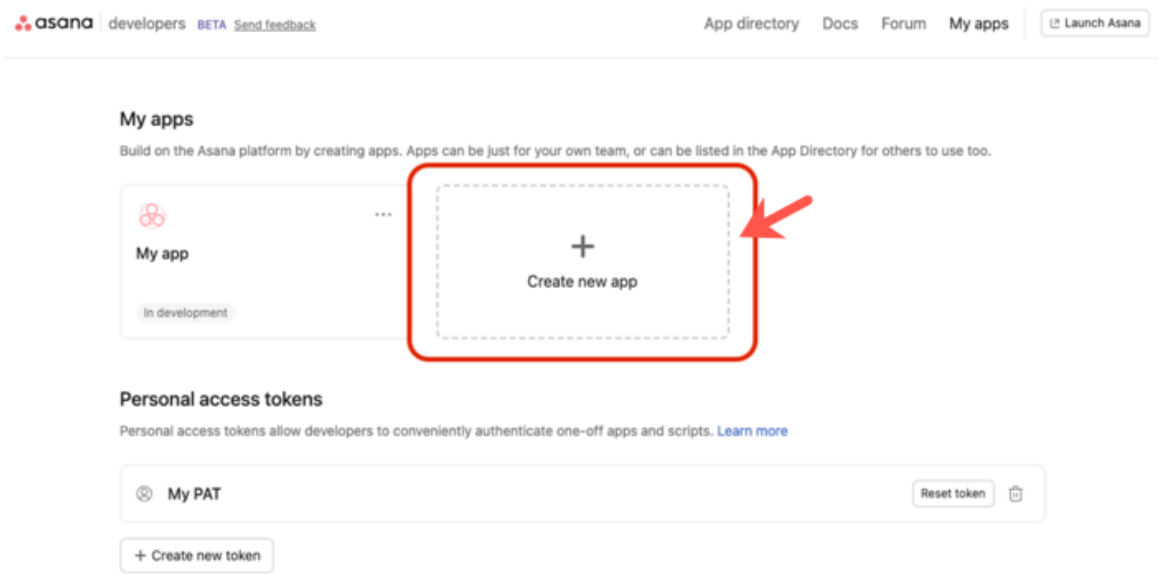
Before you begin

Role required: admin

Access to the Asana developer's console.

Procedure

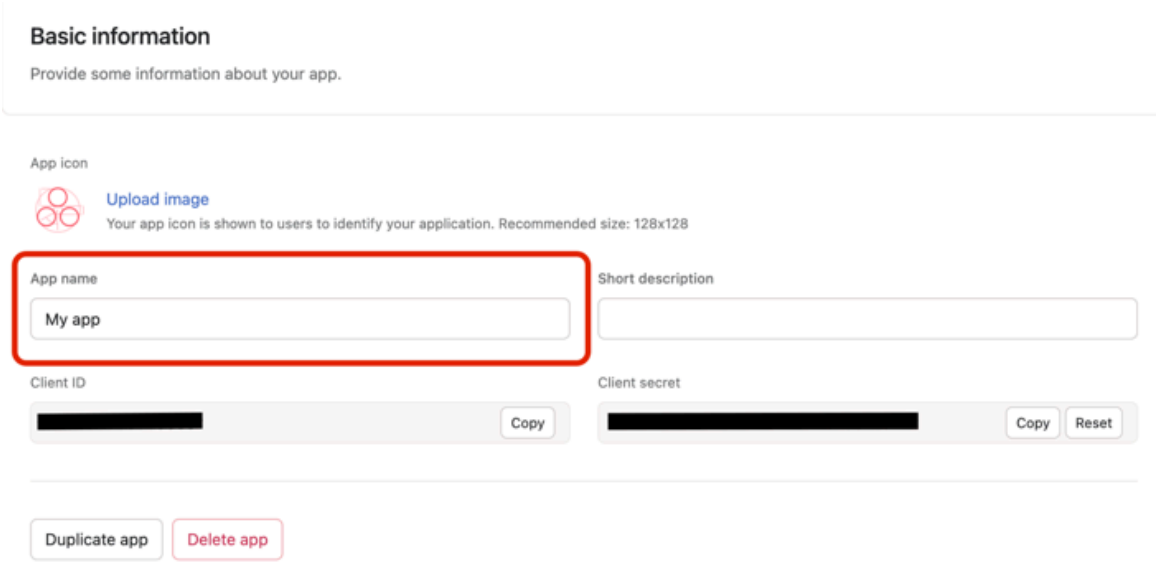
1. Log in to the Asana developer's console.
2. Under My apps, select **Create new app**.



3. Enter a name of the app.

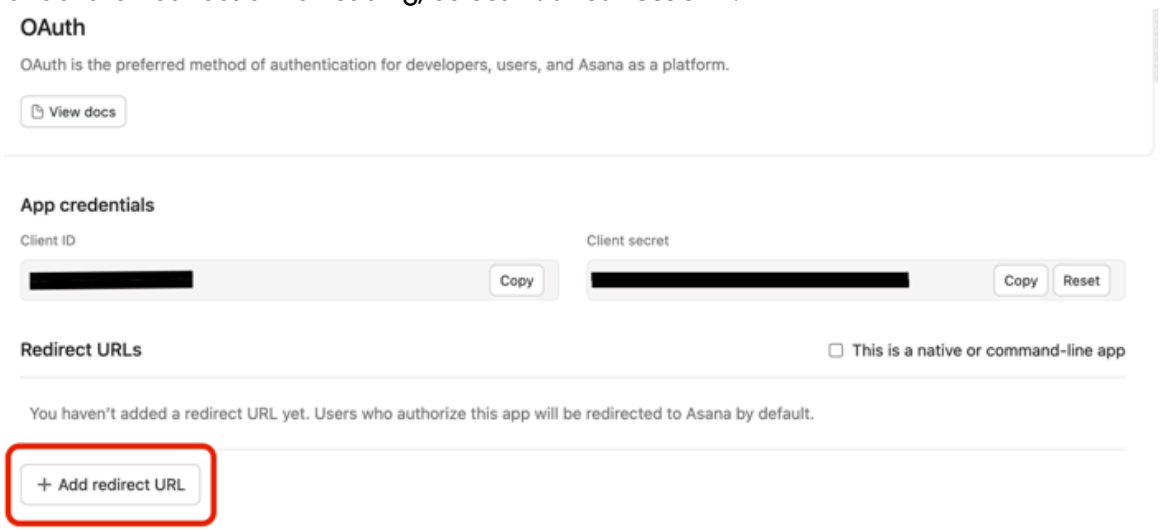
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can change the app name as many times as needed. To change the name, go to the Basic information tab on the left



panel.

4. From the Client ID and Client secret fields, copy the respective values and store them securely.
5. Under the Redirect URLs heading, select **Add redirect URL**.



6. Enter the redirect URL in the format `https://<your instance name>.service-now.com/oauth_redirect.do`.
   You've created the OAuth app and generated the details required to create a connection record for the Asana spoke.

Create a connection record for the Asana spoke

Create a connection record with all the details needed to integrate your ServiceNow instance to the Asana instance. When your ServiceNow instance requests a connection, the OAuth app you had set up authenticates the request based on the details in the connection record.

Before you begin

Role required: admin

Procedure

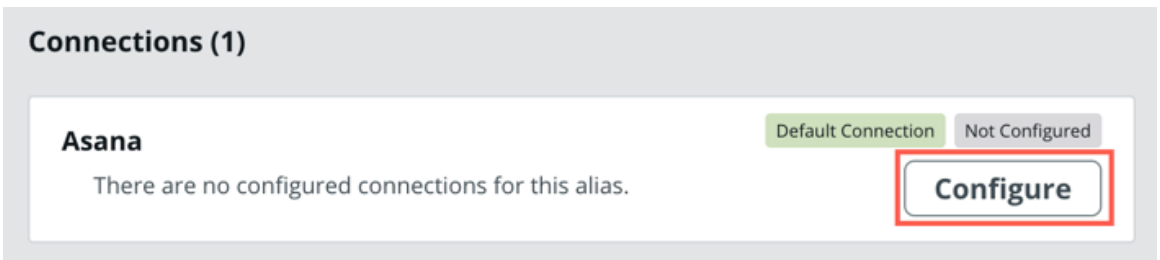
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Asana** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Asana spoke, click **View Details**.

   - To manage more than one Asana spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



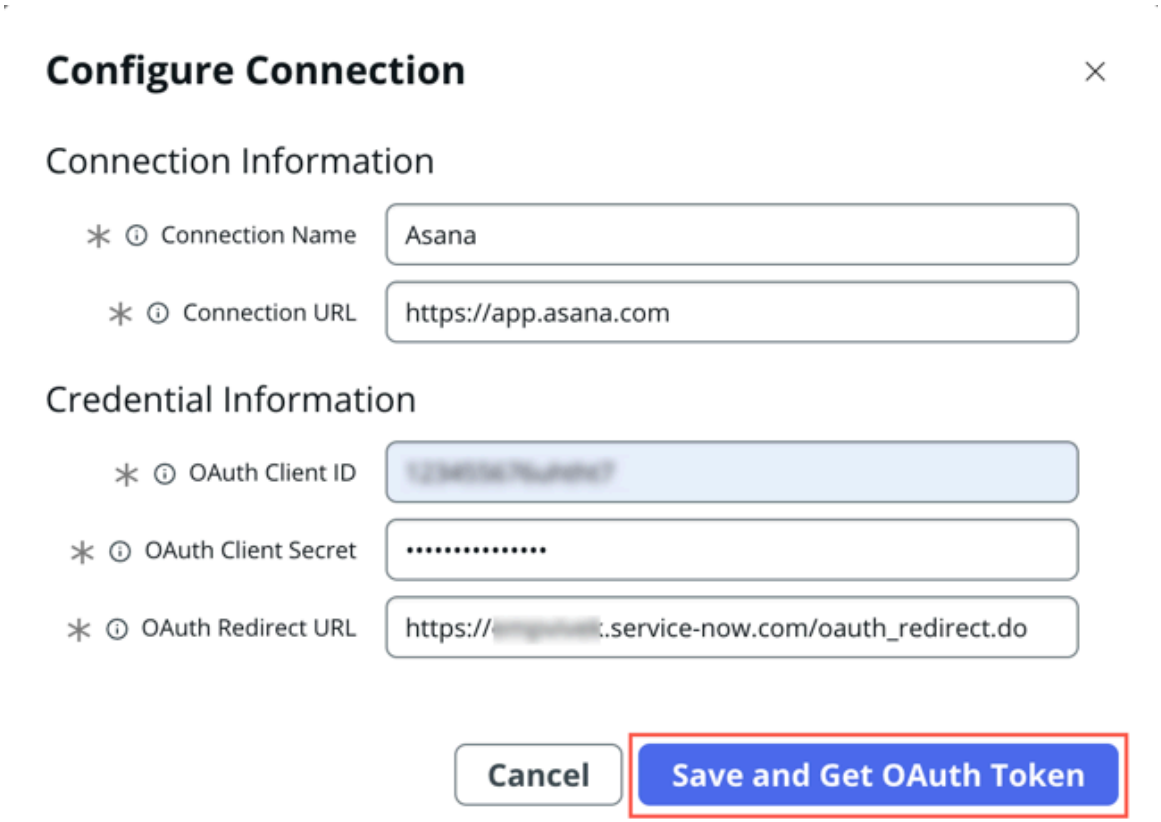
5. On the form, fill in these fields:

Configure Connection

Field	Description
Connection Name	Name of the connection established with the Asana instance. The first connection's default name is automatically assigned to match the name specified in the Connections and Credentials form on the Connection &

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Credential Aliases page. To provide your custom name, create a connection record by selecting **Add Connection**.
Connection URL	The URL your ServiceNow instance uses to connect to the Asana instance.
OAuth Client ID	The client ID that you had generated while you set up the OAuth application.
OAuth Client Secret	The client secret that you had generated while you set up the OAuth application.
OAuth Redirect URL	The redirect URL that the OAuth application uses to redirect to your ServiceNow instance. The URL must be in the format `https://<your instance name>.service-now.com/oauth_redirect.do`.



6. Click **Configure and Get OAuth Token**.
   The OAuth application authenticates the connection request and provides a temporary token to access the Asana instance.

Register an Asana OAuth application

Register the Asana OAuth application to access the Asana API 1.0 and to receive a Client ID and Client secret.

Before you begin

Asana Role required: admin

- The Asana Integration Hub spoke must be active. For more information, see Asana Spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to your Asana account.
2. Select the user's profile icon on the top-right corner.
3. Select **My Settings**.
4. Select the **Apps** tab.
5. Select the **Manage Developers App** link at the bottom to navigate to the developer console window.
6. Select **+ Create new app**.
7. On the **Create new app** page, provide a name for your application.
8. Select the **I agree to API terms and conditions** check box.
9. Select **Create app**.
10. **Optional:** Provide basic information about your application.
11. Select **OAuth** in the left-pane.
12. Copy the Client ID and Client secret for later use.
13. In the **Redirect URLs** field, select **+ Add redirect URL**.
14. Enter `https://<instance>.service-now.com/oauth_redirect.do` where <instance> is the name of your ServiceNow instance.

Atlassian Administration Spoke

The Atlassian Administration spoke provides actions to view and analyze meaningful usage data for Atlassian Administration subscriptions. The spoke downloads subscription information and usage, pulls group details, and removes users from a group.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Atlassian Administration Spoke v1.0.1 is the latest version. For version history of the spoke, see Atlassian Administration Spoke release notes.

Supported versions

This spoke was built for Atlassian Administration v1, but may be compatible with later versions.

Spoke requirements

- Atlassian Administration account
- Atlassian Administration Role required: Organization admin
- API Key to authenticate the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Spoke subflows

The Atlassian Administration spoke provides sample subflows to demonstrate automating Atlassian Administration tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Pull Atlassian Group Details	This subflow retrieves all Group Details from Atlassian Administration such as group product and site details.

Spoke actions

The Atlassian Administration spoke provides actions to automate Atlassian Administration tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Group Management	Look up Organization Groups Stream	Retrieves information about groups, users, and roles assignments.
User Management	Look up Organization Users Stream	Retrieves information about users, groups, and product last access.
	Remove User from Group	Removes given user from a group in the Atlassian Administration instance.

Spoke module

The Atlassian Administration spoke adds the Atlassian Administration application to your instance and includes these modules:

Module	Description
Groups	Contains data related to groups.
Product and Site Details	Contains data related to product and site.
Group Product Site Role Details	Contains data related to site roles for product groups.

Spoke user roles

The Atlassian Administration spoke provides these user roles to control access to data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User role	Description
Atlassian Admin (sn_atlassian_spoke.atlassian_admin)	Creates connections for the Atlassian Administration application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Create an Atlassian Administration API Key

Create an Atlassian Administration API Key to authenticate ServiceNow requests.

Before you begin

Role required: Organization admin

Procedure

1. Log in to Atlassian Administration with your admin credentials.
2. Select your organization if you have more than one.
3. Select **Settings** > **API keys**.
4. Select **Create API key**.
5. On the Create an API key page, provide a name to identify the API key and the expiration date in the **Expires on** field.

   Note: By default, the key expires in one week from the creation date. If you'd like to modify the expiration date, select a new date in the **Expires on** field. You must select a date within one year of the creation date.

6. Select **Create** to save the API key.
7. Copy the values for your Organization ID and API key.

   Note: Save these values to use them later.

8. Select **Done**.
   The key appears in your list of API keys. You can also revoke the API by selecting **Revoke** from the Actions column.

Set up the Atlassian Administration spoke

Integrate the ServiceNow instance and Atlassian Administration by using an API key to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Atlassian Administration spoke.
- Create an Atlassian Administration API key.
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for **Atlassian Administration** alias.
3. From the Related Links section, select **Create New Connection & Credential**.
4. On the form, fill in the fields.

Create Connection and Credential

Field	Description
Connection information	
Name	Name of the Atlassian Administration connection.
Connection URL	URL for the connection. This field is automatically set to `https://api.atlassian.com`.
Organization ID	Atlassian Administration Organization ID that you find while creating an Atlassian Administration API Key.
Credential information	
API Key	The API Key that you find while creating an Atlassian Administration API Key.

5. Select **Create**.

Automation Anywhere Spoke

Manage workflows and robotics processes in Automation Anywhere instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Automation Anywhere spoke v1.3.0 is the latest version. For version history of the spoke, see Automation Anywhere spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Complex Object (com.glide.cobject)
- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Automation Anywhere spoke provides actions to automate Automation Anywhere tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Bot Management	Deploy Bot	Deploys a bot in the bot runner devices.
	Get Bot	Retrieves details of the specific bot.
	Look up Bots	Retrieves information about all the bots.
Device Management	Get Device Details	Retrieves details of the specific device.
	Look up Devices	Retrieves details of all the devices.
	Look up Pool	Retrieves details of the specified pool.
Folder Management	Get Folder	Retrieves details of the requested folder.
	Look up Folders	Retrieves information about all the folders.
Queue Management	Look up Queues Stream	Retrieves all queues for the Enterprise Control Room.
	Look up Work Items in Queue	Retrieves details of all the work items in a queue.
User Management	Look up User	Retrieves details of the requested user.
	Look up Users Stream	Retrieves details of all the users.

Note: Only users with bot runner or admin role can execute the spoke actions.

Spoke module

The Automation Anywhere spoke adds the Automation Anywhere application to your instance and includes the Authentication module. In this module, you should provide details in the default credential record to authentication the ServiceNow requests. See Create a Credential record for the Automation Anywhere spoke for more information.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Set up the Automation Anywhere spoke.

Set up the Automation Anywhere spoke

Integrate ServiceNow and Automation Anywhere instances by using the Automation Anywhere credential record to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Automation Anywhere spoke.
- Role required: admin.

Create a Credential record for the Automation Anywhere spoke

Create a credential record for the Automation Anywhere instance. The Automation Anywhere spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Automation Anywhere** > **Authentications**.
2. Open the record, **Automation Anywhere Credential**.
3. On the form, fill these values.

Field	Description
Name	Default name of the credential record. **Note:** Users are cautioned against modifying the default credential name.
User Name	Credentials to log in to your Automation Anywhere instance.
Password	
Credential alias	Default credential alias available along with the Automation Anywhere spoke. For example, select **sn_autoanywher_spk.Automation_Anywhere**.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Automation Anywhere**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.
Connection URL	URL to connect to your Automation Anywhere instance.
Dedicated Integration User	Option to specify if you are using a dedicated user for the purpose of integrating Automation Anywhere and ServiceNow instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ The dedicated user mentioned here, should be used only for the purpose of integrating Automation Anywhere with ServiceNow. ○ If you aren't using a dedicate user, the ServiceNow instance makes 2 or 3 API calls to execute an action. ○ If you are using a dedicated user, the ServiceNow instance makes only one API call to execute an action.

4. Right-click the form header and click **Save**.
5. Click **Get Token**.

   Note: This step is applicable when you select the **Dedicated Integration User** check box.

   The confirmation message, `Token retrieval successful` is displayed.

AWS Certificate Manager Spoke

Manage certificates in AWS Certificate Manager account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS Certificate Manager spoke v1.0.1 is the latest version. For version history of the spoke, see AWS Certificate Manager spoke release notes.

Supported versions

This spoke was built for AWS Certificate Manager API version 2015-12-08, but may be compatible with later versions.

Spoke requirements

- User with full access to AWS Certificate Manager.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS Certificate Manager spoke provides actions to automate AWS Certificate Manager tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Certificate Management	Delete Certificate	Deletes a certificate and its associated private key.
	Get Certificate	Retrieves an Amazon-issued certificate and its certificate chain.
	Get Certificate Details	Retrieves detailed metadata about the specified ACM certificate.
	Import Certificate	Imports a certificate to AWS Certificate Manager (ACM) to use with services that are integrated with ACM.
	Look up Certificates	Retrieves a list of certificate ARNs and domain names.
	Request Certificate	Requests an ACM certificate for use with other AWS services.
	Resend Validation Email	Resends the email that requests domain ownership validation.
	Update Certificate Option	Updates details of the specified certificate.
Tag Management	Add Tags To Certificate	Associates a set of tags with the required certificate.
	Look up Tags For Certificate	Retrieves all tags that are associated with the specified certificate.
	Remove Tags From Certificate	Removes the association of tags from certificate.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Certificate Manager spoke.

Set up the AWS Certificate Manager spoke

Integrate the ServiceNow instance and AWS Certificate Manager by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS Certificate Manager spoke.
- Role required: admin.

Create a credential record for the AWS Certificate Manager spoke

Create a credential record for the AWS Certificate Manager account. The AWS Certificate Manager spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Cred.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS Certificate Manager.
Secret Access Key	Secret Access Key of the user with full access to AWS Certificate Manager.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS Certificate Manager**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.
Credential alias	Credential alias associated with the spoke.

5. Click **Save**.
   The AWS Certificate Manager spoke is set up and you can start using the spoke actions in your flows.

AWS CloudFormation Spoke

Model and provision AWS resources in your cloud environment using AWS CloudFormation from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for AWS CloudFormation API version 2010-05-15, but may be compatible with later versions.

Spoke version

AWS CloudFormation spoke v1.1.4 is the latest version. For version history of the spoke, see AWS CloudFormation spoke release notes.

Spoke requirements

- User with full access to AWS CloudFormation.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS CloudFormation spoke provides actions to automate AWS CloudFormation tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Change Set Management	Create Change Set	Creates a list of changes that will be applied to a stack so that you can review the changes before executing them.
	Delete Change Set	Deletes the specified change set.
	Execute Change Set	Updates the stack using the input information that was provided when the specified change set was created.
	Get Change Set	Returns the details of the specified change set.
	Look up Change Sets	Returns basic information of each active change set for a stack.
Stack Management	Cancel Update Stack	Cancels an update on the specified stack.
	Continue Update Rollback	For the specified stack that is in the UPDATE_ROLLBACK_FAILED state, continues rolling the state back to the UPDATE_ROLLBACK_COMPLETE state.
	Create Stack	Creates a stack as specified in the template.
	Delete Stack	Deletes the specified stack.
	Get Stack Policy	Returns the stack policy for a specified stack.
	Get Template	Returns the template body for a specified stack.
	Look up Stack Events	Returns all stack related events for a specified stack in reverse chronological order.
	Look up Stack Set Operation Stream	Returns the summary of information for the operations performed on a stack set.
	Look up Stack Set Operation Result Stream	Returns the summary of information for the results of a stack set operation.
	Look up Stack Resources	Returns details of all resources of the specified stack.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Stacks	Returns the details for the specified stack.
	Set Stack Policy	Sets policy for the specified stack.
	Update Stack	Updates the specified stack.
	Validate Template	Validates a specified template. AWS CloudFormation initially verifies if the template is a valid JSON. If it is not a valid JSON, AWS CloudFormation verifies if the template is a valid YAML. If both these checks fail, AWS CloudFormation returns a template validation error.
Stack Set Management	Create Stack Instance	Creates stack instances for the specified accounts, within the specified regions.
	Create Stack Set	Creates Stack set in the specified region.
	Delete Stack Instance	Deletes stack instances for the specified accounts, in the specified regions.
	Delete Stack Set	Deletes the specified Stack set.
	Get Stack Set	Returns the details of the specified stack set.
	Look up Stack Instances	Returns information about stack instances that are associated with the specified stack set.
	Look up Stack Sets	Returns summary information about all the stack sets or the stack sets with the specified Status.
	Update Stack Set	Updates the specified stack set and associated stack instances in the specified accounts and Regions.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS CloudFormation spoke.

Set up the AWS CloudFormation spoke

Integrate the ServiceNow instance and AWS CloudFormation using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS CloudFormation spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Credential record for the AWS CloudFormation spoke

Create Credential record for your AWS CloudFormation account. The AWS CloudFormation spoke connection and credential alias uses this credential to perform actions in AWS CloudFormation.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Amazon VPC**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `CloudFormation Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS CloudFormation.
Secret Access Key	Secret Access Key of the user with full access to AWS CloudFormation.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS_CloudFormation**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record the AWS CloudFormation spoke is created.

AWS Elastic Beanstalk Spoke

AWS Elastic Beanstalk enables you to quickly deploy and manage applications in the Amazon AWS Cloud. Elastic Beanstalk reduces management complexity without restricting choice or control. When you upload your application, Elastic Beanstalk automatically handles capacity provisioning, load balancing, scaling, and application health monitoring.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS Elastic Beanstalk spoke v1.0.3 is the latest version. For version history of the spoke, see AWS Elastic Beanstalk spoke release notes.

Supported versions

AWS Elastic Beanstalk API version 2010-12-01.

Spoke subflows

There are no subflows provided with the AWS Elastic Beanstalk spoke.

Spoke actions

The AWS Elastic Beanstalk spoke provides actions to perform Elastic Beanstalk tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Account Management	Look Up Account Attributes	Retrieves attributes related to AWS Elastic Beanstalk that is associated with the calling AWS account.
Application Management	Check DNS Availability	Checks if the specified CNAME is available.
	Create application	Creates an application that has one configuration template name default and no application versions.
	Create Application Version	Creates an application version for the specified application.
	Create Configuration Template	Creates an AWS Elastic Beanstalk configuration template, associated with a specific Elastic Beanstalk application.
	Delete Application	Deletes the specified application along with all associated versions and configurations.
	Delete Application Version	Deletes the specified version from the specified application.
	Delete Configuration Template	Deletes the specified application along with all associated versions and configurations.
	Look Up Application Versions	Retrieves the descriptions of existing applications.
	Look up Applications	Retrieves the descriptions of existing applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Application	Updates the specified application to have the specified properties.
	Update Application Version	Updates the specified application version to have the specified properties.
	Update Configuration Template	Updates the specified configuration template to have the specified properties or configuration option values.
Environment Management	Create Environment	Launches an AWS Elastic Beanstalk environment for the specified application.
	Create Storage Location	Creates a bucket in Amazon S3 to store application versions, logs, and other files used by Elastic Beanstalk environments.
	Get Environment Health	Lists the overall health information of the specified environment.
	Look up Available Solution Stacks	Lists the available solution stack names.
	Look up Environment Resources	Lists AWS resources for the specified environment.
	Look up Environments	Retrieves the information about the existing environments.
	Look Up Instances Health	Retrieves the descriptions of existing applications.
	Restart App Server	Restarts the application container server running on each Amazon EC2 instance in the environment.
	Swap Environment CNAMEs	Swaps the CNAMEs of two environments.
	Terminate Environment	Terminates the specified environment.
	Update Environment	Updates the specified environment.

AWS Elastic Beanstalk account requirements

The AWS Elastic Beanstalk spoke requires a credential that you create in the Amazon Web Services Management Console.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about setting up the spoke, see Create a credential record for the AWS Elastic Beanstalk spoke.

Set up the AWS Elastic Beanstalk spoke

Create a credential record to integrate AWS Elastic Beanstalk with ServiceNow.

Before you begin

Role required: admin

Create an access key

Create an access key in Amazon Web Services to authorize actions.

Before you begin

Role required: admin

Procedure

1. Log in to AWS Management Console.
2. From the menu under your user name, select **My Security Credentials**.
3. Click **Create access key**.
4. Copy the access key ID and the secret access key to a text file.
   You can only show the secret access key once, but you can delete and create keys if necessary. For more information, see Create new access keys for an IAM user in AWS documentation.

Create a credential record for the AWS Elastic Beanstalk spoke

Create a credential record to integrate AWS Elastic Beanstalk with ServiceNow. The AWS Elastic Beanstalk connection and credential aliases use these credentials to authorize actions. Once connected, Elastic Beanstalk uses basic authentication to authenticate ServiceNow requests.

Before you begin

To set up the AWS Elastic Beanstalk spoke, you must be able to configure security credentials in Amazon Web Services and have a ServiceNow admin role.

- Request an Integration Hub subscription.
- Activate the AWS Elastic Beanstalk spoke spoke.
- Role required: admin.

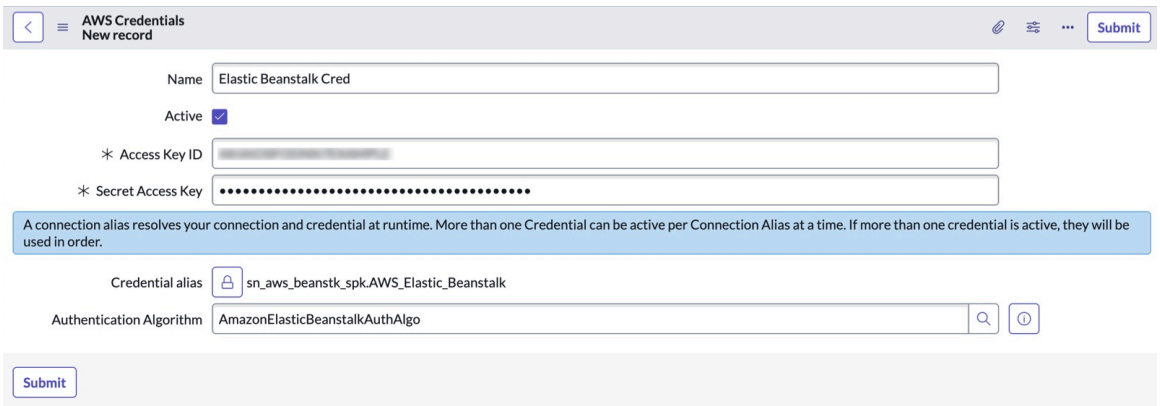
Procedure

1. Navigate to **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record **AWS_Elastic_Beanstalk**.
3. In the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Description
Name	Name to identify the credential record. For example, `Elastic Beanstalk Cred`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Access Key ID	Access key ID you created in AWS Management Console. For more information, see Create an access key.
Secret Access Key	Secret access key you created in AWS Management Console. For more information, see Create an access key.
Authentication Algorithm	Select **AmazonElasticBeanstalkAuthAlgo**.



6. Click **Submit**.

Result

The AWS Elastic Beanstalk spoke is set up and integrated with the ServiceNow instance.

AWS Elastic Load Balancing Spoke

Manage load balancers, tags, and target groups in AWS account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS Elastic Load Balancing spoke v1.0.1 is the latest version. For version history of the spoke, see AWS Elastic Load Balancing spoke release notes.

Supported versions

This spoke was built for AWS Elastic Load Balancing API version 2012-06-01.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- User with full access to AWS Elastic Load Balancing.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS Elastic Load Balancing spoke provides actions to automate AWS Elastic Load Balancing tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Elastic Load Balancer Management	Create Load Balancer	Creates an application load balancer or network load balancer.
	Create Load Balancer Listener	Creates a listener for the specified application load balancer or network load balancer.
	Delete Load Balancer	Deletes the specified application load balancer or network load balancer.
	Delete Load Balancer Listener	Deletes the specified listener.
	Get Account Limits	Lists the Elastic Load Balancing resource limits for the AWS account.
	Get Load Balancer Attributes	Lists the attributes for the specified application load balancer or network load balancer.
	Look up Listeners	Retrieves list of the specified listeners for the specified application load balancer or network load balancer.
	Look up Load Balancers	Retrieves list of the specified load balancers or all the load balancers.
	Look up SSL Policies	Lists all policies used for SSL negotiation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Load Balancer Attributes	Updates the specified attributes of the specified application load balancer or network load balancer.
Tag Management	Add Tags	Adds the specified tags to the specified Elastic Load Balancing resource.
	Delete Tags	Removes the specified tags from the specified Elastic Load Balancing resource.
	Look up Tags	Retrieves list of the tags for the specified resources.
Target Group Management	Create Target Group	Creates a target group.
	Deregister Target	Deregisters the specified targets from the specified target group.
	Get Target Group Attributes	Lists the attributes for the specified target group.
	Get Target Health	Lists the health of the targets.
	Look up Target Groups	Retrieves details of the specified target groups or all of your target groups.
	Register Target	Registers the specified targets with the specified target group.
	Update Target Group	Updates the health checks used for evaluating the health state of the targets in the specified target group.
	Update Target Group Attribute	Updates the specified attributes of the specified target group.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Elastic Load Balancing spoke.

Set up the AWS Elastic Load Balancing spoke

Integrate the ServiceNow instance and AWS Elastic Load Balancing account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS Elastic Load Balancing spoke.
- Role required: admin.

Create Credential record for the AWS Elastic Load Balancing spoke

Create credential record for the AWS Elastic Load Balancing account. The AWS Elastic Load Balancing spoke connection and credential alias uses these credentials to authorize actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **AWS_Elastic_Load_Balancing**.
3. In the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Elastic Load Balancing Cred`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS Elastic Load Balancing.
Secret Access Key	Secret Access Key of the user with full access to AWS Elastic Load Balancing.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonElasticLoadBalancingAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Right-click the form header and click **Submit**.

AWS IAM Spoke

Integrate ServiceNow instance with AWS IAM to manage access to AWS services and resources securely. Manage groups, policies, and roles in AWS IAM from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes .

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview .

Spoke version

AWS IAM spoke v1.2.0 is the latest version. For version history of the spoke, see AWS IAM spoke release notes .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported version

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to IAM.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see AWS Identity and Access Management Documentation site.

Spoke subflows

The Jenkins spoke provides sample subflows to demonstrate automating AWS IAM tasks. Available subflows are:

Subflow	Description
Delete Group	Deletes the specified AWS IAM group.
Delete User	Deletes the specified AWS IAM user.
Delete Policy	Deletes the specified policy from the AWS IAM account.

Spoke actions

The AWS IAM spoke provides actions to automate AWS IAM tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Group Management	Add User to Group	Adds user to a group in AWS IAM.
	Create Group	Creates a group in AWS IAM.
	Delete Group	Deletes a group in AWS IAM.
	Look up Group	Searches for the required group in AWS IAM.
	Look up Group Users	Lists all the users in the required group.
	Remove User from Group	Removes a user from a group in AWS IAM.
Group Policy Management	Attach Inline Policy in Group	Adds or updates an inline policy document embedded in the specified IAM group.
	Attach Policy to Group	Attaches the specified managed policy to the required IAM group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Detach Inline Policy from Group	Deletes the specified inline policy from the specified AWS IAM group
	Detach Policy from Group	Detaches the specified managed policy from the required IAM group.
	Look up Attached Group Policies	Retrieves the list of all policies attached to the IAM group.
	Look up Group Policies	Retrieves all the inline policies of the specified group. If none exists, the operation returns an empty list
Policy Management	Create Policy	Creates managed policy in the specified IAM group.
	Delete Policy	Deletes specified Policy from AWS IAM.
	Detach Policy from Roles	Detaches the specified managed policy from the specified IAM Role.
	Look up Entities for Policy	Lists all entities (Users, Group, and Roles) attached to this policy.
User Management	Create User	Creates a user in AWS IAM.
	Deactivate MFA Device	Deactivates the required MFA device attached to a user.
	Delete Access Key for User	Deletes the access key of the AWS IAM user.
	Delete Login Profile	Deletes the password for the specified IAM user, which terminates the user's ability to access AWS services through the AWS Management Console.
	Delete Service Specific Credential	Deletes the required service-specific credential.
	Delete Signing Certificate	Deletes a signing certificate associated with the specified IAM user.
	Delete SSH Public Key	Deletes the specified SSH public key.
	Delete User	Deletes the required IAM User.
	Delete Virtual MFA Device by User	Deletes the specified Virtual MFA device.
	Detach Policy from User	Detaches the specified managed policy from the specified IAM role.
	Look up User	Searches for the required user in the AWS IAM.
	Look up Access Keys by User	Lists the access key of the AWS IAM user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Groups for User	Retrieves the list of all the groups, a particular user belongs to.
	Look up Inline User Policies	Retrieves all the inline policies of the specified IAM user. If none exists, the operation returns an empty list.
	Look up MFA Devices by User	Retrieves information about the MFA services associated with the specified IAM user. If none exists, the operation returns an empty list.
	Look up Service Specific Credentials	Retrieves information about the service-specific credentials associated with the specified IAM user.
	Look up Signing Certificates by User	Retrieves information about the signing certificates associated with the specified IAM user. If none exists, the operation returns an empty list.
	Look up SSH Public Keys by User	Retrieves information about the SSH public keys associated with the specified IAM user. If none exists, the operation returns an empty list.
User Policy Management	Attach Policy to User	Attaches the specified managed policy to the specified user.
	Delete Inline User Policy	Deletes an inline policy attached to the user.
	Look up Attached User Policies	Retrieves all the attached policies of the user.
Role Management	Look up Roles	Retrieves list of all roles.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS IAM spoke.

Set up the AWS IAM spoke

Integrate the ServiceNow instance and AWS IAM using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS IAM spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Credential record for the AWS IAM spoke

Create Credential record for your AWS IAM account. The AWS IAM spoke connection and credential alias uses this credential to perform actions on AWS IAM.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **AWS IAM**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `AWS Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to IAM.
Secret Access Key	Secret Access Key of the user with full access to IAM.
Credential alias	Associated credential record.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS IAM Auth Algo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result
The credential record the AWS IAM spoke is created.

AWS Lambda Spoke

Manage alias and function in AWS Lambda from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

AWS Lambda spoke v1.1.3 is the latest version. For version history of the spoke, see AWS Lambda spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- AWS IAM Spoke (sn_aws_iam_spoke)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Lambda.

  Note: The AWSLambdaFullAccess IAM policy must be assigned to the user. See Identity-based IAM policies for AWS Lambda for more information about the IAM policy.

- Access Key ID and Secret Access Key of the user as obtained in the IAM Console. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The AWS Lambda spoke provides actions to automate AWS Lambda tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Alias Management	Create Function Alias	Creates an alias for the specified function.
	Delete Function Alias	Deletes the specified alias of the function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Function Alias Details	Retrieves the details of the specified function alias.
	List Function Aliases	Retrieves the list of all aliases for the specified function.
	Update Function Alias	Updates settings of the specified alias.
Function Management	Add Permission	Grants an AWS service or another account permission to use the specified AWS Lambda function.
	Create Function	Creates a function in AWS Lambda.
	Delete Function	Deletes the specified AWS Lambda function or function version.
	Get Function Details	Retrieves details of the specified AWS Lambda function or function version.
	Invoke Function	Invokes the specified AWS Lambda function.
	List Functions	Retrieves list of all AWS Lambda functions in a region
	Update Function Code	Updates code of the specified AWS Lambda function.
	Update Function Configuration	Updates configuration of the specified AWS Lambda function.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Lambda spoke.

Set up the AWS Lambda spoke

Integrate the ServiceNow instance and AWS Lambda account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS IAM Spoke.
- Activate the AWS Lambda spoke.
- Role required: admin.

Create a credential record for the AWS Lambda spoke

Create a credential record for your AWS Lambda account. The AWS Lambda spoke connection and credential alias uses this credential to perform actions on AWS Lambda.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **AWS_Lambda**.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Lambda Credentials`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS Lambda.
Secret Access Key	Secret Access Key of the user with full access to AWS Lambda.
Credential alias	Associated credential records of the AWS IAM spoke and AWS Lambda spoke. Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AWS IAM Auth Algo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

Result

The credential record the AWS Lambda spoke is created.

AWS OpsWorks Spoke

Manage elastic load balancers, instances, relational database services, and others in AWS OpsWorks account from the ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for AWS OpsWorks API version 2013-02-18, but may be compatible with later versions.

Spoke requirements

- User with full access to AWS OpsWorks
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke version

AWS OpsWorks spoke v1.0.2 is the latest version. For version history of the spoke, see AWS OpsWorks spoke release notes.

Spoke actions

The AWS OpsWorks spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Elastic Load Balancer Management	Attach Elastic Load Balancer	Attaches an Elastic Load Balancer to a specified layer.
	Detach Elastic Load Balancer	Detaches a specified Elastic Load Balancing instance from its layer.
	Look up Elastic Load Balancers	Retrieves information about Elastic Load Balancers of the specified stack ID.
Instance Management	Create Instance	Creates an instance in the specified stack.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Instance	Deletes the specified instance.
	Look up Instances	Retrieves the list of instances for the specified stack ID.
	Start Instance	Starts the specified instance.
	Start Stack Instances	Starts instances of the specified stack.
	Stop Instance	Stops the specified instance.
	Stop Stack Instances	Stops instances of the specified stack.
Relational Database Service Management	Deregister RDS DB Instance	Deregisters an Amazon RDS instance.
	Look up RDS DB Instances	Retrieves the list of Amazon RDS instances.
	Register RDS DB Instance	Registers an Amazon RDS instance with a stack.
Stack Management	Delete App	Deletes a specified app.
	Delete Layer	Deletes the specified layer.
	Get Stack Summary	Retrieves information of the specified stack ID.
	Get User Profile	Retrieves information about the user profile.
	Look up Apps	Retrieves information about the apps in the specified stack ID.
	Look up Deployments	Retrieves information about the deployments in the specified stack ID.
	Look up Layers	Retrieves list of the layers in the specified stack ID.
	Look up Permissions	Retrieves information about the permissions for the specified stack ID or IAM user.
	Look up Stacks	Retrieves list of information of the specified stack ID.
Tag Management	Add Tags	Adds tags for the specified resource.
	Delete Tags	Deletes tags of the specified resource.
	Look up Tags	Retrieves list of tags for the specified resource.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS OpsWorks spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the AWS OpsWorks spoke

Integrate the ServiceNow instance and AWS OpsWorks account by using the AWS credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS OpsWorks spoke.
- Role required: admin.

Create a credential record for the AWS OpsWorks spoke

Create a credential record for the AWS OpsWorks account. The AWS OpsWorks spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **AWS Credentials**.
4. On the form, fill these values.

AWS Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, `AWS OpsWork Credential`.
Active	Option to actively use the credential record.
Access Key ID	Access Key ID of the user with full access to AWS OpsWorks.
Secret Access Key	Secret Access Key of the user with full access to AWS OpsWorks.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **AmazonOpsWorkAuthAlgo**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.
Credential alias	Credential alias associated with the AWS OpsWorks spoke.

5. Right-click the form header and click **Submit**.

AWS Translate Spoke

Integrate your ServiceNow instance with AWS Translate to detect languages in the text and translate text to the required language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

AWS Translate Spoke v1.0.3 is the latest version. For version history of the spoke, see AWS Translate Spoke release notes.

Supported version

This spoke was built for AWS Translate API version 2017-07-01 and AWS Comprehend version 2017-11-27, but may be compatible with later versions.

Note:

- If you use different API version, ensure that you change the API version in all spoke actions.
- The current version of the AWS Translate spoke is not compatible with dynamic translation.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke requirements

- User with full access to AWS Translate.
- Access Key ID and Secret Access Key of the user. Record these values for later use. For more information, see Create an access key.

For more information about creating user and providing the required access, see AWS Identity and Access Management Documentation site.

Spoke flow

The AWS Translate spoke provides a sample flow, Translate Short Description when Incident is Created to demonstrate translating the short description to Spanish when an incident is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

created. You can customize the sample flow as per your requirement by creating a copy of it in the required scope.

Spoke actions

The AWS Translate spoke provides actions to automate translating tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Language Management	Detect Dominant Language	Detects the language of text using AWS Comprehend service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: Provide the text for which you want to detect the dominant language in the action input **Text**. The output is a JSON string that contains an array of the detected languages. One of the elements in the array is **Score**. This is a decimal number and its value is between 0 and 1.  When the action is executed, the Languages Detected action output may not display any runtime value. However, the output data pill still holds the response data and can be used in the subsequent actions in the flow or subflow. Translate Management	Translate Text	Translates text from the source language to the target language using AWS Translate service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: • For **Source Language** and **Target Language**, input values can't be selected until a valid input value is provided for **Region**. • If you select **Auto** from the **Source Language** list, the AWS Translate API uses the AWS Comprehend service to automatically detect the language. In this case, you must provide the region that supports Amazon Comprehend. Else, the request returns an error indicating the auto-detect is not supported.

Note: The actions have **Region** as an input. To retrieve the list of available regions, use the List Regions action from the Amazon EC2 Spoke.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the AWS Translate spoke.

Set up the AWS Translate spoke

Integrate the ServiceNow instance and AWS Translate using the AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the AWS Translate spoke.
- Role required: admin.

Create an access key

Create an access key for the required user in the AWS Management Console to authenticate requests from the ServiceNow® instance.

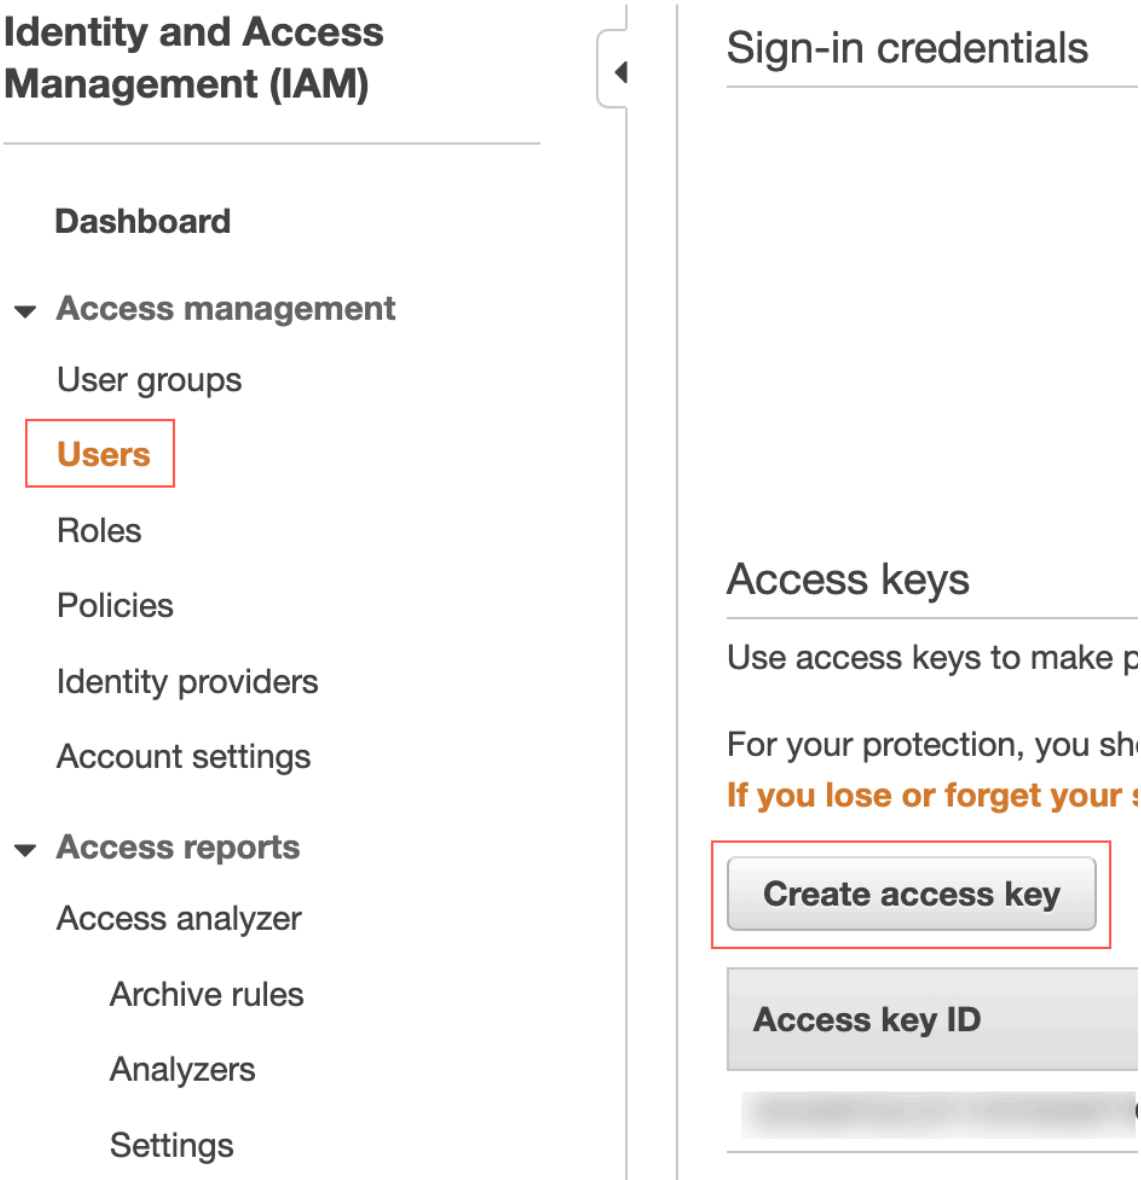
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to the AWS Management Console and open the IAM console.
2. In the navigation pane, click **Users**.
3. Click the required user record for which you want to create or manage the access keys.

   Note: Ensure that the user has admin access to AWS Translate.

4. Click the **Security credentials** tab.
5. Under **Access keys**, click **Create access key**.



The access key is created.

6. Click **Download .csv file** to save the access key ID and secret access key to a CSV file and record them for later use.
   For more information, see Managing access keys (console).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create credential record

Create Credential record for the AWS Translate spoke. The AWS Translate spoke uses this credential to perform actions on AWS Translate.

Procedure

1. Navigate to **Integration Hub** > **Connection & Credential Aliases**.
2. Open the record, **AWS Translate**.
3. In the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **AWS Credentials**.
5. On the form, fill these values.

Field	Description
Name	Name to identify the credential record.
Access key ID	Access key ID you had copied from the AWS Management Console.
Secret Access Key	Secret access key you had copied from the AWS Management Console.
Authentication algorithm	Authentication algorithm to authenticate the web services. Select **AWS Translate Authentication Algorithm**.

6. Click **Submit**.

Result

The credential record for the AWS Translate spoke is created.

BigFix Inventory Spoke

Manage hardware, software, and licenses in BigFix Inventory from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

BigFix Inventory spoke v1.6.0 is the latest version. For version history of the spoke, see BigFix Inventory spoke release notes.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Streaming (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - Get Connection Info (com.glide.hub.action_step.get_connection_info)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for BigFix Inventory version 9.2.16.0, but may be compatible with later versions.

Spoke requirements

BigFix Inventory Management account.

Spoke flow

The BigFix Inventory spoke provides a sample flow, Configure End of Support Date for Software Component to demonstrate setting the end of support date for software component when the Set Software Support End Date service catalog request is created. You can customize the sample flow as per your requirement by creating a copy of it in the required scope.

Spoke subflow

The BigFix Inventory spoke provides a sample subflow, Send an Email Notification for BigFix Inventory Report to demonstrate sending an email notification with the received BigFix Inventory report attachment. To customize the sample subflow, copy it to the required application scope.

Spoke remote table

ServiceNow provides a sample remote table that you can use to connect to BigFix Inventory, and view, pull, and manipulate data from the BigFix Inventory. The name of the sample remote table is Computers. You can create custom remote tables based on the sample remote table. To access the remote table, on your instance, navigate to **All** > **BigFix Inventory Spoke** > **Software Inventories** > **Remote Table**, and then select **Computers**.

For more information on remote tables, see Remote tables.

Spoke actions

The BigFix Inventory spoke provides actions to automate BigFix Inventory tasks when events occur in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Hardware Management	Look up BIOS Details by Computer ID	Retrieves the BIOS details of a computer.
	Look up BIOS Details Stream	Retrieves the list of BIOS Details of the scanned systems
	Look up Computer Hardware Fields by Computer ID	Retrieves list of logical partitions associated with a computer.
	Look up Hardware Inventories Stream	Lists summary information about hardware records in the BigFix Inventory system.
	Look up IP Addresses by Computer ID	Retrieves the list of IP addresses associated with a computer.
	Look up IP Addresses Stream	Retrieves the list of IP address details of the computers in the Infrastructure.
	Look up Logical Partitions by Computer ID	Retrieves the list of logical partitions associated with a computer.
	Look up Logical Partitions Stream	Retrieves the list of logical partition details of the computers in the infrastructure.
	Look up Memory Details by Computer ID	Retrieves the memory details of a computer.
	Look up Memory Details Stream	Retrieves the list of system memory details of the scanned systems.
	Look up Network Adapters by Computer ID	Retrieves the list of network adapters associated with a computer.
	Look up Network Adapters Stream	Retrieves the list of network adapters.
	Look up Operating System Details by Computer ID	Retrieves the operating system details of a computer.
	Look up Operating System Details Stream	Retrieves details of the operating system of the scanned computers.
	Look up Physical Partition Details by Computer ID	Retrieves list of physical partitions associated with a computer.
	Look up Physical Partitions Stream	Retrieves the list of physical partitions of the scanned computers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Processor Details by Computer ID	Retrieves the operating system details of a computer.
	Look up Processor Details Stream	Retrieves the details of all active physical processors.
	Look up Shared Disks Stream	Lists shared disks in BigFix Inventory.
	Look up Storage Devices by Computer ID	Retrieves list of the physical partitions associated with a computer.
	Look up Storage Devices Stream	Retrieves the list of storage devices of the scanned systems.
License Management	Look up License Metric Utilizations Stream	Retrieves utilization data for licenses in BigFix Inventory.
Software Management	Look up Cluster Information Stream	Lists clusters in the BigFix Inventory system.
	Look up IBM Product Release by Product ID	Retrieves the list of releases associated with an IBM software product.
	Look up IBM Product Release Instances by Release ID	Retrieves the list of instances associated with an IBM software product release.
	Look up IBM Product Release Instances Stream	Retrieves the list of Instances associated with the specified software product release.
	Look up IBM Product Releases Stream	Retrieves the list of releases associated with the specified software product.
	Look up IBM Software Products Stream	Retrieves the list of IBM software product details installed in the infrastructure.
	Look up License Usages Stream	Lists peak license usage over the last 90 days.
	Look up Software Components Stream	Lists software components in BigFix Inventory.
	Look up Software Inventories Stream	Lists installed software in the infrastructure scanned by BigFix Inventory.
	Look up VM Managers	Lists VM managers in the BigFix Inventory system.
	Set End of Support Date for Software Component	Configures the End of Support Date for software component.

For information about setting up the spoke, see Set up the BigFix Inventory spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke modules

The BigFix Inventory spoke provides the BigFix Inventory Spoke application that has these modules:

Field	Description
Software Inventories	Displays details of all software inventories.
Remote Table	
Computers	Displays details of all computers in the BigFix Inventory. When users navigates to this module, the system retrieves this data and displays it for a duration of 5 minutes. After this duration, the data is deleted.

Spoke user role

The BigFix Inventory spoke the bigfix_admin (sn_bigfix_in_spoke.bigfix_admin) role. Users with this role can access the BigFix Inventory Spoke application.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the BigFix Inventory spoke

Integrate the ServiceNow instance and the BigFix Inventory using an API key for authenticating ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the BigFix Inventory spoke.
- BigFix Inventory administrator access to the BigFix Inventory portal.
- Role required: admin.

Generate an API key

Generate an API key that enables your ServiceNow instance to request access to the BigFix Inventory instance.

Before you begin

BigFix Inventory requirements:

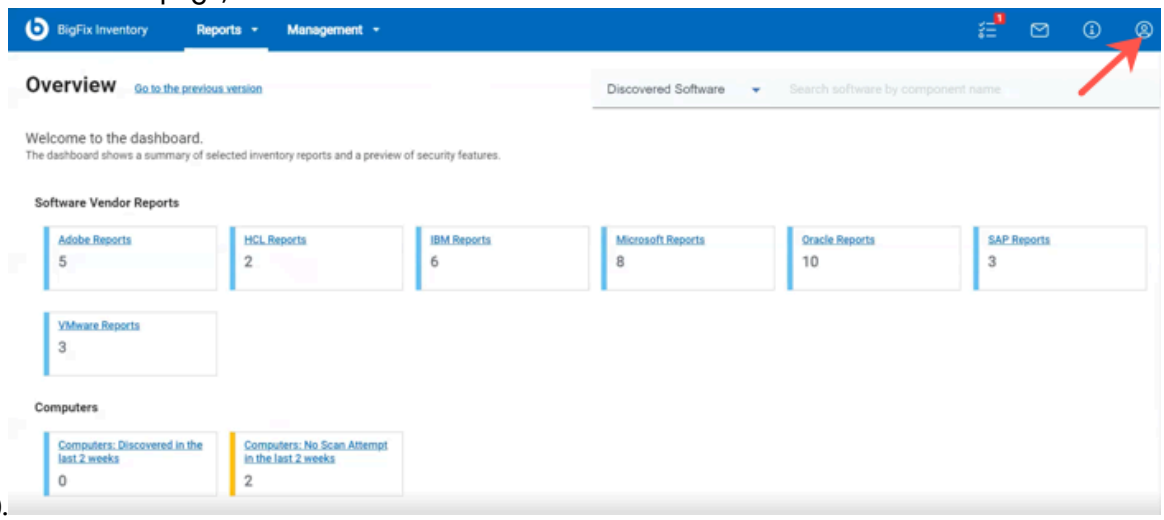
- BigFix Inventory account
- Role required: BigFix Inventory administrator

Complete these steps from your BigFix Inventory environment. For more information on installation and configuration, see BigFix V9.5 Inventory Documentation.

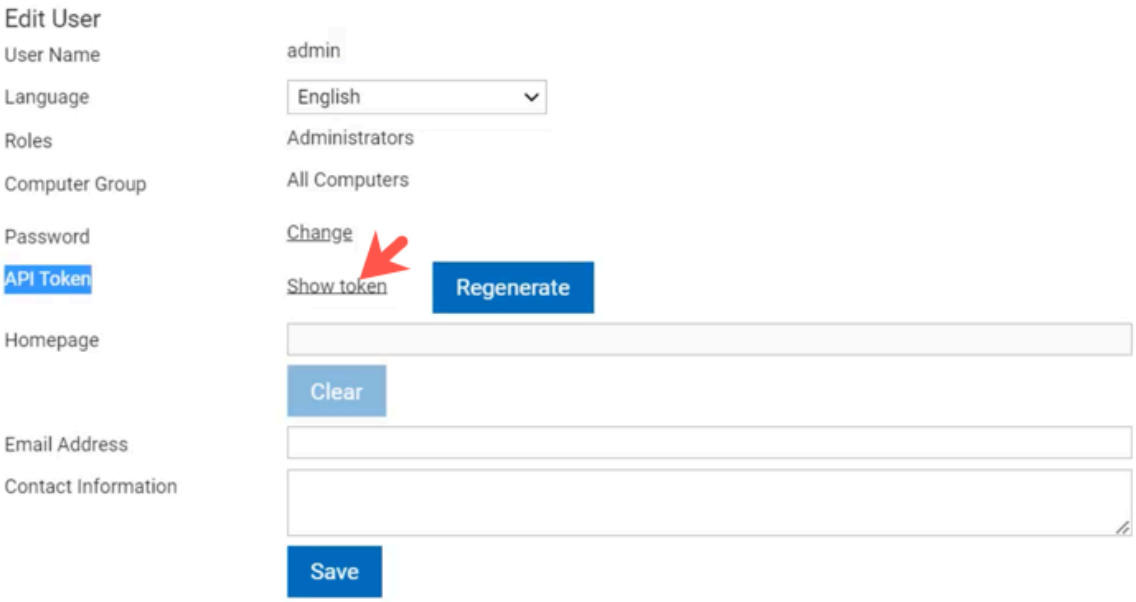
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to your BigFix Inventory portal.
2. On the Overview page, select the Profile icon ().

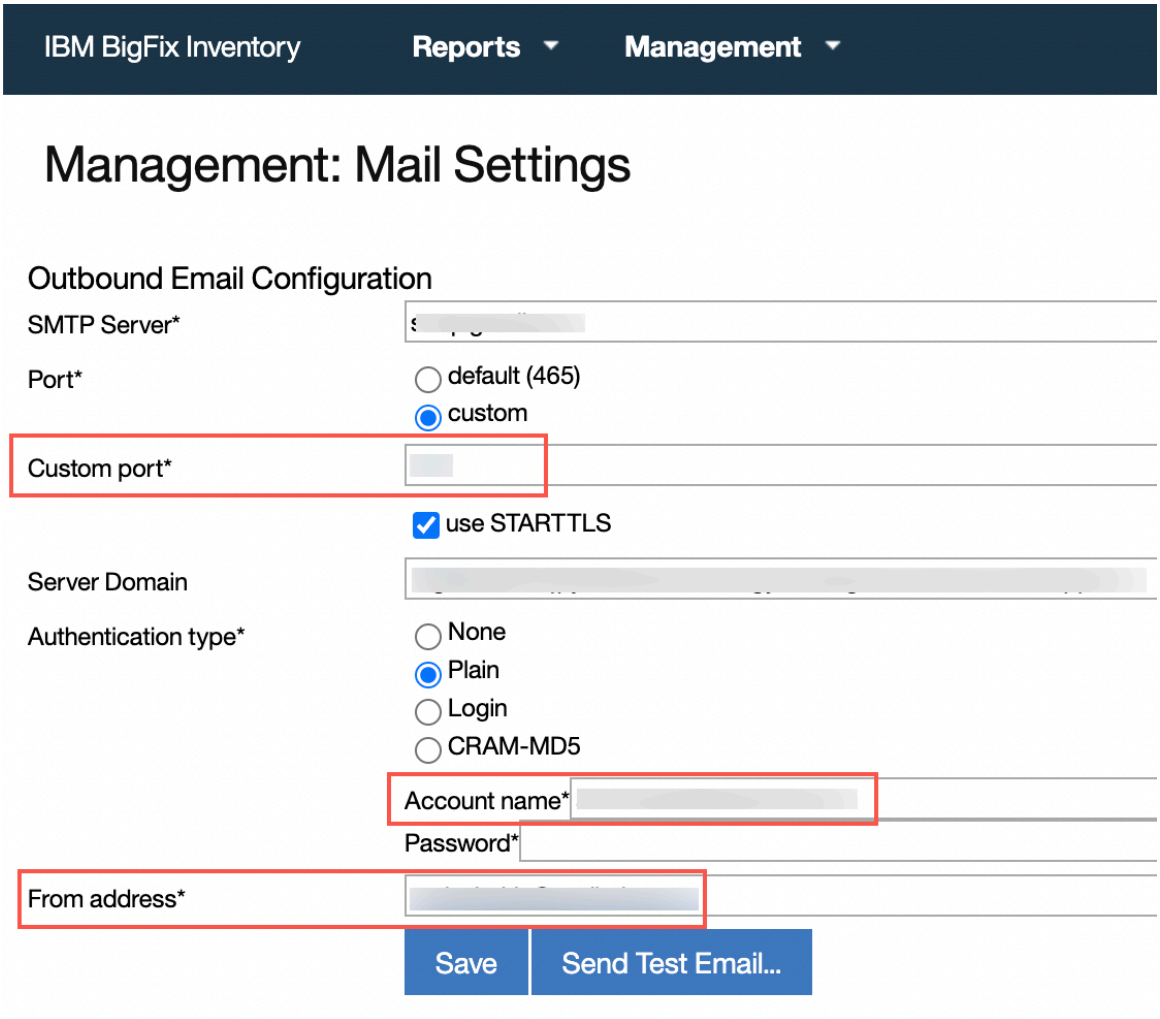


3. Select Profile.
4. On the Edit User page, select the Show token link in the API Token field.



5. Copy the API token and store at a secure place.
6. Navigate to **Management** > **Configuration** > **Mail Setting**.
7. Configure the mail settings.

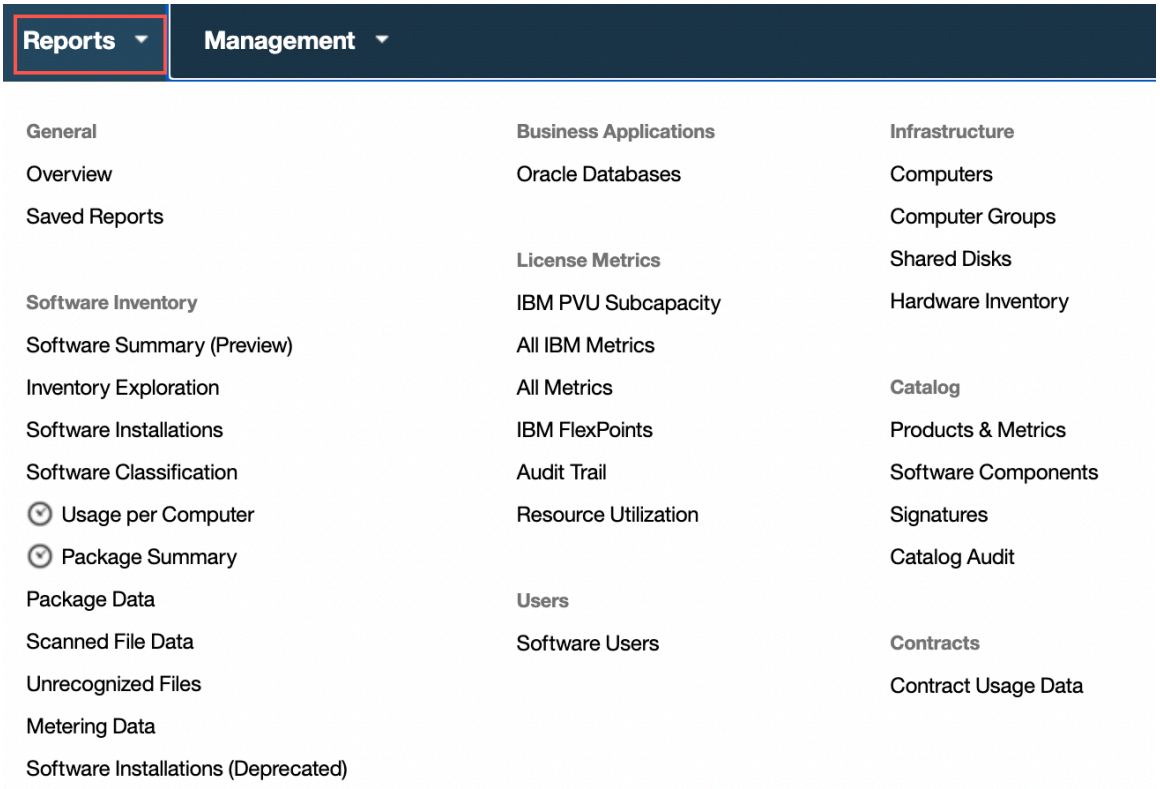
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



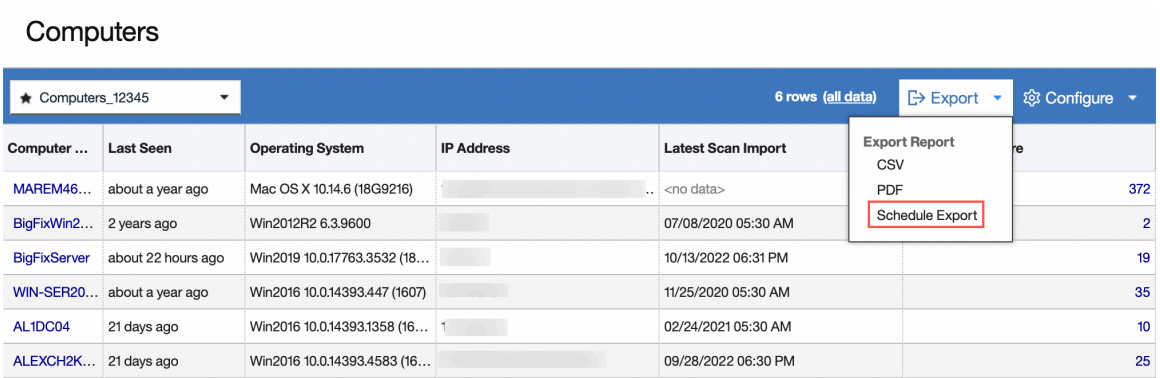
8. Schedule exports of the required reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to the required report under **Reports**, for example, **Computers**.

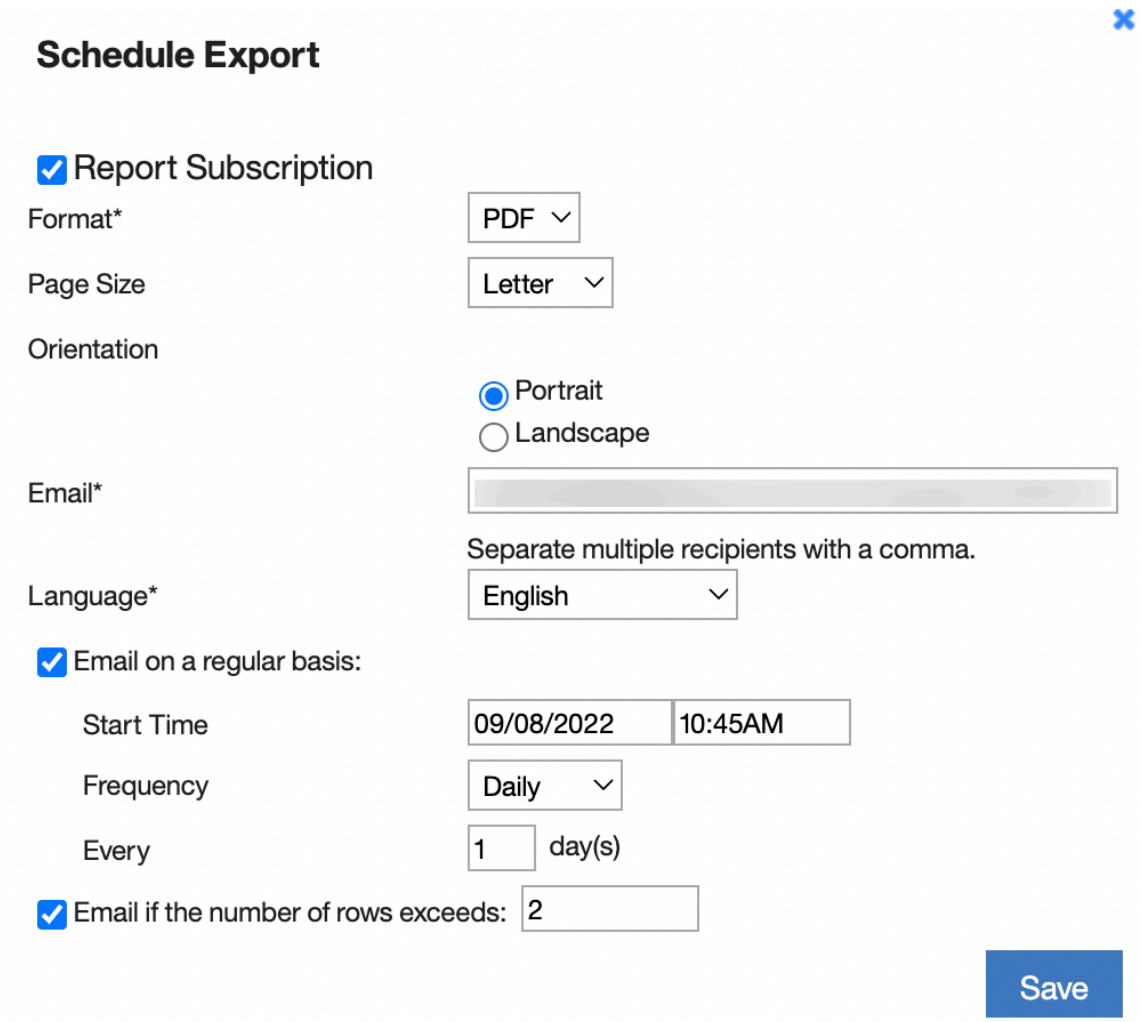


b. Select **Schedule Export**.



c. On the form, specify the ServiceNow instance email address to which the report must be sent and the frequency and time at which the report must be emailed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Save the configurations.

Configure the connection and credential record

Configure the connection and credential record that contains the information to request access to the BigFix Inventory instance.

Before you begin

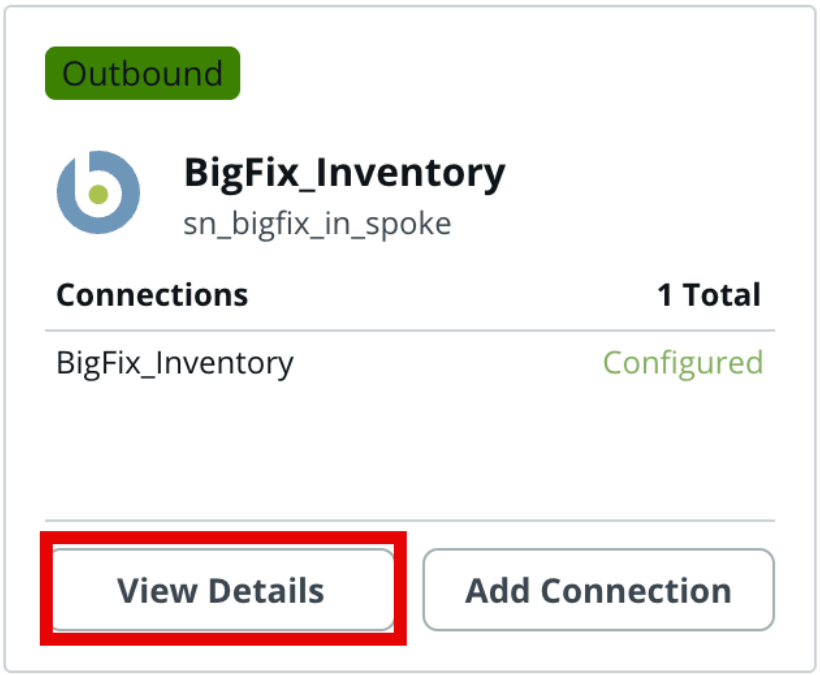
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **BigFix_Inventory** and click **View Details**.

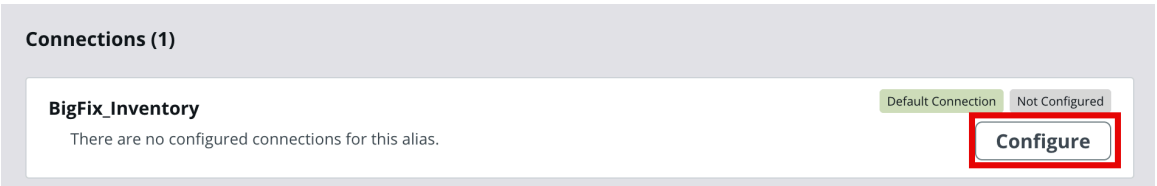
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the BigFix Inventory spoke, click **View Details**.



- To manage more than one BigFix Inventory spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

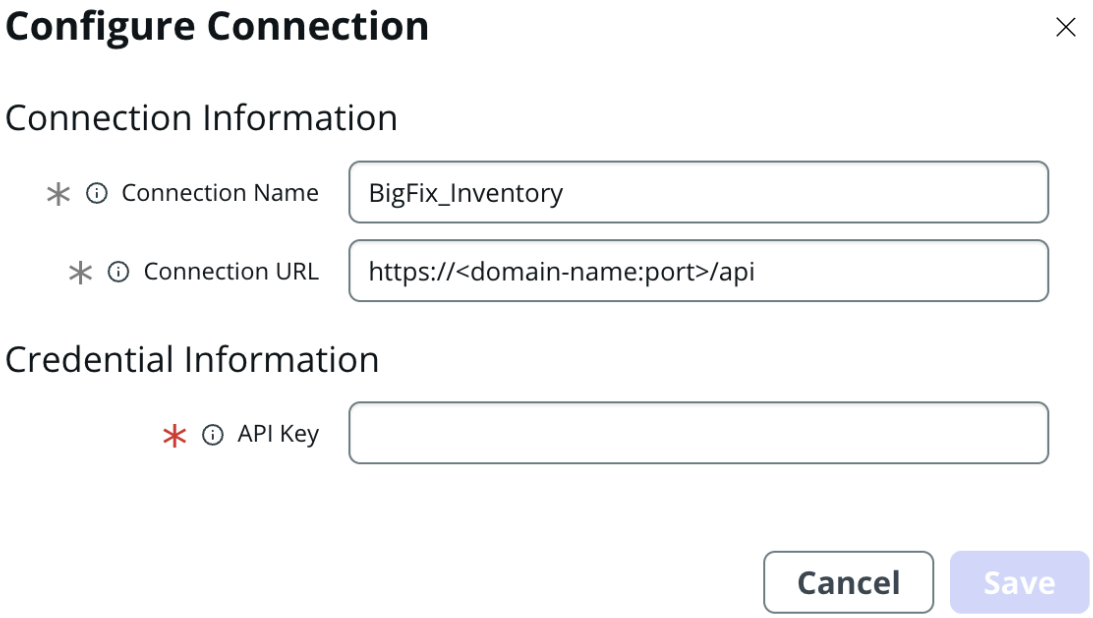
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Name of the connection established with the BigFix Inventory instance. The first connection's default name is automatically assigned to match the name specified in the Connections and Credentials form on the Connection & Credential Aliases page. To provide your custom name, create a connection record by selecting `Add Connection`.
URL	The URL your ServiceNow instance uses to connect to the BigFix Inventory instance.
Credential Information	
API Key	The key that your ServiceNow instance requires to access the BigFix Inventory instance. Enter the API key that you had generated in the BigFix Inventory portal. To learn how to generate an API key, seeGenerate an API key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Save**.

Blue Prism Spoke

Manage jobs and processes in Blue Prism environment from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Blue Prism spoke v1.0.2 is the latest version. For version history of the spoke, see Blue Prism spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Workflow Studio - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Integration Hub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow Integration Hub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for Blue Prism Process Dispatch Framework version 2.6, but may be compatible with later versions.

Spoke Requirements

Blue Prism account.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Blue Prism spoke provides actions to automate Blue Prism tasks when events occur in ServiceNow. Available actions include:

Spoke actions

Category	Action	Description
Job Management	Get Job Status	Retrieves the status of the specified job.
	List Job Outputs	Retrieves the list of outputs of a job associated with the specified session ID.
	Start Job	Executes a job with the specified inputs on the Blue Prism environment.
Process Management	Get Process Parameters	Retrieves the list of parameters for the specified process on the Blue Prism environment.
	List Processes	Retrieves the list of processes on the Blue Prism environment.
Utilities	Generate Collection Inputs	Creates a formatted string of the collection type. This formatted string is used as input for the Start Job action.

For information about setting up the spoke, see Set up the Blue Prism spoke.

MID Server requirements

To use these actions, your instance must have a MID Server set up and configured to use SOAP. For more information about running actions on the MID Server, see Integration steps. For more information about the MID Server, see MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Blue Prism spoke

Integrate your ServiceNow instance with the Blue Prism server to have the requests from your ServiceNow instance authenticated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Blue Prism spoke.
- Role required: admin.

Configure Blue Prism application

Configure the Dispatch Framework and Process info utilities in your Blue Prism environment to enable integration with ServiceNow.

Before you begin

Blue Prism Digital Exchange account.

Role required: admin.

Procedure

1. Log in to Blue Prism Digital Exchange.
2. Click **Link to Asset** of Dispatch Framework utility.
   You're redirected to the Dispatch Framework repository on GitHub.
3. Complete the steps mentioned in the Blue Prism Process Dispatch Framework User Guide.
4. Click **Link to Asset** of Process Info utility.
   You're redirected to the Process Info repository on GitHub.
5. Complete the steps mentioned in the Blue Prism Process Info VBO User Guide.
   Your Blue Prism environment is ready for integration with your ServiceNow instance.

