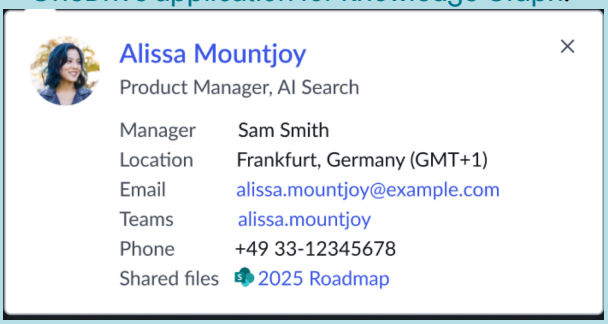
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting the person's name presents a popover. The information in the popover can include the following information:

- Manager
- Location
- Email
- Teams
- Phone
- Shared files

Important:

- Shared Microsoft SharePoint files between you and the person found, appear only on the people popover.
- The shared files only appear after you have completed the prompt to **Log in**, and signed in successfully. If you do not have a valid token, you will be prompted to sign in and re-directed to Microsoft login page.
- If you have not configured Microsoft OneDrive application, see Configure Microsoft OneDrive application for Knowledge Graph.



Integration with AI Search

Knowledge Graph is also integrated with AI Search. You can enable ServiceNow Otto® Multi-Content Response Genius Results to get answers from Knowledge Graph on AI Search.

Ensure that you have already configured Knowledge Graph with an assistant before enabling it on AI search.

To configure and enable the AI Search see Knowledge base articles Genius Results.

Knowledge Graph integration with AI agents

The prebuilt integrations of Knowledge Graph, improve live agent productivity by assisting AI agents in performing tasks and answering user queries.

In this release, the available prebuilt integrations with AI agents are:

1. Integration with AI agents for User Context: Helps users with personalized responses.
2. Integration with AI agents as a tool: Used to perform specific tasks that are assigned to the AI agents.

Integration with AI agents for User Context

ServiceNow AI agents integrates the context from the prebuilt User Profile schema to fetch relevant data and provide personalized responses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By using relationships between users, teams, and content, AI agents can fetch relevant, permission-aware user information and provide answers to reduce slot-filing requirement.

Here's an example use case of how Knowledge Graph is used within AI agents for user context.

- A user needs assistance in writing their resume, so they use ServiceNow AI agents called Resume builder.
- The user ads their task: `Build my resume`.
- AI agents uses Knowledge Graph to fetch the following information from the user profile schema:
  - First name
  - Last name
  - Location
  - Email ID
  - Phone number
  - Occupation
- AI agents reverts with the available information and request for the missing information to proceed building the resume.
- Once the agent as all the required information, it provides user with output.

Integration with AI agents as a tool

Knowledge Graph can now be used as a tool within AI agents. Users can choose Knowledge Graph to perform tasks, while creating an Agent.

You can define the flow action to use Knowledge Graph as a reusable operation in automating the ServiceNow AI Platform features without having to write code.

See Add a Knowledge Graph to an AI agent to add Knowledge Graph to an AI agents in AI Agent Studio.

Example use case:

- A user wants to view and retire all the assets assigned to another user. To execute this task, user will use Asset Manager agent.
- Asset Manager uses Knowledge Graph to fetch the asset information related to the user.
- After processing the query, the agent provides the following output:`User has the following assets:1.<asset1> 2.<asset2> 3.<productID>- <asset 3> <purchase date>. The email address for the user is <emailId> and username <username1>.`
- User then proceeds with the task of retiring the assets: `Proceed with retiring the assets associated with Username1.`
- The next tool, used execute this task, will take the table name and sysId displayed in Knowledge Graph output and proceed with the task.

Example: Knowledge Graph API output in AI agents

When a user ask a query `What is my Manager's name?` , AI agents reaches out to Knowledge Graph to fetch this information. Here's an example output of the query:

```
{
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "Manager": [
        {
            "sys_user": {
                "user_name": {
                    "value": "abel.tuter",
                    "displayValue": "abel.tuter"
                },
                "sysId": "62826bf03710200044e0bfc8bcbe5df1",
                "name": {
                    "value": "Abel Tuter",
                    "displayValue": "Abel Tuter"
                },
                "first_name": {
                    "value": "Abel",
                    "displayValue": "Abel"
                },
                "last_name": {
                    "value": "Tuter",
                    "displayValue": "Tuter"
                }
            }
        }
    ]
}
```

In this example, the table that is called is `sys_user` and column referred is `user_name`. The output also displays sysId, example: `"sysId": "62826bf03710200044e0bfc8bcbe5df1"`.

Knowledge Graph integration with MCP server

The Knowledge Graph integration with MCP server provides a secure and governed access to Knowledge Graph functionality on a ServiceNow instance for AI applications with Model Context Protocol (MCP) servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use Knowledge Graph as a tool within MCP server console to help AI agents by providing context and insights based on live instance data and enable AI agents to complete their task.

Refer Create a tool from a Knowledge Graph to add Knowledge Graph as a tool and to expose it to Model Context Protocol (MCP) clients from an MCP Server.

Natural language queries use cases and examples

View example use cases of some natural language queries used in Knowledge Graph and Enterprise Graph.

Natural Language Query support in Knowledge Graph and Enterprise Graph allows users to interact with structured data using human-like language. This feature enhances the user experience by enabling more intuitive and flexible search capabilities within the ServiceNow platform.

Supported Queries

Knowledge Graph and Enterprise Graph, understand and process queries that reference specific tables, columns, choice values, and conditions. It also handles queries involving system-generated identifiers (sys-ids), person names, dates, and contextual pronouns. Additionally, it supports aggregate and sorting queries, enabling users to perform simple statistical analysis and order results.

Knowledge Graph also supports queries with Glidelist References.

Here are some examples of the supported query types:

Queries with specific reference

Queries having reference to all table names, column names, or choice values and conditions required are supported. Ensure that the conditions are specified exactly.

Here are some example queries and description of how they works in Knowledge Graph.

Example use cases

Example	Description
Show all stories which are ready for acceptance.	Stories refers to stories table and ready for acceptance refer to choice.
Find details of CI associated with P1 priority incident.	CI refers to look at configuration table and find those CI which are liked to incident with priority 1.
List all change requests with high risk.	Change request refers to change_request table, risk refers to column, and high refers to choice.
Give details of CI named "AppleMacBookPro15".	CI refers to configuration item table and named refers to name column. The exact name of CI is also specified.
Show all incidents which are open.	Incident refers to the table; "in progress," "new," and "on hold" are choice value in state column options that correspond to open.
Share all case task assigned to "Dev – Knowledge Graph" group.	Case task is reference to table, group is a reference to assignment group column, and exact condition to look for is specified exactly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example use cases (continued)

Example	Description
Find Configuration items where manufacturer = Lenovo.	Configuration item is reference to cmdb_ci table, manufacturer is column, and the exact name of manufacturer is specified.
Show me assets assigned to <Person Name>.	Assets refer to asset table, assigned to is column and person name is well specified.
Find details of CI associated with P1 priority incident.	CI refers to look at configuration table and P1 indicated the choice value of the priority column.
Show me incidents that have at least one user on the watch list.	Incident refers to the incident table and watch_list refers to the glidelist field containing user references, and the condition checks for non-empty values to identify actively monitored incidents.
Show me the work_notes_list for INC0009009.	Incident refers to the incident table, work_notes_list refers to the glidelist field containing user references who have added work notes, and returns paired incident and sys_user records.

Queries with Sys-IDs, Person Names, and Date References

Queries having person names or references to dates such as yesterday, last month and contextual pronouns to the right person. Queries using system-generated identifiers (sys-ids) also works and can identify the table based on sys-ids.

Here are some example queries and description of how they works in Knowledge Graph.

Example use cases

Example	Description
Find details of request items linked to REQ0010144.	The request item refers to sc_req_item table and REQ sys-id refers to to sc_request table.
Show details for INC0000044.	INC as sys-id refers to incident table.
Get status for CHG000567.	CHG as sys-id refers to change request table and the status refers to the status column for that record.
Find department for person who requested RITM0010144.	The RITM sys-id refers to sc_request_item and department refers to department column from cmn_department which is linked to the person who requested RITM0010144.
Find details of problem linked to INC0000047.	This query requests the details of problem record linked to incident INC0000047.
Show incidents assigned to Fred Luddy.	Finds incident table with user in assigned to column.
List tasks created by Beth Anglin.	Task refers to task table and User name refers to created by column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example use cases (continued)

Example	Description
Find approvals pending for Joe’s reportees.	Find approvals from the sysapproval_approver table for approval that are pending for the user's reportees.
Display incidents created more than 3 days ago and aren't resolved yet.	Uses incident table, created date, and state column to fetch the details.
Find certificates expiring in the next 30 days.	Certificates refer to table name, the next 30 days reference can be converted to date related condition and can be understood from the date reference in query.
Find case task created in last 30 minutes.	Case task refers to table, created refers to created column and time related condition can be understood from time reference in query.
What are the Problems open with my group?	Problem refers to problem table, group refers to column, ‘my’ reference will be resolved to the person asking the query.
Show my open incidents.	Uses incident table and 'my' reference is the person asking the query.
What is the status of my request?	Uses request table and 'my' reference is the person asking the query.
What are their pending approvals?	Uses `sysapproval_approver` table and 'their' reference is the person who was referred to in previous turn of conversation.
Give me the watchlist for incident INC0009009.	INC0009009 is the sys-id referring to the incident table, and watch_list refers to the glidelist field that contains related sys_user records associated with that incident.
Show watchlist users associated with incident INC0009009.	INC0009009 is the sys-id referring to the incident table and watch_list refers to the glidelist field containing user references. Returns all sys_user records linked to that incident.

Aggregate or Sorting Queries

These queries let users perform simple statistics and sorting directly in ServiceNow® Otto for Virtual Agent or ServiceNow Otto® panel.

Here are some example queries and description of how they works in Knowledge Graph.

Example use cases

Example	Description
Count of incidents grouped by priority.	Counts the records in incident table grouped by priority column.
Count of problems grouped by stage.	Counts the records in problem table grouped by stage column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example use cases (continued)

Example	Description
Count case task assigned to group "Dev - Knowledge Graph ".	Counts the records in case task table that are assigned to assignment group = Dev – Knowledge Graph.
List in progress hr cases by ordered by created date.	Lists the HR cases from HR cases table ordered by the created date field.
Show top 5 users by number of incident assigned to them.	Lists the top 5 user by number of incidents from the incident table assigned to them.

Unsupported Query Categories

Knowledge Graph does not support the following types of queries:

Queries Missing References or with Misspellings

Queries that lack references to table, columns, choice values, or conditions, or contain misspellings, aren't supported.

Here are a few examples of unsupported queries that will work if rephrased, as suggested below:

Example unsupported queries

Example	Rephrase to:
Find incidents about SAP login issue.	Find incidents where short description = SAP login issue.
Find CI where manufacturer is Orrange. (Incorrect spelling)	Find CI where manufacturer is Orange.
Find CI in SanDiego city.	Find CI in San Diego city.
Locate changes related to patch upgrade.	Locate change request where description contains patch upgrade.
Change request for Abel Tuter.	Change request assigned to Abel Tuter or Change request opened by Abel Tuter.
Problem by Mark Andrew.	Problem updated by Mark Andrew or Problem closed by Mark Andrew.

Queries on Journal Fields or Document IDs

Queries involving journal entries, and document ID references aren't supported.

Here are a few examples of unsupported queries:

- Show latest comments added to INC0000044.
- What comments or work notes were added in the approval of change request CHG0000046.
- Show tasks with 'urgent' in comments.
- Find incident where Joe commented about email resolution steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Keyword Queries or Queries Requiring KB Resolution

Keyword-based queries or those requiring resolution from the Knowledge Base (KB) are handled by AI Search, not the Knowledge Graph.

Here are a few examples of unsupported queries:

- VPN issue
- Password reset
- Incident SLA
- How can I request a windsurf license?
- How to install global protect for PC?

CMDB query support

Knowledge Graph supports CI Relationship (Rel CI) queries, enabling natural language questions about CMDB configuration item dependencies and infrastructure topology. For more details see Configuration item relationships and Knowledge Graph.

Workflow Data Fabric integration with Knowledge Graph

Knowledge Graph supports Workflow Data Fabric to fetch third party information securely without copying the data.

The integration of Workflow Data Fabric (WDF) with the Knowledge Graph allows organizations to seamlessly connect external and internal data sources. This integration extends the functionalities of the Knowledge Graph to external data, ensuring real-time access and enabling advanced insights, workflow automation, and personalization using external data.

The key feature of Workflow data fabric integration with Knowledge Graph are:

- Real-Time Access: Zero Copy connectors from WDF and the semantic layer of the Knowledge Graph ensure that external data is accessible in real-time.
- Deep Data Connection: WDF tables are automatically included in the Enterprise Graph, enhancing the connectivity and utility of external data within the ServiceNow platform.
- Natural Language Query Support: Users can ask natural language queries (NLQ) in Virtual Agent and AI Agents, leveraging both external (WDF) and internal data.

The benefits of using Workflow data fabric integration in Knowledge Graph are:

- Requestors and Fulfillers: Can ask NLQ questions and receive insights from external (WDF) tables integrated with the KG schema.
- Admins: Can create a KG schema with WDF tables and link it to the ServiceNow Otto panel, AI Agents, or ServiceNow® Otto for Virtual Agent.

Admins can add WDF tables to the Knowledge Graph just like any other internal table. However, only WDF tables configured with a primary key are supported.

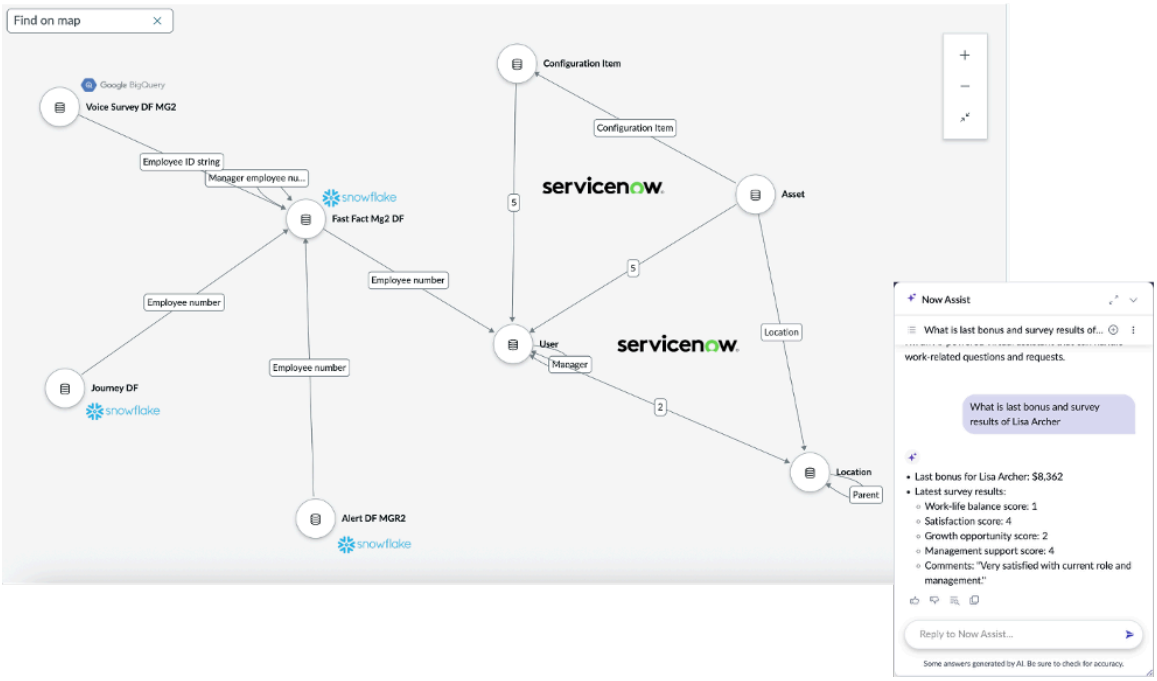
Here are some integration best practices:

- Primary Key Requirement: Always add a primary key to your WDF table during configuration. This is mandatory for supporting WDF tables in the Knowledge Graph.
- Meaningful Naming: Use clear and meaningful names when creating WDF tables. Add synonyms to your tables in the Knowledge Graph schema as needed to improve the accuracy of natural language queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Here is some example use cases:

Snowflake and Google BigQuery Integration: WDF tables sourced from Snowflake and Google BigQuery can be added to the Knowledge Graph schema, allowing users to query and analyze data from these external sources within ServiceNow.



Configuration item relationships and Knowledge Graph

Configuration item (CI) Relationships enable Knowledge Graph to answer natural language questions about service dependencies and infrastructure topology by storing typed parent-child relationships between CMDB configuration items.

The *CMDB_REL_CI* table stores relationships between configuration items (CIs) in ServiceNow CMDB. Each relationship connects a parent CI to a child CI through a defined relationship type, enabling the Knowledge Graph to understand and traverse the topology of your IT environment.

CI relationship support in Knowledge Graph enables users to ask natural language questions. You can ask about how services, servers, databases, and other CIs relate to one another without writing queries or navigating CMDB tables directly.

Enabling CI relationship for Knowledge Graph

CI relationship support for the Knowledge Graph is inactive by default. Set both of the following system properties to true to enable it

System properties for CI relationship support

System Property	Purpose
sn_kg.description_generation.enable_cmdb_rel_ci	Enables description generation for CI relationship data
sn_kg.query.enable_cmdb_rel_ci	Enables Knowledge Graph querying against CI relationship data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: After enabling both properties, allow time for CI relationship data to be fully indexed before running queries. Results may be incomplete until indexing is complete.

How CI relationship data is stored

Each record in the CI relationship table represents a bi-directional relationship between two CIs. Relationships are described by a relationship type that consists of a parent to child relationship and child to parent relationship, separated by double colons:

`<parent descriptor>::<child descriptor>`

This means every relationship can be read in two directions:

- Parent → child: read using the parent to child relationship (parent descriptor)
- Child → parent: read using the child to parent relationship (child descriptor)

For example, a record in the CI relationship table has Bond Trading (*cmdb_ci_service*) as the parent, lnux100 (*cmdb_ci_linux_server*) as the child, and a relationship type of `Depends on::Used by`. This relationship is read as:

- Bond Trading depends on lnux100
- lnux100 is used by Bond Trading

Note: The direction of the relationship affects how you phrase queries to the Knowledge Graph. Parent-to-child queries (for example, "depends on") return more reliable results than child-to-parent queries (for example, "used by").

Knowledge Graph support for CI relationships

The Knowledge Graph can answer questions about CI relationships when the query clearly specifies all three of the following:

- The class of the parent CI (for example, service)
- The relationship direction — either the parent to child relationship or child to parent relationship (for example, depends on)
- The class of the child CI (for example, Linux server)

Class hierarchy inheritance

When you define a relationship between two CI classes, the Knowledge Graph automatically extends that relationship to all classes higher up in the CI class hierarchy. This means users can query at a more general class level and still get results across all matching subclasses.

For example, a relationship defined between service and linux server also applies to server, which is a parent class of Linux server in the hierarchy. Querying for servers rather than Linux servers returns results across all server subclasses — including Linux server, windows server, UNIX server, and others.

Note: If a query returns fewer results than expected, try using a broader parent class in the hierarchy (for example, "server" instead of "Linux server") to include all inherited CI types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported query patterns

The following table shows examples of queries the Knowledge Graph can answer using CI relationship data. Each query specifies a parent class, a relationship descriptor, and a child class.

Supported query patterns

Scenario	Example Query
Service that depends on a specific Linux server	Which services depend on 'linux100' Linux server?
Servers that a specific service depends on	'Bond Trading' service depends on which UNIX server?
All server types a service depends on (using hierarchy)	'Bond Trading' service depends on which server?
Computers connected to a database	Which databases are connected by computers?
Multi-hop relationship across three CI types	What database runs on UNIX server that connects to 'nc6500-a01' network gear?

Unsupported query patterns

The following query types are not currently supported. Use the recommended alternatives to get the results you need.

Unsupported query patterns

Limitation	Unsupported Query	Recommended Alternative
Negation of a relationship	Which business capabilities have no related business applications?	Rephrase to ask for what does exist rather than what does not.
Unspecified relationship type	Show me services related to Linux servers.	Show me services depending on Linux servers.
Skipping steps in a multi-hop path	Show me servers in New York.	Show me servers in racks present in datacenters located in New York.

Configuring Knowledge Graph

Plan and configure Knowledge Graph implementation.

Configuration overview

Knowledge Graph is a ServiceNow AI Platform feature that is available with activation of any ServiceNow generative AI application.

On activation, the following Knowledge Graph plugins are installed by default:

- Graph QL plugin
- Knowledge Graph application

To implement the Knowledge Graph adoption, you must configure Knowledge Graph for Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For integration with Virtual Agent for Slot filling, configure Knowledge Graph in Virtual Agent. Refer Assistants overview for admin guided setup.

Knowledge Graph now supports Workflow Data Fabric that enables users to retrieve data from different systems without moving them. This ensures efficiency and security when working with sensitive information.To configure and integrate the Workflow Data Fabric tables for Knowledge Graph, see Managing data fabric tables

Configure LLM for Knowledge Graph

Choose which large language model (LLM) service provider for Knowledge Graph.

Before you begin

LLMs are part of the foundation for Knowledge Graph. Different LLMs can provide slightly different performance and responses. You can select which LLM to use for your Knowledge Graph schema.

Role required: admin

Procedure

1. Navigate to **All** > **sys_one_extend_capability.list** > **TextToResult**.
2. Open the TextToResult record and select **OneExtend Definition Configs** (related list).
3. For one of the following options, change the value of the default field to **True**.
   - **TextToResult (NowLLM)**
   - **TextToResult (Claude Large)**
   - **TextToResult (GPTLarge)**
   - **TextToResult (Gemini)**

   Once you select the default LLM, ensure that the Default field value for another LLM is set to **False**.
4. Select the LLM to open the record and update the default field to **True**.

Configure Microsoft OneDrive application for Knowledge Graph

Use Microsoft SharePoint for fetching user-specific external data, such as shared files, from external services through a Knowledge Graph API.

Before you begin

Knowledge Graph uses Microsoft OneDrive application for authentication of Microsoft SharePoint required to fetch external data such as shared files used for people citation in Virtual Agent. Use the following process to setup the necessary authentication, used for people citation in Virtual Agent.

To view the share files, configure the Microsoft OneDrive application with Knowledge Graph.

To complete the configuration, you must:

- Create Microsoft OneDrive application.
- Setup Knowledge Graph application on Microsoft OneDrive tenant.
- Update Microsoft OneDrive permissions for delegated access.
- Create client secret value and complete the authentication process.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Go to portal.azure.com and select **view** to Manage Microsoft Entra ID.
2. To register the app, do the following:
   - Select **Manage** > **App registration** and select **New Application**.
   - Add a Name for the application
   - Select **Accounts in this organizational directory only** single-tenant apps for use.
   - Select Register.

     Note: Copy and save the Application ID and Tenant ID for future reference.
3. Once the new application is registered, add the client credentials:
   - Select **Add a certificate or secret**.
   - Select **New client secret** and add Description and Expiry duration.
   - Select **Add**.
   - Copy and save the New client secret value that is created.
4. Select **Overview** from the left navigation pane to add the redirect URL.
   - Select **Add a redirect URI**.
   - Select **Add a platform** from the platform configurations section.
   - Add `https://<instanceURL>/oauth_redirect.do` in **Redirect URIs** and **Front-channel logout URL** fields on the configure web page.

     Note: Replace the <instanceURL> with your instance path. Example: *`abc.service-now.com`*.
   - Select both the Access token and ID tokens option from the **Select the token you would like to be issued for authorization endpoint** section.
   - Select **Configure**.
5. Select **Manage** > **App permissions** from the left navigation pane, to add permissions.
   - Select **Add a permission**.
   - Select **Microsoft Graph**.
   - Select **Delegated permission**.
   - Add and select *`offline.access`* and *`Sites.Read.All`* in Select permissions section.
   - Select **Add permissions**.
   - Set the **Admin consent required** field to Yes for the newly added Microsoft Graph.
6. Go to your ServiceNow instance to change the Application registry settings:
   - Select **All** > **System OAuth** > **Application registry**
   - Select **KG MS OneDrive Delegated Connector**.
   - Add the copied Application ID in the **Client ID** field.
   - Add the Client secret in the **Client secret** field.
   - Add the Tenant ID in the placeholder for [tenantId] in the Authorization URL and Token URL field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that the Redirect URL is correct.
- Select **Update**.

Using Knowledge Graph Designer

Use Knowledge Graph Designer to create customized Knowledge Graph schema that consist of nodes and edges.

Knowledge Graph schema are the customized Knowledge graphs that consist of nodes and edges.

Like tables, nodes also denote and store details about entities such as user, location, department. You can add nodes to the Knowledge Graph schema so that the system can reach out to all the relevant tables to fetch the data. You can also edit node properties such as data source, start node, end node, and connected nodes.

Knowledge Graph enables you to select the node columns that can be queried.

The relationship or connections between these nodes are referred to as edges. You can select and edit the connecting edges and available edges for each node.

With Knowledge Graph Designer, you can create, edit, duplicate, or delete a Knowledge Graph schema.

Apart from ServiceNow tables, you can also create Knowledge Graph schema using WorkFlow Data Fabric tables to retrieve data from different systems in real time without moving it.

There's an option to test a Knowledge Graph schema by generating and running a query.

View Knowledge Graph schema

By default, ServiceNow published Knowledge Graph schema is available with the product. View the prebuilt schema provided by ServiceNow, or the schema created by your organization admin. There are currently two prebuilt schema available that are read-only but can be cloned and edited:

1. User profile schema
2. Employee schema

Create a Knowledge Graph schema

Create customized Knowledge Graph schema that will be used by Virtual Agent, AI Agents and ServiceNow Otto Panel.

Before you begin

Role required: kg_admin

Procedure

1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer**.
   The UI displays a list of all the Knowledge Graph schemas on the landing page.
2. Start creating a Knowledge Graph schema by selecting **Create New**.

   Note: You can create Knowledge Graph schema using ServiceNow tables or the external Workflow Data Fabric tables.