Create Connection and Credential record for Blue Prism ProcessInfo

Create a connection and credential record to enable your ServiceNow instance to connect to the Blue Prism ProcessInfo utility. The record is a single form that contains all the information needed to connect to the Blue Prism ProcessInfo utility every time.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection and Credential Aliases**.
2. Open the record for **BluePrismProcessInfo**.
3. From the **Related Links** section, Click **Create New Connection & Credential**.
4. On the form, fill these fields:

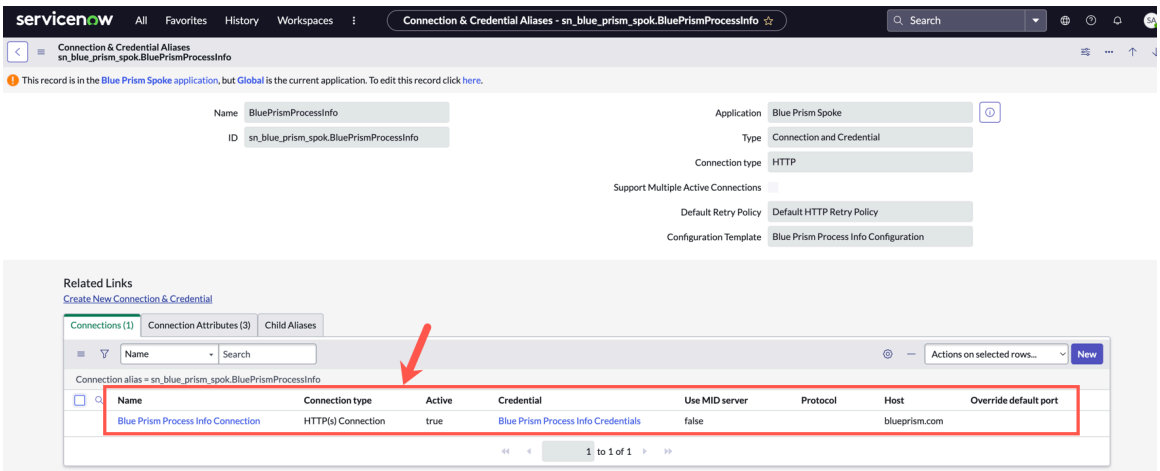
Field	Description
Connection Name	Name of the connection. Default value is `Blue Prism Process Info Connection`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	URL used to connect to the connection to the Blue Prism environment.
Database Credential Name	Credential name of the database. Default value is `DB Read User`.
Database Server Address	Database server address in the Blue Prism environment.
Database Name	Name of the database. Default value is `BluePrism`.
Credential Name	Blue Prism Process Info Credentials.
User Name	User name that the Blue Prism Process Info server authenticates.
Password	Password that the Blue Prism Process Info server authenticates.

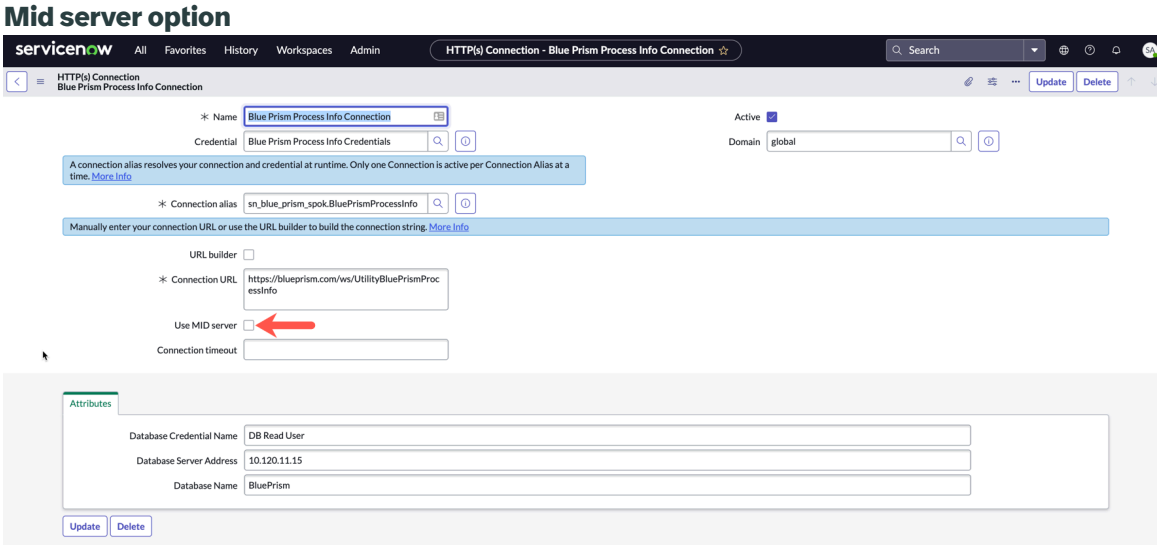
5. Click **Create**.
   A new connection and credential record is created in the Connections tab. This is the default record unless you create another record and set that as default.

Default connection and credential record created



6. Click to open the record.
7. Enable the **Use MID server** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Create Connection and Credential record for Blue Prism Process Dispatcher

Create a connection and credential record to enable your instance to connect to the Blue Prism Process Dispatcher utility. The record is a single form that contains all the information needed to connect to the Blue Prism ProcessInfo utility every time.

Before you begin

Role required: admin.

Procedure

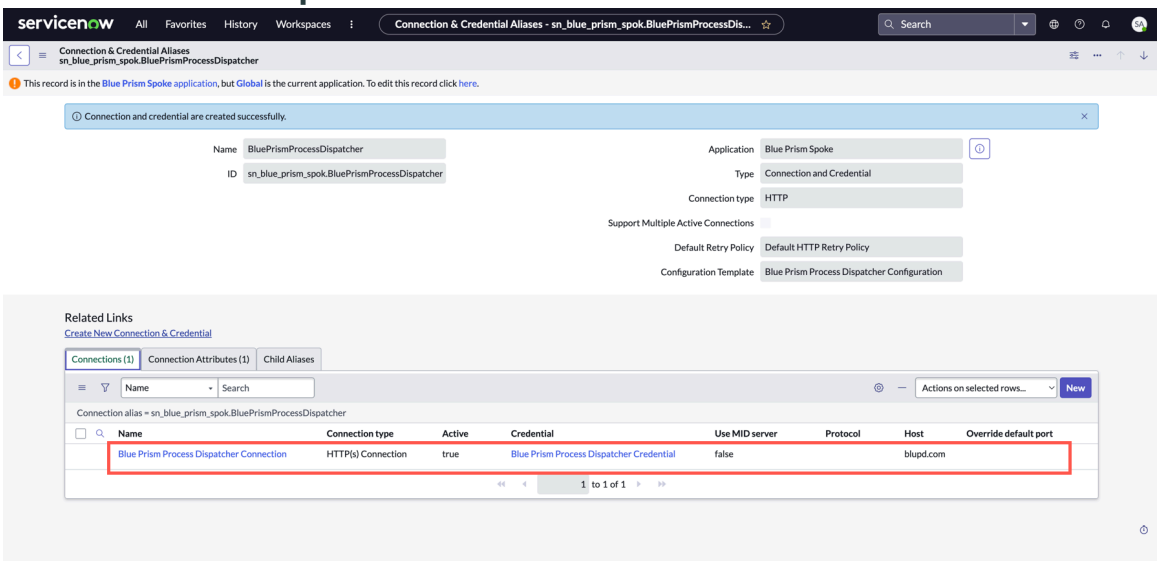
1. Navigate to **All** > **Connections & Credentials** > **Connection and Credential Aliases**.
2. Open the record for **BluePrismProcessDispatcher**.
3. From the **Related Links** section, click **Create New Connection & Credential**.
4. On the form, fill these fields:

Field	Description
Connection Name	Name of the connection. Default value is `Blue Prism Process Dispatcher Connection`.
Connection URL	URL used to connect to the Blue Prism environment.
Runtime Credential Name	Credential with runtime access configured in the Blue Prism environment.
Credential Name	Name of the credential. Default value is `Blue Prism Process Dispatcher Credentials`.
User Name	User name that the Blue Prism Process Dispatcher server authenticates.
Password	Password that the Blue Prism Process Dispatcher server authenticates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Create**.
   A new connection and credential record is created in the Connections tab. This is the default record unless you create another record and set that as default.

Blue Prism Process Dispatcher connection and credential record



6. Click to open the record.
7. Enable the **Use MID server** option.

   To set up the MID Server for this spoke, see Set up MID Server for a spoke.

BMC Remedy Spoke

Manage change requests, incidents, problems, and other records in BMC Remedy from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

BMC Remedy spoke v1.5.0 is the latest version. For version history of the spoke, see BMC Remedy spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for BMC Remedy AR server version 19.08, but may be compatible with later versions.

Spoke flows

The BMC Remedy spoke provides the Look up Record sample flow to demonstrate retrieving the details of records based on last modified date. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The BMC Remedy spoke provides the Get Incident Request ID sample subflow to demonstrate retrieving the Request IDs of the specified incident numbers. To customize the sample subflow, copy it to the required application scope.

Spoke actions

The BMC Remedy spoke provides actions to perform BMC Remedy tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Change Management	Create Change	Creates a change request in BMC Remedy.
CMDB Management	Get Class Attributes	Retrieves class attributes schema from BMC Remedy.
	Get Classes	Retrieves the list of all non-abstract classes in the BMC Remedy CMDB.
	Get Datasets	Retrieves the list of all datasets in BMC Remedy CMDB.
	Get Namespace	Retrieves the list of all namespaces in BMC Remedy CMDB.
	Look up CMDB Data	Get All Incidents all CMDB data for specified dataset, namespace, and class from BMC Remedy.
Incident Management	Create Incident	Creates an incident in BMC Remedy.
	Get All Incidents	Retrieves details of all incidents from BMC Remedy.
	Update Attachment	Updates the attachment of the required incident in BMC Remedy.
	Get Incident By Number	Retrieves details of the specified incident.
Metadata Retrieval	Get All Objects	Retrieves name and label of all objects in BMC Remedy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Alias Selector	Validates the given alias specific to the BMC Remedy spoke and retrieves the alias if it is valid.
	Get Change Form Fields	Retrieves the list of fields in the Change Interface form table.
	Get Change Status	Retrieves the list of all statuses in the BMC Remedy Change Management.
	Get Change Timing	Retrieves the list of all change timings in BMC Remedy Change Management.
	Get Creatable Fields	Retrieves the list of creatable fields in a required standard or custom BMC Remedy table.
	Get Creatable Objects	Retrieves the list of creatable objects in BMC Remedy.
	Get Impact	Retrieves the list of all impacts in the BMC Remedy.
	Get Incident Form Fields	Retrieves the list of fields in the Incident Interface form table.
	Get Incident Status	Retrieves the list of all statuses in BMC Remedy Incident Management.
	Get Investigation Driver	Retrieves the list of all investigation drivers in BMC Remedy Problem Management.
	Get Object Schema	Retrieves schema of the specified object in BMC Remedy.
	Get Problem Form Fields	Retrieves the list of fields in the Problem Interface form table.
	Get Problem Status	Retrieves the list of all statuses in BMC Remedy Problem Management.
	Get Queryable Fields	Retrieves the list of updatable fields in a required standard or custom BMC Remedy table.
	Get Reported Source	Retrieves the list of all reported sources in BMC Remedy Incident Management.
	Get Risk Level	Retrieves the list of all risk levels in BMC Remedy Change Management.
	Get Service Type	Retrieves the list of all service types in BMC Remedy Incident object.
	Get Token	Generates access token for BMC Remedy.
	Get Updatable Fields	Retrieves the list of updatable fields in the required standard or custom BMC Remedy table.
	Get Urgency	Retrieves the list of all urgencies in BMC Remedy.
Problem Management	Create Problem	Creates a problem in BMC Remedy.
Record Management	Create Record	Creates record of the required type in BMC Remedy.
	Get Record Details By ID	Retrieves details of the specified record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Record	Looks up a record in BMC Remedy based on the query fields.
	Update Record	Updates details of the specified record in BMC Remedy.
Service Request Management	Create Service Request	Creates a service request in BMC Remedy.
	Get Service Request Form Fields	Retrieves the list of fields in the Service Request Interface form table.
	Get Service Request Status	Retrieves the list of all status in the BMC Remedy Service Request management.

Spoke modules

The BMC Remedy spoke adds a BMC Remedy application to your instance and includes these modules:

Module	Description
Credentials	Credential records for the BMC Remedy spoke can be accessed here.
Objects	Information about the objects in BMC Remedy can be accessed here. You can also create an object that can be used in your flows. See Create a BMC Remedy object in your ServiceNow instance for information about creating an object.

Spoke user roles

The Remedy_Admin (sn_bmcremedy_spoke.Remedy_Admin) is available when the BMC Remedy spoke is installed. Users with role can view and create objects in the Objects module.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Two aliases are available when you install the BMC Remedy spoke; one alias is of the **Connection and Credential** type and the other alias is of the **Credential** type. For information about setting up the spoke, see Set up the BMC Remedy spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the BMC Remedy alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the BMC Remedy spoke

Integrate the ServiceNow instance and BMC Remedy by using Remedy credentials to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the BMC Remedy spoke.
- Role required: admin.

Note: Ensure that you perform these steps in the **BMC Remedy Spoke** application scope only.

Create Credential record for the BMC Remedy spoke

Create Credential records for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record for the **BMC Remedy spoke** whose **Type** is **Credential**, for example, `BMCRemedy_Credential`.
3. From the **Credentials** tab, click **New**.
   The system displays the message `What type of Credentials would you like to create?`.
4. Select **Remedy Credential**.
5. On the form, fill in the fields.

Field	Value required
Name	Name to uniquely identify the record. For example, `Remedy Cred`.
Active	Option to actively use the credential record.
User name	User name of the BMC Remedy user. **Note:** Administrator user isn't necessary. However, ensure that the BMC Remedy user has permissions to perform the required change, incident, and problem management actions.
Password	Password of the BMC Remedy user's account.
Credential alias	Credential alias record associated with this record.
Token Status	Status of the BMC Remedy token. Select **Active**.
Applies to	MID Servers that can use this credential record.
MID servers	Specific MID Servers that can use this credential record. **Note:** This field appears only when **Specific MID servers** is selected from **Applies to**.

6. Right-click the form header and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The credential record the BMC Remedy spoke is created.

Create Connection record for the BMC Remedy spoke

Create Connection record for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses this connection to perform actions in BMC Remedy.

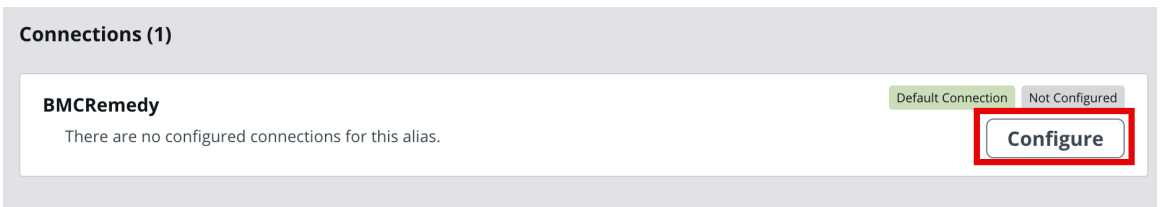
Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **BMCRemedy** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the BMC Remedy spoke, click **View Details**.

   - To manage more than one BMC Remedy spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

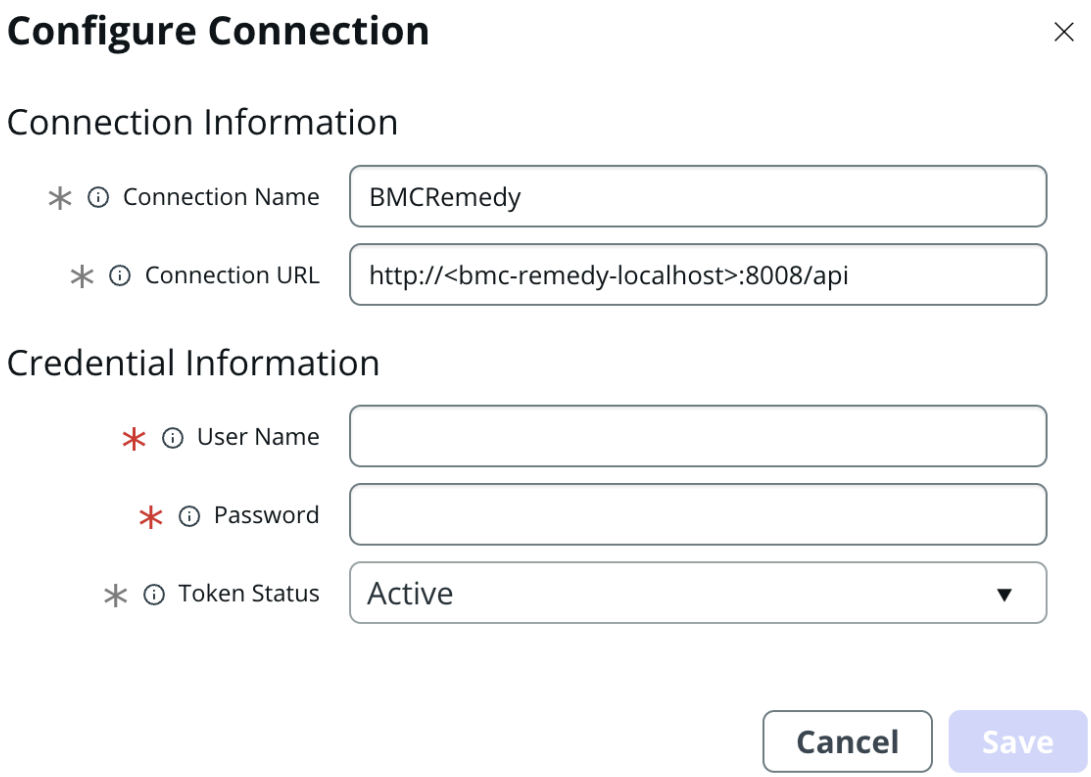
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Auto-generated name to identify the connection record.
URL	URL of the connection website.
Credential Information	
User Name	User name of the BMC Remedy user.
Password	Password of the BMC Remedy user's account.
Token Status	Status of the BMC Remedy token. Select `Active`.



6. Click **Configure and Get OAuth Token**.

Result
The connection record the BMC Remedy spoke is created.

Create a BMC Remedy object in your ServiceNow instance

Manage other objects in BMC Remedy from your ServiceNow instance by creating the required object.

Before you begin
Role required: admin or Remedy_Admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, the BMC Remedy spoke supports the change request, incident, and problem objects. To manage other objects, such as Product Catalog, create an object in your ServiceNow instance.

Procedure

1. Navigate to **All** > **BMC Remedy Spoke** > **Objects**.
2. Click **New**.
3. On the form, fill these fields.

BMC Remedy Objects form

Field	Description
Name	Name of the required form. This value is unique to each object. For example, the form value for Product Catalog is PCT : `Product Catalog`.
Label	Label name to identify the record.
Creatable	Option to create records in the object. Select the option to create records and use the object in your flows.

4. Click **Submit**.

Box Spoke

Move attachments to Box where they can be managed as shared documents.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Box spoke v3.7.0 is the latest version. For version history of the spoke, see Box Spoke release notes.

Supported versions

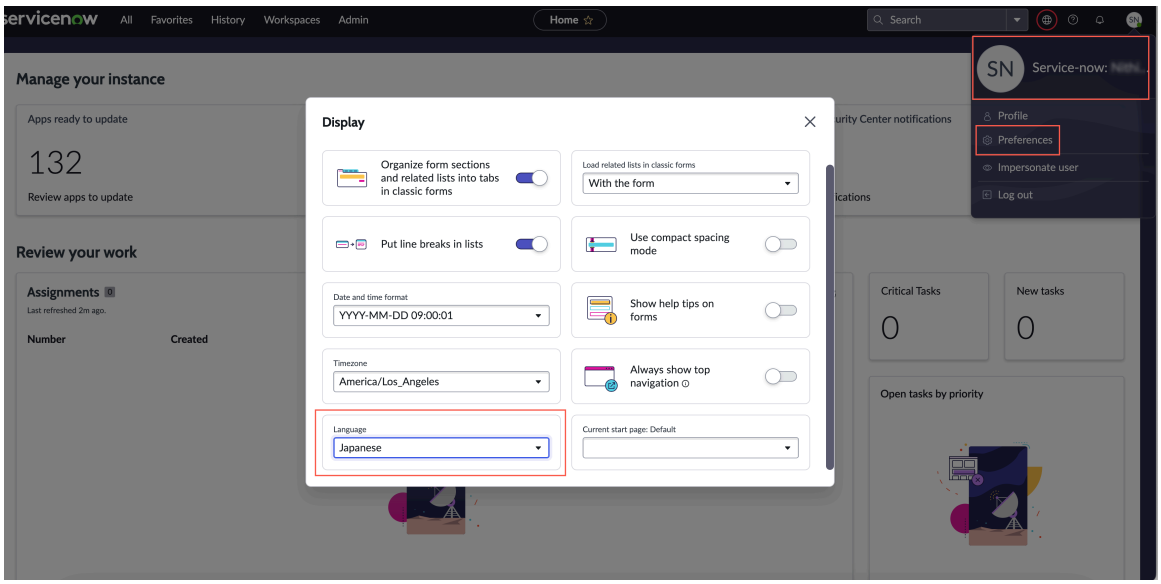
API version v2.

Spoke requirements

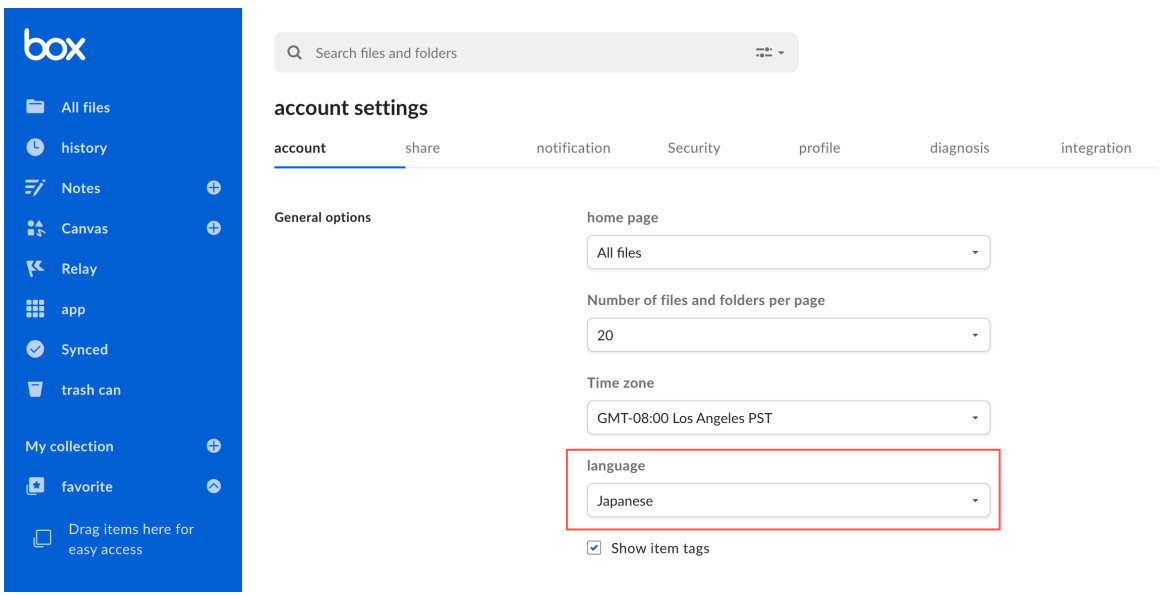
Ensure that same languages are selected in your ServiceNow instance and Box account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In your ServiceNow instance, select the required language by navigating to **User Profile** > **Preferences** > **Display**.



- In your Box account, select the required language by navigating to **Account Settings** > **Account** > **General Options**.



Spoke flows

The Box spoke provides sample flows in the draft state to demonstrate automating Box tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Move Attachment when created to Box	Moves attachment files from ServiceNow to Box when a new attachment record is added. Updates the trigger record with a shared link to the moved attachment file on Box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
On-boarding user	Creates a user in Box when you create a ServiceNow user in the **Box User** group.

Spoke actions

The Box spoke provides actions to automate Box tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Box AI Management	Ask Question	Sends a prompt to the supported AI models using the provided context and returns a brief answer focused on the user's question.
	Extract Metadata Freeform	Sends a context#aware request to supported AI models and extracts metadata as structured key#value pairs.
	Look up AI Agent Default Configuration	Retrieves the default configuration settings for the specified AI agent.
Box Hub Management	Look up Box Hub Info by ID	Retrieves details for a Box Hub using the specified Hub ID.
	Look up Box Hub Items Stream	Retrieves all items associated with the specified Box Hub.
	Look up Box Hubs Stream	Retrieves all Box Hubs available to the requesting user based on the Box credentials used to generate the access token.
Document Management	Add Metadata to File	Stores the provided attributes information by adding it as metadata for Box files.
	Attach Box File to Record	Copies a file from Box and attaches it to the specified ServiceNow record.
	Lookup File ID	Retrieves the ID of the specified file in Box.
	Move Owned Item	Moves all items owned by the specified user in Box to the specified folder.
	Remove File	Removes the specified file from Box.
	Search Content Stream	Searches for files, folders, web links, and shared files across the user's content or across the entire enterprise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Upload File	Uploads the specified file to Box.
	Look up Archives Stream	Retrieves all available archives from the Box application.
Document Sharing	Add Collaborator	Grants a user or group a specified level of access to a particular file or folder. Collaborators have one of these access levels. • Co-Owner • Editor • Previewer • Preview Uploader • Uploader • Viewer • Viewer Uploader
	Create Shared Link	Create a direct and read-only link to a file or folder in Box.
	Look up Folder Collaborators By ID	Retrieves all the collaborators associated to the specified folder ID.
	Remove Collaborator	Removes the specified collaboration from a file or folder in Box.
File Management	Look up File Information	Retrieves detailed information for the specified file.
Folder Management	Create Folder	Creates a folder in Box on behalf of the specified Box user account.
	Delete Folder	Deletes the specified folder in Box.
	Lookup Folder ID	Retrieves the ID of the specified folder in Box. **Note:** Items added to Box require 10 minutes to become accessible. For example, if one action creates a folder, a Lookup Folder ID action won't return results until after 10 minutes have passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Folder Information	Retrieves details for the specified folder.
	Look up Folder Items Stream	Retrieves all items within the specified folder, including files, subfolders, and web links.
Group Management	Create Group	Creates a group in Box with the specified invitation preferences.
	Delete Group	Deletes the specified group in Box.
	Update Group	Updates the specified group in Box with the specified preferences.
Legal Hold Management	Assign Legal Hold Policy	Assigns a legal hold policy to a file, file version, folder, or user.
	Create Legal Hold Policy	Creates a legal hold policy.
	Look up All Legal Hold Policies Stream	Retrieves a list of legal hold policies of an enterprise.
	Look up Legal Hold Policy Assignment by ID	Retrieves a legal hold policy assignment for the specified ID.
	Look up Legal Hold Policy Assignments Stream	Retrieves a list of items assigned to a legal hold policy.
	Look up Legal Hold Policy by ID	Retrieves a legal hold policy for the specified ID.
	Remove Legal Hold Policy	Deletes an existing legal hold policy.
	Unassign Legal Hold Policy	Removes the assignment of an item to a legal hold.
	Update Legal Hold Policy	Updates a legal hold policy.
Metadata Management	Look up Metadata Instance on File By File ID	Retrieves the metadata instance of the file with the specified file ID.
	Look up Metadata Instance on File by Scope and Template Key	Retrieves the metadata instance of a folder with the specified scope and template key.
	Look up Metadata Instance on Folder By Folder ID	Retrieves all the metadata of the folder with the specified folder ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: Don't use this action on a root folder that has a folder ID value as zero.
	Look up Metadata Instance on Folder by Scope and Template Key	Retrieves all the metadata of a folder with the specified scope and template key.
	Query Files or Folders by Metadata Stream	Searches for files or folders using SQL-like syntax and returns the matching results.
Retention Policy Management	Assign Retention Policy	Assigns a retention policy to an item.
	Create Retention Policy	Creates a retention policy.
	Look up Retention Policies	Retrieves all the retention policies of an enterprise.
	Look up Retention Policy Assignment By ID	Retrieves the retention policy with the specified ID.
	Look up Retention Policy Assignments Stream	Returns a list of all retention policy assignments associated with a specified retention policy.
	Look up Retention Policy by ID	Retrieves the retention policy with the specified ID.
	Update Retention Policy	Updates a retention policy.
User Management	Add User to Group	Adds the specified user to the specified group in Box.
	Create User	Creates a user account in Box.
	Delete User	Deletes the specified user in Box.
	Disable User	Sets the status of the specified user in Box to inactive.
	Enable User	sets the status of the specified user in Box to active.
	Lookup User ID	Retrieves the ID of the specified user in Box.
	Update User	Updates the specified user in Box with the specified role changes.
Webhook Management	Create Webhook	Creates a webhook.
	Look up Webhook By ID	Retrieves the webhook with the specified ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Webhooks Stream	Retrieves all the defined webhooks for the specified application.
	Remove Webhook	Removes a webhook.
	Update Webhook	Updates a webhook.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI agent	Description
Box user management AI agent	Manages user management tasks (that is, adds a user to group, enables a user, create user, delete user, update user, look up user ID, disable user) in Box.
Box folder management AI agent	Manages folder management tasks (that is, create a folder, look up the folder ID, delete a folder) in Box.
Box document sharing AI agent	Manages document sharing tasks (that is, remove a collaborator, add a collaborator, create a shared link, look up the folder collaborators by ID) in Box.
Box group management AI agent	Manages group management tasks (that is, update a group, create a group, delete a group) in Box.
Box metadata management AI agent	Manages metadata retrieval tasks (that is, look up a metadata instance on a file by scope and template key, look up a metadata instance on a folder by folder ID, look up a metadata instance on a folder by scope and template

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
	key, look up a metadata instance on a file by file ID) in Box.
Box retention policy management AI agent	Manages retention policy management tasks (that is, update a retention policy, look up a retention policies stream, look up a retention policy assignment by id, look up a retention policy by id, look up a retention policy assignments stream) in Box.
Box document management AI agent	Manages document management tasks (that is, remove a file, attach a box file to a record, upload a file, move an owned item, search a content stream, look up a file ID, add metadata to a file) in Box.
Box legal hold management AI agent	Manages legal hold management tasks (that is, create a legal hold policy, look up a legal hold policy assignment by ID, update a legal hold policy, look up all legal hold policies stream, look up a legal hold policy by ID, unassign a legal hold policy, remove a legal hold policy, look up a legal hold policy assignments stream) in Box.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke triggers

ServiceNow supports specific events on Box that create triggers. You must first configure a flow with a supported trigger definition. When an event, for example, a push request, occurs on the Box, it sends the payload via a webhook to the ServiceNow instance. After that, the flow that you configured is triggered at the ServiceNow instance to automate a workflow. The supported events are:

Category	Trigger	Description
File Management	File Downloaded	Flow is triggered when a file is downloaded.
	File Locked	Flow is triggered when a file is locked.
	File Moved	Flow is triggered when a file is moved.
	File Renamed	Flow is triggered when a file is renamed.
	File Unlocked	Flow is triggered when a file is unlocked.
	File Uploaded	Flow is triggered when a file is uploaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Trigger	Description
Folder Management	Folder Created	Flow is triggered when a folder is created.
	Folder Downloaded	Flow is triggered when a folder is downloaded.
	Folder Moved	Flow is triggered when a folder is moved.
	Folder Renamed	Flow is triggered when a folder is renamed.

For information about setting up the triggers for the Box spoke, see Set up triggers for the Box spoke. For more information about inbound integration, see Conditional and event-driven inbound integration.

Spoke user roles

The following user roles are available with the spoke:

- Policy User (sn_box_spoke.box_policies_user): Users with this role have access only to **Retention Policies** module.
- Legal Hold Policy User (sn_box_spoke.legal_hold_policy_user): Users with this role have access only to the **Legal Hold Policies** module.
- Box Webhook Registry User (sn_box_spoke.box_webhook_registry_user): Users with this role have access only to the **Box Webhook Registry** module.

Box spoke module

Bi-directional webhooks can be set up to be notified about the required events. A webhook registry defines the conditions that must be met to notify the ServiceNow app. These conditions are based on the events in Box that you want to be notified about. When the conditions are met, the specified trigger name triggers the associated subflow, which in turn automates the Box tasks.

Webhooks require separate setup and can be used independently without using the spoke actions. The Box spoke adds the Box Spoke application to your instance and includes the following modules.

Box module

Module	Description
Box Webhook Registry	Create and view the Box webhooks in ServiceNow.
Legal Hold Policies	View the list of available Box legal policies.
Retention Policies	View the list of available Box retention policies.

Box account requirements

The Box spoke requires creating a custom app on your Box account to generate OAuth 2.0 tokens. See Create an OAuth application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the following alias records to authorize actions.

Connection & Credential alias	Description	Connection alias requirements
Box	Connection to the Box Collaboration and File Management APIs.	• Connection type: HTTP • Connection URL: https://api.box.com
Box Upload	Connection to the Box upload service.	• Connection type: HTTP • Connection URL: https://upload.box.com

To use the spoke connection aliases, create an associated Connection record and an associated Credential record for each alias. For information about setting up the spoke, see Set up the Box spoke.

Set up the Box spoke

Integrate your ServiceNow instance and the Box APIs to automate the Box spoke actions. For example, you can set up a flow that removes a file in your Box account. When you set up the Box spoke, this flow is automated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Box spoke.
- Access to Box developer's console.
- Role required: admin.

Create an OAuth application

Create a custom OAuth application from your Box account to enable OAuth 2.0 authentication with the Box spoke.

Before you begin

Box requirements:

- Box account
- Box administrator credentials
- Role required: admin

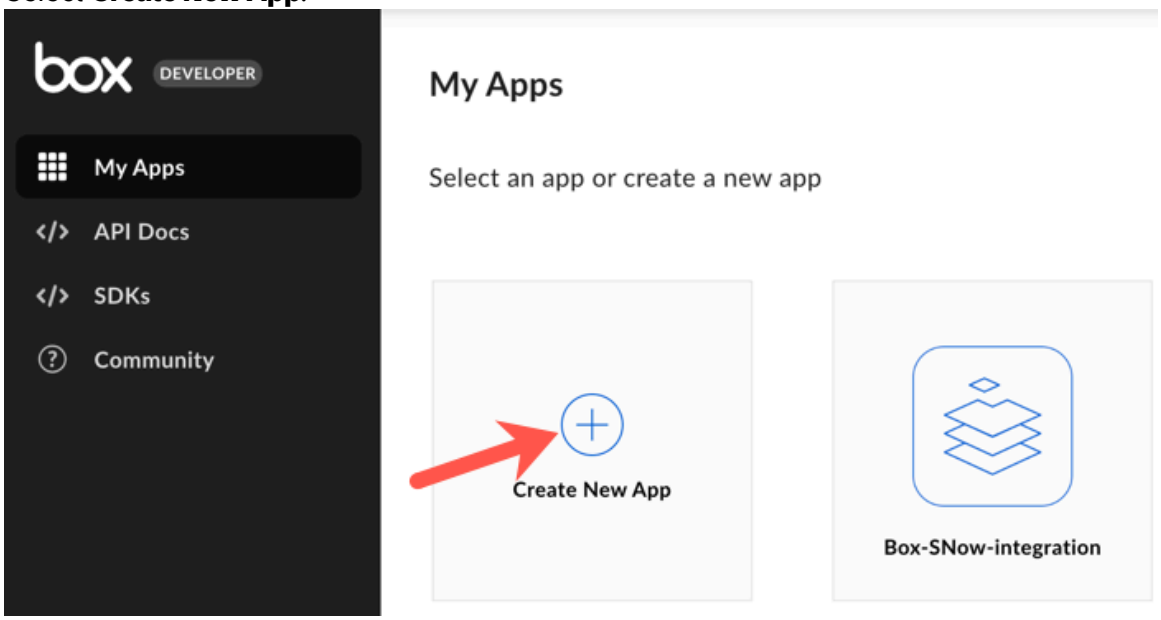
About this task

Complete these steps from your Box account. See the Box Developer Portal documentation for instructions on creating and configuring custom applications.

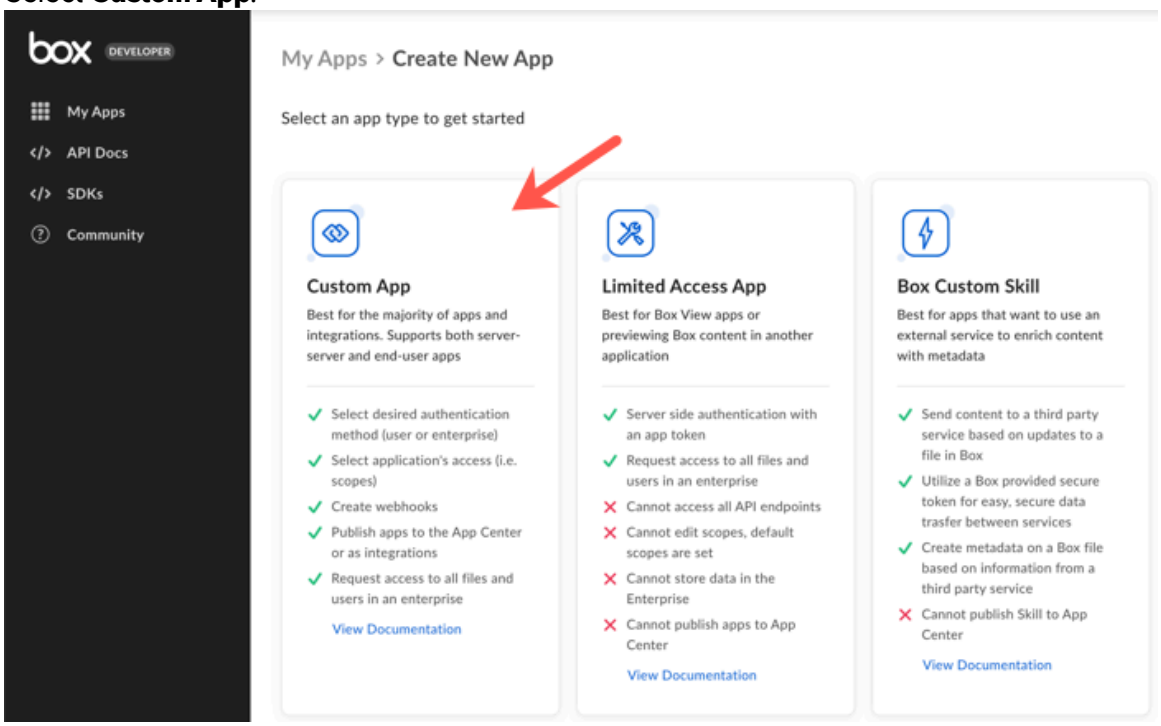
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to the Box developer's console.
2. Select **Create New App**.



3. Select **Custom App**.



4. Complete the form.

Field	Value
App Name	`Box App`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Description (optional)	Leave this field empty
Purpose	Select**Custom Portal**

5. Select **Next**.
   The Create a Custom App modal appears.
6. Select **User Authentication (OAuth 2.0)**.
7. To confirm, select **Create App**.
   You are in your application's configuration settings.
8. In the OAuth 2.0 Credentials section, copy the Client ID and Client Secret.

   You need this information to register the application as a third-party OAuth provider on your ServiceNow instance.
9. In the Application Scopes section, enable the scope permissions you want to support.

Application Scopes	Use for
Read and write all files and folders stored in Box	Document management, document sharing, and folder management actions
Manage users	User management actions
Manage groups	Group management actions
Manage enterprise properties	Document sharing, group management, and user management actions
Manage webhooks	Configuring V2 webhooks
Manage AI	Interact with Box AI actions

10. Select **Save Changes**.

Configure a connection record for the Box spoke

Add and configure a Box connection to authenticate ServiceNow requests in a Box spoke.

Before you begin
Role required: admin

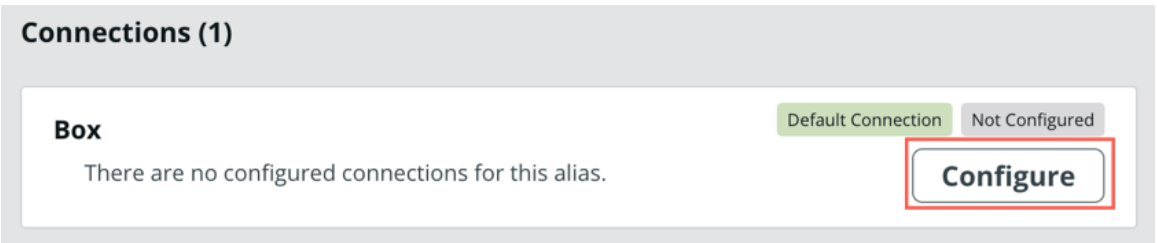
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In your ServiceNow instance, navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Box** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Box spoke, click **View Details**.

   - To manage more than one Box spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

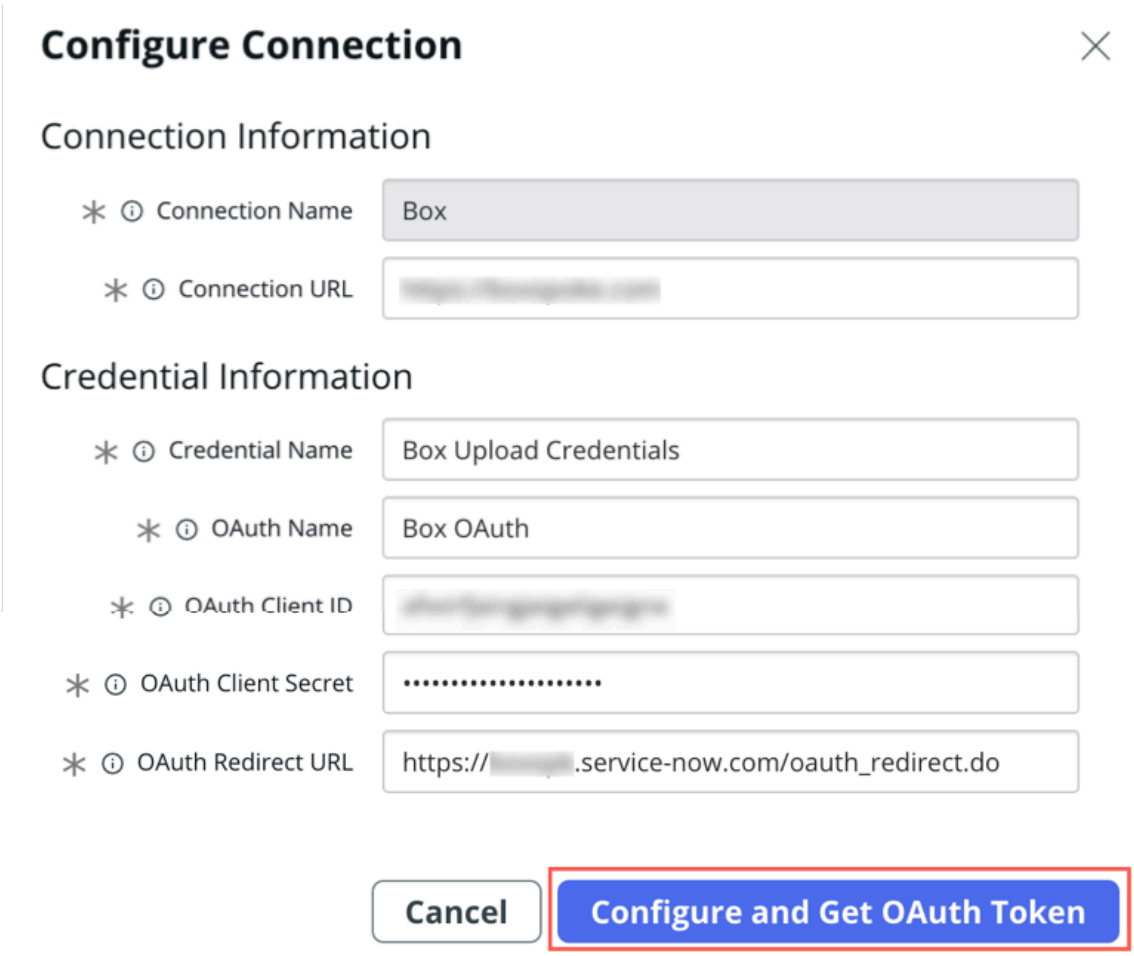


5. On the form, fill these values.

Field	Value
Connection Name	`Box`.
Connection URL	The instance URL in this format:`<provider-domain-name>.net`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Credential Name	`Box Upload Credentials`.
OAuth Name	`Box OAuth`.
OAuth Client ID	The application client ID. For more information, see Create an OAuth application.
OAuth Client Secret	The application client secret. For more information, see Create an OAuth application.
OAuth Redirect URL	The URL in this format: `https://<ServiceNow-instance-name>.service-now.com/oauth_redirect.do`. Replace `<ServiceNow-instance-name>` with your ServiceNow instance name.



6. Click **Configure Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The spoke connection is configured and ready to be used.

Note: OAuth tokens expire after 30 days. An administrator can regenerate the spoke OAuth token every 30 days.

Regenerate Box OAuth token

Regenerate the Box OAuth token when it expires. The Box spoke OAuth token expires every thirty days.

Before you begin
Role required: admin

Procedure
1. In your ServiceNow instance, navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the **Connections** tab.
3. Search for the **Box** connection alias.
4. Select **View Details**.
5. Select **Get OAuth Token** for the connection.

Result
The Box spoke receives a new OAuth access token. It expires in 30 days.

Integrate ServiceNow instance with JWT Bearer grant type

Set up an OAuth provider with the JWT Bearer grant type to integrate your ServiceNow instance with Box.

Before you begin
Role required: admin

Procedure
1. Do the steps at the Box end.
   a. Sign Up for Box Developer Account.
   b. On the Developer Console, select **Custom App** .
   c. Confirm that the authentication method is OAuth 2.0 with JWT (Server Authentication).
   d. Enter a unique name for the app and create the app.
   e. View the app.
   f. On OAuth 2.0 Credentials, copy the Client ID and Client Secret.
   g. Create a new keystore and export a public key from that into BOX.
   h. Note the enterpriseID under the App Settings.
   i. Navigate to **My apps** > **<App Name>** > **General** > **Submit for Authorization**.
   j. Select your account name on the top of the Admin Console.
   k. In your account, create a folder and upload a text file.
2. Do the steps at the ServiceNow instance end.
   a. Navigate to **System Definition** > **Certificates** > **New** > **Type** > **Storepass**.
   b. Attach the keystore certificate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Configure a JWT signing key by navigating to **System OAuth** > **JWT Keys** > **New**.

d. Create OAuth application registry entry by navigating to **System OAuth** > **Application Registry** > **New** > **Connect to a third party OAuth Provider** > **Default Grant type (JWT Bearer)**.

e. Under the OAuth entity profile (oauth_entity_profile) associate the created 'jwt provider'.

f. Create a REST message.

g. In the REST Message, select **Get OAuth token** to get the access token.

h. Go to the 'Default GET' method and click on 'Test'.

i. An the BOX end, share the folder and file.

Set up a bi-directional webhook for the Box spoke

Configure a webhook to subscribe to Box with a ServiceNow callback URL.

Before you begin

- Request an Integration Hub subscription.
- Activate the Box spoke.
- Role required: admin.

Add an endpoint URL in a Box account

Specify an endpoint URL in your Box account to create a webhook for Box spoke.

Before you begin

Role required: admin

Procedure

1. Log in to the Box developer's console.
2. Create an app according to your requirements.

   For more information about app creation, see Create an OAuth application.
3. Generate a primary Key and secondary Key for your app and record the values.

   a. In **My Apps**, select the application.
   You are in your application's **General Settings**.

   b. Navigate to **Webhooks**.

   c. Select **Manage Signature Keys**.

   d. In the Primary Key section, select **Generate Key**.

   e. In the Secondary Key section, select **Generate Key**.

   f. Copy and save both key values for later.
4. Navigate to the **Webhooks** section.
5. To create a V1 webhook, select **Create Webhook** and select **V1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Complete the fields.

Field	Value
Name	`Update Chatter feed`
Description	`Automatically updates your Chatter feed when a change occurs`
Event Type	Enable at least one option
Endpoint URL	The endpoint URL of the ServiceNow instance in the following format: `https://<instance-name>.service-now.com/api/sn_box_spoke/box_spoke_webhook_endpoints/webhook_endpoint`
Payload format	Select the appropriate payload data format
Callback Parameters	Select **add callback parameter** to configure any GET or POST methods

b. Select **Save Webhoook**.

6. To create a V2 webhook, select **Create Webhook** and select **V2**.

> **Note:** To create a V2 webhook, you must enable **Manage webhooks** in the **Configuration** settings. For more information, see Create an OAuth application.

a. For the URL Address, enter the endpoint URL of the ServiceNow instance in the following format: `https://<instance-name>.service-now.com/api/sn_box_spoke/box_spoke_webhook_endpoints/webhook_endpoint`.

b. For The type of item to trigger a webhook, select **Choose an item**.

c. Select the webhook configured file or folders.

d. To confirm select **Choose**.
A list of configured webhook triggers display in the **Create a Webhook** page.

e. Enable the appropriate GET and POST methods for each trigger.

f. To confirm, select **Create Webhook**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The endpoint URL is added in your Box account. You can create webhook registries and subflows according to your requirements.

Register a Box webhook in ServiceNow

Create a Box webhook registry in ServiceNow to notify the ServiceNow app when certain events occur in your Box account.

Before you begin
Role required: admin.

Procedure

1. In your ServiceNow, navigate to **All** > **Box** > **Box Webhook Registry**.
2. Select **New**.
3. Fill in the fields.

Field	Value
Name	Optionally, name the webhook registry
Trigger Name	Select the appropriate event trigger
Primary Key	The primary key that you generated in Add an endpoint URL in a Box account
Flow Name	The flow that occurs when the event triggers
Secondary Key	The secondary key that you generated in Add an endpoint URL in a Box account
Description	Optionally, describe the purpose of the record

4. To confirm, select **Submit**.

Result
The Box webhook is registered in your ServiceNow instance.

Set up triggers for the Box spoke

Set up the trigger to generate the secret and callback URL on your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the Box spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure secret and callback URL in Box

Set the secret and callback URL to enable Box to securely send webhooks to your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to the Box account.
2. Create a custom application.
   a. Click **Dev Console**.
   b. Under **My Platform Apps**, click **Create Platform App**.
   c. Click **Custom App**.
   d. On the Create a Custom App form, provide app details.
      Provide a name for **App Name** and select **Custom Portal** for **Purpose**.
   e. Click **Next**.
   f. Select **Server Authentication (with JWT)** for **Authentication Method** and click **Create App**.
      The custom application is created and the **Configuration** tab is displayed.
   g. Copy the value of **Client ID** from the **Configuration** tab.
3. Authorize the custom application.
   a. Navigate to the **Admin console** from the Box account homepage.
   b. Click **Integrations**.
   c. Under the **Platform Apps Manager**, click **Server Authentication App**.
   d. Click **Add Platform App**, paste the value of **Client ID**, and click **Next**.
      The custom application details are displayed.
   e. Click **Authorize**.
4. Provide the required application scopes to the custom application.
   a. In the **Configuration** tab, for **Application Scopes** select the **Write all files and folders stored in Box**, **Manage signature requests**, **Manage webhooks**, and **Enable integrations** options.
   b. Click **Save Changes**.
5. Generate primary key for the custom application.
   a. In the **Webhooks** tab, click **Manage Signature Keys**.
   b. Under **Primary Key**, click **Generate Key**.
   c. Click **Copy** to copy the value of **Primary Key** and record it for later use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Create a webhook for the custom application and add ServiceNow endpoint URL.

   a. In the **Webhooks** tab, click **Create Webhook** and select **V2**.

   b. For **URL Address** under **Configuration**, enter ServiceNow endpoint URL in this format: `https://<ServiceNow-Instance-Name>.service-now.com/api/sn_box_spoke/box_external_trigger?X-SkipCookieAuthentication=true`.

   c. For **Content Type**, select either file or folder as per your requirement. Flow events differ based on the selected **Content Type**.

   d. Select the required triggers that are associated with the selected **Content Type**.

   e. Click **Create Webhook**.

Activate the trigger definition on ServiceNow instance for the Box spoke

Activate the trigger definition to generate the secret and callback URL on your ServiceNow instance for the Box spoke.

Before you begin

Role required: flow_designer and connection_admin.

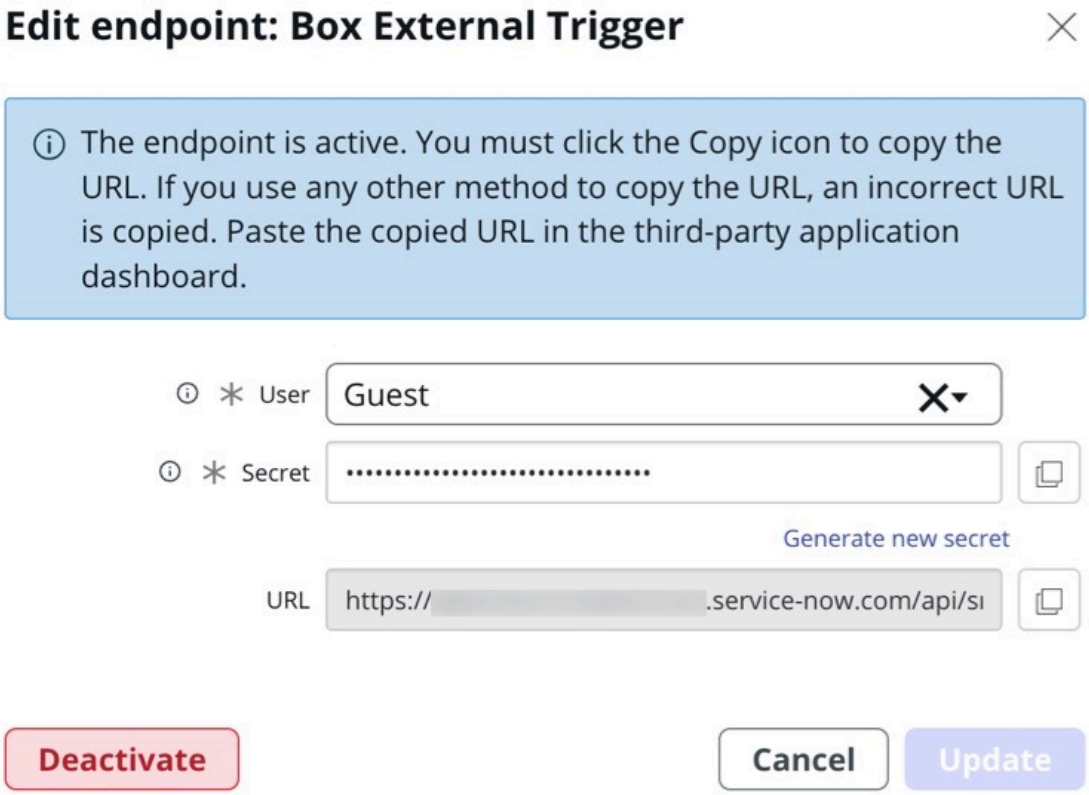
About this task

Box uses the secret and callback URL to securely send the payload to the ServiceNow instance. The ServiceNow instance verifies the secret that Box sends and accepts the payload.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Toggle and enable the **Inbound** tab.
4. Locate the **Box Spoke** card and select **View Details**.
5. Select **Configure**.
6. In the **User** field, select the user name on whose behalf the inbound session or flow is triggered.
7. In the **Secret** field, paste the value of **Primary Key** that was generated in the Box account. The secret is used to sign the payload of the webhook.
8. Select **Activate**.
   The callback URL is generated in the URL field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Close the window.

Calendly Spoke

The Calendly spoke provides actions to view and analyze meaningful usage data for Calendly software subscriptions. Analyze usage for a Calendly account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Calendly spoke v1.3.1 is the latest version. For version history of the spoke, see Calendly spoke release notes.

Spoke requirements

- Organization owner or admin role in Calendly
- LastPass Enterprise admin account

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Calendly spoke provides actions to automate Calendly tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Event Management	Cancel Event	Cancels the specified event.
	Look up Event	Retrieves the details of a specified event.
	Look up Scheduled Events Stream	Retrieves details about all scheduled events within an organization.
User Management	Invite User to Organization	Invites the specified user to the organization.
	Look up Organization	Retrieves the URI of the organization that the authenticated user currently belongs to.
	Look up Organization Members Stream	Retrieves details about all members within an organization.
	Look up User	Retrieves the details of the specified user.
	Remove User from Organization	Deletes a user's organization membership.

Note: This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Calendly spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Calendly spoke

Set up an outbound integration between your ServiceNow instance and the Calendly APIs by creating an OAuth application in Calendly and a connection and credential record on your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Calendly spoke.
- Ensure that you have a Calendly account.
- Role required: admin.

About this task

After setting the outbound integration, you can set up a flow on the Workflow Studio using the Calendly spoke actions and automate tasks in Calendly. For example, you can set up a flow that cancels an event on Calendly. The connection and credentials record contains the credentials to establish a connection with the Calendly APIs before you automate the tasks on Calendly. The OAuth application authenticates the connection request from your ServiceNow instance.

Set up an OAuth application in Calendly

Set up an OAuth application that authenticates requests from your ServiceNow instance.

Before you begin

Role required: Calendly organization owner or admin

Procedure

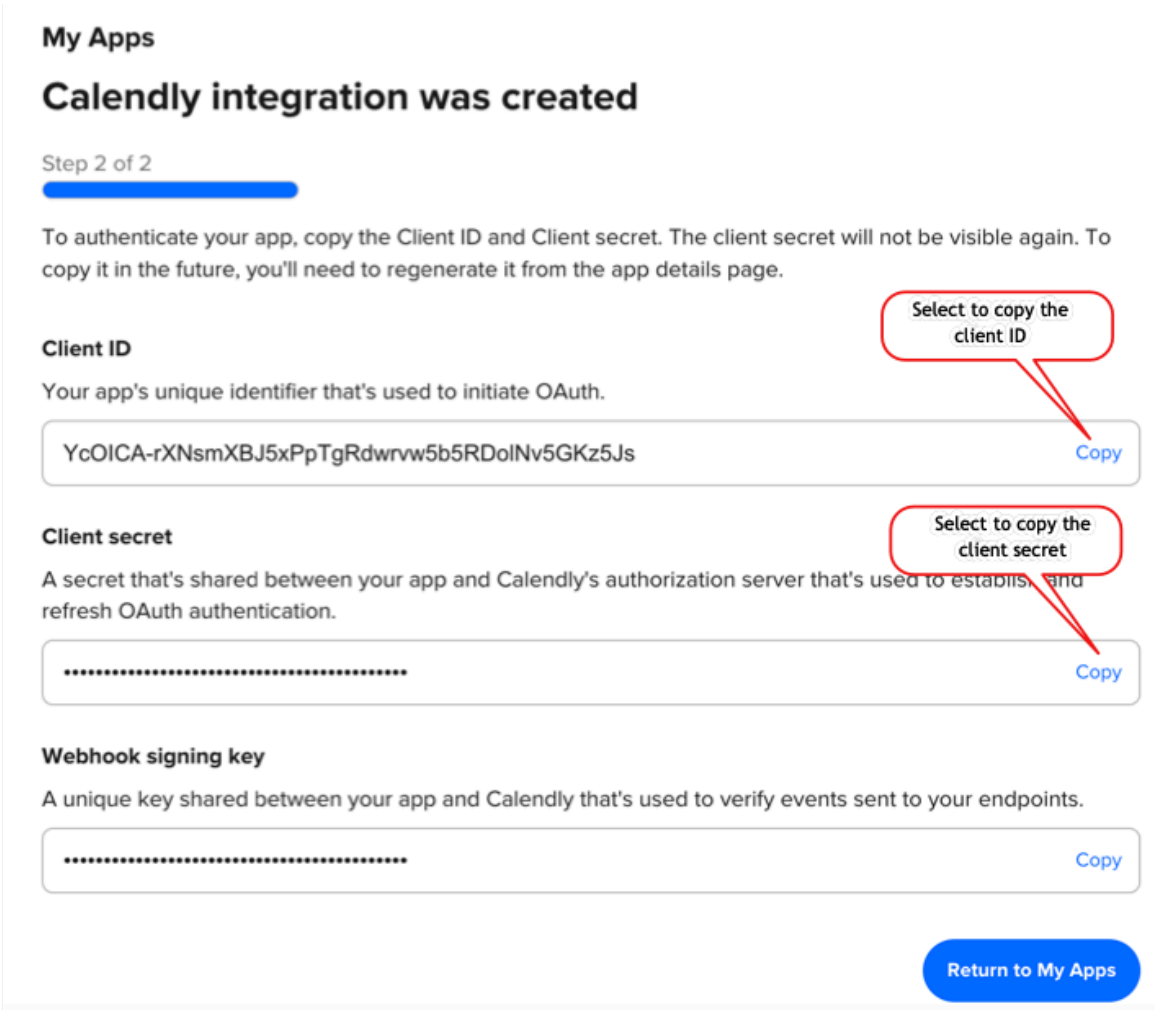
1. Go to https://developer.calendly.com/ .
2. Log in to the developer portal.
3. Select **+ Create new app**.
4. Fill the form.

Calendly OAuth app

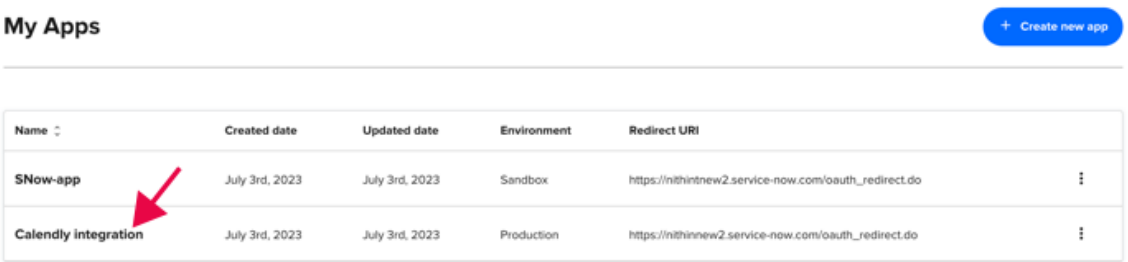
Field	Description	Mandatory?
Name of app	Custom name of the OAuth application.	Yes
Kind of app	Type of application the OAuth app will support. Select **Web**.	Yes
Environment type	Type of environment in which the OAuth app will be deployed.	Yes
Redirect URI	The URL of your ServiceNow instance.	Yes

5. Select **Save & Continue**.
   The client ID and client secret that you use in the connection and credentials record are generated.
6. To copy the client ID, select **Copy**.
7. To copy the client secret, select **Copy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select **Return to My Apps**.
   The OAuth app is created.



Create a connection and credential record

Create a connection and credential record that contains the details required to access the Calendly APIs.

Before you begin

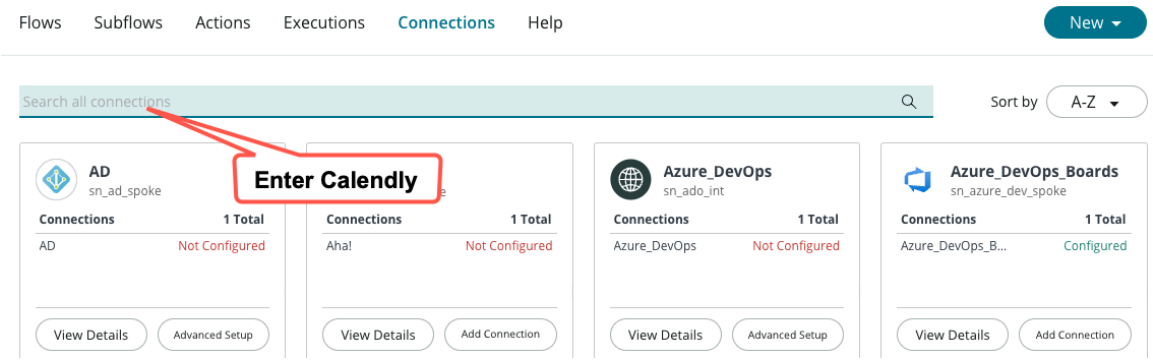
Role required: ServiceNow admin

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **Process Automation** > **Workflow Studio**.
3. Select **Integrations**.

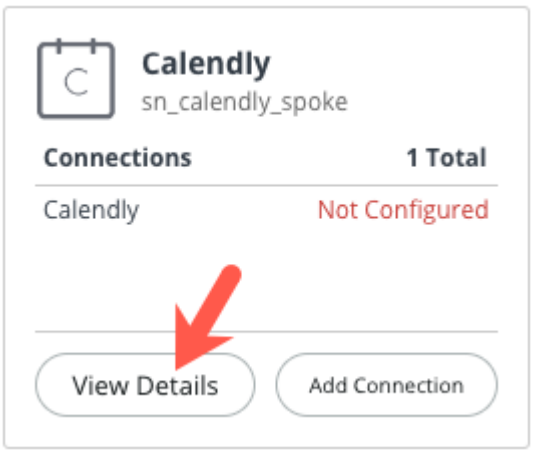
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Search all connections field, enter `Calendly`.

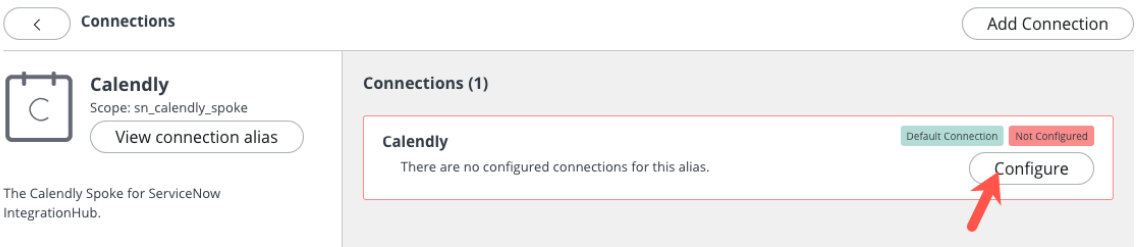


The **Outbound** tab is enabled by default. Confirm that the **Outbound** tab is enabled already.

5. On the Calendly card, select **View Details**.



6. Select **Configure**.



7. Fill the form.

Create Connection and Credential dialog box

Field	Description
Connection Name	Name of the connection. **Note:** The first and default connection name is read-only. To provide a custom name, create a connection by selecting **Add Connection**.
Connection URL	Base URL for the Calendly Application Programming Interface (API). This field is automatically set to `https://api.calendly.com`.
OAuth Client ID	Client ID that you had generated on the Calendly developers portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	To learn how to generate a client ID, see Set up an OAuth application in Calendly.
OAuth Client Secret	Client ID that you had generated on the Calendly developers portal. To learn how to generate a client secret, see Set up an OAuth application in Calendly.
OAuth Redirect URL	URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on your instance name.

8. Select **Configure and Get OAuth Token**.
9. Select **Connect to Calendly**.
   The OAuth refresh token becomes available.

10. To get the OAuth token, select **Get OAuth Token**.

> **Important:** To get the OAuth token, log in to https://calendly.com/app/login with your licensed account credentials.

Cisco Webex Meetings Spoke

Manage users of the Cisco Webex Meetings application. Get a list of all users, view user activity, and deactivate user accounts.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Cisco Webex Meetings spoke v2.3.3 is the latest version. For version history of the spoke, see Cisco Webex Meetings spoke release notes.

Supported versions

Webex Meetings XML API

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Cisco Webex Meetings spoke provides actions to automate Webex tasks when events occur in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Training Management	Look up Trainings Stream	Retrieves details of all scheduled training sessions.
Support Session Management	Look up Support Sessions Stream	Retrieves details of the previously hosted support sessions.

Note: This spoke has a Look up User action and Software Asset Management related actions only.

Webex Meetings account requirements

The Cisco Webex Meetings spoke requires creating a custom app in Cisco DevNet to generate OAuth 2.0 tokens. See Create a Webex OAuth application in Cisco DevNet.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Webex alias record to authorize actions. For information about setting up the spoke, see Set up Cisco Webex Meetings spoke.

Set up Cisco Webex Meetings spoke

Integrate your ServiceNow instance and the Cisco Webex Meetings application by creating a custom OAuth application in Cisco DevNet to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Cisco Webex Meetings spoke.
- Role required: admin.

Create a Webex OAuth application in Cisco DevNet

Create a custom OAuth application in Cisco DevNet to enable OAuth 2.0 authentication with the Cisco Webex Meetings spoke.

Before you begin

Webex Meetings requirements:

- Webex Meetings account
- Role required: Webex Meetings administrator

Procedure

1. Navigate to https://developer.webex.com/ and log in.
2. Click on your profile icon and select **My Webex Apps**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Create a New App**.
4. Click **Create an Integration**.
5. On the form, fill in the fields.

Field	Value
Integration name	Name of the integration as it appears in Webex. For example, ServiceNow integration.
Icon	Icon that displays in Webex. Upload your own icon and select from the available default icons.
App Hub Description	Short description about the integration.
Redirect URI(s)	`https://<instance-name>.service-now.com/oauth_redirect.do`, where `<instance-name>` is the name of your ServiceNow instance
Scope	Webex Meetings application scope permissions you want the application to support. **Note:** Select the **admin_schedule_read scope** for the integration.

6. Click **Add Integration**.
   After the integration is successfully created, the values of **Client ID** and **Client Secret** are displayed.
7. Record the client ID and client secret to register the application as a third-party OAuth provider on your ServiceNow instance.

Configure a connection for Cisco Webex Meetings spoke

Add and configure a Cisco Webex Meetings connection to authenticate ServiceNow requests in the Cisco Webex Meetings spoke.

Before you begin

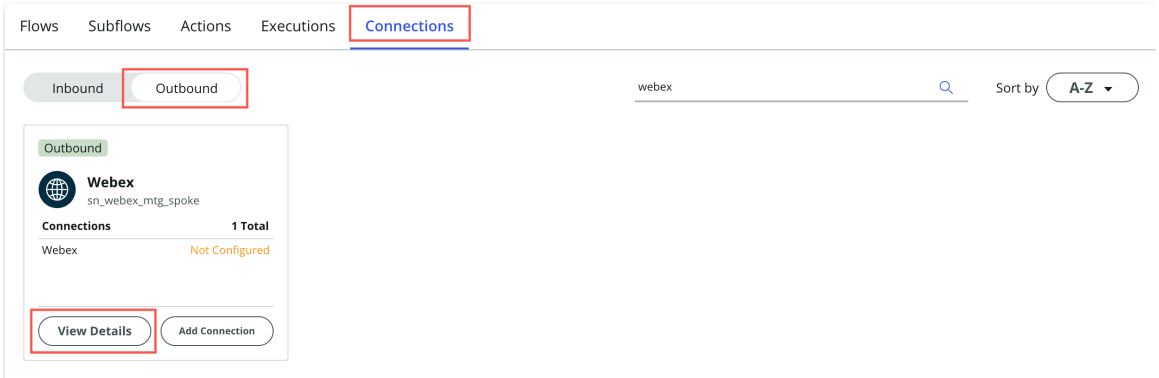
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the **Webex** connection alias and click **View Details**.

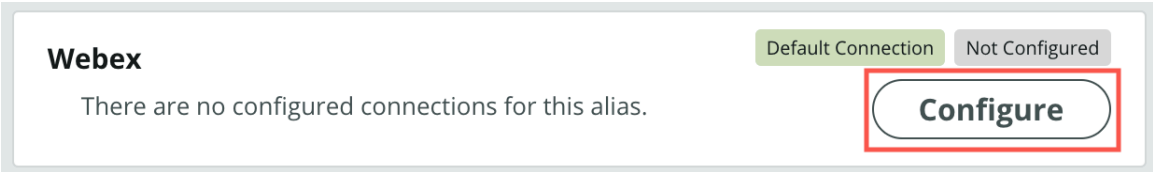
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Cisco Webex Meetings spoke, click **View Details**.



- To manage more than one Cisco Webex Meetings spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

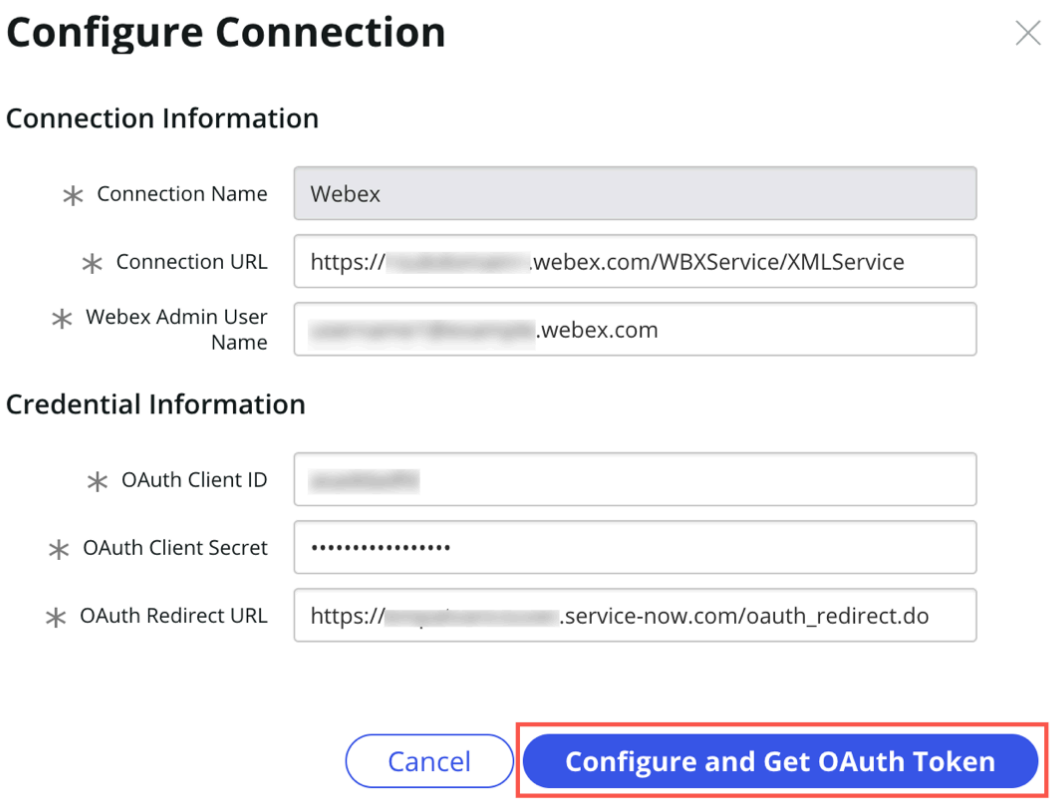


5. On the form, fill in the fields.

Connection form

Field	Description
Connection Information	
Connection URL	`https://<site>.webex.com/WBXService/XMLService`, where *`site`* is the name of your Webex site.
Webex Admin User Name	User name for the Webex administrator account.
Credential Information	
OAuth Client ID	Client ID you created during the Webex app configuration.
OAuth Client Secret	Client Secret you created during the Webex app configuration.
OAuth Redirect URL	`https://<instance-name>.service-now.com/oauth_redirect.do`, where *`instance-name`* is the name of your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Configure and Get OAuth Token**.

Result
The spoke is configured and ready to be used.

Cisco Webex Teams Spoke

Manage Cisco Webex Teams from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Cisco Webex Teams spoke v2.3.6 is the latest version. For version history of the spoke, see Cisco Webex Teams spoke release notes.

Supported versions

This spoke was built for Cisco Webex Teams v1, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

Cisco Webex Teams account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Cisco Webex Teams Spoke provides actions to automate Cisco Web Teams tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Membership Management	Create Membership	Creates membership and adds a member to a space using the specified email address. You can choose to make the member as the moderator of the space.
	Delete Membership	Removes membership from a space for the specified member.
	Get Membership	Retrieves details for a space membership.
	Look up Membership	Retrieves a list of all space memberships.
	Update Membership	Updates details of a space membership.
Message Management	Delete Message	Deletes the specified message.
	Get Message Details	Retrieves details of the specified message.
	Look up Direct Messages	Retrieves a list of messages in a direct space.
	Look up Messages	Retrieves all messages in a space.
	Post Direct Message	Posts a plain text or rich text message to a the specified email address. A file can be specified as an attachment to the message optionally.
	Post Message to Space	Posts a plain text or rich text message to the specified space. A file can be specified as an attachment to the message optionally.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Space Management	Create Space	Creates a space.
	Delete Space	Deletes the specified space.
	Get Space Details	Retrieves details of the specified space.
	Look up Spaces	Retrieves details of the spaces to which the authenticated user belongs.
	Update Space	Updates details of the specified space.
Event Management	Look up Events Stream	Retrieves all events in an organization.
People Management	Update Person	Updates details of a person.
	Delete Person	Deletes details of the specified person.
	Look up Person Details	Retrieves details of a person.
	Look up People Stream	Retrieves all people in an organization.
Organization Management	Look up Organizations	Retrieves all organizations visible to the authenticated user.
Meeting Management	Look up Meetings Stream	Retrieves a list of meetings.
License Management	Look up Licenses	Retrieves all licenses for an organization. If the organization ID is not specified, the default is the authenticated user's organization.
	Look up Roles	Retrieves all authenticated user roles.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

You can use OAuth 2.0 or the custom Cisco Webex Credentials to authenticate requests. For information about setting up the spoke, see Set up the Cisco Webex Teams spoke.

Set up the Cisco Webex Teams spoke

Integrate the ServiceNow instance and Cisco Webex Teams by creating a custom OAuth application in Cisco Webex Teams or using the custom Cisco Webex Credentials to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Cisco Webex Teams spoke.
- Role required: admin.

You can choose to use either OAuth 2.0 or the custom credentials, Cisco Webex Credentials, for authentication.

Register Cisco Webex Teams as an OAuth provider

Use the information generated during the Cisco Webex Teams application configuration to register Cisco Webex Teams as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays this message: `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, enter: `Cisco Webex Teams OAuth`
Client ID	Client ID created during the Cisco Webex Teams application configuration.
Client Secret	Client Secret created during the Cisco Webex Teams application configuration.
Authorization URL	OAuth authorization code endpoint. Enter: `https://webexapis.com/v1/authorize`
Token URL	OAuth server token endpoint. Enter: `https://webexapis.com/v1/access_token`
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`
OAuth API Script	Script to customize the request and response. Select **OauthCiscoWebexTeamsUtils**.
Logo URL	URL that contains an image to use as the application logo.
Default Grant Type	Grant type used to establish the token. Select **Authorization Code**.

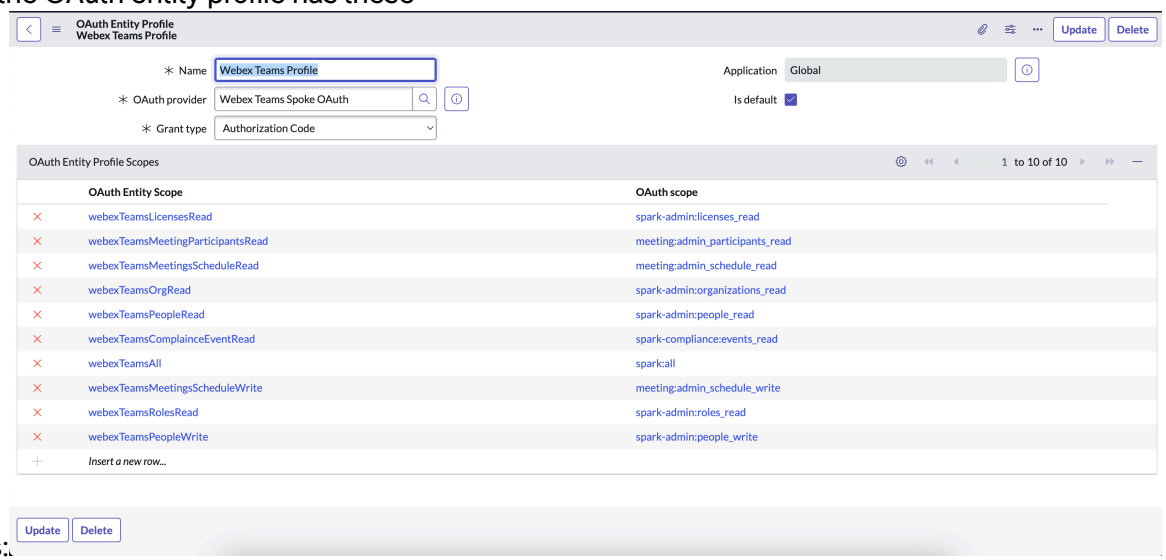
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

5. Right-click the form header, and click **Save**.

What to do next

Ensure that the OAuth entity profile has these permissions:



Create a OAuth credential record for the Cisco Webex Teams Spoke

Create a credential record for the Cisco Webex Teams account. The Cisco Webex Teams Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **OAuth 2.0 Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Cisco Webex Teams Cred.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Cisco Webex Teams as an OAuth provider. For example, Cisco Webex Teams OAuth Profile.
Applies to	Option to specify if the credential applies to all MID Servers in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use this credential in the **MID servers** field.
Order	Order to apply this credential. For example, 100.
Credential alias	Credential alias associated with the spoke.

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

Create a connection and credential alias record for the Cisco Webex Teams Spoke

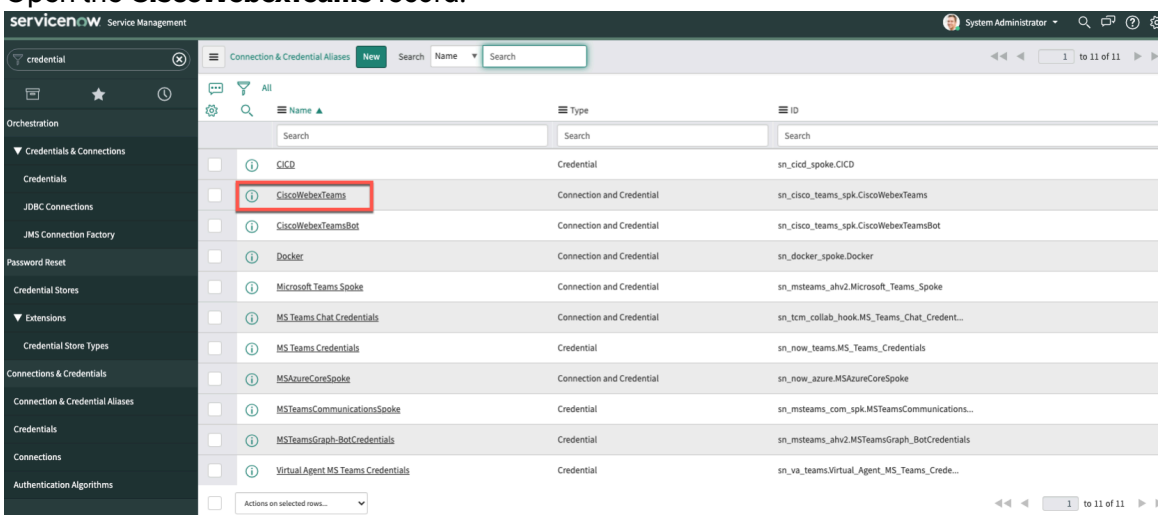
Create a credential record for the Cisco Webex Teams account. The Cisco Webex Teams Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

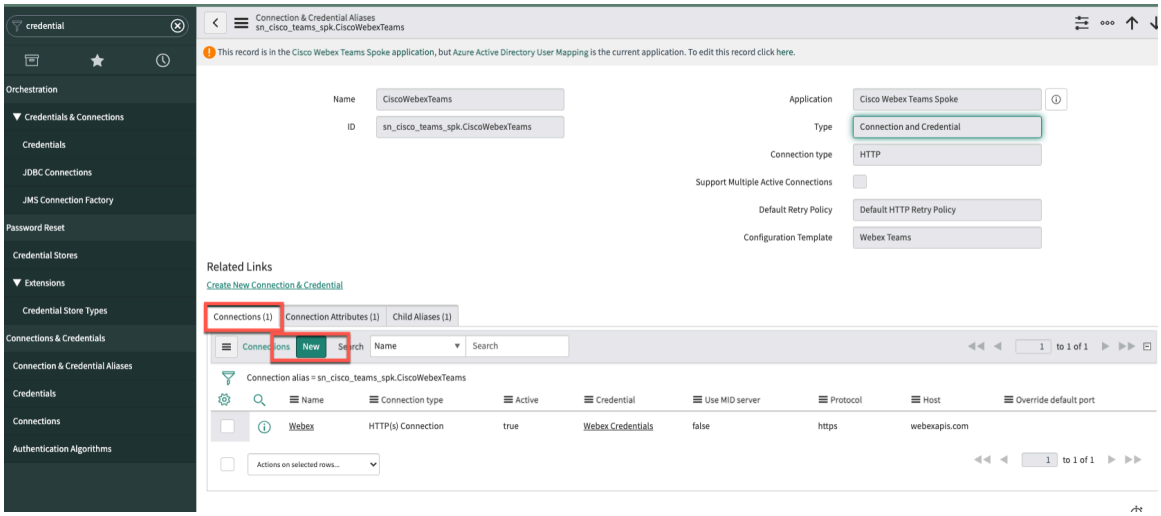
1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the **CiscoWebexTeams** record.



The **CiscoWebexTeams** Connection & Credential Aliases display.

3. Click **New** under **Connections** tab.

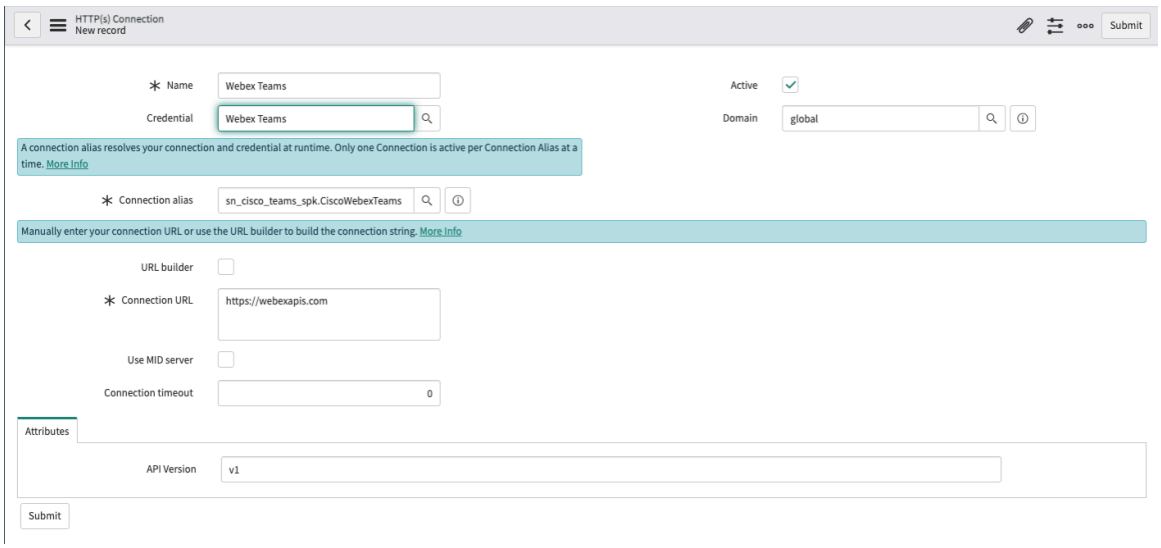
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. On the form, fill these values.

Connection & Credential for Cisco Webex Teams

Field	Description
Name	Name for the HTTPS connection record for Cisco Webex Teams spoke
Credentials	Name of the credential created for Cisco Webex Teams spoke Provide the value ceated in “Create a OAuth credential record for the Cisco Webex Teams spoke”.
Connection URL	Option to provide the connection URL. Provide the value as https://webexapis.com



5. Right-click the form header and click **Submit**.

Create a Connection & Credentials alias for Visa Spoke

Create a connection record for your . The Visa spoke connection and credential aliases use these connections to perform actions in .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for .
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `<Application-Name> Connection`.
Credential	Credential record created for Visa spoke. For example, `<Application-Name> Cred`.
Connection alias	Alias record associated with this connection.
Host	Fully qualified domain name of the target host where the server is installed. For example, `<host>.<domain>.com`.
Connection URL	Base URL to connect to . Enter:
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.

5. Click **Submit**.

Confluence Cloud Spoke

The Confluence Cloud spoke provides actions to manage groups, group members, and search content in your Confluence Atlassian account.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Confluence Cloud spoke v2.1.1 is the latest version. For version history of the spoke, see Confluence Cloud Spoke release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions

This spoke was built for the Confluence Cloud REST API.

Spoke requirements

Atlassian site admin account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Confluence Cloud spoke provides actions to automate Confluence Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Account Management	Look up Accessible Resources	Retrieves sites with scopes that are granted by the OAuth token.
Content Management	Look up Pages Stream	Retrieves a list of pages in a Confluence space. Inputs: • Page size: Limit number of pages returned per request. • Query (Optional): Use query input to filter status of pages (for example, `status=archived`). Values include: current, archived, deleted, and trashed.
	Look up Spaces Stream	Retrieves a list of Confluence spaces. Inputs: Page size. Number of Space entries expected to be fetched per page.
	Search Content	Retrieves the list of content based on the provided query.
Group Management	Look up Groups	Retrieves all groups in the Atlassian account, including default groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Members By Group ID	Retrieves all active users within the specified group.
	Remove Member From Group By Group ID	Removes a user from the specified group.
User Management	Look up Group Memberships For User	Retrieves information about the groups that the user is a member of.
	Report Personal Data	Reports a user's personal data for the specified apps.

Note: This spoke has a Look up User action and Software Asset Management related actions only.

Spoke module

The Confluence Cloud spoke adds the Confluence Cloud application to your instance and includes these modules:

Module	Description
Confluence Groups	Enables you to specify the groups that have access to Confluence products. By specifying these groups, you can manage the users within only these groups using the Confluence Cloud spoke.

Data accessed through these spoke modules is stored in these tables:

Table	Description	Fields
Confluence Groups	Displays the list of groups that have access to Confluence products.	• Group Name • Group ID

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Confluence Cloud spoke.

Set up the Confluence Cloud spoke

Integrate the ServiceNow instance and Confluence Cloud by creating a custom OAuth 2.0 application in Confluence Cloud to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Confluence Cloud spoke.
- Atlassian role required: site admin
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Obtain the value of Cloud ID

Obtain the value of Cloud ID of the cloud instance. This value is required during the configuration of the connection record in your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Log in to Atlassian Administration as an admin.
2. Click **Select** against the required organization.
3. From the **Jira Software** product, click **Manage product access**.
   A new window is opened and the URL is in this format: `https://admin.atlassian.com/s/<Cloud-ID>/apps`.
4. Copy the value of the Cloud ID for later use.

Configure a connection for the Confluence spoke

Add and configure a Confluence Cloud connection to authenticate ServiceNow requests in Confluence Cloud spoke.

Before you begin

Role required: admin

Procedure

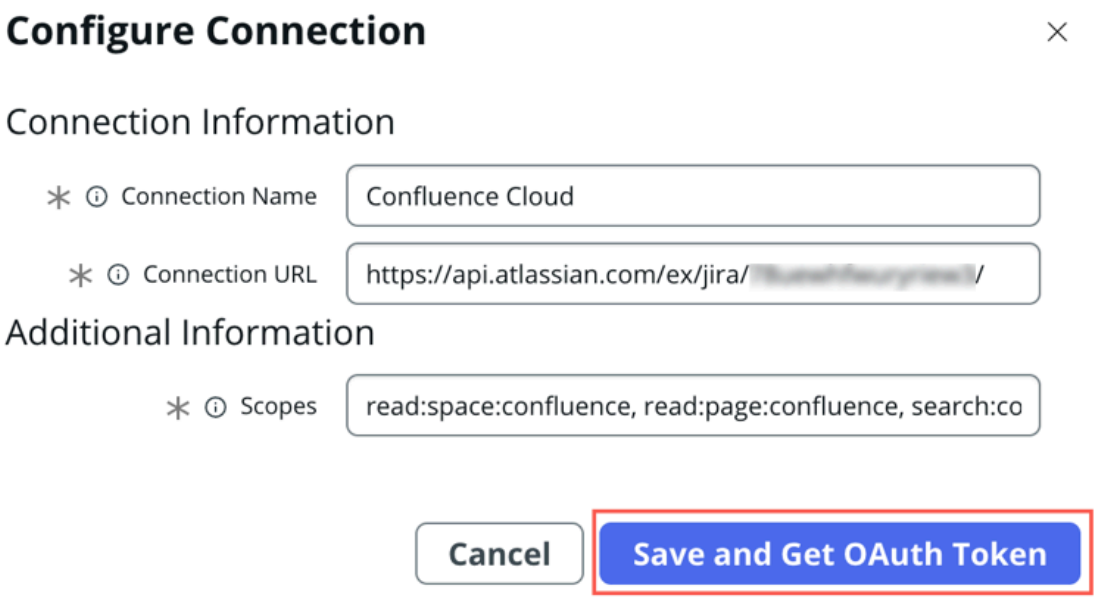
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **Confluence Cloud** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Confluence Cloud spoke, click **View Details**.
   - To manage more than one Confluence Cloud spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.
5. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection. For example, `Confluence Cloud Spoke Connection`.
Connection URL	URL of the Atlassian API endpoint: `https://api.atlassian.com/ex/jira/{cloud-id}/`. Replace `{cloud-id}` with value of the Cloud ID you had obtained previously.
Scopes	By default, these scopes are provided: `ace:confluence`, `read:page:confluence`, `search:confluence`,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`read:confluence-groups, write:confluence-groups, read:confluence-user, read:me, read:account, offline_access`. You can modify the scopes as per your requirement.



6. Click **Save and Get OAuth Token**.

Confluent Kafka REST Proxy Spoke

Integrates your ServiceNow instances with the Kafka cluster through Confluent Kafka REST Proxy API.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Confluent Kafka REST Proxy Spoke v1.0.0 is the latest version. For version history of the spoke, see Confluent Kafka REST Proxy Spoke release notes.

Supported versions

This spoke was built for Confluent REST Proxy API v2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that the dependent plugin, ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime) is installed.

Note: The plugin is a licensable feature and requires appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Confluent Kafka REST Proxy spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Action	Description
Assign Consumer Instance to Topic Partition	Assigns a list of partitions to this consumer manually.
Commit Consumer Offsets	Commits a list of offsets for the consumer. When the post body is empty, all the records that have been fetched by the consumer instance are committed.
Create a Consumer Instance within a Consumer Group	Creates a consumer instance within Kafka consumer group.
Delete Consumer Instance	Destroys the consumer instance.
Get Kafka Partition Details For A Topic	Retrieves partition details for a Kafka topic.
Get Messages	Retrieves messages from a Kafka topic.
Publish Message	Produces messages to a Kafka topic.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Confluent Kafka REST Proxy spoke.

Set up the Confluent Kafka REST Proxy spoke

Integrate Confluent Kafka REST proxy with your ServiceNow instance using basic authentication.

Before you begin

- Request an Integration Hub subscription.
- Activate the Confluent Kafka REST Proxy spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This procedure outlines steps to set up Confluent Kafka REST Proxy spoke using basic authentication. However, based on your customisations, you can also set up the spoke using ay other HTTP authentication mechanism that is currently supported by the ServiceNow Platform.

Procedure

1. Create a credential record for the Confluent Kafka REST Proxy spoke.

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.

   c. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.

   d. Enter these values.

Field	Value required
Name	Name to uniquely identify the record. For example, enter `Kafka spoke Credentials`.
User name	User name to connect to the Confluent Kafka REST Proxy API endpoint.
Password	Password to connect to the Confluent Kafka REST Proxy API endpoint.
Active	Option to actively use the record.
Order	Order to apply this credential. For example, enter `100`.

   e. Click **Submit**.

2. Create a connection record for the Confluent Kafka REST Proxy spoke.

   a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

   b. Open for the record, **Kafka REST** .

   c. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.

   d. Enter these values.

Field	Value required
Name	Name to uniquely identify the connection record. For example, enter `Kafka spoke Connection`.
Credential	Credential record you created for the Confluent Kafka REST Proxy spoke. For example, select **Kafka spoke Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Connection URL	URL to connect to the Confluent Kafka REST Proxy API.

e. Click **Submit**.

Continuous Integration and Continuous Delivery (CICD) Spoke

Build a Continuous Integration and Continuation Delivery (CICD) pipeline for your ServiceNow instances. You can automate publishing and installing applications from an application repository, activating plugins, running ATF test suites, and running an instance scan.

CICD spoke application

The CICD spoke application is installed by default from the Orlando upgrade onward.

Spoke version

Continuous Integration and Continuous Delivery (CICD) spoke v1.0.11 is the latest version.

Supported versions

Continuous Integration and Continuous Delivery (CICD) REST API version 1.0.0, which is a ServiceNow AI Platform feature active by default.

Spoke flows

This spoke has no sample flows.

Spoke subflows

The Continuous Integration and Continuous Delivery (CICD) spoke provides sample subflows in the draft state to demonstrate automating CICD tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Activate Plugin	Activate a plugin by ID on the specified instance URL.
Apply Changes From Source Control With ID	Apply remote changes from source control to an application by its Sys ID.
Apply Changes From Source Control With Scope	Apply remote changes from source control to an application by its scope name.
ATF Suite Start With ID	Start a test suite by its Sys ID on the specified instance URL. Return the test suite execution results.
ATF Suite Start With Name	Start a test suite by its name on the specified instance URL. Return the test suite execution results.

Batch Install	Given a Batch Plan in JSON format, install multiple packages (applications, customizations to store applications, and plugins) together in a single batch operation. Example JSON:
	`{`
	`"applications": [`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description

	{
	{
	"id": "syd_id_abcefghi",
	"type": "application",
	"load_demo_data": false,
	"requested_version": "1.0.2",
	"notes": "User specific text to describe this application install"
	},
	{
	"id": "syd_id_defabcde",
	"type": "application",
	"requested_version": "1.0.0",
	"requested_customization_version": "2.0.7",
	"notes": "Customization for CSM App1"
	},
	{
	"id": "com.glide.some.plugin",
	"type": "plugin",
	"load_demo_data": true,
	"notes": "Plugin related notes"
	}
	],
	"rollback_on_failure": true
	}

Batch Results	Given the sys_id of a result object, view the installation status of each package along with entire batch plan.
Batch Rollback	With a rollback ID, roll back the installation(s) of package(s) installed as a single batch.
Get Instance Scan Results	Return Instance Scan execution results by progress ID. Scan_results always return but scan_finding results display only if present.
Import Application from Source Control	Import Application from Source Control using repository URL on the given instance.
Instance Scan Execute Full Scan	Start full Instance Scan on specified instance URL. Scan runs with all active checks.
Instance Scan Execute Point Scan	Start Instance Scan on specified instance starting from a particular table and record (the table and sys_ID). Target is scanned using all relevant and applicable checks.
Instance Scan Execute Suite Scan	Start full Instance Scan on specified instance URL using a specific suite of checks.
Instance Scan Execute Suite Scan on one or more scoped apps	Start Instance Scan on specified scoped apps using checks from a specified suite ID.
Instance Scan Execute Suite Scan on one or more update sets	Start Instance Scan on the specified update sets using checks from a specified suite ID.
Install Application With ID	Install an application by its Sys ID from the application repository.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Install Application With Scope	Install an application by its scope name from the application repository.
Publish Application With ID	Publish an application by its Sys ID to the application repository.
Publish Application With Scope	Publish an application by its scope name to the application repository.
Rollback Application With ID	Roll back an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.
Rollback Application With Scope	Roll back an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.
Rollback Plugin	Roll back a plugin by ID on the specified instance URL to the last installed version.
Wait Until Tracker Completes	Wait for a tracker to complete its progress on the specified instance URL and return the results.

Spoke actions

The Continuous Integration and Continuous Delivery (CICD) spoke provides actions to automate CICD tasks when events occurs in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Application Repo	Install Application With ID	Install an application by its Sys ID from the application repository.
	Install Application With Scope	Install an application by its scope name from the application repository.
	Publish Application With ID	Publish an application by its Sys ID to the application repository.
	Publish Application With Scope	Publish an application by its scope name to the application repository.
	Rollback Application With ID	Rollback an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.
	Rollback Application With Scope	Roll back an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.
ATF	ATF Get Suite Results	Return the test suite execution results by Sys ID.
	Get Execution Tracker Progress	Return tracker progress information by Sys ID.
	Start ATF Suite With ID	Start a test suite by its Sys ID on the specified instance URL.
	Start ATF Suite With Name	Start a test suite by its name on the specified instance URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Batch Install	Batch Install	Install multiple applications at once
	Batch Results	View installation status of each package along with entire batch plan.
	Batch Rollback	With a rollback ID, roll back the installation(s) of package(s) installed as a single batch.
Instance Scan	Get Instance Scan Results	Return Instance Scan execution results by progress ID. Scan_results always display but scan_finding results display only if present.
	Instance Scan Execute Full Scan	Return Instance Scan execution results by progress ID. Scan_results always return but scan_finding results display only if present.
	Instance Scan Execute Point Scan	Start full Instance Scan on specified instance URL. Scan runs with all active checks.
	Instance Scan Execute Suite Scan	Start Instance Scan on specified instance starting from a particular table and record (the table and sys_ID). Target is scanned using all relevant and applicable checks.
	Instance Scan Execute Suite Scan on one or more scoped apps	Start full Instance Scan on specified instance URL using a specific suite of checks.
	Instance Scan Execute Suite Scan on one or more update sets	Start Instance Scan on specified scoped apps using checks from a specified suite ID.
Plugin	Activate Plugin	Activate a plugin by ID on the specified instance URL.
	Rollback Plugin	Rollback a plugin by ID on the specified instance URL to the last installed version.
Source Control	Apply Changes From Source Control With ID	Apply remote changes from source control to an application by its Sys ID.
	Apply Changes From Source Control With Scope	Apply remote changes from source control to an application by its scope name.
	Import Application from Source Control	Import Application from Source Control using repository URL on the given instance.

CICD account requirements

The Continuous Integration and Continuous Delivery (CICD) spoke requires creating basic authorization credentials. The user credentials must have either the admin or sn_cicd.sys_ci_automation roles to authorize CICD actions and flows.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the CICD alias record to authorize actions on local and remote instances. For information about setting up the spoke, see Set up the Continuous Integration and Continuous Delivery (CICD) spoke.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the CICD alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Continuous Integration and Continuous Delivery (CICD) spoke

Use basic authentication to authenticate CICD REST API calls on a ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Continuous Integration and Continuous Delivery (CICD) spoke.
- Role required: admin or sn_cicd.sys_ci_automation.

Create Credential records for the Continuous Integration and Continuous Delivery (CICD) spoke

Create Credential records to the ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `CICD Credentials`.
User name	The ServiceNow instance user name that authorizes and runs spoke actions and flows. This user must have either the admin or sn_cicd.sys_ci_automation roles.
Password	The password for the ServiceNow instance user.
Active	Enable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Order	Select the order to apply this credential. For example, enter `100`.

5. Click **Submit**.

Create Connection records for the Continuous Integration and Continuous Delivery (CICD) spoke

Create Connection records to your ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) spoke connection and credential alias uses these connections to perform actions on your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **CICD**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP or HTTPS Connection form.
4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `CICD Connection`.
Credential	Select the Credential record you created for CICD. For example, select **CICD Credentials**.
Connection URL	The URL of the ServiceNow instance on which the spoke runs actions and flows.

5. Click **Submit**.

Cornerstone Spoke

Manage employee records, approvals, and employee learning in your Cornerstone instance from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Cornerstone spoke v1.4 is the latest version. For version history of the spoke, see Cornerstone spoke release notes.

Supported versions

This spoke was built for Cornerstone version v2, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke flows

The Cornerstone spoke provides a sample flow in the draft state to demonstrate automating the Cornerstone tasks. The sample flow, Cornerstone - Pull Todos Details, retrieves the list of Todos for the required user. Ensure that this user is added to your ServiceNow instance. The retrieved records can be accessed by navigating to the TO DO Lists module in the Cornerstone application of your instance.

To customize the sample flow, copy it to a new application scope.

Spoke subflows

The Cornerstone spoke provides sample subflows in the draft state to demonstrate automating Cornerstone tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Cornerstone - Get Certificate Transcript Details	Retrieves the certificate information of the required employee.
Cornerstone - Get Transcripts	Retrieves the transcript information of the required employee.
Cornerstone - Remove Dangling To Do	Deletes the dangling Todo records. Some of the retrieved Certificate records may not have values set for the **Status** and **Launch URL** fields. The Cornerstone - Remove Dangling To Do action deletes such todo records.

Spoke actions

The Cornerstone spoke provides actions to automate Cornerstone tasks when events occurs in ServiceNow. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permission Required	OAuth 2.0 Scope
Core Management	Look up Approval Details Stream	Retrieves information about the pending approvals.	Request Items - View, Manage Employee Relationships	approval:read
	Look up Organizational Units Stream	Retrieves the list of organization units based on organization unit type.	No permission required.	ou:read
	Global Search Stream	Searches for the required people, training, certification, and so on.	No permission required.	globalsearch:read
Employee Management	Create Employee	Creates an employee record and retrieves core employee data from Cornerstone.	Employee API - Edit	No OAuth scope required.
	Get Custom Fields For Employee Stream	Retrieves custom fields for an employee from Cornerstone.	Employee API - View/View - Constrainable	No OAuth scope required.
	Look up Employees Stream	Retrieves core data of the required employees in Cornerstone.	Employee API - View/View - Constrainable	No OAuth scope required.
	Update Employee	Updates details of the required employee in Cornerstone.	Employee API -Edit	No OAuth scope required.
Learning Management	Look up Approvals Stream	Retrieves the pending approvals of the manager or approver.	No permission required.	approval:read
	Look up Assigned Trainings	Retrieves details of the trainings assigned to a user.	No permission required.	transcript:read
	Look up Catalog Search Stream	Retrieves details of the required training.	Course Catalog - View	training:read
	Look up Certification	Retrieves certification transcript	No permission required.	certification:read

Category	Action	Description	Permission Required	OAuth 2.0 Scope
	Look up Trainings From Data Exporter Stream	Retrieves the main view to get training data.	Reporting API	Reporting API
	Look up Transcripts From Data Exporter Data Stream	Retrieves the main view to get all user transcript related data.	transcript_core	Reporting API
	Look up Training Local From Reporting Data Stream	Retrieves the main view to get the training's local data.	Reporting API	Reporting API

Spoke module

The Cornerstone spoke adds a Cornerstone application to your ServiceNow instance. The Cornerstone application has the TO DO Lists module. List of Todos that the sample flow, Cornerstone - Pull Todos Details, retrieves for the specified user, can be accessed here.

Cornerstone spoke account requirements

If you want to use the default settings and permissions provided along with the spoke, you can install the ServiceNow tile on the Cornerstone Marketplace. For more information about registering an application, see Register an OAuth Application in Cornerstone Online Help. Record the generated Client ID and Client Secret for later use.

If you want to configure and customise the spoke as per your requirement and provide additional permissions, register an OAuth 2.0 application in your Cornerstone account to generate OAuth 2.0 tokens for the Cornerstone spoke. For more information, see API Management in the Cornerstone online help . Record the generated Client ID and Client Secret for later use.

Connection and credential alias requirements

Integration hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Cornerstone spoke.

Set up the Cornerstone spoke

Integrate your Cornerstone application with your ServiceNow instance. Register an OAuth application in Cornerstone and authenticate requests from ServiceNow.

Before you begin

- Request an Integration Hub subscription.
- Activate the Cornerstone spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register an application in the Cornerstone instance

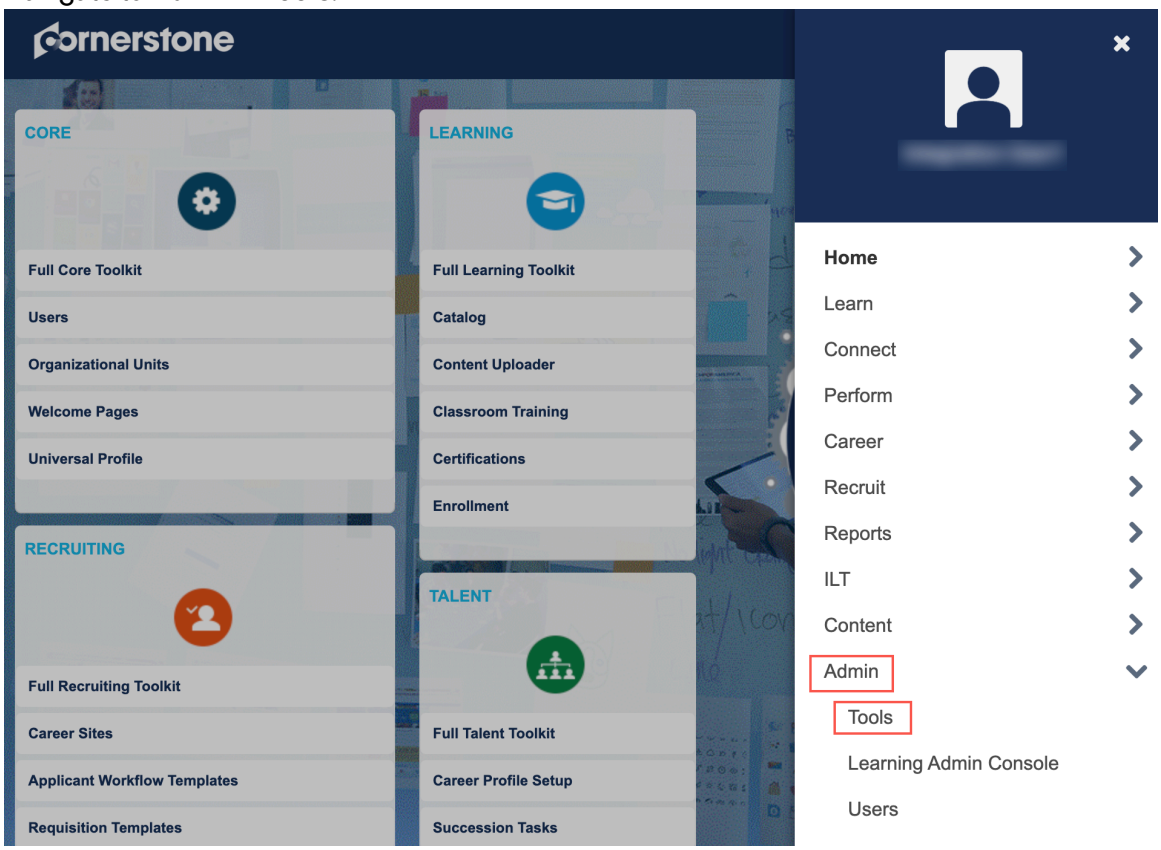
Register an application in the Cornerstone instance and record the generated Client ID and Client Secret for later use.

Before you begin

Role required: admin

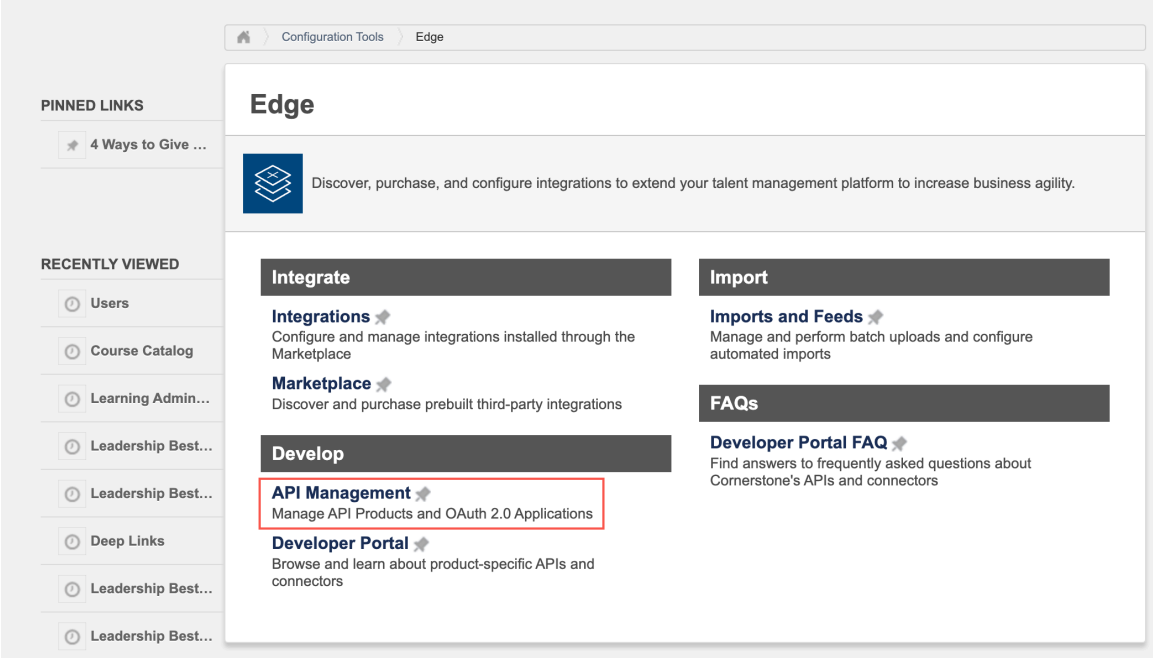
Procedure

1. Log in to the Cornerstone instance as an admin.
2. Navigate to **Admin** > **Tools**.



3. Click **EDGE**.
4. Click **API Management** under **Develop**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



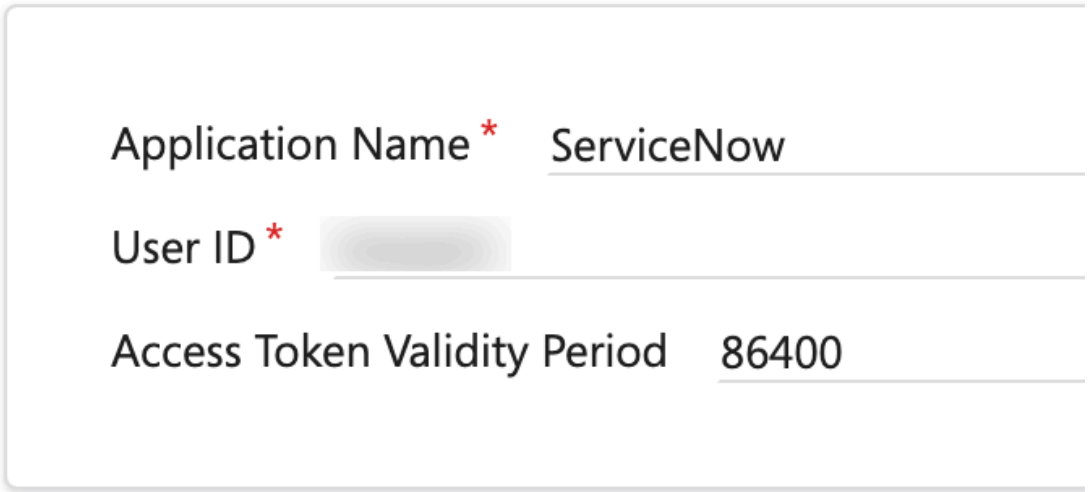
The API Management window is displayed in a new browser tab.

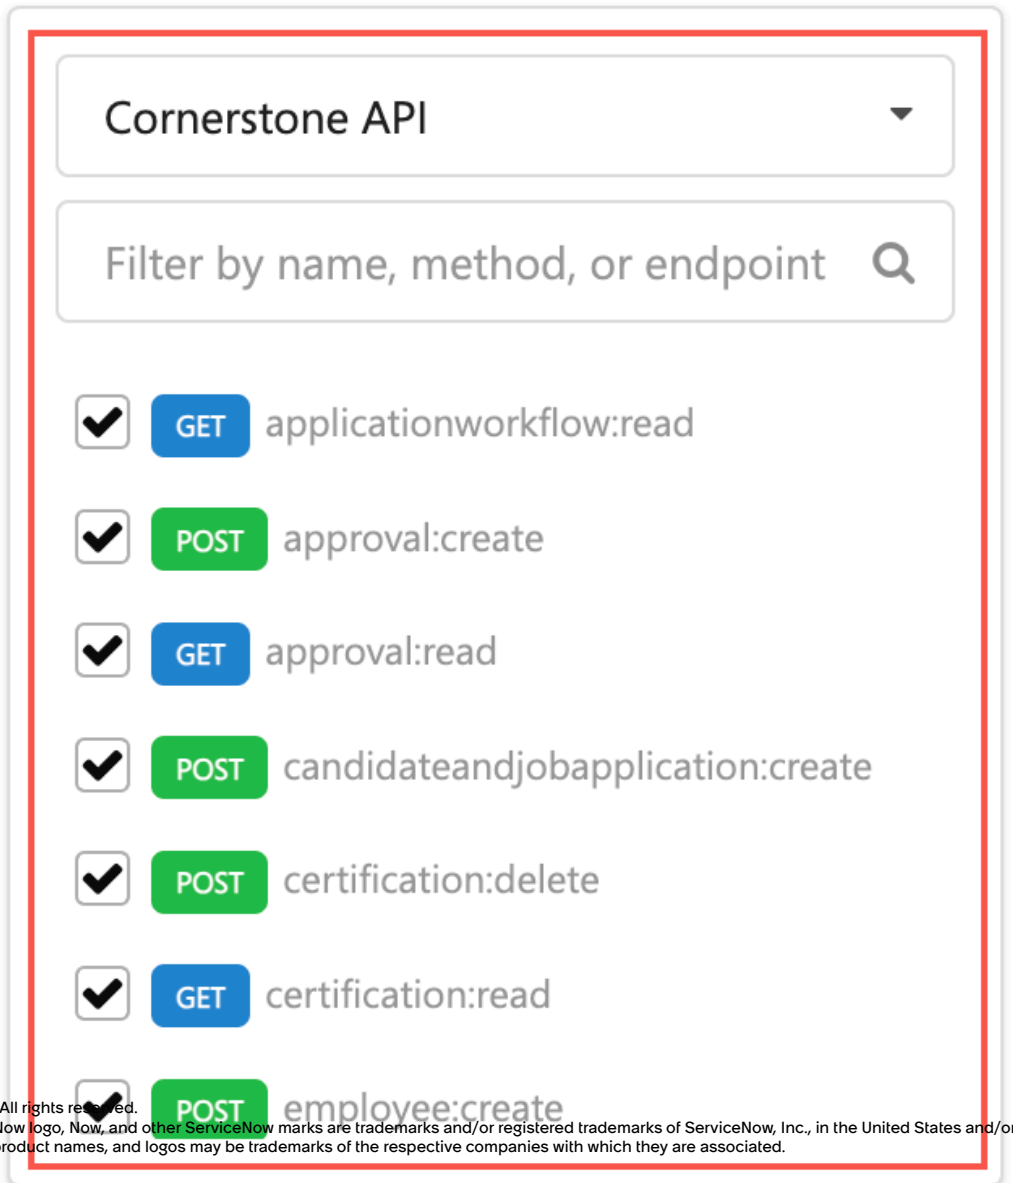
5. Click the **Manage OAuth 2.0 Applications**.
6. Click **+ Register New Application**.
7. On the form, fill the values.

Field	Description
Application Name	Name to identify the application.
User ID	User ID for an active user account in your Cornerstone portal.

8. Select the scopes as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Click **Register Application**.
   The values of Client ID and Client Secret are generated. Copy and record these values for later use.

Configure connection for the Cornerstone spoke

Add and configure a Cornerstone connection to authenticate ServiceNow requests in Cornerstone spoke.

Before you begin

Role required: admin.

Procedure

1. Navigate to **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Locate the **Cornerstone** connection alias in the outbound connections.
4. Click **View Details**.

   Note: Don't click **Add Connection**.

5. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.
6. On the form, fill in the fields.

Configuration form

Field	Description
Connection Name	Name to identify the connection record.
Connection URL	URL of the Cornerstone instance.
Base URL	URL of the Cornerstone instance.
OAuth Entity Name	Name to identify the application registry record.
OAuth Client ID	Client ID created during the application configuration in Cornerstone.
OAuth Client Secret	Client Secret created during the application configuration in Cornerstone.
Token URL	OAuth server token endpoint. For example, `https://<Cornerstone-Instance>.com/services/api/oauth2/token`.

7. Click **Configure and Get OAuth Token**.

Result

The spoke connection is configured and ready to be used.

Coupa Spoke

Manage business spend and automate approval, contract, inventory, purchase order, requisition, supplier, and user management in Coupa from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Coupa spoke v4.17.0 is the latest version. For version history of the spoke, see Coupa Spoke release notes.

Supported versions

This spoke was built for Coupa version stable_v4.2.0, but may be compatible with later versions.

Spoke requirements

Create an API key in your Coupa instance and record the API key for later use. See Coupa documentation for information about creating API key.

Spoke user roles

The following user roles are available with the spoke:

- Coupa Admin (sn_coupa_spoke.Coupa Admin): Users with this role have access to both, **My Current Approvals** and **Contracts** modules.
- Coupa Approval User (sn_coupa_spoke.Coupa Approval User): Users with this role have access only to the **My Current Approvals** module
- Coupa Contract User (sn_coupa_spoke.Coupa Contract User): Users with this role have access only to the **Contracts** module.

Spoke module

The Coupa spoke adds a Coupa application to your ServiceNow instance. The Coupa application supports Coupa Approval User and Coupa Contract User roles. You can access the Coupa application from the ServiceNow instance on your Now Mobile app.

Note: Make sure that Coupa Login attribute and the user ID of ServiceNow instance match before using the **My Current Approvals** module.

The Coupa application has the following modules.

Module	Description
My Current Approvals	Displays the list of approvals in Coupa for a user.
Contracts	Displays a list of contracts in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available sample conversational subflows

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

Sample conversational subflows

Conversational subflow	Description
Look up Suppliers - Sample	Retrieves the specified supplier in Coupa using the Coupa query.
Look up Purchase Orders - Sample	Retrieves the specified purchase order in Coupa using the Coupa query.
Look up Contracts - Sample	Retrieves the specified contract records in Coupa using the Coupa query.
Look up Receipts - Sample	Retrieves the specified receipts in Coupa using the Coupa query.
Look up Invoices - Sample	Retrieves details of the specified invoices in Coupa.
Look up Approvals - Sample	Retrieves details of approvals in Coupa.
Look up Requisitions - Sample	Retrieves the specified requisitions in Coupa using the Coupa query.

Spoke actions

The Coupa spoke provides actions to automate approval, contract, inventory, invoice, catalog item, purchase order, requisition, supplier, and user management when events occur in ServiceNow. Available actions include:

Category	Action	Description
Approval Management	Approve Approval Request	Approves the required approval request in Coupa.
	Look up Approval Details by Approval ID	Retrieves the details of the required approval in Coupa.
	Look up Approval	Looks up an approval record in Coupa using the Coupa query.
	Look up Approval By Requisition ID	Looks up the required approval record in Coupa using its Requisition ID.
	Look up Approvals Stream	Retrieves details of approvals in Coupa.
	Reject Approval Request	Rejects the required approval request in Coupa.
Catalog Management	Create Item	Creates an item in Coupa.
Contract Management	Create Contract	Creates contract with the provided details in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Contracts Stream	Looks up the required contract records in Coupa using the Coupa query.
Primary Data Management	Look up Addresses Stream	Retrieves the address details from Coupa.
	Look up Conversion Rates Stream	Retrieves details of the conversion rates in Coupa.
	Look up Currencies Stream	Retrieves details of currencies in Coupa.
	Look up Legal Entities Stream	Retrieves details of the legal entities in Coupa.
	Lookup Cost Centers Stream	Retrieves details of the cost centers in Coupa.
	Look up Advanced Shipment Notices Stream After Updated Date	Retrieves details of advance shipment notices after filtering by the specified updated at field in Coupa.
	Look up Advance Shipment Notice by Purchase Order Line ID	Retrieves details of the advance shipment notice for the specified purchase order line ID.
	Look up Advanced Shipment Notices by Purchase Order Line ID Stream	Retrieves details of all advance shipment notices for the specified purchase order line ID. **Note:** This is a data stream action.
	Look up Accounts Stream	Retrieves details of the chart of accounts in Coupa.
Inventory Management	Create Goods Receipt	Creates a goods receipt record in Coupa.
	Create Receipt	Creates a receipt in Coupa. **Note:** Ensure that description has the exact item name. When you want to access the item name in a flow, use the description data pill.
	Get Receipt Fields	Retrieves the list of fields in the Coupa Receipts table. **Note:** This is a metadata action and doesn't make an API call to Coupa.
	Look up Advanced Shipment Notices After Updated Date	Retrieves the details of the advance shipment notices after the updated date in Coupa.
	Look up Advance Shipment Notice By Purchase Order Line ID	Look up an advance shipment notice by purchase order line ID in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Receipt	Looks up the required receipt in Coupa using the Coupa query.
	Look up Receipt Details by Receipt ID	Retrieves details of the required receipt.
	Look up Receipts Stream	Looks up the required receipts in Coupa using the Coupa query.
	Void Receipt	Makes the required receipt void.
Invoice Management	Create Invoice	Creates an invoice with the provided details in Coupa.
	Update Invoice	Updates the details of the specified invoice in Coupa.
	Void Invoice	Makes the required invoice void.
	Look up Invoices Stream	Retrieves details of the required invoices in Coupa.
	Look up Invoice Payments Details Stream	Retrieves information about the required invoice payment details in Coupa.
	Bypass Approval	Bypasses the approvals for the specified invoice in Coupa.
	Submit Invoice	Submits the specified invoice in Coupa.
Item Management	Look up Items Stream	Looks up the required items in Coupa using the Coupa query.
	Look up Item	Looks up the required item in Coupa using the Coupa query.
	Look up Commodities Stream	Retrieves commodity records from Coupa based on the specified filter criteria.
Purchase Order Management	Cancel Purchase Order	Cancels the required purchase order in Coupa.
	Close Purchase Order	Closes the required purchase order in Coupa.
	Create Fixed Assets	Creates fixed assets with the specified details in Coupa.
	Create Purchase Order	Creates a purchase order in Coupa.
	Look up PO Line by Line ID	Retrieves details of a purchase order line in Coupa.
	Look up Purchase Order	Looks up the required purchase order in Coupa using the Coupa query.
	Look up Purchase Orders Stream	Looks up the details of the purchase orders in Coupa that you specify using the Coupa query.
	Revise Purchase Order	Revises or updates the purchase order in Coupa.
	Update Purchase Order Status in Coupa	Updates status of the required purchase order in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Requisition Management	Create Draft Requisition	Creates a requisition in Coupa with its status as Draft.
	Create Requisition	Creates a requisition with the status as Pending Approval or Pending Buyer Action.
	Get Requisition Fields	Retrieves the list of fields in the Coupa Requisitions table. **Note:** This is a metadata action and doesn't make an API call to Coupa.
	Look up Requisition	Looks up the required requisition in Coupa using the Coupa query.
	Look up Requisitions Stream	Looks up the required requisitions in Coupa using the Coupa query.
	Update Requisition	Updates an existing requisition in Coupa.
Sourcing Management	Award Purchase	Awards a purchase in Coupa. To award a purchase, you can specify the quote request ID and the quote supplier ID as inputs.
	Create Sourcing Event	Creates a sourcing event in Coupa.
	Look up Sourcing Quote Response Stream	Looks up the quote response in Coupa based on the quote request ID that you specify. You can also specify other criteria such as the limit of records that the response returns, and the offset.
	Look up Sourcing Events Stream	Retrieves details of the required sourcing event in Coupa.
Supplier Management	Look up Supplier	Looks up the required supplier in Coupa using the Coupa query.
	Create Supplier	Creates a supplier in Coupa.
	Deactivate Supplier	Deactivates the specified supplier in Coupa.
	Update Supplier	Updates details of the specified supplier in Coupa.
	Look up Product Catalogs Stream	Retrieves the product catalogs in Coupa.
	Look up Suppliers Stream	Retrieves list of suppliers in Coupa using the query.
	Look up Suppliers Payment Stream	Retrieves details of the required supplier payments in Coupa.
	Create Supplier Payment Information	Creates supplier payment information in Coupa.
	Update Supplier Payment Information	Updates supplier payment information in Coupa.
	Get Supplier Fields (Metadata)	Retrieves the list of fields in the Coupa Suppliers table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
		Note: This is a metadata action and doesn't make an API call to Coupa.
User Management	Look up User	Looks up the required user in Coupa using the Coupa query.
	Look up Users Stream	Looks up the required users in Coupa using the Coupa query.
	Reset User Password	Resets password of the required user in Coupa.

Note: Remote tables are created when the Coupa spoke is activated. Users are cautioned against directly modifying schema or inserting data in these tables.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
Coupa sourcing management AI agent	Manages sourcing data (that is, looks up sourcing event streams, creates new sourcing events) in Coupa.
Coupa approval management AI agent	Manages approvals (that is, looks up approvals, retrieves approval details) in Coupa.
Coupa requisition management AI agent	Manages requisition (that is, looks up operations to retrieve requisition data) in Coupa.
Coupa purchase order management AI agent	Manages purchase orders (that is, closes purchase orders, retrieves detailed purchase order information, and creates fixed assets) in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent	Description
Coupa invoice management AI agent	Manages invoices (that is, creates invoices, retrieves invoice details, and queries payment details) in Coupa.
Coupa inventory management AI agent	Manages inventories (that is, looks up receipt details, manages advanced shipment notices, and creates goods receipts) in Coupa.
Coupa supplier management AI agent	Manages supplier information (that is, creates, retrieves supplier and product catalog information) in Coupa.
Coupa item management AI agent	Manages items (that is, look up items and retrieve item streams) in Coupa.
Coupa primary data management AI agent	Manages primary data (that is, looks up conversion rates, cost centers, currencies, and legal entities) in Coupa.
Coupa user management AI agent	Manages users (that is, reset user passwords, look up individual user details, and retrieve streams of user data) in Coupa.
Coupa catalog management AI agent	Creates a catalog item in Coupa.
Coupa contract management AI agent	Manages contracts (that is, looks up or creates a contract) in Coupa.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Coupa spoke

Integrate the ServiceNow instance and Coupa by creating a custom OAuth application in Coupa to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Coupa spoke.

  Note: If you are upgrading to version 4.0.0 from the previous versions (3.0.3 and earlier) of the spoke, see this KB article: KB0550471.

- Role required: admin.

Configure a connection for Coupa spoke

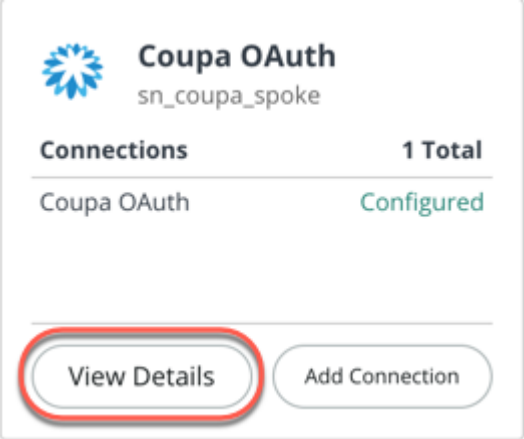
Add and configure a Coupa connection to authenticate ServiceNow requests in Coupa spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

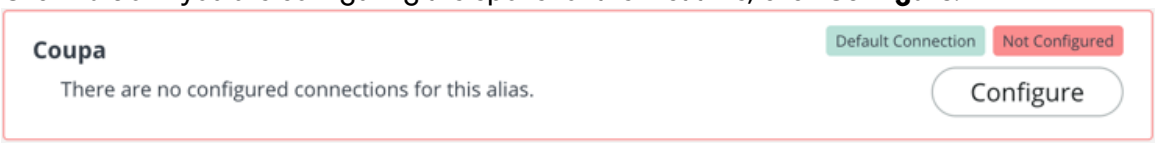
Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select **Integrations**.
3. Locate the **Coupa OAuth** connection alias and click **View Details**.

   Note: Don't click **Add Connection**.



4. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.



5. On the form, fill in the fields.

Configuration form

Field	Description
Name (Connection)	Name to uniquely identify the connection. For example, `Coupa spoke connnection`.
Connection URL	URL to make a connection to Coupa. ○ For customer instances, use this format: `https://{organization_name}.coupahost.com` ○ For partner and demo instances, use this format: `https://{organization_name}.coupacloud.com`
Name (Credential)	Name to uniquely identify the credential. For example, `Coupa spoke credential`.
Token URL	URL used to generate OAuth token. Use this format:`https://<connection_url>/oauth2/token`
OAuth Client ID	Identifier (Client ID) generated in Coupa.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Client Secret	Secret (Client Secret) generated in Coupa.

6. Click **Configure and Get OAuth Token**.

Result
The spoke connection is configured and ready to be used.

Craft spoke

Manage alerts and retrieve company information from Craft from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Craft spoke v1.1.0 is the latest version. For version history of the spoke, see Craft Spoke release notes.

Supported versions

This spoke was built for Craft version v1, but may be compatible with later versions.

Spoke requirements

Craft account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Remote Tables (com.glide.script.vtable)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Craft spoke provides sample flows to demonstrate automating the Craft tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
Create Incident if Company is not Active	Fetches company data using the required fragments aliases. If the company is not active, an incident with a description and a short description is created.

Spoke actions

The Craft spoke provides actions to automate Craft tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Alert Management	Look up Alerts Stream	Retrieves the list of alerts from Craft.
Company Data Management	Look up Added Companies Stream	Retrieves the list of added companies from Craft.
	Look up Company Data	Retrieves the company information for the specified details.
	Look up Company Details by Name.	Retrieves the company information for the specified company name.

Spoke module

The Craft spoke adds the Craft Spoke application to your instance and includes these modules:

Module	Description
Craft Alerts	Lists the alerts that are retrieved from the Import Craft Alerts import.
Query Fragments	Lists all the query data about the company such as company name, company ID and so on.

Data accessed through these spoke modules is displayed in these Remote tables:

Note: When you open a remote table, the actions you've set up run in the background to fetch information from Craft. This information displays in the table. When you close the remote table, the information is deleted.

Table	Description
Recently added companies	Retrieves the list of companies that were activated in the last 7 days.
Recent Craft alerts	Runs the remote Recent Craft Alerts remote definition in the background and retrieves the list of all alerts. **Note:** You can customize the alert filter by modifying the script in the Recent Craft Alerts remote definition.

Import set

The Craft spoke adds this Import in the integrations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import	Description
Import Craft Alerts	Retrieves the alerts from Craft and stores them in the Crafts Alerts table.

Set up the Craft spoke

Integrate the ServiceNow instance and Craft spoke by using the basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Craft spoke.
- Role required: admin.

Configure a connection for Craft spoke

Add and configure a Craft spoke connection to authenticate ServiceNow requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio.**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **sn_craft_spoke** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Azure DevOps Boards spoke, click **View Details**.

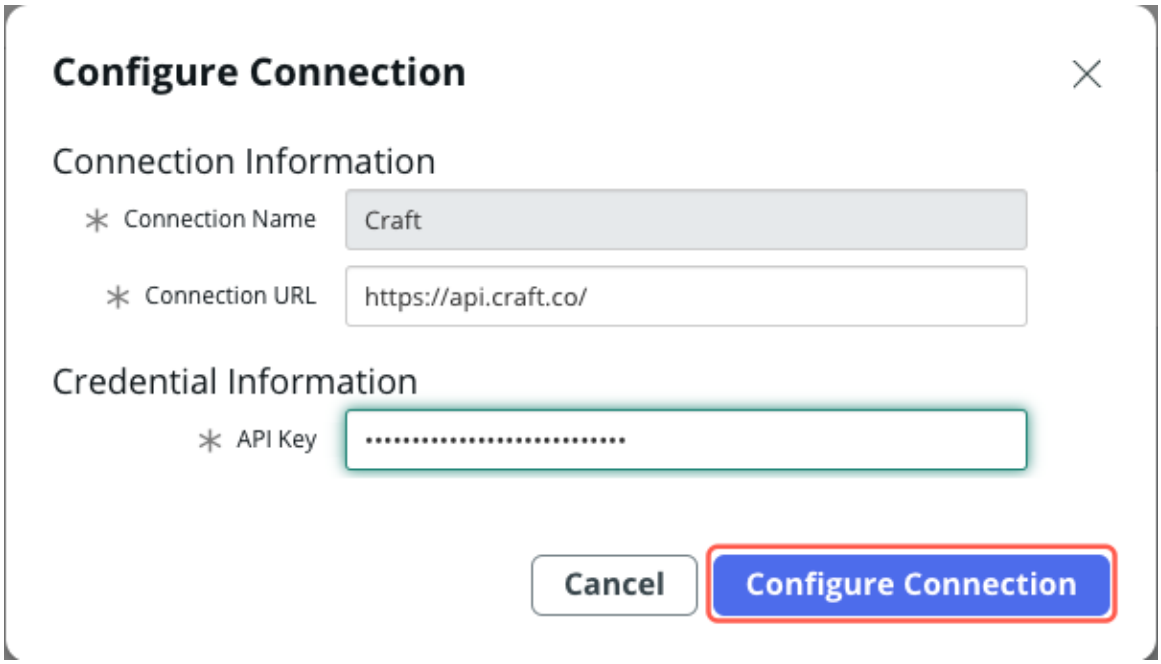
   - To manage more than one Azure DevOps Boards spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Configure Connection** form, fill in the fields.

Field	Description
Connection name	Name to uniquely identify the connection record. For example, `Craft connection`.
Connection URL	URL of the Craft instance. For example, enter the URL in this format: `https://api.craft.co/`
API Key	API key from your Craft account.



6. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Credly spoke

Credly integration helps employees prove, manage, and showcase their skills more effectively, addressing common issues related to skill verification, visibility, recognition, and career development.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Credly spoke v1.0.0 is the latest version. For version history of the spoke, see Credly Spoke release notes.

Supported versions

This spoke was built for brazil, and is compatible with later Washington DC and Xanadu versions.

Key features

Credly enables a flow designer to:

- Sync employee badges
- Accept/reject badges

Spoke requirements

A valid Credly account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed: Credentials core

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Credly provides sample flows to demonstrate automating the Talent Development Core tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Credly event processing	Fetches employee badges to sync from Credly.

Spoke subflows

The Credly spoke provides sample subflows to demonstrate automating Talent Development Core tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Process credly event	Processes the credly event that was triggered.

Spoke actions

The Credly provides actions to automate Talent Development Core tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Retrieving information	Process event information	Retrieves the event process information.
	Gen organization name	Retrieves the employee's organization name.
	Get event details	Retrieves the event details.
	Get employee data	Retrieves the employee data.

Spoke module

Data accessed through these spoke modules is stored in these tables:

Table	Description
Credly Event Log	Retrieves the list of events that were created.

Spoke user roles

The Credly provides these user roles to control access to data:

User role	Description
Admin	Role that is authorized to sync employee badges.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Credly spoke

Integrate the ServiceNow instance and Credly by creating a custom OAuth application in Credly to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Credly spoke.
- Role required: admin

Create a connection record for Credly spoke

Create a connection record for your Credly spoke. The Credly connection and credential aliases use these connections to perform actions in Credly.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record for **Credly**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `<Credly spoke> Connection`.
Credential	Credential record created for Credly. For example, `<Credly spoke> Cred`.
Connection alias	Alias record associated with this connection.
URL builder	Option to use the URL builder to build the connection string.
Connection URL	Base URL to connect to **Credly**. Enter:
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.
Override default port	Target port used by the connection. If blank, the system uses the default port.
Use MID server	Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.
Attributes	
Organization ID	The ID of the employee's organization in Credly.

5. Select **Submit**.

CrowdStrike Spoke

Manage licenses for CrowdStrike Falcon protection suite by fetching details of devices with active Falcon sensors installed and checking license compliance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

CrowdStrike spoke v1.1.0 is the latest version. For version history of the spoke, see CrowdStrike spoke release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

CrowdStrike account with a Falcon administrator role.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate licenses when used outside the spoke implementation.

Spoke actions

The CrowdStrike spoke provides actions to automate CrowdStrike tasks when events occur in your ServiceNow instance.

Category	Action	Description
Host Management	Look up Active Hosts	Retrieves all active hosts. Active hosts are the hosts on which the last_seen date is greater than the date provided in the **Active Since** field.
	Look up Host Details	Retrieves details of the hosts for the Device IDs passed in the **Host IDs** field.
Sensor Management	Look up Hourly Sensor Usage	Retrieves a daily breakdown of your Customer Identification (CID) average hourly sensor usage by sensor category. **Note:** The usage data is retrieved up to two days prior to the current date.
	Look up Weekly Sensor Usage	Retrieves a daily breakdown of your CID average weekly sensor usage by sensor category. **Note:** The usage data is retrieved up to two days prior to the current date.

Note: This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Register a CrowdStrike OAuth application

Register the CrowdStrike OAuth application to access the CrowdStrike API and to receive a Client ID and Client secret.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The CrowdStrike Integration Hub spoke must be active. For more information, see CrowdStrike spoke.

Role required: CrowdStrike Falcon administrator

Important:

- To use the Sensor Usage APIs, your API client must be assigned the Sensor usage scope with read permissions.
- To use the Look up Hourly Sensor Usage and Look up Weekly Sensor Usage actions, contact your account team to enable the following feature flags:
  - Hourly usage data feature flag: This flag must be enabled for your Customer Identification (CID) to view hourly usage data.
  - Aggregated usage data feature flag: This flag must be enabled to get aggregated usage data in multi-CID (non-Flight Control) accounts.

Procedure

1. Log in to Falcon using your admin credentials.
2. Navigate to **Support** > **API Clients and Keys**.
3. Select **Add new API Client**.
4. Provide the client name and description.
5. Select the appropriate check boxes for the following scopes:
   - To use the Look up Active Hosts and Look up Host Details actions, select the **Read** check box for the **Hosts** scope.
   - To use the Look up Hourly Sensor Usage and Look up Weekly Sensor Usage actions, select the **Read** check box for the **Sensor usage** scope
   - To use all the supported actions, select the **Read** check box for both **Hosts** and **Sensor usage** scopes.
6. Select **ADD**.
   The API client created screen is displayed.
7. Copy the Client ID and Client secret for later use.

Create a CrowdStrike connection

Create a connection between your CrowdStrike applications and your ServiceNow instance so that your instance can retrieve user data from your applications.

Before you begin

ServiceNow Role required: admin

Procedure

1. Log in to your ServiceNow instance.
2. Navigate to **Connection & Credentials** > **Connection & Credentials Aliases**.
3. Locate your CrowdStrike connection and select **Create New Connection & Credential**.
4. In the dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential dialog box

Field	Value
Connection Information	
Connection Name	Name of the CrowdStrike connection. This field populates automatically.
Connection URL	URL for the connection. This field is automatically set to `https://api.crowdstrike.com`. Each CrowdStrike cloud has a different base URL. Use the base URL that corresponds to the cloud where your integration is hosted. ○ **US-1**: `https://api.crowdstrike.com` ○ **US-2**: `https://api.us-2.crowdstrike.com` ○ **EU-1**: `https://api.eu-1.crowdstrike.com` ○ **US-GOV-1**: `https://api.laggar.gcw.crowdstrike.com` ○ **US-GOV-2**: `https://api.us-gov-2.crowdstrike.mil`
Credential Information	
OAuth Client ID	Client ID that you generated while configuring the CrowdStrike API settings.
OAuth Client Secret	Client Secret that you generated while configuring the CrowdStrike API settings.
OAuth Redirect URL	`https://<instance name>/oauth_redirect.do`, where the instance name is the name of your ServiceNow instance.

5. Select **Create and Get OAuth Token**.
   The OAuth token is generated successfully.

Databricks Spoke

Retrieves details of warehouses, tables, schemas, and catalogs, and executes SQL statements in Databricks from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Databricks Spoke v1.0.1 is the latest version. For version history of the spoke, see Databricks Spoke release notes.

Supported versions

This spoke was built for these versions of Databricks, but may be compatible with later versions:

Action category	Databricks version
Unity Catalog Management	API version 2.1
SQL Management	API version 2.0

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Databricks spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Look up Catalogs	Retrieves list of all catalogs.
Look up Schemas	Retrieves list of all schemas from a specific catalog.
Look up Tables	Retrieves list of all tables from a specific schema in a catalog.
Sample - Execute Databricks SQL Statement	Executes a SQL statement on Databricks and returns the result columns and data array.

Spoke actions

The Databricks spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
SQL Management	Execute SQL Statement	Executes the provided SQL statement.
	Look up Execution Status	Retrieves the execution status of a SQL statement.
	Look up Result Chunk by Index	Retrieves a specific chunk of the result set for a SQL statement by chunk index. **Note:** If the data you want to retrieve is more than 5MB, modify the default value of the system property *glide.pf.rest.response_payload_max_size* and increase it as per your requirement.
	Look up Warehouses Stream	Retrieves a list of SQL warehouses.
Unity Catalog Management	Look up Catalogs	Retrieves details of the required number of catalogs. **Note:** To retrieve list of all catalogs, use the Look up Catalogs subflow.
	Look up Schemas	Retrieves details of the required number of schemas from a specific catalog. **Note:** To retrieve list of all schemas from a specific catalog, use the Look up Schemas subflow.
	Look up Tables	Retrieves details of the required number of tables from a specific schema in a catalog. **Note:** To retrieve list of all tables from a specific schema in a catalog, use the Look up Tables subflow.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

Set up the Databricks spoke

Integrate your ServiceNow instance and the Databricks workspace by using an OAuth secret to authenticate the ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Databricks spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an OAuth secret in Databricks workspace

Create an OAuth secret in Databricks workspace to authenticate the ServiceNow requests.

Before you begin
Role required: admin

Procedure

1. Log in to the Databricks workspace as an admin.
2. Click the user icon and click **Settings**.
3. Under **Workspace admin**, click **Identity and access**.
4. On the Identity and access page, for **Service principals** click **Manage**.
5. On the Service principals page, click **Add service principal**.
6. On the Add service principal form, click **Add new**.
7. On the Add service principal form, select the **Databricks Managed** option and for **Service principal name**, enter a name to identify the record.
8. Click **Add**.
   Service principal is added to the workspace and the list of service principals records is displayed.
9. Click and open the service principal record you have created.
10. Click the **Secrets** tab.
11. Under **OAuth secrets**, click **Generate secret**.
12. On the Generate OAuth secret form, for **Lifetime (days)** enter the required number of days the secret should be valid for.
13. Click **Generate**.
    The values of **Secret** and **Client ID** are generated.
14. Copy the values of **Secret** and **Client ID** for later use and click **Done**.
15. **Optional:** Click the **Permissions** tab.
16. **Optional:** Click **Grant access**.
17. **Optional:** On the Grant access to others form, select **User, Group or Service principal** and **Permission** as per your requirement and click **Save**.

Configure a connection for the Databricks spoke

Configure a connection to your Databricks workspace. The Databricks spoke connection and credential aliases use these connections to perform actions in the Databricks workspace.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **Databricks** and click **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Databricks spoke, click **View Details**.

- To manage more than one Databricks spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Auto-generated name to identify the connection record.
Connection URL	URL of the Databricks workspace.
Credential Information	
OAuth Client ID	Client ID you created in the Databricks workspace.
OAuth Client Secret	Key value you created in the Databricks workspace.
OAuth Redirect URL	Redirect URL of your ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.

6. Click **Configure and Get OAuth Token**.

Docker Spoke

Lookup Docker data from your ServiceNow instance. Automate changes in the Docker engine when an event occurs in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Docker spoke v2.4.3 is the latest version. For version history of the spoke, see Docker spoke release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

Community Edition version 18.09.0.

Spoke actions

The Docker spoke provides actions to automate Docker tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Images Management	Create An Image	Creates an image in the Docker instance.
	List Images	Lists images from the Docker instance.
	Remove An Image	Removes an image from the Docker instance.
	Search Images	Searches for images on Docker Hub.
Services Management	Create A Service	Creates a service in the Docker instance. Services are tasks run on a swarm.
	Delete A Service	Deletes a service from the Docker instance.
	Inspect A Service	Returns detailed information about a service in the Docker instance.
	Update A Service	Updates a service to the swarm on the docker instance.
	List Services	Returns a list of services from the Docker instance.
Containers Management	Create A Container	Creates a container in the Docker instance.
	Inspect A Container	Inspects a container in the Docker instance.
	Kill A Container	Kills a container in the Docker instance.
	List Containers	Lists containers in the Docker instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Pause A Container	Suspends all processes in a container on the Docker instance.
	Remove A Container	Removes a container from the Docker instance.
	Rename A Container	Renames a container in the Docker instance.
	Restart A Container	Restarts a container in the Docker instance.
	Start A Container	Starts a container in the Docker instance.
	Stop A Container	Stop a container in the Docker instance.
	Unpause A Container	Unpauses a container in the Docker instance.
	Update A Container	Updates a container in the Docker instance with the provided values.
	Wait for A Container	Blocks all processes until a container stops, then returns the exit code for the container on the Docker instance.
Executions Management	Create An Exec Instance	Creates an exec instance in Docker, through which you can run a new command in a running container. To execute a command in a container, create and start an exec instance.
	Inspect An Exec Instance	Inspects an exec instance in Docker.
	Start An Exec Instance	Starts an exec instance in Docker, through which you can run a new command in a running container.
Networks Management	Create A Network	Creates a network on the Docker instance.
	Inspect A Network	Returns detailed information about a network in the Docker instance.
	List Networks	Returns a list of networks from the Docker instance.
	Remove A Network	Removes a network from the Docker instance.
Volumes Management	Create A Volume	Creates a volume in Docker.
	Inspect A Volume	Returns detailed information about a volume in Docker.
	List Volumes	Returns a list of volumes from Docker.
	Remove A Volume	Removes a volume from the Docker instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Swarm Management	Delete A Node	Deletes a node from the Docker instance.
	Initialize A New Swarm	Initializes a new Docker swarm. A swarm is a group of machines running Docker joined into a cluster.
	Inspect Swarm	Returns detailed information about a Docker swarm.
	Join An Existing Swarm	Joins a node to a swarm as a manager or worker node based on the Docker token.
	Leave A Swarm	Removes a Docker instance from a swarm.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Docker alias record to authorize actions. To use the spoke connection alias, create an associated Connection record. This spoke does not require a credential record. For information about setting up the spoke, see Configure a connection for Docker spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Docker alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Docker spoke

Integrate the ServiceNow instance and Docker spoke by using the Docker Connection and Credential alias to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Docker spoke.
- Role required: admin.

Configure a connection for Docker spoke

Add and configure a Docker connection to authenticate ServiceNow requests in Docker spoke.

Before you begin

Role required: admin

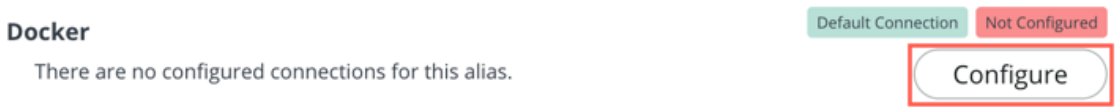
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the **Docker** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Docker spoke, click **View Details**.

   - To manage more than one Docker spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

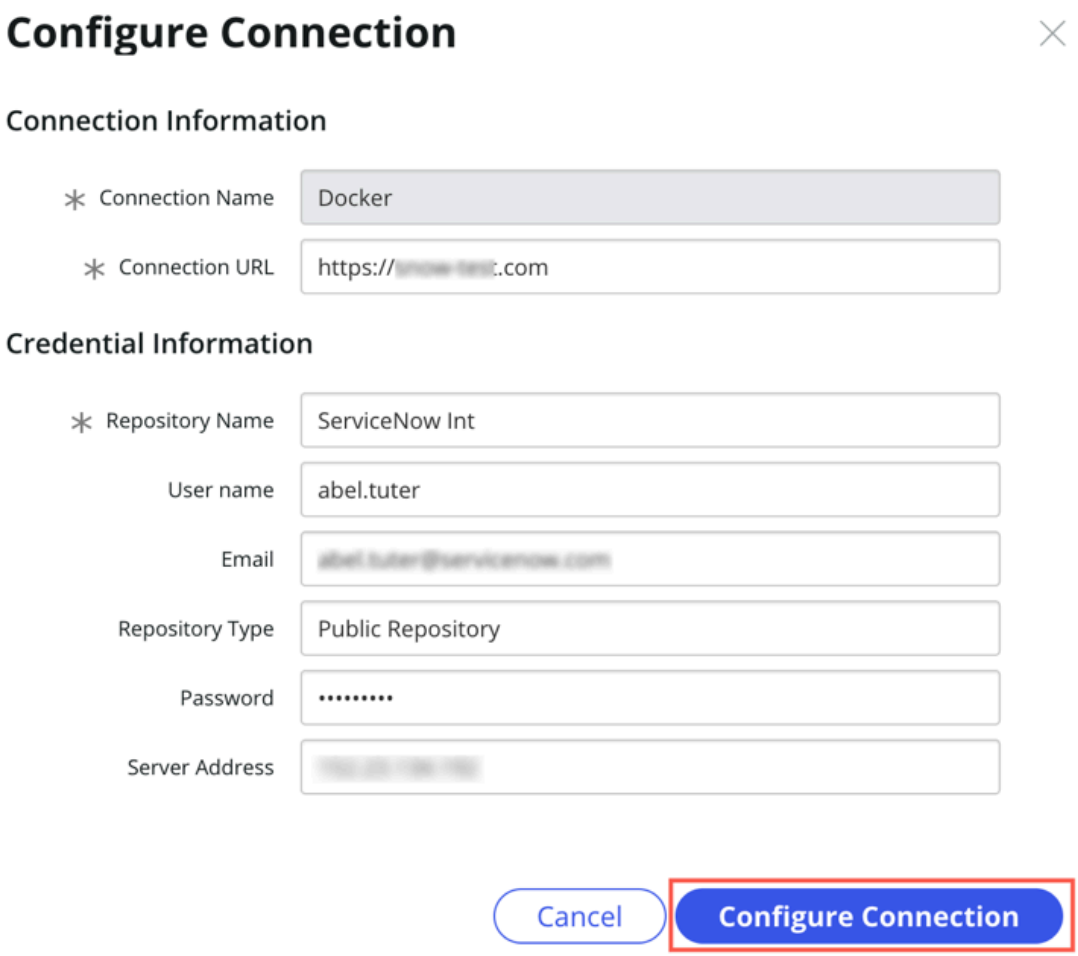


5. On the Configure Connection form, fill in the fields.

Connection Name	Name to uniquely identify the connection record. For example, `Docker connection`.
Connection URL	IP address and port of the host server where Docker is installed. The format of the URL should be: `https://<ip_address>:<port_number>` or `https://<provider-domain-name>.com`.
Repository Name	Name of the repository.
User name	User name of your Docker account.
Email	Email address used in your Docker account.
Repository Type	Type of the Docker repository.
Password	Password of your Docker account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Server Address	IP address of the host server where Docker is installed.



6. Click **Configure Connection**.

Result
The spoke connection is configured and ready to be used.

Docusign eSignature Spoke

Automate the process of sending a document to an individual or list of recipients for digital signature using Docusign eSignature. For example, automate employee onboarding and offboarding, or send non-disclosure agreements, legal agreements, and statements of work. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Docusign eSignature spoke v4.5.1 is the latest version. For version history of the spoke, see Docusign eSignature Spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Compatible versions

This spoke was built for Docusign eSignature API version v2 or v2.1, but may be compatible with later versions.

Key features

Docusign eSignature spoke enables a flow designer to:

- Automate the process of sending a document from a ServiceNow attachment or Docusign eSignature template to an individual or recipient list for digital signature.
- Discover and synchronize Docusign eSignature accounts and templates in ServiceNow.
  - Retrieve a list of accounts and associated templates from Docusign eSignature and then insert or update them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusign_templates] tables using the Get Accounts subflow.
  - Retrieve templates associated with a specified Docusign eSignature account and then insert or update them as records in the Templates [sn_docusign_spoke_docusign_templates] table using the Get Templates Per Account subflow.
- Copy and customize sample flows for sending templates and on-demand document requests.
- Pause a flow until a document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Attach a completed Docusign eSignature document to a ServiceNow record for auditing purposes.
- Manage envelopes and users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke requirements

- Docusign eSignature account
- Docusign eSignature administrator credentials
- Docusign eSignature application configured to integrate with ServiceNow
- Docusign eSignature application details such as client ID, integrator key, secret keys, and RSA keypairs
- ServiceNow IntegrationHub subscription

Note: Ensure that you have activated the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin.

See the Docusign Developer Center documentation for instructions on creating and configuring custom applications.

Spoke flows

The Docusign eSignature spoke provides sample flows to demonstrate automating Docusign tasks. Use Docusign eSignature spoke actions to automate any tasks desired by your organization. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Send a Document for Digital Signature	Sends a document to Docusign for a digital signature when a Service Catalog request is created by the **Send a Document for Digital Signature** item. Before using this flow, activate the **Send a Document for Digital Signature** catalog item.
Send employment offer to candidate using Docusign template	Sends a Docusign envelope to a user using a template. For example, use this flow to send a job offer to a candidate. Before using this flow, activate the **Demonstrate Template - Send Job Offer to Candidate** catalog item.

The Docusign eSignature spoke adds catalog items for use with the Docusign eSignature spoke sample flows. Before triggering a Docusign eSignature spoke sample flow, activate these catalog items.

Catalog item	Description
Send a Document for Digital Signature	Sends a document for digital signature in Docusign.
Demonstrate Template - Send Job Offer to Candidate	Sends a job offer using a Docusign template.

Spoke subflows

The Docusign eSignature spoke provides sample subflows to demonstrate automating Docusign tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Subflow	Description
Envelope Management	Attach Docusign Envelope To ServiceNow Record	Attaches all the documents in an envelope to a ServiceNow record.
	Get & Set Docusign Field Data	Processes a list of catalog item variables and updates a draft envelope with each variable value.
User Management	Create User	Creates a user including the permission profile and group memberships.
	Update User	Updates a user including the permission profile and group memberships.
Templates Management	Get Templates Per Account	Retrieves templates from a Docusign account and stores them in the Templates table.
Default	Docusign Webhook Sample Subflow	Retrieves the recipient details for the specified envelope.
Account Management	Get Accounts	Retrieves Docusign Accounts and Templates related to every account and store them in Accounts and Templates table respectively.