3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

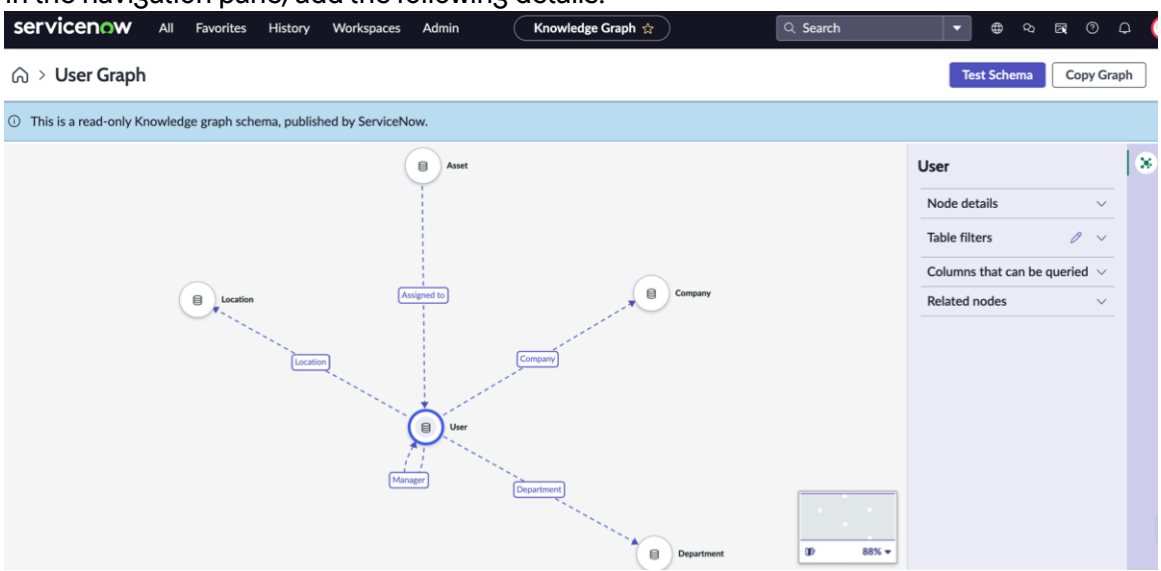
Edit Knowledge Graph schema details form

Field	Description
Display Name	Display name for the Knowledge Graph schema.
Name	Optional name for the Knowledge Graph schema.
Scope	Scope used when creating the Knowledge Graph schema. This field is a read-only.
Description	Knowledge Graph schema overview to provide additional information to users.

4. Select **Create**.
   The Add nodes to the Knowledge graph schema window is displayed.
5. Enter or search for the nodes that you want to add to the Knowledge Graph schema and select **Add**.

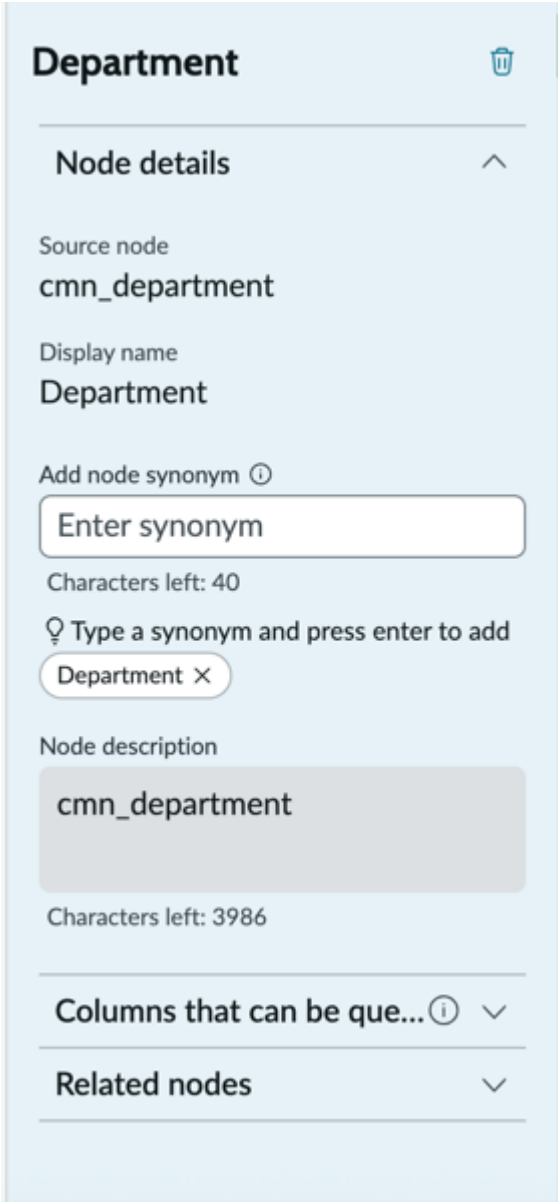
   You can search and select the Workflow Data Fabric tables, if integrated.

   The Knowledge Graph schema is created and displayed on the Knowledge Graph canvas.
6. In the navigation pane, add the following details:



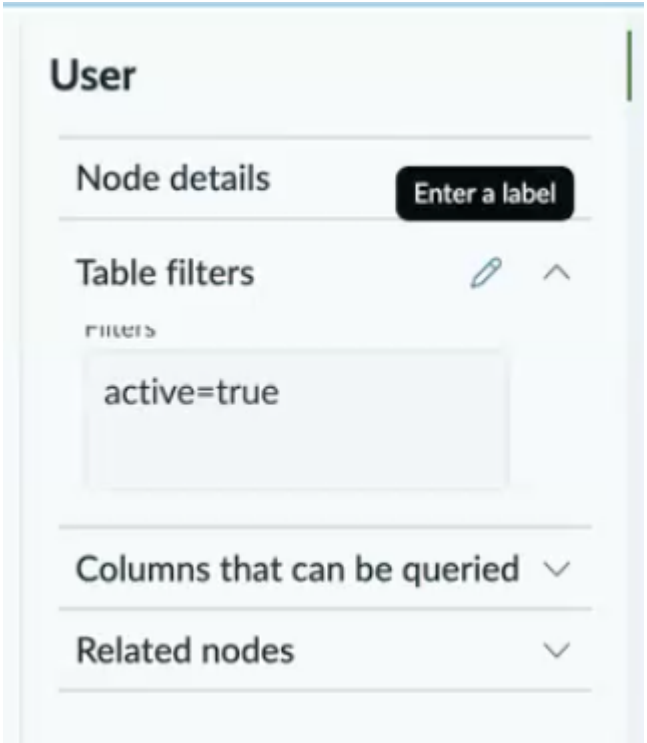
7. In the Node details section, you can add or edit the following fields.
   - Add node synonym
   - Node description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



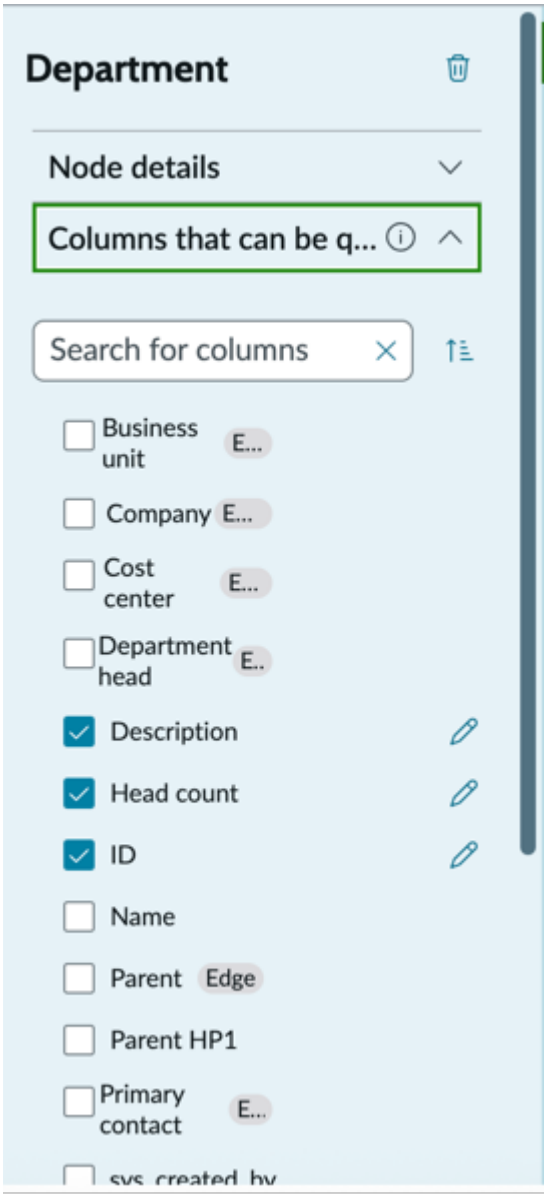
8. In the **Table filters** section, view and add filters to set rules that control which records are shown in query results.
   To add table filters, provide the following information:
   - Field
   - Operator
   - Value
   - Add Condition set: optional field to add an alternative filter condition.
   - Apply filters to child tables: optional check box to add the same filter conditions for the child table of the selected table in the graph.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



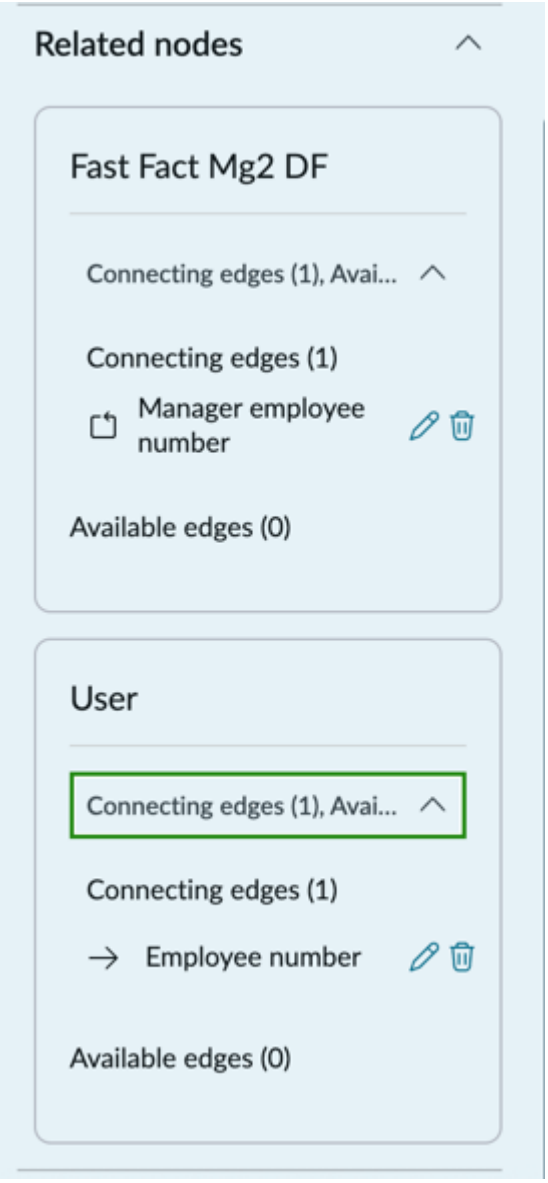
9. In the Columns that can be queried section, search for and select the desired columns and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Add, delete, or edit edges in the Related nodes section and select **Save**.



Edit a Knowledge Graph schema

Edit a Knowledge Graph schema to customize or update the existing schema details.

Before you begin

Role required: kg_admin

Procedure

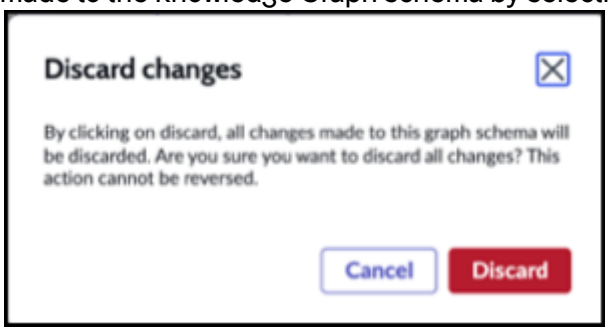
1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer**.
   The UI displays a list of all the Knowledge Graph schema on the landing page.
2. From the list of existing Knowledge Graph schema, select a Knowledge Graph schema to edit.
   The Knowledge Graph schema opens in the Knowledge Graph canvas.
3. Select the edit icon ( ).
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit Knowledge Graph schema details form

Field	Description
Display Name	Display name of the Knowledge Graph schema.
Name	Name of the Knowledge Graph schema.
Scope	Scope used to create the Knowledge Graph schema.
Description	Knowledge Graph schema overview for users.

5. To save the changes, select **Save**.
6. Delete all the changes made to the Knowledge Graph schema by selecting **Discard**.



Manage nodes in a Knowledge Graph schema

Add or delete a node from an existing Knowledge Graph schema.

Before you begin

Role required: kg_admin

Procedure

1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer**.
   The UI displays a list of all the Knowledge Graph schemas on the landing page.
2. Select a Knowledge Graph schema from the list.
   The Knowledge graph schema opens in the Knowledge Graph canvas page.
3. From the toolbar, select the **Add nodes** option.
   The Edit Knowledge Graph Schema details form is displayed.
4. In the Add nodes to Knowledge graph schema window, enter or search for the nodes that you want to add to the Knowledge Graph schema.

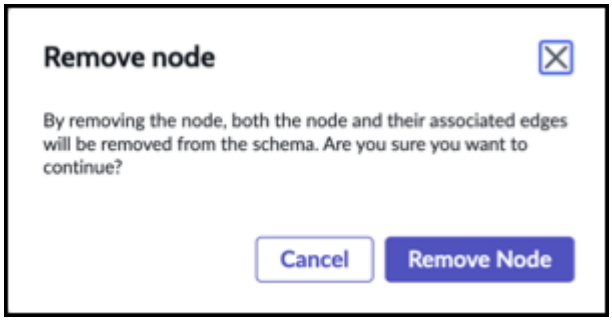
   You can search and select the Workflow Data Fabric tables, if integrated.

5. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The nodes are added to the Knowledge Graph schema and displayed on Knowledge Graph canvas.

6. Select the node to update the node details in the side navigation pane.
7. Select **Save** to save your changes.
8. Select **Remove node** to delete a node from the schema.



Add or delete edges to a Knowledge Graph schema

Add, edit, or delete edges that connect the nodes to customize a Knowledge Graph schema.

Before you begin

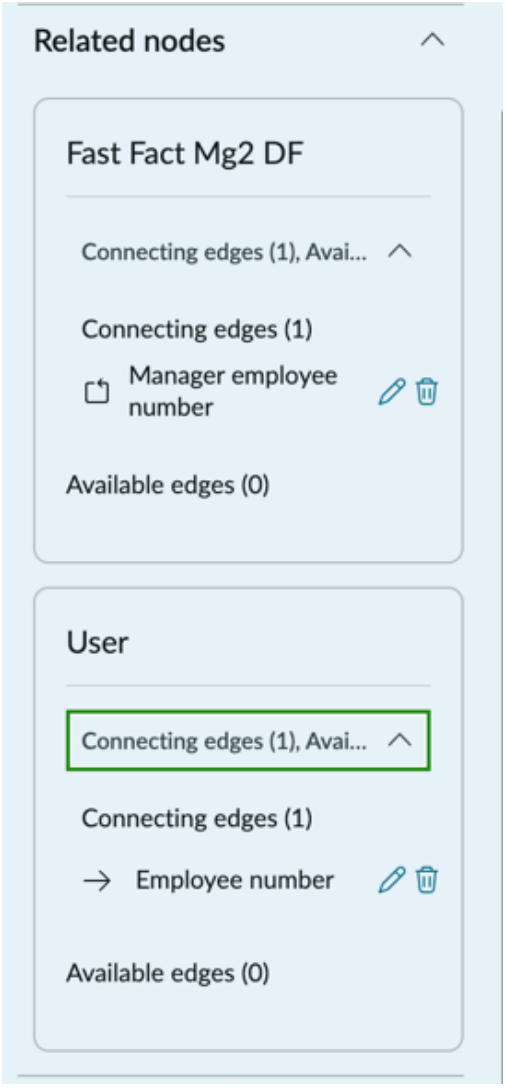
Role required: kg_admin

Procedure

1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer**.
   The UI displays a list of all the Knowledge Graph schemas on the landing page.
2. Select a Knowledge Graph schema from the list.
   The Knowledge Graph schema opens in the canvas.
3. From the Knowledge Graph schema, select a node to edit.
4. In the side navigation pane, select **Related nodes**.

   Each related node displays a list of connecting edges and available edges.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. To establish a connection to an available edge, select the plus icon ( ) against the edge. The available edge is moved to **Connecting edges**. Select an edge to see its parent node and grandparent nodes in the hierarchy.
6. To reconfigure a connecting edge, select the edit icon (and update the following:
   - Edge type
   - Edge description
7. To delete an edge and move it to available edges, select the remove edge (
8. To delete the edge, select **Remove edge** when prompted.
9. To save your changes, select **Save** or to undo all your changes, select **Discard**.

Test a Knowledge Graph schema

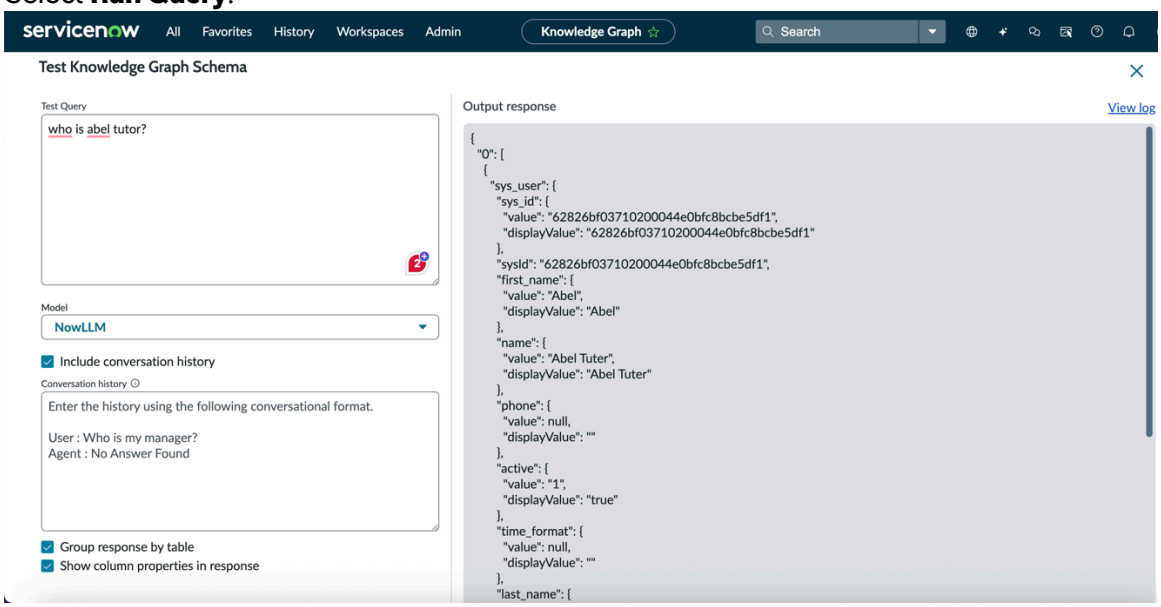
Promote functionality by entering a query and testing the Knowledge Graph schema.

Before you begin
Role required: kg_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer**.
   The UI displays a list of all the Knowledge Graph schema on the landing page.
2. From the list of Knowledge Graph schema, select the Knowledge Graph that you want to test.
   The Knowledge Graph schema opens in the canvas.
3. From the toolbar, select **Test**.
4. In the Query section of the Test Knowledge Graph Schema window, enter your question.
5. Select an LLM model from the following:
   - **NowLLM**
   - **Claude**
   - **Gemini**
   - **GPT**
6. **Optional:** Select **Include conversation history** check box to add the any previous chats.
7. **Optional:** Select **Group response by table** to sort the results.
8. **Optional:** Select **Show column properties in response** to view the associated properties.
9. Select **Run Query**.



Analyze Knowledge Graph logs for debugging

Review Knowledge Graph logs and history to analyze performance and diagnose issues.

Before you begin

Don't make any changes to the production instance.

Role required: admin

Procedure

1. Navigate to **All** > **sys_properties.list** > **sn_kg.log.level** or **All** > **System Properties** > **All Properties** > **sn_kg.log.level**.
2. Open *sn_kg.log.level* and in the value field add `debug`.
   The default value is **Err** but you can use any of the following values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- emerg
- alert
- crit
- err
- warning
- notice
- info
- debug

3. Select **Update**.
   The logs will now be added to *syslog*.

Create a copy of a Knowledge Graph schema

Create a copy of a Knowledge Graph schema and duplicate it for further customization.

Before you begin

Verify that you have not selected a ServiceNow prebuilt Knowledge Graph schema that is non-editable.

Verify that the scope selected when creating a Knowledge Graph schema is the same as the scope of the existing Knowledge Graph schema.

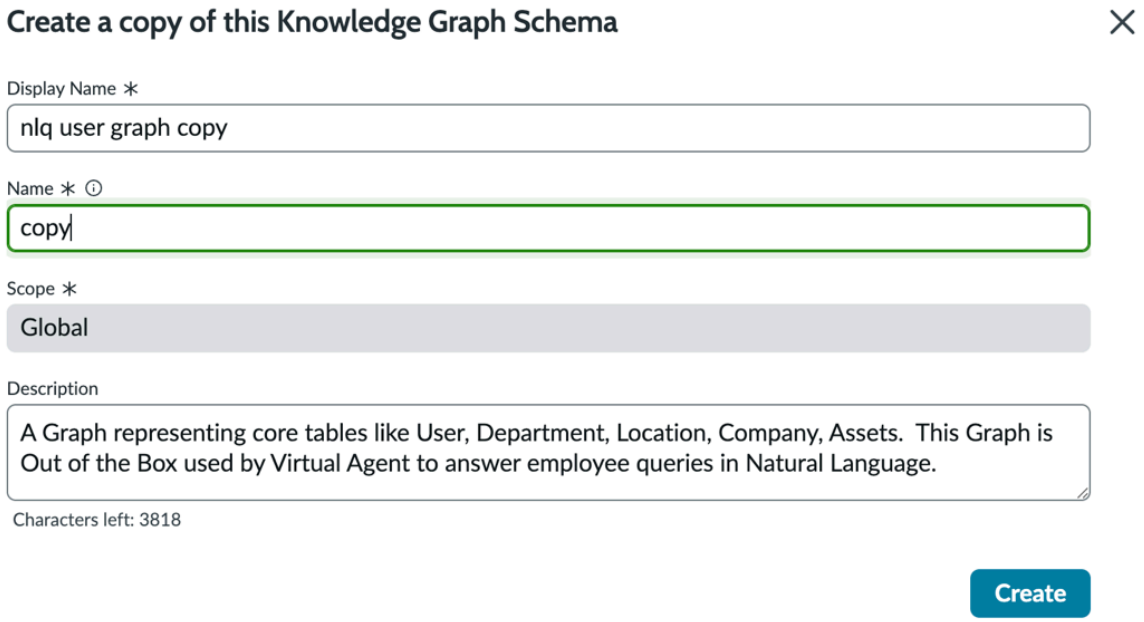
Role required: kg_admin

Procedure

1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer**.
   The UI displays a list of all the Knowledge Graph schemas on the landing page.
2. Select a Knowledge Graph schema.
3. Select the more icon ( ).
4. Select **Copy Graph**.
   Verify that the scope of the existing Knowledge Graph schema is the same as the new schema.
5. On the form, fill in the fields.

Field	Value
Display Name	Existing name of the Knowledge Graph schema.
Name	Name of the cloned Knowledge Graph schema.
Scope	Scope under which you want to create the Knowledge Graph schema.
Description	Knowledge Graph schema overview for users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Create**.

Using Enterprise graph schema

Use Enterprise Graph for accurate natural language query responses, across the entire database.

Enterprise graph is a pre-configured Knowledge Graph schema that maps all instance tables and their connections, enabling natural language queries for data across all tables.

To see some examples of the Natural Language query responses, refer Natural language queries use cases and examples.

Enterprise graph schema simplifies Knowledge Graph setup by providing a preconfigured schema, eliminating the need for custom schema creation in Knowledge Graph designer.

Admins can choose Enterprise graph as the Knowledge Graph schema when using AI agents, ServiceNow® Otto for Virtual Agent, or ServiceNow Otto panel admin and add tags to enhance accuracy.

By mapping all tables, the Enterprise graph schema expands query capabilities to cover the entire database, whereas a custom or out-of-the-box (OOTB) schema limits queries to only the tables included in its specific schema.

Benefits of Enterprise Graph on Prebuilt integration

Now Assist ServiceNow® Otto for Virtual Agent- With Enterprise Graph integration, ServiceNow® Otto for Virtual Agent can respond to a wide range of questions about their enterprise data from requester, helping to deflect queries.

ServiceNow Otto panel- With Enterprise Graph enabled, ServiceNow Otto panel allows fulfillers to obtain insights from the structured data in instance by asking natural language questions, which boosts their productivity.

AI agents- With Enterprise Graph enabled, AI agents can access relevant information from structured data in ServiceNow instance directly from the Knowledge Graph, giving them essential context for tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Modes of Enterprise Graph

Enterprise Graph has two modes:

- Enterprise Graph- regular mode
- Enterprise Graph (Small)

Regular mode is used for use cases with large number of tables (more than 50 tables), to:

- Searches across all tables, but gives more priority to tables which are included in the tag added at time of configuring Enterprise Graph in the consuming app (AI agent or VA).
- Useful for scenarios where answer is expected from large number of tables.

Enterprise Graph (Small) is a version of Enterprise Graph that limits the search to only the tables tagged with specific labels. This means it can only answer queries related to those tables. It's useful for:

- Searches only within tables which are included in the tag added at time of configuring Enterprise Graph (Small) in consuming app (AI agent or VA). Tagging is mandatory in this mode.
- Useful for latency-sensitive use cases with limit of 50 tables

Tags in Knowledge Graph

Tags are lists of key tables that are important for answering natural language questions in a specific use case. They are required to be used with Enterprise Graph and Enterprise Graph (Small).

Tagging in Knowledge Graph Designer

Use Knowledge graph tags to mark the key tables, that are important for answering natural language questions for specific use cases.

Use Knowledge Graph Designer to create and edit tags from the **Enterprise Graph Tags** section.