Spoke actions

The Docusign eSignature spoke provides actions to automate Docusign tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Account Management	Look up Account Signature Providers	Retrieves a list of signature providers that the specified account can use.
	Look up Accounts by Alias	Retrieves accounts associated with the spoke Connection and Credential alias record.
	Look up Role ID	Retrieves the roles ID for the specified role name.
Bulk Envelopes Management	Create Bulk Send List	Creates a bulk send list.
	Create Bulk Send Request	Creates a bulk send request based on an existing bulk send list using an envelope or template.
	Create Bulk Send Test Request	Creates a bulk send test request for testing compatibility with the existing envelope or template.
	Delete Bulk Send List	Deletes the specified bulk send list.
	Look up Bulk Send Batch	Retrieves the envelopes from the specified bulk send batch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Envelopes Stream	
	Look up Bulk Send Batch Status	Retrieves the general status of the specified bulk send batch such as number of successes, number pending, number of errors and so on.
	Look up Bulk Send Batches Stream	Retrieves the information of the bulk send batches.
	Look up Bulk Send List	Retrieves the specified bulk send list.
	Look up Bulk Send Lists	Retrieves a list of the bulk send lists.
	Update Bulk Send Batch Action	Performs a bulk action (resend, correct or void) on the specified bulk send batch.
	Update Bulk Send Batch Status	Updates the name of the specified bulk send batch.
	Update Bulk Send List	Updates the specified bulk send list.
Document Signature	Look up Embedded Signing URL	Creates a signing URL that is embedded into an application. User can sign the document without leaving the application. **Note:** Signing URL is active for 300 seconds and can be sent to one recipient at a time.
	Look up Embedded Signing URL Inline	Retrieves a URL which enables you to embed the recipient view of the on Docusign.
Document Management	Add Document to Envelope	Adds documents to envelope.
	Attach Combined Document to ServiceNow Record	Attaches Docusign documents to a ServiceNow record.
	Attach Docusign Document	Retrieves a signed Docusign document and attaches it to a ServiceNow record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	to ServiceNow Record	
	Look up Document ID by Name	Retrieves the document ID from an envelope using the specified document name.
	Look up Documents in an Envelope	Returns a list of documents with an ID and name in the given Docusign envelope.
	Replace Document in an Envelope	Replaces documents to envelope.
Envelope Management	Add Recipient to Envelope	Adds the specified recipient to the specified envelope. **Note:** • Recipient ID used in this action is associated with the envelope and is different from the Recipient ID used in the Get All Template Fields action. • Administrator enters a numeric value for this Recipient ID.
	Add Recipients to Envelope	Adds the specified recipients to the specified envelope.
	Attach Docusign Certificate To ServiceNow Record	Attaches a Docusign certificate to a ServiceNow record.
	Cancel Envelope	Cancels an in-process envelope.
	Create Draft Envelope from Template	Creates a draft envelope from an existing Docusign template.
	Create Envelope from Composite Template	Creates an envelope from an existing composite template.
	Look up Field ID	Retrieves the ID of the specified field from the specified draft envelope.
	Look up Field Value	Retrieves the value of the specified field from the specified envelope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Fields	Retrieves the list of fields associated to a document in a draft envelope.
	Look up Recipient ID by Role Name	Retrieves the recipient ID of the specified role name from the specified envelope.
	Look up Recipients in an Envelope	Returns a list of recipients with a Recipient ID and Role Name in the given Docusign envelope.
	Remove Recipient from Envelope	Deletes a recipient from a Docusign envelope.
	Send Adhoc Signature Request to User	Sends a Docusign document associated with the specified ServiceNow record to the specified recipient for signature.
	Send Adhoc Signature Request To Users - Inline	Sends one or more uploaded documents from a ServiceNow record to multiple recipients.
	Send Envelope	Sends an envelope to the specified recipients. **Note:** All recipient details must be provided before sending an envelope.
	Resend Envelop	Send a reminder to recipients who are currently the pending signers.
	Lock Envelop	Locks the specified envelope and sets the time until the lock expires to prevent other users or recipients from changing the envelope.
	Unlock Envelope	Unlocks the specified locked envelope.
	Set Field Value	Sets the value of the specified field in the specified draft envelope.
	Set Field Values	Assigns the values of multiple fields associated to a document in a draft envelope.
	Wait for Signature from Docusign	Pauses a flow until the specified document has been signed or rejected. Returns the status of the document to the flow for further processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Remove Recipient from Envelope	Deletes a recipient from an envelope. Prior to using this action, Create Draft Envelope from Template action should be used to generate a draft Envelope.
	Upsert Recipients for Envelope	Updates or adds recipients to the envelope. If a recipient with the specified recipient ID already exists, their information will be updated; otherwise, a new recipient will be created with the provided details. Prior to using this action, Create Draft Envelope from Template action will be used to generate a draft Envelope.
Group Management	Add User To Group	Adds user from a group.
	Look up Group ID	Retrieves a group ID for the specified role name.
	Remove User From Group	Removes the specified user from a group.
Template Management	Look up Templates Per Account	Retrieves the templates associated with the specified Docusign account.
	Look up Template Fields	Retrieves all fields in a template that is defined for a recipient. **Note:** • Recipient ID used in this action is associated with the template and is different from the Recipient ID used in the Add Recipient to Envelope action. • Value of the Recipient ID is a unique system-generated number.
	Look up Template Recipients	Retrieves all recipients defined for a template.
User Management	Create User	Creates a Docusign user with the specified user details.
	Look up User Detail	Retrieves details for a user.
	Update User	Updates the specified user.
	Delete User	Deletes the specified Docusign user.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
Docusign eSignature account management AI agent	Manages account management (that is, looks up accounts by alias, retrieves role IDs and identifies account signature providers) in Docusign.
Docusign eSignature envelope management AI agent	Manages envelope management (that is, sendS signature requests, manages envelope statuses, and attaches DocuSign data to ServiceNow records) in Docusign.
Docusign eSignature templates management AI agent	Manages template management (that is, retrieves recipient details, accesses template fields, and fetches template names per account) in Docusign.
Docusign eSignature bulk envelopes management AI agent	Manages bulk envelope management tasks (that is, updates and looks up bulk send batch statuses, manages bulk send lists, create bulk send requests) in Docusign.
Docusign eSignature user management AI agent	Manages user management (that is, creates, updates, deletes, and retrieves user details) in Docusign.
Docusign eSignature group management AI agent	Manages group management (that is, looks up group IDs, adds users to groups, and removes users from groups) in Docusign.
Docusign eSignature document management AI agent	Manages document management tasks (that is, attaches documents, manages envelopes, and retrieves document details) in Docusign.
Docusign eSignature document signature AI agent	Manages document signature tasks (that is, looks up embedded signing URL, and looks up embedded signing URL inline) in Docusign.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke module

The Docusign eSignature spoke adds a Docusign module to your ServiceNow instance. The Docusign eSignature spoke synchronizes and stores templates and envelopes in ServiceNow. The Docusign eSignature spoke includes these tables and records.

Table/Record	Description
Connection Aliases	The Docusign connection alias.
Scheduled Job	The Get Accounts & Templates scheduled job that synchronizes templates and envelopes with your Docusign account.
Accounts	Docusign accounts synchronized with your ServiceNow instance. To synchronize accounts, see Synchronize Docusign with ServiceNow. The Get Accounts subflow retrieves a list of accounts and associated templates from Docusign and then inserts or updates them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusign_templates] tables.
Templates	Docusign templates from synchronized Docusign accounts. The Get Templates Per Account subflow retrieves templates associated with a specified Docusign account and then inserts or updates them as records in the Templates [sn_docusign_spoke_docusign_templates] table.
Envelopes	Docusign envelopes from synchronized Docusign accounts. Records in the Envelopes table are updated only when webhook is configured for the Docusign account.
DocuSign Webhook Answer Subflows	List of webhook answer subflows.

The Docusign eSignature spoke tables include these fields.

Table	Fields
Accounts [sn_docusign_spoke_accounts]	• Account ID • Account Name • Description • Email • Alias • Display Name
Templates [sn_docusign_spoke_docusign_templates]	• Account • Template ID • Name • Description • Last Modified • Display Name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Fields
Envelopes [sn_docusign_spoke_envelopes]	• Account • ID • Status • Signed Date • Declined Reason • Display name • Embedded Signing • Signed Date Time Zone • Template

Spoke triggers

ServiceNow supports specific events on Docusign that create triggers. You must first configure a flow with a supported trigger definition. When an event, for example, a push request, occurs on the Docusign, it sends the payload via a webhook to the ServiceNow instance. After that, the flow that you configured is triggered at the ServiceNow instance to automate a workflow. The supported events are:

Category	Trigger	Definition
Envelope Management	Envelope Completed	Trigger is initiated when an envelope has been completed by all the recipients. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Declined	Trigger is initiated when an envelope has been declined by one of the recipients. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Deleted	Trigger is initiated when a sent envelope is deleted. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Delivered	Trigger is initiated when all recipients have opened the envelope through the Docusign signing website. Configure the flow to execute only when the specified trigger conditions are met.
	Envelope Sent	Trigger is initiated when an envelope is sent to recipient. Configure the flow to execute

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Trigger	Definition
		only when the specified trigger conditions are met.
	Envelope Voided	Trigger is initiated when an envelope has been voided by the sender or has expired. Configure the flow to execute only when the specified trigger conditions are met.
Recipient Management	Recipient Completed	Trigger is initiated when the recipient has completed their actions for the envelope. Configure the flow to execute only when the specified trigger conditions are met.
	Recipient Declined	Trigger is initiated when the recipient declines to sign the document(s) in the envelope. Configure the flow to execute only when the specified trigger conditions are met.
	Recipient Delivered	Trigger is initiated when the recipient has viewed the document(s) in an envelope through the Docusign signing web site. Configure the flow to execute only when the specified trigger conditions are met.
	Recipient Sent	Trigger is initiated when an email notification is sent to the recipient signifying that it is their turn to sign an envelope. Configure the flow to execute only when the specified trigger conditions are met.

For information about setting up the triggers for the Docusign eSignature spoke, see Set up triggers for the Docusign eSignature spoke. For more information about inbound integration, see Conditional and event-driven inbound integration.

Docusign account requirements

The Docusign eSignature spoke requires configuring your Docusign account to generate an OAuth 2.0 JWT Bearer Grant token.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the Docusign Connection & Credential Alias record to authorize actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- You can choose to set up the Docusign spoke using authorization code grant or JWT grant.
  - Use Authorization Code Grant if your integration uses a browser or client to make requests to a web server.
  - Use JWT Grant if each user of your integration will use a single system account to log in.

  For more information about when to chose either of the setup methods, see Choose OAuth Type in Docusign Developer documentation.
- Your company may have a Docusign account for each department that uses Docusign. To use multiple accounts with this spoke, create a child alias for each account. Also, ensure that you override the base alias with the child alias in your flows. At runtime, the system identifies the child alias associated with the account and sends the correct connection and credential information in the request.
  - For more information about child alias and overriding the base alias, see Supporting multiple connections.
  - For information about setting up multiple accounts, see Create child aliases for additional Docusign accounts.

  If your company only has one account, you can use the default **Docusign** alias provided with the spoke and proceed to setting up the Docusign spoke using authorization code grant or JWT grant.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Docusign alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Docusign eSignature spoke using authorization code grant

Integrate the ServiceNow instance and Docusign eSignature spoke by using Authorization Code to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Docusign eSignature spoke.
- Role required: admin

Important: If you are setting up Docusign eSignature spoke using authorization code grant, you need not set up the spoke using JWT grant.

Configure the Docusign account

Configure a custom OAuth application from your Docusign account to enable authentication with the Docusign eSignature spoke.

About this task

Complete these steps from your Docusign account. See the Docusign Developer Center documentation for instructions on creating and configuring custom applications. Docusign uses

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a scripted webhook to send signed document data to ServiceNow instance. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

Before you begin

Docusign requirements:

- Docusign account
- Docusign app configured to integrate with ServiceNow
- Role required: Docusign administrator

Procedure

1. Log in to the Docusign account as an admin.
2. From your Docusign account, register your application.

   Note: Ensure that you select the **Authorization Code Grant** option for **User Application**.

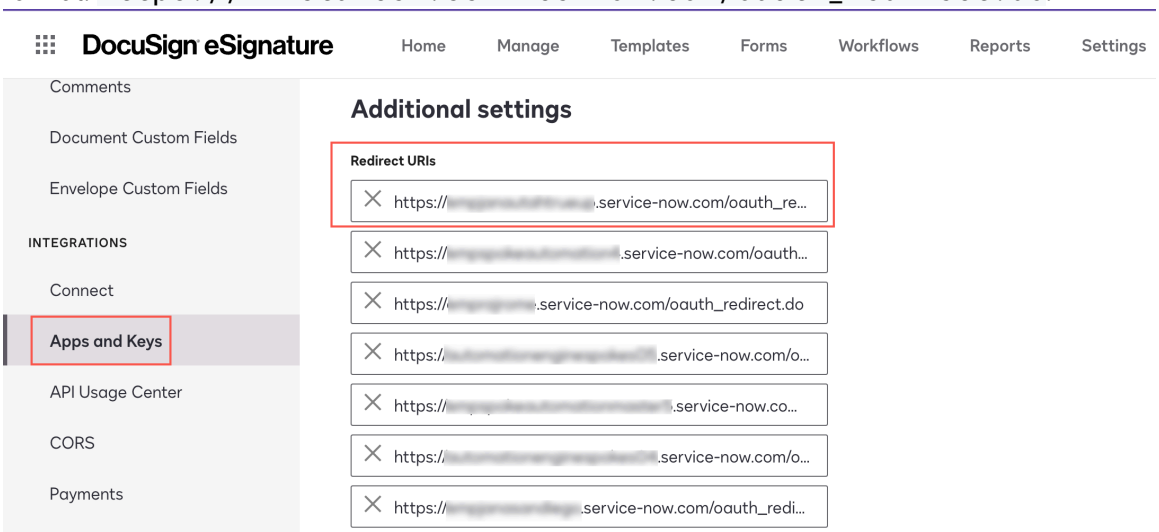
3. Generate an integrator key and secret key.
4. Record the values of integrator key and secret key to register the app as a third-party OAuth provider on your ServiceNow instance.
   You need these values when you Configure the connection for Docusign eSignature spoke.
5. Add the ServiceNow OAuth Redirect URL in your Docusign account.

   a. Navigate to **Integrations** > **App and Keys**.

   b. Under **Apps and Integration Keys**,find the required app.

   c. For the required app, click the **Actions** drop-down list and click **Edit**.

   d. Under **Additional settings**, click **Add URI** and add the OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

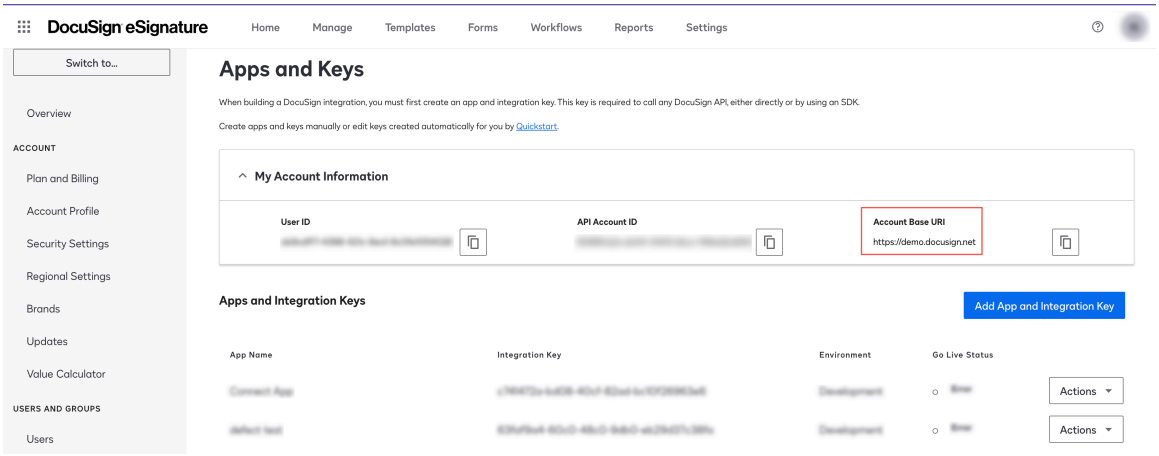


6. Obtain the value of **Account Base URI** from the Docusign account.

   a. Navigate to **Integrations** > **App and Keys**.

   b. Under **My Account Information**, you can find the value of the **Account Base URI**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Copy and record this value for later use.

Configure the connection for Docusign eSignature spoke

Integrate the ServiceNow instance and Docusign account instance using authorization code grant to authenticate ServiceNow requests.

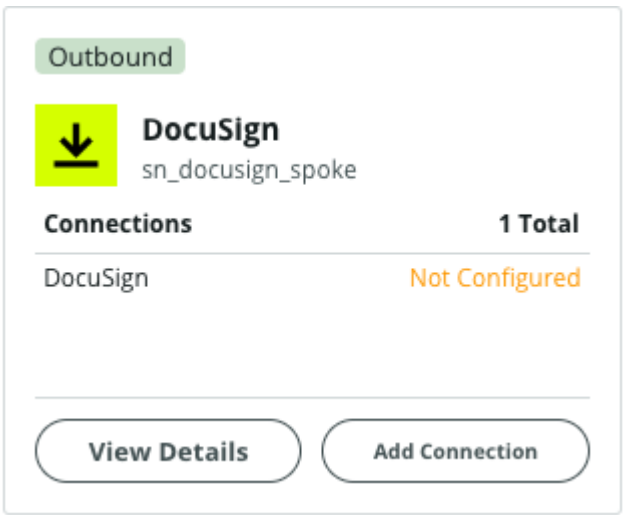
Before you begin

Role required: admin

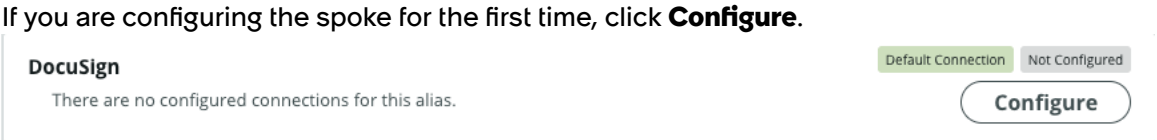
Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for Docusign and click **View Details**.

Note: Don't click Add Connection.



5. If you are configuring the spoke for the first time, click **Configure**.



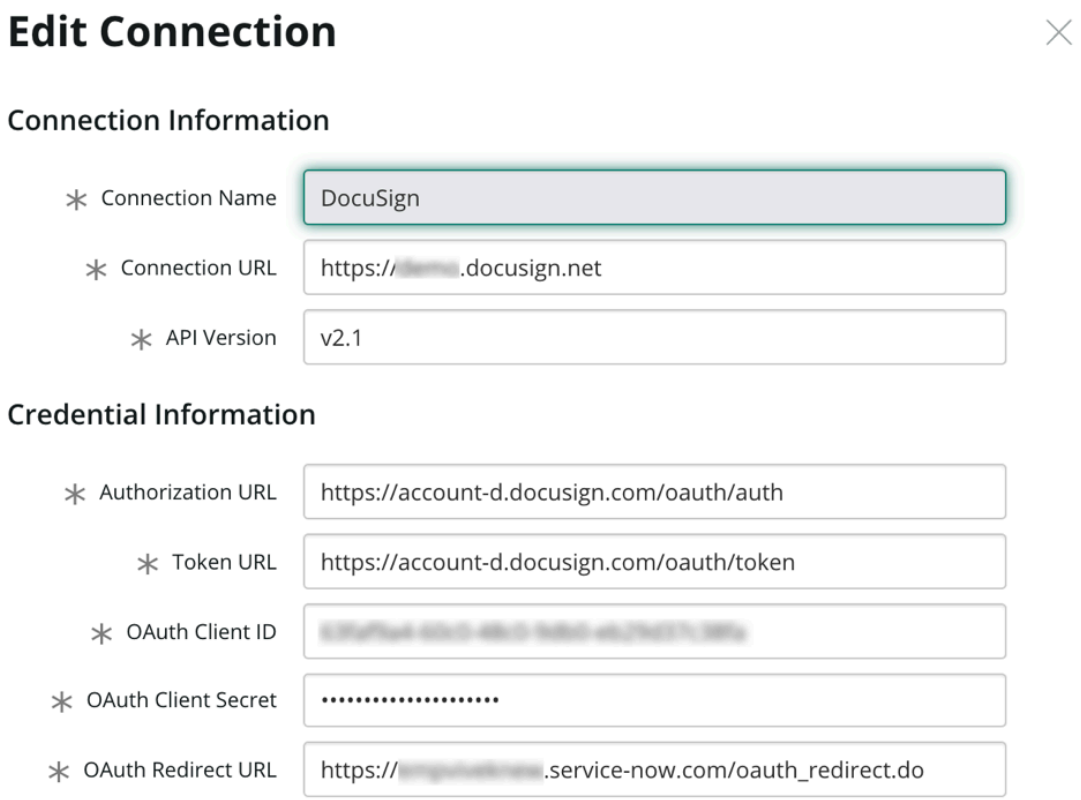
6. On the Configure Connection form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Connection form

Field	Description
Connection Name	Unique name to identify the connection.
Connection URL	**Account Base URI** to connect to Docusign environment. This value can be obtained from your Docusign account. For more information see, Configure the Docusign account.
API Version	Docusign API version. The default value is v2.1.
Authorization URL	Docusign authorization URL. ○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/auth`. ○ For live production system, enter `https://account.docusign.com/oauth/auth`.
Token URL	URL from which the ServiceNow instance obtains the access token. ○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/token`. ○ For live production system, enter `https://account.docusign.com/oauth/token`. For more information see, Post Go-Live and User Info Endpoint Reference in the Docusign Developer Center documentation.
OAuth Client ID	Integrator key of your Docusign account.
OAuth Client Secret	Secret key (client secret) of your Docusign account.
OAuth Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. **Note:** Ensure that you add this URL in your Docusign account. For more information see, Configure the Docusign account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Configure and Get OAuth Token**.

Set up Docusign eSignature spoke using JWT grant

Integrate the ServiceNow instance and Docusign by using JWT grant to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Docusign eSignature spoke.
- Role required: admin.

Important: If you are setting up Docusign eSignature spoke using JWT grant, you need not set up the spoke using authorization code grant.

Configure Docusign account

Create a custom OAuth application from your Docusign account to enable OAuth 2.0 authentication with the Docusign eSignature spoke.

Before you begin

Docusign requirements:

- Docusign account
- Docusign app configured to integrate with ServiceNow
- Role required: Docusign administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Complete these steps from your Docusign account. See the Docusign Developer Center documentation for instructions on creating and configuring custom applications. Docusign uses a scripted webhook to send signed document data to ServiceNow instance. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

Procedure

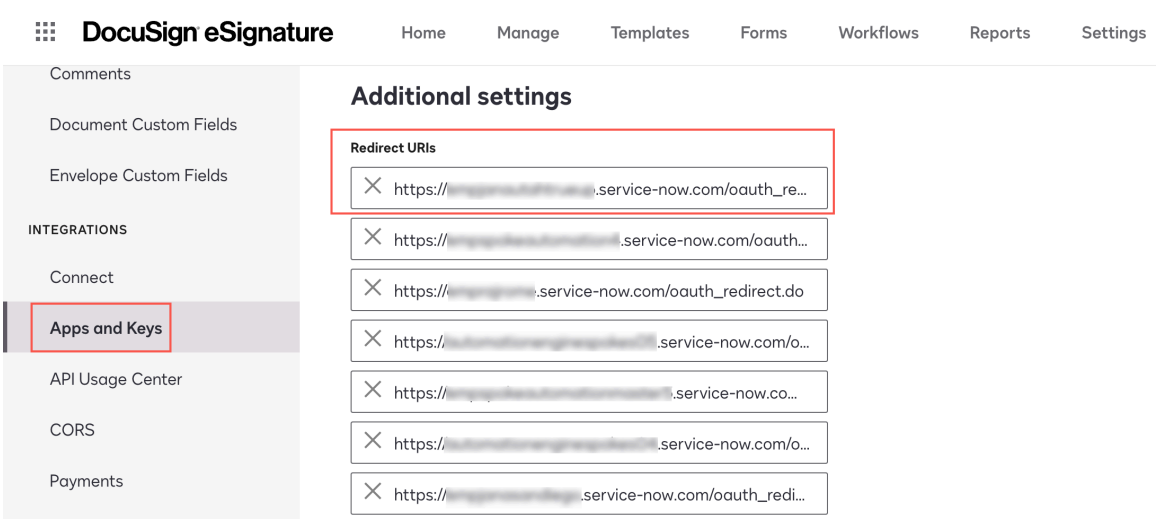
1. From your Docusign account, register your application.
2. Generate an integrator key and secret key.
3. Record the values of integrator key and secret key to register the app as a third-party OAuth provider on your ServiceNow instance.
   You need these values when you Register Docusign as OAuth Provider
4. Click **ADD RSA KEYPAIR** and record the **Keypair ID**, **Public Key**, and **Private Key**.
5. Add the ServiceNow OAuth Redirect URL in your Docusign account.

   a. Navigate to **Integrations** > **App and Keys**.

   b. Under **Apps and Integration Keys**,find the required app.

   c. For the required app, click the **Actions** drop-down list and click **Edit**.

   d. Under **Additional settings**, click **Add URI** and add the OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

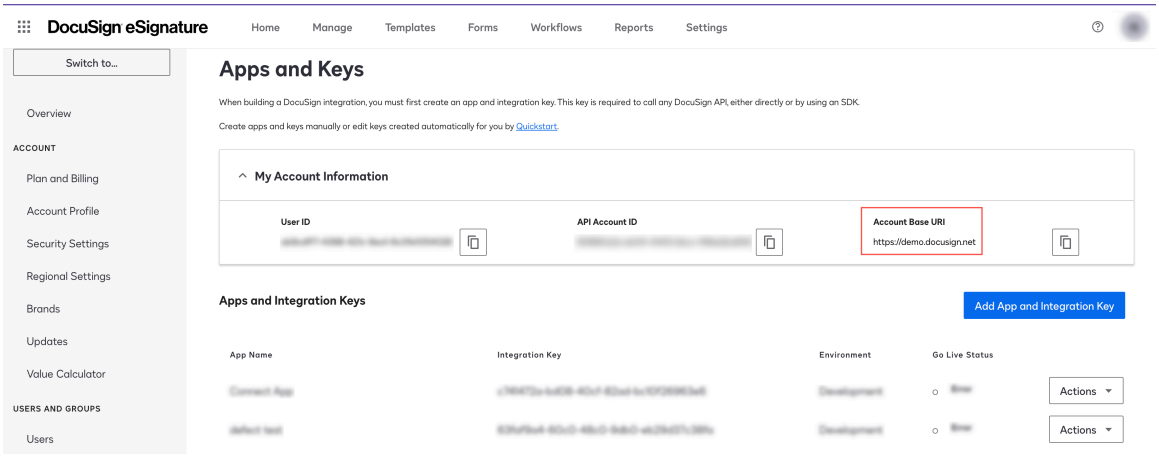


6. Obtain the value of **Account Base URI** from the Docusign account.

   a. Navigate to **Integrations** > **App and Keys**.

   b. Under **My Account Information**, you can find the value of the **Account Base URI**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Copy and record this value for later use.

Generate the JKS certificate

Generate a JKS certificate for the JWT authentication of the Docusign eSignature spoke.

Before you begin

Role required: admin

Procedure

1. Open the text editor for code such as, Sublime Text.
2. Create a new file.
3. Paste the Private Key you had earlier generated from your Docusign integrator app. For more information, see Configure Docusign account.

   Note: Ensure that you include both beginning and ending of the private key.

4. Save the file with the .key extension, for example, `privatekey.key`.
5. Open terminal and navigate to the directory where you saved the file with the `.key` extension.
6. Create a CA signed certificate using your private key by executing the command:

   ```
   openssl req -new -x509 -key <file-name>.key -out
    <certificate-name>.pem -days 1095
   ```

   System prompts you to provide required details such as Country Name, Province Name and so on.
7. Enter the required details.
8. Create PKCS 12 file using your private key and CA signed certificate by executing the command:

   ```
   openssl pkcs12 -export -in <certificate-name>.pem -inkey
    <file-name>.key -certfile <certificate-name>.pem -out
    <PKCS-12-file-name>.p12
   ```