Tagging in different Enterprise Graph modes

Name	Description
Enterprise Graph- regular mode	Provides suggestion to Enterprise Graph on which tables to prioritize when retrieving information, to improve the accuracy of results. Tag up to 30 tables for regular mode as hints to prioritize while searching.
Enterprise Graph (Small)	Provides a list of tables to run the search operation. Enterprise Graph (Small) will only search on the tables provided by tags. It is mandatory to add a tag when Enterprise Graph (Small) is used with any of the prebuilt integration with AI agent, Virtual Agent or ServiceNow Otto panel. You can tag a maximum of 50 tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tagging in different Enterprise Graph modes (continued)

Name	Description
	Note that to enable querying on columns of table which are references to another table, also include referenced table in tags.

Creating tags

Tags are created by kg_admins using the Knowledge Graph Tags section. Tags has to be linked to schema when selecting the Enterprise Graph or Enterprise Graph (Small).

Link Knowledge Graph schema for your use case in Virtual Agent, ServiceNow Otto panel or AI agent.

Knowledge Graph ships the following prebuilt tags:

1. Virtual Agent DEFAULT TAG: A prebuilt tag listing common to core, ITSM, and HR tables for integrating Enterprise Graph with the Virtual Agent on the employee portal. Admins can edit this tag to include additional tables relevant for answering Virtual Agent queries.
2. ServiceNow OttoPANEL DEFAULT TAG: A prebuilt tag listing common to core, ITSM and HR tables which can be leveraged as general tag on ServiceNow Otto panel. Admins can edit this tag to add additional important table for answering questions on ServiceNow Otto panel.

Follow these steps to create or edit tags:

- Go to the Knowledge Graph Designer to view the existing tags and their associated tables. You can use an existing tag, edit one to fit your needs, or create a new tag for your particular use case.
- Navigate to the admin center for consuming apps.
  - For the Virtual Agent or ServiceNow Otto panel, go to your virtual agent's setup, select Information Sources, and open the Knowledge Graph.
  - For AI agent, proceed to its setup and open the Knowledge Graph tool for the AI agent.
- Select Enterprise graph or Enterprise Graph (Small) as the Knowledge Graph schema and select the required tag from Tag drop down to link it to graph schema.

Note: In this release, the Enterprise Graph option is hidden by default for Virtual Agent and ServiceNow Otto panel, and only Enterprise Graph (Small) can be selected as schema option. To use Enterprise Graph, Admins can enable it as a schema option by setting the property `sn_kg.va.enable_global_graph_all_modes` to true. The role required is Admin.

Recommended tables for different use cases

- Virtual Agent: For Virtual Agent, include the tables necessary to answer the expected user queries. For example if you want to deploy a new virtual agent on employee center portal, you should add a tag having tables relevant for answering employee questions.
- ServiceNow Otto panel: ServiceNow Otto panel operates as a unified assistant across multiple workspaces, hence it is essential to tag tables as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An individual tag for each workspace that encompasses key tables relevant to that workspace. This ensures the ServiceNow Otto panel can deliver responses specific to queries related to the workspace tables when accessed within each workspace.
- Create a general tag that includes the most important tables required to answer users questions on ServiceNow Otto panel, allowing the panel to provide answers when used outside of any workspace.
- For more information on adding workspace tags in ServiceNow Otto panel, see Add a Knowledge Graph schema to a chat assistant.

- AI agent: For an AI agent use case, include key tables relevant to the agent's purpose. For example, for asset manager agents User, Asset, and other crucial tables should be included in the tag. For more information, see Add a Knowledge Graph to an AI agent.

Improving Natural Language Queries with Tag configuration

AI instructions add more business context to natural language queries. They guide users and promote responses that more closely align with their needs and expectations.

AI instructions

AI instructions help clarify how the knowledge graph interprets user queries and accesses data. When a user submits a query, relevant instructions at all applicable levels like node, property, and edge are considered.

AI Instructions are persistent, declarative guidance applied at three levels:

- Node (entity/table) level
- Property (column/attribute) level
- Edge (relationship) level

The Always Include flag

The option to set an **Always include** flag enables users to indicate that a particular instruction should be considered unconditionally. This is useful for enforcing critical business filters, such as always excluding certain asset statuses unless requested otherwise.

Instructions:

- Use **Always include** for business-critical filters that must apply regardless of user query phrasing.
- Omit **Always include** for context-sensitive instructions that should only apply when relevant.
- Verify that flagged instructions do not conflict with each other or produce duplicate results.

The following table shows common scenarios where AI instructions improve query accuracy and provide better business context.

Examples of how to use AI instructions effectively

No.	Instruction Pattern	Example Query	Behavior without AI instruction	Sample AI instructions	Behavior with AI ins
1	Preventing incorrect traversal paths	Which companies are located in New York?	When no instructions are added, the query goes from	Table Instruction on `core_company` table: `For company-city queries, always use`	When instruction the query matche field in core_comp and then filters cit

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples of how to use AI instructions effectively (continued)

No.	Instruction Pattern	Example Query	Behavior without AI instruction	Sample AI instructions	Behavior with AI ins
			core_company to cmn_location table and filters on city field by default. But if your use case requires to query location from city field of core_company table, you need to write an AI instruction to guide the system on the traversal path.	`core_company.city directly. Do NOT traverse through cmn_location.` This instruction avoids the system from using cmn_location path for city-based company queries.	York and returns a companies.
2	Providing column specific context	Who hosted BBS0000013 brown bag session?	When there is no AI instruction, the system will return sys_id without traversing to host_s. You need to add an instruction on host_s column to provide business context to use this column when query is about host.	Column Instruction on `host_s` of `x_snc_brown_bags_sessions` table: `Use s.host_s or :host_s relationship for the host of a brown bag session, NOT s.sys_created_by`	When instructions added, the query returns the name column.
3	Providing column specific context	What is Kelsey Rodriguez's tenure in current role (months)?	When there is no AI instruction, the system may not give accurate result as it may provide incorrect information for tenure column. You need to add an instruction to guide the system to refer right column for such queries.	Column instruction on `time_in_current_role` column: `Prioritize this column when query contains 'tenure in current role'`	When instructions added, the query returns the time fr `time_in_curr` column.
4	Providing context on what to prioritize in case of similar tables	Give me name of Allison Hill's reports having goals pastdue >0?	When there is no AI instruction, LLM will directly refer to “sys_user” table to fetch user details instead of traversing to WDF table where	Table instruction on WDF table – “x_snc_wdf_user” “Always give more priority to " x_snc_wdf_user”over sys_user and other glide tables”	When instructions added, the query refers to WDF tabl return results.

Examples of how to use AI instructions effectively (continued)

No.	Instruction Pattern	Example Query	Behavior without AI instruction	Sample AI instructions	Behavior with AI ins
			this information is stored. We need to add an instruction to guide LLM to refer right table when there are similar tables.		
5	Providing context on what to prioritize in case of similar tables	What is your job title?	When there is no AI instruction, LLM will directly refer to “sn_hr_core_job” table to fetch job details instead of traversing tosn_hr_core_profile" table where this information is stored. We need to add an instruction to guide LLM to refer right table when there are similar tables.	Table instruction on table – “sn_hr_core_profile” “Always give more priority to "sn_hr_core_profile" over “sn_hr_core_job” when user specifically asks about job titles.	When instructions added, the query refers to “sn_hr_c table and return re
6	Disambiguate among multiple similar and confusing choice values	What are the hardware models that are in normalized state?	When there is no AI instruction, LLM will refer to “normalized” choice value of “normalization status” column which could confuse LLM whether to use other choice values or not as “normalization status” field has 5 choice values (normalized, manufacturer normalized, manually normalized, partially normalized, match not found).	Column instruction on “Column-normalization status”: “Always consider normalization status as normalized when choice values is any of the following choices: “normalized, manufacturer normalized, manually normalized”	When instructions added, the query considers all 3 ch “normalized, manu normalized, manu normalized” as no state and return re

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples of how to use AI instructions effectively (continued)

No.	Instruction Pattern	Example Query	Behavior without AI instruction	Sample AI instructions	Behavior with AI ins
			We need to add instruction to guide LLM on which all choices to include in normalization status.		

Best practices for AI instructions

Follow these guidelines when creating AI instructions to verify optimal performance and accuracy:

- Write clear, unambiguous, and actionable instructions tied to business logic. Always reference the correct tables (nodes), columns (properties), and relationships (edges). Use flags like Always include only when enforcing true default business behavior.
- Avoid vague or contradictory instructions. Instructions that do not align with the underlying data model can confuse the system and lead to incorrect results. For example, an instruction like "Filter by manufacturer" without specifying the column or condition is ambiguous.
- Use conditions to control when logic applies. Clearly state when an instruction should be applied (for example, only when the user asks for host information), rather than applying logic universally.
- Keep instructions focused and generalized. Instructions should guide intent interpretation across similar queries, not solve a single one-off case.
- Do not duplicate logic already handled elsewhere. Avoid restating filters or constraints that are already enforced through data filters to avoid conflict.

Support for Synonyms, Data Filters and hidden columns

Synonyms:

Knowledge Graph supports configuring synonyms for tables, columns, edges, and reverse edges to enhance flexibility and user-friendliness. Synonyms enable users to define alternate names for these entities, accommodating different terminologies.

- Each entity can have up to five synonyms.
- Synonyms promote broad coverage for commonly used alternate terms.
- Maintaining a manageable synonym set reduces ambiguity in query resolution.

Data Filters:

Data filters are applied deterministically as post-processing rules to refine query results. After initial Cypher generation, filters are systematically applied to promote consistency and reliability of outcomes.

- Filters are applied after Cypher generation, not during.
- Dynamic filters enable real-time adaptation based on user context.
- Improves precision and relevance of returned data. Does not modify the core graph query.

Hidden columns:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hidden columns cannot be queried and do not appear in the result.

For example: add Employee number as hidden columns for sys_user table to hide the employee number from query results.

Create Knowledge Graph tag

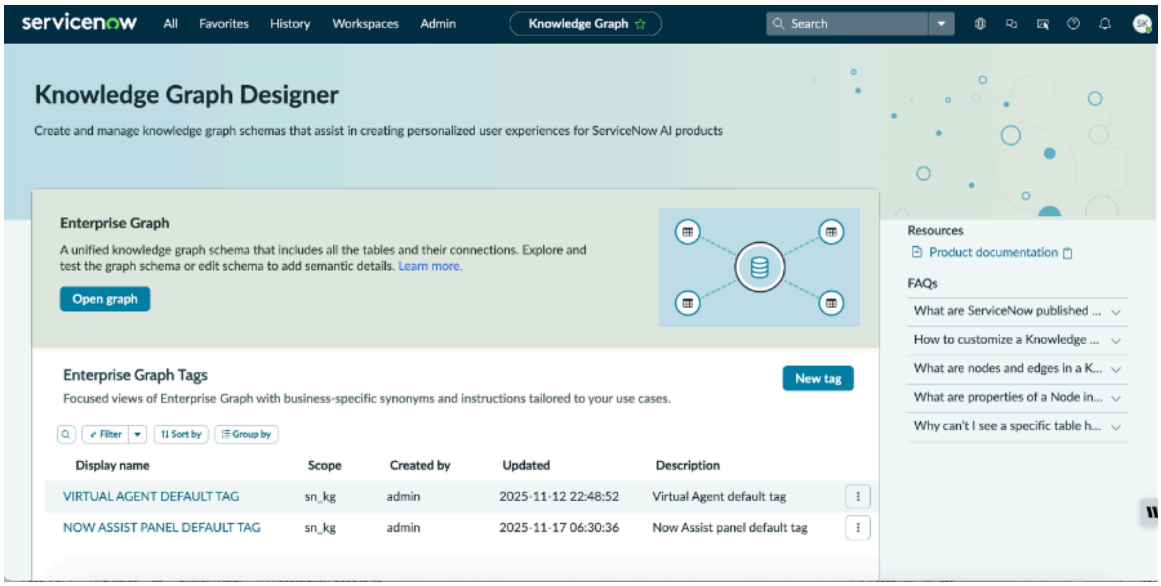
Create Knowledge Graph tags for Now Assist Virtual Agent, AI agent or Now Assist panel Enterprise Graph using Knowledge Graph Designer to improve accuracy of natural language queries.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Knowledge Graph Designer** > **Enterprise Graph Tags** > **New tag**.
   You are navigated to the Create New Tag record page.



2. On the Create New Tag record page, add the following information:

   - Tag name: Name for the tag.
   - Description

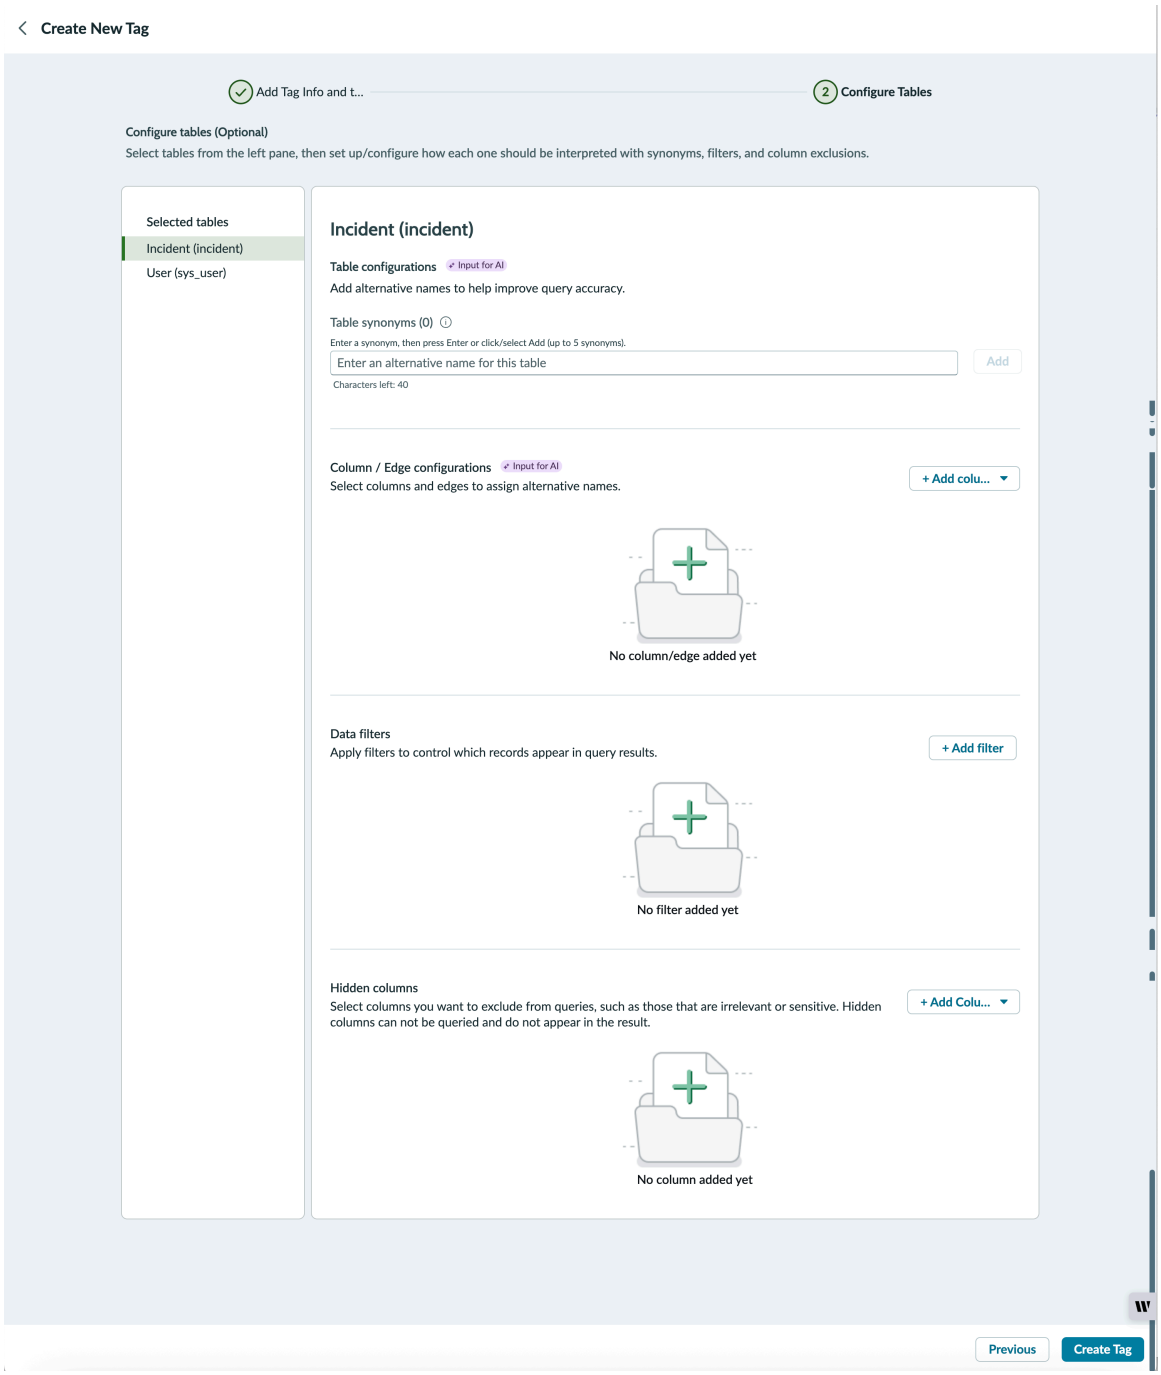
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Scope: The default selection in Global. Read-only field.
- Select Tables: The tables or nodes that you want to add to the tag.

3. Select **Next** to go to Configure tables page.

   The details that are added to the Configure tables page will help to further improve the accuracy of the natural language queries.

   The selected tables will be displayed on the left pane of the Configure tables page.



4. Select a table from the left pane to add the following: , column and edge configurations, data filters and hidden columns.
   - Tables configurations: Synonyms and AI instructions
   - Column and edge configurations: Synonyms and AI instructions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data filters
- Hidden columns

AI Instructions injects business context directly into the Knowledge Graph natural language query engine, shaping how the system interprets and traverses data. Instructions can be configured at three levels:

- Node (entity/table)
- Property (column/attribute)
- Edge (relationship)

Each instruction can optionally be marked as **Always Include**, ensuring critical business logic applies unconditionally across all queries. For example, excluding retired assets or closed tickets by default unless explicitly requested.

For best results, write instructions as generalized, context-driven guidance rather than hard-coded references to specific table values. See Improving Natural Language Queries with Tag configuration to see detailed examples.

5. Add alternative names in the **Table synonyms** field and select **Add**.
   - Use the commonly used table names as synonyms to help AI recognize it in natural language queries.
   - Example: you can add Tickets as a synonym for the Incident table.
   - You can add up to five synonyms only.
6. To delete a synonym, select icon next to the synonym.
7. Add AI Instructions in the Table Configurations section and select **Add**.

   Note: Add up to 5 table specific business context in the **AI Instructions** field.

8. Select **Always include** to allow adding an instruction as a default business logic.
   For example, always include instruction to skip retired assets from the results unless user explicitly request for it.
9. Select **Add Column** and choose the columns and edges that you want to add synonyms to.
   - Add commonly used column and edge names as synonyms to help the AI match user terms to this field.
   - Example: you can add Opened On as a synonym for Created Date.
   - You can add up to five synonyms only.

   The selected columns and edges are added to the **Column / Edge configurations** section.
10. To delete a column from the section, select next to the column.
11. Add AI Instructions in the **Column/Edge Configurations** section and select **Add**.

    Note: Add up to 5 instructions per entity in the **AI Instructions** field.

12. Select **Add filter** option to add data filters for managing which records appear in the query results and add the following details:
    - Field
    - Operator
    - Value

    Examples:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To exclude inactive users from search results, apply `Active = True` filter.
- To include only active incidents in response, add a data filter to consider `state in (in progress, on hold)`.

13. Select **Apply filters to child tables** check box if you want to add the same filter conditions for the child table of the selected table in the tag.
    If enabled, these filters will also apply to child tables that inherit data from this table.
14. Select irrelevant or insensitive columns from the **Hidden column** drop-down to exclude them from queries.
    Hidden columns cannot be queried and do not appear in the result.

    For example, add `Employee number` as hidden columns for `sys_user` table to hide the employee number from query results.
15. Select **Create tag** and repeat the same process for each of the selected columns.

Managing Knowledge Graph tags

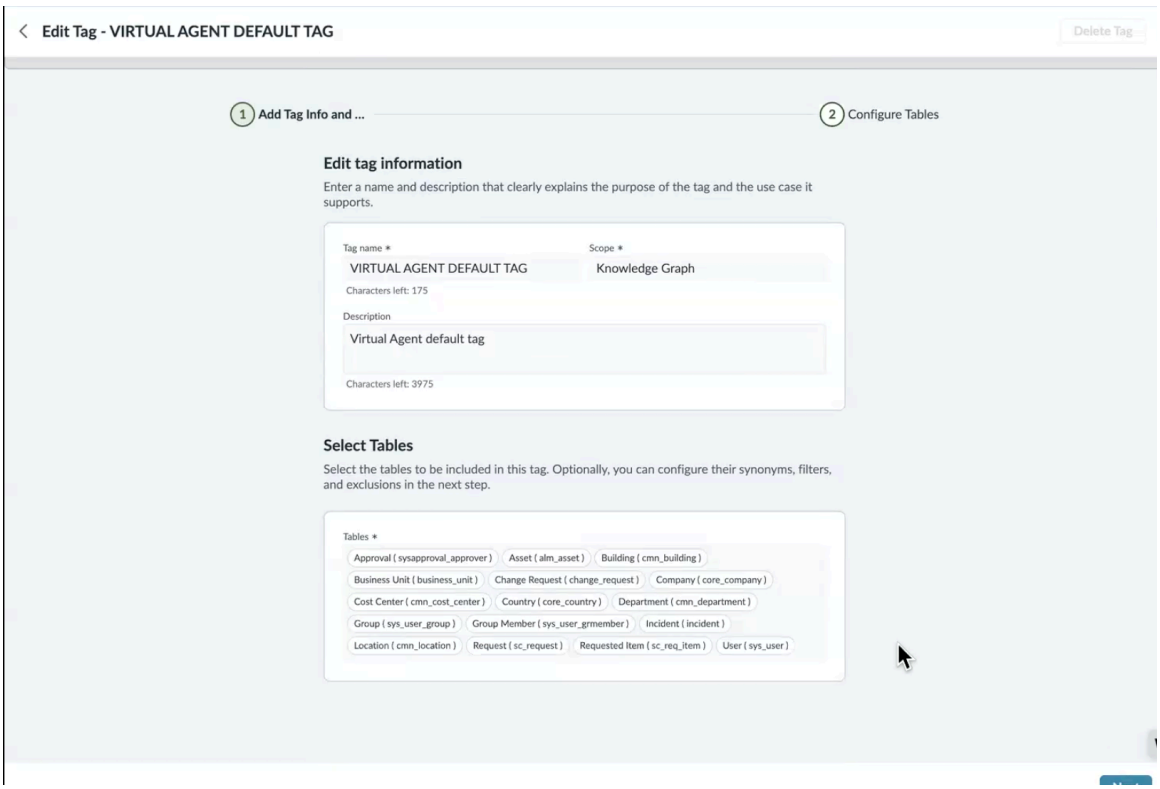
Edit or delete Knowledge Graph tags for Now Assist Virtual Agent, AI agent or Now Assist Panel Enterprise Graph use case.

Before you begin

Role required: admin

Procedure

1. To edit an existing tag, go to **All** > **Knowledge Graph Designer** > **Enterprise Graph Tags**.
2. Select a tag to open it in Knowledge Graph canvas.
   You can see all the tables that are part of the tag on the Knowledge Graph canvas.



3. Select **Edit tag** option to open the Edit Tags window or select a node to edit.
   If you select a node you will see the Tag configuration section on the right pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. You can also select the Edit tag configuration ( ) icon from the **Tag configuration** section to open the Edit Tags window.
5. To delete a tag, select the ⋮ icon next to a tag on Enterprise Graph tags section on home page.
6. Select **Delete** from the drop-down.
   You can also select the edit option here, to go to the Edit tags window.
7. When prompted, confirm the deletion process.

Setting up Enterprise graph in sub-production instance

Use these steps to setup Enterprise graph in sub-production instance manually.

Before you begin

Unlike production instances, the Enterprise Graph setup does not start automatically in the sub-production instance.

You have to manually enable the system property:
`sn_kg.description_generation.enable.non_production_envs`

When you enable this system property, the Enterprise Graph setup starts in the sub-production instances and can take several days to complete.

Until this setup is finished, the Enterprise Graph schema won't work effectively for answering queries.

This step creates the necessary descriptions for the Enterprise Graph to respond to queries.

Role required: kg_admin

Enterprise Graph initial setup in production instance

Setup and use Enterprise Graph Schema, a unified Knowledge Graph schema, that captures all the ServiceNow and third-party tables and their connections.

Before you begin

When you install Enterprise Graph, it automatically begins configuring instance tables. This may take several days and until the setup is complete, the schema won't respond effectively to queries.

If you have already completed the setup in sub-production instance, you can import the generated descriptions to production instance and fasten the process.

Assuming that you have completed the setup in sub-production instance, do the following to complete the initial setup in production instance:

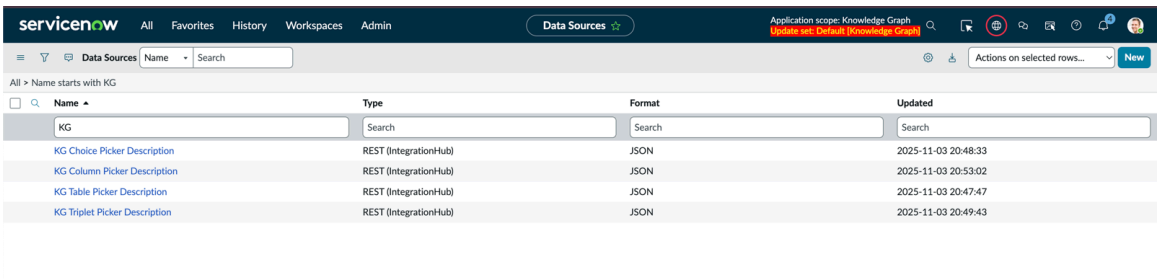
- Create an integration user, in the sub-production instance. For more information, see Create a user
- Verify if the descriptions are generated in sub-production instance.
- Use the following procedure to:
  - Import the data into production.
  - Run the associated Transform Maps.
- Remove tracker records from the production instance.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record with name **Description_Connector**.
3. Select **Create New Connection & Credential** from the related links section.
4. Enter the required details in the **Create Connection & Credential** form.
5. Add the user name and password that was used, while creating the new user.
   See Create a user for more information.
6. Navigate to **All** > **System Import Sets** > **Administration** > **Data Sources**.
7. In the name field search bar, enter **KG** to view the related tables.
   The following tables are displayed:
   - KG Choice Picker Description.
   - KG Column Picker Description.
   - KG Table Picker Description.
   - KG Triplet Picker Description.



8. Open one of the displayed table and select **Load All Records** from the Related links section.
   Ensure the data is loaded.
9. Navigate to **System Import Sets** > **Advanced** > **Import Sets**, once the data is loaded.
   For detailed information, see import set documentation Import sets
10. Open the import set and select **Transform** from the Related links section.
    For detailed information, see Transform map documentation Transform maps
11. Select **Transform** to complete the transformation.
12. Navigate to the selected table and verify if the data is loaded.
13. Repeat the import set and transformation steps for other three tables.

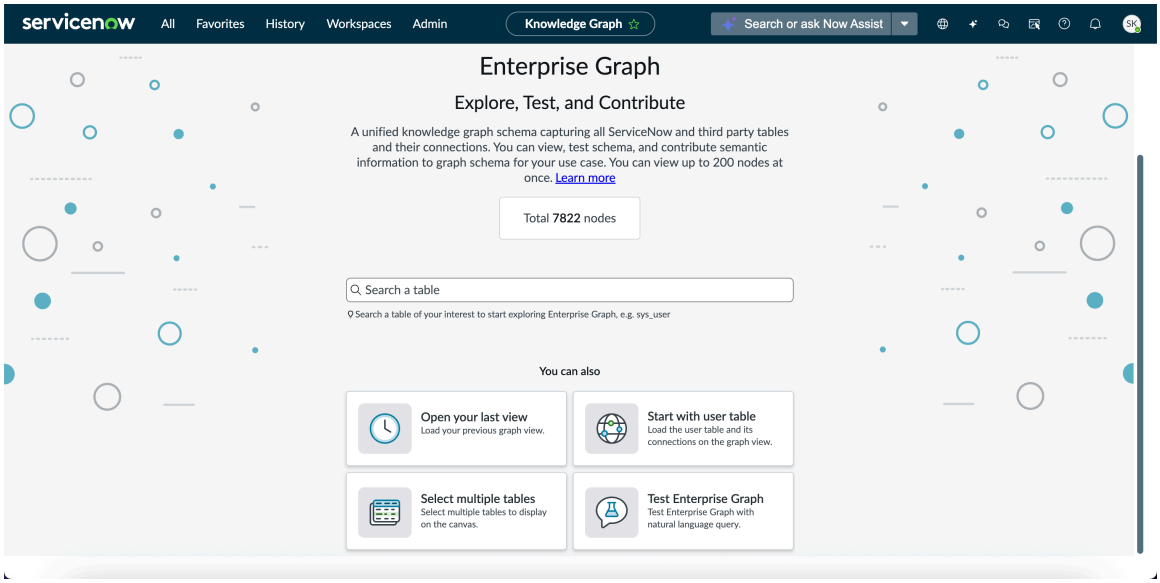
Access Enterprise Graph schema

View and manage Enterprise Graph schema, select tables and test the schema with Knowledge Graph Designer.

You can view and manage the Enterprise Graph schema, go to **All** > **Knowledge Graph Designer** > **Open Enterprise Graph**.

Use Enterprise Graph to view and test the schema. You can also contribute synonyms to the schema for your use case. Synonyms will help improve the accuracy of Enterprise Graph for answering queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



On the Enterprise Graph start page, use the search bar to search and select a table you want to view or manage. Alternately, you can use the **Open your last view** or **Start with user tables** to view the user and the related table.

The Enterprise Graph start page displays the total number of nodes. You can use the **Select multiple tables** option to select tables that you want to view in the schema.

Within **Select multiple tables** option, you can select an application, tag or individual tables. Once you select the node, you will see selected nodes and their associated tables on the schema.

You can also use the **Test Enterprise Graph** option to run a query on the Enterprise Graph schema.

View and manage Enterprise Graph schema

Use Knowledge Graph Designer to view and manage Enterprise Graph schema

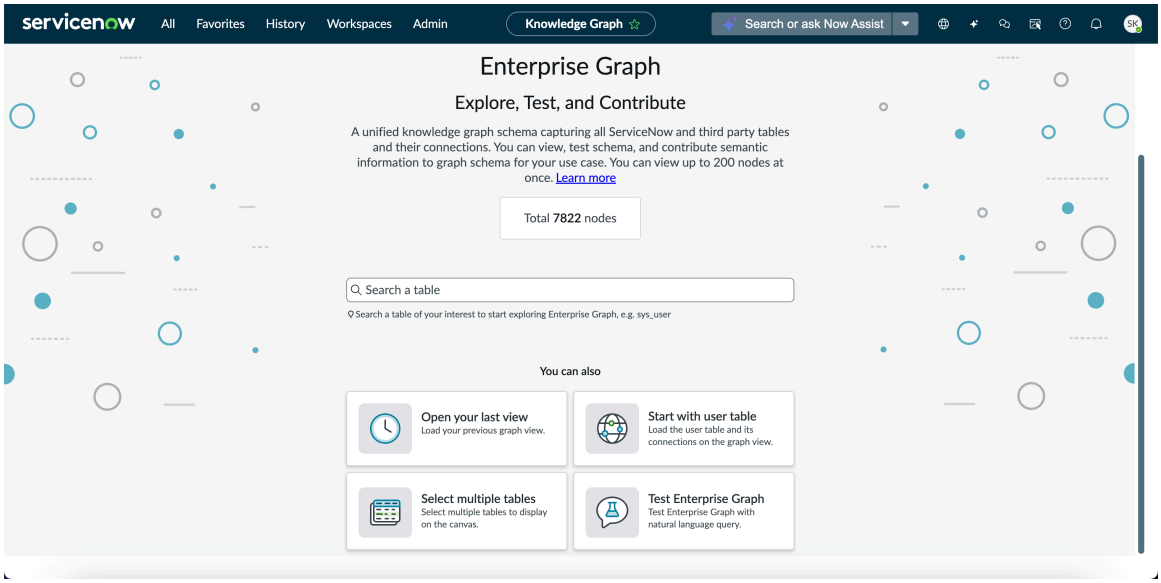
Before you begin

Role required: admin

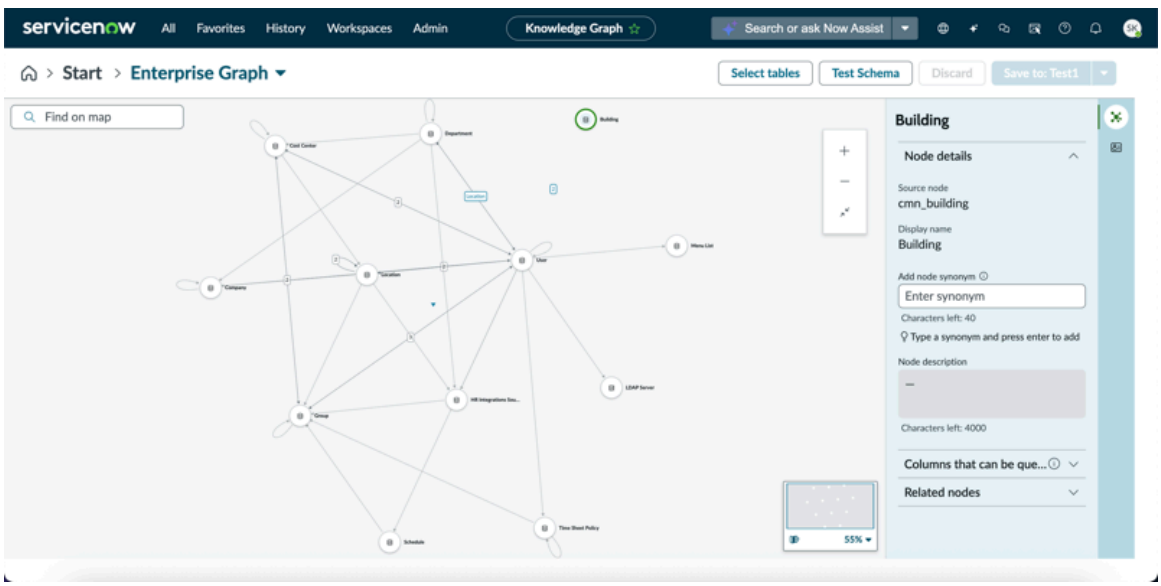
Procedure

1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer** > **Enterprise Graph**.
   You are navigated to the Enterprise Graph start page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Do one of the following to go to the Enterprise Graph canvas:
   - Search and select a table from the search bar.
   - Select **Open your last view**.
   - Select **Start with user tables**.
   - Select**Select multiple tables**.

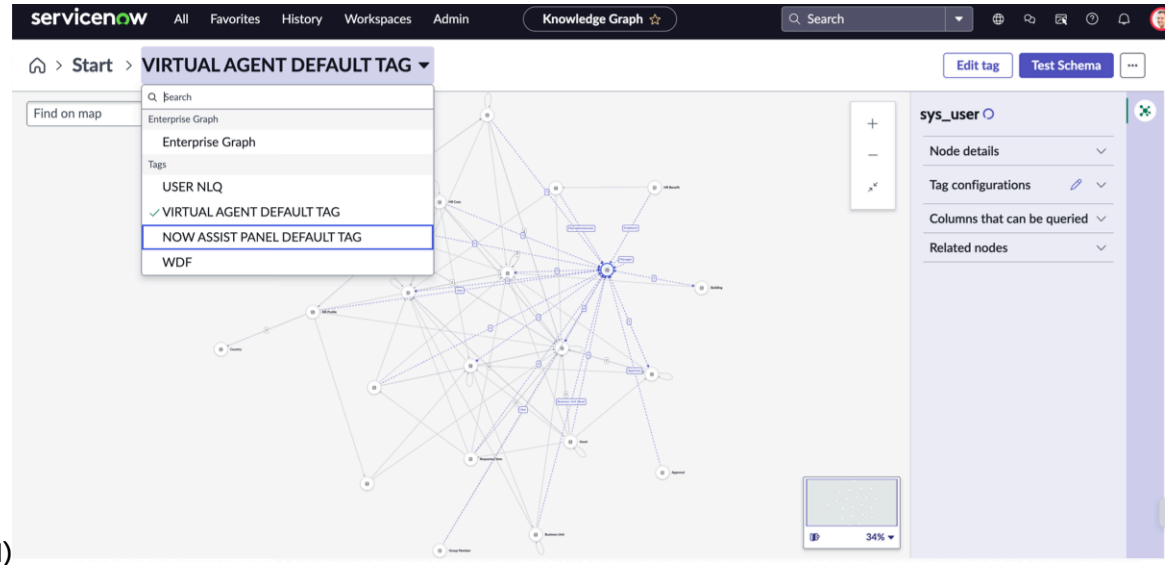


The Enterprise graph schema opens in the Knowledge Graph canvas page.

3. **Optional:** You can select a tag from the drop-down next to Enterprise Graph to see a specific tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional)



4. From the toolbar, select **Nodes details** option to view details or add a synonym for the node. The other fields are read-only and cant be edited. In the tag view of Enterprise Graph, you can also see tag configuration when you select a node.
5. Use the icon in the **Tag configurations** section to go to the Edit tag configurations page and update the following details:
   - Node synonyms
   - Column with synonyms
   - Data filters
   - Hidden columns
6. In the **Columns that can be queried** section, search and view the columns of the tables.
7. From the toolbar, select **Related nodes** to view the related nodes.
8. Select **Save** to save the synonyms that you have added.
   You can save to the most recent contribution or choose a another contribution from the drop-down, to save your changes.
9. Select **Discard** to delete your changes.

Select multiple tables

Choose one or multiple nodes to view in the Enterprise graph canvas.

Before you begin

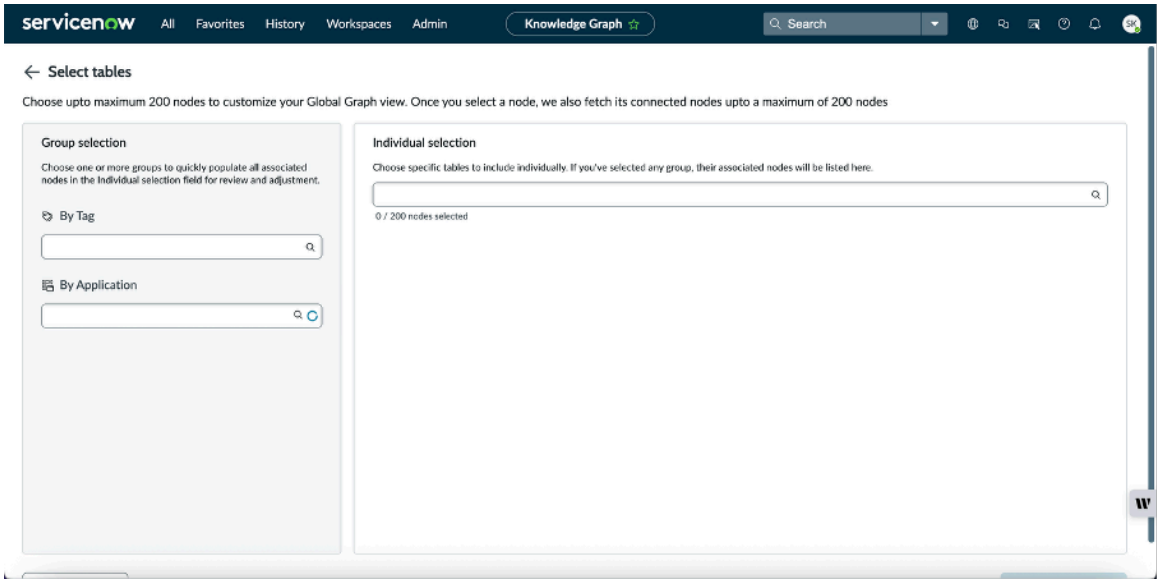
You can select an entire group or individual tables to view in Enterprise Graph canvas. All the connected nodes or associated tables also gets populated, once you select the node. However, you can only choose up to 200 nodes at once.

Role required: admin

Procedure

1. Navigate to **All** > **Knowledge Graph Designer** > **Open Enterprise Graph** > **Select multiple tables**.
   Choose up to 200 nodes to customize your view. Once you select a node, all the related edges will also be selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select a group using the **By Tag** or **By Application** search bar.
   You can search and choose multiple groups and all the associated nodes. The selection will be listed in the Individual selection section.
3. Select an individual node using the **Individual Selection** search bar.
4. Select **Apply** to view these nodes and its related tables on Enterprise Graph canvas.

Test an Enterprise Graph schema

Promote functionality by entering a query and testing the Enterprise Graph schema.

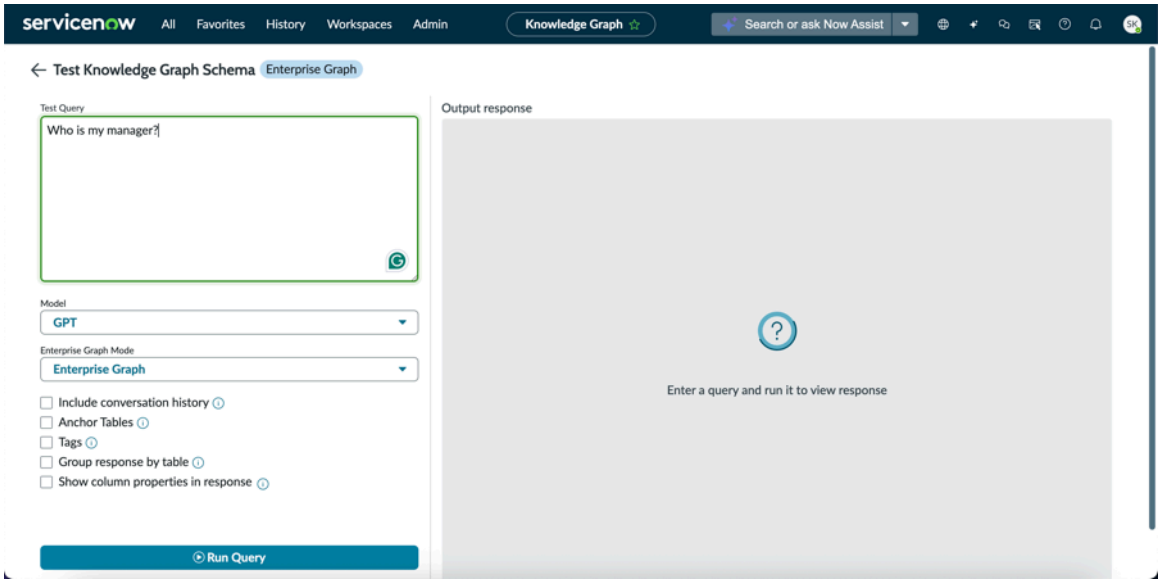
Before you begin

Role required: admin

Procedure

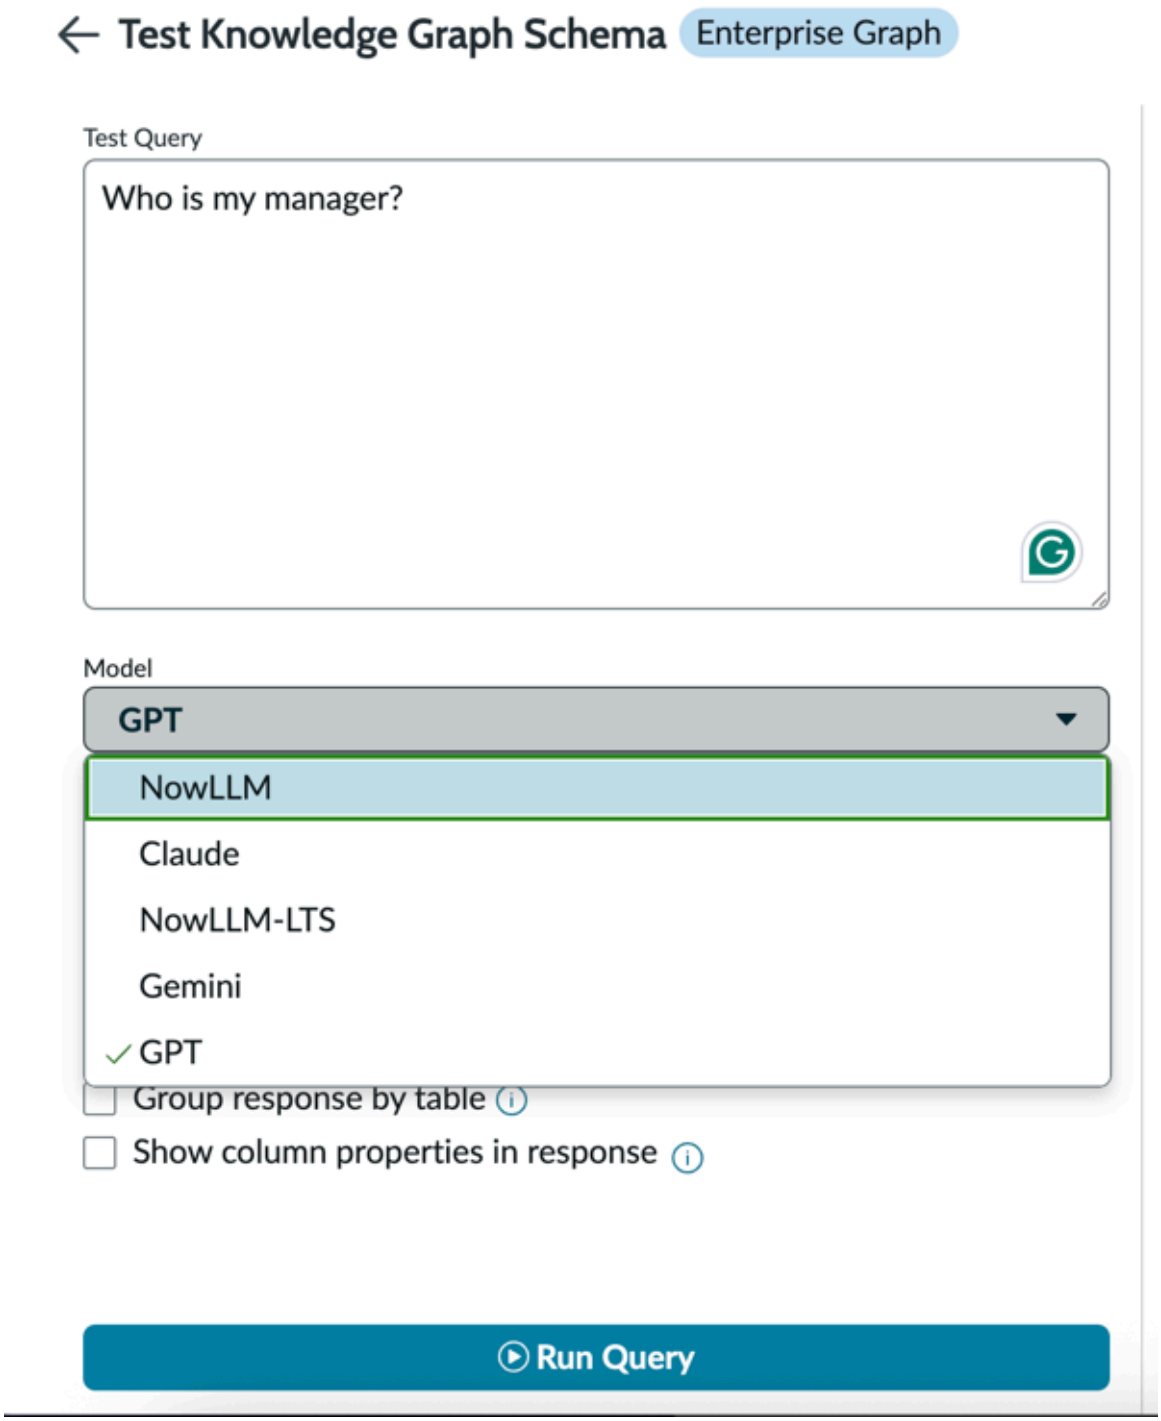
1. Navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer** > **Enterprise Graph**.
2. Select **Open your last view** to load and view the recently opened Enterprise Graph schema.
   The Enterprise graph schema opens in the Knowledge Graph canvas page.
3. From the toolbar, select **Test**.
   You are navigated to Test Knowledge Graph Schema page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



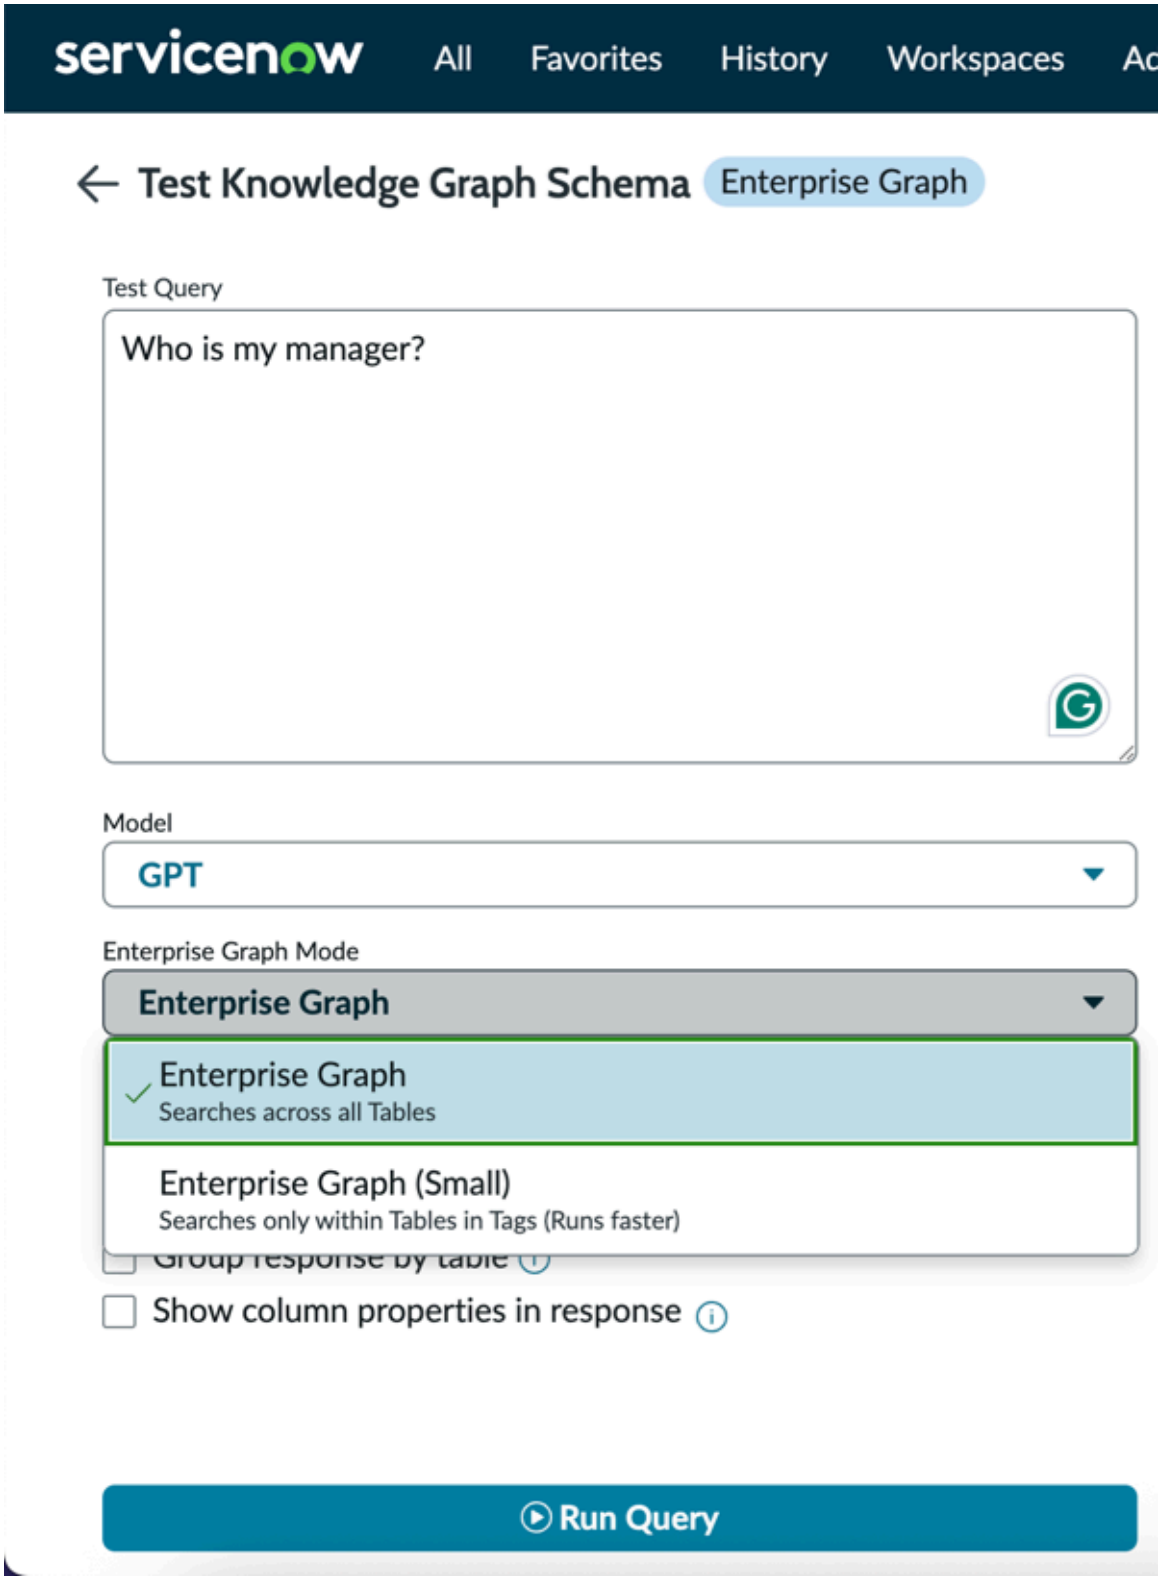
4. In the Query section of the Test Knowledge Graph schema window, enter your question.
5. Select an LLM model from the following:
   - **NowLLM**
   - **Claude**
   - **NowLLM-LTS**
   - **Gemini**
   - **GPT**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select an Enterprise Graph mode.
   The options are:
   - Enterprise Graph
   - Enterprise Graph (Small)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. **Optional:** Select **Include conversation history** check box to add the any previous chats.
8. **Optional:** Select **Anchor Tables** check box to add the Anchor tables.
9. **Optional:** Select **Tags** check box to add the associated tags.
   In Enterprise Graph (Small) mode, tags are mandatory.
10. **Optional:** Select **Group response by table** to sort the results.