   System prompts you to provide a password.
9. Provide the export password.
10. Create the JKS file by executing this command:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
keytool -importkeystore -srckeystore
 <PKCS-12-file-name>.p12 -srcstoretype pkcs12 -destkeystore
 <JKS-certificate-filename>.jks -deststoretype JKS
```

System prompts you to provide a password.

11. Provide the destination and source keystore passwords.

Attach a Java Key Store certificate to the Docusign eSignature spoke

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Docusign eSignature spoke.

Before you begin

- Ensure the availability of a valid Java KeyStore certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. Complete the form.

X.509 Certificate form fields

Field	Description
Name	Enter a name to uniquely identify the record. For example, `Docusign Certificate`.
Notify on expiration	Define users to be notified when the certificate expires.
Warn in days to expire	Enter the number of days to send a notification before the certificate expires.
Active	Enable
Type	Select **Java Key Store**.
Expires in days	Enter the number of days until the certificate expires.
Key store password	Enter a password associated with the certificate.
Short description	Enter a summary about the certificate.

4. Click the attachments icon ( ) and attach a JKS certificate.
5. Click **Validate Stores/Certificates**.

Create a JWT signing key for the Docusign eSignature spoke

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. Complete the form.

JWT Keys form fields

Field	Description
Name	Enter a name to uniquely identify the JWT signing key. For example, `Docusign JWT Keys`.
Signing Keystore	Select the valid JKS certificate attached in the previous task. For example, `Docusign Certificate`.
Key Id	Enter a key Id to identify which key is used when multiple keys are used to sign tokens.
Signing Algorithm	Select an algorithm to sign with the JWT key.
Signing Key Password	Enter a password associated with the signing key.
Active	Enable.

4. Click **Submit**.

Create a JWT provider for the Docusign eSignature spoke

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Enter a name to uniquely identify the JWT provider. For example, `Docusign JWT Provider`.
Expiry Interval (sec)	Enter a number in seconds to set the lifespan of JWT provider tokens.
Signing Configuration	Select a JWT signing key. For example, `Docusign JWT Keys`.

4. Right-click the form header, and click **Save**.
   The Standard Claims and Custom Claims related lists display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the same page of the JWT provider record, enter values for **iss**, **sub**, and **aud** in the **Standard Claims** related list.

Claim	Value
iss	`<your_integration_key>`
sub	`<your_user_ID>`
aud	`account-d.docusign.com`

For more information, see How to get an access token with JWT Grant in Docusign Developer Center.

6. Insert a record in the **Custom Claims** related list and complete the form.

Custom Claims related list fields

Field	Value
Claim Name	scope
Claim Value Type	string
Claim Value	signature impersonation

7. Click **Update**.

Register Docusign as OAuth Provider

Use the information generated during Docusign account configuration to register Docusign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. Complete the form.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Docusign OAuth`.
Client ID	Enter the integrator key you generated during the Docusign account configuration.
Client Secret	Enter the client secret you generated during the Docusign account configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Default Grant type	Select **JWT Bearer**.
Authorization URL	○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/auth`. ○ For live production system, enter `https://account.docusign.com/oauth/auth`.
Token URL	○ For developer sandbox environment, enter `https://account-d.docusign.com/oauth/token`. ○ For live production system, enter `https://account.docusign.com/oauth/token`. For more information see, Post Go-Live and User Info Endpoint Reference in the Docusign Developer Center documentation.

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **Docusign OAuth default_profile**
6. Insert a record in the **OAuth Entity Scopes** related list and fill the values.

OAuth Entity Scopes related list fields

Field	Value
Name	scope
OAuth Scope	signature impersonation

7. Copy the value from **Redirect URL**.
8. Click **Update**.
9. Login to your Docusign account to edit the configuration of your custom Docusign application. See the Docusign Developer Center for instructions.
10. Paste the Redirect URL value into the Redirect URI for your custom Docusign application. For example, paste `https://instance.service-now.com/oauth_redirect.do`

Result

The instance can request OAuth 2.0 tokens for the spoke.

Note: When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Obtain consent

Obtain explicit consent for the ServiceNow application from Docusign.

Role required: admin

Obtain consent for an organization administrator

See Docusign Developer documentation (Admin consent for internal applications) for instructions to obtain consent for an organization administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Credential records for the Docusign eSignature spoke

Create Credential records to the Docusign custom OAuth application you created during Docusign account configuration. The Docusign spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Fill these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Docusign Credentials`.
Active	Enable
OAuth Entity Profile	Select the OAuth profile you created when you registered the custom Docusign application as an OAuth provider. For example, select **Docusign OAuth default_profile**.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

Create Connection records for the Docusign eSignature spoke

Create Connection records to your Docusign account. The Docusign spoke connection and credential alias uses these connections to perform actions in DocuSsign.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **Docusign**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Name	Enter any name to uniquely identify the connection record. For example, enter `Docusign Connection`.
Credential	Select the Credential record you created for Docusign. For example, select **Docusign Credentials**.
Connection URL	○ For demo environment, enter `https://demo.docusign.net`. ○ For live production system, enter the Base URI such as `na2.docusign.net` or `eu.docusign.net`. For instructions on obtaining the base URI, see Post Go-Live and User Info Endpoint Reference in the Docusign Developer Center documentation.

5. Click **Submit**.

What to do next
Synchronize ServiceNow with Docusign to access Docusign accounts, templates, and envelopes from the Docusign spoke. See Synchronize Docusign with ServiceNow.

Create child aliases for additional Docusign accounts

Create a child connection alias under the base alias for each account if your Docusign implementation includes multiple Docusign accounts.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Docusign** > **Connection Aliases**.
2. Select **New**.
3. In the **Name** field, add a descriptive name for the account, for example, `Docusign HR account`.
4. Save the record.

Set up triggers for the Docusign eSignature spoke

Set up the trigger to generate the callback URL on your ServiceNow instance.

Before you begin
- Request an Integration Hub subscription.
- Activate and set up the Docusign eSignature spoke.
- Role required: admin.

Enable system property for client credentials grant type

Create or enable the glide.oauth.inbound.client.credential.grant_type.enabled system property to use the OAuth client credentials grant type for inbound integrations from the Docusign OAuth client to ServiceNow instance.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
For more information about client credentials grant type, see Client Credentials.

Procedure
1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the `glide.oauth.inbound.client.credential.grant_type.enabled` system property.
3. Open the record.
4. For **Value**, enter `true`.
5. Right-click the form header and click **Save**.

Create an application registry to authenticate the inbound calls

Create an application registry in the ServiceNow instance to authenticate the inbound calls.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
3. Select **Create an OAuth API endpoint for external clients**.
4. On the form, fill in the fields.

Application Registries form

Field	Description
Name	Name to identify the application registry record. For example, `Docusign External Trigger`.
OAuth Application User	User role to which the OAuth token flow is mapped. **Important:** By default, this field is not displayed on the Application Registries form. Configure the form layout to see the field on the form. For information about configuring the form layout, see Configuring the form layout.

5. Right-click the form header and click **Save**.
   Application registry record is created and value of **Client Secret** is generated.

   Copy and record the values of **Client ID** and **Client Secret** for later use.

Activate the trigger definition on ServiceNow instance

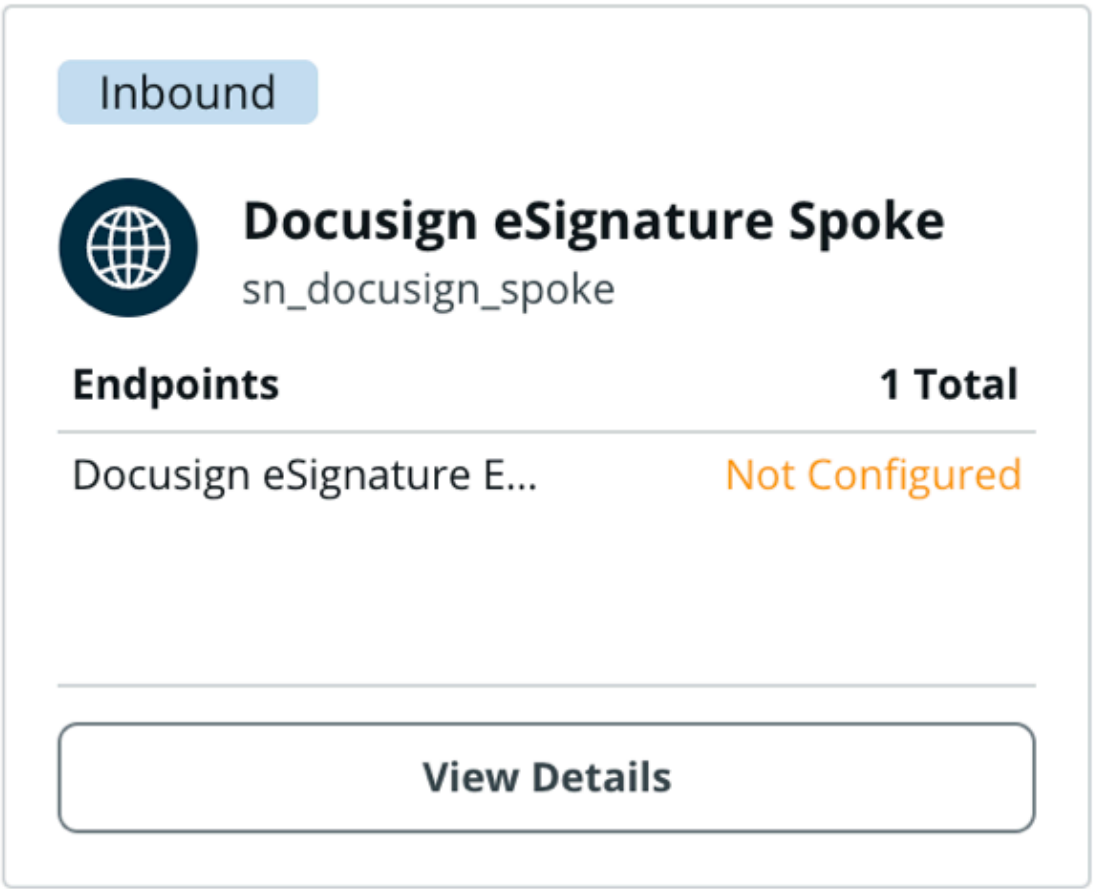
Activate the trigger definition to generate the callback URL on your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

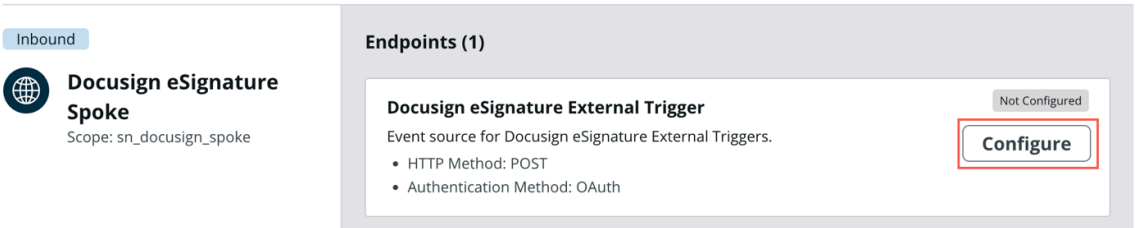
Before you begin
Role required: flow_designer and connection_admin.

About this task
Docusign uses the callback URL to securely send the payload to the ServiceNow instance.

Procedure
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Toggle and enable the **Inbound** tab.
4. Locate the **Docusign eSignature Spoke** card and select **View Details**.



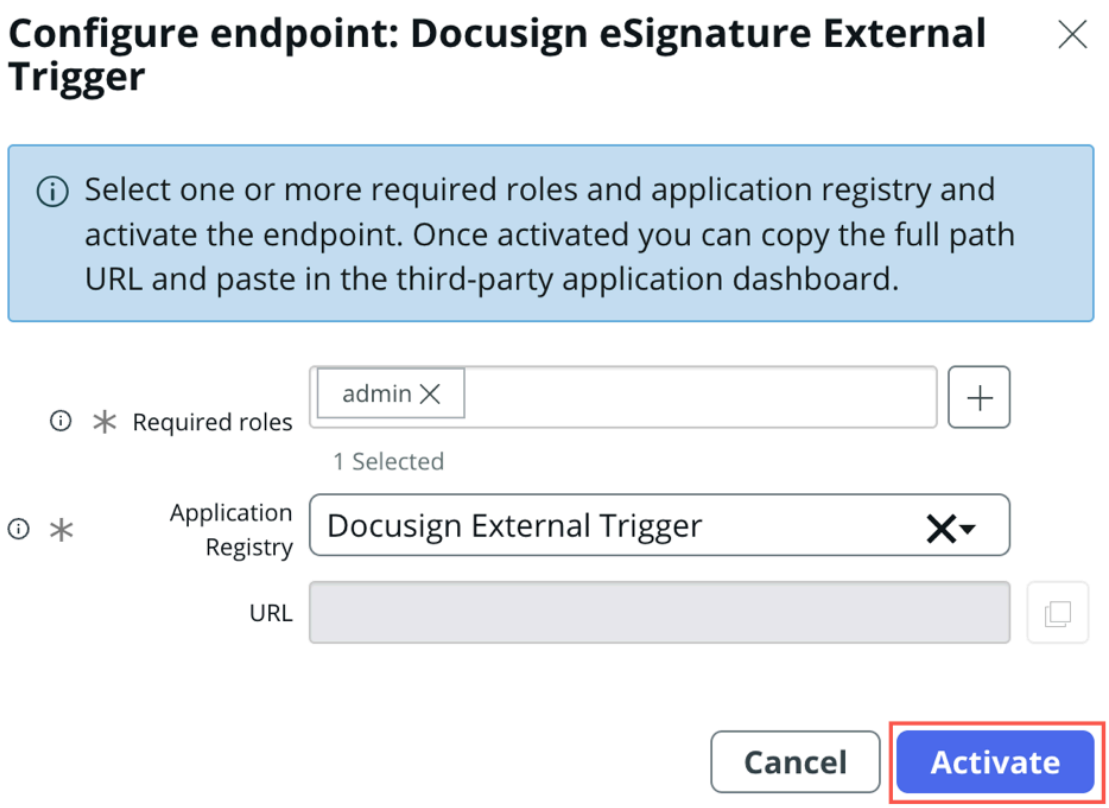
5. Select **Configure**.



6. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

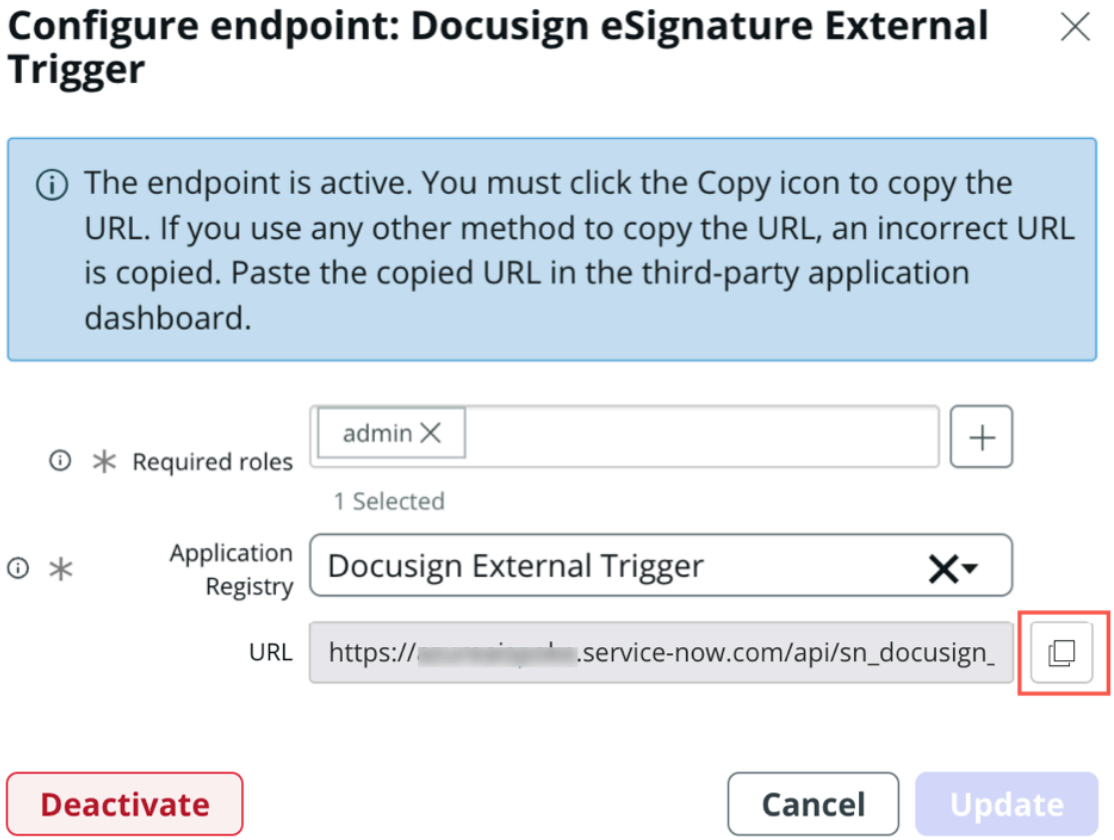
Field	Description
Required roles	Roles using which the flow will be triggered. For example, select **admin**.
Application Registry	Select the application registry you had created to authenticate inbound calls. For example, select **Docusign External Trigger**.



7. Click **Activate**.
   The endpoint is activated and the value of **URL** is generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copy and record the value of **URL** for later use.



Add configuration in Docusign account

Add a custom configuration in the Docusign account to send real-time data updates to the ServiceNow instance.

Before you begin

Role required: admin

Procedure

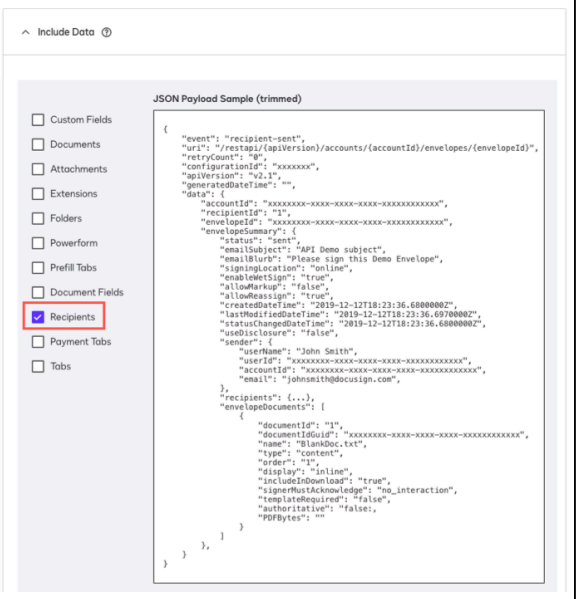
1. Log in to the Docusign account as an admin.
2. Click **Admin**.
3. Navigate to **Integrations** > **Connect**.
4. Under **Configurations**, click **Add Configuration** and select **Custom**.
5. On the form, fill in the values.

Field	Description
Name	Name to identify the custom configuration record.
URL to Publish	Enter the URL that is generated when you activated the trigger definition in this format: `https://<ServiceNow-instance-name>.service-`

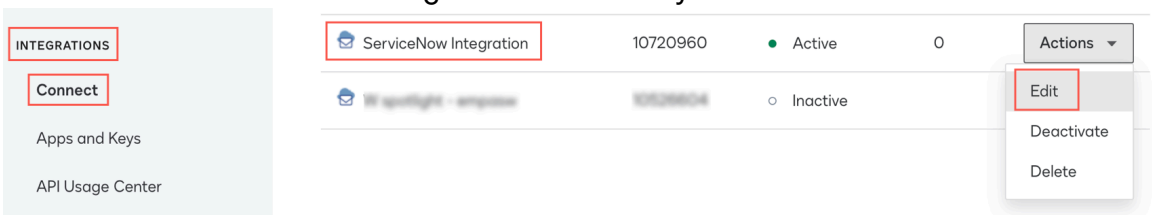
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`now.com/api/sn_docusign_spoke/docusign_esignature_external_trigger`. For more information, Activate the trigger definition on ServiceNow instance.
Data Format	Ensure that you select **REST v2.1**.
Event Message Delivery Mode	Select **Send Individual Messages (SIM)**.
Trigger Events	Expand **Envelope and Recipients** and select these events: ○ Envelope Sent ○ Envelope Delivered ○ Envelope Signed/Completed ○ Envelope Declined ○ Envelope Voided ○ Envelope Deleted ○ Recipient Sent ○ Recipient Auto Responded ○ Recipient Delivered ○ Recipient Signed/Completed ○ Recipient Declined  Under **Include Data**, select the **Recipients** option. Select other options as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	


6. Under **Integration and Security Settings**, select the **Include OAuth (Recommended)** check box.
7. Click **Add Configuration**.
   The custom configuration record is created.
8. Click **Actions** for the custom configuration record that you created and select **Edit**.



9. Under **Integration and Security Settings**, click **Manage OAuth**.
   The **OAuth 2.0** tab is displayed.
10. Enter the values of Client ID and Client Secret.
    These values are created when you create application registry record in ServiceNow instance. For more information, see Create an application registry to authenticate the inbound calls.
11. Enter **Authorization Server URL** in this format: `https://<ServiceNow-instance-name>.service-now.com/oauth_token.do`.
12. Click **Save**.

What to do next

Create flows in Workflow Studio using these triggers as per your requirement. For more information, see Create a flow with an external trigger.

Set up a bi-directional webhook for the Docusign eSignature spoke

Configure the webhook in your Docusign account to enable Docusign to send data to ServiceNow when a recipient signs a document.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Connect a custom configuration to enable your Docusign application to share events and data with your ServiceNow instance.

   a. Log in to your Docusign account as an admin.

   b. In the admin dashboard, navigate to **Integrations** > **Connect**.

   c. Click **Add Configuration**.
   A list of the configuration types is displayed.

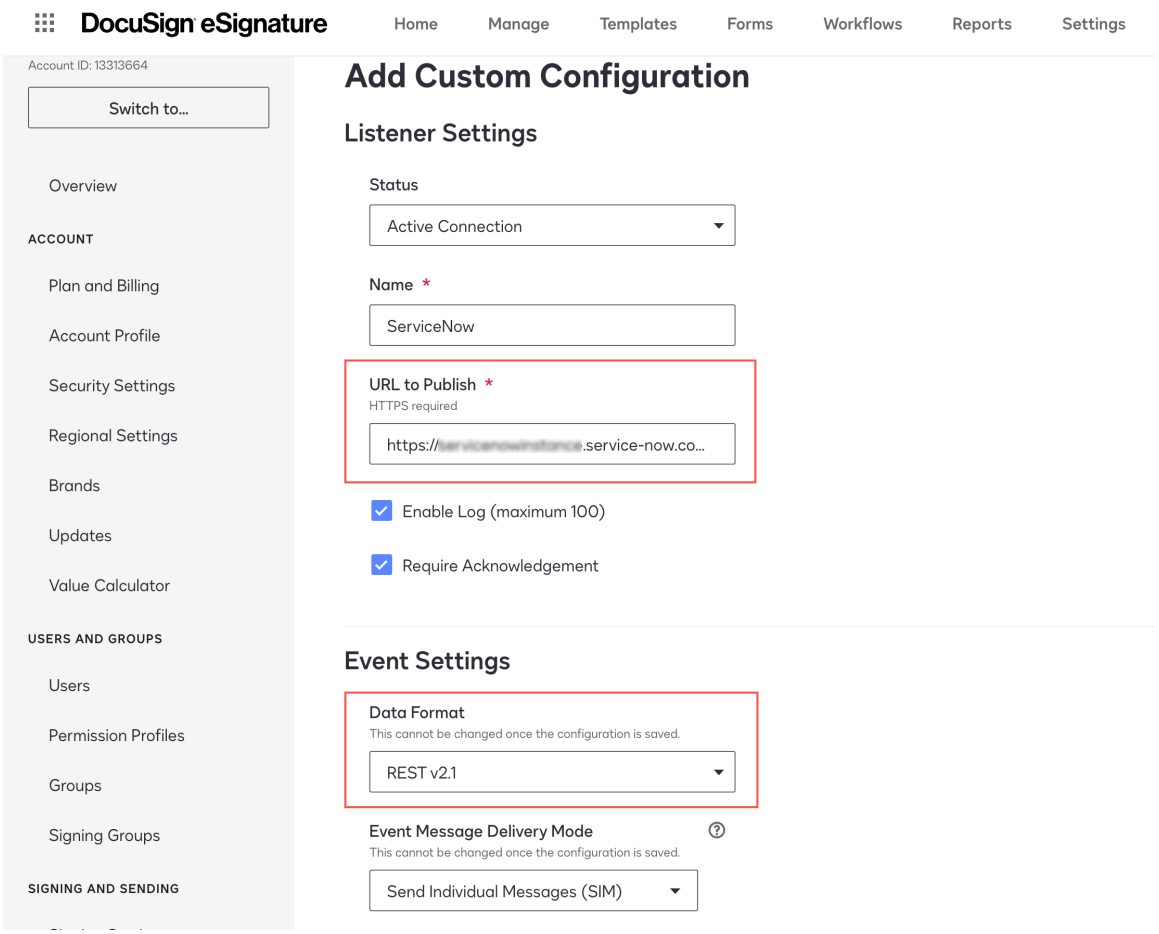
   d. Select **Custom**.

   e. On the form, fill these values.

Field	Description
Name	Name to identify the custom configuration.
URL to Publish	Add your ServiceNow instance URL in this format: ▪ Under **Event Settings**, if you select **Data Format** as **Legacy**, enter `https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook` ▪ Under **Event Settings**, if you select **Data Format** as **REST v2.1**, enter, `https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook_rest`
Data Format	Select either **Legacy** or **REST v2.1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Ensure that this selection matches is accordance with the URL you provided in **URL to Publish**.

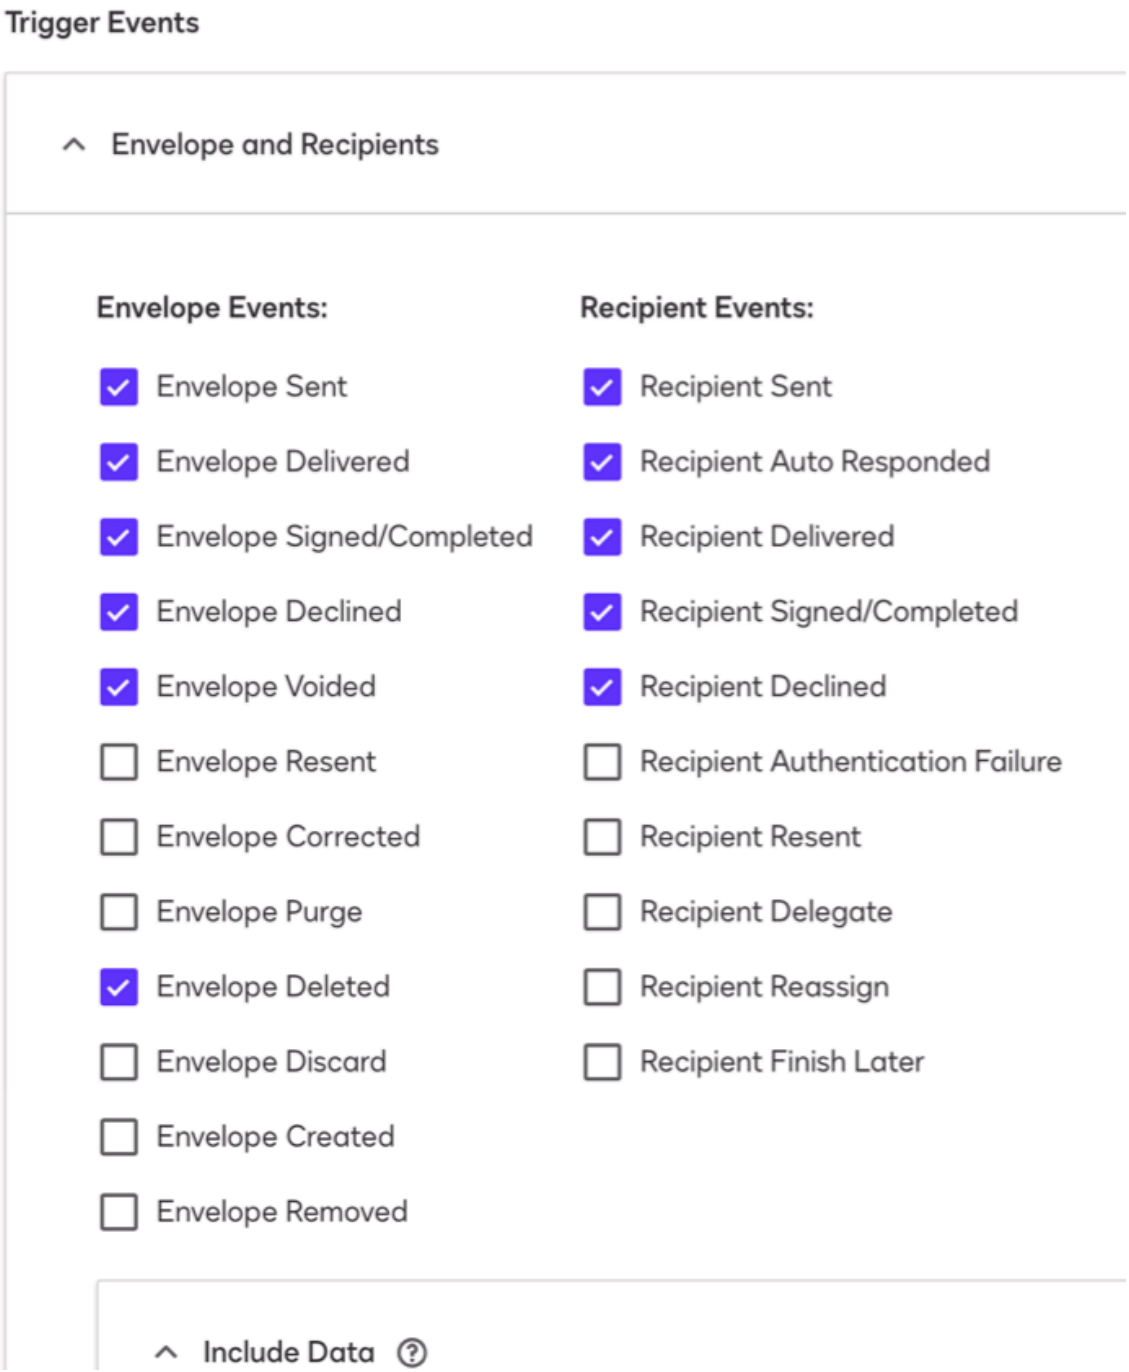


2. Under **Trigger Events**, enable Docusign to share envelope events with ServiceNow by selecting these events:

   - Envelope Sent
   - Envelope Delivered
   - Envelope Signed/Completed
   - Envelope Declined
   - Envelope Voided
   - Envelope Deleted
   - Recipient Sent
   - Recipient Auto Responded
   - Recipient Delivered
   - Recipient Signed/Completed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

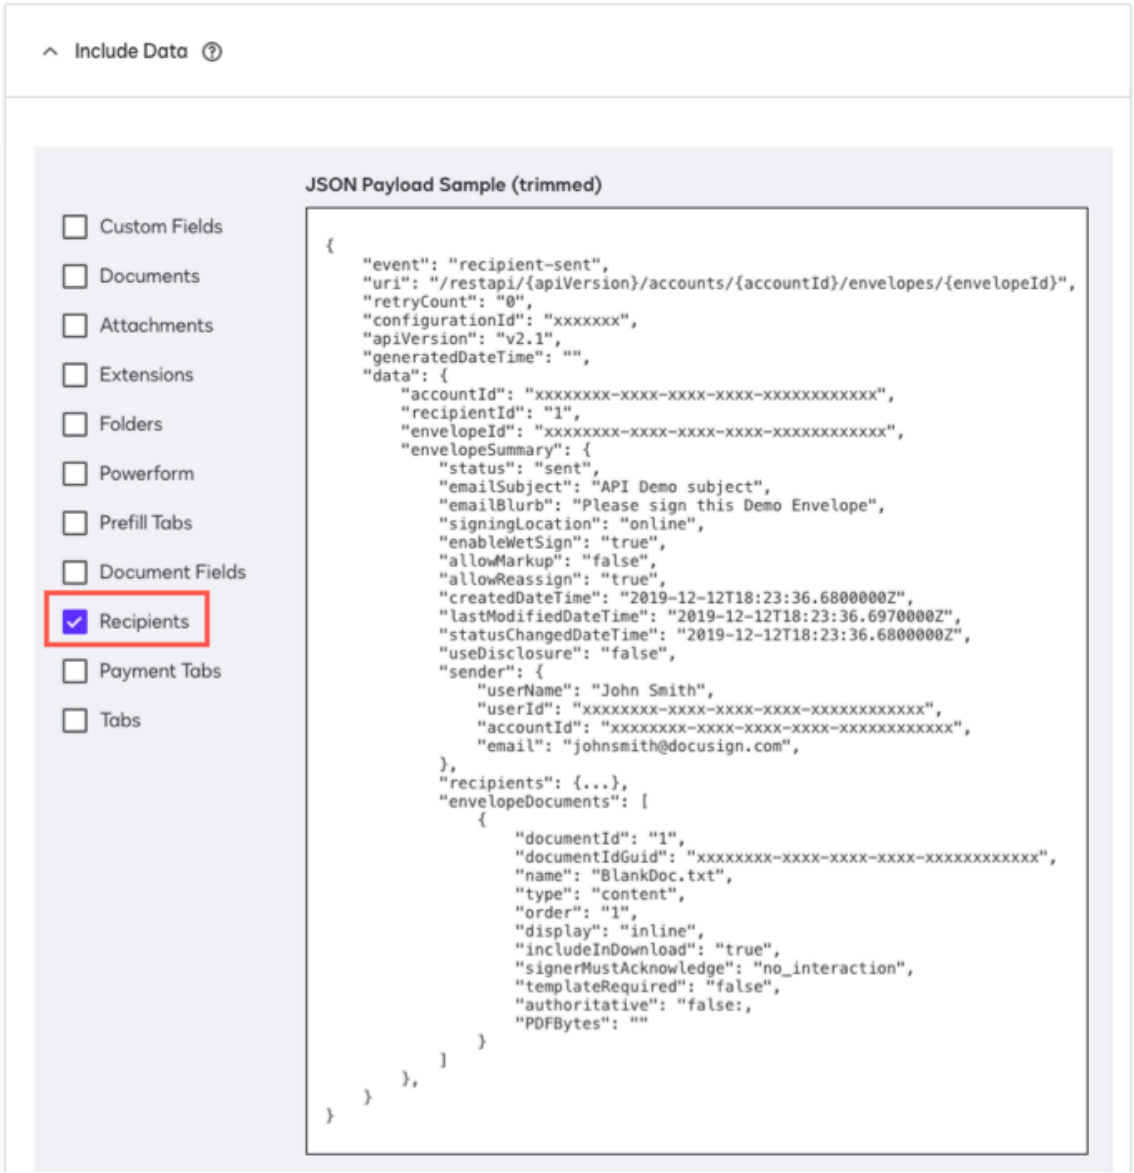
- Recipient Declined
- Recipient Delegate



3. Under **Include Data**, select the **Delegates** and **Recipients** options.

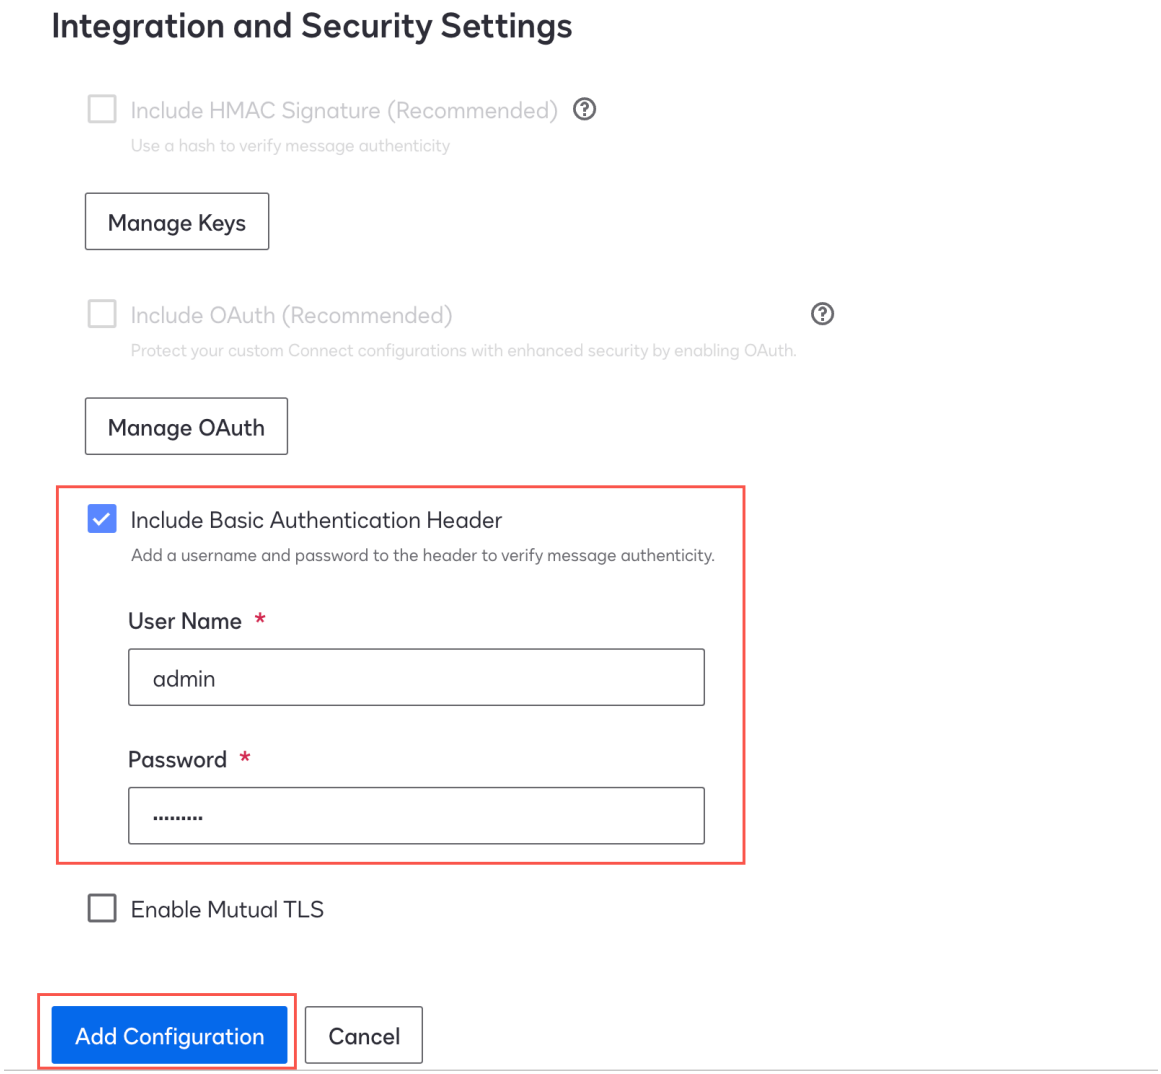
   Select other options as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the **Include basic authorization** option in the header and provide your ServiceNow instance credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Add Configuration**.

Synchronize Docusign with ServiceNow

Synchronize ServiceNow with Docusign to access Docusign accounts, templates, and envelopes from the Docusign spoke.

Before you begin

Role required: admin

- Request IntegrationHub subscription
- Activate Docusign spoke
- Set up Docusign eSignature spoke using JWT grant

About this task

Schedule a job to synchronize Docusign with your ServiceNow instance daily, or synchronize data as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Schedule a job to synchronize Docusign data with your ServiceNow instance.

   a. Navigate to **Docusign** > **Scheduled Job**.
   The Get Accounts & Templates scheduled job opens.

   b. Select **Active**.

   The Docusign eSignature spoke synchronizes accounts, templates, and envelopes daily.
2. Synchronize Docusign data as needed with a UI action.

   a. Navigate to **Docusign** > **Accounts**.
   The Accounts [sn_docusign_spoke_accounts] table opens.

   b. Click the **Get Accounts** related link.

   The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with Docusign data. Use template and envelope records when constructing flows.

Activate Docusign eSignature spoke catalog items

Trigger events in Docusign when an item is requested in the Service Catalog. For example, The Send a Document for Digital Signature catalog item triggers a sample flow that sends a Docusign document to a designated recipient.

Before you begin

- Request IntegrationHub subscription
- Activate Docusign eSignature spoke
- Activate the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin
- Role required: admin

About this task

The Docusign eSignature spoke adds catalog items for use with the Docusign eSignature spoke sample flows. Before triggering a Docusign eSignature spoke sample flow, activate these catalog items.

Catalog item	Description
Send a Document for Digital Signature	Sends a document for digital signature in Docusign.
Demonstrate Template - Send Job Offer to Candidate	Sends a job offer using a Docusign template.

Procedure

1. Navigate to **All** > **Service Catalog** > **Maintain Items**.
2. Search for and select **Send a Document for Digital Signature**.
3. Click **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Open the record, **Send a Document for Digital Signature**.
5. In the **Process Engine** tab, select **Send a Document for Digital Signature** for **Flow**.
6. Search for and select **Send employment offer to candidate using DocuSign template**.
7. Click **Activate**.
8. Open the record, **Send employment offer to candidate using DocuSign template**.
9. In the **Process Engine** tab, select **Send employment offer to candidate using DocuSign template** for **Flow**.

Result
When one of these items is requested in the Service Catalog, the associated Docusign eSignature spoke sample flow triggers and performs actions in DocuSign.

Change the Docusign API version

By default, the Docusign spoke sends REST API requests to Docusign API v2. For forward compatibility and to take advantage of Docusign's newer API, you can update a connection attribute to send API requests to Docusign API v2.1.

Before you begin
Role required: admin

About this task
To understand the difference between the two APIs, see the Docusign Developer site.

Procedure
1. Navigate to **All** > **Docusign** > **Connection Aliases**.
2. Open the connection alias that you want to update the version for.
   Only requests sent using this alias use the new API version. For example, if you want to update the API version for all requests and your implementation uses multiple connection aliases, you must update each connection alias.
3. In the **Connection Attributes** related list, add or edit the **API Version** record.

Field	Value
Type	String
Label	API Version
Column name	api_version
Default value	v2.1

4. Save or submit the record.

Result
When the Docusign spoke makes an API request, it uses the API version designated in the connection attribute **Default value** field.

How to automate on-demand signing requests

Send Docusign on-demand signing requests using information in your ServiceNow instance by creating flows in Flow Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request Integration Hub subscription
- Activate Docusign spoke
- Role required: admin
- Set up Docusign eSignature spoke using JWT grant or Set up Docusign eSignature spoke using authorization code grant

About this task

Note: Customize flows in Flow Designer based on your requirements.

Procedure

1. In Workflow Studio, create a flow.
2. Specify **TRIGGER** to initiate the flow.
3. Specify one of the following actions to be performed during the flow:
   - **Send Adhoc Signature Request To User**
   - **Send Adhoc Signature Request To Users - Inline**
4. **Optional:** To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from Docusign** action.
5. Perform one of the following set of actions:
   - To send an embedded signing URL, select **Use Embedded Signing**, and **Embedded Signing Recipient [User]**.
   - To send a document for signing, provide details regarding Docusign account, PDF document, recipient, email, and envelope expiry.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

How to automate signing requests using templates

Send Docusign signing requests using Docusign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, `Send employee offer`.

Before you begin

Role required: admin

- Request Integration Hub subscription
- Activate Docusign eSignature spoke
- Set up Docusign eSignature spoke using JWT grant or Set up Docusign eSignature spoke using authorization code grant

About this task

Note: Customize flows based on your requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In Docusign, create document templates and specify recipient roles, for example, `Candidate` and `Manager`.
   The system retrieves other recipient details such as name and email, when the flow is triggered.
2. In Workflow Studio, create a new flow.
3. Specify **TRIGGER** to initiate the flow.
4. Specify one of the following actions to be performed during the flow and provide recipient details:
   - **Create Draft Envelope from Template**
   - **Get Recipient ID by Role Name**
   - **Add Recipient to Envelope**
   - **Get Recipient ID by Role Name**
   - **Add Recipient to Envelope**
   - **Get Field ID**
   - **Set Field Value**
   - **Send Envelope**
   - **Get Field Value**
5. **Optional:** Pause the flow until the specified document is signed or rejected by selecting the **Wait for Signature from Docusign** action.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

How to separate Docusign account data

Restrict access to Docusign data based on a user's role. For example, your company may have one Docusign account used by the HR team and another used by the Legal team. To keep the data separate between these two accounts, you can create a role for each account and add it to the accounts record.

Before you begin

- Request Integration Hub subscription
- Activate Docusign eSignature spoke
- Create child aliases for additional Docusign accounts
- Set up Docusign eSignature spoke using JWT grant or Set up Docusign eSignature spoke using authorization code grant
- Role required: admin.

Procedure

1. Create a role for each Docusign account that you want to restrict access to.

   a. Navigate to **System Security** > **Users and Groups** > **Roles**.

   b. In the Roles [sys_user_role] table, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Check that the value of the **Application** field is **Docusign Spoke**.
If a different scope is listed, change the scope to **Docusign Spoke**.

d. In the **Suffix** field, add a name to indicate the account that the role is for, for example, `Legal`.

e. Save the record.

f. Note the name of the role you just created.
For example, **sn_docusign_spoke.legal**.

2. Add the role to the associated account in the accounts table.
   a. Navigate to **Docusign** > **Accounts**.
   b. Open the account record that you want to restrict access to.
   c. In the **Role** field, add the associated role.
   d. Select **Update**.
3. Grant the role to the desired users.
   a. Navigate to **System Security** > **Users and Groups** > **Users**.
   b. Open the record for the user that you want to provide access.
   c. Add the role that you created to the Roles related list.

Result
Only users with the designated role have access to Docusign data associated with the account.

Dropbox Business Spoke

Use Dropbox Business as file storage in place of attachments in ServiceNow. This spoke adds Dropbox storage to your ServiceNow instance and enables users to reference Dropbox files in ServiceNow records.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Dropbox Business spoke v1.1.0 is the latest version. For version history of the spoke, see Dropbox Business spoke release notes.

Supported versions

API version v2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Dropbox Business spoke provides sample subflows in the draft state to demonstrate automating Dropbox tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Flow	Description
Process File Changes	Subflow to process file changes in Dropbox.
Process Team Member Changes	Subflow to process team member changes in Dropbox.

Spoke actions

The Dropbox Business spoke provides actions to perform Dropbox tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
File and Folder Management	Copy Dropbox File To Attachment	Copies a Dropbox file and attaches it to a ServiceNow record. If a ServiceNow incident record is supplied as input, the specified record is attached to it.
	Copy File or Folder	Creates a copy of the specified Dropbox file or folder in Dropbox.
	Create Folder	Creates a folder at the specified path in Dropbox.
	Delete File Or Folder	Deletes a file or folder at the specified path in Dropbox.
	Get File Changes - Webhook	Retrieves the file changes noticed in Dropbox.
	Look up Folder	Looks up the contents of a Dropbox folder and returns an object containing information about the folder
	Update Latest Cursor	Updates the latest cursor value for the corresponding team in the Team Details table.
	Upload Attachment to Dropbox	Copies a ServiceNow attachment to a Dropbox folder. It copies to the specified folder. To change the file name during the copy, use the optional file name.
User Management	Add Users To Group	Adds users to a specified group
	Add Users To Team	Adds users to a specified team.
	Get Admin Details	Retrieves details of the administrator account used to generate the access token.
	Get Current Account	Retrieves information about the current account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Get Team Members Info	Retrieves information on specified team members. Returns profile and role details.
	Look up Groups in Team	Lists all the groups in the team. Output includes group IDs, number of members, group name, and the role of users who manage the group.
	Look up Users in Group	Lists all the members in the specific group. Returns user profile data and role in the group.
	Look up Users in Team	List all the members in the team. Returns user profile data, membership type, and role.
	Remove User From Team	Removes user from a team. Options include user retains files, and access to team shares, keeps email account and unrestricted team shares, and to delete relevant data.
	Remove Users From Group	Removes one or more users from an existing group.

Dropbox Business spoke account requirements

The Dropbox Business spoke requires a custom app that you create in Dropbox Business.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Dropbox Business spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Dropbox alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server .

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Dropbox Business spoke

Set up an outbound integration between a ServiceNow instance and a Dropbox Business application by setting up the connection and credential records.

Before you begin

- Request an Integration Hub subscription.
- Activate the Dropbox Business spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up the Dropbox Business spoke, includes actions in the Dropbox app console, in the ServiceNow AI Platform® user interface, and in the Workflow Studio. Setup is easier if you keep each of these pages open in separate tabs.

About this task

You must set up three connection and credential records for Team Management, File Access, and Content alias, in that order. The connection and credential forms contain the OAuth 2.0 credentials needed to establish a connection with the Dropbox business application. Before setting up the form, you must configure the data it needs by setting up an OAuth 2.0 authentication at the Dropbox Business application end. You must also ensure that you've already set up the alias and application registries.

Set up OAuth 2.0 authentication

Set up an OAuth 2.0 authentication between the Dropbox Business application and the ServiceNow instance by setting up a custom Dropbox Business application.

Before you begin

OAuth 2.0 setup requirements:

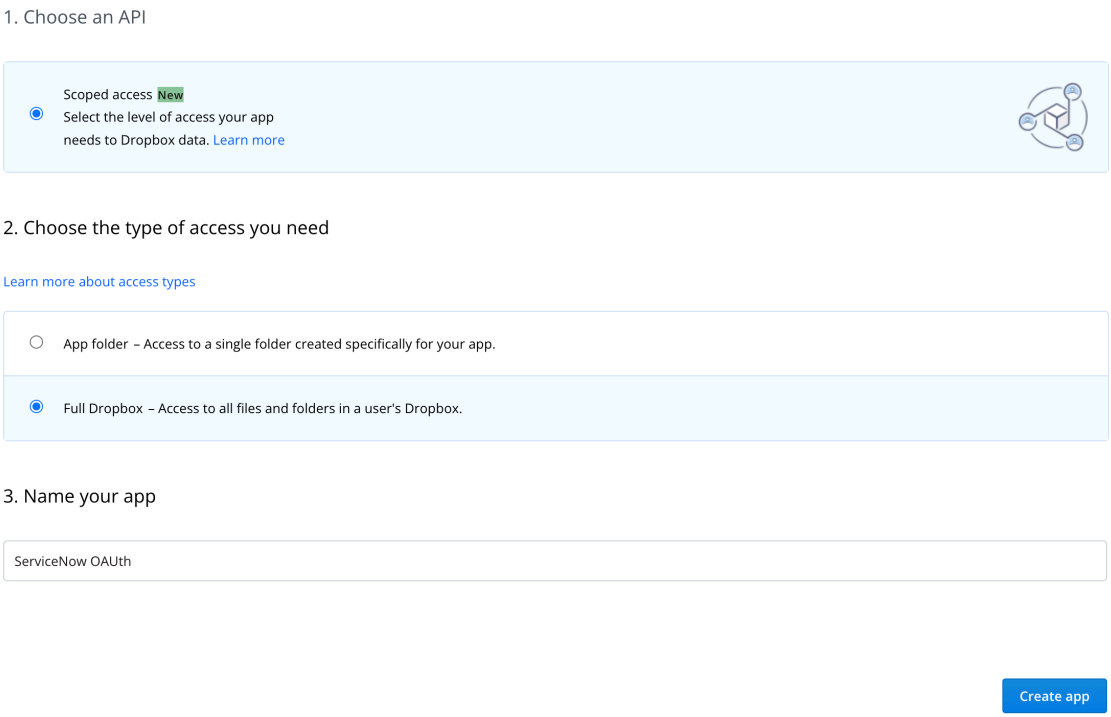
- A Dropbox Business account.
- Role required: team admin.

About this task

This procedure creates a custom application on the Dropbox Business account. The application provides the OAuth 2.0 credentials necessary to set up the connection and credential records for all three Dropbox Business aliases. For more information on setting up applications, see https://www.dropbox.com/developers/documentation.

Procedure

1. Log in to the Dropbox Professional My apps console, https://www.dropbox.com/developers/apps.
2. Select **Create app**.
3. On the Create a new app on the DBX Platform page, do the following



actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

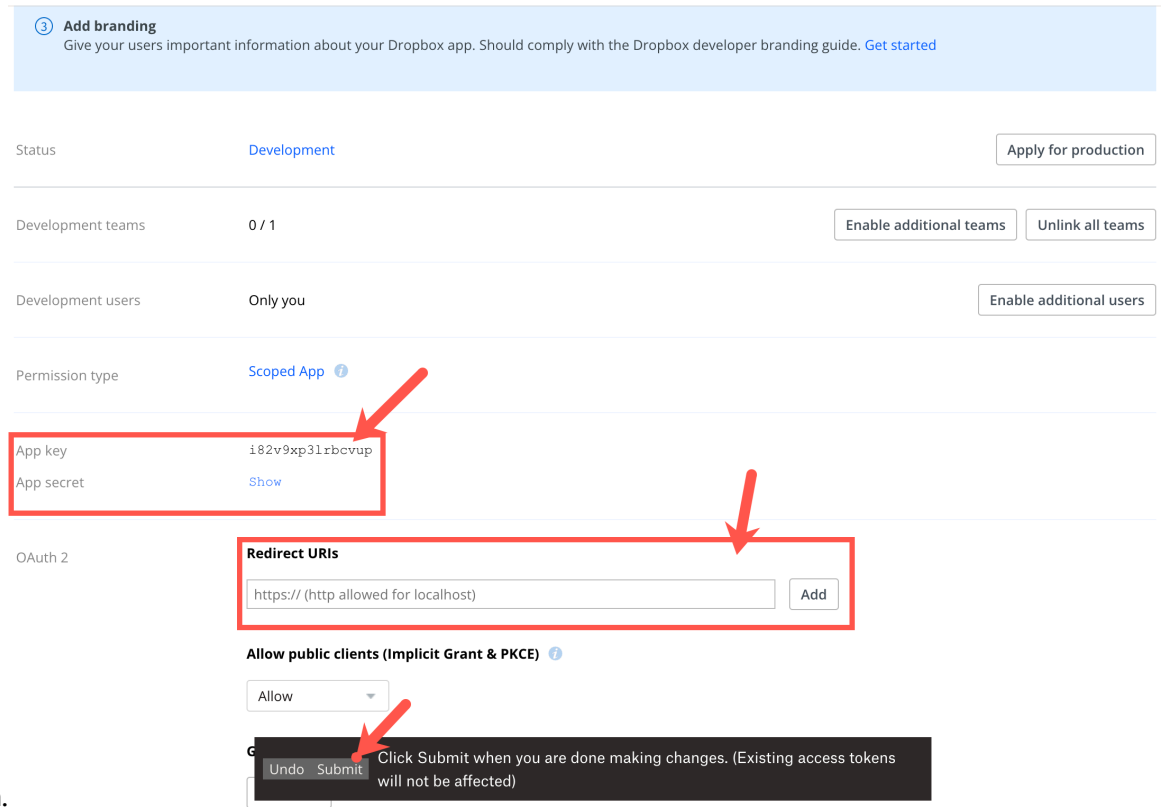
a. Under Choose an API, select Scoped access.

b. Under Choose the type of access that you need, select the appropriate access type.

c. Under Name your app, enter a custom name for the application.

d. Select **Create app**.
The custom application is created.

4. To set up the OAuth 2.0 application, do the following steps under the **Settings** tab of the custom application.



a. Copy and store the value under the App key.
Use the App key value in the Client ID field of the application registry on the ServiceNow instance.

b. Select Show under the App secret and then copy and store the value.

> **Tip:** You need both the App key and App secret values when you set up the application registries on the ServiceNow instance.

c. In the Redirect URIs field, enter the ServiceNow instance URL in the format https://instancename/oauth_redirect.do.

> **Note:** You can add multiple URIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Optional: To add a redirect URI, select **Add** and then enter the ServiceNow instance URL.

e. Select **Submit**.

All three connection and credential records for the Dropbox Business application use the same App secret, App key, and Redirect URI that you set up in this step.

What to do next

Create Connection and Credential records for the Dropbox Business Team Management alias

Create Connection and Credential records for the Dropbox Business Team Management alias

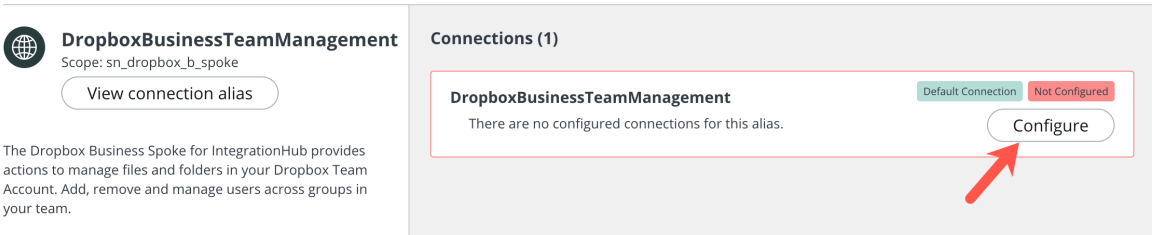
Create connection records to a Dropbox Business account. A connection alias resolves your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the Connections tab.
3. In the Search all connections field, enter `Dropbox`.
4. On the DropboxBusinessTeamManagement tile, select **View Details**.
5. Select **Configure**.



6. In the Configure Connection form, fill the details.

Configure connection

Field	Description
Connection Name	Name of the connection between the Dropbox Business application and the ServiceNow instance. **Note:** The default and read-only name is DropboxBusinessTeamManagement. To provide a custom name, create another connection and credential record.
Connection URL	The URL to connect to the Dropbox Business account. The URL is https://api.dropboxapi.com.
API Version	The version of the API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential Name	The custom name of the credential to access the Dropbox Business account.
OAuth Entity Name	The custom name of the OAuth entity that you created in the Dropbox Business account.
OAuth Client ID	The client ID that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Client Secret	The client secret that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Redirect URL	The redirect URI that you had provided in the Dropbox business application.

7. Select **Configure and Get OAuth Token**.
   A temporary OAuth token is generated.

What to do next
Create Connection and Credential records for the Dropbox Business File Access alias

Create Connection and Credential records for the Dropbox Business File Access alias

Create connection records to a Dropbox Business account for the DropboxBusinessFileAccess alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the Connections tab.
3. In the Search all connections field, enter `Dropbox`.
4. On the DropboxBusinessFileAccess tile, select **View Details**.
5. Select

   Configure.
6. In the Configure Connection form, fill the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure connection

Field	Description
Connection Name	Name of the connection between the Dropbox Business application and the ServiceNow instance. **Note:** The default and read-only name is DropboxBusinessFileAccess. To provide a custom name, create another connection and credential record.
Connection URL	The URL to connect to the Dropbox Business account. The URL is https://api.dropboxapi.com.
API Version	The version of the API.
Credential Name	The custom name of the credential to access the Dropbox Business account.
OAuth Entity Name	The custom name of the OAuth entity that you created in the Dropbox Business account.
OAuth Client ID	The client ID that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Client Secret	The client secret that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Redirect URL	The redirect URI that you had provided in the Dropbox business application.

7. Select **Configure and Get OAuth Token**.
   A temporary OAuth token is generated.

What to do next

Create Connection and Credential records for the Dropbox Content alias

Create Connection and Credential records for the Dropbox Content alias

Create connection records to a Dropbox Business account for the DropboxBusinessContent alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Before you begin

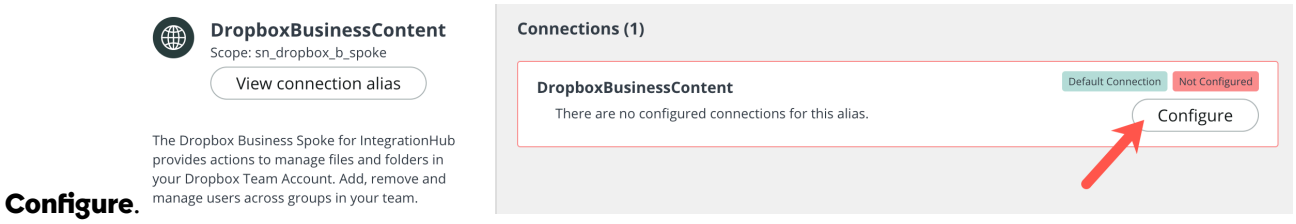
Role required: admin.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the Connections tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Search all connections field, enter `Dropbox`.
4. On the DropboxBusinessContent tile, select **View Details**.
5. Select



Configure.

6. In the Configure Connection form, fill the details.

Configure connection

Field	Description
Connection Name	Name of the connection between the Dropbox Business application and the ServiceNow instance. **Note:** The default and read-only name is DropboxBusinessContent. To provide a custom name, create another connection and credential record.
Connection URL	The URL to connect to the Dropbox Business account. The URL is https://api.dropboxapi.com.
API Version	The version of the API.
Credential Name	The custom name of the credential to access the Dropbox Business account.
OAuth Entity Name	The custom name of the OAuth entity that you created in the Dropbox Business account.
OAuth Client ID	The client ID that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Client Secret	The client secret that you generated in the custom Dropbox Business application. To learn how to generate, see Set up OAuth 2.0 authentication.
OAuth Redirect URL	The redirect URI that you had provided in the Dropbox business application.

7. Select **Configure and Get OAuth Token**.
   A temporary OAuth token is generated.

Result

The Dropbox Business spoke is set up and integrated with the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dun and Bradstreet DirectPlus Spoke

Manage comprehensive business data and analytics tasks in your Dun and Bradstreet account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Dun and Bradstreet DirectPlus spoke v1.1.0 is the latest version. For version history of the spoke, see Dun and Bradstreet DirectPlus Spoke release notes.

Supported versions

This spoke was built for Dun and Bradstreet DirectPlus v1, but may be compatible with later versions.

Spoke requirements

Dun and Bradstreet Direct+ account

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Workflow Studio - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Dun and Bradstreet DirectPlus spoke provides sample flows to demonstrate automating the Dun and Bradstreet DirectPlus tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
Look up Companies	Retrieves the supplier information and verifies if the supplier is in good business standing before creating a new supplier in the downstream system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Dun and Bradstreet DirectPlus spoke provides actions to automate data and analytics tasks tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Data Block Management	Look up Data Blocks by Duns Number	Retrieves information about the specified data block for the specified D-U-N-S (Data Universal Numbering System) number.
Profile Management	Look up Industry Detailed Profile	Retrieves detailed information about the requested industry, including industry indicators, challenges, financials, and industry forecast.
Report Management	Look up Company Report	Retrieves the Dun and Bradstreet(D&B)'s Business Information Report and Comprehensive Report that can be used for determining a company's profitability, stability, viability, and payment performance to evaluate the risk for both new or existing business relationships. **Note:** PDF reports are not available for all markets, including Canada. For better global coverage, use the HTML format of the report.
Search Management	Look up Company Typeahead Search	Retrieves the company records based on search term and other additional attributes of the company. **Note:** This action returns the top 25 matched results.
	Look up Identity Resolution Cleanse Match	Retrieves the best matches for provided search parameters using Dun & Bradstreet proprietary algorithms. **Note:** For Multi-Process, this action returns only one result. For a nationwide search in US, this action returns a maximum 100 results. In all other scenarios, this action returns the top 25 matched results.

Spoke module

The Dun and Bradstreet DirectPlus spoke adds the Dun and Bradstreet DirectPlus spoke application to your instance and includes these modules:

Module	Description
Companies	Lists all the available companies records.

Set up the Dun and Bradstreet DirectPlus spoke

Integrate the ServiceNow instance and Dun and Bradstreet Direct+ by using the client ID and client secret credentials to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate Dun and Bradstreet DirectPlus spoke.
- Role required: admin

Configure a connection for Dun and Bradstreet DirectPlus spoke

Add and configure a Dun and Bradstreet DirectPlus connection to authenticate ServiceNow requests.

Before you begin

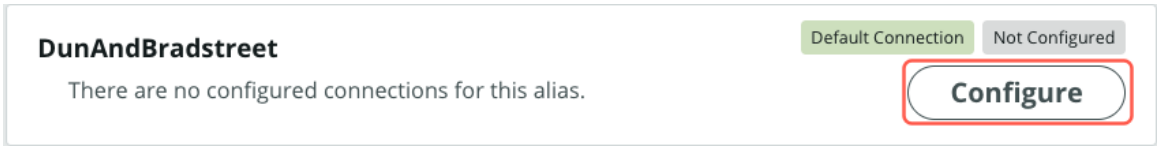
- Get the client ID and client secret of your Dun and Bradstreet account from the account administrator.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, toggle and enable the **Outbound** connections.
4. Locate the alias for **DunAndBradstreet** and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Dun and Bradstreet DirectPlus spoke, click **View Details**.

   - To manage more than one Dun and Bradstreet DirectPlus connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

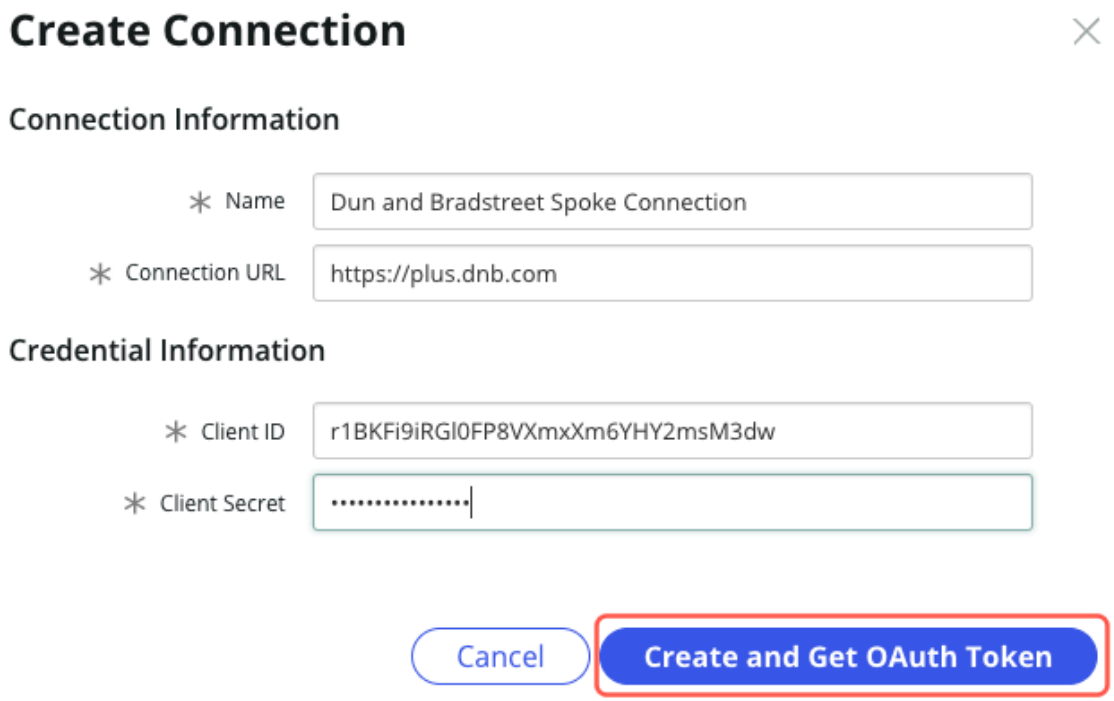
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Configure Connection** form, fill in the fields:

Field	Description
Name	Name to uniquely identify the connection record. For example, `Dun and Bradstreet Directplus connection`
Connection URL	URL of the Dun and Bradstree Direct+ instance. Enter `https://plus.dnb.com`.
Client ID	Client ID of your Dun and Bradstreet DirectPlus account.
Client Secret	Client secret of your Dun and Bradstreet DirectPlus account.



6. Click **Configure Configure and Get OAuth Token**.

Result
The spoke connection is configured and ready to be used.

Ethoca spoke

Integrate ServiceNow instance with your Ethoca account to manage card dispute resolution and prevent fraud. By using this spoke, you can access detailed merchant information and subscription control, view digital receipts, and manage their disputes.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Ethoca spoke v3.0.0 is the latest version. For version history of the spoke, see Ethoca Spoke release notes.

Supported versions

This spoke was built for Consumer Clarity and Issuer Alerts Management .

Key features

- Streamlines dispute resolution processes
- Facilitates collaboration between issuers and participating merchants through Ethoca Alerts during the dispute lifecycle
- Resolves cases at the pre-dispute stage, benefiting both issuers and cardholders
- Reduces the occurrence of disputes and chargebacks

Spoke requirements

- Integration Hub subscription
- Ethoca configuration details such as, certificate, key alias, consumer key, and keystore password

Spoke dependencies

Ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)

Note: If used outside the spoke implementation, some of these plugins are licensable features and need appropriate licenses.

Spoke actions

The Ethoca spoke provides actions to obtain enriched merchant and transaction information. Available actions include:

Category	Action	Description
Consumer Clarity	Look up Consumer Clarity	Enables cardholders to view their credit card transactions with clear merchant information and transaction details.
Issuer Alerts Management	Create Transaction Alert	Submits a batch of transactions (confirmed fraud or customer disputes) to Ethoca. These transactions are processed and delivered to merchants as alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Transaction Alert Status by Batch	Returns the processing status of previously submitted transaction requests.
	Look up Alert Status	Provides the status of the alert delivered to the merchant.
	Look up Alert Outcome by Batch Stream	Retrieves a list of alerts and their outcomes based on the Batch ID provided by the Submit Batch endpoint or Ethoca Notification Callback. Results are paginated with up to 50 alerts per request and a maximum of 1000 alerts per batch. **Note:** To enable the Look up Alert Outcome by Batch Stream action, install the ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream) plugin.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Ethoca spoke

Set up Ethoca spoke

Integrate the ServiceNow instance with the Ethoca account using the using the OAuth protocol (version 1.0a) for the Consumer Clairty category and using Basic Auth credentials for the Issuers Alert Management category to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Ethoca spoke.
- Role required: admin.

For the Consumer Clarity category

Integrate the ServiceNow instance with the Ethoca account in the Consumer Clarity category using the OAuth protocol (version 1.0a) to securely authorize and authenticate ServiceNow requests.

Follow these steps:

- Attach a Ethoca certificate
- Create credential records
- Create connection records

Attach a Ethoca certificate

Use the certificate generated during the Ethoca account configuration to sign the request and payloads.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Valid Ethoca certificate
- Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields:

X.509 Certificate form fields

Field	Description
Name	Enter a name to identify the certificate.
Type	Type of the certificate. Select `PKCS12 Key Store`.
Notify on expiration	Select the list of users to be notified when the certificate expires.
Warn in days to expire	Enter the number of days when a notification is sent to users before a certificate expires.
Key store password	Password to access the certificate. Use the destination keystore password specified when creating the certificate.
Active	Option to make the client certificate active.
Short description	Short description of the user client certificate.

4. Click the manage attachments icon ( ) and attach a Ethoca certificate.
5. Click **Validate Stores/Certificates** to validate the certificate.
6. Click **Submit**.

Create credential records

Create a credential record for your Ethoca account. The Ethoca spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **Ethoca Credential**.
   A blank Ethoca Credential form displays.
4. Enter these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, `Ethoca Credentials`.
Active	Enable
Key alias	Key alias associated with the Ethoca account.
Keystore password	Password associated with the certificate.
Consumer key	Consumer key that you generated during the Ethoca configuration.
Certificate	Select the newly created Ethoca certificate.
Authentication Algorithm	Custom authentication algorithm for outbound signing requests. Select **Ethoca**. **Note:** Users are cautioned against directly modifying the default authentication algorithm.

5. Click **Submit**.

Create connection records

Create a connection record for your Ethoca account. The Ethoca spoke connection and credential aliases use these connections to perform actions in Ethoca.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open for the record for **Ethoca**.
3. On the **Connections** tab, click **New**.
4. On the form, fill these values.

Field	Value required
Connection URL	Base URL to connect to your Ethoca instance. Enter: `https://sandbox.api.ethocaweb.com/ethoca` .
Credential	Credential record that you created for Ethoca. For example, `Ethoca Credentials`.

5. Right-click the form header and click **Save**.

For the Issuer Alerts Management category

Integrate the ServiceNow instance with the Ethoca account in the Issuer Alerts Management category using Basic Auth credentials to authenticate ServiceNow requests.

Follow these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create basic auth credentials
- Create connection records

Create basic auth credentials

Create credentials to access a ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credentials**.
4. On the form, fill in the fields.

Field	Description
Name	Unique name to identify the credential record. For example, `Ethoca Alerts Credentials`
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to actively use the credential record. Select the option.
Order	The order (sequence) in which the platform tries this credential while it attempts to log in to devices. Default value: `100`.

5. Select **Submit**.

Create connection records

Create a connection record for your Ethoca account. The Ethoca spoke connection and credential aliases use these connections to perform actions in Ethoca Alerts.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open for the record for **Ethoca Alerts**.
3. On the **Connections** tab, click **New**.
4. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection established with the Ethoca instance. The first connection's default name is automatically assigned to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	match the name specified in the Connections and Credentials form on the Connection & Credential Aliases page.
Credential	Credential record you that created for Ethoca Alerts. For example, `Ethoca Alerts Credentials`.
Connection URL	Base URL to connect to your Ethoca instance. Enter: `https://sandbox.ethocaweb.com/ethoca-rest`.

5. Right-click the form header and click **Save**.

Equifax Spoke

Integrate the ServiceNow instance with the Equifax spoke to access important information about the credit history for a customer, fraud alerts, digital identity verification, transaction screening, and other relevant data.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Equifax Spoke v1.0.0 is the latest version. For version history of the spoke, see Equifax Spoke release notes.

Supported versions

Equifax spoke v1.0.0 supports Equifax OneView - 1.0.2212 (Consumer API).

Key features

Equifax spoke enables a flow designer to do the following tasks:

- Access customer information, such as the credit history for a customer, the credit score for a customer, and fraud alerts.
- Evaluate a customer's creditworthiness to make lending decisions faster.
- Verify customer identities to ensure that you have accurate information.

Spoke actions

The Equifax spoke provides actions (under the Equifax Credit Report category) to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Equifax Credit Report	Look up One View Credit Report	Provides the JSON response that gives the credit history of the customer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up One View Credit Report by Request ID	Provides the PDF report of the credit history for the customer.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Equifax spoke.

Set up Equifax spoke

Integrate the ServiceNow instance and Equifax spoke by using basic Auth or OAuth 2.0 authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Equifax spoke.
- Ensure that the dependent plugins are activated.
- Role required: admin.

Register Equifax as an OAuth provider

Use the information generated during the application configuration to register Equifax as an OAuth provider. OAuth provider registration enables the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

- Role required: admin
- Client ID and client secret generated from configuration of the third-party Equifax application

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
   The system displays this message: `What kind of OAuth application?`.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, enter: `Equifax OAuth`
Client ID	<Client ID> created during the Equifax account configuration.
Client Secret	<Client Secret> created during the Equifax account configuration.
Authorization URL	OAuth Server's authorization code flow endpoint. Required only for Authorization Code grant type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token URL	OAuth Server's token endpoint. For example, `xxx.equifax.com`.
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`
OAuth API Script	Script to customize the request and response.
Logo URL	URL that contains an image to use as the application logo.
Default Grant Type	Grant type used to establish the token. Select **Client Credentials**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 1430 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to actively use the application registry.
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.
Send credentials	Option for whether or how to send authentication information identifying the application and its authorized users to the OAuth server. Select **In Request Body**.

5. On the form header, select **Submit**.

Create OAuth 2.0 credential record for the Equifax spoke

Create credential records to the Equifax custom OAuth application you created during Equifax account configuration. The Equifax spoke connection and credential aliases use these credentials to authorize actions in Equifax application.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.

   The system displays this message: `What type of Credentials would you like to create?`

3. Select **OAuth 2.0 Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The pop-up window displays a blank OAuth 2.0 Credentials form.

4. Enter these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `Equifax OAuth2.0 API Credentials`.
Active	Enable
OAuth Entity Profile	Select the OAuth profile you created when you registered the custom *Equifax* application as an OAuth provider. For example, select *Equifax* **OAuth default profile**.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

5. Select **Submit**.
6. To generate the OAuth token, select the **Get OAuth Token** related link.

Create connection record for the Equifax spoke

Create a connection record for your Equifax application with the credential aliases provided. You need to select the credential record to the Equifax custom OAuth application you created during Equifax account configuration.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, for example, *Equifax*.
3. From the **Connections** tab, select **New**.
4. On the form, fill these fields.

Connection form

Field	Description
Name	Name to uniquely identify the record. For example, *Equifax* `Connection`.
Credential	Basic Auth or OAuth 2.0 credential record created for *Equifax*. For example, *Equifax* `OAuth2.0 API Credentials`.
Connection alias	Alias record associated with this connection. For example, `sn_equifax_spoke.Equifax`
Connection URL	Base URL to connect to *Equifax*.
Active	Option to actively use the connection record.
Domain	Domain that the action runs in.

5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Equifax OAuth token

Generate the Equifax access token.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Equifax spoke OAuth Credential record.

   Example
   For example, select **Equifax OAuth2.0 Credentials**.
3. From Related Links, select **Get OAuth Token**.

F5 BIG-IP Spoke

Manage servers and pools in the F5 BIG-IP system.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported version

BIG-IP 13.1.0.

Spoke version

F5 BIG-IP spoke v1.3.0 is the latest version. For version history of the spoke, see F5 BIG-IP spoke release notes.

Spoke flows

The F5 BIG-IP spoke provides sample flows in the draft state to demonstrate automating F5 tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
Local Traffic Management Using F5 Big-IP	Creates a virtual server, associates it to a pool, and adds pool member in the BIG-IP system from a ServiceNow Service Catalog request.

Spoke subflows

The F5 BIG-IP spoke provides sample subflows to demonstrate automating F5 tasks. Available sample subflows include:

Flow	Description
F5 Server - Pool Management	Creates a pool in the BIG-IP system and manages it.

Spoke actions

The F5 BIG-IP spoke provides actions to automate F5 tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Pool Management	Create Pool	Creates a pool in the BIG-IP system.
	Add Pool Member	Creates a pool member in the BIG-IP system.
	Check Pool	Checks pool health in BIG-IP system. Returns whether the pool is available, unavailable, offline, or if the status is unknown.
	Delete Pool	Deletes a pool from the BIG-IP system.
	Disable Pool Member	Disables a pool member in the BIG-IP system.
	Enable Pool Member	Enables a pool member of a specified pool in the BIG-IP system.
	Get Pool Members	Retrieves the list of members of a specified pool from the BIG-IP system.
	Remove Pool Member	Deletes a pool member in the BIG-IP system.
Server Management	Add Profile to Virtual Server	Adds a profile to a virtual server in the BIG-IP system. Profiles enable you to control network traffic. For example, you can enable HTTP connections to the virtual server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Virtual Server	Creates a virtual server in the BIG-IP system.
	Delete Virtual Server	Deletes a virtual server from the BIG-IP system.
	Update Virtual Server	Updates virtual server attributes in the BIG-IP system.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
F5 BIG-IP pool management AI agent	Manages (that is, adds a pool member, fetches pool members, disable a pool member, removes a pool member, creates a pool, deletes a pool, verifies a pool) pools in BIG-IP system.
F5 BIG-IP server management AI agent	Manages (that is, adds a profile to virtual server, deletes a virtual server, updates a virtual server, creates a virtual server) servers in BIG-IP system.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses this alias record to authorize actions.

Connection & Credential alias	Description	Connection alias requirements
F5_BIG_IP	Connection to the F5 BIG-IP system.	• Connection type: HTTP • Connection URL: URL of the host machine where the F5 server is installed.

To use the spoke connection alias, create an associated Connection record and an associated Credential record. For information about setting up the spoke, see Configure a connection for the F5 BIG-IP spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the F5 BIG-IP alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Configure a connection for the F5 BIG-IP spoke

Integrate the ServiceNow instance and F5 using basic authentication to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the F5 BIG-IP spoke.
- Role required: admin.

Procedure

1. Navigate to **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.
3. Locate the **F5_BIG_IP** connection alias and click **View Details**.
4. Click **Edit**.
5. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to identify the F5 BIG-IP connection alias record.
Connection URL	URL of the host machine where the F5 BIG-IP server is installed.
User name	Your F5 BIG-IP user name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password	Your F5 BIG-IP user name.

6. Click **Submit**.

First Advantage Spoke

Manage and track the background verifications of candidates using First Advantage from your ServiceNow instance. Manage users, accounts, candidates, invites, and orders in First Advantage from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

First Advantage spoke v1.9.0 is the latest version. For version history of the spoke, see First Advantage spoke release notes.

Supported versions

This spoke was built for First Advantage API version v1.1, but may be compatible with later versions.

Spoke requirements

- First Advantage account
- API key

  Note: Contact the First Advantage team to obtain the API key.

- Account ID

  Note: Contact the First Advantage team to obtain the Account ID.

Spoke flows

The First Advantage spoke provides sample flows to demonstrate automating the First Advantage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

Flow	Description
First Advantage - Candidate Background Verification using Invite	Initiates background check of the candidate using invite. Sends a request to the candidate to complete an application. For information

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow	Description
	about creating a case, see Create a case in First Advantage from ServiceNow.
First Advantage - Candidate Background Verification using Order	Initiates background check of the candidate using order. An order record is created and request to provide essential details is sent to the candidate. For information about creating a case, see Create a case in First Advantage from ServiceNow.
First Advantage - (Order As) Candidate Background Verification using Order	Initiates background check of the candidate using order and places order on behalf of the required user.
First Advantage - (Order As) Candidate Background Verification using Invite	Initiates background check of the candidate using invite and places order on behalf of the required user.

Spoke subflows

The First Advantage spoke provides a sample subflow to demonstrate automating First Advantage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Packages. The subflow retrieves packages in First Advantage and stores the details in the Packages table.

Spoke actions

The First Advantage spoke provides actions manage accounts, candidates, invites, orders, and users when events occur in ServiceNow. Available actions include:

Category	Action	Description
Account Management	Get Account Details	Retrieves details of the First Advantage account.
	Get Account Packages	Retrieves the details of all the packages in an account.
	Get Account Profiles	Retrieves the details of all profiles in an account.
	Get Account Users	Retrieves the details of all users in an account.
Candidate Management	Create New Candidate	Creates a candidate profile for background verification.
	Get Candidate By Candidate ID	Retrieves the details of the required candidate.
	Get Documents For A Specific Candidate	Retrieves the documents associated with the required candidate.
	Get Monitoring Product Details For A Specific Candidate	Retrieves the details of the monitoring product for the required candidate.
	Update Candidate Details	Updates the details of a candidate profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Invite Management	Create Invite	Create an invite for the candidate to fill the application.
	Get Invite Status By Applicant ID	Retrieves the latest status of the invite for the required applicant.
	Get Invite View Link By Application ID	Retrieves a secure link to access the profile that the candidate must complete.
Order Management	Create Order	Creates a First Advantage screening order.
	Get Order Report By Order ID	Retrieves the completed order report for the required order.
	Get Order Status By Order ID	Retrieves the latest order status for the required order.
User Management	Activate User	Activates the required user.
	Create User	Creates a user profile.
	Deactivate User	Deactivates the required user.
	Update User Password	Updates the password of the required user.
	Update User Profile	Updates information in the profile of the required user.

Spoke module

The First Advantage spoke adds a First Advantage spoke module to your ServiceNow instance. The First Advantage spoke synchronizes and stores information about First Advantage cases, tasks, employee tasks, order tasks, and packages.

The First Advantage spoke includes these modules:

Module	Description
Accounts	Enables you to view the details of all accounts available in First Advantage. To view the account details, you must set up the spoke and synchronise the accounts.
FADV Webhook Client Details	Enables you to set up First Advantage webhook by providing key for the First Advantage webhook client.
Create New First Advantage Case	Enables you to initiate the background check of the required candidate using invite or order from ServiceNow.
First Advantage Cases	Enables you to view list of all First Advantage cases created using invite and order.
Packages	Enables you to view the details of all packages available in First Advantage. To view the package details, you must set up the spoke and synchronise the packages.
Order Tasks	Enables you to view list of all First Advantage order records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
Employee Tasks	Enables you to view list of all First Advantage cases created using invite.

The First Advantage spoke includes the these tables:

- First Advantage Task [sn_fadv_spoke_first_advantage_task]
- First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table]
- Packages [sn_fadv_spoke_packages]
- FADV Webhook Client Details [sn_fadv_spoke_webhook_client_details]

Table	Description
First Advantage Task	Details of all the First Advantage order records.
First Advantage Employee Task	Details of all the First Advantage invite records.
Packages	First Advantage packages that are synchronized with ServiceNow®.
FADV Webhook Client Details	Client details to set up the First Advantage webhook.

Spoke user roles

- First Advantage admin
- First Advantage user

Only users with the First Advantage admin role can view the **FADV Webhook Client Details** module.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the First Advantage spoke.

Set up the First Advantage spoke

Integrate the ServiceNow instance with your First Advantage account using an API key to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the First Advantage spoke.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection record for the First Advantage spoke

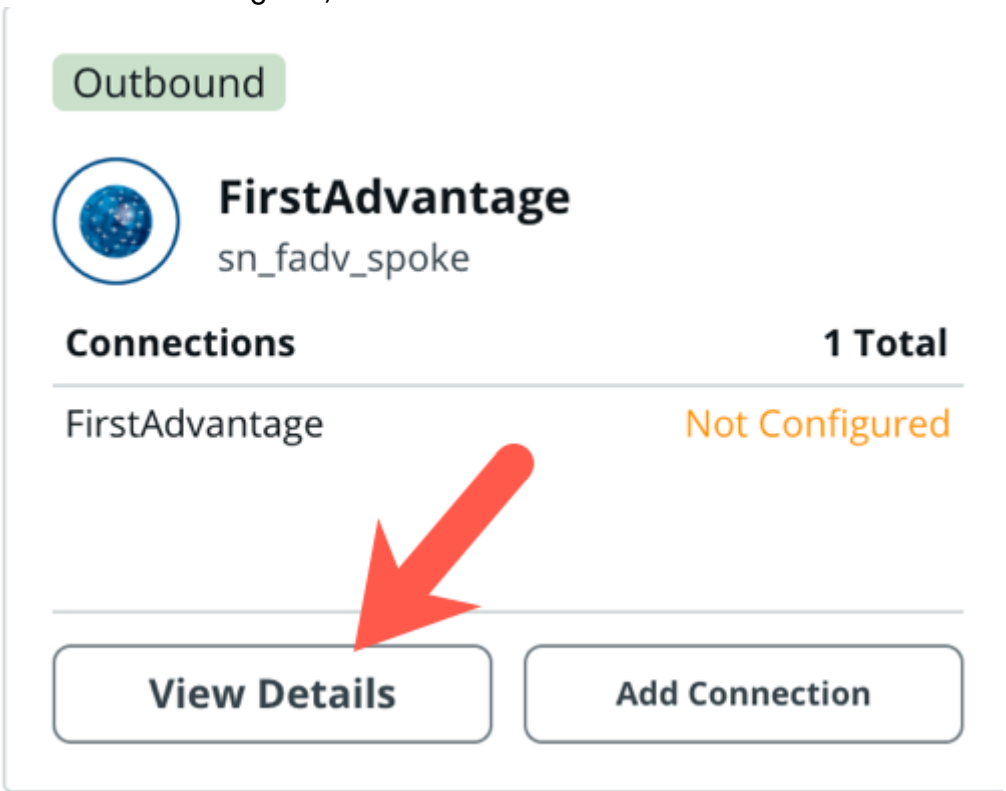
Create a connection record to integrate your ServiceNow instance and the First Advantage server. Your ServiceNow instance uses this connection record to perform the First Advantage spoke actions.

Before you begin
Role required: admin.

Acquire the API key from the First Advantage server.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select **Integrations**.
3. Select the **Connections** tab.
4. In the Search all connections field, enter `First Advantage`.
   Confirm that the **Outbound** tab is selected.
5. On the FirstAdvantage tile, select **View Details**.



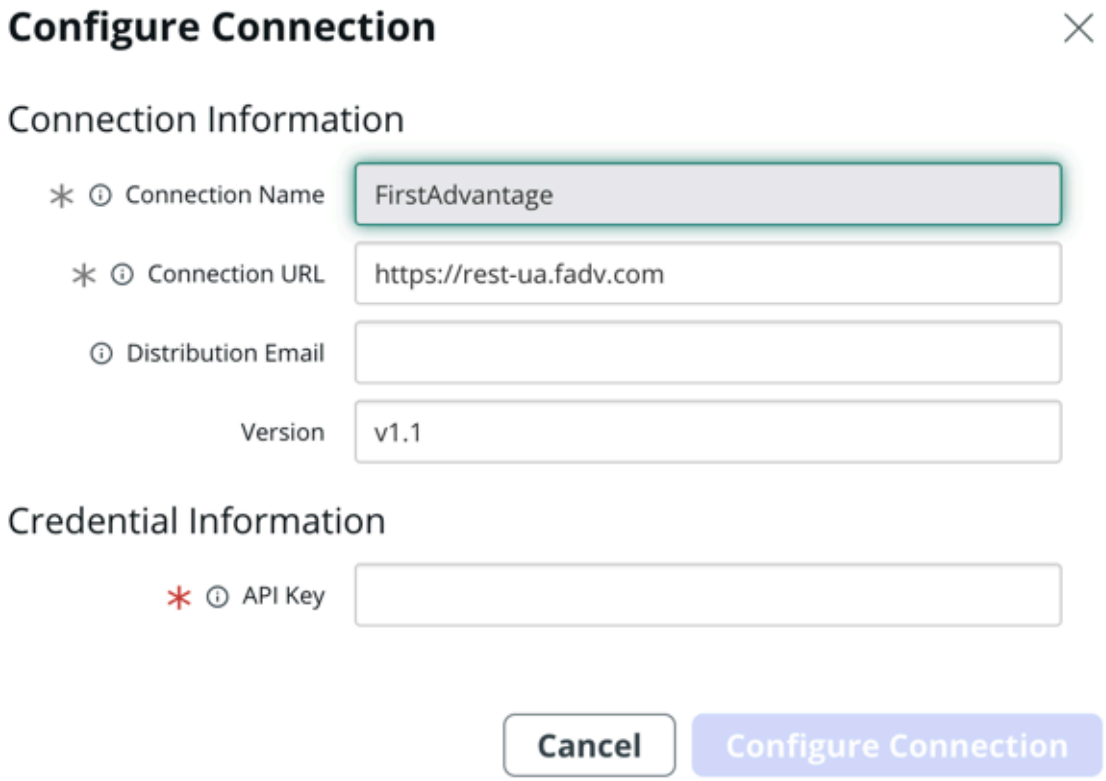
6. Select **Configure**.
7. Fill the form.

First Advantage spoke connection form

Field	Description
Connection Name	Name of the connection. The default and read-only name of the first record is the same as that of the connection alias. You can provide a different name when you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	create a connection record by clicking **Add Connection**.
Connection URL	Option to provide the connection URL to the First Advantage server. The URL is https://rest-ua.fadv.com.
Distribution Email	Option to provide a distribution email ID.
Version	Option to provide the version of the API.
API Key	Option to enter the API key that the First Advantage server uses to authenticate access requests.



8. Select **Configure Connection**.
   The connection record is configured.

Create First Advantage states in your ServiceNow instance

Create First Advantage states to be displayed in the **State** list in your ServiceNow instance.

Before you begin
Role required: admin

Create the Draft, Ready, and In Progress states

Create the Draft, Ready, and In Progress states in the Task [task] table.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Filter navigator, enter `sys_choice.list`.
   The records in the Choice [sys_choice] table are displayed.
2. Click **New**.
3. On the form, fill these values and create three records for the Draft state.

Record 1 - Draft state

Field	Value
Table	Task [task]
Element	state
Label	Draft
Value	137

Note:

- Ensure that you provide the exact numbers in the **Value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the **Global** application.

4. Click **Submit**.
5. Similarly, create records for the Ready and In Progress states.

Record 2 - Ready state

Field	Value
Table	Task [task]
Element	state
Label	Ready
Value	173

Record 3 - In Progress state

Field	Value
Table	Task [task]
Element	state
Label	In Progress
Value	181

Note:

- Ensure that you provide the exact numbers in the **Value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the **Global** application.

Result

The Draft, Ready, and In Progress states are created in the Task [task] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create the Complete and Cancelled states

Create the Complete and Cancelled states in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Order Tasks**.
2. Click **New**.

   Note: Ensure that the record is created in the **First Advantage** application.

3. Right-click **State** and click **Configure Choices**.
4. Perform these steps to create the Cancelled state:

   a. Enter `Cancelled` in **New item text**.

   b. Enter `149` in **Numeric value**.

   Note: Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

5. Perform these steps to create the Complete state:

   a. Enter `Complete` in **New item text**.

   b. Enter `127` in **Numeric value**.

   Note: Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

Result
The Complete and Cancelled states are created in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

Create the Complete - Success and Complete - Deal Broken states

Create the Complete - Success and Complete - Deal Broken states in the First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table] table.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Employee Task**.
2. Click **New**.

   Note: Ensure that the record is created in the **First Advantage** application.

3. Right-click **State** and click **Configure Choices**.
4. Perform these steps to create the Cancelled state:

   a. Enter `Complete - Success` in **New item text**.

   b. Enter `161` in **Numeric value**.

   Note: Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

5. Perform these steps to create the Complete state:

   a. Enter `Complete - Deal Broken` in **New item text**.

   b. Enter `117` in **Numeric value**.

   Note: Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c. Click **Add**.

   d. Click **Save**.

Result

The Complete - Success and Complete - Deal Broken states are created in the First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table] table.

Set up First Advantage webhooks

Receive invite and order event updates at your ServiceNow instance by setting up the webhooks.

Before you begin

Role required: admin

Create authorization key for the First Advantage spoke

Create a authorization key to authorise requests from Jenkins.

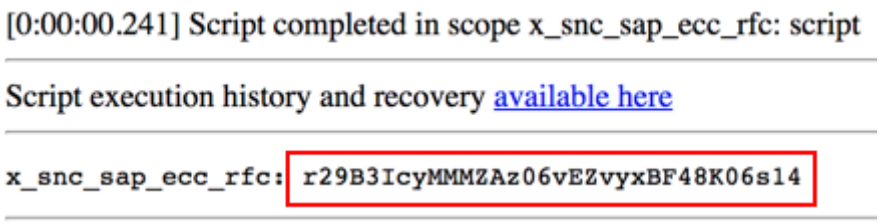
Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
   `gs.info(GlideSecureRandomUtil.getSecureRandomString(32));`
3. Click **Run Script**.
4. Copy and record the generated value for later use.



Provide key in your ServiceNow instance

Set up the First Advantage webhook by providing key for the First Advantage webhook client.

Before you begin

- Create authorization key for the First Advantage spoke and record the value.
- Role required: admin

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **FADV Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values.

Field	Description
Name	Name to uniquely identify the record.
Authorization Key	Authorization key you had generated. For more information, see Create authorization key for the First Advantage spoke.

4. Click **Submit**.

Access API endpoints

Access the API endpoint for the invite and order events and share the required details with First Advantage to set up the webhooks.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Web Services** > **Scripted REST APIs**.
2. Open the record for the First Advantage spoke, for example, **First Advantage Webhook**.
3. In the **Resources** tab:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the record for the invite event, for example, **Invite Status**.

b. Copy and record the path provided in **Resource path**, for example, `/api/sn_fadv_spoke/fadv/invite_status`.

c. Open the record for the order event, for example, **Order Status**.

d. Copy and record the path provided in **Resource path**, for example, `/api/sn_fadv_spoke/fadv/order_status`.

What to do next

Contact First Advantage to setup webhooks for your ServiceNow instance. For this, share these details with First Advantage:

- Custom header in this format: `fadvKey <authorization-key>`.

Note:

- Ensure that the custom header is in this format only. The spoke flows will not be triggered if there is any change.
- Provide the same key you had earlier provided in **First Advantage Spoke** > **FADV Webhook Client Details**.
- Use the same case as mentioned here: `fadvKey`.

- API endpoint for the invite events in this format: `<ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/invite_status`
- API endpoint for the order events in this format: `<ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/order_status`

Synchronise First Advantage accounts and packages with ServiceNow

Store the details of the First Advantage accounts and packages by synchronizing First Advantage accounts and packages with ServiceNow.

Before you begin

Role required: First Advantage admin

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Accounts**.
2. Click **New**.
3. On the form, fill in the values.

Account form

Field	Description
Primary Account	Option to specify that the account is a primary account. Select the check box.
Account ID	ID of the primary account.
Account Name	Name of the primary account.

4. Click **Submit**.
   The primary account is created and the record is displayed.
5. Navigate to **First Advantage Spoke** > **Accounts**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click the **Get Accounts** related list.
7. Navigate to **First Advantage Spoke** > **Packages**.
8. Click the **Get Packages** related link.

Result
The First Advantage account and package details are retrieved.

Note: Only users with the FADV admin role can synchronize the account and package details. Users with FADV user role can only view the retrieved details.

Create a case in First Advantage from ServiceNow

Initiate the background check of the required candidate using invite or order from ServiceNow.

Before you begin

- Set up the First Advantage spoke
- Synchronise First Advantage accounts and packages with ServiceNow
- Create users in the User [sys_user] table. Background check can be performed only for these users.
- Role required: First Advantage admin or First Advantage user

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **Create New First Advantage Case**.
   Form to provide the First Advantage case details is displayed.
2. On the form, fill these values.

Field	Description
Use Distribution Email for getting invite email from First Advantage	Option to send invitation email to all users in the distribution email.
Select User	User in the User [sys_user] table.
First Name	First name of the selected user. The value is auto-populated based on the user selected in **Select User**.
Last Name	Last name of the selected user. The value is auto-populated based on the user selected in **Select User**.
Email	Email address of the selected user. The value is auto-populated based on the user selected in **Select User**.
Select An Account	First Advantage account to perform the background check.
Select A Package	First Advantage package to perform the background check.
Short Description	Brief description about the background check.
Agent Name	Agent to perform the background check.
Send Invite link	Option to send an invite email. When selected, a request to complete an application is sent to the candidate through an invite email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If this option isn't selected, an order email is sent to the user. An order record is created and request to provide essential details is sent to the candidate. **Note:** ○ When the **Send Invite link** option is selected, an order is created only after the candidate has filled the application form. ○ When the **Send Invite link** option isn't selected, an order is immediately created. Events updates can be accessed in your ServiceNow instance .
Use "Order As"	Option to place order on behalf of the required user.
Email (Order As)	Email ID of the required user. This field is available only when the **Use "Order As"** check box is selected.
Account ID (Order As)	Account ID of the required user. This field is available only when the **Use "Order As"** check box is selected.
User ID (Order As)	User ID of the required user. This field is available only when the **Use "Order As"** check box is selected.

3. Click **Submit**.
   A First Advantage task is created in your ServiceNow instance with **State** as **Draft**. The case can be accessed by navigating to **First Advantage Spoke** > **First Advantage Cases**.

Initiate background verification in First Advantage from ServiceNow using invite

Initiate background verification of the required candidate by sending a request to complete an application through an invite email.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note: Ensure that the **Send Invite link** option is selected and the **Use "Order As"** option isn't selected.

- Role required: First Advantage admin or First Advantage user

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.
3. Ensure that the **Send Invite link** option is selected and the **Use "Order As"** option isn't selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Invite flow is triggered.
   - **State** is changed to **In Progress**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Employee Tasks** tab, a record is created and its details such as **Number**, **Invite ID** and so on, are populated. Open the record to access details such as **Invite URL**, **Candidate ID**, and so on. Also, real-time updates are displayed here.

  Note: The **Employee Tasks** tab displays all the invite records created for the user.

- In the **Order History** tab, a record is created and its details such as **Number**, **Short Description** and so on, are populated.

  Note: The **Order History** tab displays all the order records created for the user.

- Real-time updates and System Administrator events are displayed in the **Order Details** tab.

  Note: **Order ID** is populated only after the invite is executed successfully. For example, **Order ID** isn't populated if the candidate has declined to complete the application form.

- An invite email is sent to the candidate.

Result

After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form,First Advantage approves, cancels, or rejects the task after performing the background verification.

- The status and all other details can be accessed in real-time by navigating to **First Advantage Spoke** > **Employee Tasks**.
- Guest events are displayed in the respective First Advantage Employee Task record.

Note:

- You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.
- If the candidate has declined the request for background verification, the Order record isn't created for the task.

Initiate background verification in First Advantage from ServiceNow using order

Initiate background verification of the required candidate by sending an email requesting for the essential information.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note: Ensure that the **Send Invite link** and **Use "Order As"** options aren't selected.

- Role required: First Advantage admin or First Advantage user

About this task

An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Ensure that the **Send Invite link** and **Use "Order As"** options aren't selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Order flow is triggered.
   - **State** is changed to **In Progress**.
   - In the **Order History** tab, a record is created and its details such as **Order ID**, **Number**, **Short Description** and so on, are populated.
   - Real-time updates and System Administrator events are displayed in the **Order Details** tab.

     Note: The **Order History** tab displays all the order records created for the user.

   - An order email is sent to the candidate.

Result

A mail is sent to candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the **Order Details** tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

Note: You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.

Initiate background verification in First Advantage from ServiceNow using invite on behalf of another user

Initiate background verification of the required candidate by sending a request on behalf of another user to complete an application through an invite email.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note: Ensure that the **Send Invite link** and **Use "Order As"** options are selected.

- Role required: First Advantage admin or First Advantage user

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.
3. Ensure that the **Send Invite link** and **Use "Order As"** options are selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Invite flow is triggered.
   - **State** is changed to **In Progress**.
   - In the **Employee Tasks** tab, a record is created and its details such as **Number**, **Invite ID** and so on, are populated. Open the record to access details such as **Invite URL**, **Candidate ID**, and so on. Also, real-time updates are displayed here.

     Note: The **Employee Tasks** tab displays all the invite records created for the user.

   - In the **Order History** tab, a record is created and its details such as **Number**, **Short Description** and so on, are populated.

     Note: The **Order History** tab displays all the order records created for the user.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Real-time updates and System Administrator events are displayed in the **Order Details** tab.

  Note: **Order ID** is populated only after the invite is executed successfully. For example, **Order ID** isn't populated if the candidate has declined to complete the application form.

- An invite email is sent to the candidate.

Result

After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form, First Advantage approves, cancels, or rejects the task after performing the background verification.

- The status and all other details can be accessed in real-time by navigating to **First Advantage Spoke** > **Employee Tasks**.
- Guest events are displayed in the respective First Advantage Employee Task record.

Note:

- You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.
- If the candidate has declined the request for background verification, the Order record isn't created for the task.

Initiate background verification in First Advantage from ServiceNow using order

Initiate background verification of the required candidate by sending an email requesting for the essential information on behalf of the required user.

Before you begin

- Create a case in First Advantage from ServiceNow

  Note: Ensure that the **Send Invite link** option isn't selected and the **Use "Order As"** option is selected.

- Role required: First Advantage admin or First Advantage user

About this task

An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.

Procedure

1. Navigate to **All** > **First Advantage Spoke** > **First Advantage Cases**.
2. Search for the required task.
3. Ensure the **Send Invite link** option isn't selected and the **Use "Order As"** option is selected.
4. Change the **State** of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Order flow is triggered.
   - **State** is changed to **In Progress**.
   - In the **Order History** tab, a record is created and its details such as **Order ID**, **Number**, **Short Description** and so on, are populated.
   - Real-time updates and System Administrator events are displayed in the **Order Details** tab.

Note: The **Order History** tab displays all the order records created for the user.

- An order email is sent to the candidate.

Result
A mail is sent to candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the **Order Details** tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

Note: You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.

FRISS Spoke

Integrate a ServiceNow instance with your FRISS account to leverage the fraud detection capabilities for claims and to detect fraud early in the claims process.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

FRISS Spoke v1.2.0 is the latest version. For version history of the spoke, see FRISS Spoke release notes.

Supported versions

This spoke was built for FRISS API version v 2.0 but may be compatible with later versions.

Key features

FRISS spoke enables a flow designer to do the following:

- Integrate with the FRISS API for Claims to save the scores returned by FRISS into the relevant claim data object.
- Detect fraud as you manage your claims cases.
- Get real-time scores of your claims data at different stages of the claims process.
- Use the user interface for portfolio monitoring.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Some of these plugins may require the appropriate licensing if used outside the spoke implementation.
- The flow actions input parameter is provided for you to use. For more information on the sample input data structure and data types used in an array and object, see Complex data.

Spoke actions

The FRISS spoke provides actions that trigger FRISS Trust automation in response to events that occur within your ServiceNow instance. These actions are classified under the Claim Fraud Management category. Available actions include:

Action	Description
Look up History Stream by Claim ID	Retrieves all the screening results by the Claim ID.
Look up Fraud Indicator Score by Screening ID	Retrieves the fraud score, which has been calculated by FRISS, for a claim that has been identified by a screening ID.
Look up Screening ID	Sends a request to calculate a FRISS score for a claim and returns unique ID called screening ID.
Delete History by Claim ID	Deletes the screening that is associated with a Claim ID.
Delete History by Screening ID	Deletes the screening by the identifier of a screening by FRISS.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For more information about setting up the FRISS spoke, see Set up the FRISS spoke.

Set up the FRISS spoke

You can integrate a ServiceNow instance and FRISS account by using the API key and Tenant ID to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the FRISS spoke.
- Contact the FRISS support team and obtain the connection URL to connect to your FRISS account.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a credential record for the FRISS spoke in your ServiceNow instance:

   a. Navigate to **Connections & Credentials** > **Credentials**.

   b. Select **New**.
   The system displays the message **What type of Credentials would you like to create?**

   c. Select **API Key Credentials**.
   An empty API Key Credentials form is displayed.

   d. On the form, fill in the fields.

   API Key Credentials form

Field	Description
Name	Name to identify the record. For example, enter `FRISS Spoke Credential`.
Active	Option to actively use the credential record.
API Key	FRISS token in this format: `<Value of ID+key>`.
Applies to	Option that is not applicable to this spoke.
Order	Order to apply this credential. For example, enter `100`.

   e. Select **Submit**.

2. Create a connection record for the FRISS spoke in your ServiceNow instance:

   a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

   b. Open the FRISS record.

   c. From the **Connections** tab, select **New**.
   The system displays an empty HTTP(s) Connection form.

   d. On the form, fill in these fields.

   HTTP(s) Connection form

Field	Description
Name	Name to identify the connection record. For example, enter `FRISS`.
Credential	Credential record that you created for FRISS. For example, select **FRISS Spoke Credential**.
Connection URL	Connection URL to connect to FRISS account.
Attributes	Subsequent calls that you can authorize to the FRISS API. To authorize calls, use the following two parameters:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ **tenant_id**: An identifier of the tenant, as defined in the FRISS Identity. This identifier is provided to you by FRISS. ▪ **api_version**: The API version key that was retrieved from the FRISS Identity by the earlier request. **Note:** This API version key is short-lived, so each time it expires, you must generate a new one.

e. Select **Submit**.

GitHub Spoke

Manage distributed version control and source code in GitHub from your ServiceNow instance. Create flows in ServiceNow to manage collaborative features such as tracking bugs, feature requests, tasks and so on, for projects in GitHub. View and analyze meaningful usage data for GitHub Enterprise Cloud and GitHub Enterprise Server software subscriptions so that you can reclaim stale licenses.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

GitHub spoke v3.6.4 is the latest version. For version history of the spoke, see GitHub spoke release notes.

Supported versions

This spoke was built for GitHub API version v3, but may be compatible with later versions.

Spoke requirements

- GitHub account
- User with admin credentials
- Token to authenticate the ServiceNow instance

See the GitHub documentation for instructions on creating a GitHub account and generating a token.

GitHub Webhooks module

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in GitHub for which you want to be notified about. When the conditions are met, the routing policy triggers the associated subflow, which in turn automates the GitHub tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the GitHub Webhooks application is available in the GitHub spoke and has the following modules:

- GitHub Webhook Registries
- GitHub WebHook Routing Policies

Use the GitHub Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in GitHub. A default routing policy is provided in the GitHub WebHook Routing Policies module. The default routing policy supports these GitHub fields:

Supported GitHub fields		
Action	Project Card Creator	Ref
Base Ref	Project Card Note	Ref Type
Commit Comment Body	Project Card Previous Note	Release Assets
Commit Comment Created At	Project Card Updated At	Release Author
Commit Comment Path	Project Column Created At	Release Body
Commit Comment Updated At	Project Column Name	Release Created At
Commit Comment User	Project Column Previous Name	Release Draft
Force Push	Project Column Updated At	Release Name
GitHub Instance URL	Project Created At	Release Published At
Issue Assigned To	Project Name	Release Tag Name
Issue Assignees	Project Previous Body	Release Target Commits
Issue Body	Project Previous Name	Repository Archived
Issue Closed At	Project State	Repository Created At
Issue Comment	Project Updated At	Repository Description
Issue Comment Count	Pull Request Assigned To	Repository inactive
Issue Comment Created At	Pull Request Assignees	Repository Full Name
Issue Comment Updated At	Pull Request Body	Repository Has Issues
Issue Created At	Pull Request Closed At	Repository Has Projects
Issue Labeled To	Pull Request Comment Count	Repository Import Status
Issue Labels	Pull Request Created At	Repository License
Issue Locked	Pull Request Draft	Repository Open Issues Count
Issue Milestone	Pull Request Labeled To	Repository Owner

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

directional webhook for the GitHub spoke for information regarding setting up and configuring the webhooks.

Spoke triggers

ServiceNow supports specific events on GitHub that create triggers. You must first configure a flow with a supported trigger definition. When an event, for example, a push request, occurs on the GitHub, it sends the payload via a webhook to the ServiceNow instance. After that, the flow that you configured is triggered at the ServiceNow instance to automate a workflow. The supported events are:

Category	Trigger	Description
Branch Management	Branch Created	Flow is triggered when you create a branch on GitHub.
Repository Management	Pull Request Opened	Flow is triggered when you initiate a new pull request on GitHub.
	Pull Request Edited	Flow is triggered when you update a pull request on GitHub.
	Pull Request Closed	Flow is triggered when you close a pull request on GitHub.
	Pull Request Assigned	Flow is triggered when you assign a pull request to a user on GitHub.
	Pull Request Reopened	Flow is triggered when you reopen a pull request on GitHub.
	Repository Fork	Flow is triggered when you fork a repository on GitHub.
	Repository Push	Flow is triggered when you push to a repository on GitHub.
Release Management	Release Created	Flow is triggered when the details of a release are created on GitHub.
	Release Edited	Flow is triggered when the details of a release are updated on GitHub.
	Release Deleted	Flow is triggered when a release is removed on GitHub.
	Release Released	Flow is triggered when a release is released on GitHub.

For information about setting up the triggers for the GitHub spoke, see Activate the trigger definition on ServiceNow instance. For more information about inbound integration, see Conditional and event-driven inbound integration.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The GitHub spoke provides a sample subflow to handle various GitHub webhook events. Available sample subflows are:

Spoke subflows

Subflow	Description	Supported GitHub Event
Process GitHub Branch and Tag Webhook Events	Handles branch and tag webhook events.	Branch and Tag
Process GitHub Commit Webhook Events	Handles commit webhook events.	Commit
Process GitHub Issue Webhook Events	Handles issue webhook events.	Issue
Process GitHub Milestone Webhook Events	Handles milestone webhook events.	Milestone
Process GitHub Project Webhook Events	Handles project webhook events.	Project
Process GitHub Pull Request Webhook Events	Handles pull request webhook events.	Pull Request
Process GitHub Push Webhook Events	Handles push request webhook events.	Push Request
Process GitHub Release Webhook Events	Handles release webhook events.	Release
Process GitHub Repository Webhook Events	Handles repository webhook events.	Repository
Process GitHub Security Webhook Events	Handles security webhook events.	Security

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows (continued)

Subflow	Description	Supported GitHub Event
Process GitHub Webhook Events	Handles all GitHub webhook events.	**Note:** This subflow handles all GitHub events. You can customize this subflow to handle other GitHub webhook events that are not supported by default.

To create subflows to handle other GitHub webhook events or handle the supported GitHub webhook events differently, customize the Process GitHub Webhook Events subflow. For this, you must a create a copy of the subflow, parse the payload, and customize the subflow according to your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must confirm that the subflows are configured to avoid infinite loops.

Note:

- You must configure webhooks to use the spoke subflow. See Set up bi-directional webhook for the GitHub spoke for information regarding setting up and configuring the webhook.
- The sample subflows run as a user by default. It can be configured to run as a system.
- GitHub spoke supports application/json payload. Configure the GitHub webhook accordingly. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

Spoke actions

The GitHub spoke provides actions manage branches, issues, repositories, and source code when events occur in ServiceNow. Available actions include:

Category	Action	Description
Branch Management	Create Branch	Creates a branch in GitHub based on a specific commit SHA.
	Delete Branch	Deletes a branch from the GitHub repository.
	Look up Branch	Retrieves the details of a branch in the GitHub repository.
	Look up Branch Protection	Retrieves the restriction details of the required branch.
	Look up Branches	Retrieves the list of all branches in a repository.
	Remove Branch Protection	Removes protection on the required branch.
	Update Branch Protection	Updates protection on the required branch.
Issue Management	Create Comment on Issue	Creates comment on a required issue.
	Create Issue	Creates issue for the required repository.
	Delete Comment on Issue	Deletes comment on a required issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Lock Issue	Locks the required issue. This limits the conversation to collaborators only.
	Look Up Comments on Issue Stream	Retrieves the list of comments on an issue.
	Look Up Issues Stream	Retrieves the list of issues for a repository.
	Unlock Issue	Unlocks the required issue. This opens conversation to all users.
	Update Comment on Issue	Updates a comment on an issue.
	Update Issue	Updates the details of the required issue.
Metadata Retrieval	Look up Fields by Action	Retrieves the list of fields for an action filter in the GitHub Fields table.
	Look up Branches Metadata	Retrieves metadata of the branches.
	Look up Issues Metadata	Retrieves metadata of the issues.
	Look up Milestones Metadata	Retrieves metadata of the milestones.
	Look up Pull Requests Metadata	Retrieves metadata of the pull requests.
Organization Management	Look up Organization Plan	Retrieves the plan name of an organization.
	Look up Organization Members Stream	Retrieves the list of all members within an organization.