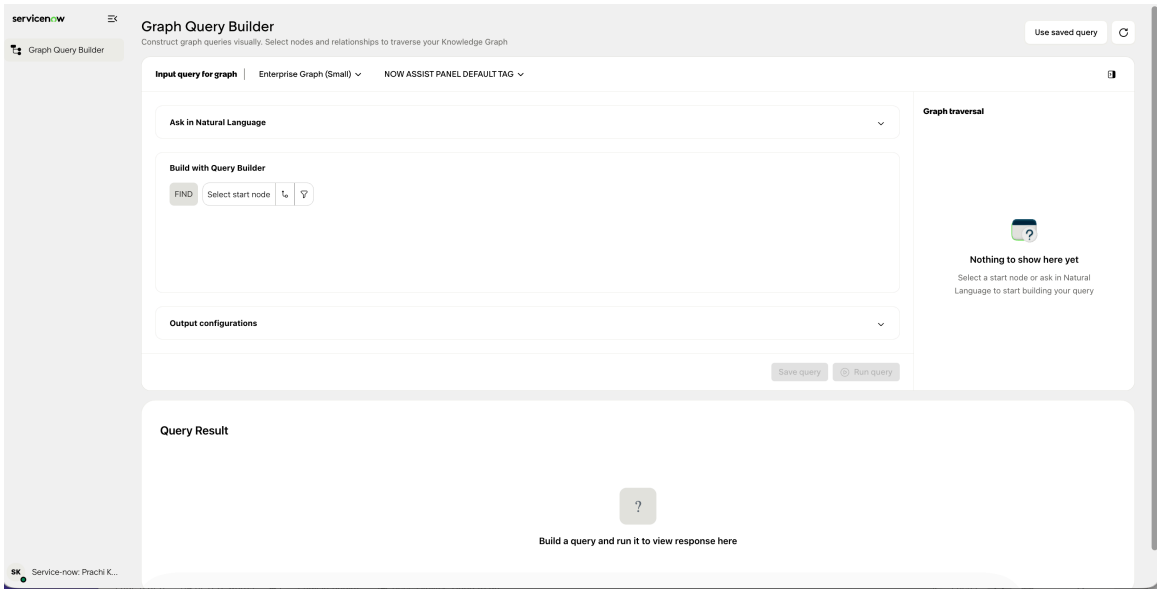
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. **Optional:** Select **Show column properties in response** to view the column properties along with associated data.
12. Select **Run Query**.

Graph Query Builder

Graph Query Builder provides a visual interface for building and running Knowledge Graph queries without writing code. You can also use natural language to generate queries.

You have two options on the Graph Query Builder page. You can either to ask query in Natural language or build your own query using the Query Builder.



If you prefer to build a query, you can select a graph between Enterprise Graph, Enterprise Graph Small, or a user-created graph. Choose a starting entity and add relationships to the connected entities by applying **AND** or **OR** filters on the properties. You can define which output fields appear in the results and whether to return individual records or aggregated results.

As you build, a live graph in the right panel shows the query taking shape. You can confirm it matches your intent before running it.

You can also skip this manual query construction and ask a natural language question instead. Graph Query Builder converts your natural language input into a query using the LLM of your choice and lets you review, edit, and rerun it.

Example natural language query: `Show me all incidents assigned to the Finance team.`

You can save the successful queries as private or for everyone who has access. This prevents rebuilding common or complex queries.

Graph Query Builder benefits

Discover what you can actually query: Explore the entities, relationships, and properties available in a graph, instead of guessing at the underlying data model.

Build complex queries without writing syntax: The UI guides you through multi-hop traversal, relationship selection, and filters, step by step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See your query before you run it: A live graph view builds alongside you as you add entities and relationships, so you can confirm the query matches your intent before executing it.

Get results in the shape you need: Choose a list of records or an aggregated result, such as a count, so the output matches what you want to answer.

Reuse and share your work: Save a successful query for yourself, or share it with everyone who has access, so complex or recurring queries aren't required to be built from scratch.

Review and refine your query: Ask a natural language question and Query Builder shows you the exact query it generates, revealing how the question would be interpreted by ServiceNow® Otto for Virtual Agent or an AI agent. It is useful to refine phrasing and building trust in AI-assisted results.

Access Graph Query Builder

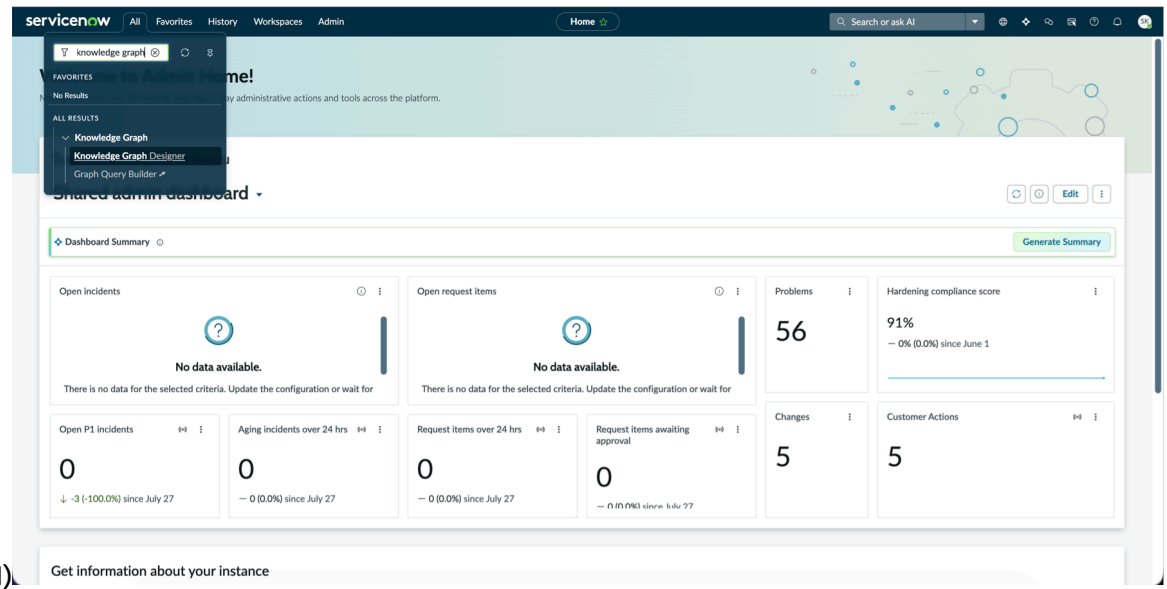
Open Graph Query Builder directly from drop-down menu options on the home page of ServiceNow UI or from the Query Builder section within Knowledge Graph Designer.

Before you begin

Role required: kg_admin

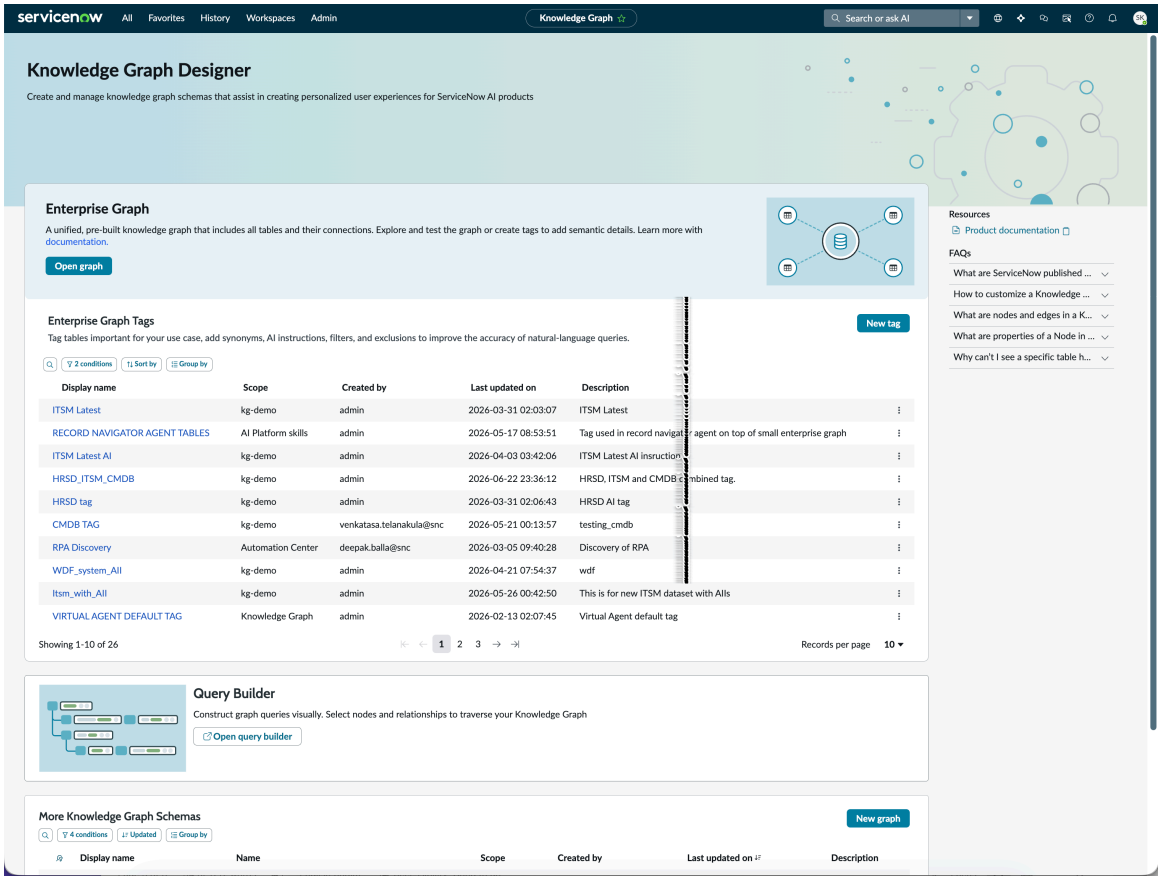
Procedure

1. Navigate to **All** > **Knowledge Graph** > **Graph Query Builder**.
2. **Optional:** You can also navigate to **All** > **Knowledge Graph** > **Knowledge Graph Designer** > **Query Builder** and select **Open Query Builder** from home page.



(Optional)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Graph Query Builder opens in a new browser tab, separate from Knowledge Graph Designer window.

Build a query in Graph Query Builder

Use Graph Query Builder to build a query by selecting the entities and their relationship, apply filters, choose the output columns and run the query.

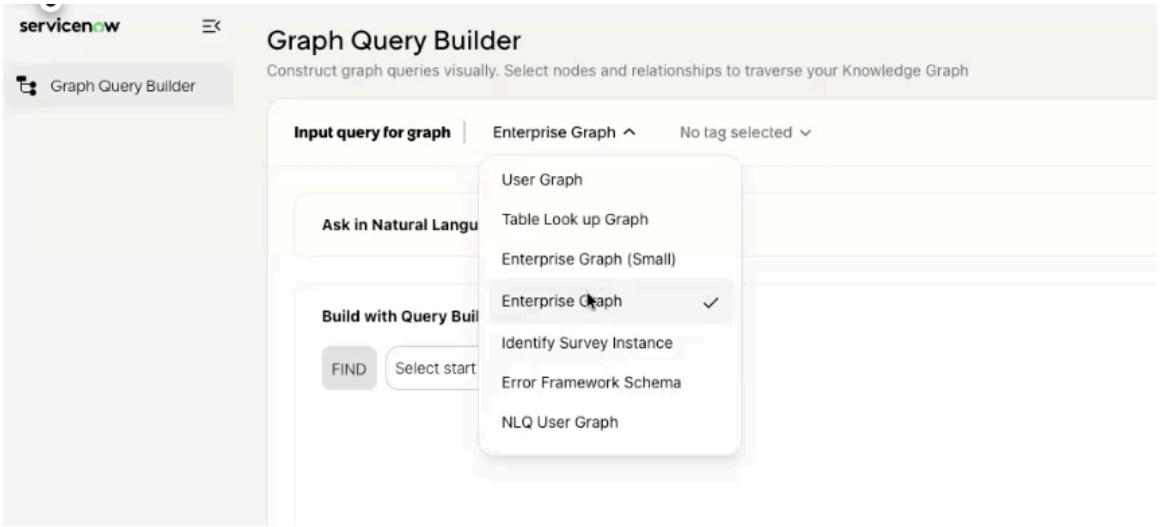
Before you begin

Role required: kg_admin

Procedure

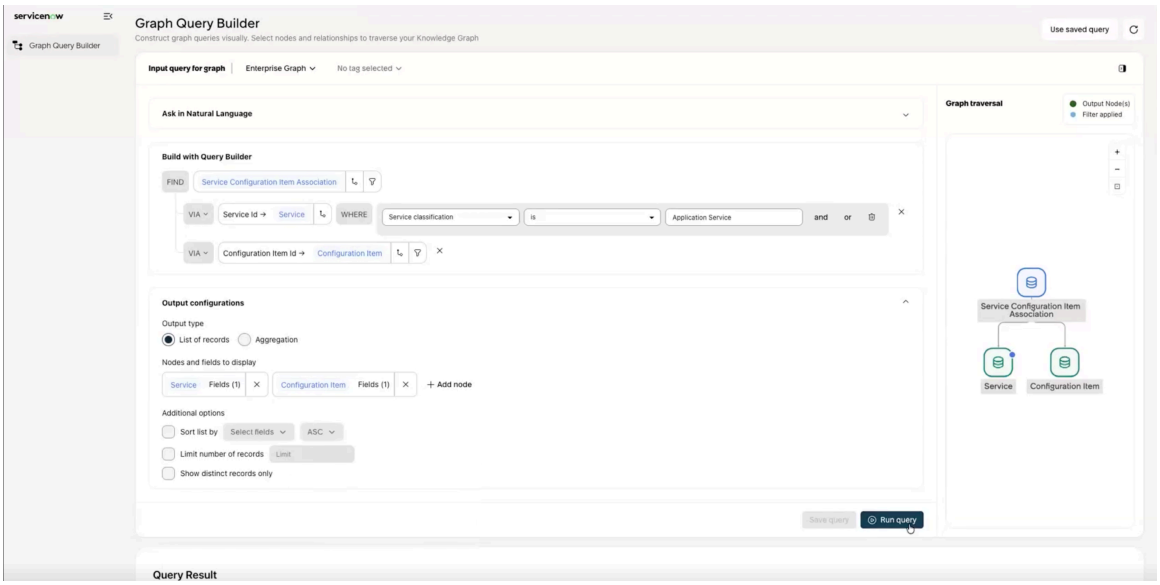
1. Navigate to **All** > **Knowledge graph** > **Graph Query Builder**.
2. Select a graph from the graph drop-down in the **Input query for graph** section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you select Enterprise Graph or Enterprise Graph (small), you will see an additional tag selection field to scope the available entities to specific tables.

Note: Tags aren't available for user created graphs.

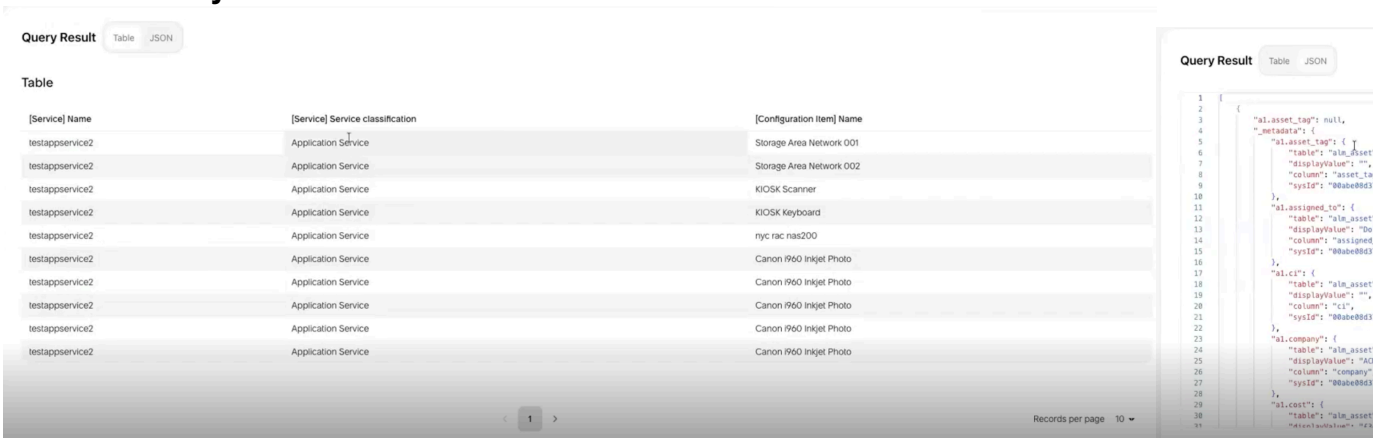


3. **Optional:** Select one or more tags from the drop-down, if you want to run a query using Enterprise Graph or Enterprise Graph (small).
4. Select a start node from the **Build with Query Builder** section.
5. **Optional:** Select the option to add filters and option to add relationships and hop onto another node.
   The selected node is the root of your query. As you add conditions and relationships, you can see a live graph view of the query alongside the builder, in the right panel.
6. **Optional:** Combine multiple filters with AND or OR and add second-level conditions and relationships to the existing conditions, if required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can add a relationship to traverse to a related entity. Add connection on the node to see the outgoing, incoming, and self-referencing relationships related to that entity, including any related CMDB tables.
- Select a relationship to add the connected entity to your query.
- You can add more entities, relationships, and filters to build a multi-hop query.

7. Select an output type from the **Output configurations** sections.
   The options are:
   - List of records: For a list, select the output entity and the specific columns you want returned. You can rename any column with an alias.
   - Aggregation: Select **Add numbers** and an option from the drop-down. You can then select a node and field and also rename any column with an alias, to show it in the results.
8. **Optional:** Select the **Group numbers by** check box and select a field from the drop-down.
   The options are
   - Sort list by: select a field to sort the list of records in ascending or descending order.
   - Limit number of records: To limit records in the results.
   - Show distinct records only: To show only distinct results.
9. **Optional:** Select **Group numbers by** option for aggregation and an option to sort the output.
   The options are:
   - Sort the output by a column
   - Limit the number of records returned
   - Restrict results to distinct records
10. Select **Run Query**.



Graph Query Builder runs the query and displays the results in table view and as JSON.

Build a query using natural language in Graph Query Builder

You can also ask a question in natural language, the Graph Query Builder populates the query in the builder and runs it to get results.

Before you begin

Role required: kg_admin

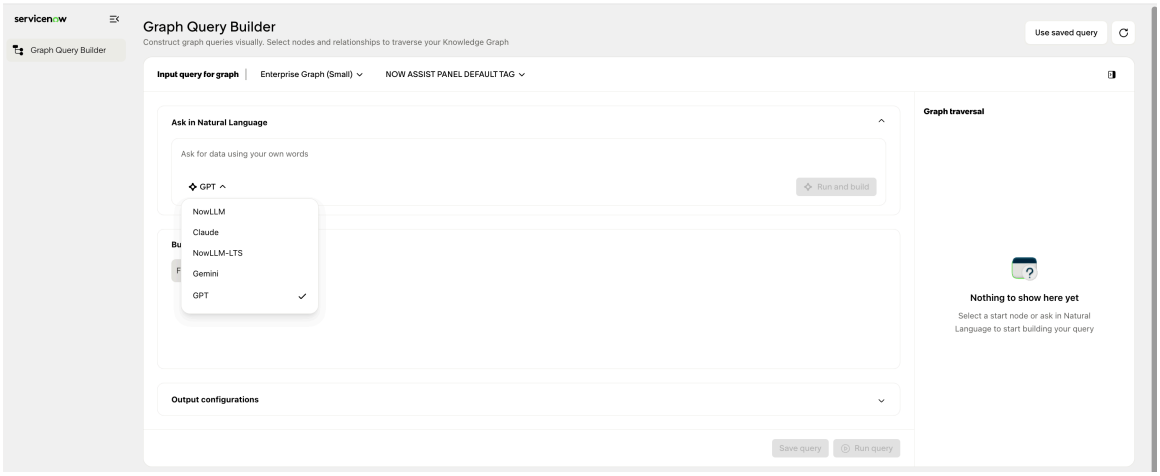
Procedure

1. Navigate to **All** > **Knowledge graph** > **Graph Query Builder**.
2. Select a graph from the graph drop-down in the **Input query for graph** section.

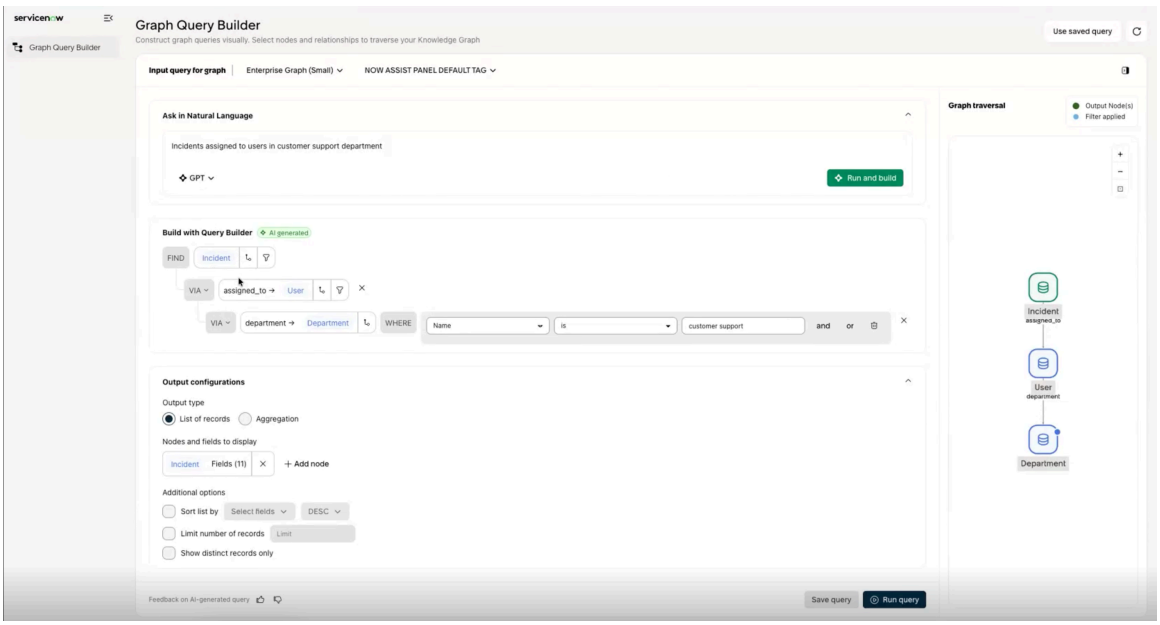
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you select Enterprise Graph or Enterprise Graph (small), you will see an additional tag selection field to scope the available entities to specific tables.

Note: Tags aren't available for user created graphs.



3. **Optional:** Select one or more tags from the drop-down, if you want to run a query using Enterprise Graph or Enterprise Graph (small).
4. Enter a natural language question in the **Ask in natural language** section.
   Example: `Show me all the incidents assigned to users in customer support department`.



5. Select an LLM to use from the following options:
   - NowLLM
   - Claude
   - NowLLM-LTS
   - Gemini
   - GPT
6. Select **Run and build**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Graph Query Builder generates a query from your input, populates it in the query builder, runs it, and displays the results in the Query results section.

7. Review the generated query and edit it directly in the query builder.
8. **Optional:** Select **Run** to re-run the query after editing and save it, if you want to reuse it later.

Save and reuse a query in Graph Query Builder

Save and share a successfully run query to load and rerun it later in Graph Query Builder

Before you begin

You must run a query successfully at least once before you can save it.

Role required: kg_admin

Procedure

1. Navigate to **All** > **Knowledge graph** > **Graph Query Builder**.
2. Build and run a query successfully from the Ask Natural Language Query or Build with Query Builder section.
   Once you run the query, **Save query** option is enabled.
3. Select **Save query**.
   Save query window is displayed.
4. Choose whether to save as a new query or to add to an exiting query.
5. Add a query name and assign permissions.
   For permission, the options are:
   - Me: only you can see and load the saved query.
   - Everyone: all users with access to Query Builder can see and load the saved query.
6. Select **Save**.
7. **Optional:** Select **Use saved queries** option to load saved queries.
8. Choose a query from either **My queries** or **Others** section on saved queries window.
9. Select **Load query** to view and load the query.
10. Edit the query, if required and select **Run**.
    - You can rename a saved query, but you can't edit its underlying logic directly.
    - To change the logic, build the updated query in the builder and save it as a replacement.
    - Queries saved by other users might be visible to everyone but can't be edited or deleted by you.
    - You can only delete the queries that you have saved.

Reference for Knowledge Graph

Knowledge Graph uses the following terminologies.

Terminologies

Term	Description
Knowledge Graph Schema	Structured representation of real-world entities and their relationships, stored in a graph database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminologies (continued)

Term	Description
Knowledge Graph Canvas	The editor used to create and edit Knowledge Graph Schemas. You can also use it to add or delete nodes and edges.
Node	An entity or object that represents a data point such as a person, place, product, or concept.
Data Source	The source table that is linked to a node.
Node Properties	The attributes or columns of the source table linked to a node.
Connected Node	The nodes that have a connection with the selected node.
Edge	Represent the relationships or interactions between nodes.
Connecting Edges	The edge that connects two nodes.
Available Edges	Available connection between selected nodes.
Start Node	The start data point for creating an edge or relationship.
End Node	The end data point for creating an edge or relationship.

Knowledge Graph roles

Certain roles are required to use Knowledge Graph functionality.

Knowledge Graph Admin [kg_admin]

This user can create and update Knowledge Graph schema using Knowledge Graph designer.

Contains Roles

List of roles contained within the role.

Knowledge Graph administrator [kg_admin].

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Avoid granting an admin role when more specialized roles are available.

AI Data Kit

Use ServiceNow® AI Data Kit to add datasets to a data catalog. The curated data works with AI Skill Kit to enable AI skill development and evaluation.

- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring AI Data Kit

The AI Data Kit plugin for ServiceNow Otto enables you to add datasets to a data catalog and create collections for use in AI Skill Kit.

AI Data Kit overview

If the base system ServiceNow Otto skills don't fit your needs, use AI Data Kit to create custom datasets and data collections. These can be used in AI Skill Kit for evaluation.

AI Data Kit users

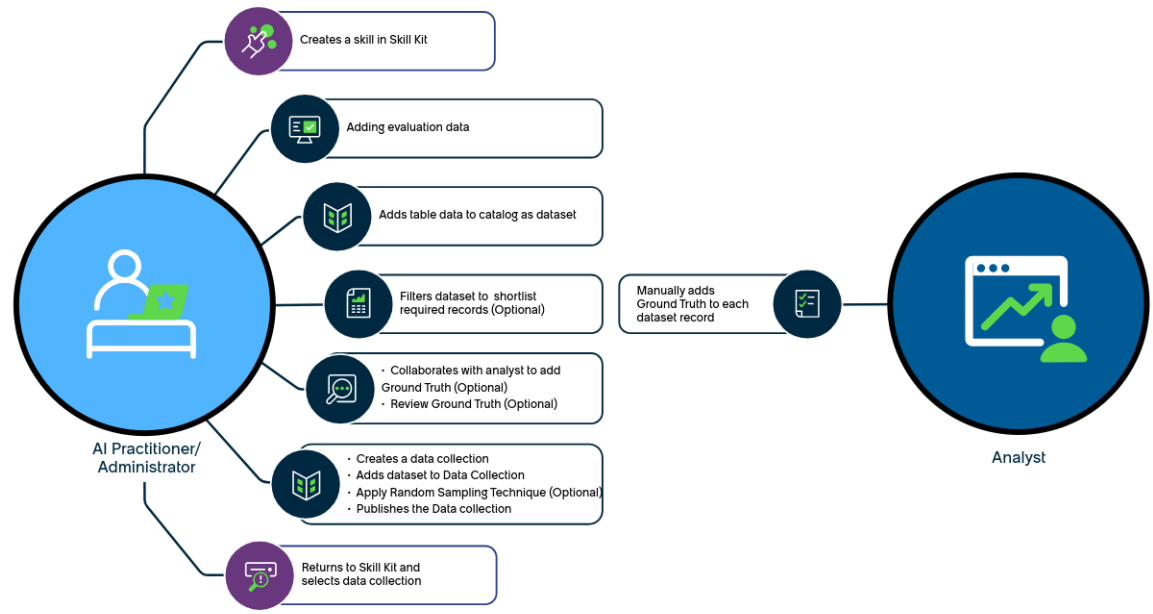
Users

User	Description
AI practitioner	AI practitioners manage data set creation in AI Data Kit. They develop and evaluate skills and other technical solutions for various use cases.
Analyst	Analysts confirm data quality for AI development and evaluation. They work with AI practitioners to follow data curation guidelines set for specific AI use cases.

AI Data Kit workflow

The following diagram shows the user journey for AI Data Kit.

User journey for AI Data Kit



Two users take part in this workflow. The AI practitioner does most of the work. An analyst can enter and review ground truth values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create a skill in AI Skill Kit.
2. Add records from an instance table to the data catalog as a dataset. If you don't have suitable records, generate synthetic data instead.
3. (Optional) Create a derived dataset to work with a smaller set of records.
4. (Optional) Check the dataset before you use it:
   - Scan for sensitive data and cleanse what the scan finds.
   - View data insights to see completeness and distribution.
5. (Optional) Add a ground truth to each dataset record. The AI practitioner creates the guidelines. An analyst can enter and review the values.
6. Create a data collection and add one or more datasets to it.
7. (Optional) Apply a sampling method to choose which records go into the collection.
8. Publish the data collection.
9. Return to AI Skill Kit, select the data collection, and run the evaluation.
10. Review the results, iterate on the prompt if needed, and publish the skill.

AI Data Kit benefits

Benefits

Benefit	Feature	Users
Curate records from an instance table into a dataset that you can reuse for AI development and evaluation.	Add a dataset	AI practitioner
Create a smaller dataset from an existing one so that you can evaluate a skill without processing every record.	Create a derived dataset	AI practitioner
Generate records when you don't have production data, or when using production data raises privacy concerns.	Generate synthetic data	AI practitioner
Scan a dataset for sensitive data, such as names and email addresses, and cleanse what the scan finds.	Find and cleanse sensitive data	AI practitioner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits (continued)

Benefit	Feature	Users
Check the completeness and distribution of a dataset before you use it, so that gaps don't affect your evaluation results.	View data insights	AI practitioner
Record the expected output for each record so that an evaluation can compare a skill's response against a known result.	Add a ground truth to each dataset record	AI practitioner, Analyst
Combine one or more datasets into a data collection and publish it for use in AI Skill Kit.	Create a data collection	AI practitioner

What to explore next

To learn more about configuring and using AI Skill Kit, see:

- Configuring AI Data Kit
- Using AI Data Kit
- AI Data Kit reference

Configuring AI Data Kit

Set up AI Data Kit so that users in your organization can start working with datasets.

Configuration overview

1. #unique_748

   Install AI Data Kit and its dependent applications and plugins from Application Manager.

2. Assign the sn_data_kit.admin role or the sn_data_kit.analyst role to users, depending on the tasks they perform.

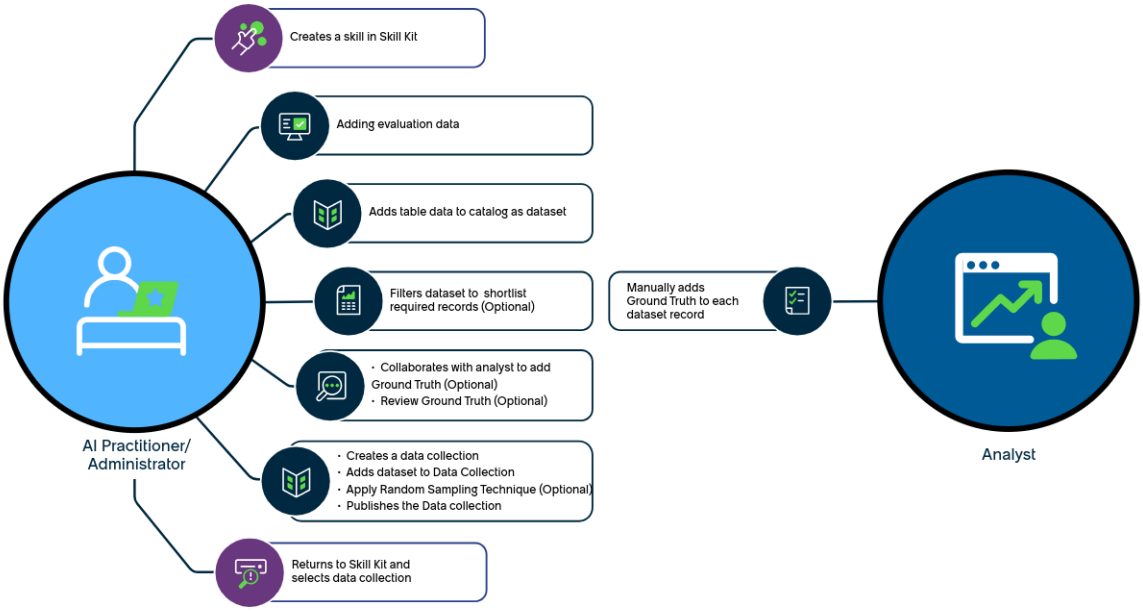
Using AI Data Kit

Use AI Data Kit to add datasets to a data catalog to create collections for use in ServiceNow SDK.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of AI Data Kit

AI Data Kit work flow



1. Create a skill

   Create a custom skill for ServiceNow Otto. Creating a custom skill enables you to have greater flexibility with the ServiceNow Otto generative AI capabilities.

2. Configure deployment and skill settings

   Configure the deployment settings for the skill that you create. The deployment settings enable you to choose where the administrator can find the skill in AI Admin Hub.

3. Navigate to **AI Data Kit** to Add a dataset.

Add a dataset

Add the data from a table to a data catalog as a dataset through generative AI by using the AI Data Kit application. Adding a dataset is required to create and publish a data collection.

Before you begin
Role required: sn_data_kit.admin

Procedure

1. Navigate to **All** > *AI Data Kit* > **Home**.
2. Navigate to Discover datasets and select **Get started**.
3. On the **Datasets** tab, select **New**.
4. Select where to curate data from.
   - I'll import data from instance table
   - I'll import data from my computer
5. On the **Choose data** form, select the table and columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a column does not appear as a possible selection, then the field is not a supported data type. For example, Watch List fields are the glide_list datatype, which is not supported, so Watch List is not a selectable field.

6. **Optional:** Select **Add column via scripting** if you have columns, such as work notes or comments, that aren't stored in the table.
   This is an example script for adding worknotes.

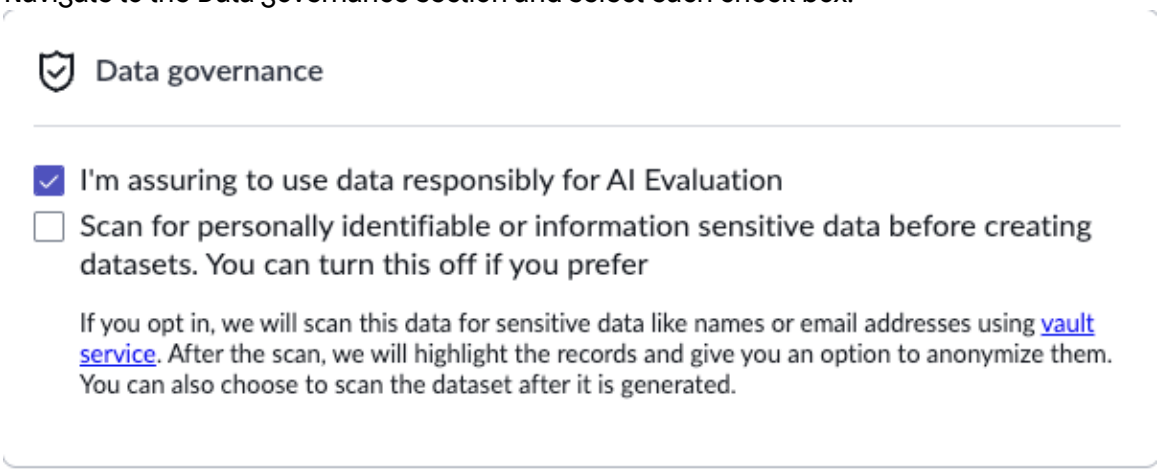
```
(function generate(current) {
//Current is the Gliderecord object of current record.
// //Sample script for adding worknotes
// var gr = new GlideRecord("sys_journal_field");
// gr.addQuery('name', current.getTableName());
// gr.addQuery('element_id', current.getUniqueValue());
// gr.query();
// var records = [];
// while (gr.next()) {
//     var obj = {
//         "value": gr.getValue("value"),
//         "type": gr.getValue("element"),
//         "created": gr.getValue("sys_created_on"),
//         "created_by": gr.getValue("sys_created_by")
//     };
//     records.push(obj);
// }
// return records;
})(current);
```

7. Select **Edit filter condition**.
8. Review the records and select **Continue**.
9. On the form, fill in the fields.

Add dataset info form

Field	Description
Dataset name	Name of the dataset.
Dataset description	Description of the dataset.

10. Add tags to identify the dataset.
11. Navigate to the Data governance section and select each check box.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- I'm assuring to use data responsibly for AI Evaluation
- Scan for personally identifiable or information sensitive data before creating datasets. You can turn this off if you prefer.

  Note: If you opt in, your data is scanned for sensitive data like names or email addresses using vault service. After the scan, records will be highlighted and give you an option to anonymize them. You can also choose to scan the dataset after it is generated.

12. Select **Generate dataset**.
    Fields of any data type are stored as strings when converted to a data asset.
    The dataset is added to the data assets.

What to do next

After your dataset is added to the data catalog, you can choose to create a smaller dataset. TO do this,c reate a derived dataset or add a ground truth to your existing data set. For more information, see Create a derived dataset or Add a ground truth to each dataset record.

Create a derived dataset

Create a smaller dataset from an existing dataset through generative AI by using the AI Data Kit application. A derived dataset enables you to choose a smaller dataset.

Before you begin

Role required: sn_data_kit.admin

About this task

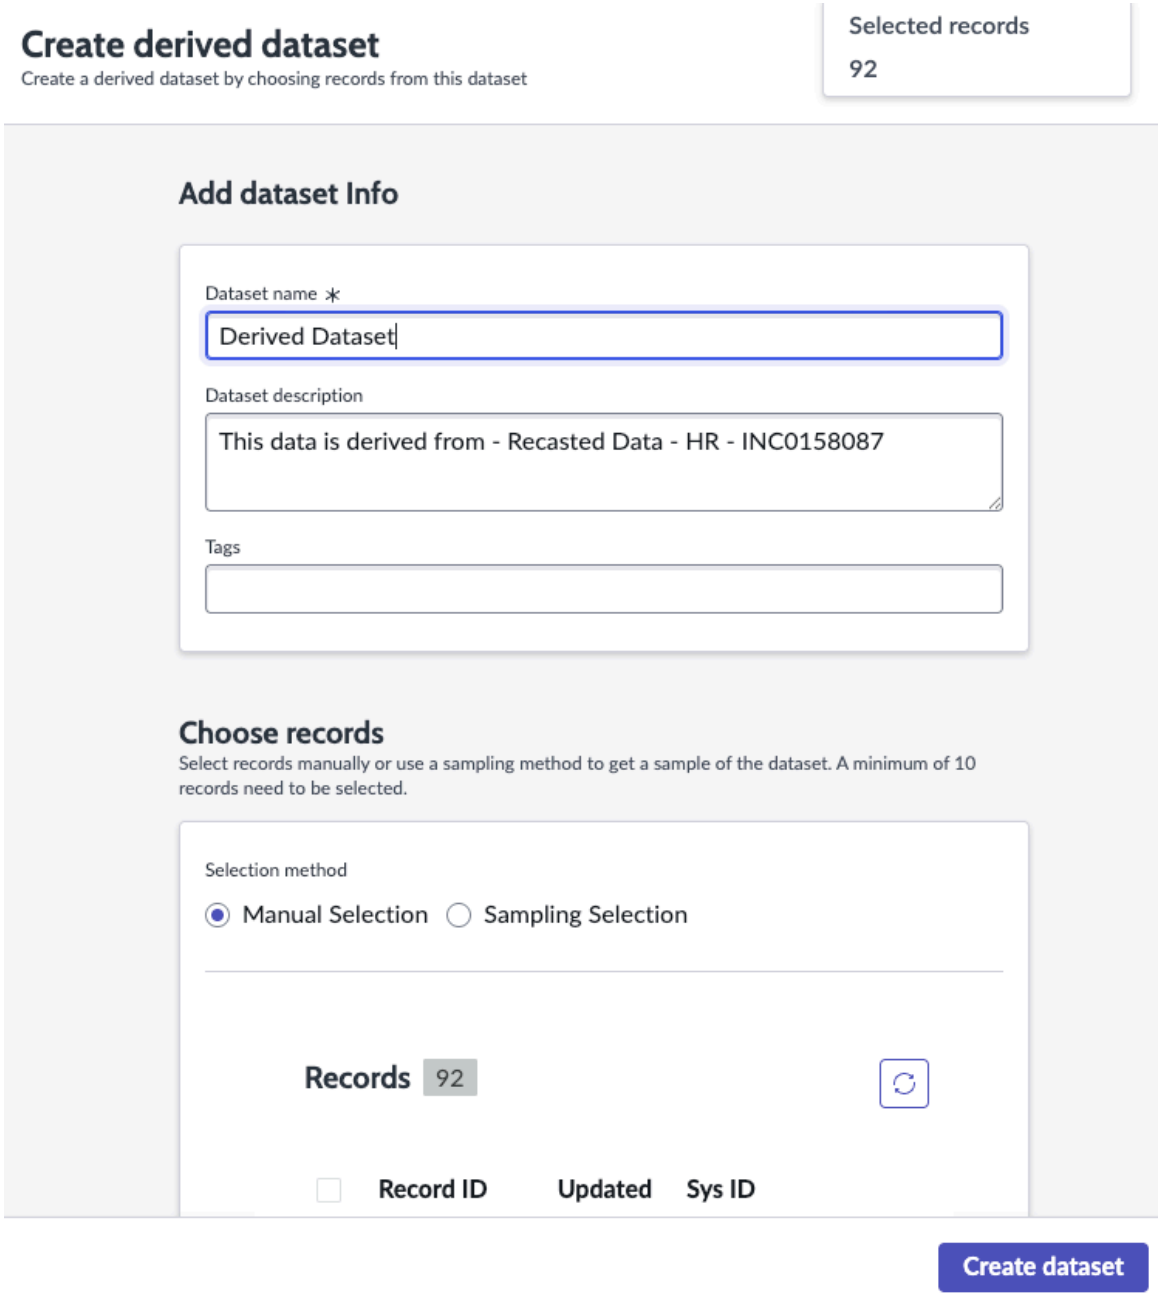
After you add a dataset to the data catalog, you can create a smaller dataset or derived dataset from the Create derived dataset page.

Procedure

1. Select the dataset where you want to create a derived dataset.
2. Select **Create derived dataset**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Add information for the new derived dataset.



New derived dataset info form

Field	Description
Dataset name	Name of the dataset.
Dataset description	Description of the dataset.
Tags	Tags to identify the dataset.

4. Navigate to the Choose records section and select a data selection method for your user. You can select records manually or use a sampling method to choose the data. If you select a sampling selection, use the drop-down menu and then enter a number in the sample size box.
5. Select **Run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Preview the record results and select **Create dataset**.
   The derived dataset is added to the data catalog as a separate dataset.

What to do next
After the derived dataset is completed, you can add the ground truth.

Generate synthetic data

Create synthetic data with a sample dataset and a prompt through generative AI by using the AI Data Kit application. You can use synthetic data to create training for a test model or an evaluation dataset.

Before you begin
Role required: sn_data_kit.admin

Procedure
1. Navigate to **All** > **AI Data Kit** > **Home**.
2. Select the **Synthetic datasets** tab.
3. Select **Generate dataset**.
4. Choose how you want to generate data.

Way to generate synthetic data

Method	Description
Use a default generator	The Default Data Generator creates flat records based on a fixed schema with files like name, description, and short description. By providing a few examples, the model learns the structure and generates consistent, realistic data, making it suitable for typical use cases. These configurations can also be saved as templates for easy reuse.

5. On the Add job info page, fill in the fields.

Add job info form

Field	Description
Job name	Name of the generated data.

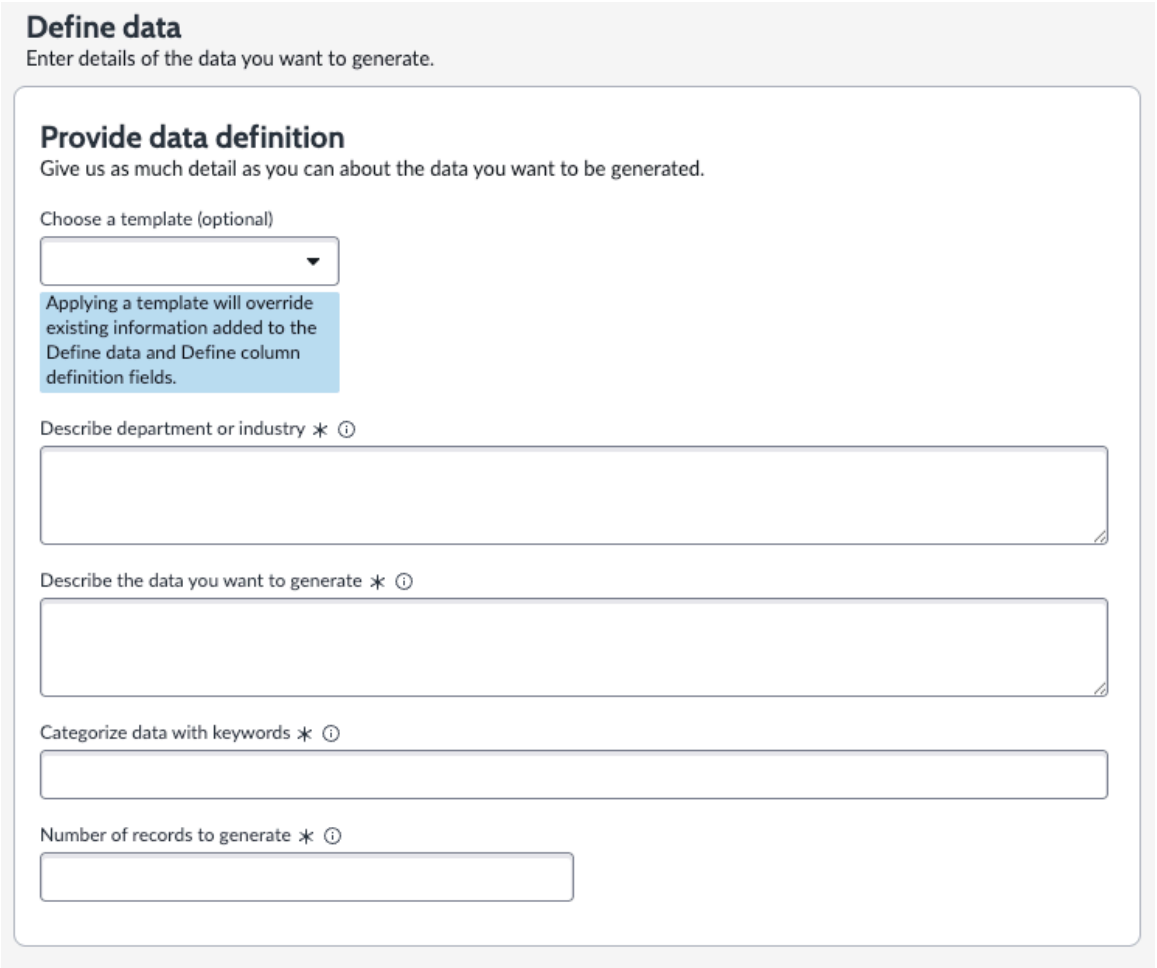
6. Navigate to **Define data** .
7. **Optional:** Select a template.

Synthetic data templates

Template	Description
Catalog item	Service Catalog is a user-friendly interface that allows end-users to browse, request, and manage services and products offered by the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Template	Description
	organization, streamlining self-service and improving operational efficiency.
Incident data	Information Technology Service Management is a business function that involves managing IT services and processes to meet business needs effectively.



8. On the form, fill in the rest of the fields.

Define data form

Field	Description
Name	Department or industry where the data belongs.
Type	Data that you want to generate.
Category	Data that has been categorized with keywords.
Count	Number of records to generate.

Note: If you have sample data available, you can navigate to Select the sample data to enhance the accuracy of the generated data. If you don't have sample data, refer to the in-product help for guidance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select **Continue**.
10. Add your sample data by navigating to Define columns to generate data.
    The columns are populated when you add the sample data. If no sample data is available, you must manually populate the columns with data.
11. Select **Continue**.
12. **Optional:** Add additional rules to improve generated data.
13. Select the number of records to generate for testing.
14. Select **Start generation**.

Select the sample data

Add the available sample data to enhance the accuracy and relevancy of the generated data in the AI Data Kit application. The sample data can be curated, added into the data collection, or published.

Before you begin
Role required: sn_data_kit.admin

Procedure

1. Navigate to **Select sample data**.
2. In the Select table and columns pop-up window, select an existing dataset in the Data collection field.
3. Navigate to **Continue** to select up to three records.
   The data is populated in the different columns.
4. Enter the descriptions for each column that you want to generate the data for.
   Describe the columns for the large language model (LLM) to generate values accordingly.
5. Set the key column toggle switch on one column.
   The key column is required and used as a baseline for creating the data in the other columns.
6. Navigate to **Test generation** to preview a small number of records before generating a full dataset.
   When previewing a small number of records, you can make adjustments before generating a full dataset.
7. Select the records to generate for testing.
8. Select **Start testing**.
   You see the preview generation data results page. If you want more refined results, select **Define data** or **Select sample data** to update the criteria.
9. If you're satisfied with the preview results, select **Start generation** for all the data.
   The generated data is completed.