	Look up Organization Repositories Stream	Retrieves the list of all repositories within an organization.
	Remove Organization Member	Removes a user from an organization.
	Look up Organization Events Stream	Retrieves the list of events in an organization based on the provided look back date.
	Look up Organization Outside Collaborators Stream	Retrieves the list of all Outside Collaborators within an organization.
	Remove Organization Outside Collaborator	Removes an outside collaborator from an organization.
	Look up Organization Pending Outside Collaborators Stream	Retrieves a list of pending collaborators within a repository.
	Look up Organization Invitations Stream	Retrieves a list of invitations within an organization.
	Look up Organization Audit Log Stream	Retrieves a list of organization audit log events for a specified look-back date.
Repository Management	Add Collaborator	Adds collaborator to the required repository.
	Delete Repository	Deletes a repository from GitHub.
	Create Comment on Pull Request	Create review comments on a pull request.
	Create Milestone	Creates milestone for the required repository.
	Create Pull Request	Creates a pull request for a repository.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Reply on Pull Request Review Comment	Creates reply to a review comment for a pull request.
	Create Repository	Creates a repository in GitHub.
	Delete Comment on Pull Request	Deletes review comment on a pull request.
	Delete Milestone	Deletes milestone from the required repository.
	Look up Comments on Pull Request Stream	Retrieves the list of all review comments on a pull request.
	Look up Milestones Stream	Retrieves the list of all milestones in a repository.
	Look up Repository Events Stream	Retrieves the list of events across a repository.
	Look Up Pull Requests Stream	Retrieves the details of pull requests for a repository.
	Look Up Repositories Stream	Retrieves the details of repositories based on a specific user or organization.
	Look up Repository Details	Retrieves the details of the specified repository.
	Merge Pull Request	Merges the pull request to a repository.
	Remove Collaborator	Removes collaborator from a repository.
	Update Comment on Pull Request	Updates review comments provided for a pull request.
	Update Milestone	Updates the details of a milestone in a repository.
	Update Pull Request	Updates the details of a pull request in a repository.
	Update Repository	Updates the details of a repository in GitHub.
Source Code Management	Create Comment on Commit	Creates a comment for the required commit using its SHA.
	Create or update a file	Creates a file or updates an existing file in a repository.
	Look up Comments by Commit ID Stream	Retrieves comments provided for a single commit.
	Look up Commit Information By ID	Retrieves the contents of the required commit reference.
	Look up File Content	Retrieves the contents of a file in a repository. **Note:** This action supports files with file size up to 1 MB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Commits on a Repository	Retrieves the details of all commits made on a repository.
User Management	Look up All Users for Enterprise Server	Retrieves the list of all GitHub Enterprise Server users.
	Look up Organizations for the Authenticated User Stream	Retrieves the list of organizations that the logged-in user is a member of.
	Suspend User	Suspends a GitHub user account.
	Look up Authenticated User	Retrieves information about the authenticated user.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI agent	Description
GitHub branch management AI agent	Manages and maintains the GitHub branches. Also, retrieves information about the GitHub branches.
GitHub issue management AI agent	Manages and automates GitHub-related tasks in Integration Hub.
GitHub repository management AI agent	Manages the GitHub repositories by handling the repository operations, pull requests, comments on pull request and milestones.
GitHub source code management AI agent	Manages source code and handles the repository files, commits, and comments.
GitHub Code Automation Agent	Manages code changes and GitHub operations from your ServiceNow instance. This agent interprets your requests, asks clarifying questions, and analyzes context to deliver well-integrated code updates. It also performs GitHub tasks such as creating

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
	branches, committing changes, and opening pull requests.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke modules

The GitHub spoke adds these modules to your ServiceNow instance.

Module	Description
GitHub Owner	Displays the GitHub owner records that you had created.
GitHub Repositories	Displays the details of the GitHub repositories associated with the GitHub owners.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the GitHub spoke.

Set up the GitHub spoke

Integrate your ServiceNow instance with the GitHub and GitHub Enterprise Server to automate flows and perform actions on GitHub and GitHub Enterprise Server. For example, create a flow that creates a branch on GitHub and retrieves its details.

https://player.vimeo.com/video/958553772?badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

- Request an Integration Hub subscription.
- Activate the GitHub spoke.
- An account with GitHub to create personal access tokens.
- If you are using GitHub Enterprise server, an account to create personal access tokens.
- Role required: admin.

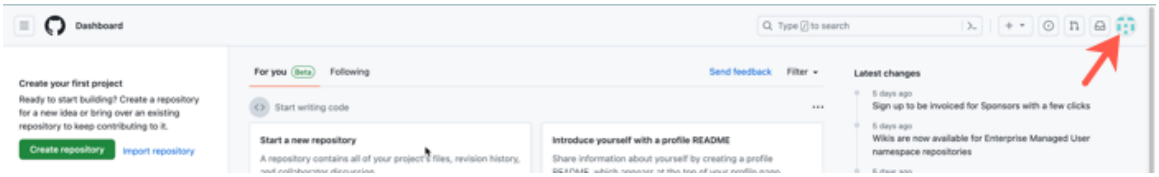
Procedure

1. Generate a personal access token in GitHub account.

   a. Log in to https://github.com/.

   b. On the dashboard, select your profile icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select **Settings**.

d. In the Settings page, on the left panel, select **Developer settings**.

e. In the Developer settings page, on the left panel, navigate to **Personal access tokens** > **Tokens (classic)**.

f. Select **Generate new token** > **Generate new token (classic)**.

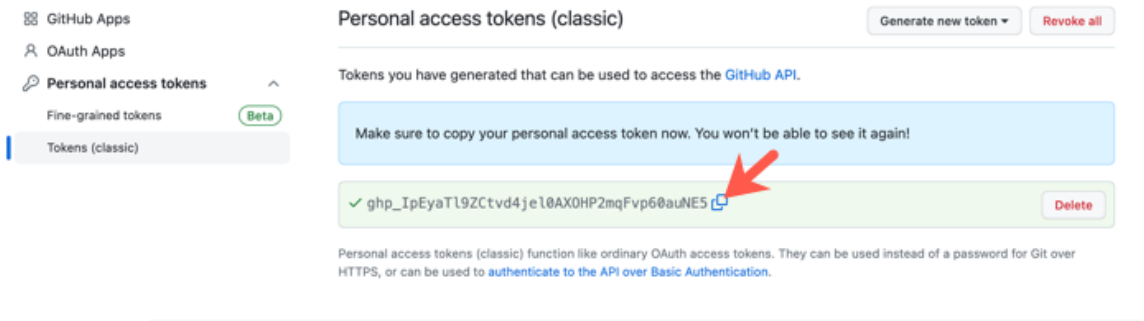
g. In **Note**, enter a description or purpose of the personal access token.

h. In **Expiration**, set the expiry period of the token or select No expiration.

i. Under the **Select scopes** heading, select the scopes that define the access for the personal access token you're generating.

j. Select **Generate token**.
The personal access token is generated.

k. To copy the personal access token, select the copy button.



Important: Keep the personal access token at a secure place. You'll need it when you create a connection record for GitHub.

2. Configure the connection record that connects your ServiceNow instance with GitHub.

a. Log in to your ServiceNow.

b. Navigate to **All** > **Process Automation** > **Workflow Studio**.

c. Click the **Integrations** tab.

d. Under **Connections**, toggle and enable the **Outbound** connections.

e. Locate the **GitHub** connection alias and click **View Details**.
If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. On the form, fill the details.

Configure Connection form

Field	Description
Connection Name	Name of the connection. **Note:** The default and read-only name of the first connection record is **GitHub**.
Connection URL	URL to connect to GitHub. Enter https://api.github.com.
Use Mid Server	▪ Enter `1` if your ServiceNow instance requires a MID Server to connect with GitHub. ▪ Enter `0` if your ServiceNow instance does not require a MID Server to connect with GitHub. **Important:** To enable this option, you must already have a MID Server set up on your instance. See MID Server for detailed instructions.
API Key	Personal access token that you had generated on GitHub.

g. Select **Create Connection**.
The GitHub connection record is created.

3. If you are using GitHub Enterprise server, configure the **GitHub Server** connection.

Important: Generate a personal access token on the GitHub Enterprise server.

To learn to generate a personal access token on the GitHub Enterprise server, see Integrate with GitHub Enterprise Server.

a. Select the GitHub Server connection card.

b. Select **View Details**.

c. Fill the form.

Configure Connection form

Field	Description
Connection Name	The name of the connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The default and read-only name of the first connection record is GitHub Server. To create a connection with your custom name, select **Add Connection** and fill the form.
Connection URL	URL of your GitHub instance.
Use Mid Server	▪ Enter `1` if your ServiceNow instance requires a MID Server to connect with the GitHub Enterprise server. ▪ Enter `0` if your ServiceNow instance does not require a MID Server to connect with the GitHub Enterprise server. **Important:** To enable this option, you must already have a MID Server set up on your instance. See MID Server for detailed instructions.
API Key	Personal access token that you had generated on the GitHub Enterprise Server.

d. Select **Create Connection**.
The GitHub Enterprise Server connection record is configured.

Set up bi-directional webhook for the GitHub spoke

Configure webhook to subscribe to GitHub with a ServiceNow callback URL.

https://player.vimeo.com/video/1125629681?h=17672b2593&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

- Request Integration Hub subscription
- Activate the GitHub spoke
- Role required: admin

Register GitHub webhook in ServiceNow

Register a GitHub in ServiceNow to notify the ServiceNow app when certain events occur in GitHub.

Before you begin

Role required: admin

Procedure

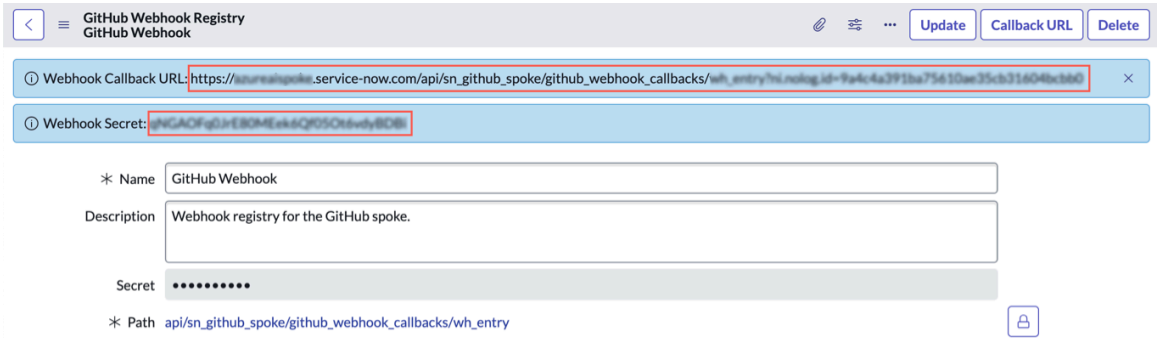
1. Navigate to **All** > **GitHub Webhooks** > **GitHub Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GitHub Webhook Registry form

Field	Description
Name	Unique name to identify the record. For example, `GitHub webhook`.
Description	Description of the record.

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
   The system displays the **Webhook Callback URL** and **Webhook Secret**.



6. Copy and record the values of **Webhook Callback URL** and **Webhook Secret**.

Result
The GitHub webhook is registered in your ServiceNow instance.

Add Callback URL in GitHub

Provide Webhook Callback URL in GitHub account to create webhook.

Before you begin
Role required: admin

Procedure

1. Log in to your GitHub account.
2. Navigate to the required repository.
3. Select **Settings**.
4. On the left panel, select, **Webhooks**.
5. Select **Add Webhook**.
6. Enter Webhook Callback URL in **Payload URL** and Secret in **Secret**.

   See the GitHub Developer documentation for instructions on creating and configuring a webhook.

   Note: GitHub spoke supports **application/json** payload. Configure the GitHub webhook accordingly. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The Callback URL is added in the GitHub account. You can create routing policies and subflows as per your requirement. See Customize a bi-directional webhook for information regarding creating new routing policies and subflows.

Customize bi-directional webhook in the GitHub spoke

Create webhook routing policy and subflow as per your requirement in the GitHub spoke.

Before you begin
Role required: admin

About this task
The default routing policy in the GitHub WebHook Routing Policies modules triggers the relevant GitHub subflow and notifies the ServiceNow app when certain events occur in GitHub. See GitHub Spoke for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click **Subflows**.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it.
   See Building subflows for more information about creating and using subflows and GitHub Spoke for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support.
5. Navigate to **GitHub Webhooks** > **GitHub WebHook Routing Policies**.
6. Click **New**.
7. On the form, fill in the fields.

Decision form

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. Default answer is applicable when the conditions are not met.
Condition	Conditions to be met when the required events occur in GitHub. See GitHub Spoke for information about the supported fields.
Answer	Subflow that has to be triggered when the specified conditions are met. **a.** Click the Lookup icon. **b.** Select the required subflow from the **Document:** list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.

8. Click **Submit**.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Routing policy and subflow are created.

Set up triggers for the GitHub spoke

Set up the trigger to generate the secret and callback URL on your ServiceNow instance.

https://player.vimeo.com/video/1122004833?h=f5acab7f7a&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

- Request an Integration Hub subscription.
- Activate and set up the GitHub spoke.
- Role required: admin.

Activate the trigger definition on ServiceNow instance

Activate the trigger definition to generate the secret and callback URL on your ServiceNow instance.

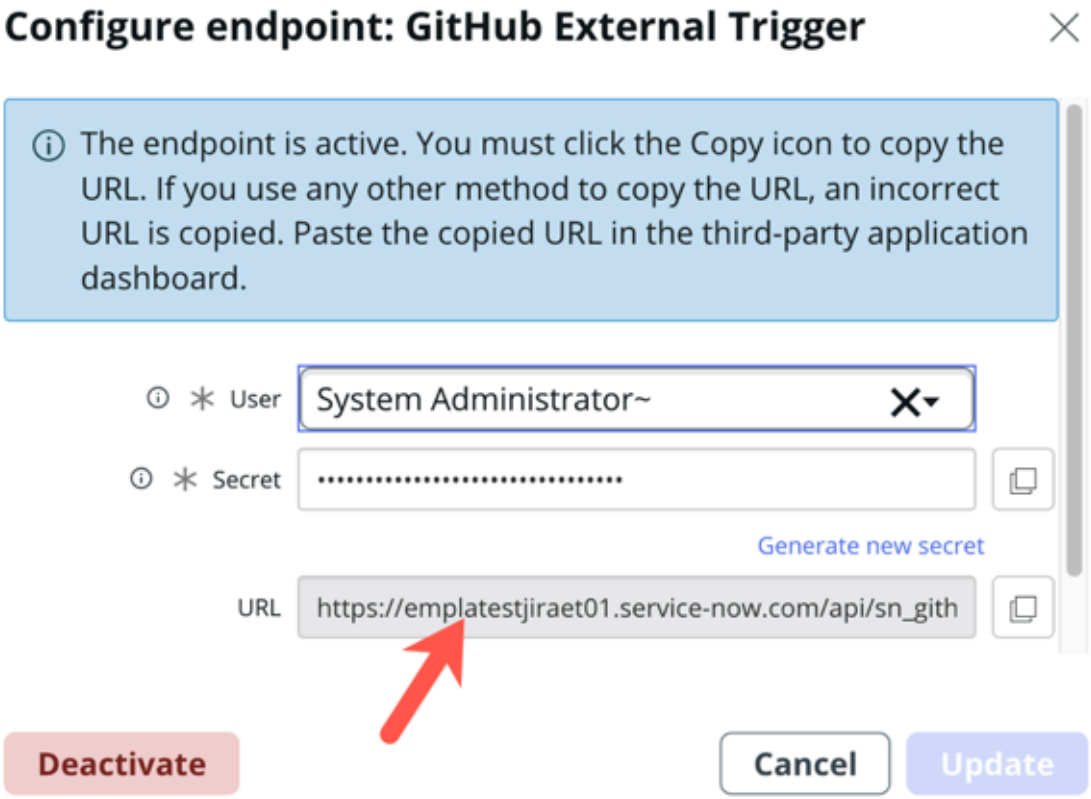
Before you begin
Role required: flow_designer and connection_admin.

About this task
GitHub uses the secret and callback URL to securely send the payload to the ServiceNow instance. The ServiceNow instance verifies the secret that GitHub sends and accepts the payload.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Toggle and enable the **Inbound** tab.
4. Locate the GitHub Spoke card and select **View Details**.
5. Select **Configure**.
6. In the User field, select the user name on whose behalf the inbound session or flow is triggered.
7. Select **Generate secret** to generate the secret.
   The secret is used to sign the payload of the webhook. You must configure the secret on GitHub.
   The secret is generated on the Secret field.
8. Select **Activate**.
   The callback URL is generated in the URL field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Copy the values of **Secret** and **URL** for later use.
10. Close the window.

What to do next

Configure secret and callback URL on GitHub

Configure secret and callback URL on GitHub

Set the secret and callback URL to enable GitHub to securely send webhooks to your ServiceNow instance.

Before you begin

Role required: Admin

Procedure

1. Log in to the GitHub account.
2. Navigate to the required repository.
3. Select **Settings**.
4. On the left panel, select, **Webhooks**.
5. Select **Add Webhook**.
6. Fill the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Webhook trigger

Field	Description
Payload URL *	Option to provide GitHub the payload URL that GitHub uses to send the payload via the webhook. Enter the URL that you have generated while activating the trigger. See Activate the trigger definition on ServiceNow instance.
Content type *	Option to select the payload content format. Select **application/json**.
Secret	Option to provide the secret that the ServiceNow verifies when it receives the webhook from GitHub. Enter the secret that you have generated while activating the trigger. See Activate the trigger definition on ServiceNow instance.
Which events would you like to trigger this webhook?	Option to specify the event that triggers the webhook. Choose from the following options. ○ Just the push event: Triggers the webhook when there's a push event on GitHub. ○ Send me everything: Triggers webhooks whenever an event occurs. ○ Let me select individual events: Triggers the webhook when you specify an event.

7. Select **Add Webhook**.

GitLab Spoke

Manage the DevOps lifecycle in GitLab from your ServiceNow instance. Create flows in ServiceNow to manage branches, groups, issues, merge requests, projects, and source code in GitLab.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

GitLab spoke v2.5.3 is the latest version. For version history of the spoke, see GitLab spoke release notes.

Compatible versions

This spoke was built for GitLab API version v4, but may be compatible with later versions.

Spoke requirements

- GitLab account
- An application in GitLab configured to integrate with ServiceNow
- **Application ID** and **Secret** of the GitLab application

See the https://docs.gitlab.com/ee/integration/oauth_provider.html documentation for instructions on creating and configuring applications.

Spoke actions

The GitLab spoke provides actions to automate GitLab tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Branch Management	Compare Branches Tags or Commits	Compares branches, tags, or commits.
	Create Branch	Creates a branch in the required project.
	Delete Branch	Deletes the required branch from a project.
	Delete Merged Branches	Deletes the required merged branch from a project.
	Look up Branch	Retrieves the details of the required branch.
	Look up Branches Stream	Retrieves a list of branches and the branch details in a project.
	Protect Branch	Protects a branch in a project with access levels.
	Unprotect Branch	Unprotects a branch in a project with access levels.
Group Management	Add User To A Group	Adds user to a GitLab group.
	Remove User From A Group	Removes user from a GitLab group.
Issue Management	Create Issue	Creates an issue in the required project.
	Create Issue Note	Creates an issue note for the required issue.
	Delete Issue Note	Deletes an issue note for the required issue.
	Look up Issue Notes Stream	Retrieves all issue notes in an issue.
	Look up Issues Stream	Retrieves a list of issues and issue details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update Issue	Updates details of the required issue.
	Update Issue Note	Updates an issue note in a project.
Merge Request Management	Accept Merge Request	Approves a merge request in GitLab.
	Create Merge Request	Creates a merge request in GitLab.
	Create Merge Request Note	Creates a note for the required merge request.
	Delete Merge Request Note	Deletes a note for the required merge request.
	Look up all Merge Requests Stream	Retrieves the list of merge requests in a project.
	Look up Merge Request Notes	Retrieves the list of merge request notes in a project.
	Update Merge Request	Updates details of the required merge request.
	Update Merge Request Note	Updates details of the required merge request note.
Package Management	Delete Package File	Deletes a package file from the project package registry.
	Delete Project Package	Deletes a package from the project package registry.
	Delete Registry Repository	Removes a registry repository from a project.
	Delete Registry Repository Tags	Removes registry repository tags in a batch from a project.
	Look up Details of a Registry	Retrieves details of a registry repository for a specified project.
	Look up Package Files Stream	Retrieves list of package files of a single package.
	Look up Packages within Group Stream	Retrieves a list of project packages and package details at the group level.
	Look up Packages within Project Stream	Retrieves a list of project packages and package details.
	Look up Project Package	Retrieves the details of the specified package for a specified project.
	Look up Registry Repositories	Retrieves a list of registry repositories for a specified project.
Pipeline Management	Look up Project Pipeline by ID	Retrieves the details of a specified pipeline for a specified project.
	Look up Project Pipeline Jobs Stream	Retrieves the list of jobs in a project pipeline.
	Look up Project Pipeline Test Report	Retrieves the test report of the specified pipeline for the specified project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Project Pipelines Stream	Retrieves the list of pipelines in a project.
Project Hook Management	Create Project Hook	Creates a hook to a project.
	Delete Project Hook	Removes a hook from a project.
	Look up Project Hook	Retrieves details of a specified hook in a project.
	Look up Project Hooks	Retrieves details of all the hooks in a project.
	Update Project Hook	Updates details of a hook for a specified project.
Project Management	Add User To A Project	Adds user to a project in GitLab.
	Archive Project	Archives a project in GitLab.
	Create Milestone	Creates milestone in a GitLab project.
	Create Project	Creates a project in GitLab.
	Delete Milestone	Deletes milestone in a GitLab project.
	Delete Project	Deletes a project in GitLab.
	Look up Milestones Stream	Retrieves the details of the milestones GitLab.
	Look up Project	Retrieves details of the specified project.
	Look up Project Jobs Stream	Retrieves the project jobs details.
	Look up Projects Stream	Retrieves the details of the projects.
	Remove User from a Project	Removes user from a project in GitLab.
	Share Project With Group	Shares a project with a group in GitLab.
	Unarchive Project	Unarchives a project in GitLab.
	Unshare Project With Group	Unshares a project with a group in GitLab.
	Update Milestone	Updates details of a milestone in a project.
	Update Project	Updates details of a project.
Source Code Management	Get Commit	Retrieves a details of a commit in GitLab.
	Add New File To Repository	Adds a file to a repository in GitLab.
Token Management	Look up Personal Access Tokens	Retrieves a list of personal access tokens.
	Revoke Personal Access Token	Revokes a personal access token.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
GitLab pipeline management AI agent	Manages pipeline tasks (that is, looks up project pipelines by ID, retrieves pipeline test reports, streams project pipeline jobs and streams project pipeline data) in GitLab.
GitLab branch management AI agent	Manages branch management (that is, compare branches, tags, or commits, creates and deletes branches, manages branch protection, and looks up branch details or streams) in GitLab.
GitLab merge request management AI agent	Manages merge requests (creates, updates, accepts, and deletes merge request notes, and retrieves information about merge request notes) in GitLab.
GitLab package management AI agent	Manages package management (that is, deletes project packages, manages registry repositories, and performs detailed lookups for packages and files) in GitLab.
GitLab token management AI agent	Manages token management (that is, looks up and revokes personal access tokens) in GitLab.
GitLab issue management AI agent	Manages issue management tasks (that is, creates, updates, and manages issues and the related notes) in GitLab.
GitLab project management AI agent	Manages project management tasks (that is, creates, updates, and deletes projects and milestones, manages user and group access, and retrieves project and milestone streams) in GitLab.
GitLab source code management AI agent	Manages source code tasks (that is, looks up commit difference, adds new file to repository, and looks up commit by project ID) in GitLab.
GitLab group management AI agent	Manages user-group tasks (that is, adds and removes users from groups) in GitLab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke flows

The GitLab spoke provides sample flows to demonstrate automating the GitLab tasks. To customize a sample flow, copy it to a new application scope.

Flow	Description
Archive projects older than 6 months	Archives the projects which are inactive for the last six months.

Spoke subflows

The GitLab spoke provides sample flows to demonstrate automating the GitLab tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflows	Description
Process GitLab Deployment Webhook Events	Processes deployment webhooks in GitLab.
Process GitLab Job Webhook Events	Processes job webhook events in GitLab.
Process GitLab Merge Request Webhook Events	Processes merge request webhook events in GitLab.
Process GitLab Pipeline Webhook Events	Processes pipeline webhook events in GitLab.
Process GitLab Push Webhook Events	Processes push webhook events in GitLab.

Spoke webhooks

Bi-directional webhooks can be setup to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in GitLab for which you wish to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the GitLab tasks.

The bi-directional webhooks requires separate setup and can be used independently without using the spoke actions. By default, the GitLab Webhooks application is available in the GitLab spoke and has the following modules:

Webhook	Description
GitLab Webhook Registries	Displays the list of available webhook registries.
GitLab Webhook Routing Policies	Displays the list of available webhook routing policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke module

The GitLab spoke provides Gitlab Token Management application that includes the Gitlab Token Managements module. You should record here to authenticate requests from your ServiceNow instance.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the GitLab spoke.

Set up the GitLab spoke

Integrate your ServiceNow instance and the GitLab by creating a custom OAuth application in the GitLab.

Before you begin

- Request an Integration Hub subscription.
- Activate the GitLab spoke.
- Create an account with GitLab at https://gitlab.com/users/sign_in .
- Role required: admin.

Add GitLab token

Add GitLab token to authenticate requests from your ServiceNow instance.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **GitLab Token Management** > **GitLab Token Managements**.
2. Click **New**.
3. On the form, fill these values.

Gitlab Token Management form

Field	Description
Secret	Secret created during the GitLab application configuration.
Name	Name to identify the record.
OAuth Entity Profile	Leave the field empty. System auto-assigns the default entity profile after the connection is configured.

4. Right-click the form header and click **Save**.
5. Click **Generate Secure Token**.
   Value of the generated secure token is displayed.
6. Copy and record the value of the secure token for later use.
7. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create OAuth application in GitLab account

Create a custom OAuth application from your GitLab account to enable OAuth 2.0 authentication with the GitLab spoke.

Before you begin

- GitLab account
- Role required: GitLab admin.

About this task

Complete these steps from your GitLab account. See the GitLab documentation for instructions on creating and configuring applications.

Procedure

1. From your GitLab account, create an application.
2. Enter ServiceNow instance URL in **Redirect URI**.
   The format of the redirect URL is: `https://<instance-name>.service-now.com/api/sn_gitlab_spoke/gitlab_oauth_redirect/oauth?secureToken=<Secure-Token>`.

   Replace **<Instance-Name>** with the name of your ServiceNow instance and replace **<Secure-Token>** with the secure token you had generated in the ServiceNow instance.
3. Copy and record the **Application Id** and **Secret** for later use.
   These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

Result

The custom OAuth application from your GitLab account is created and can be integrated with the ServiceNow instance.

Configure a connection for the GitLab spoke

Add and configure a GitLab connection to authenticate ServiceNow requests in GitLab spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Integrations** tab.
3. Under **Connections**, the **Outbound** connections are displayed by default.
4. Locate the **GitLab** connection alias and click **View Details**.
5. Click **Edit** or if you are configuring the spoke for the first time, click **Configure**.
6. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection.
Connection URL	Enter `https://gitlab.com/api`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you have installed GitLab on an on-premise server, enter the URL in this format: `https://<gitlab-hosted-instance>.com/api`
OAuth Entity Name	Name to identify the OAuth entity record.
OAuth Client ID	Application ID created during the GitLab application configuration.
OAuth Client Secret	Secret created during the GitLab application configuration.
OAuth Redirect URL	OAuth callback endpoint. The format of the redirect URL is: `https://<instance-name>.service-now.com/api/sn_gitlab_spoke/gitlab_oauth_redirect/oauth?secureToken=<Secure-Token>`. Replace **<Instance-Name>** with the name of your ServiceNow instance and replace **<Secure-Token>** with the secure token you had generated in the ServiceNow instance.

7. Click **Configure and Get OAuth Token**.

Set up bi-directional webhook for the GitLab spoke

Configure a webhook to subscribe to GitLab with a ServiceNow callback URL.

Before you begin

- Request Integration Hub subscription
- Activate the GitLab spoke
- Role required: admin

Register GitLab webhook in ServiceNow instance

Register GitLab in ServiceNow to notify the ServiceNow app when certain events occur in GitLab.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **GitLab Webhooks** > **GitLab Webhook Registries**.
2. To retrieve the existing webhooks GitLab account, click **Get All Webhooks**.
3. To create a webhook, click **New**.
4. On the form, fill in the fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Name	Name of the webhook. For example, `Job webhook`.
Description	Description of the record.
Project ID	Unique identifier of the project for which the webhook should be created.
Trigger and SSL	Events in the projects you want to subscribe to. When one of these events occurs, the webhook is triggered.

5. Click the **Generate Secret Token** related link.
   The secret token is generated and displayed. Also, the date on which the secret expires is populated in **Secret Expires**.

   Note: The secret is regenerated and updated every 30 days. This secret is also updated in GitLab.

6. Right-click the form header and click **Save**.
7. Click **Create Webhook**.
   The webhook is created in GitLab and its ID is populated in **Webhook ID**.

What to do next
To update details of the webhooks or change the subscribed events, click **Update Webhook**.

Customize a bi-directional webhook in the GitLab spoke

Create webhook routing policy and subflow as per your requirement in the GitLab spoke.

Before you begin
Role required: admin

About this task
The default routing policy in the GitLab WebHook Routing Policies modules triggers the relevant GitLab subflow and notifies the ServiceNow app when certain events occur in GitLab. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure
1. Navigate to **All** > **Flow Designer** > **Designer**.
2. Click **Subflows**.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it.
   See Building subflows for more information about creating and using subflows and GitLab spoke for information about the GitLab fields that the default routing policy supports and the GitLab events that the subflows support.
5. Navigate to **All** > **GitLab Webhooks** > **GitLab Webhook Routing Policies**.
   Five routing policies are available along with the spoke. You can configure them as per your requirement or create a routing policy.
6. To create a routing policy, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the form, fill in the fields.

Field	Description
Label	Unique label to identify the routing policy.
Default answer	Option to specify if this is the default answer. Default answer is applicable when the conditions are not met. a. Click the Lookup icon. b. Select the required subflow from the **Document:** list. **Note:** Ensure that the **Table name** is `Flow [sys_hub_flow]`.
Condition	Conditions to be met when the required events occur in GitLab.
Answer	Subflow that has to be triggered when the specified conditions are met.

8. Click **Submit**.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Result
Routing policy and subflow are created.

Gmail Spoke

Set up an outbound integration between the ServiceNow instance and the Google APIs.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

API version v1.

Spoke version

Gmail spoke v1.3.3 is the latest version. For version history of the spoke, see Gmail spoke release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke subflows

The Gmail spoke provides sample subflows in the draft state to demonstrate automating Gmail tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Move a ServiceNow attachment to Gmail	Copies an attachment from ServiceNow to Gmail.

Spoke actions

The Gmail spoke provides actions to automate Gmail tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Label Management	Add Label to Email	Add a label to an email.
	Create New Label	Create a label in your Gmail account.
	Lookup Label ID By Name	Retrieve details of a specified Label ID.
	Remove Label From Email	Remove the specified label from an email.
Email Management	Add Attachment To ServiceNow Record	Add an attachment from an email in your Gmail account to a ServiceNow record.
	Get Email Details	Retrieve details of a specified email.
	Look Up Emails	Retrieve details of specified emails.
	Reply To Email	Send a reply to an email.
	Send Email	Send email from your Gmail account to specified recipients.
	Delete Email	Delete the specified email.
	Undelete Email	Retrieve the specified email from the Bin.

Gmail spoke account requirements

The Gmail spoke requires a custom app that you create in the Google Developers Console.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Gmail spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Gmail alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Gmail spoke

Set up an outbound integration between the ServiceNow instance and the Google APIs.

Before you begin

- Request an Integration Hub subscription.
- Install the Gmail spoke plugin on the ServiceNow instance.
- Role required: admin.

About this task

To establish an outbound integration, you must complete these steps.

- Set up an OAuth 2.0 client ID
- Configure a connection for the Gmail spoke

Set up an OAuth 2.0 client ID

Create a custom OAuth application to enable OAuth 2.0 authentication of the ServiceNow by the Google APIs.

Before you begin

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. You can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

Role required: admin.

Procedure

1. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select **OAuth consent screen**.
3. Enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **Web application**.
7. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and select **Create**.
8. Copy the Client ID and the Client Secret to a text file.

Configure a connection for the Gmail spoke

Configure the Gmail connection record to establish a connection between the ServiceNow instance and the Google APIs.

Before you begin

Role required: admin.

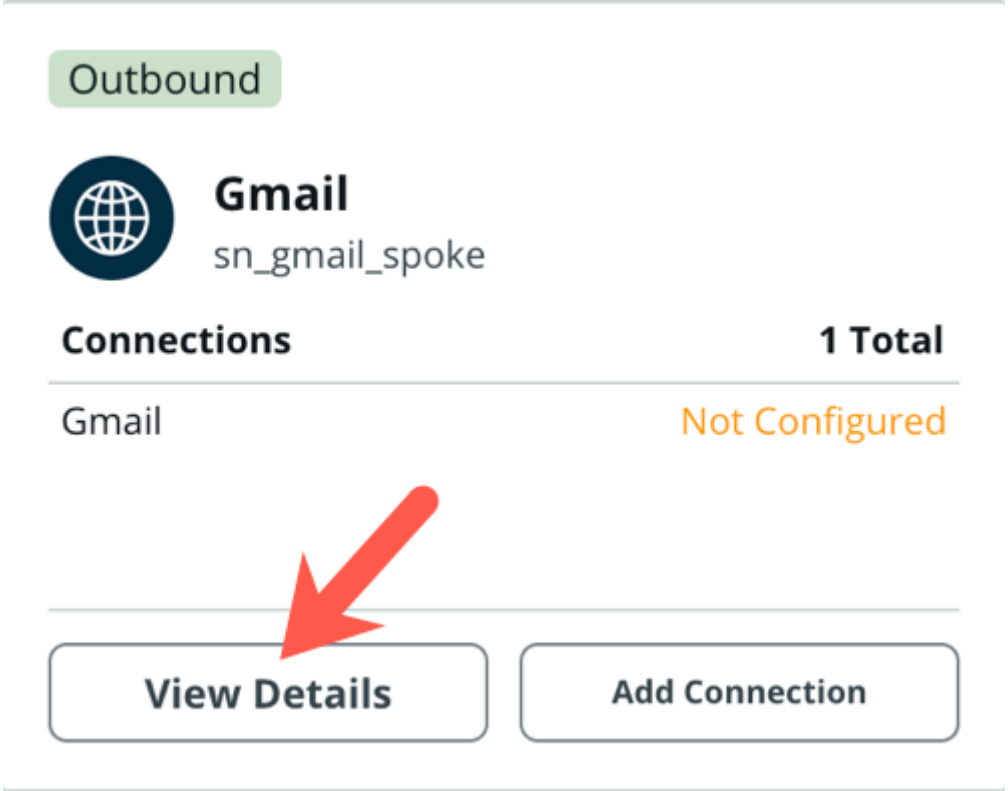
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The connection and credentials contain the details such as the client ID, client secret, and the redirect URL that the Google Workspace must authenticate the ServiceNow instance.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Select the **Connections** tab.
4. In the Search all connections field, enter `Gmail`.
5. Select **View Details**.



6. Select **Configure**.

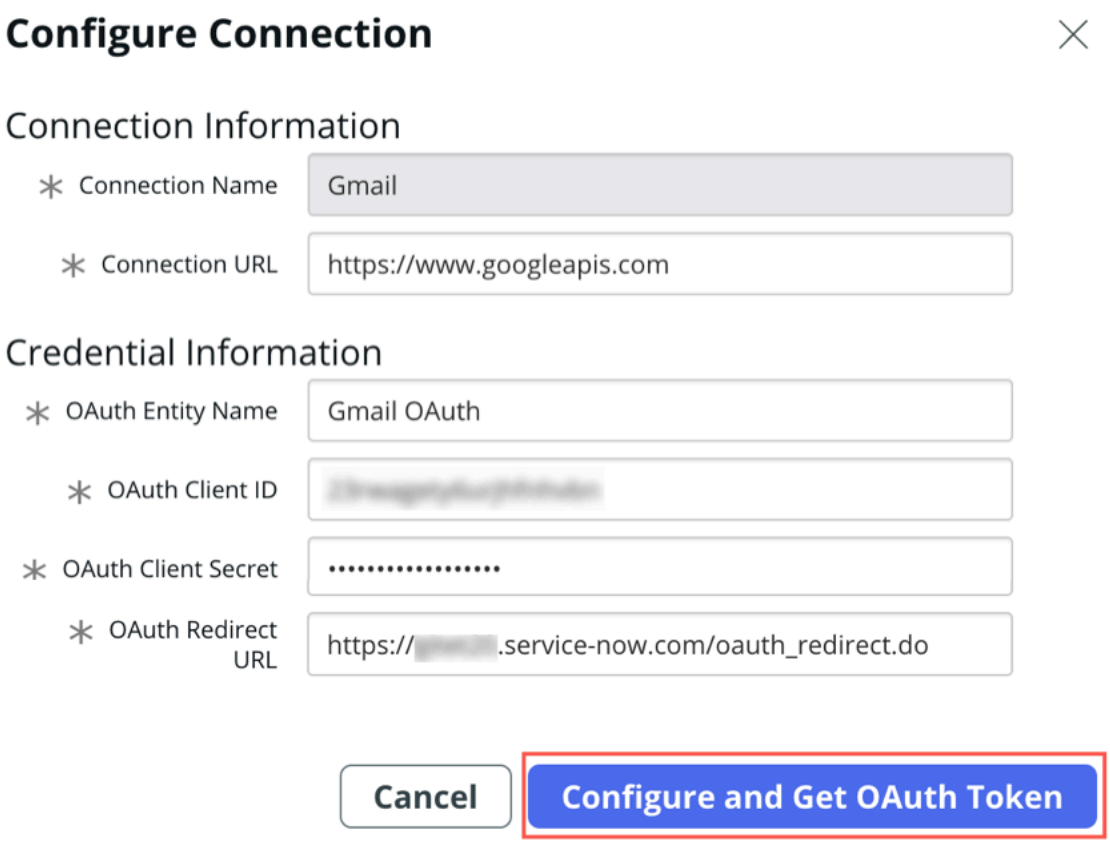
7. Fill the form with the details given in the table.

Configure connection form

Field	Description
Connection Name	Name of the connection between the Google Workspace and the ServiceNow instance. **Note:** The default name is Gmail and it's read-only. However, you can provide custom names when you set up more connection and credential records after this record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connection URL	Enter the URL `https://www.googleapis.com` **Note:** Make sure that you don't include spaces before or after this URL. If there are spaces, the connection fails. .
OAuth Entity Name	Name to identity the OAuth entity record.
OAuth Client ID	The OAuth client ID generated when you created the OAuth client ID.
OAuth Client Secret	The OAuth client secret generated when you created the OAuth client ID.
OAuth Redirect URL	The OAuth redirect URL. It must be in the format: `https://<instance-name>.service-now.com/oauth_redirect.do`.



8. Select **Configure and Get OAuth Token**.
   You must log into Gmail after the OAuth token is issued.

Google Calendar Spoke

Use ServiceNow to create and update events and attendees in Google Calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Calendar spoke v2.7.0 is the latest version. For version history of the spoke, see Google Calendar Spoke release notes.

Supported versions

API version v1.

Spoke actions

The Google Calendar spoke provides actions to perform Google Calendar tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Attendee Management	Add Attendees To Event	Updates an event by adding to the list of attendees. Values you specify replace the existing values. Fields that you don't specify in the request do not change.
	Remove Attendees From Event	Updates an event by removing specified attendees. Values you specify replace the existing values. Fields that you don't specify in the request do not change.
Event Management	Create Event	Creates an event on the specified calendar.
	Update Event	Edit event information. Values you specify replace the existing values. Fields that you don't specify in the request do not change.
	Look up Event By ID	Retrieves details of the specified event.
	Delete Event	Removes a specified event from a calendar.
	Look up Events Stream	Retrieves events on a specified calendar based on start time, end time, or search terms.
	Look up Events by Calendar ID	Retrieves events on the specified calendar.
	Look up Free or Busy Schedules	Retrieves the free or busy information for the specified set of calendars.
	Move Event	Moves the specified event to another calendar.
Access Control List Management	Create Access Control List	Creates an access control rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Access Control List	Deletes the specified access control rule.
	Look up Access Control List by Calendar ID	Retrieves details of the required access control rule.
	Look up Access Control List Stream	Retrieves the rules in the access control list for the calendar.
	Update Access Control List	Updates details of the required access control rule.
Calendar List Management	Add Calendar to Calendar List	Inserts an existing calendar into the user's calendar list.
	Delete Calendar from Calendar List	Removes a calendar from the user's calendar list.
	Look up Calendar from Calendar List by ID	Retrieves calendar from the user's calendar list.
	Look up Calendars from Calendar List Stream	Retrieves calendars on the user's calendar list.
	Update Calendar from Calendar List	Updates an existing calendar on the user's calendar list.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents	Description
Google Calendar event manager AI agent	Manages event manager tasks (that is, look up an event by an event ID, look up an events stream, look up busy slots by a calendar ID, move an event, create an event, look up events by a calendar ID, delete an event, update an event) in Google Calendar.
Google Calendar list manager AI agent	Manages calendar list tasks (that is, delete a calendar from a calendar list, look up a calendar from a calendar list by an ID, look up calendars from a calendar list stream) in Google Calendar.
Google Calendar access control list manager AI agent	Manages access control list tasks (that is, update an access control list, delete an access control list, look up an access control list stream, look up an access control list by a calendar ID) in Google Calendar.
Google Calendar metadata manager AI agent	Retrieves time zones metadata (that is, look up time zones metadata) from Google Calendar.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke module

The Google Calendar spoke adds a Google Calendars module to your ServiceNow instance. The Google Calendars module displays the details of the calendar lists.

Google Calendar Online account requirements

The Google Calendar spoke requires a custom app that you create in Google G Suite.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Calendar spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Google Calendar alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Google Calendar spoke

Set up an outbound integration between your ServiceNow instance and the Google Calendar Application Programming Interfaces (API) by setting up a connection and credential record.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Calendar spoke.
- Ensure that you have a Google Workspace account.
- Ensure that you have a domain and an email address related with the domain. For example, www.mydomain.com and jane-admin@mydomain.com.

  Note: you can only register one email address per domain in Google Workspace.

- Role required: admin.

Create OAuth application on Google Calendar

Create an OAuth application on the Google Calendar that authenticates requests to access the Google Calendar APIs from your ServiceNow instance. After successful authentication, you can generate an OAuth token that your ServiceNow can use to access the Google Calendar APIs.

Before you begin

Google Calendar spoke integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in Google Workspace.
- Google Workspace login credentials created with the same domain.

Role required: admin.

Procedure

1. Log in to https://console.developers.google.com with your Google Workspace credentials.
2. Create a project on Google Workspace.
   The project provides the OAuth application and the permissions to access the Google Calendar APIs from your ServiceNow instance.

   a. Select the button.

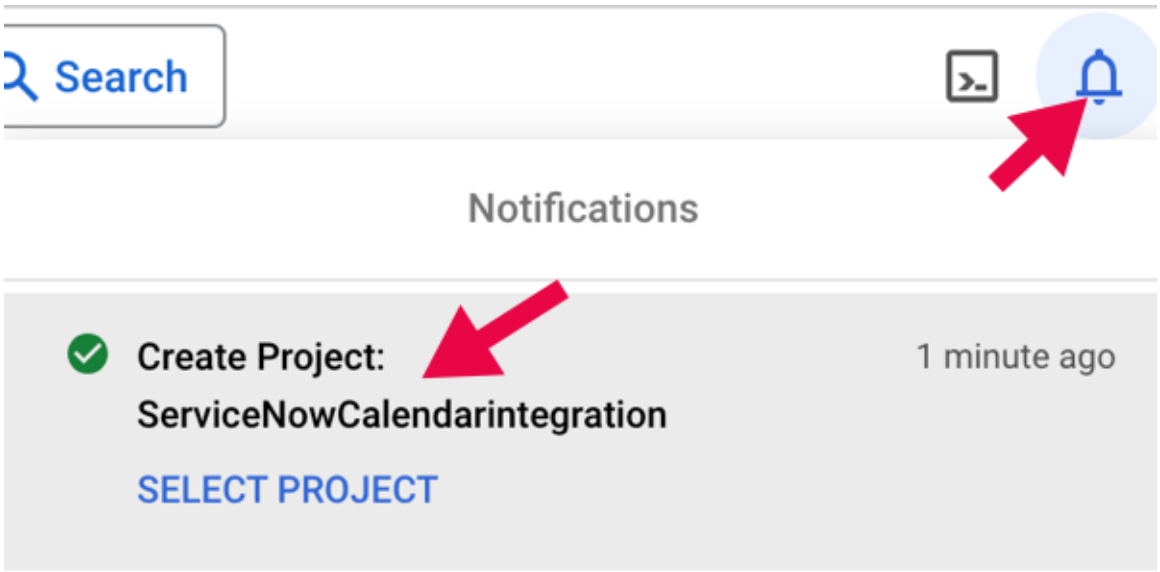
   b. On the Select a Project window, select **NEW PROJECT**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Project name field, enter a unique name for the project.

d. In the Location field, select BROWSE to select an organization.

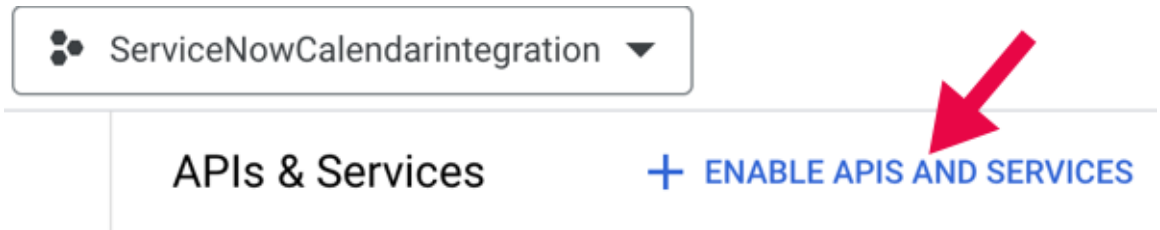
e. Select **CREATE**.
The Notifications window confirms that the project is created.



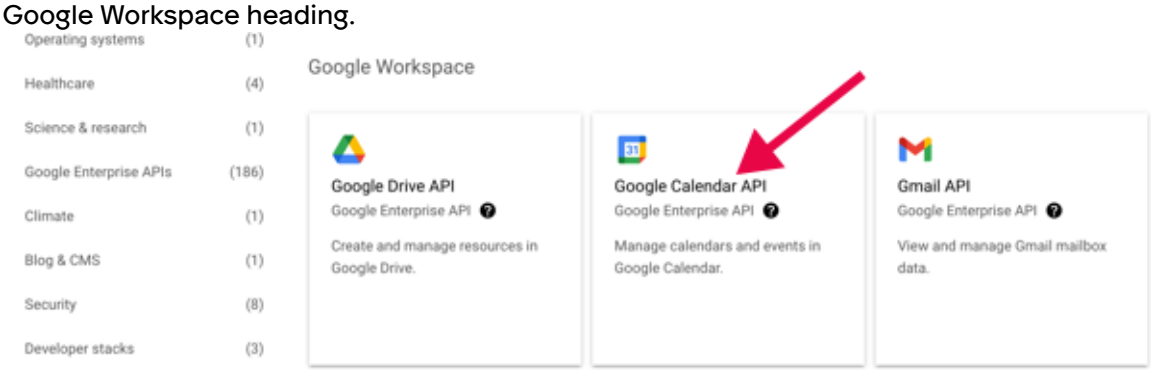
f. Select SELECT PROJECT.

3. Enable the Google Calendar API permissions.

a. Select **+ ENABLE APIS AND SERVICES**.



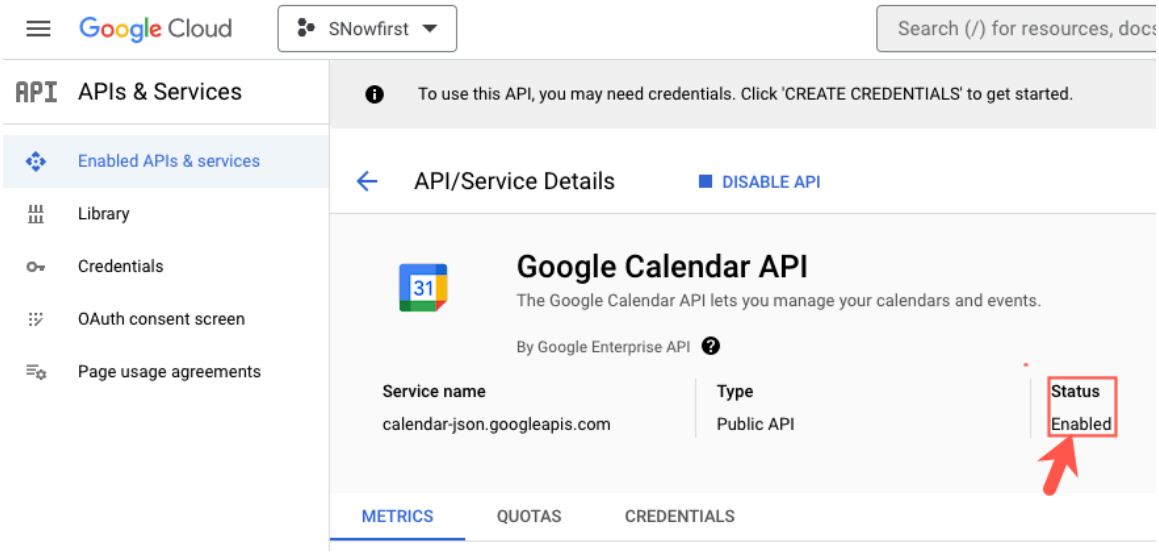
b. On the Welcome to the API Library page, navigate to the Google calendar API card under the Google Workspace heading.



c. Select **Google Calendar API**.

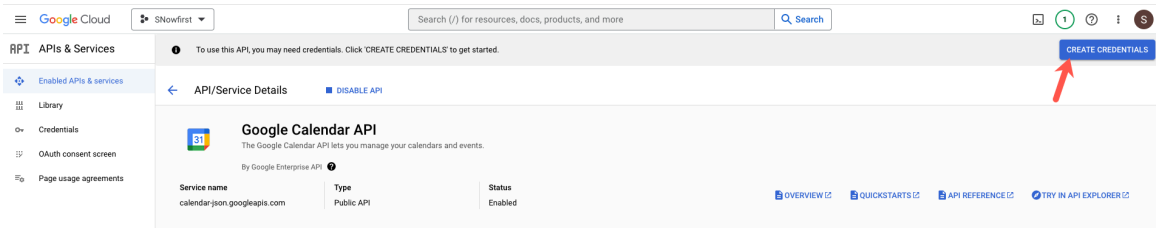
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **ENABLE**.
The Google calendar API is enabled on your project.



4. Create the credentials that the connection and credential form will store.

a. Select **CREATE CREDENTIALS**.



b. Fill the form.

Google Calendar API credentials

Select an API	Name of the API that your ServiceNow instance accesses. **Note:** Ensure that the Google Calendar API option is chosen.
What data will you be accessing? *	Type of data that your ServiceNow instance accesses from the Google Calendar application. **Tip:** To create an OAuth application, select User data.

c. Select **NEXT**.

d. In the OAuth Consent Screen section, fill the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth Consent Screen form

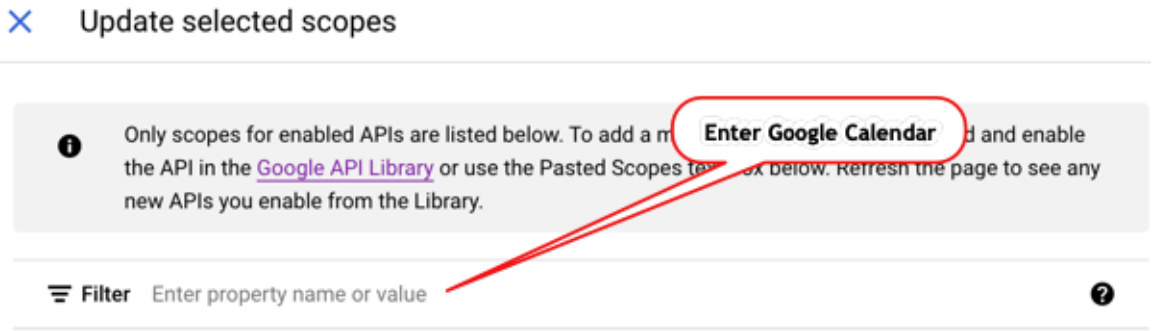
Field	Description	Mandatory?
App name	Custom name of the OAuth app.	Yes
User support email	Users of the OAuth app can send their queries on consent to this email.	Yes
App logo	Logo of the OAuth app,	No
Developer contact information	Google uses this email ID to inform you about any changes to the project.	Yes

e. Select **SAVE AND CONTINUE**.

5. **Optional:** Specify the permissions to access specific Google Calendar API.

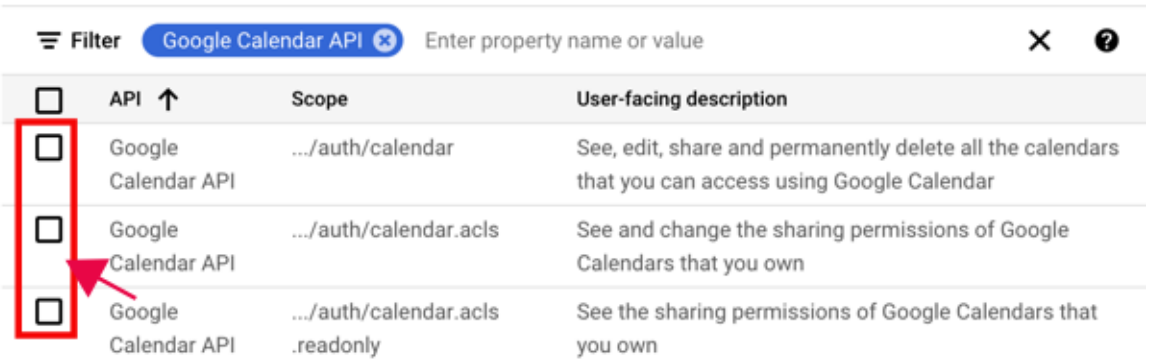
a. Under the SCOPES heading, select **ADD OR REMOVE SCOPES**.

b. In the Update selected scopes window, enter `Google Calendar` in the Enter property name or value field.



c. From the list, select Google Calendar API.

d. Select the required APIs from the list.



e. Select **UPDATE**.

6. Generate the OAuth Client ID and related details.
You must enter the OAuth Client ID and related details in the connection and credential form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

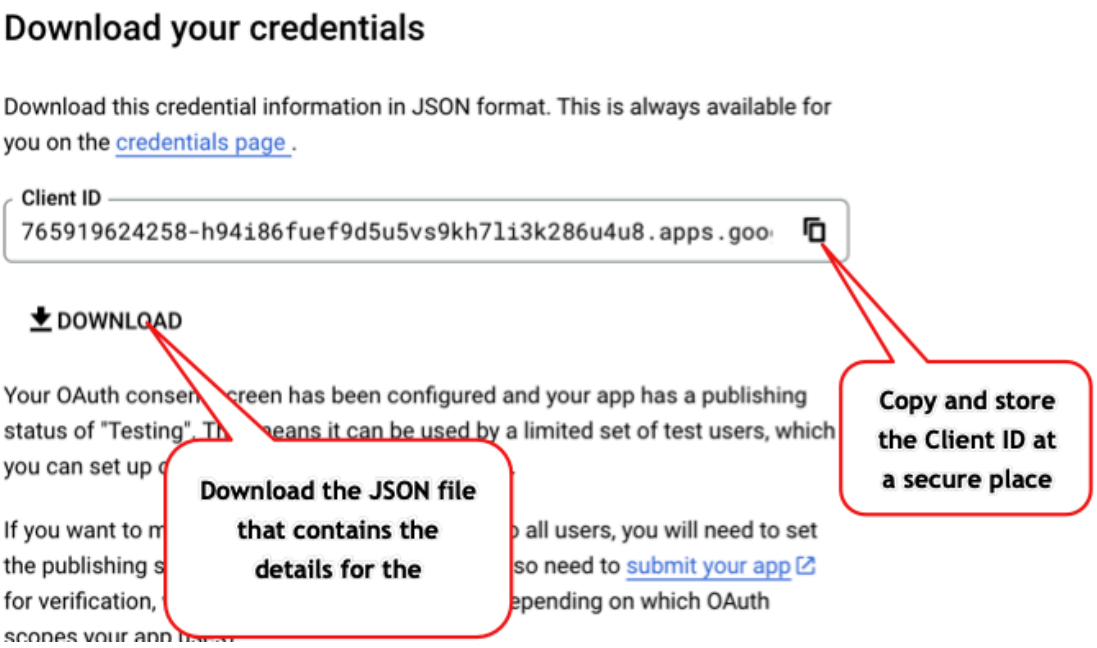
a. In the Application type field, select `Web application`.

b. In the Name field, enter a custom name for the application.

c. To add a redirect URL, under the Authorised redirect URIs heading, select **+ ADD URI**.

d. Enter the URL of your ServiceNow instance.

e. Select **CREATE**.
The credentials for the OAuth application are created, as shown in the image.



7. Select **DONE**.

Create Connection and Credential record for the Google Calendar spoke

Create a connection and credential record that enables your ServiceNow instance to integrate with the Google Calendar Application Programming Interface (API).

Before you begin
Role required: admin.

About this task
The connection and credential record includes the details that you had set up when you created the OAuth app. See Create OAuth application on Google Calendar.

Procedure
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.

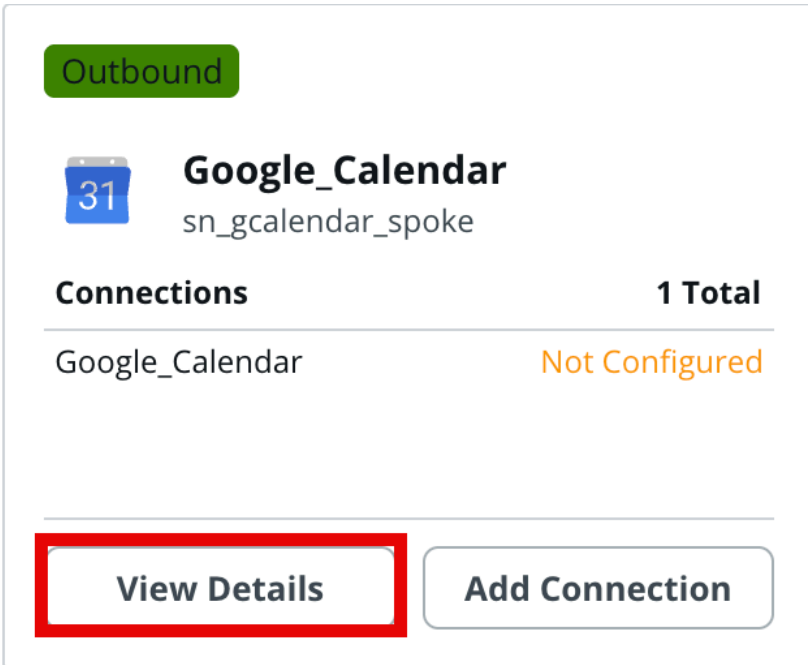
2. Click the **Integrations** tab.

3. Under **Connections**, toggle and enable the **Outbound** connections.

4. Locate the alias for **Google Calendar** and click **View Details**.

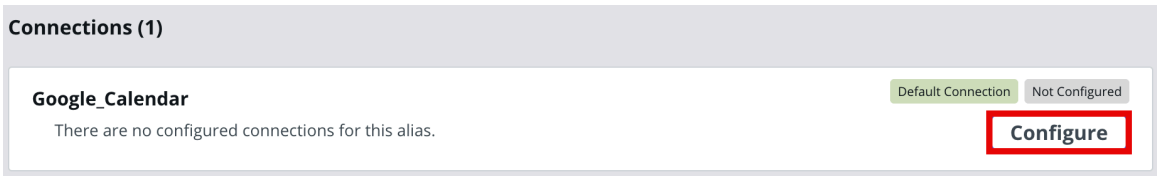
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure the default connection and credential alias record that is shipped along with the Google Calendar spoke, click **View Details**.



- To manage more than one Google Calendar spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

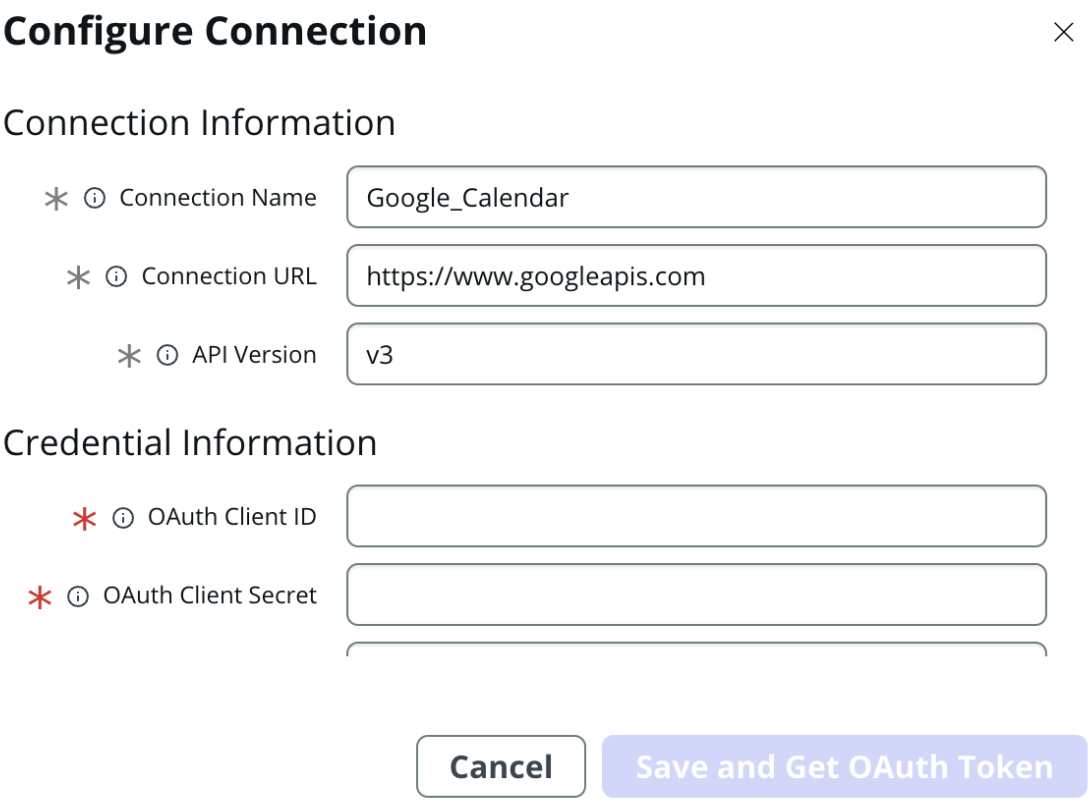


5. On the form, fill in these fields:

Field	Value required
Connection Information	
Name	Auto-generated name to identify the connection record.
URL	Auto-generated URL for the Google APIs website.
API Version	Auto-generated input of the current API version.
Credential Information	
OAuth Client ID	Client ID you created during the Google Calendar application registration.
OAuth Client Secret	Key value you created during the Google Calendar application registration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
OAuth Redirect URL	Redirect URL of your ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`.
Auth URL	Authorization URL for your Google Calendar configuration.
Token URL	Token URL for your Google Calendar configuration.



6. Click **Save and Get OAuth Token**.

Google Chat spoke

Manage communication within your Google Chat spaces directly from your ServiceNow instance using Google Chat spoke. Create flows in your ServiceNow instance to manage media, members, messages, and spaces in Google Chat.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Google Chat spoke v1.2.0 is the latest spoke version. For version history of the spoke, see Google Chat Spoke release notes.

Supported versions

This spoke was built for Google Chat API v1, but may be compatible with later versions.

Spoke requirements

- Google Chat API access
- Google Cloud console access

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Chat spoke provides actions to automate Google Chat tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description	Required Scopes (at least one scope is required)
Media Management	Download Media	Downloads the uploaded media from Google Chat and attaches to the specified incident record. This action does not download the media uploaded to Google Drive.	• https://www.googleapis.com/auth/chat.messages.readonly • https://www.googleapis.com/auth/chat.messages
Member Management	Add Current Application to Space	Adds the current calling application to the specified space.	• https://www.googleapis.com/auth/chat.memberships.app • https://www.googleapis.com/auth/chat.memberships

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
	Add Member to Space	Adds the specified member to the specified space.	https://www.googleapis.com/auth/chat.memberships
	Look up Space Member	Retrieves details of the specified member for the specified space.	• https://www.googleapis.com/auth/chat.memberships.readonly • https://www.googleapis.com/auth/chat.memberships
	Look up Space Members Stream	Retrieves members of the specified space to which you have access.	• https://www.googleapis.com/auth/chat.memberships.readonly • https://www.googleapis.com/auth/chat.memberships
	Remove Current Application from Space	Removes the current calling application from the specified space.	• https://www.googleapis.com/auth/chat.memberships.app • https://www.googleapis.com/auth/chat.memberships
	Remove Member from Space	Removes the specified member from the specified space.	https://www.googleapis.com/auth/chat.memberships
Message Management	Create Message Thread	Creates a message thread in the specified space.	• https://www.googleapis.com/auth/chat.messages.create • https://www.googleapis.com/auth/chat.messages
	Delete Message	Deletes the specified message from the specified space. All the threaded replies of the message are also deleted.	https://www.googleapis.com/auth/chat.messages
	Look up Message	Retrieves details about the specified message from the specified space.	• https://www.googleapis.com/auth/chat.messages.readonly • https://www.googleapis.com/auth/chat.messages

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
	Look up Messages Stream	Retrieves messages from the specified space in which you are a member.	• https://www.googleapis.com/auth/chat.messages.readonly • https://www.googleapis.com/auth/chat.messages
	Send Message to Thread	Creates a message in the specified thread of the specified space.	https://www.googleapis.com/auth/chat.messages
Space Management	Create Space	Creates a named space in Google Chat.	• https://www.googleapis.com/auth/chat.spaces.create • https://www.googleapis.com/auth/chat.spaces
	Delete Space	Deletes the specified Google Chat space.	https://www.googleapis.com/auth/chat.delete
	Look up Space	Retrieves information about the specified Google Chat space.	• https://www.googleapis.com/auth/chat.spaces.readonly • https://www.googleapis.com/auth/chat.spaces
	Look up Spaces Stream	Retrieves a stream of Google Chat spaces in which you are a member.	• https://www.googleapis.com/auth/chat.spaces.readonly • https://www.googleapis.com/auth/chat.spaces
	Update Space	Updates the specified Google Chat space.	https://www.googleapis.com/auth/chat.spaces

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Chat member management AI agent	Performs actions for managing members(adds current application to a space, removes current application from a space, adds member to a space, removes member from a space, look up a space member) in Google Chat.
Google Chat space management AI agent	Performs actions for managing(looks up a space, deletes a space, creates a space, updates a space) spaces in Google Chat.
Google Chat message management AI agent	Performs actions for managing(deletes a message, creates a message thread, looks up a message, sends a message to thread) messages in Google Chat.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Set up the Google Chat spoke

Integrate the ServiceNow instance and Google Chat by creating a custom OAuth application in Google Cloud console to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Chat spoke.
- Role required: admin.

Create OAuth credentials in Google Cloud console for Google Chat spoke

Create credentials in Google Cloud console account to enable OAuth 2.0 authentication with the Google Chat spoke.

About this task

Complete these steps from the Google Cloud console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

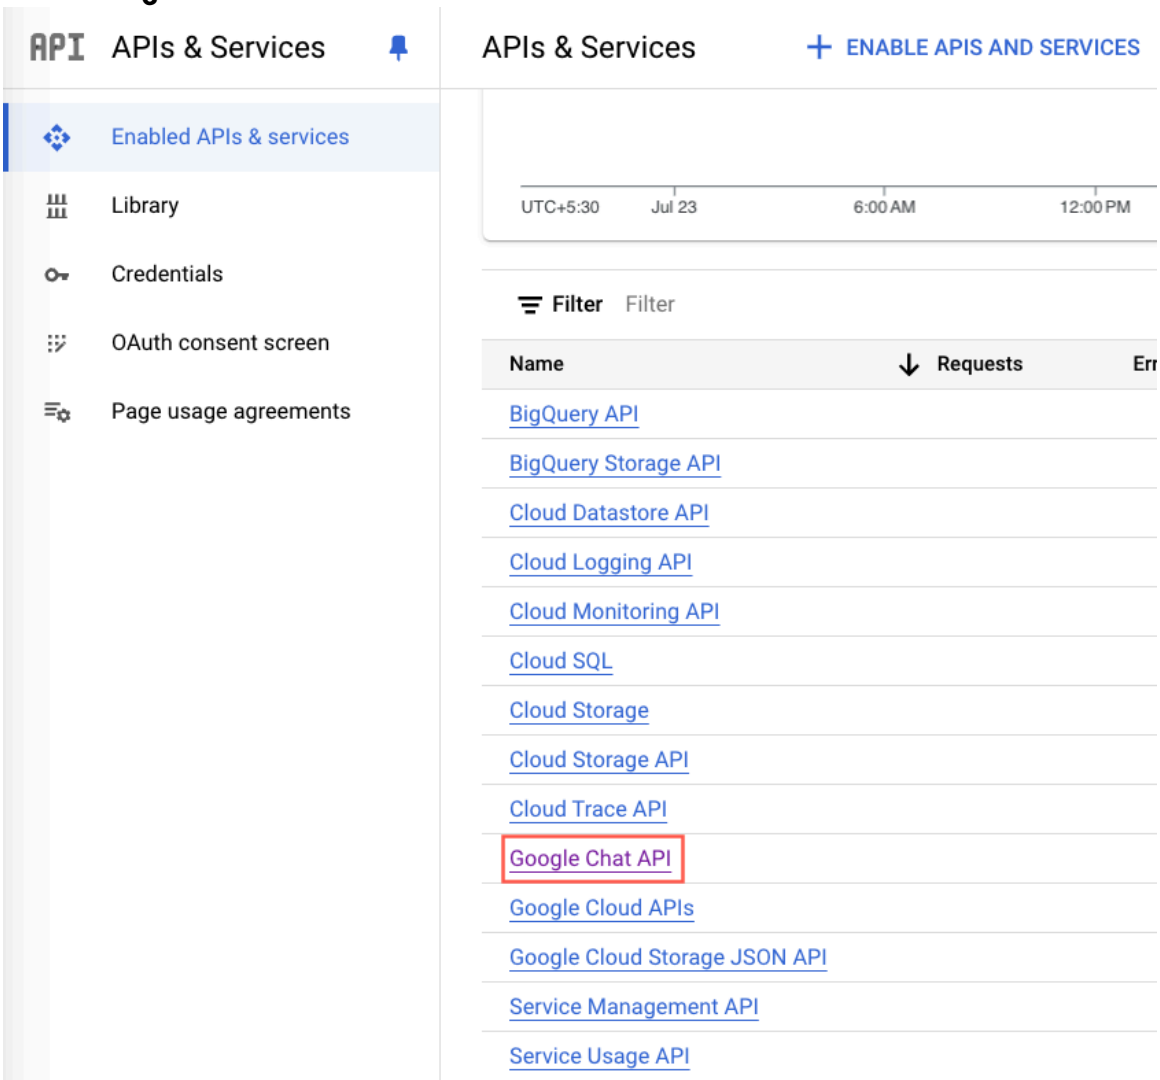
- Create a Google Chat application. For more information, see Develop Google Chat apps and Google Apps Script Chat app quickstart.
- Role required: none

Procedure

1. In the Google Cloud console, navigate to **Main menu** > **IAM & Admin** > **Create a Project**.
   You can also directly go to https://console.cloud.google.com/projectcreate
2. Enter a descriptive name for your project in the **Project Name** field.

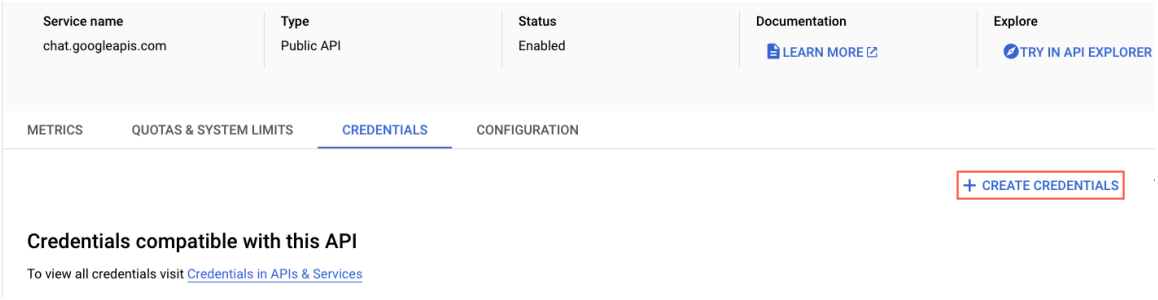
   Note: The project ID can't be changed after the project is created, so choose an ID that meets your needs for the lifetime of the project.

3. After creating a Google Chat app, get the deployment ID of the app and record it.
   You need to provide the deployment ID for connection configuration. For more information, see Find a deployment ID.
4. Navigate to **Navigation Menu** > **APIs & Services** > **Enabled APIs & Services**.
5. Select **Google Chat API** from the list.



6. Click on the **CREDENTIALS** tab.
7. Click on **+ CREATE CREDENTIALS** and select **OAuth client ID.**

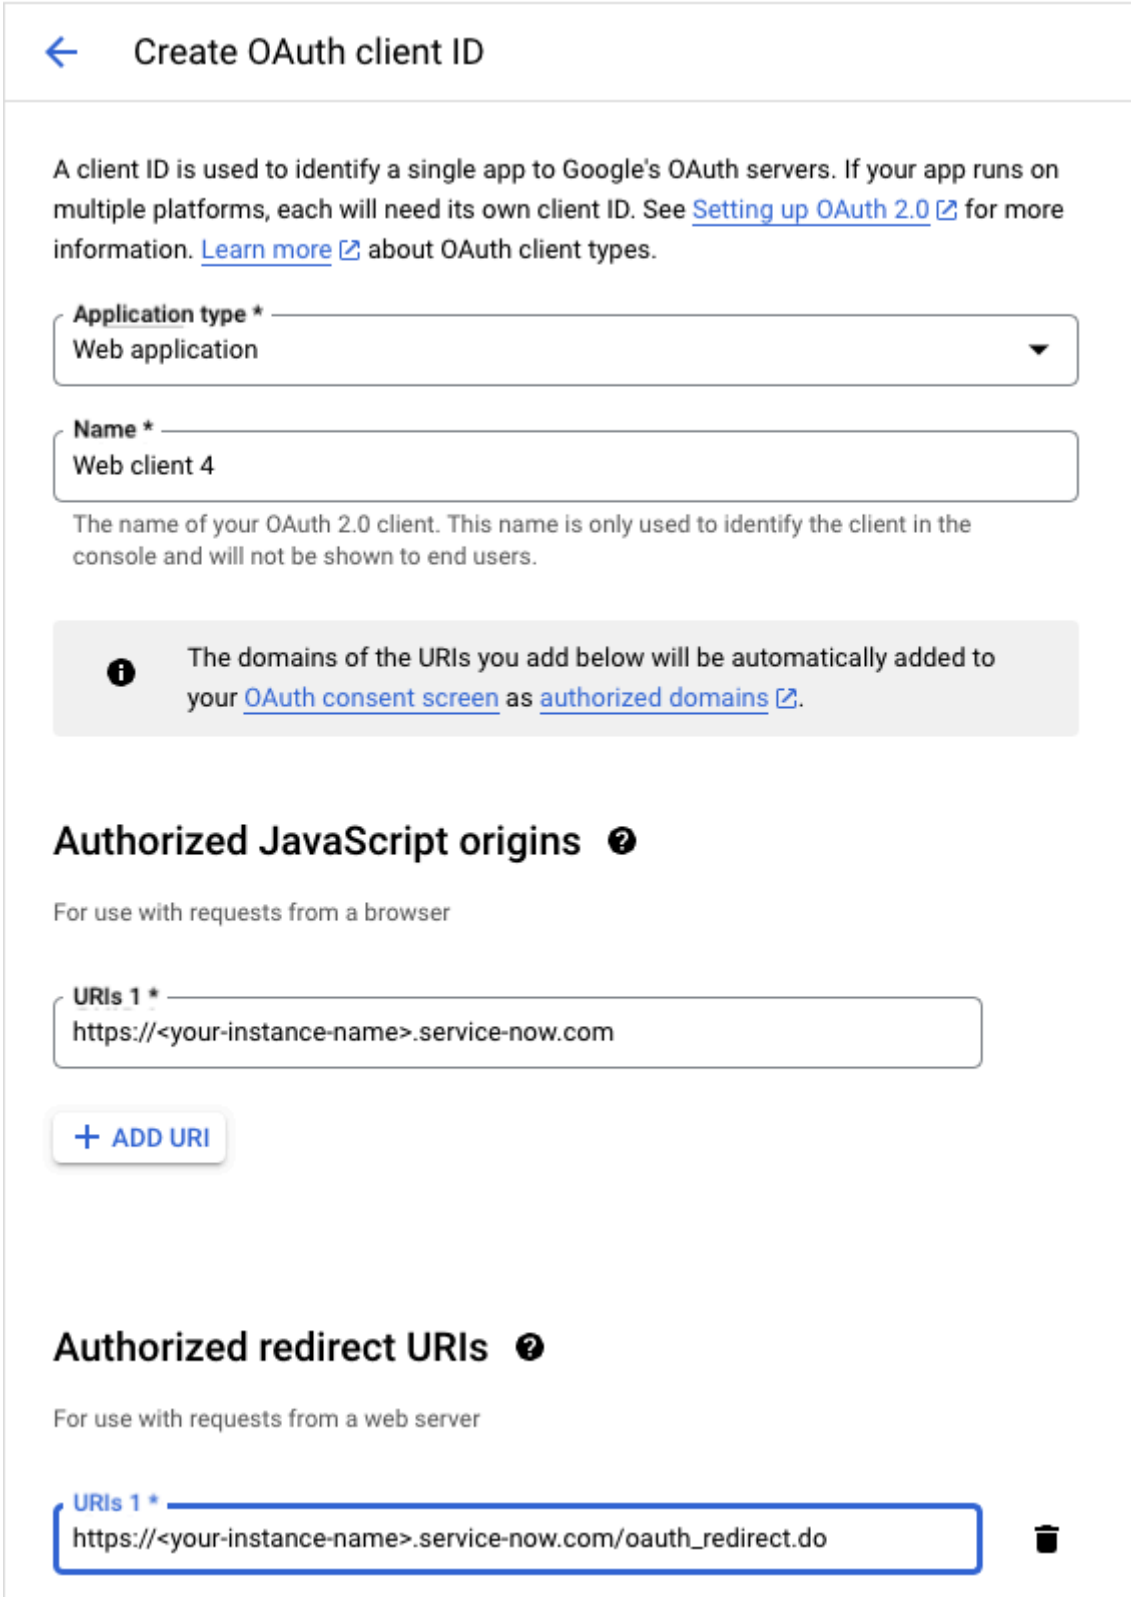
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. On the **Create OAuth client ID** form, fill in the fields.

Field	Description
Application	Select Web application from the list.
Name	Enter a unique name to identify the OAuth 2.0 client.
Authorized JavaScript origins URI	Enter the URI of your ServiceNow instance. For example, `https://<your-instance-name>.servicen-now.com`
Authorized redirect URIs	Enter the redirect URI of your ServiceNow instance. For example, `https://<your-instance-name>.servicen-now.com/oauth_redirect.do`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



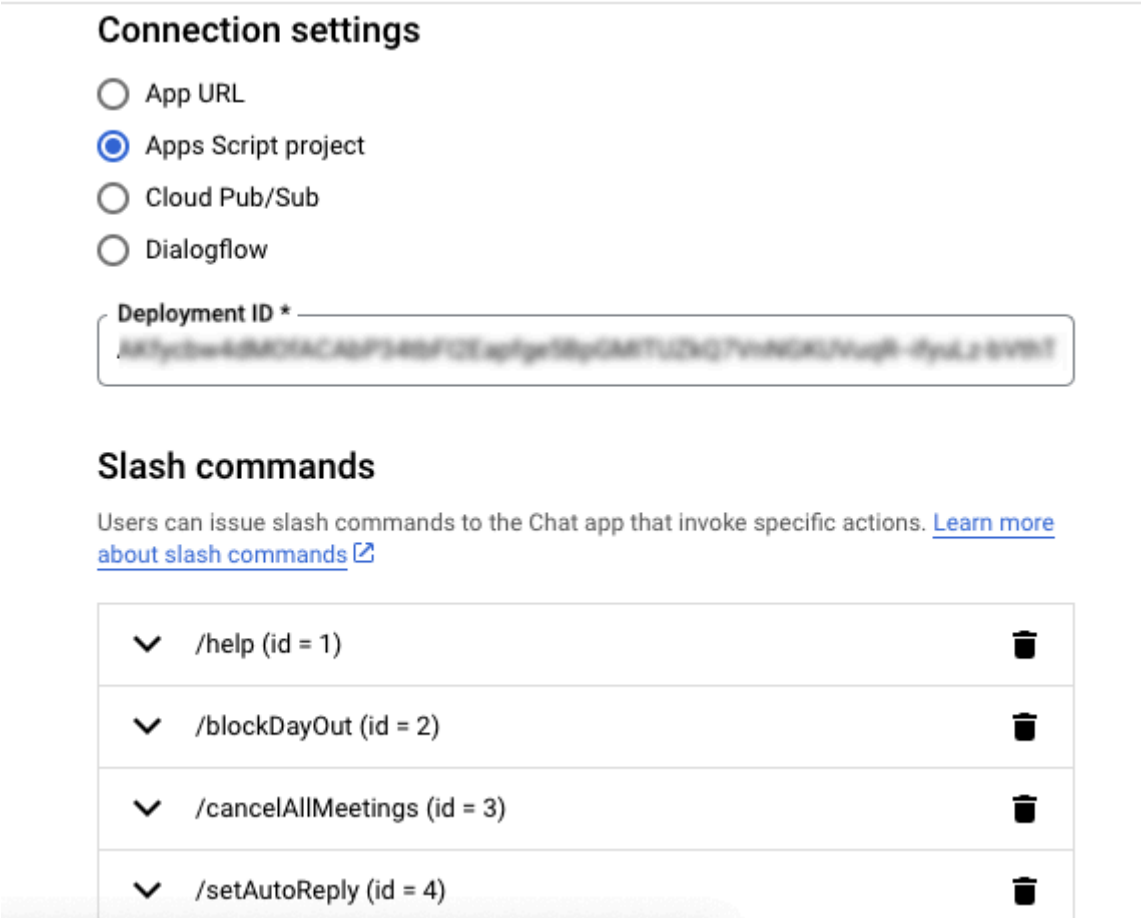
9. Click **CREATE**.
   An OAuth client is created with client ID and client secret. Record the client ID and client secret.
10. Click on the **CONFIGURATION** tab and fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
App name	Enter a name for your application.
Avatar URL	Specify an HTTPS URL for your app's avatar image.
Description	Enter a description for your application.

11. In **Connection** settings, specify the deployment ID of the Google Chat app from Step 4 in the **Deployment ID** field.

Note: If you have created any Slash commands while creating the app, specify them.



12. Save the configuration of your app in Google Cloud console.

Configure a connection for Google Chat spoke

Add and configure a Docker connection to authenticate ServiceNow requests in Docker spoke.

Before you begin
Role required: admin

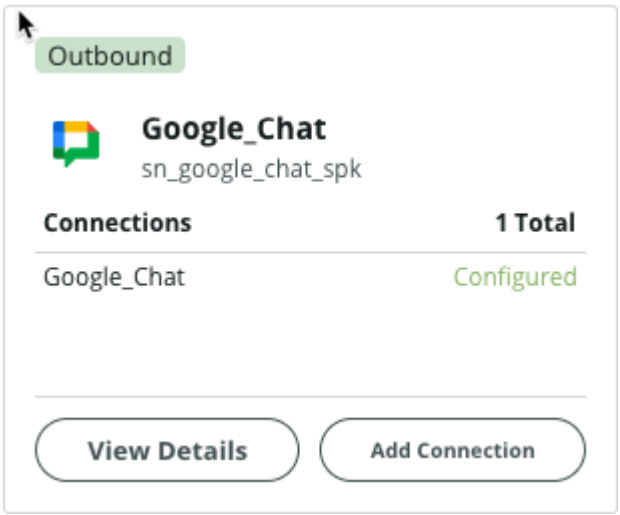
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Click the **Connections** tab.

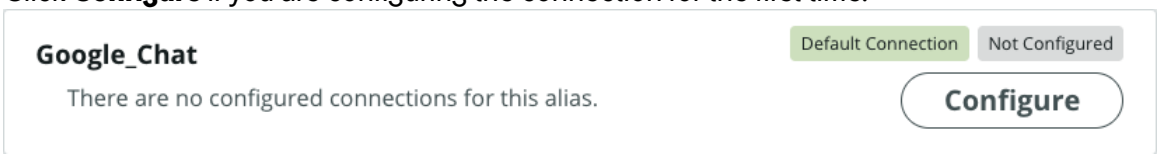
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Locate the alias for **Google_Chat** and and click **View Details**.

   Note: Don't click**Add Connection**.



4. Click **Configure** if you are configuring the connection for the first time.



5. On the **Configure Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection record.
Connection URL	URL to Google Chat APIs. Enter `https://chat.googleapis.com`
API Version	Google Chat API version. Enter `v1`.
OAuth Client ID	OAuth client ID of Google Chat app in Google Cloud console.
OAuth Client Secret	OAuth client secret of Google Chat app in Google Cloud console.
OAuth Redirect URL	OAuth redirect URL of your ServiceNow instance. Enter in this format`https://<your-instance-name>.service-now.com/oauth_redirect.do`

6. Click **Configure and Get OAuth Token**.
   You will be redirected to Google accounts login page.
7. Enter your Google Chat API credentials.

Result

An OAuth token is generated and configured for the Google Chat spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Google Cloud Datastore Spoke

Manage the NoSQL database services in Google Cloud Datastore from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Datastore spoke v1.0.2 is the latest version. For version history of the spoke, see Google Cloud Datastore spoke release notes.

Supported versions

This spoke was built for Google Cloud Datastore v1, but may be compatible with later versions.

Spoke requirements

Google Cloud Datastore account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

IntegrationHub (com.glide.hub.integrations)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud Datastore spoke provides actions to automate Google Cloud Datastore tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Entity Management	Entity Export	Exports a copy of all or a subset of entities from Google Cloud Datastore to another storage system.
	Entity Import	Imports entities into Google Cloud Datastore.
Index Management	Create Index	Creates the specified index.
	Delete Index	Deletes an existing index.
	Get Index	Gets an index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Index	Retrieves the list of indexes that match the specified filters.
Operation Management	Cancel Operation	Starts asynchronous cancellation on a long-running operation.
	Delete Operation	Deletes a long-running operation.
	Get Operation	Gets the latest state of a long-running operation.
	Look up Operation	Retrieves the list of operations that match the specified filter in the request.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Cloud Datastore spoke.

Set up the Google Cloud Datastore spoke

Integrate the ServiceNow instance and Google Cloud Datastore spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Datastore spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Datastore spoke.

Before you begin

Role required: admin

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.
3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud Datastore as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud Datastore as an OAuth provider

Register G suite as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Datastore**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Datastore application.
Client Secret	Client Secret of the Google Cloud Datastore application.
OAuth API Script	**OAuthGoogleDatastoreUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud Datastore spoke

Create a credential record for the Google Cloud Datastore custom application. The Google Cloud Datastore Spoke connection and credential alias uses this credential to authorize actions.

Before you begin

Role required: admin.

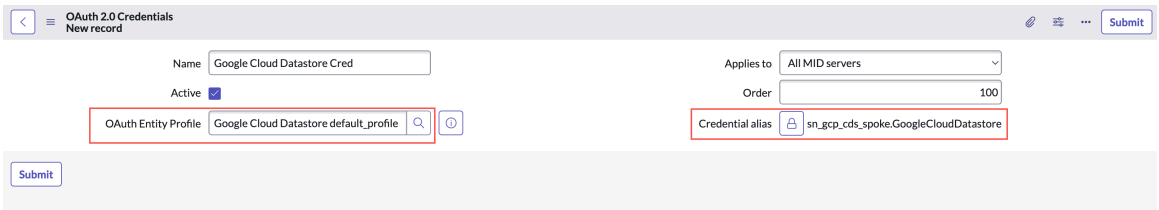
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudDatastore**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Datastore Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Datastore default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_cds_spoke.GoogleCloudDatastore** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud DNS Spoke

Manage public zones and private managed DNS zones in using Google Cloud DNS account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Google Cloud DNS API version v1, but may be compatible with later versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Google Cloud DNS Spoke version is 1.0.2. For version history of the spoke, see Google Cloud DNS spoke release notes.

Spoke requirements

The Google Cloud DNS spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Google Cloud Virtual Network Spoke
- Google Identity and Access Spoke

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud DNS spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Change Management	Create Change	Updates the resource record set collection.
	Get Change	Retrieves the details of an existing change.
	Look up Changes	Retrieves list of changes to a resource record set collection available with in the specified managed zone.
DNS Key Management	Get DNS Key	Retrieves details about an existing DNS key.
	Look up DNS Keys	Retrieves list of DNS keys to a resource record set collection available with in the specified managed zone.
Managed Zone Management	Create Managed Zone For Private	Creates a managed private zone with private DNS records.
	Create Managed Zone For Public	Creates a managed public zone.
	Delete Managed Zone	Deletes the specified existing managed zone.
	Get Managed Zone	Retrieves the details of the specified managed zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Managed Zones	Retrieves list of managed zones available in the specified project.
	Update Managed Zone For Private	Updates the details of the specified managed zone.
	Update Managed Zone For Public	Updates the details of the specified managed zone.
Operation Management	Get Operation	Retrieves the details of an existing operation.
	Look up Operations	Retrieves list of operations available with in the specified managed zone.
Policy Management	Create Policy	Creates a policy.
	Delete Policy	Deletes the specified policy.
	Get Policy	Retrieves the details about the specified policy.
	Look up Policies	Retrieves list of policies available with in the specified project.
	Update Policy	Updates details of the specified policy.
Project Management	Get Project	Retrieves the details about the specified project.
Resource Record Set Management	Look up Resource Record Sets	Retrieves list of resource record set collections available with in the specified managed zone.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud DNS spoke.

Set up the Google Cloud DNS spoke

Integrate the ServiceNow instance and Google Cloud DNS account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud DNS spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud DNS spoke.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.
3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud DNS as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud DNS as an OAuth provider

Use the information generated during the Google Cloud DNS application configuration to register Google Cloud DNS as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud DNS**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud DNS application.
Client Secret	Client Secret of the Google Cloud DNS application.
OAuth API Script	**OAuthGoogleCloudDNSUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud DNS spoke

Create a default credential record for the Google Cloud DNS application. The Google Cloud DNS spoke connection and credential alias uses this credential to authorize actions.

Before you begin

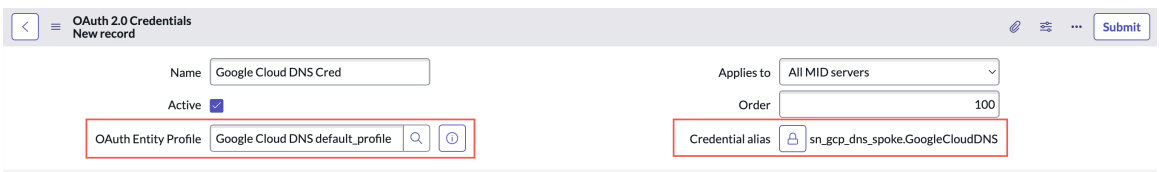
Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudDNS**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud DNS Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud DNS default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_dns_spoke.GoogleCloudDNS** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Functions Spoke

Manage functions that are attached to events, using your Google Cloud Functions account from ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Functions v1.0.3 is the latest version. For version history of the spoke, see Google Cloud Functions spoke release notes.

Supported versions

This spoke was built for the Google Cloud Functions API version v1, but may be compatible with later versions.

Google Cloud Functions spoke requirements

The Google Cloud Functions spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Google Identity and Access Spoke
- Google Cloud VPC Access Spoke
- Google Cloud Storage Spoke
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud Functions spoke provides actions to automate Google Cloud Functions tasks when events occurs in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Function Management	Create Function For Event	Creates a function for an event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Function For HTTP	Create a function to process an HTTP request.
	Delete Function	Deletes the specified function.
	Generate Download URL	Retrieves details of a signed URL to download source code of the deployed function.
	Generate Upload URL	Retrieves details of a signed URL for uploading source code of the deployed function.
	Get Function	Retrieves information about the specified function.
	Get IAM Policy	Retrieves details of IAM access control policy for a function.
	Look up Functions	Retrieves a list of functions available in the specified location.
	Set IAM Policy	Sets the IAM access control policy for the specified function.
	Update Function	Updates details of the specified function.
Location Management	Look up Locations	Retrieves a list of locations available in the specified project.
Operation Management	Get Operation	Retrieves details of the specified operation.
	Look up Operations	Retrieves the list of operations available in the specified project.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud Functions spoke.

Set up the Google Cloud Functions spoke

Integrate the ServiceNow instance and Google Cloud Functions account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Functions spoke.
- Role required: admin.

Configure the Google Cloud Functions application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Functions spoke.

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/ and creating a project with your administrator credentials.
2. Open your new project and, in the APIs & Services menu, select **OAuth consent screen**.
3. Enter the application name, specify the Authorized domain `service-now.com`, and select **Save**.
4. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
5. Select the application type **OAuth client ID**.
6. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and select **Create**.
7. Copy your client ID and client secret from the OAuth client window to a text file so that you can use them when you Register Google Cloud Functions as an OAuth provider.
   The client ID and secret can be accessed in the Google APIs & Services interface. Select **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud Functions as an OAuth provider

Use the information generated during the Google Cloud Functions application configuration to register Google Cloud Functions as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Functions**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Functions application.
Client Secret	Client Secret of the Google Cloud Functions application.
OAuth API Script	**OauthGoogleCloudFunctionsUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a credential record for the Google Cloud Functions spoke

Create a credential record for the Google Cloud Functions application. The Google Cloud Functions spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

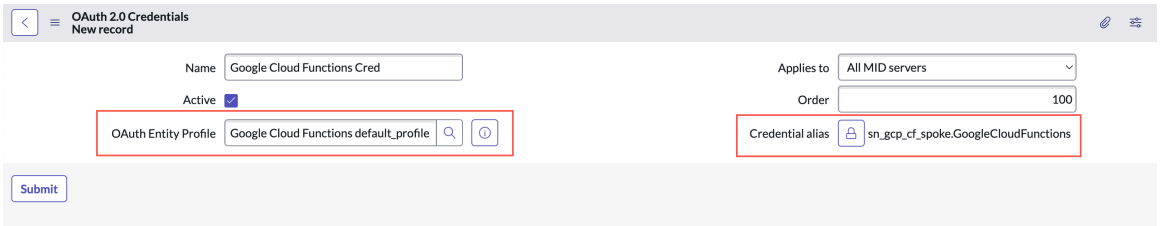
Role required: admin.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudFunctions**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Functions Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Functions default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_cf_spoke.GoogleCloudFunctions** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Load Balancer Spoke

Manage load balancing of your external or internal Virtual Private Cloud (VPC) network from ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Load Balancer spoke v1.0.1 is the latest version. For version history of the spoke, see Google Cloud Load Balancer spoke release notes.

Supported versions

This spoke was built for Google Cloud Load Balancer v1, but may be compatible with later versions.

Spoke requirements

Google Cloud Platform (GCP) account with access to Google Compute Engine and Google Virtual Private Network.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- Google Compute Engine spoke (sn_gcompute_spoke)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Google Cloud Load Balancer Spoke provides subflows to automate Google Cloud Load Balancer tasks when events occurs in your ServiceNow instance. Available subflows include:

Categotry	Action	Description
HTTPS Load Balancer Management	Create HTTPS Load Balancer For A New Backend Service	Creates a HTTPS load balancer for a new backend service in the specified project.
	Create HTTPS Load Balancer For An Existing Backend Service	Creates a HTTPS load balancer for an existing backend service in the specified project.
	Delete HTTPS Load Balancer	Deletes the components of the specified load balancer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Categotry	Action	Description
	Look up Components Of HTTPS Load Balancer	Retrieves a list of names of all the components associated with a HTTPS load balancer.
HTTP Load Balancer Management	Create A HTTP Load Balancer For A New Backend Service	Creates a HTTP load balancer for a new backend service in the specified project.
	Create HTTP Load Balancer For An Existing Backend service	Creates a HTTP load balancer for an existing backend service in the specified project.
	Delete HTTP Load Balancer	Deletes the components of a HTTP load balancer.
	Look up Components Of HTTP Load Balancer	Retrieves a list of names of all the components associated with a HTTP load balancer.

Spoke actions

The Google Cloud Load Balancer Spoke provides actions to automate Google Cloud Load Balancer tasks when events occurs in your ServiceNow instance. Available actions include:

Spoke actions

Category	Action	Description
Backend Service Management	Create Backend Service	Creates a backend service.
	Delete Backend Service	Deletes the specified backend service
	Get Backend Service	Retrieves the details of the specified backend service.
	Get Health Of Backend Service	Retrieves the health details of the specified backend service.
	Look up Backend Services	Retrieves a list of all backend services.
	Update Backend Service	Updates the details of the specified backend service.
Global Address Management	Create A Global Address	Creates a global address.
	Delete A Global Address	Deletes the specified global address.
	Get Global Address	Retrieves the details of all the global addresses.
	Look up Global Addresses	Retrieves a list of all global addresses.
Global Forwarding Rule Management	Create Global Forwarding Rule	Creates a global forwarding rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
	Delete Global Forwarding Rule	Deletes the specified global forwarding rule.
	Get Global Forwarding Rule	Retrieves the details of a global forwarding rule.
	Look up Global Forwarding Rules	Retrieves a list of all global forwarding rules.
	Set Target For Global Forwarding Rule	Assigns target information to the specified global forwarding rule.
HTTP Health Check Management	Create A HTTP Health Check	Creates a HTTP health check.
	Delete A HTTP Health Check	Deletes the specified HTTP health check.
	Get HTTP Health Check	Retrieves the details of the specified HTTP health check.
	Look up HTTP Health Checks	Retrieves a list of all HTTP health checks.
	Update A HTTP Health Check	Updates the details of the specified HTTP health check.
HTTP Load Balancer Management	Get Resource Name	Retrieves the name of the resource from a resource URL.
HTTPS Health Check Management	Create A HTTPS Health Check	Creates a HTTPS health check.
	Delete A HTTPS Health Check	Deletes the specified HTTPS health check.
	Get HTTPS Health Check	Retrieves the details of the specified HTTPS health check.
	Look up HTTPS Health Checks	Retrieves a list of HTTPS health checks.
	Update A HTTPS Health Check	Updates the details of the specified HTTPS health check.
Instance Group Manager Management	Create An Instance Group Manager	Creates an instance group manager.
	Create Instance In Instance Manager Group	Creates an instance in the specified instance group manager.
	Delete An Instance Group Manager	Deletes the specified instance group manager.
	Get Instance Group Manager	Retrieves the details of a specified instance group manager.
	Look up Instance Group Managers	Retrieves a list of managed instance groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description
	Look up Managed Instances In An Instance Group Manager	Retrieves a list of managed instances in a specified managed instance group.
	Resize An Instance Group Manager	Resizes the number of instances in a specified instance group manager.
	Update Instance Template Of An Instance Group Manager	Assigns the details of instance template to the specified instance group manager.
Target HTTP Proxy Management	Create Target HTTP Proxy	Creates a target HTTP proxy.
	Delete Target HTTP Proxy	Deletes the specified target HTTP proxy.
	Get Target HTTP Proxy	Retrieves the details of the specified target HTTP proxy.
	Look up Target HTTP Proxies	Retrieves a list of all target HTTP proxies.
	Update URL Map Of Target HTTP Proxy	Assigns the URL map information to the specified target HTTP proxy.
Target HTTPS Proxy Management	Create Target HTTPS Proxy	Creates a target HTTPS proxy.
	Delete Target HTTPS Proxy	Deletes the specified target HTTPS proxy.
	Get Target HTTPS Proxy	Retrieves the details of the specified target HTTPS proxy.
	Look up Target HTTPS Proxies	Retrieves a list of the target HTTPS proxies.
	Set SSL Certificates To Target HTTPS Proxy	Assigns SSL certificates to the specified target HTTPS proxy.
	Set URL Map To Target HTTPS Proxy	Assigns URL map information to the specified target HTTPS proxy.
URL Map Management	Create URL Map	Creates a URL map.
	Delete URL Map	Deletes the specified URL map.
	Get URL Map	Retrieves the details of the specified URL map.
	Look up URL Maps	Retrieves the details of all URL maps.
	Update URL Map	Updates the details of the URL map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Cloud Load Balancer Spoke.

Set up the Google Cloud Load Balancer Spoke

Integrate the ServiceNow instance and Google Cloud Load Balancer by creating a custom OAuth application in Google Cloud Storage to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Load Balancer spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Load Balancer spoke.

Before you begin

Role required: admin

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.
3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud Load Balancer as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Register Google Cloud Load Balancer as an OAuth provider

Use the information generated during the Google Cloud Storage application configuration to register Google Cloud Load Balancer as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Load Balancer**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Load Balancer application.
Client Secret	Client Secret of the Google Cloud Load Balancer application.
OAuth API Script	**OAuthGoogleCloudLoadBalancerUtil** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud Load Balancer Spoke

Create a credential record for the Google Cloud Load Balancer custom application. The Google Cloud Load Balancer Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin.

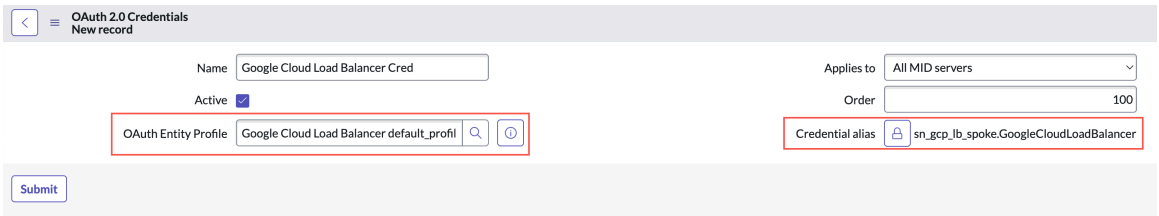
Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudLoadBalancer**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Load Balancer Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Load Balancer default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_lb_spoke.GoogleCloudLoadBalancer** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Pub Sub Spoke

Manage Google Cloud Pub/Sub messaging service from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

This spoke was built for Google Cloud Pub Sub v1, but may be compatible with later versions.

Spoke version

Google Cloud Pub Sub spoke v1.0.4 is the latest version. For version history of the spoke, see Google Cloud Pub Sub spoke release notes.

Spoke requirements

Google Cloud account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- Google Identity And Access Spoke (sn_gcp_id_acc_spk)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Google Cloud Pub Sub Spoke provides sample subflows to demonstrate automating Google Cloud Pub/Sub tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Google PubSub Messages	Receives messages from a sub topic and displays the messages in logs.

Spoke actions

The Google Cloud Pub Sub Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Snapshot Management	Create Snapshot	Creates a snapshot from the requested subscription.
	Delete Snapshot	Removes the specified existing snapshot.
	Get Snapshot IAM Policy	Retrieves the IAM policy of the snapshot.
	Look up Snapshots	Retrieves a list of existing snapshots.
	Set Snapshot IAM Policy	Assigns the access control policy to the specified snapshot.
	Update Snapshot	Updates an existing snapshot.
Subscription Management	Acknowledge	Acknowledges the messages associated with the acknowledge IDs in the acknowledge request.
	Acknowledge Deadline	Updates the acknowledge deadline in seconds for a specific message.
	Create Pull Subscription	Creates a pull subscription to the specified topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Create Push Subscription	Creates a push subscription to the specified topic.
	Delete Subscription	Deletes an existing subscription for the specified project.
	Get Subscription	Retrieves the configuration details of the specified subscription.
	Get Subscription IAM Policy	Retrieves the access control policy for the specified subscription.
	Look up Subscriptions	Retrieves a list of subscriptions.
	Pull Messages	Pulls message asynchronously for the specified project.
	Seek Subscription	Seeks an existing subscription to a point in time or to a specified snapshot.
	Set Subscription IAM Policy	Assigns the access control policy to the specified subscription.
	Update Push Configuration	Updates the push configuration for the specified subscription.
	Update Subscription	Updates the specified existing subscription.
Topic Management	Create Topic	Creates a topic with the specified name.
	Delete Topic	Deletes the specified topic.
	Get IAM Policy	Retrieves the specified access control policy of a resource.
	Get Topic	Retrieves the configuration details of the specified topic.
	Look up Topics	Retrieves a list of topics.
	Publish Messages	Adds one or more messages to the specified topic.
	Set IAM Policy	Assigns the access control policy to the specified resource.
	Update Topic	Updates the specified topic.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Cloud Pub Sub Spoke.

Set up the Google Cloud Pub Sub Spoke

Integrate the ServiceNow instance and Google Cloud Pub Sub by creating a custom OAuth application in Google Cloud account to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Pub Sub spoke.
- Role required: admin.

Create a custom application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Pub Sub spoke.

Before you begin

Role required: admin

Procedure

1. Register a new custom application by navigating to https://console.cloud.google.com/.
2. Create a project with your administrator credentials, and open the project.
3. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`.
4. Click **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **OAuth client ID**.
7. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
8. Copy these two values to a text file so that you can use them when you Register Google Cloud Pub Sub as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

Register Google Cloud Pub Sub as an OAuth provider

Use the information generated during the Google Cloud Pub Sub application configuration to register Google Cloud as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

Configure the Google Identity and Access Spoke.

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Pub Sub**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Pub Sub application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client Secret	Client Secret of the Google Cloud Pub Sub application.
OAuth API Script	**OauthGooglePubSubUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud Pub Sub spoke

Create a credential record for the Google Cloud account. The Google Cloud Pub Sub spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

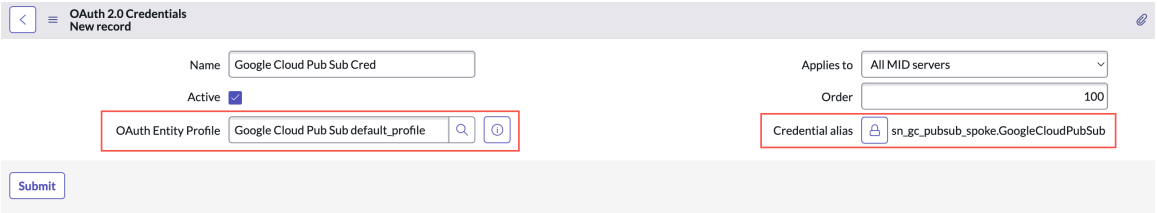
Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudPubSub**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Pub Sub Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud Pub Sub default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gc_pubsub_spoke.GoogleCloudPubSub** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud SQL Spoke

Mange provisioning of MySQL and PostgreSQL in Google Cloud SQL from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud SQL spoke v1.0.1 is the latest version. For version history of the spoke, see Google Cloud SQL spoke release notes.

Supported versions

This spoke was built for Google Cloud SQL v1beta4, but may be compatible with later versions.

Spoke requirements

- Google Cloud Platform account
- Google Identity and Access spoke (sn_gcpcloudsql_spk)

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- • ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- • ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- • ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- • ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- • Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Google Cloud SQL provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description	Required Permission
Back up Run Management:	Create Backup	Creates a backup.	cloudsql.backupRuns.create
	Delete Backup Run	Deletes a backup.	cloudsql.backupRuns.delete
	Get Backup Run	Retrieves details of the backup.	cloudsql.backupRuns.get
	Look up Backup Runs	Retrieves a list of the backup runs.	cloudsql.backupRuns.list
Database Management	Create Database	Creates a database.	cloudsql.databases.create
	Delete Database	Deletes a database.	cloudsql.databases.delete
	Get Database	Retrieves details of the instance.	cloudsql.databases.get
	Look up Databases	Retrieves a list of the databases.	cloudsql.databases.list
	Update Database	Updates a database.	cloudsql.databases.update
Instance Management	Clone Instance	Clones an instance.	cloudsql.instances.clone
	Create Instance	Creates an instance.	cloudsql.instances.create
	Delete Instance	Deletes an instance.	cloudsql.instances.delete
	Get Instance	Retrieves details of the instance.	cloudsql.instances.get
	Look up Instances	Retrieves a list of the instances.	cloudsql.instances.clone
	Restart Instance	Restarts an instance.	cloudsql.instances.restart
	Update Instance	Updates an instance.	cloudsql.instances.update
Operations	Get Operation	Retrieves details of the operation.	N/A
	Look up Operations	Retrieves a list of the operations.	N/A
Tiers	Look up Tiers	Retrieves a list of the tiers.	N/A
User Management	Create User	Creates a user.	cloudsql.users.create
	Delete User	Deletes a user.	cloudsql.users.delete

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Permission
	Look up User	Retrieves a list of the users.	cloudsql.users.list
	Update User	Updates a user.	cloudsql.users.update

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud SQL spoke.

Set up the Google Cloud SQL spoke

Integrate the ServiceNow instance and Google Cloud SQL spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud SQL spoke.
- Role required: admin.

Configure the Google Cloud SQL application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud SQL spoke.

Before you begin

Google Identity and Access integration requirements:

- Google Cloud SQL account.
- Role required: admin.

About this task

Complete these steps from the Google Cloud Platform.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your Google Cloud Platform administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the APIs & Services menu, select **Credentials**.

b. Select **Create OAuth client ID** from the **Create credentials** list.

4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you register Google Cloud SQL as an OAuth provider.

Tip: You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Cloud SQL as an OAuth provider

Use the information generated during Google Cloud SQL account configuration to register the Google Cloud SQL application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. In ServiceNow instance, navigate to **System OAuth** > **Application Registry**.
2. Open the record, **Google Cloud SQL**.
3. On the form, fill these fields:

Field	Description
Client ID	Client ID of the Google Cloud SQL application.
Client Secret	Client Secret you generated when you create the application.
OAuth API Script	Script to customize the request and response. Select `OAuthGCPSQLUtil`.
Default Grant type	Grant type used to establish the token. Select **Authorization Code**.
Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
Token URL	OAuth server token endpoint. Enter `https://oauth2.googleapis.com/token`.
Redirect URL	URL of the ServiceNow instance in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.
The system validates the OAuth credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a credential record for the Google Cloud SQL spoke

Create a credential record to connect the Google Cloud custom application you created during account configuration. The Google Cloud SQL spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

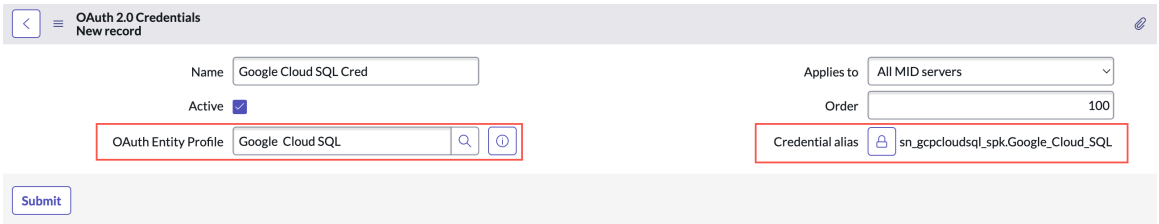
Role required: admin

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **Google_Cloud_SQL**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud SQL Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud SQL**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcpcloudsql_spk.Google_Cloud_SQL** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Storage Spoke

Manage storage and retrieval of data in Google Cloud from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Storage spoke v1.1.1 is the latest version. For version history of the spoke, see Google Cloud Storage spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Cloud Storage account requirements

The Google Cloud Storage spoke requires a custom app that you create in Google Cloud Platform.s

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke subflows

The Google Cloud Storage spoke provides sample subflows to demonstrate automating Google Cloud Storage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Move An Object	Moves an object from the source bucket to destination bucket.
Rename An Object	Renames the specified object.

Spoke actions

The Google Cloud Storage spoke provides actions to automate Google Cloud Storage when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
Bucket Access Control Management	Create/Update Bucket Access Control	Creates or updates a bucket access control.	• storage.buckets.get • storage.buckets.getIamPolicy • storage.buckets.setIamPolicy • storage.buckets.update
	Delete Bucket Access Control	Deletes the specified bucket access control.	• storage.buckets.get • storage.buckets.getIamPolicy • storage.buckets.setIamPolicy • storage.buckets.update
	List All Bucket Access Controls	Retrieves the list of all bucket access controls.	• storage.buckets.get • storage.buckets.getIamPolicy
Bucket Management	Create Bucket	Creates a bucket in Google Cloud Storage.	storage.buckets.create
	Delete A Bucket	Deletes the specified bucket in Google Cloud Storage.	storage.buckets.delete
	Get Bucket Details	Retrieves details of the specified bucket in Google Cloud Storage.	• storage.buckets.get • storage.buckets.getIamPolicy
	Get Bucket Labels	Retrieves labels of the specified bucket in Google Cloud Storage.	• storage.buckets.get • storage.buckets.getIamPolicy
	Get IAM Policy	Retrieves IAM policy of the specified bucket in Google Cloud Storage.	storage.buckets.getIamPolicy
	List All Buckets	Retrieves details of all buckets in Google Cloud Storage.	• storage.buckets.list • storage.buckets.getIamPolicy
	Update Bucket Details	Updates details of the specified bucket in Google Cloud Storage.	• storage.buckets.update • storage.buckets.setIamPolicy
	Update Bucket IAM Policy	Updates IAM policy of the specified bucket in Google Cloud Storage.	storage.buckets.setIamPolicy
Object Access Control Management	Create/Update Object Access Control	Creates or updates a object access control.	• storage.objects.get • storage.objects.getIamPolicy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
			• storage.objects.setIamPolicy • storage.objects.update
	Delete Object Access Control	Deletes the specified object access control.	• storage.objects.get • storage.objects.getIamPolicy • storage.objects.setIamPolicy • storage.objects.update
	List All Object Access Controls	Retrieves the list of all object access controls.	• storage.objects.get • storage.objects.getIamPolicy
Object Management	Copy Object	Copies an object from one bucket to another bucket.	• storage.objects.create (for the destination bucket) • storage.objects.delete (for the destination bucket) • storage.objects.get (for the source bucket)
	Delete An Object	Deletes an object in a bucket.	storage.objects.delete
	Download Object To ServiceNow	Downloads the specified object to ServiceNow.	• storage.objects.get • storage.objects.getIamPolicy
	Get Object Details	Retrieves the details of the specified object.	• storage.objects.get • storage.objects.getIamPolicy
	List All Objects	Retrieves list of all objects in the specified bucket.	• storage.objects.list • storage.objects.getIamPolicy
	Rewrite An Object	Rewrites an object from the source bucket to destination bucket.	• storage.objects.create (for the destination bucket) • storage.objects.delete (for the destination bucket) • storage.objects.get (for the source bucket)
	Update Object Details In A Bucket	Updates details of the specified object in a bucket.	• storage.objects.update • storage.objects.setIamPolicy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
	Update Object Storage Class	Updates storage class of the specified object.	• storage.objects.update • storage.objects.setIamPolicy
	Upload An Object	Uploads an object to the specified bucket.	• storage.objects.create • storage.objects.delete

For more information about the required permissions, see IAM permissions reference.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Cloud Storage object management AI agent	Manages object management tasks (that is, object management, storage class updates, and object transfers) in Google Cloud Storage.
Google Cloud Storage object access control management AI agent	Manages object access control management tasks (that is, object access controls, deletes, lists, and creates or updates access control settings) in Google Cloud Storage.
Google Cloud Storage bucket management AI agent	Manages bucket management (that is, creates, updates, and deletes buckets, retrieves bucket details, manages IAM policies, lists all available buckets) in Google Cloud Storage.
Google Cloud Storage bucket access AI agent	Manages bucket access (that is, bucket access controls, create or update bucket access controls, and delete bucket access controls) in Google Cloud Storage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud Storage spoke.

Set up the Google Cloud Storage spoke

Integrate the ServiceNow instance and Google Cloud Storage spoke by using G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Storage spoke.
- Access to Google Cloud Platform.
- Role required: admin.

Configure the Google Cloud Storage application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Storage spoke.

Before you begin

Role required: admin.

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.cloud.google.com.
   b. Create a project with your administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you Register Google Cloud Storage as an OAuth provider.

> **Tip:** You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Cloud Storage as an OAuth provider

Use the information generated during Google Cloud Storage account configuration to register the Google Cloud Storage application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud Storage**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud Storage application.
Client Secret	Client Secret of the Google Cloud Storage application.
OAuth API Script	**OAuthGoogleCloudStorageUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential for the Google Cloud Storage spoke

Create a credential record to connect the Google Cloud Storage custom OAuth application you created during account configuration. The Google Cloud Storage spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

Role required: admin.

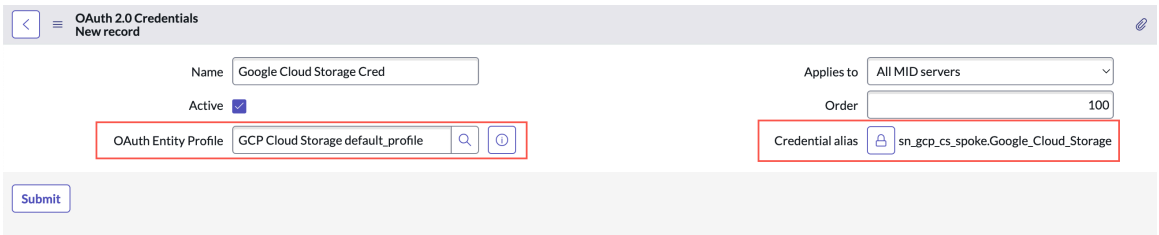
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **Google_Cloud_Storage**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Storage Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **GCP Cloud Storage default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_cs_spoke.Google_Cloud_Storage** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Cloud Translator Service Spoke

Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using the Google translation service.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription

This spoke requires one of the following subscriptions:

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See the Google Cloud Translator Service Spoke in ServiceNow Store.

Spoke version

Google Cloud Translator Service Spoke v3.2.8 is the latest version. For version history of the spoke, see Google Cloud Translator Service spoke release notes.

Supported versions

Google Translate API version v3.

Scope of the spoke in the Dynamic Translation framework

To use Google Cloud Translator Service spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see Dynamic Translation.

Spoke flows

This spoke has no sample flows.

Spoke subflows

The Google Cloud Translator Service spoke provides subflows in the Published state to integrate with the Google translation service. These subflows can be used as part of other subflows and flows.

Subflow	Description
Detect Language	Contains a set of inputs, actions, and outputs to detect the language of the input text.
Translate Text To Multiple Languages	Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.

Spoke actions

The Google Cloud Translator Service spoke provides actions to integrate with the Google translation service. Available actions include:

Action	Description
Detect Language	Detects the language of the input text.
Translate Text To Single Language	Translates the input text to a single language.
Translate Text To Multiple Languages	Translates the input text to multiple languages.

Google account requirements

The Google Cloud Translator Service spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the GoogleTranslation alias record (sn_google_trans.GoogleTranslation) to authorize actions. For information about setting up the spoke, see Set up the Google Cloud Translator Service spoke.

Set up the Google Cloud Translator Service spoke

Integrate your Google account with your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Translator Service spoke.
- Create a service account on Google Cloud, generate a service account key of JSON type and download it. For information on creating the service account key, see the Google documentation.
- Enable the Cloud Translation API service. For information on enabling a service, see the Google documentation.
- Role required: admin

Create a Java KeyStore certificate

Encrypt the security certificates obtained from Google by creating a Java KeyStore (JKS) file.

Before you begin

- Role required: admin
- Download a JSON file containing the service account key from Google. For information on downloading the JSON file, see the Google documentation. Following is a sample JSON file:

```
{
  "type": "service_account",
  "project_id": "primeval-nectar-242610",
  "private_key_id": "0c6c7b1511f1c236c1300c5933d528bbf45314e5",
  "private_key": "-----BEGIN PRIVATE KEY-----\n...\n-----END
 PRIVATE KEY-----\n",
  "client_email":
 "service-now-google-trans-v3@primeval-nectar-242610.iam.gservi
ceaccount.com",
  "client_id": "113255944370425109391",
  "auth_uri": "https://accounts.google.com/o/oauth2/auth",
  "token_uri": "https://oauth2.googleapis.com/token",
  "auth_provider_x509_cert_url":
 "https://www.googleapis.com/oauth2/v1/certs",
  "client_x509_cert_url":
 "https://www.googleapis.com/robot/v1/metadata/x509/service-n
ow-google-trans-v3%40primeval-nectar-242610.iam.gserviceaccount
.com"
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the JSON file, perform the following for the `private_key` value.
   a. Unescape the `\n` characters.

      Tip: To unescape characters in a JSON file, you can parse a JSON string into a JavaScript object.

   b. Store the private key in a file with .pem extension.
2. In the JSON file, perform the following for the `client_x509_cert_url` value.
   a. Open the link specified for `client_x509_cert_url`.
   b. Unescape the `\n` characters for the certificate associated with the private_key_id mentioned in the JSON file.
   c. Store the certificate value in a file with .pem extension.
3. Use the openssl command to create a PKCS 12 file using the recently created private key and certificate files.

   ```
   openssl pkcs12 -export -in [path to certificate] -inkey
    [path to private key] -certfile [path to certificate ] -out
    testkeystore.p12
   ```

   For example, if certificate.pem is the certficate and privatekey.pem is the private key:

   ```
   openssl pkcs12 -export -in certificate.pem -inkey
    privatekey.pem -certfile certificate.pem -out testkeystore.p12
   ```

   A PKCS 12 file, testkeystore.p12, is created.
4. Specify an export password or source keystore password.

   Note: You should specify this password when creating a JWT key for Google Cloud Translator Service spoke.

5. Use the keytool command to create a JKS file from the PKCS 12 file.

   ```
   keytool -importkeystore -srckeystore testkeystore.p12
    -srcstoretype pkcs12 -destkeystore wso2carbon.jks
    -deststoretype JKS
   ```

   Note: testKeyStore.p12 is the PKCS 12 file and wso2carbon.jks is the JKS file.

6. Specify a destination keystore password.

   Note: You should specify this password when attaching a JKS certificate to Google Cloud Translator Service spoke.

Attach a Java KeyStore certificate to Google Cloud Translator Service spoke

Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: admin
- Valid Java KeyStore certificate

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

X.509 Certificate form fields

Field	Description
Name	Identifier of the certificate.
Notify on expiration	Users to be notified when the certificate expires.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to activate the certificate.
Type	Type of the certificate. Select **Java Key Store**.
Expires in days	Number of days until the certificate expires.
Key store password	Password to access the certificate. Use the destination keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.
Short description	Summary about the certificate.

4. Click the manage attachments icon ( ) and attach a JKS certificate.
5. To validate the JKS certificate, click **Validate Stores/Certificates**.
6. Click **Submit**.

Create a JWT signing key for Google Cloud Translator Service spoke

Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JWT Keys form fields

Field	Description
Name	Identifier of the JWT signing key.
Signing Keystore	Valid JKS certificate for which you want to assign the key.
Key Id	Key ID to identify which key is used when multiple keys are used to sign tokens.
Signing Algorithm	Algorithm to sign with the key.
Signing Key Password	Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.
Active	Option to activate the key.

4. Click **Submit**.

Create a JWT provider for Google Cloud Translator Service spoke

Add a JSON Web Token (JWT) provider to Google Cloud Translator Service spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Identifier of the JWT provider.
Expiry Interval (sec)	Number of seconds that indicate the lifespan of the JWT provider token. Specify `3600`.
Signing Configuration	JWT signing key.

4. Right-click the form header, and click **Save**.
5. In the Standard Claims related list, enter the values for these claims.

Claim

Claim name	Claim value
aud	https://www.googleapis.com/oauth2/v4/token
iss	*`client_email`* value from the JSON file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Custom Claims related list, create the **scope** claim and enter its value as `https://www.googleapis.com/auth/cloud-translation`.
7. Click **Update**.

Configure the credential for the GoogleTranslation alias

Authorize actions of Google Cloud Translator Service spoke by configuring the Google OAuth 2.0 credential.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the **OAuth Entity Profile** field.
4. In the **JWT Provider** field, specify the JWT provider that you want to use.
5. Click **Update**.
6. To verify if an OAuth Access token is generated to connect to Google's translation services, click the **Get OAuth Token** related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the GoogleTranslation alias

Connect to the Google's translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Before you begin
Role required: connection_admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connections**.
2. Open for the record for **Google**.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

HTTP(S) Connection form fields

Field	Value required
location	Location of the customer. If the value is not specified when creating an account on Google Cloud, then specify `global`.
project_id	Identifier of a project. Specify the *`project_id`* value from the JSON file.
version	API version that the related spokes are built for. The default value is `v3beta1`. Because Google now supports the v3 version, you can override this value as `v3`.

4. Right-click the form header and click **Save**.

Google Cloud Virtual Network Spoke

Manage firewall, network, subnetwork, and IP address in Google Cloud Virtual Network from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Cloud Virtual Network spoke v1.0.4 is the latest version. For version history of the spoke, see Google Cloud Virtual Network spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Persistent Disk Spoke (sn_gpdisk_spoke)
- Google Compute Engine Spoke (sn_gcompute_spoke)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Cloud Virtual Network account requirements

The Google Cloud Virtual Network spoke requires a custom app that you create in the Google Cloud Platform.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Cloud Virtual Network spoke provides actions to automate Google Cloud Virtual Network when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions required
Address Management	Create IP Address For Region	Creates an address resource in the specified project by using the data included in the request.	compute.addresses.create
	Delete IP Address	Deletes the specified address resource.	compute.addresses.delete
	Get IP Address	Retrieves details of the specified address resource.	compute.addresses.get
Firewall Management	Create Firewall For Egress	Creates a firewall for egress rule in the specified project.	compute.firewalls.create
	Create Firewall For Ingress	Creates a firewall for an ingress rule in the specified project.	compute.firewalls.create
	Delete Firewall	Deletes the specified firewall.	compute.firewalls.delete
	Get Firewall	Retrieves details of the specified firewall.	compute.firewalls.get
	Update Firewall For Egress	Updates a firewall for the egress rule in the specified project.	compute.firewalls.update
	Update Firewall For Ingress	Updates a firewall for the ingress rule in the specified project.	compute.firewalls.update
Metadata Retrieval Management	List Addresses	Retrieves a list of addresses contained within the specified region.	compute.addresses.list
	List Firewalls	Retrieves a list of firewalls available to the specified project.	compute.firewalls.list
	List Networks	Retrieves a list of networks available to the specified project.	compute.networks.list
	List Subnetworks	Retrieves a list of subnetworks available to the specified project.	compute.subnetworks.list
Network Management	Create Network	Creates a network in the specified project.	compute.networks.create
	Delete Network	Deletes the specified network.	compute.networks.delete

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions required
	Get Network	Retrieves details of the specified network.	compute.networks.get
Subnetwork Management	Create Subnetwork	Creates a subnetwork in the specified project.	compute.subnetworks.create
	Delete Subnetwork	Deletes the specified subnetwork.	compute.subnetworks.delete
	Expand IP CIDR Range	Expands the IP CIDR range of the subnetwork to a specified value.	compute.subnetworks.expandIpCidrRange
	Get IAM Policy	Retrieves details of the access control policy for a resource.	compute.subnetworks.getIamPolicy
	Get Subnetwork	Retrieves details of the specified subnetwork.	compute.subnetworks.get
	Set IAM Policy	Sets the access control policy on the specified resource.	compute.subnetworks.setIamPolicy

For more information about the required permissions, see IAM permissions reference.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Cloud Virtual Network spoke.

Set up the Google Cloud Virtual Network spoke

Integrate the ServiceNow instance and Google Cloud Virtual Network spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

Before you begin

- Request Integration Hub subscription.
- Activate and set up the Google Compute Engine Spoke.
- Activate the Google Cloud Virtual Network spoke.
- Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Open the record for the Google Compute Engine spoke, for example, `Google Compute Cred`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. For **Credential alias**, select the Connection and Credential alias record of the Google Cloud Virtual Network spoke.
4. Right-click the form header and click **Save**.
5. Click **Get OAuth Token**.

Google Cloud VPC Access Spoke

Manage connector and operations in your Google Cloud VPC Access account from ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

The current Google Cloud VPC Access spoke version is 1.0.1. For version history of the spoke, see Google Cloud VPC Access spoke release notes.

Supported versions

This spoke was built for the Google Cloud VPC Access API version v1, but may be compatible with later versions.

Google Cloud VPC Access spoke requirements

The Google Cloud VPC Access spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Google Identity and Access Spoke
- Google Cloud Virtual Network Spoke
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Google Cloud VPC Access spoke provides actions to automate Google Cloud VPC Access tasks when events occurs in the ServiceNow AI Platform. Available actions include:

Category	Action	Description
Connector Management	Create Connector	Creates a connector in the specified project.
	Delete Connector	Deletes the specified VPC Access connector.
	Get Connector	Retrieves the specified VPC Access connector.
	Look up Connectors	Retrieves the list of VPC Access connectors available in the specified location.
Location Management	Look up Locations	Retrieves the list of locations available in the specified project.
Operation Management	Get Operation	Retrieves details of the specified operation.
	Look up Operations	Retrieves a list of operations available with in the specified location.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Cloud VPC Access spoke.

Set up the Google Cloud VPC Access spoke

Integrate the ServiceNow instance and Google Cloud VPC Access account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud VPC Access spoke.
- Role required: admin.

Configure the Google Cloud VPC Access application

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud VPC Access spoke.

Before you begin

- Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.
- Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **OAuth client ID**.
5. Enter the following **Authorized redirect URI**: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you register Google Cloud VPC Access as an OAuth provider.

> **Tip:** You can always access the client ID and secret in the Google APIs & Services interfaceby clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Cloud VPC Access as an OAuth provider

Use the information generated during the Google Cloud VPC Access application configuration to register Google Cloud VPC Access as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open for the record, **Google Cloud VPC Access**.
3. On the form, fill these values.

Application Registries form

Field	Description
Client ID	Client ID of the Google Cloud VPC Access application.
Client Secret	Client Secret of the Google Cloud VPC Access application.
OAuth API Script	**OAuthGoogleVPCAccessUtils** is selected by default.
Authorization URL	The OAuth authorization code endpoint: `https://accounts.google.com/o/oauth2/auth`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token URL	The OAuth server token endpoint: `https://oauth2.googleapis.com/token`.
Redirect URL	OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`. If left blank, the instance auto-generates the URL.

4. Right-click the form header, and click **Save**.

Create a credential record for the Google Cloud VPC Access spoke

Create a credential record for the Google Cloud VPC Access application. The Google Cloud VPC Access spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

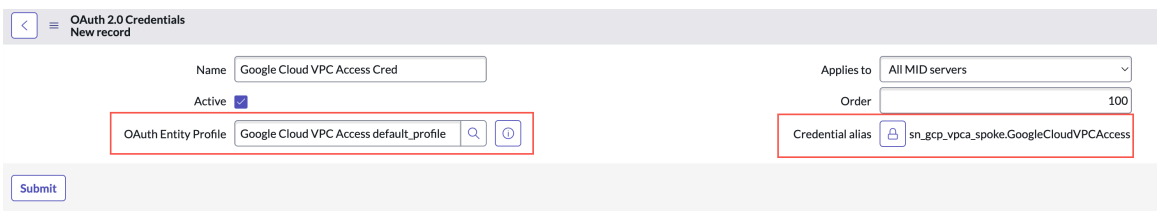
- Register Google Cloud VPC Access as an OAuth provider
- Role required: admin

Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudVPCAccess**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud VPC Access Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Cloud VPC Access default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcp_vpca_spoke.GoogleCloudVPCAccess** is selected.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Google Compute Engine Spoke

Launch and manage virtual machines in Google Compute Engine spoke from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Compute Engine spoke v1.0.5 is the latest version. For version history of the spoke, see Google Compute Engine spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Persistent Disk Spoke (sn_gpdisk_spoke)
- Google Cloud Virtual Network Spoke (sn_gcp_vpc_spoke)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Compute Engine spoke account requirements

The Google Compute Engine spoke requires a custom app that you create in Google Cloud Platform.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Compute Engine spoke provides actions to automate Google Compute Engine when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
Instance Template Management	Create Instance Template	Creates an instance template.	compute.instanceTemplates.create
	Create Instance Template From Instance	Creates an instance template from instance.	compute.instanceTemplates.create
	Delete Instance Templates	Deletes the specified instance template.	compute.instanceTemplates.delete
	Get Instance Template	Retrieves details of the specified instance template.	compute.instanceTemplates.get
Machine Types Management	Get Machine Type By Zone	Retrieves details of the specified machine type by zone.	compute.machineTypes.get
Metadata Retrieval Management	List Instance Templates	Retrieves a list of instance templates available to the specified project.	compute.instanceTemplates.list
	List Machine Types By Zone	Retrieves a list of machine types available to the specified project.	compute.machineTypes.list
	List Regions	Retrieves a list of regions available to the specified project.	compute.regions.list
	List VM Instances By Zone	Retrieves a list of VM instances available to the specified project.	compute.instances.list
	List Zones	Retrieves a list of zones available to the specified project.	compute.zones.list
Region Management	Get Region	Retrieves the specified region resource.	compute.regions.get
VM Instance Management	Attach Disk	Attaches an existing Disk resource to an instance.	compute.instances.attachDisk
	Create Instance	Creates an instance resource in the specified project.	compute.instances.create
	Delete Instance	Deletes the specified instance.	compute.instances.delete
	Detach Disk	Detaches a disk from an instance.	compute.instances.detachDisk
	Get IAM Policy	Retrieves the access control policy for a resource.	compute.instances.getIamPolicy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
	Get Instance By Zone	Retrieves the specified Instance by zone.	compute.instances.get
	Reset Instance	Performs a reset on instance.	compute.instances.reset
	Set IAM Policy	Sets the access control policy on the specified resource.	compute.instances.setIamPolicy
	Set Labels On Instance	Sets labels on an instance.	compute.instances.setLabels
	Set Tags On Instance	Sets tags for the specified instance.	compute.instances.setTags
	Start Instance	Starts an instance.	compute.instances.start
	Stop Instance	Stops an instance.	compute.instances.stop
Zone Management	Get Zone	Retrieves information about the specified zone.	compute.zones.get

For more information about the required permissions, see IAM permissions reference.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Compute Engine spoke.

Set up the Google Compute Engine spoke

Integrate the ServiceNow instance and Google Compute Engine spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Compute Engine spoke.
- Access to Google Cloud Platform.
- Role required: admin.

Note: This procedure outlines steps to configure the custom app using OAuth. You can also configure the custom app using Service Account associated with JWT tokens. For more information about setting up the spoke using JWT tokens, see Choosing an Authentication Method - Service accounts and Set up OAuth provider with JWT Bearer grant type.

Configure the Google Compute Engine application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Compute Engine spoke.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you Register Google Compute Engine as an OAuth provider.

Tip: You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Compute Engine as an OAuth provider

Use the information generated during Google Compute Engine account configuration to register the Google Compute Engine application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. In ServiceNow, navigate to **System OAuth** > **Application Registry**.
2. Open the record for **Google Compute Engine**.
3. Fill these values in the Application Registries form:

Field	Value required
Name	Name to uniquely identify the record, for example `Google Compute Engine`.
Client ID	Client ID of the Google Compute Engine application you created in G Suite.
Client Secret	Client Secret you generated when you created the application in G Suite.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
OAuth API Script	Script to customize the request and response. Select `OAuthGoogleComputeUtil`
Default Grant type	Grant type used to establish the token. Select **Authorization Code**.
Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
Token URL	OAuth server token endpoint. Enter `https://oauth2.googleapis.com/token`.
Redirect URL	URL of the ServiceNow instance in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

Create a credential record for the Google Compute Engine spoke

Create a credential record to connect the Google Compute Engine custom OAuth application you created during account configuration. The Google Compute Engine spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

Role required: admin.

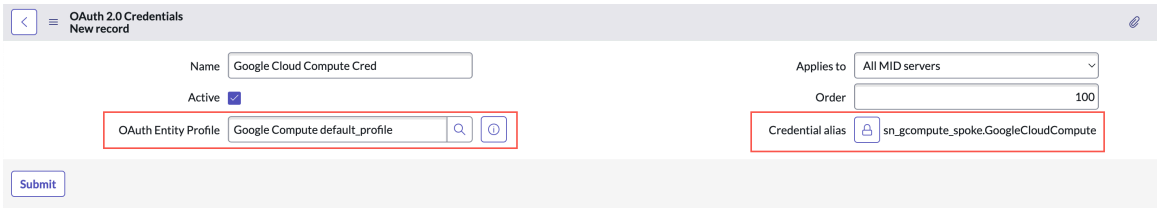
Procedure

1. Navigate to **All** > **Integration Hub** > **Connections & Credentials**.
2. Open the record, **GoogleCloudCompute**.
3. In the **Credentials** tab, click **New**.
   The system displays this message: `What type of Credentials would you like to create?`
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the credential record. For example, `Google Cloud Compute Cred`.
OAuth Entity Profile	Select the default OAuth entity profile, **Google Compute default_profile**.
Credential alias	Credential alias associated with this record. The default alias record, **sn_gcompute_spoke.GoogleCloudCompute** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

Google Directory Spoke

Manage groups, members, and users in Google Directory from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Note:

- In this version, the alias type is changed to the **Connection and Credential**. The alias type supports multiple connections.
- If you're upgrading to Google Directory spoke v1.1.2, you must reconfigure the alias record.

Spoke version

Google Directory spoke v1.6.0 is the latest version. For version history of the spoke, see Google Directory spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Google Directory account requirements

The Google Directory spoke requires a custom app that you create in the Google Developers Console.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke subflows

The Google Directory spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. These webhook subflows perform specific tasks when webhooks execute user resource changes in the Google Directory. Available sample subflows include:

Subflow	Description
Create Google Directory User Webhook Subflow	When you update the details of a user in the Google Directory, a webhook notifies your ServiceNow instance. Now, when you execute the `Create Directory User Webhook Subflow`, it creates a subscription and an entry to the `Google Directory Webhook Registries table`. **Note:** To execute the subflow, you must provide the webhook URL that ServiceNow exposes for incoming webhooks in the Test Subflow window. The webhook URL format is `https://<instance-name>.service-now.com/api/sn_googledir_spoke/google_directory_webhook_callbacks/wh_entry`.
Process Google Directory User Webhook Subflow	Processes Google Directory webhooks when user details are updated in the Google directory. The Google Directory provides sample subflows to demonstrate automating Google Directory webhook flows.

Spoke actions

The Google Directory spoke provides actions to automate Google Directory when events occur in ServiceNow. Available actions include:

Category	Action	Description
Group Management	Create Group	Creates a group.
	Delete Group	Deletes a group.
	Look up Group Details by Group Email or ID	Retrieves details of the specified groups based on group email or ID.
	Look up All Groups Stream	Retrieves the details of all groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look up Groups Stream by Filtering Criteria	Retrieves details of the specified groups based on the provided filter criteria.
	Update Group Details	Updates details of the specified group.
Member Management	Add Member To A Group	Adds member to the specified group.
	Check Membership of a Group	Checks if the given user is a member of the group email or ID.
	Look up Member Details from a Group	Retrieves the details of the required member in the specified group.
	Look up Members of a Group by Group Email or ID	Retrieves the details of all member in the specified group.
	Remove Member from a Group	Removes the specified member from a group.
	Update Member	Updates details of the specified member in a group.
User Management	Create User	Creates a user.
	Delete User	Deletes the specified user.
	Generate Random Password	Generates a random password with the specified length.
	Grant Admin To User	Grants admin privileges to the specified user.
	Look up All Users Stream by Customer ID	Retrieves a paginated list of all users in a domain, including deleted users if *`showDeleted`* is set to `true`.
	Look up User Details by User Email or ID	Retrieves details of the given user.
	Look up Users Stream by Filtering Criteria	Searches for users matching the filter criteria. This action accepts the query parameter which is a search query combining one or more search clauses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Reactivate User	Reactivates the specified user. **Note:** Exercise caution while using this action, as it may affect the other user's account.
	Reset User Password	Resets the password of the user. **Note:** Exercise caution while using this action, as it may affect the other user's account. By default, the **Force Change Password** option is enabled and the user is forced to change the password on the first login.
	Revoke Admin from User	Revokes the admin privileges of the specified user.
	Suspend User	Suspends the specified user. **Note:** Exercise caution while using this action, as it may affect the other user's account.
	Update User Details	Updates details of the specified user.
Webhook Management	Create Subscription Channel	Creates a subscription channel that watches for changes in the users list.
	Stop Subscription Channel	Stops watching resources through the given channel before the expiry of the subscription.
Schema Management	Look up Schema by ID	Retrieves details of the specified schema.
	Look up schemas	Retrieves details of all schemas for a customer.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Directory spoke.

Set up the Google Directory spoke

Integrate the ServiceNow instance and Google Directory spoke by using G Suite credentials to authenticate ServiceNow requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Directory spoke.
- Role required: admin.

Configure the Google Directory application

Create a custom OAuth application from your Google G Suit account to enable OAuth 2.0 authentication with the Google Directory spoke.

Before you begin

Google Directory integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

Role required: admin.

About this task

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your G Suite administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   The OAuth client window shows your client ID and client secret.
6. Copy these two values to a text file so that you can use them when you add the Google Directory connection in ServiceNow instance.

Tip: You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add Google Directory connection in ServiceNow instance

Add the Google Directory connection in Workflow Studio to configure the Google Directory spoke.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Connections** tab.
3. Toggle and enable the **Outbound** connections.
4. Locate the **Google Directory** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Google Directory spoke, click **View Details**.

   - To manage more than one Google Directory spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

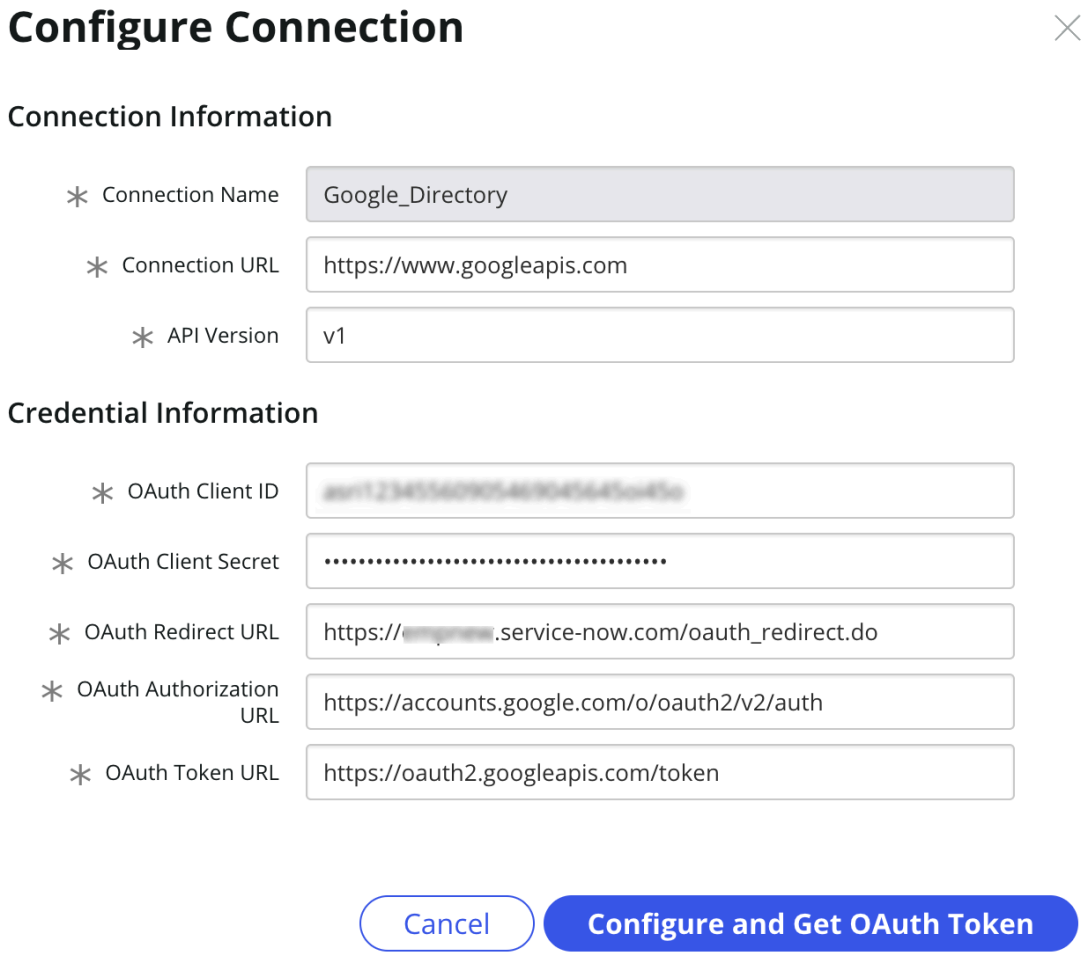
   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.

5. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Connection form

Field	Description
Connection URL	URL to connect to Google Directory. Enter `https://googleapis.com`.
Credential Name	Name to identify the credential record. For example, `Google Directory Cred`.
OAuth Name	Name to identify the OAuth record. For example, `Google_Directory OAuth`.
OAuth Client ID	Client ID of your Google app.
OAuth Client Secret	Client Secret of your Google app.
OAuth Redirect URL	Redirect URL provided in your Google app. This value is auto-populated.
OAuth Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
OAuth Token URL	Token URL. Enter `https://oauth2.googleapis.com/token`.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Click **Configure and Get OAuth Token**.
7. In the pop-up window, click **Allow**.
   The OAuth Access token is generated for the Google Directory spoke.

Set up a bi-directional webhook for the Google Directory spoke

Create a webhook routing policy and subflow according to your requirement.

Before you begin

Role required: admin

About this task

The default routing policy in the Google Directory WebHook Routing Policies module triggers the Process Google Directory User Webhook Subflow and notifies the ServiceNow app when certain events occur in the Google Directory. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure

1. Navigate to **All** > **Flow Designer**.
2. Select Subflows.
3. In the name field, enter `Process Google Directory User Webhook Subflow` and press **Enter**.
4. Select the subflow.
5. On the Process Google Directory User Webhook Subflow page, select the More Actions Menu icon ( ).
6. Select **Copy Subflow**.
7. Customize the subflow according to your requirement and publish it.
8. In the filter field, enter `Google Directory Webhook Routing Policies`.
9. Select **New**.
10. Fill the form.

Decision form

Field	Description
Label	A unique label to identify the routing policy.
Application	The application is set to Global.
Order	The order in which the request is processed.
Answer	Subflow that must be triggered when the specified conditions are met.
Default answer	Option to specify if the answer is the default answer.
Condition	Conditions to be met when the required events occur in the Google Directory.

11. Select **Submit**.

Google Docs Spoke

Manage documents in Google Docs from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Docs spoke v1.3.0 is the latest version. For version history of the spoke, see Google Docs spoke release notes.

Supported versions

This spoke was built for Google Docs v1, but may be compatible with later versions.

Spoke requirements

Google Cloud account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Docs spoke provides actions to automate Google Docs tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description
Document Management	Create Document	Creates a document in Google Docs.
	Create Footer	Creates a footer in the specified document.
	Create Header	Creates a header in the specified document.
	Get Document Details	Retrieves the structure of the specified document as a JSON object.
	Search Text in Document	Searches for the required document based on the search text or content.
	Update Document	Updates the content of a document with the provided HTML content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Docs document management AI agent	Manage documents (that is, create document, create header or footer, get document details, search text in document) in Google Docs.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Docs.

Set up the Google Docs

Integrate the ServiceNow instance and Google Docs by creating a custom OAuth application in G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Docs spoke.
- Role required: admin.

Configure Google Docs application

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Docs spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- A Google G Suite or login created with the domain
- Role required: admin

About this task

Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your G Suite administrator credentials.
   c. Open the project.
2. Set the Authorized domain.
   a. From the **APIs & Services** menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Search for the Google Docs API and enable it.
4. Create the OAuyth client ID.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
5. Select the application type **Web application**.
6. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   This redirect URI must match the **Redirect URL** you provide when you configure a connection for the Google Docs spoke.
7. The OAuth client window shows your client ID and client secret.

   Copy these two values to a text file so that you can use them when you configure a connection for the Google Docs spoke.

Tip:

You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and select the OAuth 2.0 client ID name.

Configure a connection for the Google Docs spoke

Add and configure a Google Docs connection to authenticate ServiceNow requests in Google Docs spoke.

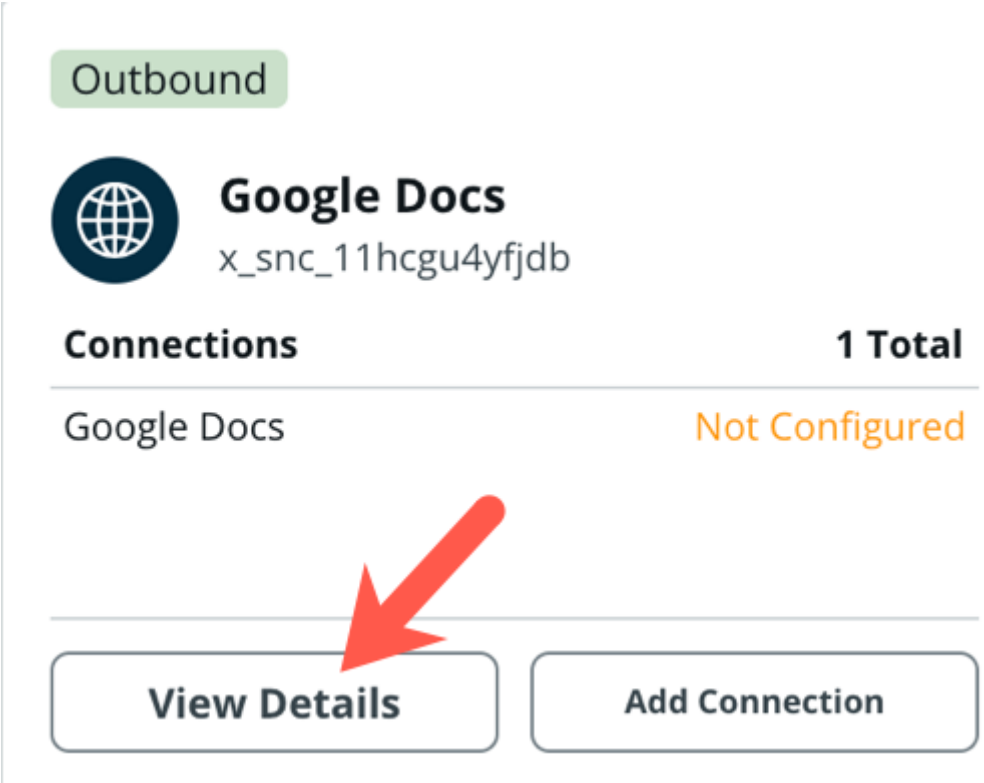
Before you begin

- Configure Google Docs application
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Select the **Connections** tab.
4. In the Search all connections field, enter `Google Docs`.
5. On the Google Docs card, select **View Details**.



6. Select **Configure**.

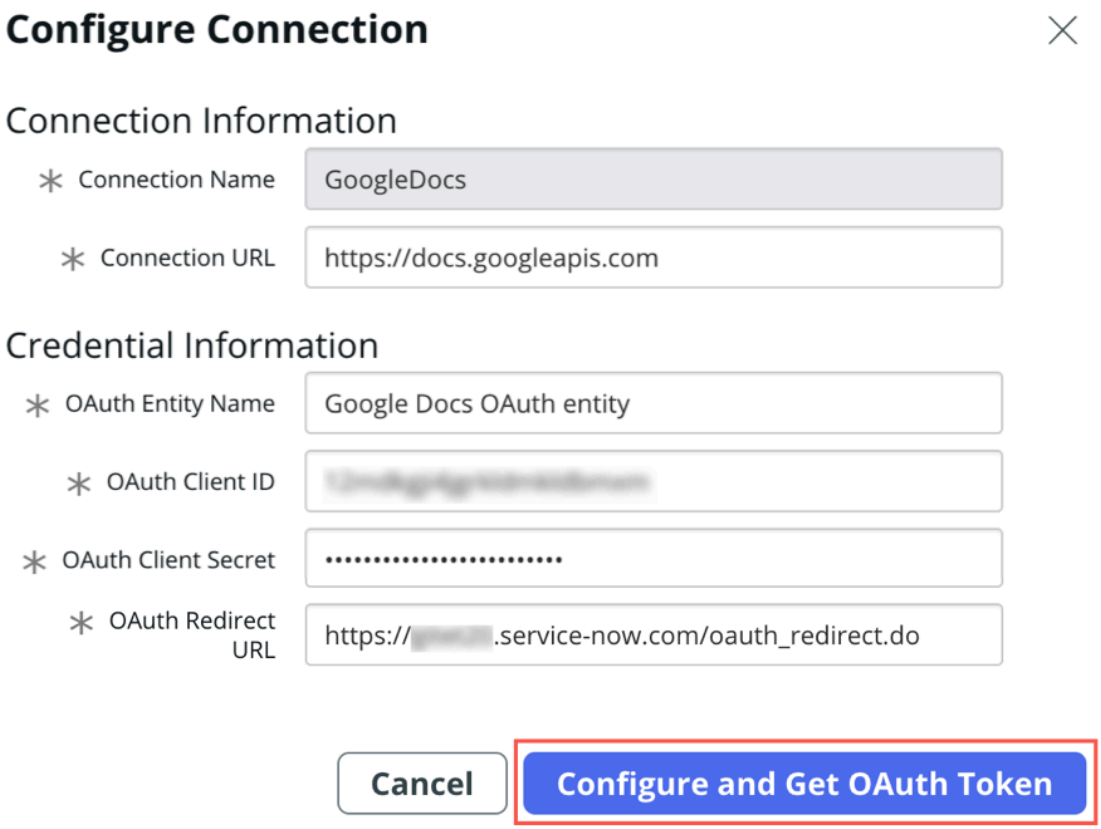
7. On the **Connection** form, fill in the fields.

Field	Description
Connection Name	Name to uniquely identify the connection record. For example, `Google Docs Connection`.
Connection URL	Connection URL for the spoke. Enter `https://www.googleapis.com/`
OAuth Entity Name	Name to identify the OAuth entity record. For example, `Google Docs entity`.
OAuth Client ID	Client ID generated while creating the application in G suite.
OAuth Client Secret	Client secret generated while creating the application in G suite.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Redirect URL	Redirect URL of your ServiceNow instance in this format: `https://<instance_name>.service-now.com/oauth_redirect.do`.

8. Click **Configure and Get OAuth Token**.



9. Log in to Google to get the OAuth token.

Result
The spoke connection is configured and ready to be used.

Google Drive Spoke

Use Google Drive as file storage in place of attachments in ServiceNow. Adds Google Drive storage to your ServiceNow instance and enables users to reference Google Drive files in ServiceNow records.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Google Drive spoke v2.3.0 is the latest version. For version history of the spoke, see Google Drive Spoke release notes.

Supported versions

API version v3.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke actions

The Google Drive spoke provides actions to perform Google Drive tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
File and Folder Management	Copy Attachment to Drive	Copies a ServiceNow attachment to a Google Drive folder. It either copies to the root drive of the current account or to the specified folder. To change the file name during the copy, use the optional file name.
	Copy Doc File to Attachment	Copies a file Google Drive and attaches it to a ServiceNow record.
	Copy File	Creates a copy of a Google Drive File and applies any metadata updates like a change in file name, file description, parent folder location, if file is starred, or shared by users with writer permissions.
	Copy Drive File To Attachment	Copies a drive file to a ServiceNow attachment. If a ServiceNow record is supplied as input, the record should be attached to it.
	Copy File Revision as Attachment	Copies the revision ID of a file ID to any record on the ServiceNow instance.
	Create Folder	Creates a Google Drive folder that can be nested within other folders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Delete Drive File Or Folder	Permanently deletes a drive file or folder owned by the Google Drive account user without moving it to the trash. To delete folders the user must be the owner of folder and its contents
	Delete File Revision	Deletes a revision to a file.
	Look up Files and Folders Stream	Retrieves the list of files and folders.
	Look up File Revisions Stream	Retrieves the list of all revisions to a file.
	Look up File	Retrieves the metadata information from a file ID.
	Look up Files Stream	Retrieves a list of Google Drive files based on the given search parameters.
	Look up Folders Stream	Retrieves a list of Google Drive folders based on the given search parameters.
	Update Attachment To Drive	Updates the contents of a file, but maintains the previous versions and metadata. This action only updates the content of the Google Drive file. It does not update metadata.
	Update File Or Folder Metadata	Updates the metadata on a file or folder. This can be a file name change, change to the file description, a move to a new parent folder, a change in starred status, or a change to sharing permissions.
	Look up Files or Folders by Name	Retrieves the details of the files or folders including ID for the specified file name or folder name.
Permission Management	Create File or Folder Permission	Adds a permission to a given user, group, domain, or anyone for a file or folder. If User or Group is selected, the email address is required for those users and groups. If Domain is selected, the domain name is required. If Anyone is selected, then anyone has permissions to the file or folder.
	Delete File Or Folder Permission	Removes a permission to a given user, group, domain, or anyone for a file or folder.
	Look up Permissions Stream	Retrieves the list of files or shared drives permissions.
	Transfer Ownership Of All User Data	Transfers the ownership of data from one user to another within a domain. All previous permissions of old owner are removed and new owner permissions are created for new user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Update File Or Folder Permission	Updates a given permission by updating the role.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agents	Description
Google Drive permission manager AI agent	Manages file or folder permissions(create file or folder permission, transfer ownership of all user data, update file or folder permission, delete file or folder permission) in Google Drive.
Google Drive file and folder manager AI agent	Manages files and folders(copy doc file to attachment, copy file revision as attachment, delete file or folder, update attachment to drive, copy drive file to attachment, copy attachment to drive, copy file, delete file revision, create folder, look up files or folders by name, update file or folder metadata, look up file) in Google Drive.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Google Drive Online account requirements

The Google Drive spoke requires a custom app that you create in Google Drive Enterprise or Google G Suite.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up Google Drive spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Google Drive alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up Google Drive spoke

Integrate a ServiceNow instance and Google Drive spoke by using Google Drive credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Drive spoke.
- Role required: admin.

Configure Google Drive application

Create a custom OAuth application from your Google Drive account to enable OAuth 2.0 authentication with the Google Drive spoke.

Before you begin

Google Drive integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in GSuite or Google Drive.
- A Google G Suite or Google Drive login created with the domain.
- A Google Drive account.

Role required: admin.

About this task

Complete these steps from your Google G Suite or Google Drive account. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Log in to the G Suite portal, https://gsuite.google.com/, with your domain email credentials.
2. Enter your business name, the number of employees, and your country, and click **Next**.
3. Enter the administrator contact name, email address and business phone number, and click **Next**.
4. Enter the domain associated with this spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Provide the user name and password for your domain.
6. Add users to the G Suite account.
7. Verify your domain and email address.
   Users must create their own logins by navigating to the Google documentation.
8. Register a new custom application.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your G Suite administrator credentials.
9. Search for the Google Drive API and enable it.
10. Create a Credentials application and save the Client ID and Client secret.
    The Client Secret is only displayed in plain text for a short time. Copy the Client ID and the Client Secret to a text file so that you can use them when you Configure the Google Drive connection.

Configure the Google Drive connection

Use the information generated during Google Drive account configuration to register the Google Drive application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin.

Procedure

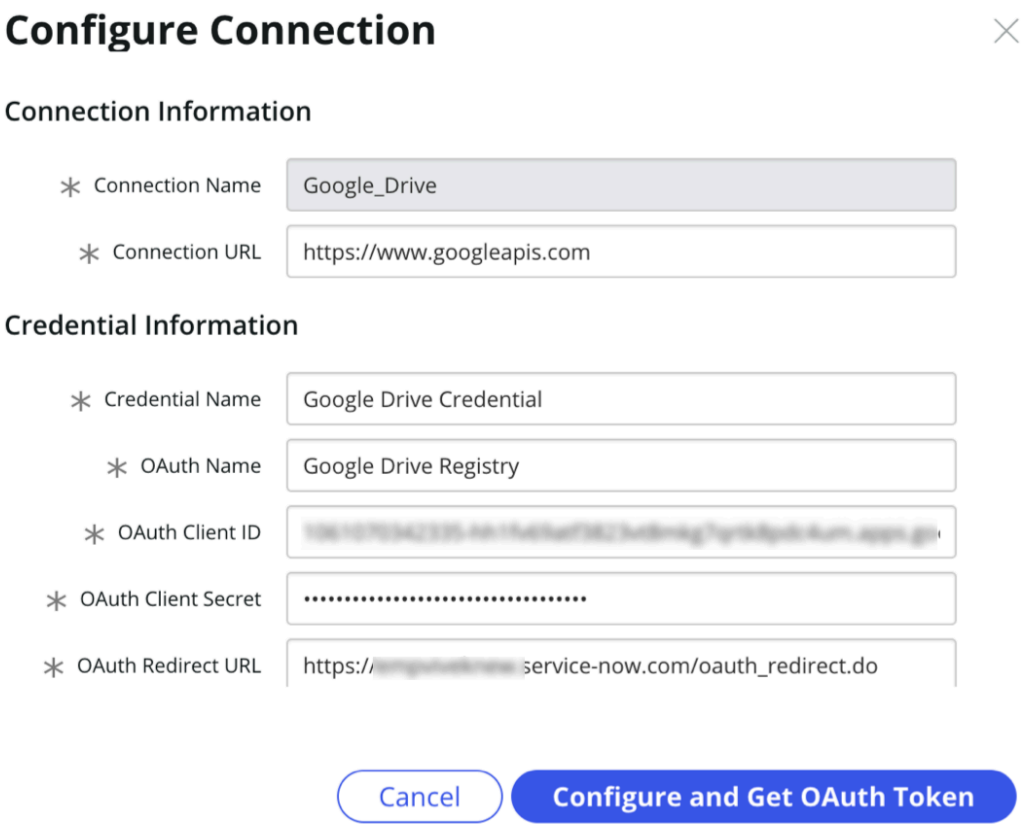
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Click the **Connections** tab.
3. Toggle and enable the **Outbound** connections.
4. Locate the **Google Drive** connection alias and click **View Details**.
   - To configure the default connection and credential alias record that is shipped along with the Google Drive spoke, click **View Details**.
   - To manage more than one Google Drive spoke connection records, you should create a new child alias record by clicking **Add Connection**. For more information about using multiple connections, see Supporting multiple connections.

   If you are configuring the spoke for the first time, click **Configure**. Otherwise, click **Edit**.
5. On the form, fill in the fields.

Field	Description
Connection Information	
Connection Name	Name to identify the connection record.
Connection URL	Enter the URL `https://www.googleapis.com/`.
Credential Information	
Credential Name	Name to identify the credential record.
OAuth Name	Name to identify the application registry record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Client ID	Client ID of the Google Drive application you created in G Suite.
OAuth Client Secret	Client Secret you generated when you created the application in G Suite.
OAuth Redirect URL	ServiceNow instance URL in this format: `https://<Instance-Name>.service-now.com/oauth_redirect.do`



6. Click **Configure and Get OAuth Token**.

Google Identity and Access Spoke

Manage folders, projects, roles, and service accounts in Google Identity and Access Management and Google Resource Manager.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke version

Google Identity and Access spoke v1.1.1 is the latest version. For version history of the spoke, see Google Identity And Access spoke release notes.

Supported Versions

This spoke was built for API version v2 only Folder Management category and v1 for other categories, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Workflow Studio - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Spoke requirements

Google Cloud Platform account.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Google Identity and Access spoke provides actions to automate Google Identity and Access Management and Google Resource Manager tasks when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available actions include:

Spoke actions

Category	Action	Description	Required Permission
Folder Management	Create Folder	Creates a folder.	resourcemanager.folders.create
	Delete Folder	Deletes a folder.	resourcemanager.folders.delete
	Look up Child Folder	Retrieves the information of a child folder.	resourcemanager.folders.get
	Look up Folders	Retrieves the list of folders.	resourcemanager.folders.list
	Rename Folder	Renames the specified folder.	resourcemanager.folders.update

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Required Permission
	Restore Folder	Restores the specified folder.	resourcemanager.folders.undelete
Organization Management	Look up Organization by Organization ID	Retrieves details of the specified organization.	resourcemanager.organizations.get
Project Management	Create Project	Creates a project.	resourcemanager.projects.create
	Delete Project	Deletes the specified project.	resourcemanager.projects.delete
	Look up Project by Project ID	Retrieves details of the specified project.	resourcemanager.projects.get
	Look up Projects	Retrieves the list of projects.	resourcemanager.projects.list
	Look up Projects Stream	Retrieves the list of projects as a complex object.	resourcemanager.projects.list
	Rename Project	Renames the specified project.	resourcemanager.projects.update
	Restore Project	Restores the specified project.	resourcemanager.projects.undelete
Role Management	Create Role For Organization	Creates a custom role for an organization.	iam.roles.create
	Create Role For Project	Creates a custom role for the specified project.	iam.roles.create
	Delete Role For Organization	Deletes a custom role for the specified organization.	iam.roles.delete
	Delete Role For Project	Deletes a custom role for the specified project.	iam.roles.delete
	Look up Role for Organization	Retrieves details of the custom role for the specified organization.	iam.roles.get
	Look up Role For Project	Retrieves details of the custom role for the specified project.	iam.roles.get
	Look up Roles in Organization by Organization ID	Retrieves the list of custom roles for the specified organization.	iam.roles.list
	Look up Roles in Organization Stream	Retrieves the list of custom roles for the	iam.roles.list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions (continued)

Category	Action	Description	Required Permission
		specified organization as a complex object.	
	Look up Roles in Project by Project ID	Retrieves the list of custom roles for the specified project.	iam.roles.list
	Look up Roles in Project Stream	Retrieves the list of custom roles in given project ID.	iam.roles.list
	Restore Role For Organization	Restores the specified custom role for an organization.	iam.roles.undelete
	Restore Role For Project	Restores the specified custom role for a project.	iam.roles.undelete
Service Account Management	Look up Service Account	Retrieves the details of the specified service account.	iam.serviceAccounts.get
	Look up Service Accounts by Project ID	Retrieves the list of service accounts in a project.	iam.serviceAccounts.list

For more information about the required permissions, see IAM permissions reference.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Identity and Access Spoke.

Set up the Google Identity and Access Spoke

Integrate the ServiceNow instance and Google Identity and Access spoke by using Google Cloud Platform credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Identity and Access spoke.
- Role required: admin.

Configure the Google Identity and Access application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Identity and Access spoke.

Before you begin

Google Identity and Access integration requirements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Google Cloud Platform account.
- Role required: admin.

About this task

Complete these steps from the Google Cloud Platform.

Procedure

1. Register a new custom application and open it.
   a. Navigate to https://console.developers.google.com.
   b. Create a project with your Google Cloud Platform administrator credentials.
   c. Open the project.
2. Provide the OAuth authorized domain name.
   a. From the APIs & Services menu, select **OAuth consent screen**.
   b. Enter the application name.
   c. Specify the Authorized domain `service-now.com`.
   d. Click **Save**.
3. Create the credentials.
   a. From the APIs & Services menu, select **Credentials**.
   b. Select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. Copy your client ID and client secret to a text file so that you can use them when you Register Google Identity and Access as an OAuth provider.

> **Tip:** You can always access the client ID and secret in the Google APIs & Services interface by clicking **Credentials** and selecting the OAuth 2.0 client ID name.

Register Google Identity and Access as an OAuth provider

Use the information generated during Google Identity and Access account configuration to register the Google Identity and Access application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. In ServiceNow instance, navigate to **System OAuth** > **Application Registry**.
2. Open the record, **Google cloud platform**.
3. On the form, fill these fields:

Field	Description
Name	Name to uniquely identify the record, for example `Google Identity and Access`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client ID	Client ID of the Google Identity and Access application.
Client Secret	Client Secret you generated when you create the application.
OAuth API Script	Script to customize the request and response. Select `OAuthGoogleIAMUtil`.
Default Grant type	Grant type used to establish the token. Select **Authorization Code**.
Authorization URL	OAuth authorization code endpoint. Enter `https://accounts.google.com/o/oauth2/v2/auth`.
Token URL	OAuth server token endpoint. Enter `https://oauth2.googleapis.com/token`.
Redirect URL	URL of the ServiceNow instance in this format: `https://<instance>.service-now.com/oauth_redirect.do`.

4. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

Create Credential record for the Google Identity and Access spoke

Create Credential records to connect the Google Identity and Access custom OAuth application you created during account configuration. The Google Identity and Access spoke connection and credential aliases use these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, `GCPIAM Cred`.
4. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Identity and Access service as an OAuth provider.
5. Click **Get Oauth Token**.

Google Meet Spoke

Set up a flow and complete various actions on Google Meet after integrating your ServiceNow instance with the Google Meet account. For example, you can set up a meeting space or end an active conference as part of the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Meet spoke v1.2.1 is the latest spoke version. For version history of the spoke, see Google Meet Spoke release notes.

Supported versions

This spoke was built for Google Meet API v2, but may be compatible with later versions.

Spoke requirements

- Google Meet API access
- Google Meet Cloud console access

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Meet provides actions to automate Google Meet tasks when events occurs in your ServiceNow instance. Available actions include:

Category	Action	Description	Required Scopes (at least one scope is required)
Conference Management	Look up Conference	Retrieve a details of conference record associated with a specific Google Meet space.	• https://www.googleapis.com/auth/meetings.space.readonly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
			• https://www.googleapis.com/auth/meetings.space.created
	Look up Conferences Stream	Retrieves a list of conference records, which can be filtered optionally and limited by a specified page size.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
Space Management	Create Meeting Space (Conversational-ready)	Creates a Google Meet space and shares the link for participants to join and collaborate.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	End Active Conference	Ends the active Google Meet session, disconnecting all participants and concluding the meeting.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Meeting Space	Retrieves conference record details, including the configuration and current conference status for a specific Google Meet space.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Update Meeting Space (Conversational-ready)	Updates the settings of an existing Google Meet space.	https://www.googleapis.com/auth/meetings.space.created

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
Participant Management	Look up Participant	Retrieves details of a participant in a Google Meet conference.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Participant Session	Retrieves the details of a specific session, including session start and end times, in a Google Meet conference.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Participants Stream	Retrieves a paginated list of participants in a specified Google Meet conference, with optional filtering.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Participant Sessions Stream	Retrieves a paginated stream of sessions for a specific participant in a Google Meet conference.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
Artifacts Management	Look up Recording	Retrieves the details of a Google Meet recording, including its state, timestamps, and Google Drive location.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Required Scopes (at least one scope is required)
	Look up Recordings Stream	Retrieves a paginated list of recordings for a specific Google Meet conference, including recording status, timestamps, and Google Drive location.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Transcript	Retrieves the details of a Google Meet transcript, including its state, timestamps, and document location in Google Docs.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Transcript Entry	Retrieves a specific transcript entry from a Google Meet conference, including its content, speaker details, and timestamp.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Transcripts Stream	Retrieves a paginated list of transcripts for a specific Google Meet conference, including transcript status, timestamps, and the document location in Google Docs.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created
	Look up Transcript Entries Stream	Retrieves a list of transcript entries for a specific Google Meet conference, including details like participant, transcript text, language, and timestamps.	• https://www.googleapis.com/auth/meetings.space.readonly • https://www.googleapis.com/auth/meetings.space.created

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
Google Meet artifacts management AI agent	Automates tasks such as retrieving recordings, transcripts, and other meeting-related data, making it easier to organize and utilize meeting resources effectively.
Google Meet participant management AI agent	Automates tasks such as looking up participant details, retrieving participant session streams, and accessing session-specific information.
Google Meet conference management AI agent	Automates tasks such as look up conference details, retrieve live conference streams, and manage meeting spaces and participants.
Google Meet space management AI agent	Automates tasks such as creating and updating meeting spaces, ending active conferences, and retrieving information about existing meeting spaces.

Available conversational actions

Install Now Assist for Conversational Spokes and start using the conversational ability of Integration Hub spokes. For more information, see Now Assist in Conversational Spokes.

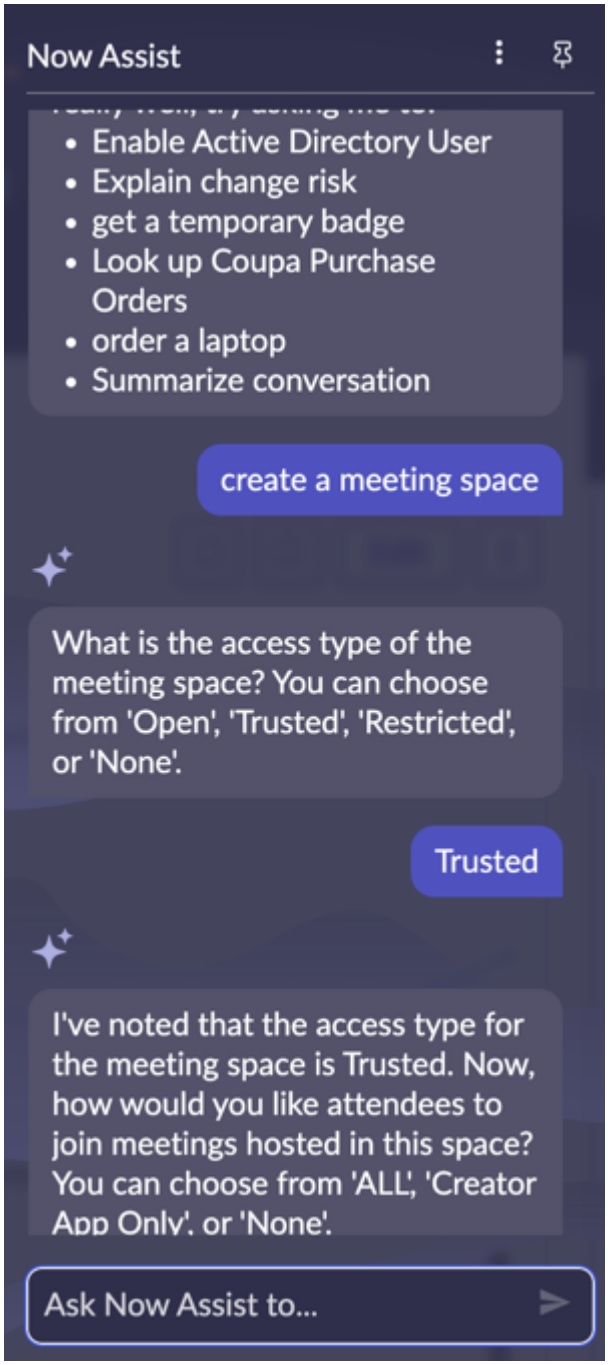
Supported actions

Action	Usage
Create Meeting Space	In the Ask Now Assist to... field, enter the phrase that asks Now Assist to perform the action and press **Enter**. For example, `Create a meeting space`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported actions (continued)

Action	Usage
Update Meeting Space	In the Ask Now Assist to... field, enter the phrase that asks Now Assist to perform the action and press **Enter**. For example, `Update a meeting space`.



Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't

need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Meet spoke.

Set up the Google Meet spoke

Integrate the ServiceNow instance and Google Meet by creating a custom OAuth application in the Google Cloud console to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Meet spoke.
- Role required: admin.

Create OAuth credentials for Google Meet API

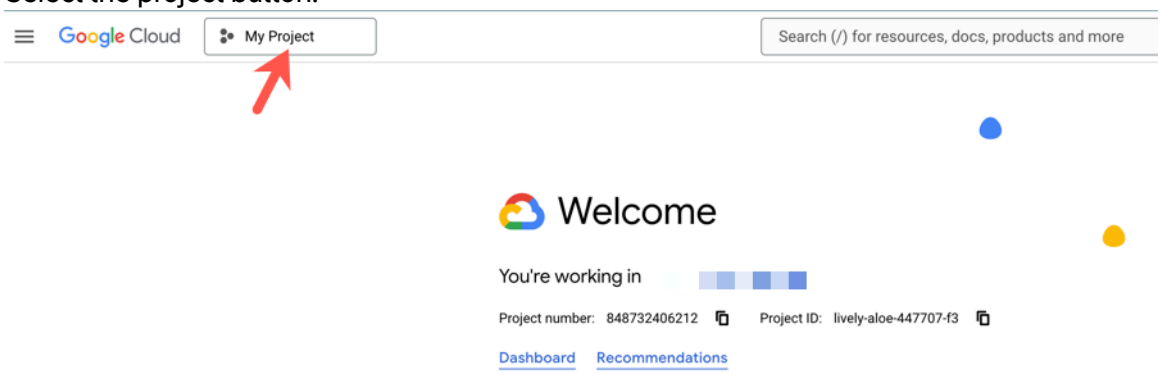
Create OAuth credentials that your ServiceNow instance uses to have its requests for connection authenticated by Google Cloud console.

Before you begin

Role required: admin

Procedure

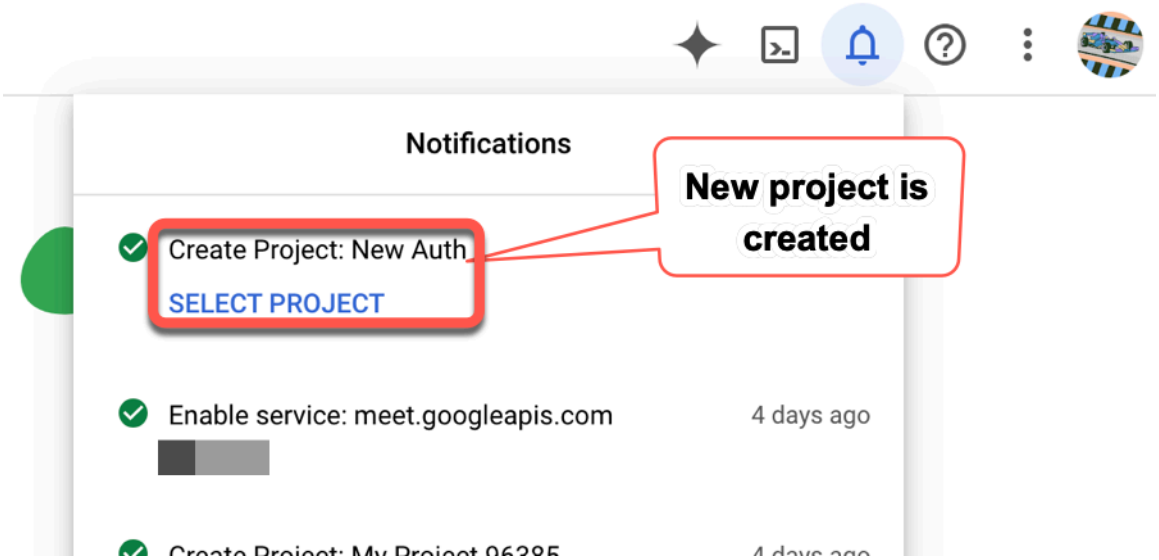
1. Log in to the Google Cloud console.
2. Select the project button.



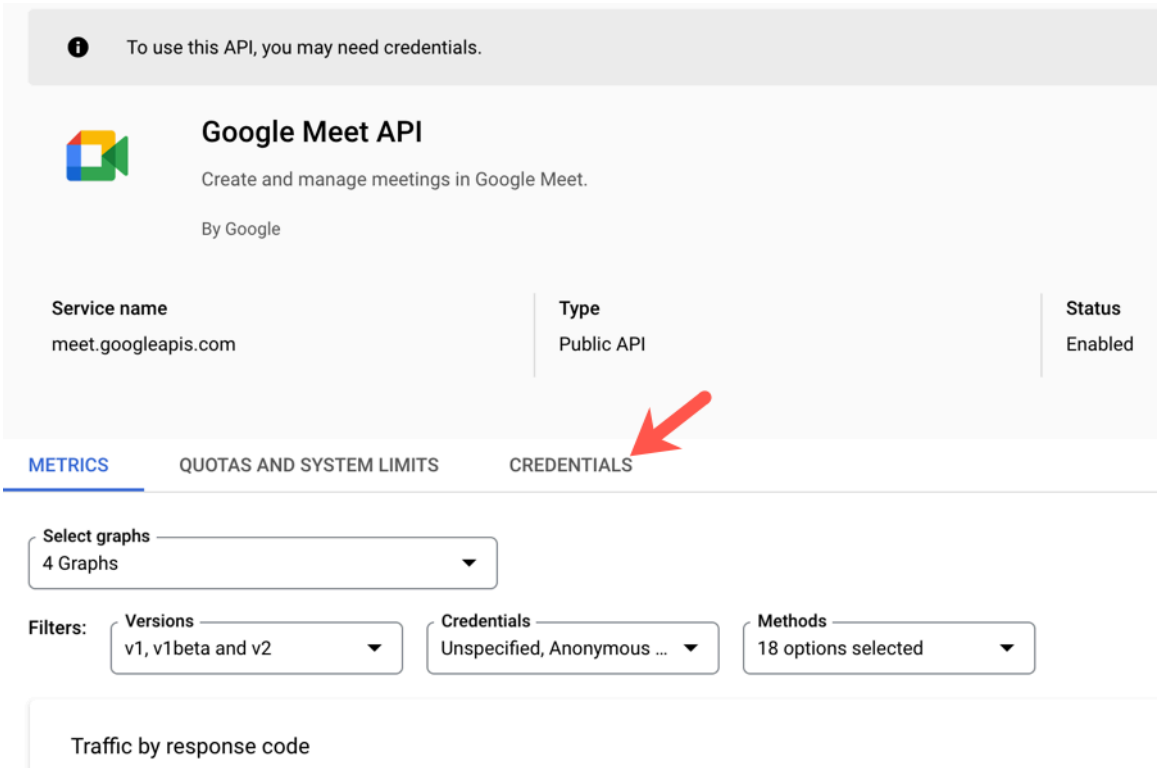
3. On the Select a project window, select **NEW PROJECT**.
4. Set up the new project.
   a. In the Project name field, enter the project name.
   b. In the Location field, select **BROWSE** to select an organization.
   c. Select **CREATE**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notifications show that the project is created.

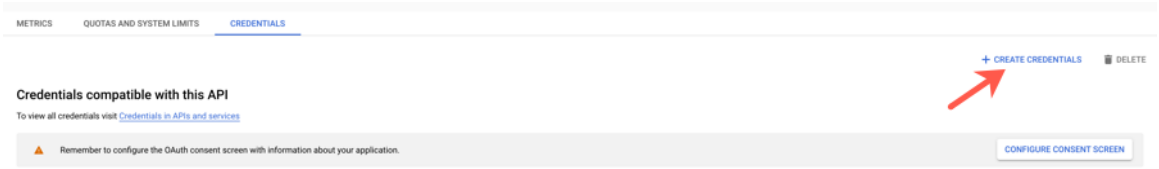


5. Select **SELECT PROJECT**.
6. Navigate to **Navigation Menu** > **APIs & Services** > **Enabled APIs & Services**.
7. Select **+ENABLE APIS AND SERVICES**.
8. In the Search for APIs and services field, enter `Google Meet REST API` and press **Enter**.
9. Select **Google Meet REST API**.
10. Select **ENABLE**.
11. Select the **CREDENTIALS** tab.



12. Select **+ CREATE CREDENTIALS** and then select **OAuth client ID.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



13. Select **CONFIGURE CONSENT SCREEN**.

> **Note:** Refresh token expires in 7 days when a Google Cloud Platform project with an OAuth consent screen is configured for an external user type and its publishing status is **Testing**. To get new OAuth, click **Edit and Get OAuth Token** by navigating to the associated connection.

14. Select **Internal**.
15. Select **CREATE**.
16. Fill the form.

OAuth application details

Field	Description
App name	Option to provide a name of the OAuth application that you're creating.
User support email	Option to provide the email ID that the users of the OAuth application can use to request support.
Developer contact information	Option to provide the email ID of the developer of the OAuth application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1 **OAuth consent screen** — 2 Scopes — 3 Test users — 4 Summary

OAuth consent screen management is changing. This page has been replaced with a new, easier-to-use experience. The current pages will only be available for a few more days.

GO TO NEW EXPERIENCE

App information

This shows in the consent screen, and helps end users know who you are and contact you

App name *

The name of the app asking for consent

User support email *

For users to contact you with questions about their consent. Learn more

App logo

This is your logo. It helps people to recognise your app and is displayed on the OAuth consent screen.
After you upload a logo, you will need to submit your app for verification unless the app is configured for internal use only or has a publishing status of 'Testing'. Learn more

Logo file to upload BROWSE

Upload an image, not larger than 1 MB on the consent screen that will help users recognise your app. Allowed image formats are JPG, PNG and BMP. Logos should be square and 120px by 120px for the best results.

App domain

To protect you and your users, Google only allows apps using OAuth to use Authorised Domains. The following information will be shown to your users on the consent screen.

Application home page

Provide users a link to your home page

Application privacy policy link

Provide users a link to your public privacy policy

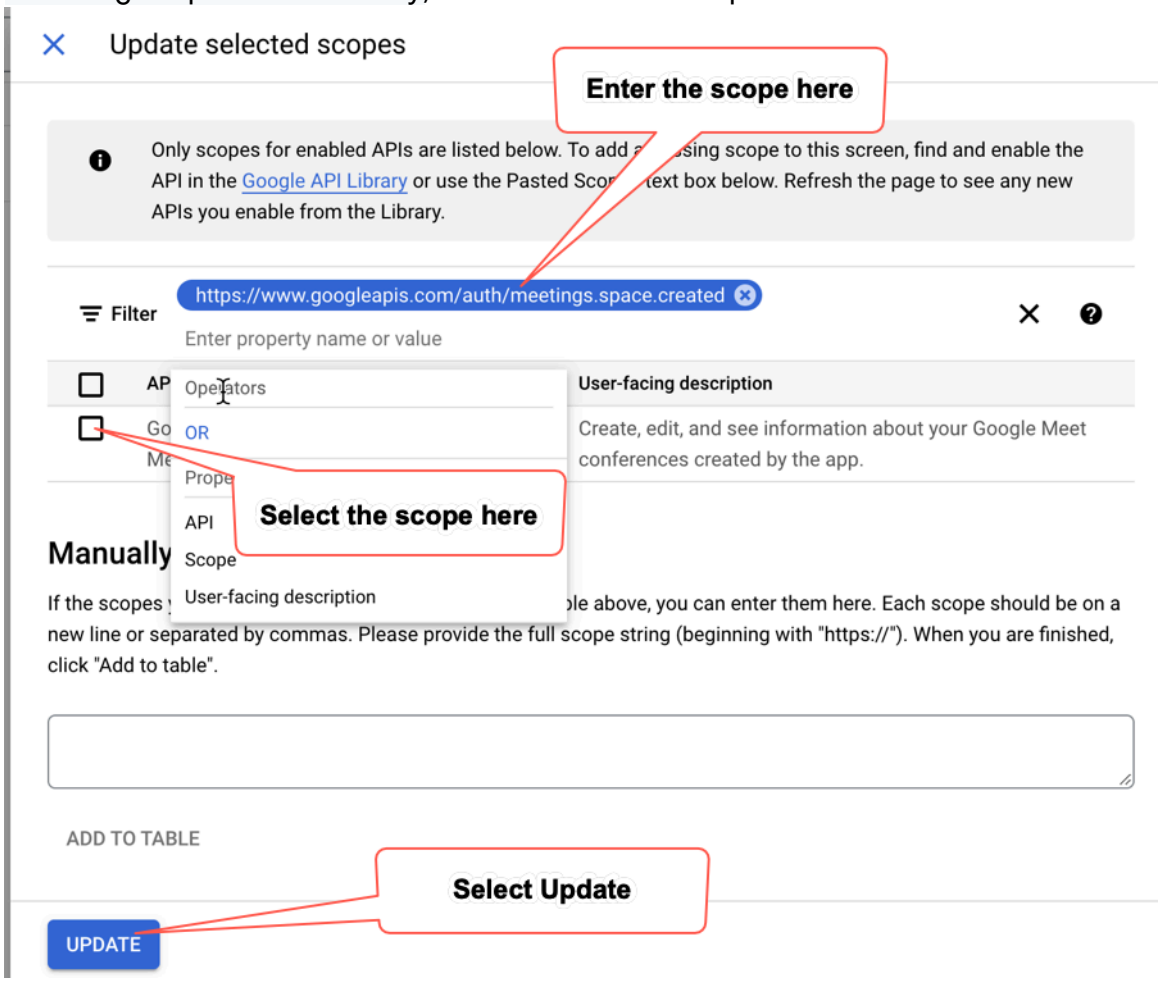
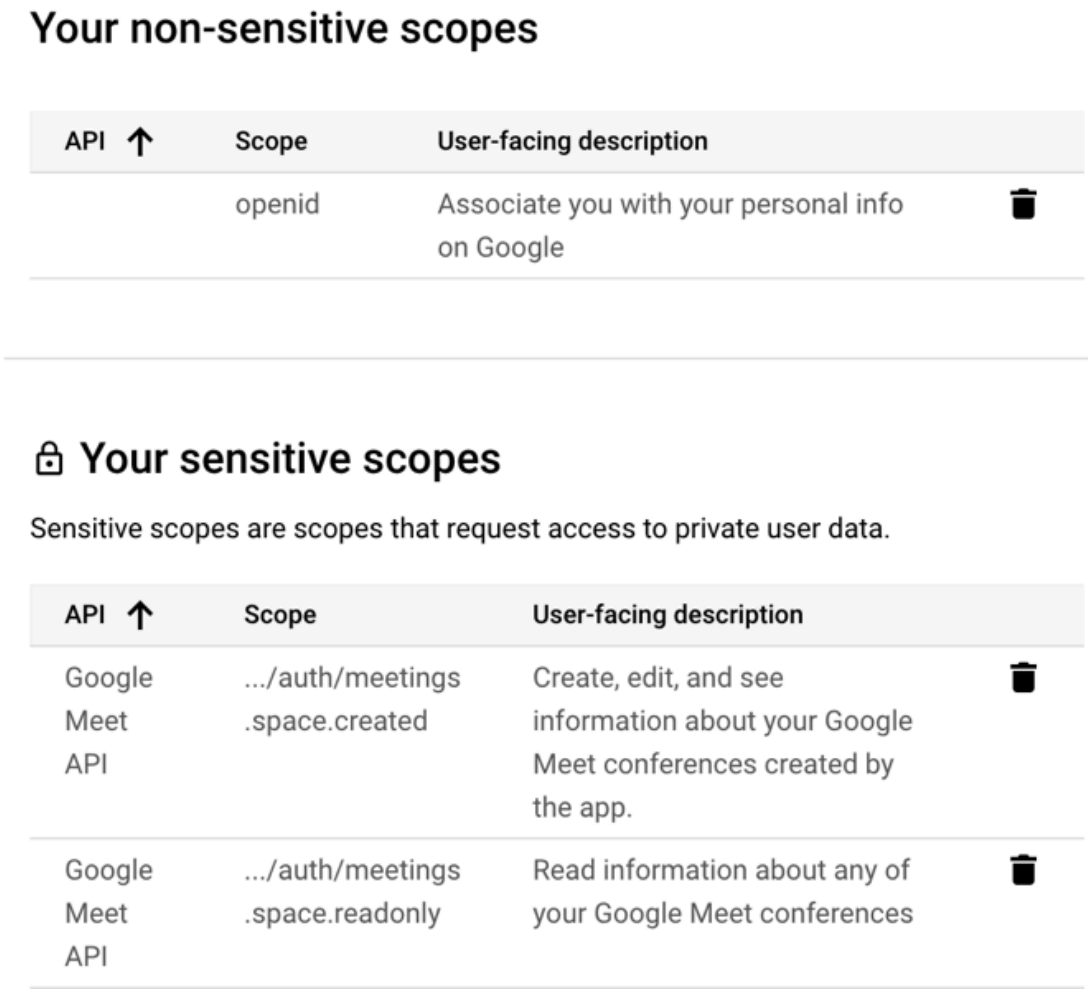
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

17. Select **SAVE AND CONTINUE**.
18. Select **ADD OR REMOVE SCOPES**.
19. In the Filter field, enter the scope `meetings.space.created`, `openid`, and `meetings.space.readonly`, and then select the scope value.



20. Select **UPDATE**.
    The scopes appear under the Your non-sensitive scopes and Your sensitive scopes sections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



21. Select **SAVE AND CONTINUE**.
22. On the left panel, select **Credentials**.
23. Navigate to **+CREATE CREDENTIALS OAuth client ID**.
24. In the Application type field, select **Web application**.
25. In the Name field, enter a name of the application.
26. Under the Authorized redirect URIs, select **+ADD URI**.
27. In the URI1 field, enter the redirect URL in the format `https://<your-instance-name>.service-now.com/oauth_redirect.do`.
28. Select **CREATE**.
29. Copy the client ID and client secret and store at secure place.

© 2026 ServiceNow, Inc. All rights reserved.

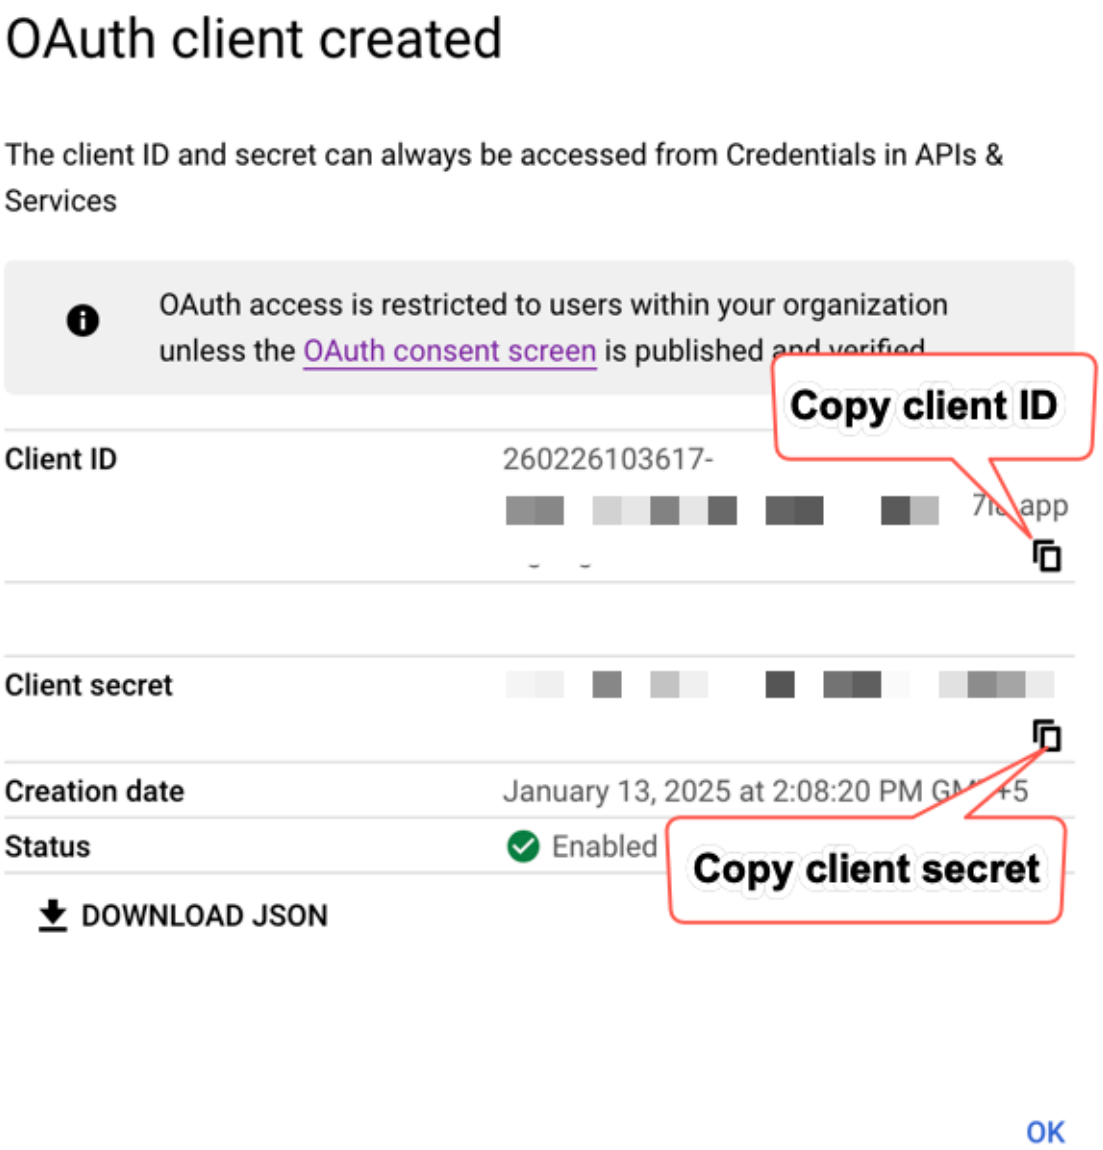
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



30. Select **OK**.

Configure connection for Google Meet spoke

Set up the connection between your ServiceNow instance and the Google Meet APIs.

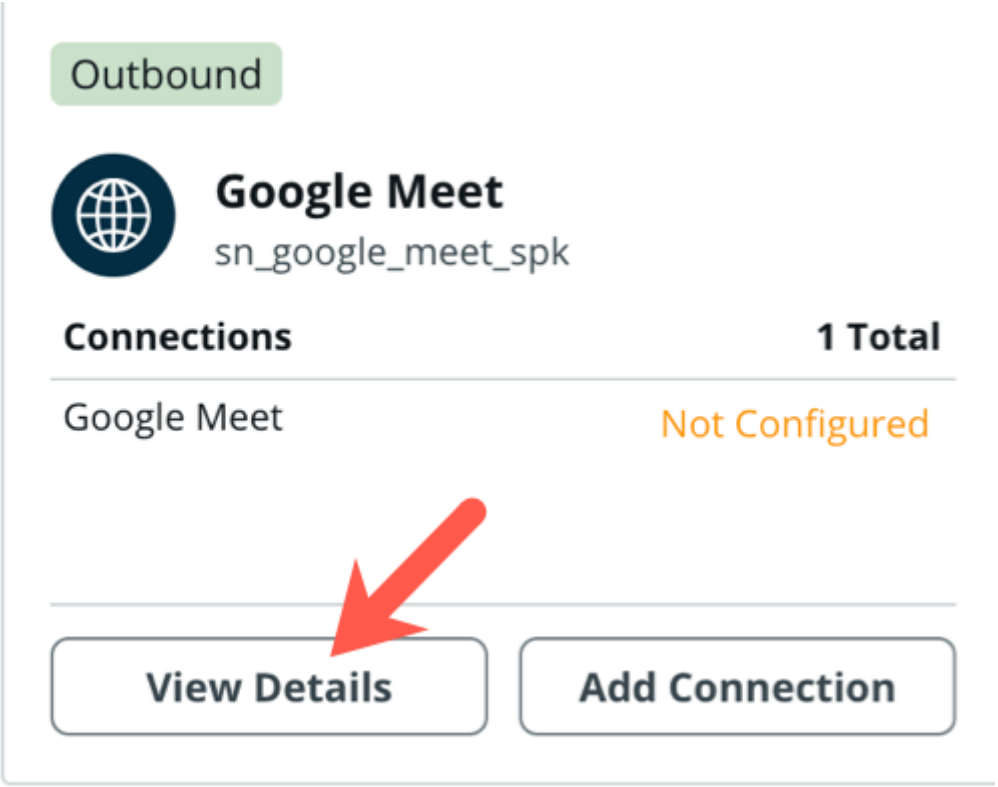
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the **Integrations** tab.
3. Confirm that the **Outbound** tab is selected.
4. In the Search all connections field, enter `Google Meet`.
5. On the Google Meet tile, select **View Details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

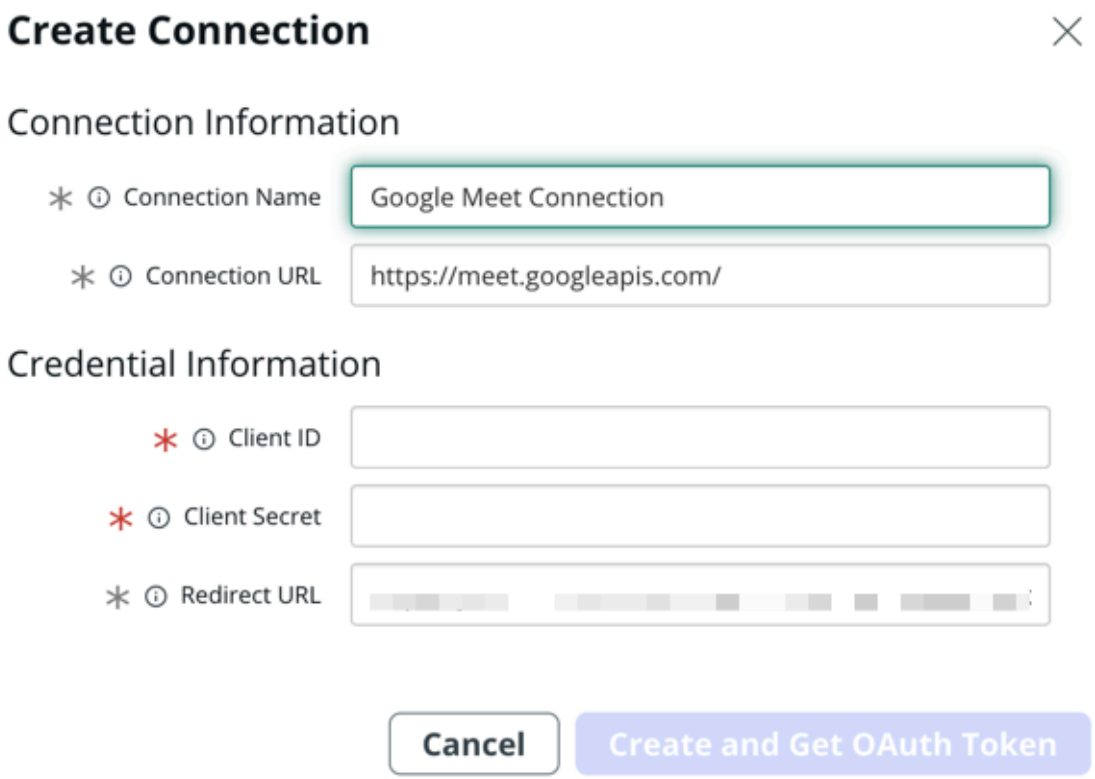


6. Select **Configure**.
7. Fill the form.

Create Connection for Google Meet spoke

Field	Description
Connection name	Name that uniquely identifies the connection record.
Connection URL	URL to Google Meet APIs. Enter `https://meet.googleapis.com`.
Client ID	OAuth client ID of the Google Meet OAuth app that you had created in the Google Cloud console.
Client Secret	OAuth client secret of the Google Meet OAuth app that you had created in the Google Cloud console.
Redirect URL	OAuth redirect URL of your ServiceNow instance. Enter in this format `https://<your-instance-name>.service.now.com/oauth_redirect.do`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select **Create and Get OAuth Token**.
   You must log in to the Google Cloud console to fetch the OAuth token.

Google Persistent Disk Spoke

Manage disks, snapshots, and images in Google Persistent Disk from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Persistent Disk spoke v1.0.2 is the latest version. For version history of the spoke, see Google Persistent Disk spoke release notes.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Cloud Virtual Network Spoke (sn_gcp_vpc_spoke)
- Google Compute Engine Spoke (sn_gcompute_spoke)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Google Persistent Disk account requirements

The Google Persistent Disk spoke requires a custom app that you create in the Google Cloud Platform.

Spoke actions

The Google Persistent Disk spoke provides actions to automate Google Persistent Disk when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

Category	Action	Description	Permissions Required
Disk Management	Create Disk	Creates a persistent disk in the specified project.	compute.disks.create
	Delete Disk	Deletes the specified persistent disk.	compute.disks.delete
	Get Disk	Retrieves details of the specified persistent disk.	compute.disks.get
	Get Disk Type by Zone	Retrieves the details of the specified disk type by zone.	compute.diskTypes.get
	Resize Disk	Resizes the specified persistent disk.	compute.disks.resize
Image Management	Create Image for Disk	Creates an image in the specified project.	compute.images.create
	Create Image for Image	Creates an image in the specified project.	compute.images.create
	Create Image for Snapshot	Creates an image in the specified project.	compute.images.create

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description	Permissions Required
	Delete Image	Deletes the specified image.	compute.images.delete
	Get Image	Retrieves details of the specified image.	compute.images.get
Metadata Retrieval Management	List Disk Types by Zone	Retrieves a list of disk types available to the specified project.	compute.diskTypes.list
	List Disks	Retrieves a list of persistent disks contained within the specified zone.	compute.disks.list
	List Images	Retrieves the list of images available to the specified project.	compute.images.list
	List Snapshots	Retrieves the list of snapshot resources contained within the specified project.	compute.snapshots.list
Snapshot Management	Create Snapshot	Creates a snapshot of a specified persistent disk.	compute.snapshots.create
	Delete Snapshot	Deletes the specified snapshot resource.	compute.snapshots.delete
	Get Snapshot	Retrieves details of the specified snapshot.	compute.snapshots.get

For more information about the required permissions, see IAM permissions reference.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Persistent Disk spoke.

Set up the Google Persistent Disk spoke

Integrate the ServiceNow instance and Google Persistent Disk spoke by using G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Persistent Disk spoke.
- Activate and set up the Google Compute Engine Spoke.
- Role required: admin.

Procedure

1. Navigate to **All** > **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Open record for the Google Compute Engine spoke. For example, `Google Compute Cred`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. For **Credential alias**, select the Connection and Credential alias record of the Google Persistent Disk spoke.
4. Right-click the form header and click **Save**.
5. Click **Get Oauth Token**.

Google Sheets Spoke

Manage spreadsheets in Google Sheets from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Google Sheets spoke v1.0.7 is the latest version. For version history of the spoke, see Google Sheets spoke release notes.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require an appropriate license if used outside the spoke implementation. For information on licenses, contact your account manager.

Supported versions

This spoke was built for Google Sheets v4, but may be compatible with later versions.

Spoke requirements

Google Cloud Platform account.

Spoke actions

The Google Sheets spoke provides actions to automate Google Sheets tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Sheet Management	Add Row	Adds a row with the specified values to a sheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Clear Cells	Clears the values in the sheet for the specified range.
	Copy Sheet	Copies a sheet from a spreadsheet to another spreadsheet.
	Create Sheet	Creates a sheet in the specified spreadsheet.
	Delete Sheet	Deletes a sheet in the spreadsheet.
	Get Cell Values	Retrieves the values in the sheet for the specified range.
	Update Cells	Updates a range of cell values in a sheet.
Spreadsheet Management	Get Spreadsheet Details	Retrieves details about the specified spreadsheet.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the Google Sheet spoke.

Set up the Google Sheet spoke

Set up an outbound integration between your ServiceNow instance and the Google Sheets by setting up a connection and credential record.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Sheets spoke plugin.
- Role required: admin.

About this task

The Google Sheets API authenticates the requests from your ServiceNow instance through an OAuth application. You must Set up OAuth app on Google Sheets API by visiting the https://console.developers.google.com/. The connection and credentials record contains the information the Google Sheets API must authenticate the requests from your ServiceNow instance.

Set up OAuth app on Google Sheets API

Set up an OAuth application on the Google Sheets API to enable authentication of requests from your ServiceNow instance.

Before you begin

- Create a business account on https://console.developers.google.com/
- Create a domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can only register one email address per domain in Google Workspace.

- Role required: admin

Procedure

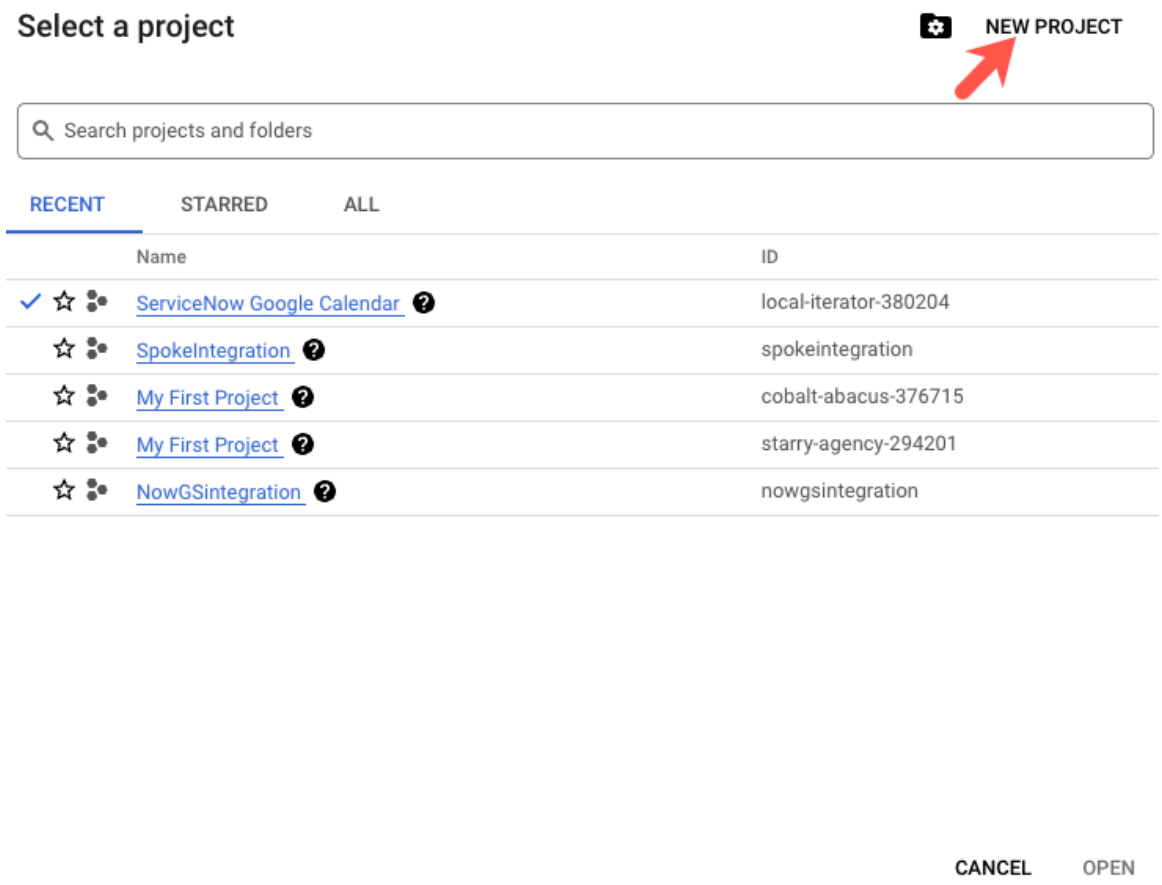
1. Set up a project on the Google Workspace.
   The project includes the details of the OAuth application and the Application Programming Interface (API) permissions, if applicable.

   a. Log in to https://console.developers.google.com/ with the same domain email ID and password as mentioned in the prerequisites.

   b. Select the button.

   c. Select **NEW PROJECT**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

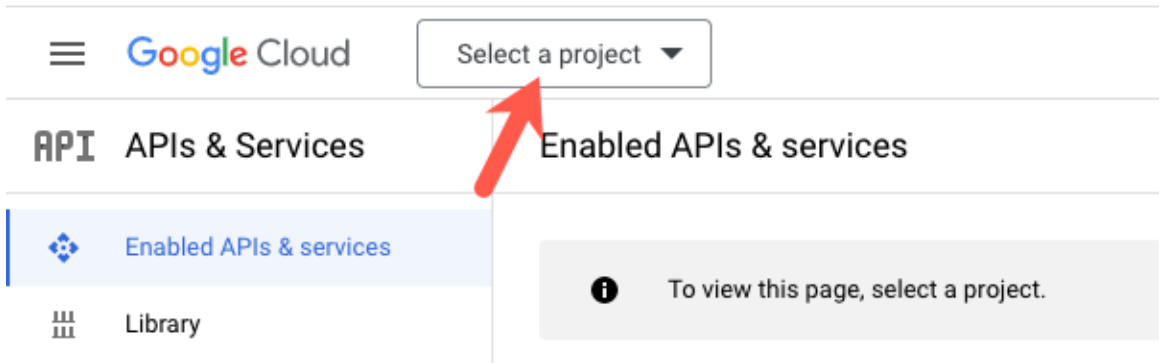


d. In the Project name* field, enter a unique name for the project.

e. In the Location* field, select **BROWSE** to select an organization.

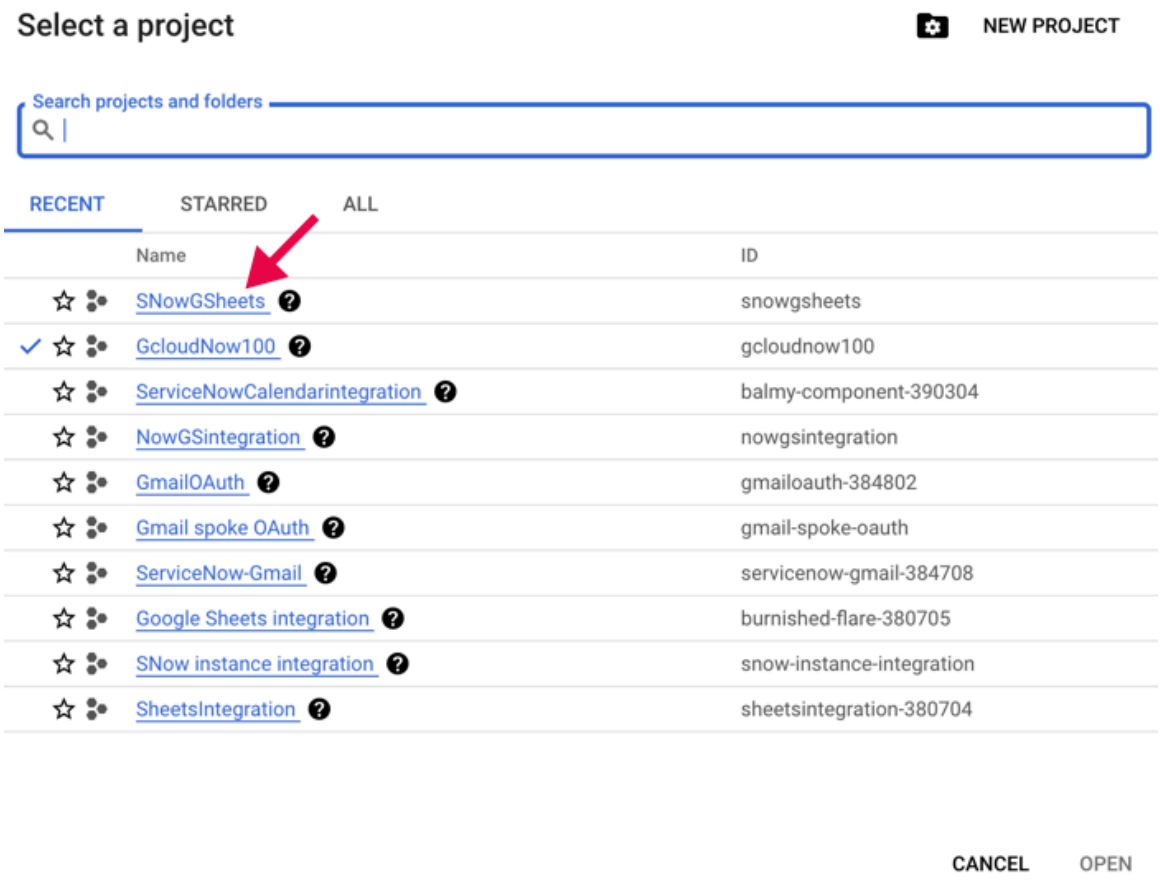
f. Select **CREATE**.
The project is created.

g. Select the button.



2. Select the project that you created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Enable the Google Sheets API.

   a. Click **+ENABLE APIS AND SERVICES**.

   b. On the Welcome to the API Library page, enter `Google Sheets` in the search box.

   c. Press **Enter**.

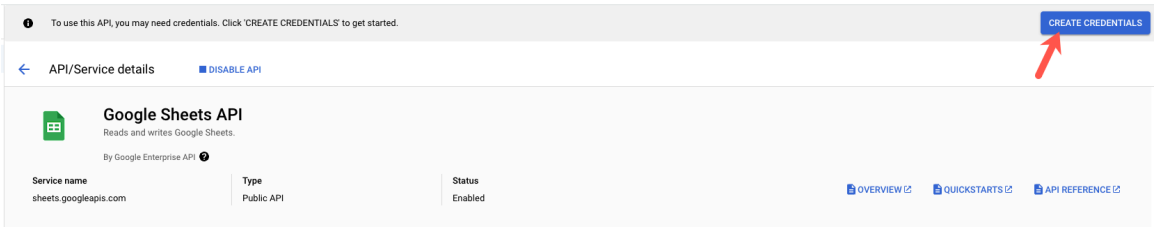
   d. Select the Google Sheets API button.

   e. Select **ENABLE**.
   The Google Sheets APIs are enabled on your project.

4. Create the OAuth app and credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **CREATE CREDENTIALS**.



b. Fill the form.

Google Sheets API credentials

Field	Description
Select an API*	Name of the API for which you're creating the credentials. **Note:** Ensure that you select Google Sheets API.
What data will you be accessing? *	Type of data your ServiceNow will access through the APIs. **Tip:** Select User data.

c. Click **NEXT**.

d. Fill the form.

Google Sheets API credentials

Field	Description	Mandatory?
App name	Name of the OAuth app.	Yes
User support email	Email at which users can send queries to you about their consent.	Yes
Logo file to upload	Logo representing the OAuth app.	No
Developer contact information	Google will contact the developer of the OAuth app if there are any changes to the project.	Yes

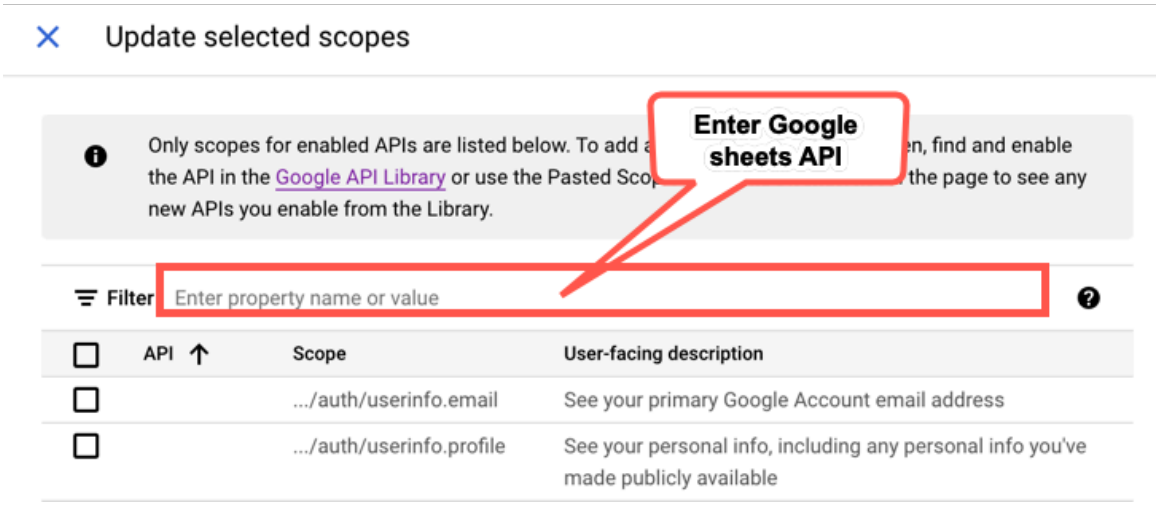
e. Click **SAVE AND CONTINUE**.

5. **Optional:** Define the API scopes.
   API scopes enable you to select specific APIs. For example, /auth/spreadsheets scope enables you to create, edit, or remove spreadsheets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click **ADD OR REMOVE SCOPES**.

b. Enter `Google sheets API`, as shown in the image.



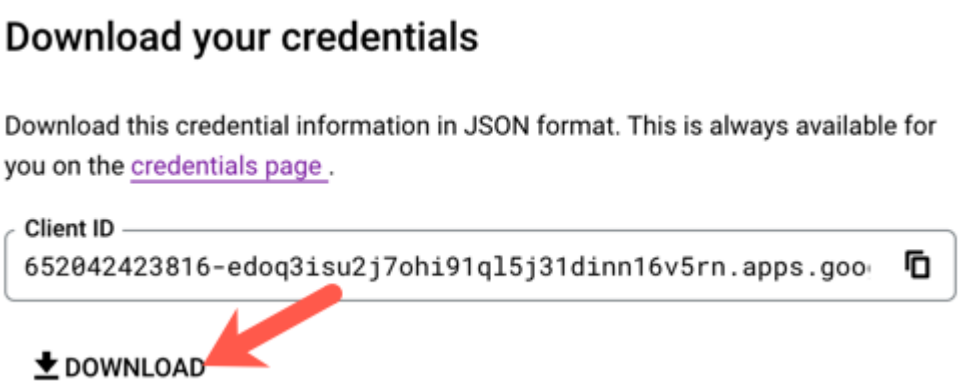
c. Select one or more scopes.

d. Click **UPDATE**.

e. Click **SAVE AND CONTINUE**.

6. Generate OAuth client ID.
   a. From the Application type* list, select `Web application`.
   b. In the Name* field, enter a unique name of the OAuth client.
7. Under the Authorised redirect URIs heading, click **+ ADD URI**.
8. In the URI field, enter the redirect URI in the following format: `https://instance.service-now.com/oauth_redirect.do`.
9. Click **CREATE**.
   The OAuth details are generated in a JSON file.

   Tip: Click DOWNLOAD to download the JSON file for later reference.



10. Click **DONE**.
    You've created the OAuth application on Google Workspace.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Connection and Credential record for Google Sheets spoke

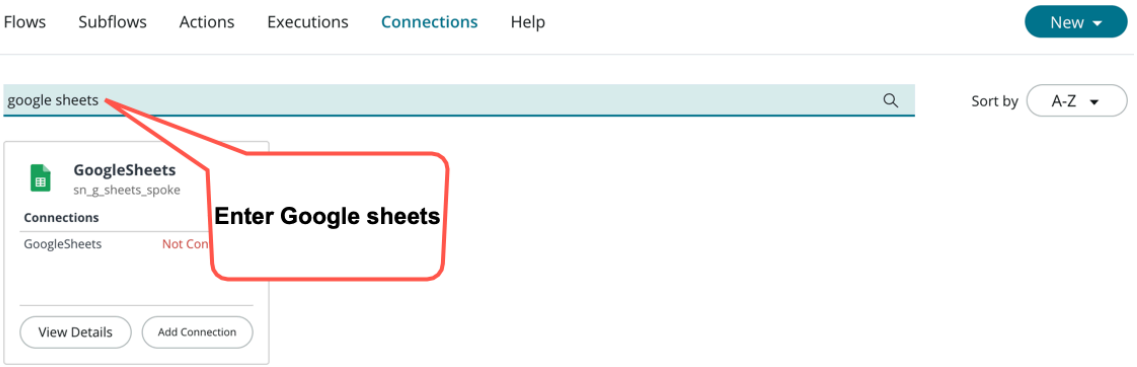
Create a connection and credential record that contains the details required to connect to the Google Sheets Application Programming Interfaces (API) on the Google Workspace.

Before you begin

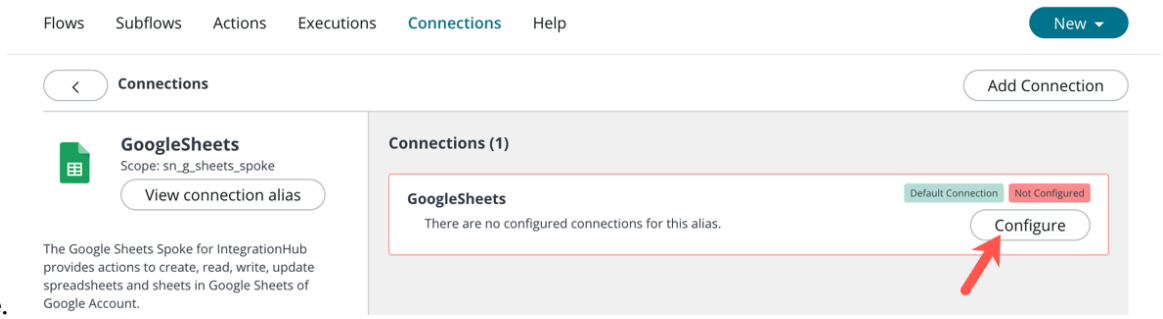
- Create an OAuth application for the Google Sheets APIs in the Google Workspace. To learn how to create an OAuth application, see Set up OAuth app on Google Sheets API.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Click Connections.
3. In the Search all connections field, enter `Google sheets`.



4. On the GoogleSheets card, click **View Details**.
5. Click **Configure**, as shown in the image.



6. Fill the form.

Configure Connection

Field	Description
Connection Name	Name of the connection. **Note:** The field is read-only.
Connection URL	The URL used for connecting to Google Sheets APIs. This field is automatically set to `https://sheets.googleapis.com/v4/spreadsheets`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential Name	Name of the credential. This field is automatically set to `Google Sheets Spoke Credential`.
OAuth Entity Name	Name of the OAuth entity profile. This field is automatically set to `Google Sheets Spoke OAuth`.
OAuth Client ID	Client ID of the Google Sheets application you registered in G Suite.
OAuth Client Secret	Client Secret generated when you registered the application in Google API Console.
OAuth Redirect URL	The redirect URL. The format of the URL is `https://<your-instance>.service-now.com/oauth_redirect.do`

7. Click **Create and Get OAuth Token**.

Google Tasks Spoke

Manage Google tasks and list from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Supported versions

API version v1.

Spoke version

Google Tasks spoke v1.4.0 is the latest version. For version history of the spoke, see Google Tasks spoke release notes.

Spoke subflows

The Google Tasks spoke provides sample subflows in the draft state to demonstrate automating Google Tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

Subflow	Description
Move a ServiceNow attachment to Google Tasks	Copies an attachment from ServiceNow to Google Tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Spoke actions

The Google Tasks spoke provides actions to automate Google Tasks when events occur in ServiceNow. Available actions include:

Category	Action	Description
Task Management	Complete Task	Mark a task complete in a task list.
	Create Task	Create a task in a task list.
	Delete Task	Delete a task from a task list.
	Get Task	Retrieve details of a specified task from a task list.
	Look Up Tasks	Retrieve details of specified tasks from a task list.
	Update Task	Update details of the specified task in a task list.
Task List Management	Create Task List	Create a task list in your Google Tasks account.
	Delete Task List	Delete the specified task list.
	Get All Task Lists	Retrieve the details of all task lists in your Google Tasks account.
	Get Task List	Retrieve details of a specified task list.
	Update Task List	Update details of a specified task list.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI agent	Description
Google Tasks Task Management AI Agents	Manages task management tasks (that is, get a tasklist ID from a tasklist name, delete a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent	Description
	task, get a task, update a task, create a task, complete a task) in Google Tasks.
Google Tasks Tasklist Management AI Agents	Manages tasklist management tasks (that is, update a tasklist, delete a tasklist, get a tasklist, create a tasklist, get all tasklists, get a tasklist ID from a tasklist name) in Google Tasks.
Google Tasks AI Agents	Retrieves tasklist ID from a tasklist name from Google Tasks.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Google Tasks spoke account requirements

The Google Tasks spoke requires a custom app that you create in the Google Developers Console.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the Google Tasks spoke.

MID Server requirements

These actions use REST calls that can run either on an instance or, optionally, through a MID Server. Use the connection record associated with the Google Tasks alias to configure where actions run and, if needed, specify MID Server selection attributes. For more information, see MID server.

To set up the MID Server for this spoke, see Set up MID Server for a spoke.

Set up the Google Tasks spoke

Integrate the ServiceNow instance and the Google Tasks spoke by using the G Suite credentials to authenticate the ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Tasks spoke.
- Role required: admin.

Set up an OAuth 2.0 Client application

Create a custom OAuth application to enable OAuth 2.0 authentication of the ServiceNow by the Google Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

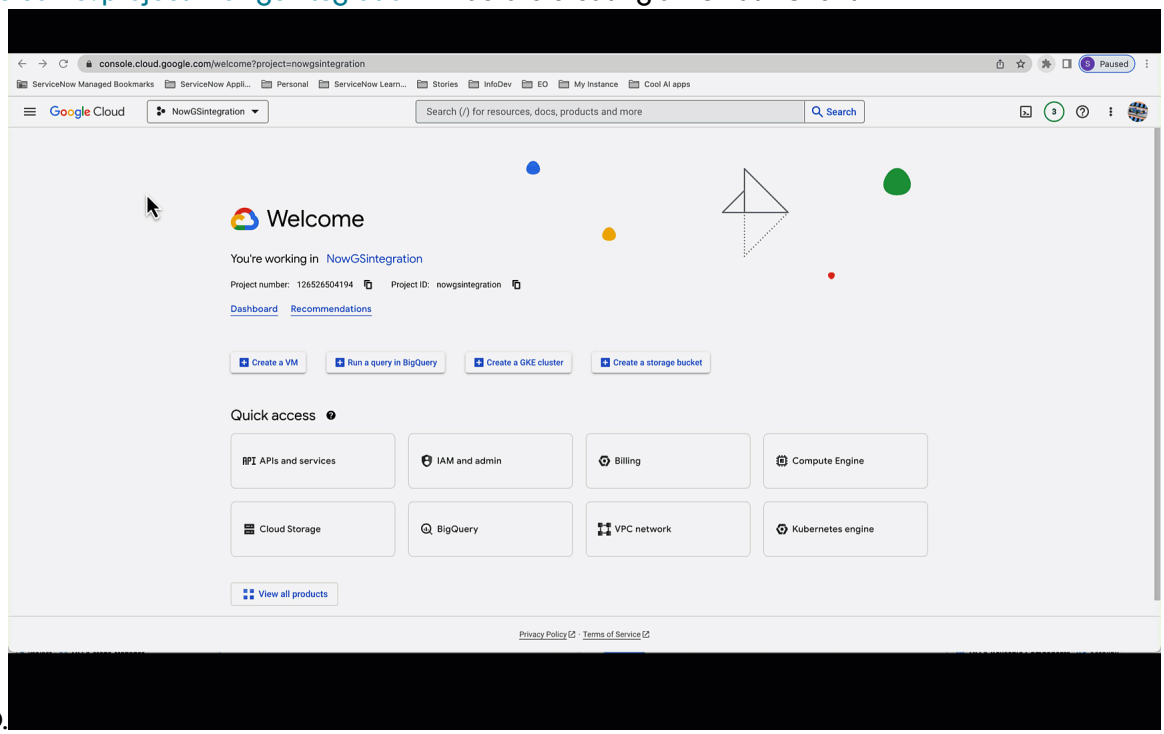
Role required: admin.

About this task

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select **OAuth consent screen**.
3. Enter the application name, and specify the Authorized domain `service-now.com`.
4. Select **Save**.
5. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
6. Select the application type **Web application**.
7. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and select **Create**.
8. Copy the Client ID and the Client Secret to a text file.
   The animation demonstrates the setting up of OAuth Client ID. You must activate the Google Tasks API on https://console.cloud.google.com/welcome?project=nowgsintegration before creating an OAuth Client ID.



Tip: Save the JSON file containing the OAuth client details for later reference.

© 2026 ServiceNow, Inc. All rights reserved.

Configure a connection for Google Tasks spoke

Create a connection and credential record to establish a connection between the ServiceNow instance and the Google Workspace.

Before you begin

Role required: admin.

About this task

The connection and credentials contain the details such as the client ID, client secret, and the redirect URL that the Google Workspace must authenticate the ServiceNow instance.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select Integrations.
3. In the Search all connections field, enter `Google Tasks`.
4. On the Google Tasks tile, select **View Details**.
5. Select **Configure**.
6. Fill the form with the details given in the table.

Configure connection form

Field	Description
Connection Name	Name of the connection between the Google Workspace and the ServiceNow instance. **Note:** The default name is Google Tasks and it's read-only. However, you can provide custom names when you set up more connection and credential records after this record.
Connection URL	Enter the URL `https://www.googleapis.com` **Note:** Make sure that you don't include spaces before or after this URL. If there are spaces, the connection fails. .
OAuth Client ID	The OAuth client ID generated when you created the OAuth client ID.
OAuth Client Secret	The OAuth client secret generated when you created the OAuth client ID.
OAuth Redirect URL	The OAuth redirect URL. It must be in the format https://<instance-name.service-now.com>/oauth_redirect.do.

7. Select **Configure and Get OAuth Token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GoTo Spoke

The GoTo spoke provides actions to view and analyze meaningful usage data for GoTo software subscriptions. Analyze usage for GoToMeeting, GoToWebinar, and GoToConnect to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

GoTo spoke v2.0.1 is the latest version. For version history of the spoke, see GoTo Spoke release notes.

Supported versions

This spoke was built for LogMeIn Admin Center v5.29.0, but may be compatible with later versions.

Spoke requirements

GoTo admin account.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Integration Hub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Integration Hub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Integration Hub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The GoTo spoke provides actions to automate GoTo tasks when events occur in your ServiceNow instance. Available actions include:

Category	Action	Description
Connect Management	Look up Connect Users Stream	Retrieves a list of all users with a GoToConnect license within a GoTo account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
	Look Up User Activity Summary Stream	Retrieves a summary of all user activities, including information about the set of users and their associated metrics.
	Look Up User Activity Details Stream	Retrieves the activity records of the specific user.
License Management	Look Up Licenses	Retrieves a list of all product licenses within a GoTo account.
	Remove User License	Removes a user from a specified product license.
Meeting Management	Get Historical Meeting Report	Reports the meeting history of all organizers within a GoTo account during a given date range.
	Get Upcoming Meeting Report	Reports meetings that are scheduled for all organizers within a GoTo account during a given date range.
User Management	Delete User	Deletes a user from a GoTo account.
	Look up Authenticated User	Retrieves details of the authenticated user, including information about the accounts the user holds.
	Look up Users	Retrieves a list of all users within a GoTo account.
Webinar Management	Get Webinars	Retrieves a list of all webinars for a GoTo account.

Note: This spoke has a Look up User action and Software Asset Management related actions only.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

For information about setting up the spoke, see Set up the GoTo spoke.

Set up the GoTo spoke

Integrate the ServiceNow instance and GoTo by creating a custom OAuth client in GoTo to authenticate ServiceNow requests.

Before you begin

- Request an Integration Hub subscription.
- Activate the GoTo spoke.
- GoTo role required: User with a LogMeIn developer account and admin account.
- Role required: admin.

Create a GoTo OAuth client

Create an OAuth client for authenticating GoTo API requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: GoTo user with a LogMeIn developer account and admin account.

Procedure

1. From a web browser, open the GoTo Developer Center.
2. Sign in using your LogMeIn developer account.
   If you have not already set up a LogMeIn developer account, see How to login or create a developer account for detailed instructions.
3. From the LogMeIn Developers home page, select the **OAuth Clients** tab.
4. Click **Create a client**.
5. On the Details tab of the form, fill in the client details.

Details tab of Create Client form

Field	Description
Client name	Name of the OAuth client.
Description	Optional description for the OAuth client.
Redirect URLs	Redirect URL of the ServiceNow instance on which you are integrating your GoTo applications. Enter `https://<instance-url>/oauth_redirect.do`, where `<instance-url>` is the URL of your ServiceNow instance.

6. Click **Next**.
7. On the Scopes tab, specify the level of access that the OAuth client has to your GoTo users and applications.

Scopes tab

Field	Description
Profile	OAuth scopes for getting and modifying user information for your authenticated users. The **Get user information** scope is enabled automatically. Select the check box to enable the **Modify user details** scope.
GoToMeeting, GoToWebinar, or GoTo Training	OAuth scope for creating, starting, and modifying sessions for your GoToMeeting, GoToWebinar, and GoTo Training applications. Select the check box to enable this scope. **Note:** The SaaS License Management GoTo integration does not support license management for the GoTo Training application.
GoTo Assist Remote Support or Service Desk	OAuth scope for creating, starting, and modifying sessions for the GoTo Assist Remote Support and Service Desk applications. Leave this check box unselected. **Note:** The SaaS License Management GoTo integration does not support license management for the GoTo Assist applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
SCIM	OAuth scope for automating user management using the System for Cross-domain Identity Management (SCIM) protocol. Leave this check box unselected.
Admin Center	OAuth scope for managing LogMeIn users through the GoTo Admin Center. Select the check box to enable this scope.
GoToConnect	OAuth scope for initiating phone calls and other telephone services using GoToConnect. If the GoToConnect license is enabled, select these check boxes: ○ Access call history for phone lines in the PBX [cr.v1.read] ○ Retrieve your phone line information [users.v1.lines.read]

8. Click **Save**.
9. On the Credentials tab, copy the values in the **Client ID** and **Client secret** fields. Save them in a secure location for later use.
10. Select the check box to verify that you have stored the client secret.
11. Click **Done**.

Create a GoTo connection

Create a connection between your GoTo applications and your ServiceNow instance.

Before you begin

Role required: admin

Procedure

1. From your ServiceNow instance, navigate to **Process Automation** > **Flow Designer**. The Flow Designer launches in a new tab.
2. Select the **Connections** tab.
3. Click **View Details** for your GoTo connection.
4. From the list of available connections, locate GoTo and then click **Configure**. The Configure Connection dialog box opens.
5. In the dialog box, fill in the fields.

Configure Connection dialog box

Field	Description
Connection Name	Name of the GoTo connection. This field populates automatically.
Name	Name of your GoTo credentials. This field populates automatically.
OAuth Client ID	Client ID that is assigned to your GoTo OAuth client.
OAuth Client Secret	Client secret that is assigned to your GoTo OAuth client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OAuth Redirect URL	Redirect URL of the ServiceNow instance on which you are integrating your GoTo applications. This field populates automatically.

6. Click **Configure and Get OAuth Token**.
   The Authorize App dialog box opens.
7. On the dialog box, click **Allow**.
   The OAuth access token becomes available for authorizing your GoTo connection.
8. If the GoToConnect license is enabled, navigate to the **Connections** tab.
9. Find the connection for GoToConnect and click **View Details**.
10. Click **Get OAuth Token** to generate a token for GoToConnect.

GovNotify Spoke

Use the GovNotify spoke to send emails, texts, and letters based on automation in your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

GovNotify spoke v1.3.0 is the latest version. For version history of the spoke, see GovNotify spoke release notes.

Supported versions

This spoke was built for GovNotify API version v2, but may be compatible with later versions.

Spoke flows

The GovNotify spoke provides the sample flow, Send a Text Message to User to demonstrate sending a text message to the specified user. To customize the sample flow, copy it to the required application scope.

Spoke subflows

The GovNotify spoke provides the sample subflow, GovNotify Webhook Callback to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope.

Spoke actions

The GovNotify spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Look up Notification Status by ID	Retrieves the latest notification by the notification ID.
Look up Notifications	Retrieves up to 250 messages and statuses that is one page.
Send a Letter	Sends a physical notification letter to a recipient.
Send a Text Message	Sends a text message to a recipient.
Send an Email	Sends an email notification to the recipient.

Available AI agents

Install Now Assist for Integration Hub and start using the available AI agents. For more information, see Now Assist for Integration Hub.

This spoke provides standalone AI agents that mimic human-like intelligence to perform tasks in your ServiceNow instance.

- In the ServiceNow agentic system, you can create an agentic workflow that comprises of a set of large language model (LLM) instructions along with one or more standalone AI agents to execute an objective. See Create an agentic workflow for information about adding AI agents to create agentic workflows as per your requirement and provide the required trigger.

  You can also search for other available AI agents and add them to your agentic workflow. See Find AI agents for more information.

- You can create a clone of the required spoke AI agent and customize it as per your requirement. See Duplicate an AI agent for more information about creating a clone.
- See AI Agent Studio (legacy) for information about AI agents.

Available AI agents include:

AI Agent	Description
GovNotify message manager	Manages notifications and messages (that is, send a text message, email, or letter, look up notifications, look up notification status by ID) in GovNotify.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

Note: Ensure that the user running an AI agent has the required roles and permissions to access data or perform operations on data in the table that is associated with the AI agent.

Spoke module

The GovNotify spoke adds the GovNotify Spoke application to your instance and includes these modules:

Module	Description
Client Details	Stores the client record that authenticates the requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module	Description
Credentials	Contains the default credential record of the GovNotify spoke.
Templates	Displays the details of the templates in your GovNotify account.
Text Notifications	Displays the details of sent text messages.
Transactions	Displays the details of all sent messages. The records include transactions for emails, text messages, and letters.
Webhook Decision Answers	Stores the webhook answer record that triggers the required subflow.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Set up the GovNotify spoke.

Set up the GovNotify spoke

Integrate ServiceNow instance and GovNotify account using JWT authentication to authenticate ServiceNow requests.

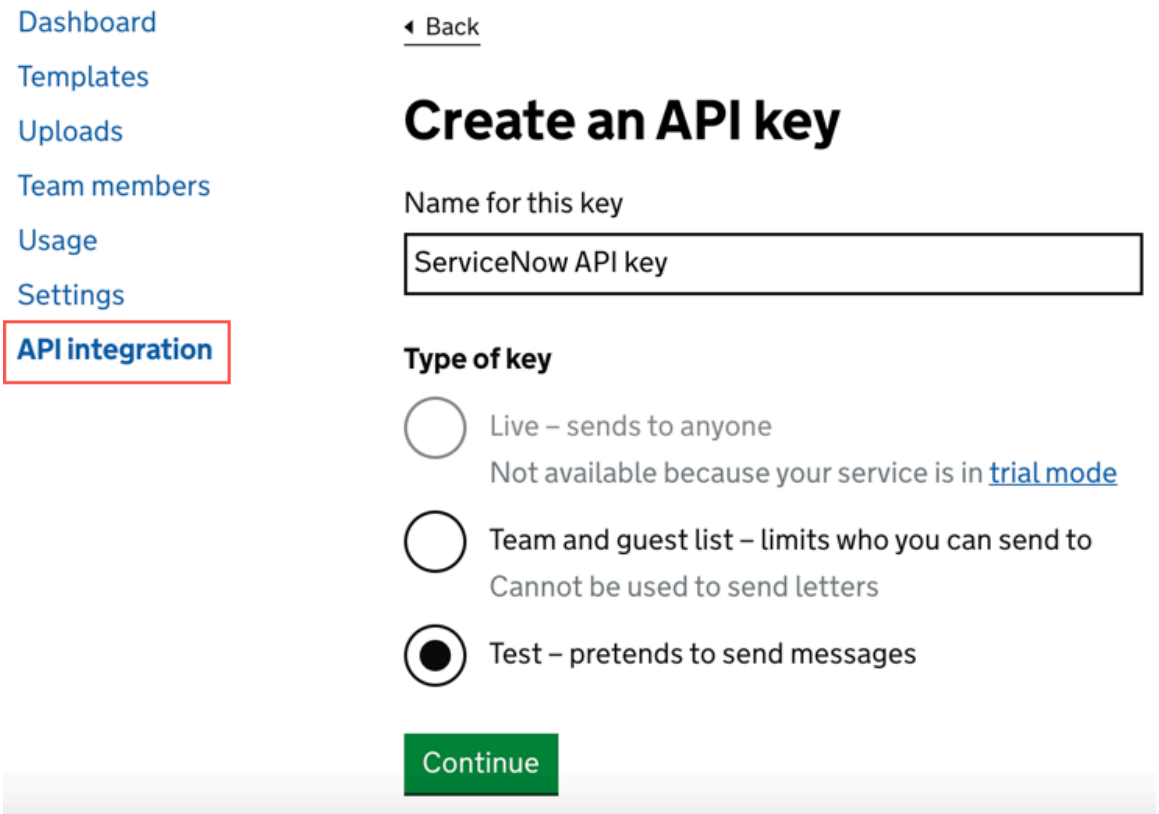
Before you begin

- Request an Integration Hub subscription.
- Activate the GovNotify spoke.
- Role required: admin.

Procedure

1. In the GovNotify account, create an API key.
   a. Log in to your GovNotify account as admin.
   b. Navigate to **API integration** and click **API Keys**.
   c. Click **Create an API key**.
   d. On the form, provide a name for the API key and select the required key type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

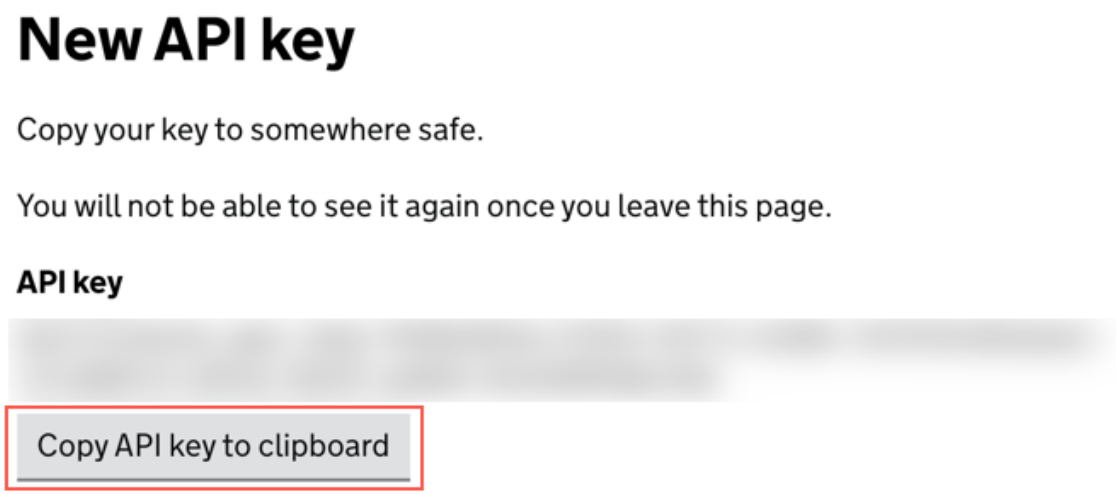


e. Click **Continue**.
The API key is displayed in this format: `{key_name}-{iss-uuid}-{secret-key-uuid}`. For example, if the API key is `my_test_key-26785a09-ab16-4eb0-8407-a37497a57506-3d844edf-8d35-48ac-975b-e847b4f122b0`:

- API key name is: `my_test_key`
- iss (service id) is: `26785a09-ab16-4eb0-8407-a37497a57506`
- secret key or signing key is: `3d844edf-8d35-48ac-975b-e847b4f122b0`

For more information, see Headers in GovNotify REST API documentation.

f. Click **Copy API key to clipboard** and record the value for later use.



2. Configure the default JWT key record in your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **System OAuth** > **JWT Keys**.

b. Open the record, **GovNotify Key**.

c. Enter the signing key you had copied from the API key in **Signing key**.

d. Click **Update**.

3. Configure the default JWT provider record in your ServiceNow instance.

a. Navigate to **System OAuth** > **JWT Providers**.

b. Open the record, **GovNotify JWT Provider**.

c. In the **Standard claims** tab, click the **iss** record.

d. Enter the iss (service id) value you had copied from the API key in **Claim value**.

e. Click **Update**.

4. Configure the default credential record in your ServiceNow instance.

a. Navigate to **GovNotify Spoke** > **Credentials**.

b. Open the record, **GovNotify Cred**.

c. For **JWT Provider**, select the JWT provider you had configured.

d. Click **Update**.

5. Configure the default connection and credential alias record in your ServiceNow instance.

a. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.

b. Open the record, **GovNotify**.

c. In the **Connections** tab, click **New**.

d. On the form, fill these values.

HTTP(s) Connection form

Field	Description
Credential	Credential record you had configured. For example, `GovNotify Cred`.
Connection URL	URL to connect to GovNotify account. Enter `https://api.notifications.service.gov.uk`.

e. Click **Submit**.

Set up the webhook for the GovNotify spoke

Configure a webhook to subscribe to GovNotify with a ServiceNow callback URL.

Before you begin

- Set up the GovNotify spoke
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Copy the scripted REST API URL for the GovNotify spoke from your ServiceNow instance.
   a. Navigate to **System Web Services** > **Scripted REST APIs**.
   b. Open the record, **GovNotify Callback**.
   c. Copy and record the value of **Base API path** for later use.
2. Add the callback URL in GovNotify account.
   a. Log in to your GovNotify account as admin.
   b. Navigate to **API integration** and click **Callbacks**.

   c. On the form, enter these values.

Field	Description
URL	Callback URL in this format: `https://<ServiceNow-instance>.com/<base-api-path>`.
Bearer token	Token to authenticate the request. Enter a token as per your requirement.

   d. Click **Save**.
3. Create client record in your ServiceNow instance.
   a. Navigate to **GovNotify Spoke** > **Client Details**.
   b. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the form, fill these values.

Field	Description
Name	Name to identify the client record.
Authorization Key	Bearer token you had provided in the GovNotify account.

d. Click **Submit**.

4. Create webhook answer record in your ServiceNow instance.

a. Navigate to **GovNotify Spoke** > **Webhook Decision Answers**.

b. Click **New**.

c. On the form, fill these values.

Field	Description
Subflow	Subflow that needs to be triggered. Select the default subflow or the subflow you had configured as per your requirement.
Description	Description of the webhook decision answer.

d. Click **Submit**.

5. Configure the webhook decision policy in your ServiceNow instance.

a. Navigate to **System Definition** > **Decision Tables**.

b. Open the record, **GovNotify Webhook Decision Policy**.

c. In the **Decisions** tab, open the **Default decision** record.

d. For **Answer**, select the sys_ID of the webhook answer record you had created.

e. Click **Update**.
The subflow that is configured in the webhook answer record is triggered when conditions in the webhook decision policy are met.

Gremlin Spoke

Simulate outages and manage attacks using Gremlin instance from your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Starting with the Yokohama release, Gremlin Spoke is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. Spoke Generator provides the latest experience for this functionality.

For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This spoke requires an Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

Spoke version

Gremlin spoke v1.0.3 is the latest version. For version history of the spoke, see Gremlin spoke release notes.

Supported versions

This spoke was built for Gremlin version v1, but may be compatible with later versions.

Spoke requirements

- Set up clients as per your requirement.
- Admin access to the Gremlin dashboard.
- Team in your Gremlin account for integration with ServiceNow instance. For more information about creating teams, see Teams.
- Team ID and API Key of the team. Copy and record these value for later use. For more information about accessing these values, see the Signature-based Authentication section.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Gremlin spoke provides actions to automate Gremlin tasks when events occurs in your ServiceNow instance. Available actions include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Action	Description
Attack Management	Create Attack	Creates an attack on the Gremlin platform.
	Get Attack Details	Retrieves details about an attack.
	Get Attack Executions	Retrieves a list of executions associated with an attack.
	Halt All Attacks	Idempotently halts all active attacks across the Gremlin platform.
	Look up Attacks	Lists all attacks on the Gremlin platform. **Note:** • By default, this action can retrieve data up to 5 MB. You can configure the *glide.pf.rest.response_payload_max_size* property to retrieve data up to 10 MB. If the data in the response is more 10 MB, an error is displayed. • As data up to 10 MB only can be retrieved, you can also specify number of records that should be retrieved in the input field, **Number of records to return**.
Attack Schedule Management	Create Attack Schedule	Creates an attack schedule on the Gremlin platform.
	Delete Attack Schedule	Deletes the specified attach schedule.
	Get Attack Schedule Details	Retrieves details about the specified attack schedule.
	Look up Active Attack Schedules	Lists all the attack schedules on the Gremlin platform.

Note:

- Time zone that is considered in the spoke actions, is same as the time zone of your ServiceNow instance.
- Based on your Gremlin license, if you don't have access to certain Gremlin functionality, you can't use the associated spoke actions in your ServiceNow instance as well.
- For some arguments that take `True` or `False` as input, the actual value that the Gremlin platform considers, might be different from the value you have provided.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

For information about setting up the spoke, see Create Connection and Credential record for the Gremlin spoke.

Create Connection and Credential record for the Gremlin spoke

Authorize the Gremlin spoke actions by creating connection and credential record for the application registered in Gremlin. The Gremlin spoke connection and credential alias uses these connections and credentials to authorize actions.

Before you begin

- Request an Integration Hub subscription.
- Activate the Gremlin spoke.
- Role required: admin.

Procedure

1. Navigate to **All** > **Connection & Credentials** > **Connection & Credential Alias**.
2. Open the record, **Gremlin**.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these values.

Field	Description
Connection Name	Name to identify the connection record. By default, this is `Gremlin Connection`. You may change it as per your requirement.
Connection URL	URL to connect to Gremlin. By default, this is `https://api.gremlin.com`.
API Version	API version of the Gremlin platform. By default, this is `v1`.
Team ID	Team ID of your team.
API Key	API Key of your team.
Credential Name	Name to identify the credential record. By default, this is `Gremlin Credentials`. You may change it as per your requirement.

5. Click **Create**.

Guidewire Spoke

Integrate a ServiceNow instance with your Guidewire account to look up insurance customer and policy information, and manage claims.