Define columns to generate data

Provide detailed definitions to preview a test for each column that you want the data to generate the results for.

Before you begin
Role required: sn_data_kit.admin

About this task
For better quality data, use fewer than 20 columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter a description for each column that you want to generate data for.
   Describe the columns for the large language model (LLM) to generate values accordingly. This description can include a range and any rules or limitations to be considered.
2. Enable one column as the key column.
   The key column is required and used as a baseline for creating data in other columns.
3. Select **Continue**.
   The test generation page opens.
4. Navigate to **Test generation** to preview a small number of records before generating a full dataset.
5. Select the records to generate for testing.
6. Select **Start testing**.
   You see the preview generation data results page. If you want more refined results, navigate to **Define data** or **Select sample data** to update the criteria.
7. Select **Start generation**.
   The generated data is completed.

Add a ground truth to each dataset record

Add a ground truth, which is the real-world data that is used to train and test AI models to each dataset record. You can do this task by using the AI Data Kit application.

Before you begin

Role required: sn_data_kit.admin, sn_data_kit.analyst

Procedure

1. After you create a data set, select **Create ground truth guidelines**.
2. On the form, fill in the fields.

Add ground truth info form

Field	Description
Type	○ Manual
Ground truth type	○ Summarization ○ Content generation ○ Other
Instructions	Guidelines for labelers and linguists who manually add the ground truth.
Column type	If you chose AI generated ground truth, select the column type. ○ String ○ Number ○ JSON
Column label	The name of the column that is added for the ground truth in the dataset.

3. Select **Confirm**.
   A new Record detail page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

Record detail info form

Field	Description
Form label	Incident record number.
State	Time of the record creation.
Summarization	Manual entry of the ground truth.

You can manually enter the ground truth and rate the ground truth. These options appear in a separate column in the dataset record.

5. Select **Save and next**
The ground truth column is added in a separate column in the dataset.

What to do next
To combine this dataset with others and make the records available for evaluation, see Create a data collection.

Create a data collection

Combine one or more datasets into a data collection, choosing the columns and records to include. Then, publish the collection so that you can use it to evaluate a skill in AI Skill Kit.

Before you begin
Role required: sn_data_kit.admin

At least one dataset must exist. To learn more, see Add a dataset.

About this task
A data collection is the object that AI Skill Kit uses to evaluate a skill. A collection can combine records from more than one dataset.

Procedure

1. Navigate to **All** > *AI Data Kit* > **Home**.
2. In the **An overview of your data assets** section, select the **Datasets** tab.
3. Select the dataset that contains the records that you want.
4. At the top of the dataset page, select **Add to data collection**.
   - To create a collection, enter the data collection name, description, and relevant tags.
   - To add the dataset to an existing collection, clear the **Create Data Collection** check box. Then select the collection from the **Available data collection** field.
5. Select **Confirm**.
6. Select **Next**.
The **Add to data collection** page displays.
7. On the **Choose columns** form, select the columns that you want to add to the data collection.
8. In the **Choose records** section, select a selection method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selection method	Action
Manual Selection	Select the check box for each record that you want to include. If you don't select any records, all records in the dataset are added to the collection.
Sampling Selection	In the **Sampling Method** field, select **Random Sampling**. In the **Sample size** field, enter the number of records to include, and then select **Run**. The sampled records appear in the records list.

9. At the bottom of the page, select **Add to data collection**.

   For sampling selection, this button is available only after you run the sample.

10. Select the data collection to preview the records.
11. Select **Publish** to make the data available for evaluation.

    When you publish a collection, the collection freezes curation and becomes available for use through AI Skill Kit.

12. Select **Confirm** to make your collection available.
    The data collection is published.

What to do next
Select the published data collection in AI Skill Kit and run the evaluation.

View data insights

You can view data insights to see the completeness and distribution of your generated data.

Before you begin
Role required: sn_data_kit.admin

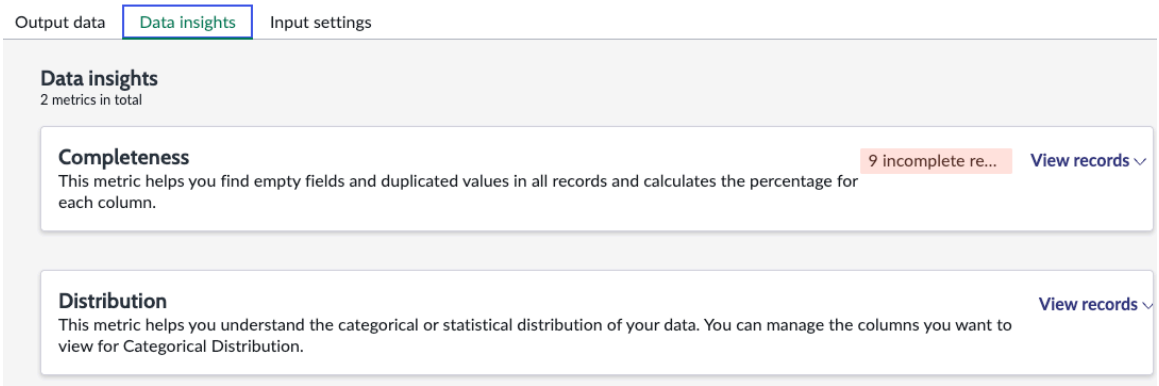
Procedure
1. Navigate to **All** > **AI Data Kit** > **Home**.
2. In the Generate Data section, select **Start now**.
3. Select the generated data job that you want to see data insights for.
4. Select the **Data insights** tab.
5. Select **View records** to see the records associated with each metric.

Data insight metrics

Metric	Description
Completeness	This metric helps you find empty fields and duplicated values in all records and calculates the percentage for each column.
Distribution	This metric helps you understand the categorical or statistical distribution of your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	data. You can manage the columns you want to view for Categorical Distribution.



Find and cleanse sensitive data

You can scan your datasets for sensitive data, like personally identifiable information (PII). If you find sensitive data, then you can cleanse it from your datasets.

Before you begin

Role required: admin

Plugins required: sn_data_discovery, sn_dp_store_app, com.glide.data_privacy.

Procedure

1. Navigate to **All** > **AI Data Kit** > **Home**.
2. From the Discover datasets section, select **Get started**.
3. Select the dataset that you want to scan for sensitive data.
4. Select **Scan Data**.
5. If there is sensitive data in your dataset, select **Cleanse Data** to remove it.
   You can also see the records that contain sensitive data by viewing the Data Insights tab. To learn more, see View data insights.

AI Data Kit reference

Reference topics for AI Data Kit.

AI Data Kit roles (sn_data_kit.analyst)

This user can edit and save ground truth in AI Data Kit. This role has read only access within AI Data Kit.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Special considerations

None.

AI Data Kit admin (sn_data_kit.admin)

Provides access to all AI Data Kit features, including everything that the analyst role allows.

Contains Roles

List of roles contained within the role.

- canvas_user
- fd_read_operations
- global_tags_creator
- sn_data_kit.analyst
- sn_diagram_builder.db_read
- sn_udc.basic_read
- sn_workflow_studio.workflow_studio_read
- snc_required_script_writer_permission

Groups

List of groups this role is assigned to by default.

None.

Special considerations

- This role doesn't include AI Skill Kit roles. To evaluate skills with data collections, assign the required AI Skill Kit roles separately.
- This role doesn't grant read access to instance tables. To add records from a table as a dataset, you also need a role that can read that table.

AI Search on the ServiceNow AI Platform

AI Search is how the ServiceNow AI Platform finds and delivers the information you need.

AI Search does not operate as a standalone search engine. It is embedded in the ServiceNow AI Platform so that every AI feature has a consistent, intelligent retrieval layer to draw from. AI Search automatically locates the most relevant information from across your ServiceNow environment and makes it available to AI features.

The ServiceNow AI Platform brings together the services, models, and infrastructure that power AI-driven experiences across ServiceNow. AI Search is a core component of that platform. It is the layer responsible for finding and delivering relevant information whenever an AI feature needs it, whether that feature is generating a response, completing a task, or helping a user find what they need.

AI Search retrieves information from the sources you configure and connects AI features such as Now Assist, AI agents, and virtual assistants to your organization's data. These sources include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Native platform data: tables, records, knowledge articles, catalog items, and other structured data within your ServiceNow instance.
- External enterprise content: documents and data from external repositories that are connected through External Content Connectors.
- Custom indexed sources: table and data sources you configure in AI Search to make content available for search applications, AI agents, and Now Assist.

The content AI Search can access is determined entirely by configuration. Sources must be indexed to be visible to AI Search and to be used by AI features.

How AI Search works on the ServiceNow AI Platform

AI features on the ServiceNow AI Platform follow a Retrieval-Augmented Generation (RAG) request pattern. AI Search is the retrieval half of that pattern. Without it, AI features on the ServiceNow AI Platform lose their connection to your data and can't return responses that are accurate or relevant to your environment.

RAG request pattern:

1. A request is received. A user asks a question, issues a command, or triggers an AI feature, a virtual assistant, or a search interface.
2. AI Search retrieves relevant information, and processes the request using keyword matching, context, and machine learning-based ranking. It queries across your configured sources and returns the most relevant content.
3. The retrieved context is passed to the AI feature. The results from AI Search provide the factual foundation that generative AI, AI agents, and other AI features use to generate responses, take actions, and present answers.
4. The user receives a grounded response. As the response is built on retrieved enterprise data, not general AI knowledge alone, it reflects your organization's actual environment, records, and context.

AI Search Admin

The AI Search Admin console integrates advanced AI Search features. It is a central hub for managing and monitoring AI Search capabilities across search applications. System administrators can use the AI Search Admin console to set up and manage AI Search in search applications, track AI Search activity, add features to AI Search, or access AI Search resources.

For more details, see AI Search Admin console.

ServiceNow Otto for AI Search

ServiceNow Otto for AI Search combines AI Search retrieval with generative AI to deliver answers alongside search results. When a user submits a question, AI Search retrieves the most relevant content from your configured sources and provides it to the LLM (large language model), which generates a contextual response grounded in that content. These AI-generated answers appear as Genius Results in Global Search, Service Portal, Employee Center, and the Virtual Agent, helping users resolve issues through self-service without contacting support.

For more details, see ServiceNow Otto for AI Search.

What happens without AI Search

AI Search is not an optional add-on to the ServiceNow AI Platform. It is the component that gives AI features access to information. Without AI Search:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI can't ground its responses in your organization's knowledge base, records, or catalog. Answers become generic or incomplete.
- AI agents can't locate the necessary records, tasks, or data. Automated workflows stall or produce inaccurate results.
- Virtual assistants can't surface relevant self-service content or route users to the right resources.
- Search experiences fall back to basic keyword matching, losing the semantic understanding, intent recognition, and relevance ranking that AI Search provides.

When AI Search is configured and maintained, the entire ServiceNow AI Platform benefits. AI Search continuously improves its relevance ranking based on user activity and engagement, which means AI features can return more relevant results as user activity increases.

Instance requirements

To set up AI Search as part of the ServiceNow AI Platform:

- Activate and configure AI Search on your instance.
- Define data sources for AI Search indexing.
- Create search profiles for your applications, virtual assistants, and AI agents.
- Connect ServiceNow Otto to your search profile to activate generative AI features.

For configuration steps, administration guidance, and integration details, see Using AI Search Admin console.

External Content Connectors on the ServiceNow AI Platform®

The External Content Connectors application helps make ServiceNow AI more useful and context-aware. It enables the ServiceNow AI Platform to securely access content stored in external repository systems and bring that content into AI-driven experiences.

The external content connectors provided by the application act as bridges between the ServiceNow AI Platform and your external content repositories. They enable ServiceNow AI to access and use knowledge from those repositories.

This means you can ask questions, search for information, or interact with AI assistants in the ServiceNow AI Platform and receive answers that include relevant content from your organization's external content repositories without switching between systems. The result is a more connected experience, where critical information is available directly within ServiceNow AI workflows.

To learn more about the External Content Connectors application, see External Content Connectors.

External content connector overview

An external content connector is an application or integration that links the ServiceNow AI Platform to an external source system, such as Microsoft SharePoint Online or Atlassian Confluence Cloud.

Within the ServiceNow AI workflow, external content connectors serve as the content ingestion and enrichment layer. Their role includes the following key stages:

Content retrieval

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector connects securely to a source system and retrieves content and metadata from entities stored in that system. These may include policy and procedure documents, knowledge base articles, team sites, shared files, attachments, project documentation topics, or other entities supported by the specific source system.

Indexing and enrichment

The connector feeds its retrieved content to AI Search, which indexes it for search. As part of indexing, AI Search tags and structures the retrieved content for easier comprehension, making it easier for AI features to interpret and summarize it.

During indexing, AI Search preserves the original content's security access permissions. As a result, indexed content is only visible to ServiceNow AI Platform users who could access that content in the source system.

AI consumption and delivery

ServiceNow AI features use the indexed content to answer your questions, provide recommendations, suggest relevant documents, and summarize information in context.

Benefits of external content connectors for AI end users

Using external content connectors to populate ServiceNow AI features with your data improves your everyday experience in the following ways:

Unified search experience improves productivity

Ask your question in a single location and get results that include both ServiceNow AI Platform content and content from your external source systems.

More complete AI responses support better decision-making

ServiceNow AI feature answers are more complete and relevant. Responses can include information from your external source systems and can reference the internal knowledge that you rely on daily.

Reduced context switching offers a consistent experience

AI answers are surfaced directly within your ServiceNow workflow. You don't need to access multiple source systems or modify your search to work with each source system's search function.

Personalized access keeps vital information secure

AI features only show you content that you already have access to in the source system. Sensitive documents retain their access restrictions.

Generative AI skills

Generative AI skills use large language models to enterprise data to complete tasks within workflows. You can activate and configure skills, or build custom skills for your organization.

Generative AI

Generative AI skills apply large language models to your enterprise data to complete a single task within a workflow, such as summarizing a record or drafting a reply. To learn what they are, why they matter, and when to use them rather than an AI agent, see Understanding generative AI skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow AI assets

AI assets are the building blocks that skills and agents use, including prompts, tools, and configurations. Some skills and agents are turned on by default when you install a product, so reviewing your active assets after installation is an important early step. To check which assets are on by default, see AI agents, skills, and agentic workflows on by default.

Generative AI skills

A skill delivers a generative AI feature plus the use case to the user. Skills are organized by the workflows they serve: IT Service Management, Customer Service Management, HR Service Delivery, and others. When you activate a product for a specific workflow, the associated skills become available. ServiceNow products provide features and skills tailored to meet the needs of users in different workflows.

Note: Start with high-impact, low-complexity skills like incident summarization or case summarization. These provide immediate value with minimal behavioral change required from your users.

To find the skills available for each workflow and activate the ServiceNow products that deliver them, see Generative AI skills.

AI Skill Kit

AI Skill Kit is a development environment for building custom generative AI skills. A skill is a self-contained unit of generative AI functionality that runs a prompt against an LLM (large language model) and returns a response. Skills can gather data using tools before the prompt runs, and can be deployed to the ServiceNow Otto panel, UI actions, flow actions, virtual assistants, and UI Builder.

Each skill is made up of a prompt (the instruction template sent to the LLM), inputs (data passed in when the skill is triggered), outputs (the structured data the skill returns), optional tools (utilities that gather additional context before the prompt executes), and deployment settings that control where the skill is available. AI developers create and test skills in AI Skill Kit, then publish them for a Now Assist admin to activate in AI Admin Hub.

To build, test, and publish custom skills with their own prompts, inputs, outputs, and deployment targets, see AI Skill Kit.

AI Admin Hub

The AI Admin Hub is where admins manage generative AI on the instance. Administrators install plugins, manage skills, choose which skills to turn on and which users can access them, and analyze usage and performance. The console provides a unified view of all active skills across your instance, so you can see what is running, where it is running, and how users are interacting with it. To install plugins, choose which skills are on and who can use them, and analyze usage across your instance, see AI Admin Hub.

ServiceNow AI Lens

ServiceNow AI Lens uses generative AI to read visual data (such as images, screenshots, scanned handwritten notes, and documents), extract the information it contains, and auto-fill forms with that data. Users can capture or upload content from a browser or the desktop application, preview what ServiceNow AI Lens extracts, and create or update records without manual data entry. ServiceNow AI Lens is a skill that administrators enable in the AI Admin Hub.

To scan images and documents, extract the data they contain, and auto-fill forms, see ServiceNow AI Lens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understanding generative AI skills

Generative AI skills use large language models to process your enterprise data to complete a single, well-defined task within a workflow, such as summarizing a record, drafting a reply, or recommending a next action. Skills reduce manual effort in work your users already do, without changing how they work.

A generative AI skill completes one task that is triggered in the moment that you need it. The skill sends a prompt and your data to a large language model, then returns a result you can use directly in the record or conversation you're working in, such as a summary, a drafted message, or a recommended action. Because each skill targets a specific task, you can adopt skills one at a time and see results without redesigning your processes.

Why generative AI skills matter

Skills reduce the manual, repetitive effort that slows down everyday work. A user who summarizes a long case in seconds, or who drafts resolution notes from a single prompt, spends less time writing and searching and more time resolving the issue. Skills run inside the interfaces your users already work in, so the productivity gain comes with little training and little change to established habits.

Skills also give your organization a measured entry point into AI. You can start with a common, self-contained task, review the result, and add more skills as your users build confidence.

Generative AI skills compared with AI agents

A skill and an AI agent solve different kinds of problems. A skill performs one bounded task on demand and returns control to the user, who decides what to do with the result. An AI agent, working within an agentic workflow, pursues a broader goal across multiple steps and can plan, act, and adapt with limited human intervention.

Consider a service request. A skill can summarize the request or draft a reply when a user asks for it. An agentic workflow can take the request further on its own by interpreting it, gathering the information it requires, completing the required actions, and reporting the outcome. Skills are the building blocks for individual tasks, and agents coordinate those capabilities to carry a process from start to finish.

When to use generative AI skills

Choose a generative AI skill when the work is a single, predictable task that a person starts and reviews, such as summarizing, drafting, translating, or recommending content. Skills fit well when you want an early, measurable result, when the user stays in control of each result, and when you're introducing generative AI to a team for the first time.

When an outcome requires several coordinated steps, decisions that depend on changing conditions, or actions across multiple systems without a person driving each one, an AI agent and an agentic workflow are the better fit.

AI agents, skills, and agentic workflows on by default

Starting with the Zurich Patch 4 release, some AI agents, generative AI skills, and agentic workflows are turned on by default in the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Some generative AI skills, agents, and agentic workflows are turned on by default. The default behavior works as follows:

New customers

When you install an AI product, designated generative AI skills, AI agents, or agentic workflows are turned on automatically.

Existing customers who are upgrading (starting with Zurich Patch 4)

There is no change to skills, agents, or agentic workflows that are currently enabled and customized.

An AI asset is turned on if:

- The AI plugin is installed, but the asset was never turned on.
- An admin has never adjusted roles for the skill.

An AI asset is not turned on if:

- The asset was previously turned on, and then turned off again.
- An admin has adjusted roles for the asset.

For more information, see AI agents, skills, and agentic workflows on by default.

Note: Some workflow skills support ServiceNow Otto functionality. Deactivating these skills can negatively affect some features.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

AI assets that are on by default

For a list of changes by release, see Release notes.

Generative AI skills

ServiceNow AI Platform products contain generative AI skills that are tailored to meet the needs of users in different workflows.

By default, all skills exist in the global domain. When you use AI in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses the summarization skill, AI only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the AI Admin Hub console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

Important: Some generative AI skills, AI agents, and agentic workflows are turned on by default. For more information, see AI agents, skills, and agentic workflows on by default.

Note: Some workflow skills support ServiceNow Otto functionality. Deactivating these skills can negatively affect some features.

IT and digital operations

Product	Available skills
ServiceNow Otto for Collaborative Work Management (CWM)	• Acceptance criteria generation • CWM subtask generation • CWM contextual task generation • Docs summarization • Doc generation • Task generation

Impact The Impact workflow contains technical accelerators that can help you get started more quickly with some Now Assist features.	• Jumpstart Your ServiceNow Otto for Creator • Jumpstart Your ServiceNow Otto for Document Intelligence • Jumpstart Your ServiceNow Otto for Virtual Agent • Jumpstart Your ServiceNow Otto Skill Kit

Now Assist skills in the Platform workflow

Most Now Assist generative AI products include skills in the Platform workflow, such as product navigation. Some Now Assist products include skills for the conversational user and platform experience, as well as knowledge article recommendations.

Auto activation of generative AI platform skills

Starting with the Zurich Patch 4 release, some generative AI platform skills for Now Assist will be active by default. This is applicable for commercial and regulated market customers.

- New users: When you install the Now Assist plugins, the related Now Assist skills will be turned on automatically.
- Existing users: When you upgrade the Now Assist plugins, any unused skill will turn on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. If you have installed the plugins but never configured, activated or changed roles for a skill, any skill with 'Default On' status will be enabled individually, after the upgrade.
2. If you have modified any role for a skill, turned it off and then back on, that skill will stay turned off after the upgrade; maintaining your last known selection.

Some skills, such as the Group Action Framework (GAF) skills, support Platform functionality and may require specific configuration.

Article optimization

The article optimization skill in ServiceNow AI Platform provides recommendations for improving the quality and health of knowledge articles, providing actionable feedback to authors and managers. The recommendations for knowledge articles become available after you activate the Article Optimization skills in Now Assist Admin.

Article optimization is a Platform skill that is enabled by the admin from the Knowledge feature card. The skill allows agents and authors to review and use article optimization recommendations to improve the quality and health of their knowledge articles.

For more information, see Review and optimize articles using Article Optimization.

Catalog item form slot-fill

With the catalog item form slot-fill skill, Now Assist can automatically complete catalog item forms based on what users search for.

For instance, if requester looks up a standard laptop with 256 GB storage in silver color, the resulting form will have those specifications already filled in provided they're part of the form. Requester can quickly review these pre-filled forms, making requests faster and more efficient.

To enable this feature, activate the catalog item form slot-fill skill so that requesters see their search criteria reflected in the catalog item request forms. As soon as requesters searches for an item, relevant fields in the form are populated with their search information, minimizing repetitive entry and streamlining the request process.

Pre-filled fields show AI icons to help users validate values populated by Now Assist.

Note: Order guides, as well as the following variables, are not supported:

- MRVS (Multi-Row Variable Sets)
- Custom and custom with labels
- Attachments
- Masked
- Break
- Container
- UI page
- HTML

Now Assist Conversational Help

This skill uses Generative AI application capabilities to provide answers to the questions on the Now Assist panel.

https://player.vimeo.com/video/1088792812?h=bceb334712&badge=0&autopause=0&player_id=0&app_id=58479.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Starting with the Australia release, Conversational Help Skills is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process article [KB0867184] in the Now Support Knowledge Base.

You can install the External Content Connectors Application Suite from the ServiceNow store

and use NAp Synthesized Search with ServiceNow Docs.

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

The Now Assist Conversational Help skill displays as **Get Help** on the Now Assist panel.

Note: The Get Help feature is available as a part of Now Assist entitlements and no new subscription is required. The feature is enabled by default and you can turn it off in the AI Admin Hub **Settings**.

How Conversational Help works

You can ask your question by selecting **Get Help** skill and submit a query to use the help option in the Now Assist panel. Your query goes through the following steps to retrieve the best response.

Note: Conversational Help Skills is not available as auto-discoverable as a help skill within Now Assist panel.

1. AI search

   The query is be sent to a **central ServiceNow instance**, where **AI Search** will search the knowledge table that stores content from product doc content.

   We use Instance Data Replication (IDR) that synchronizes product documentation content from Now Support instances.

   Note: Multiple central ServiceNow instances are deployed across three regions: US East or US West, EMEA, and APJC.

2. The top matching chunks (or records) along with the user's query, are sent to the Now Assist Q&A Genius Result configuration to generate a meaningful, contextual answer.
3. Re-ranking

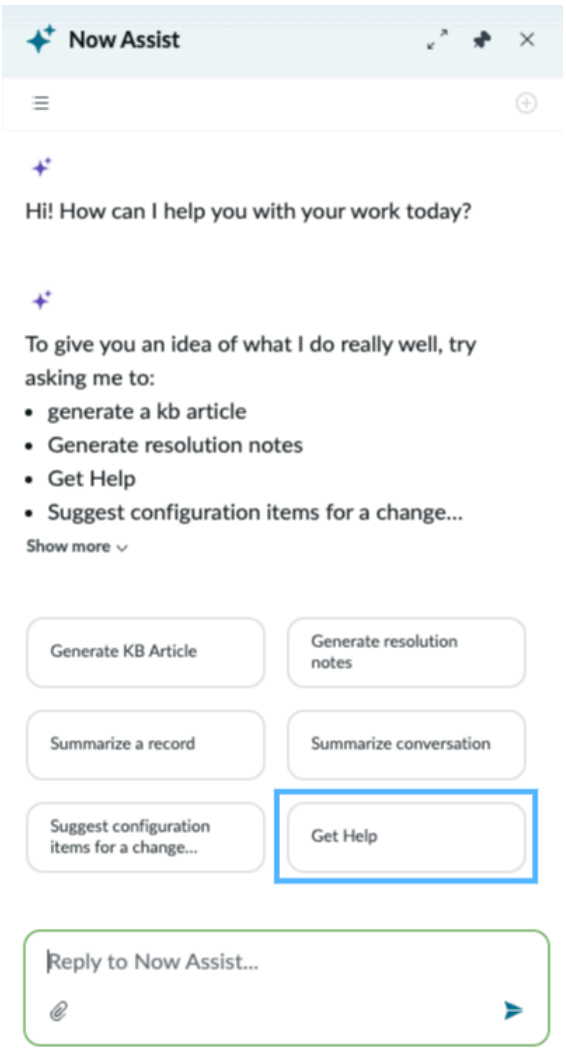
   The Now Assist Q&A, an out of box (OOB) capability, re-ranks the retrieved chunks to ensure better relevance.

4. Cache lookup
   - If the user query exists in the cache, the pre-stored answer is returned.
   - If the query is not cached, the query and re-ranked chunks are sent to Now LLM to generate a meaningful answer.

The Now LLM retrieves the most relevant result from https://www.servicenow.com/docs/ portal and displays it in the same panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Effective from this release, the query will retrieve results based exclusively on the release version of the user's current instance. This enhancement is integrated into the query process to ensure the delivery of precise results that reflect the latest updates and features.



For more information, see Fetch end points in Now Assist Conversational Help skills.

Now Assist extract information from documents

The extract information from documents skill allows you to use Now Assist predictions to extract information from document and image files.

Now Assist uses generative AI capabilities to extract values from the document based on the fields, tables, and questions defined in the skill's use case. The extracted information is turned into structured data that can be used in the platform.

Agents can use the Document Intelligence workspace to review and confirm the extracted information.

Extracted information in the Document Intelligence workspace

For more information, see .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge content recommendation

Knowledge generative AI skills on the ServiceNow AI Platform provides recommendations for editing a knowledge article. Once activated, this skill is available on the ServiceNow Otto context menu.

The ServiceNow Otto Knowledge content recommendation is a Platform skill that is enabled by the admin from the Knowledge feature card. The skill allows agents and authors to use the ServiceNow Otto context menu to elaborate and shorten content in a knowledge article.

For more information, see Edit an article using the ServiceNow Otto context menu.

Navigation

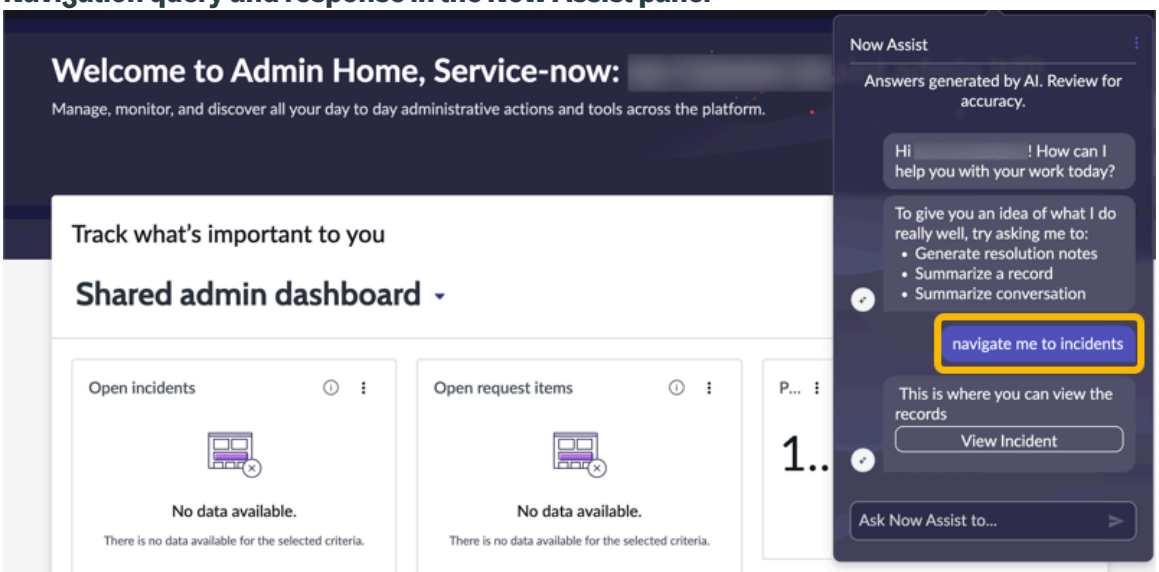
Use the navigation skill in Now Assist to take you where you want to go on the ServiceNow AI Platform.

Overview of navigation

Navigation is a skill in the Now Assist panel that handles record search requests during a chat. When you ask for records or tables in plain language Now Assist shows you links in the chat to take you to the best match to your request. For example, you could enter `Show me incident records`.

In the following figure, the user entered `navigate me to incidents` in the Now Assist panel. Now Assist responds with a link to the Incidents table.

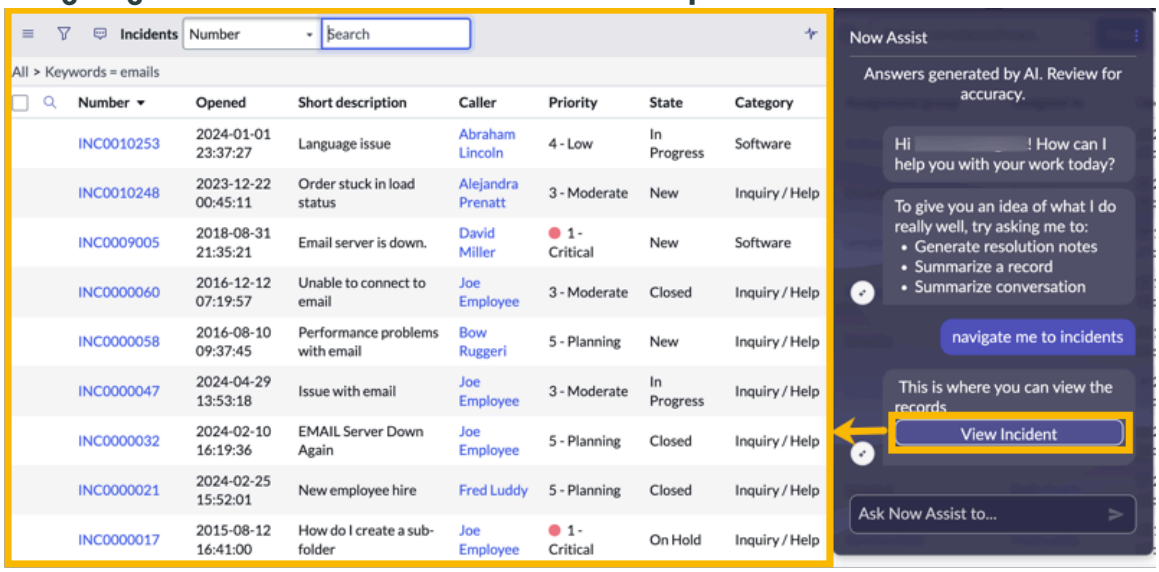
Navigation query and response in the Now Assist panel



When you click the link, the list of all records in the Incidents table displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigating to the Incidents table from the Now Assist panel

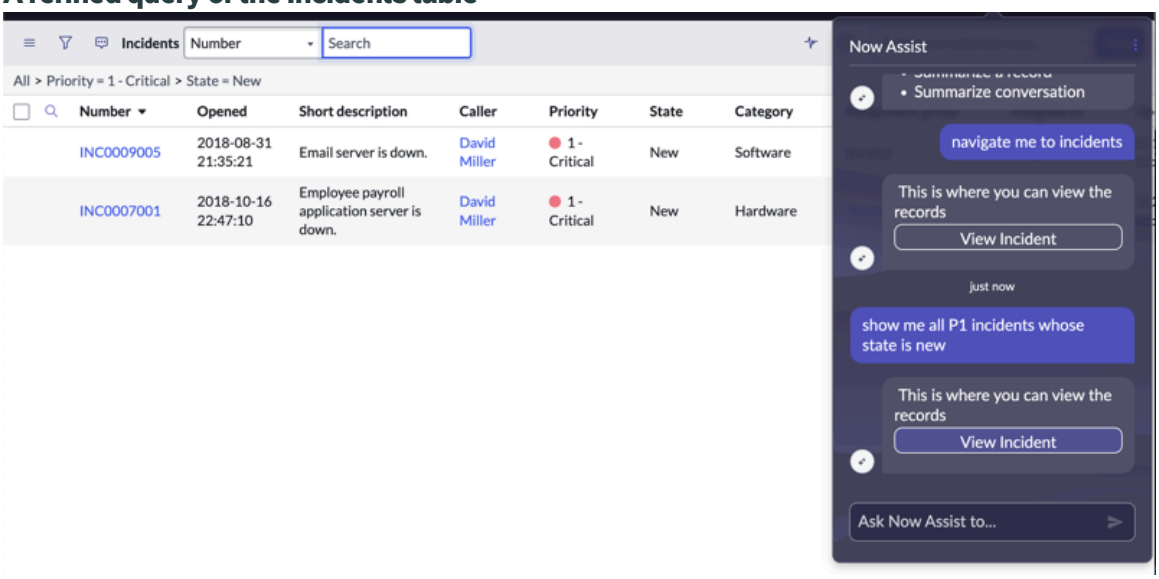


Refining your results

You can refine your results further by using more detailed requests. If you enter `Show me all incident records whose status is Complete`, Now Assist shows you only the records in the table with a Complete status.

In the following example, the user asks for all P1 incidents that are in the New state.

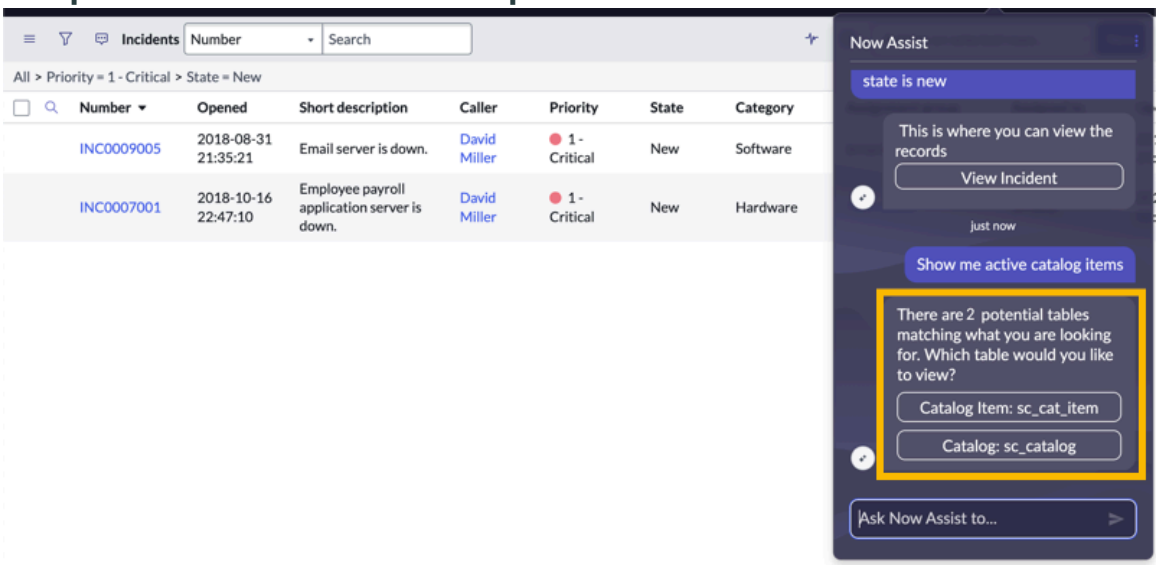
A refined query of the Incidents table



The number of results is based on how many potential results Now Assist finds in response to your request. If Now Assist finds more than 10 results, the list is paginated. In the following example, Now Assist finds two possible tables: the Catalog Item table and the Catalog table.

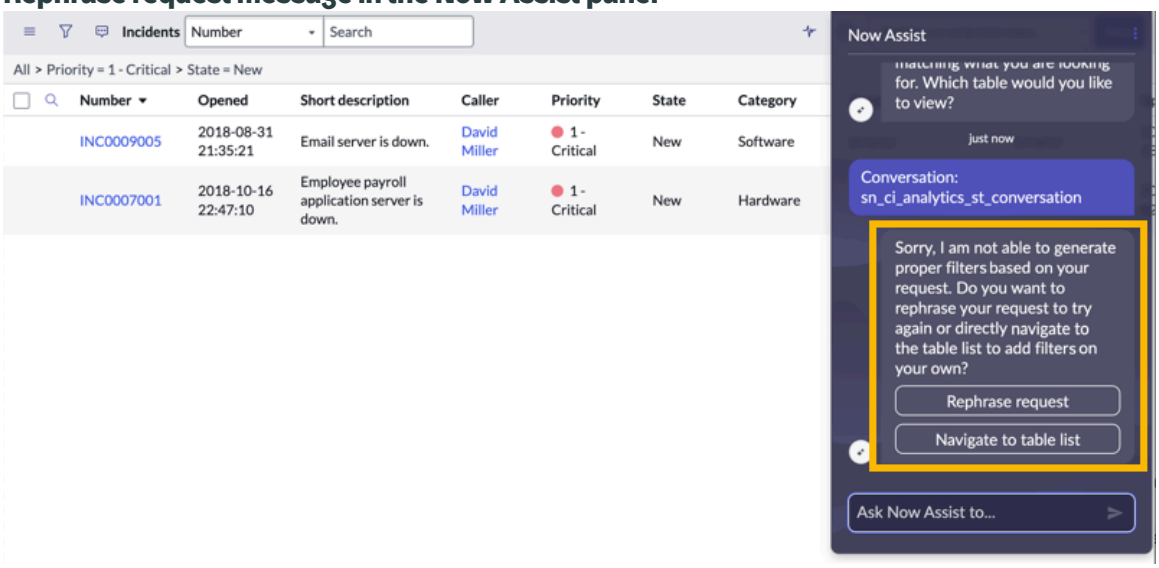
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multiple table results in the Now Assist panel



If Now Assist does not understand your request, you receive an error message asking you to rephrase your request. You can also choose to navigate to a "best guess" based on your previous request.

Rephrase request message in the Now Assist panel



ServiceNow Otto in Standard Ticket Page

The ServiceNow Otto in Standard Ticket Page skill allows you to display summaries generated by ServiceNow Otto, providing overviews of recent activities and ticket details.

When this skill is active, the standard ticket page on the Service Portal displays a **Summarize** button. If requesters want to see the ticket activity and a summary of information generated by ServiceNow Otto, they can select the **Summarize** button.

The **Summarize** button appears when at least one field is configured. If no field values are configured, the button does not appear, regardless of whether the ServiceNow Otto in Standard Ticket Page skill is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Potential knowledge gaps

The Potential Knowledge Gap helps in finding missing or incomplete knowledge coverage by analyzing service interactions. Gap recommendations is set to available after you activate the Knowledge Gaps skills in AI Admin Hub.

The Knowledge Gaps feature (also known as Potential Gaps) helps knowledge managers and service teams discover missing or insufficient knowledge articles by analyzing service case and incident patterns. When the relevant skills are activated, generative AI generates gap recommendations to guide the creation or improvement of knowledge content.

For more information, see Manage potential knowledge gaps

Requester approval checklist skill

The requester approval checklist skill in the ServiceNow AI Platform® generates a structured checklist by mapping real-time request data against your organization's knowledge articles.

Important: This generative AI skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see AI agents, skills, and agentic workflows on by default.

This skill is available within Now Assist Agents for Requester v3.1 and is designed to provide instant, data-backed decision support across in-product, agentic, and workflow experiences.

The skill uses information from the following sources to promote accuracy:

Knowledge articles

Defines the evaluation criteria based on your company policy.

System data

Fetches requester profiles and historical data from ServiceNow.

Approval request

Analyze the details submitted in a live request.

Requester Approval Checklist structure

The output is presented in a two-step format: Criteria (what is required) and Reason (why it passed, failed, or has missing information). Each item has one of the following statuses: Met, Not met, or Unknown.

Note: All referenced knowledge base articles are provided as links at the end of the checklist for easy verification.

Key skill considerations

Integration

The skill is built for workflows and agentic experiences, but doesn't support follow-up questions and answers.

Decision support

The skill provides information only. It doesn't perform actions like Approve, Reject, or Comment.

Flexibility and control

The Requester Approval Checklist respects the approval configuration to provide flexibility and control.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Using the approval assistance AI agent and Configure Service Portal Approval Configuration record.

Smart Documents Skill

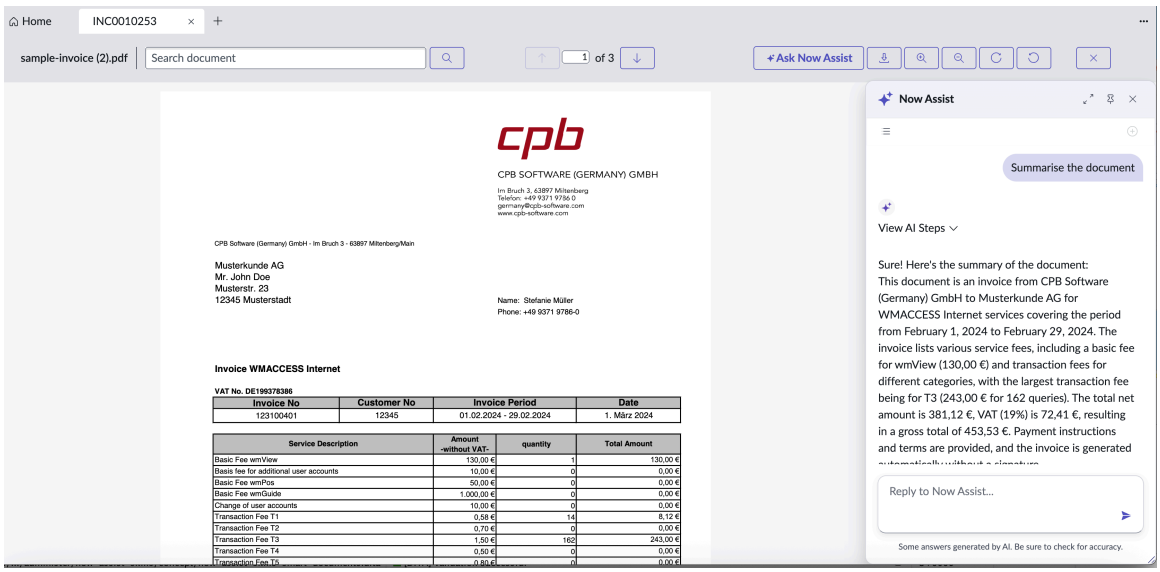
Accelerate document insights with instant summaries, interactive Q&A, and FAQs using Now Assist in Document Management.

Smart Documents Skill overview

The Smart Documents skill provides a concise summary of the document associated with a workflow, along with interactive Q&A and FAQs, enabling you to quickly understand the content, explore key insights and get answers to specific questions.

You can summarize a document in a workspace, ask interactive questions, and view FAQs. To learn how, see Generate summary and ask questions using ServiceNow Otto in Document Management

The following diagram shows that by using the Smart Document skill, you can quickly get insights from a document, such as a white paper, report, policy, contract, or case file.



Availability

Now Assist Products and Workflows

Workflow	Product
Technology	ServiceNow Otto for IT Service Management (ITSM)
Customer	ServiceNow Otto for Customer Service Management (CSM)
Employee	ServiceNow Otto for HR Service Delivery (HRSD)
Governance,Risk, and Compliance

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring AI Skill Kit

Use the AI Skill Kit plugin for ServiceNow Otto to create and activate custom prompts and skills for Otto.

AI Skill Kit overview

Use AI Skill Kit to create custom skills when base system Otto skills don't fit your needs. Custom skills give you greater flexibility with Otto's generative AI capabilities.

Before you build a custom skill

Because you create the prompts that drive your skills, you should be comfortable with the fundamentals of prompt engineering and with how a large language model (LLM) behaves.

Before you begin, you should understand:

- How an LLM produces output, including its probabilistic nature and the fact that the same prompt can produce different results on different models.
- How to write, test, and refine a prompt based on the output it produces, rather than on how you expect the model to interpret your wording.
- The use case you want to solve and the persona you're building the skill for.

Effective skill development depends on testing the prompt against representative data from your instance and refining it based on the results, not on a single example. For the full set of guidelines and the phases of building a skill, see General guidelines for AI Skill Kit. For help defining requirements and outcomes before you build, see Skill scoping guidelines.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get AI Skill Kit

To use AI Skill Kit, you must update your Otto plugins in the Application Manager. For example, update your ServiceNow Otto for ITSM plugin to the latest available release.

You must also assign the *sn_skill_builder.admin* role to anyone who uses AI Skill Kit.

AI Skill Kit users

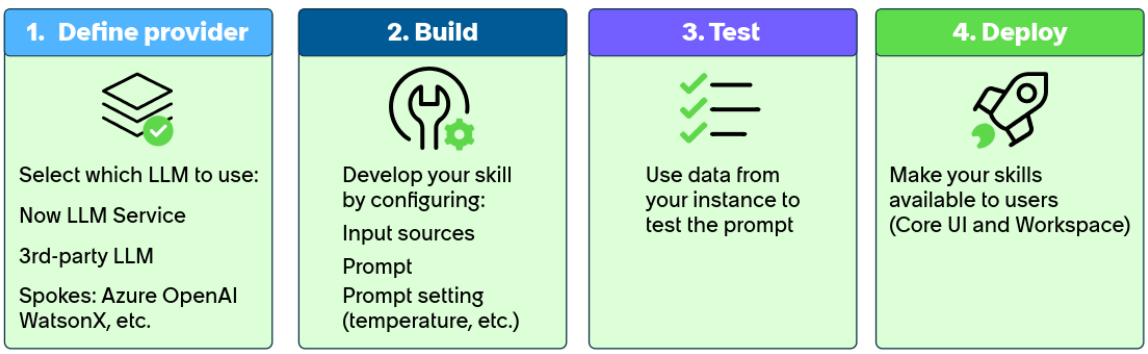
AI Skill Kit users

User	Description
AI developer	Creates new skills, writes and refines the prompts, and configures the skill settings. This user must have the *sn_skill_builder.admin* role. Building an effective skill requires prompt engineering experience and an understanding of LLM behavior.
Otto admin	Reviews and activates published skills so that they're available at the configured touch points. This user must have the *admin* role.

AI Skill Kit workflow

The following diagram shows the user journey for AI Skill Kit.

User journey for AI Skill Kit



Define the provider

Understand the benefits and potential downsides of each large language model (LLM) that you're considering using.

Build the prompt

You must have an understanding of the architecture of your instance and be able to define where input data should come from. You should also have an understanding of LLM fundamentals to build an effective prompt.

Test the prompt

AI Skill Kit enables you to test your prompt from the editor.

Deploy the skill

AI Skill Kit enables you to deploy your skill to the ServiceNow Otto panel, ServiceNow Otto Context Menu, Virtual Agent, Flow Action, or a UI Action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Skill Kit benefits

AI Skill Kit enables you to design your own custom generative AI functionality that you can then deploy to the ServiceNow platform. Custom skills can augment workflows with generative AI to increase effectiveness and efficiency.

AI Skill Kit benefits

Benefit	Feature	Users
Create custom solutions by building a custom skill or workflow.	Create a skill	AI developer
Create and edit prompts for skills and configure where you want to bring in data from to augment your prompt.	Create a prompt	AI developer
Test and iterate on your skill before activating it.	Test a prompt	AI developer

What to explore next

To learn more about configuring and using AI Skill Kit, see:

- Configuring AI Skill Kit
- Using AI Skill Kit

General guidelines for AI Skill Kit

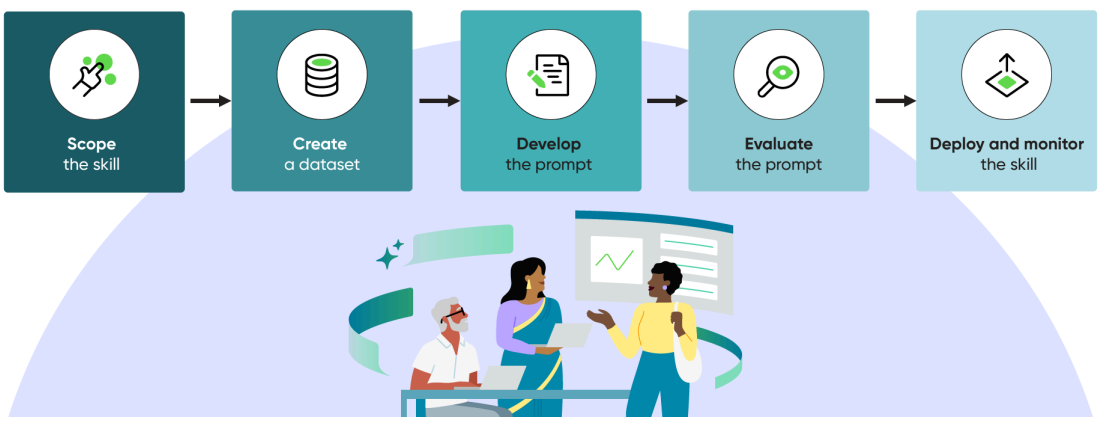
Building a custom skill in AI Skill Kit follows five phases, from scoping the skill to deploying and monitoring it.

AI Skill Kit skill-building phases

Think about the process of building a custom skill as having the following phases:

1. Scoping the skill
2. Collecting data and creating a dataset
3. Developing the prompt
4. Conducting a performance evaluation
5. Deploying and monitoring the skill

Stages of building a custom skill



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adopt a data-driven mindset while you build a skill. A data-driven mindset means emphasizing evidence-based decisions and minimizing speculation about how a large language model (LLM) can interpret the specific wording of a prompt.

Using AI Skill Kit requires intermediate prompt engineering skills. If you're not a developer, build that knowledge before you work with the tool.

Tooltips throughout the product explain individual fields and options.

To keep duties separate, a developer or generative AI practitioner creates the skill and then publishes it. After the skill is published, a AI Admin Hub activates the skill so that it appears at the configured touch points and is available to use.

Skill scoping guidelines

Scope a custom skill before you build it to define its requirements and expected outcomes.

Before you begin

Before you start to build a custom skill with AI Skill Kit, review the base system skills that are available in the AI Admin Hub console. Use these pre-existing skills whenever possible.

User prerequisites

AI Skill Kit is intended for developers and people with generative AI experience. Because you must write the initial prompt template, you should:

1. Be knowledgeable about prompt engineering, including:
   - Having familiarity with the development and testing of machine learning systems.
   - Having informed expectations about the behavior and capabilities of a prompted large language model (LLM). You should understand:
     - The fundamentally probabilistic nature of LLMs.
     - That performance can vary greatly across different LLMs and different target tasks.
   - Having experience or training with writing and evaluating prompts for LLMs.
2. Have an in-depth understanding of the use case that you're trying to solve and the persona that you're building the skill for.

Design

Before you begin building a custom skill, you must think about the overall design and document the requirements. Consider the following:

1. What precisely do you want the skill to do?
   - What are the inputs to the model?
   - What should be the outputs of the model? (Both content and format)
   - Who uses the skill?
   - How can you characterize success?
2. What don't you want the model to do?
   - It's useful to think about the possible risks and downsides of using generative AI outputs so that you can try to guard against them during development and testing.
   - It's worth listing any specific model behaviors (LLM outputs) that would be detrimental or harmful in your specific use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dataset guidelines for AI Skill Kit

A representative, appropriately sized, and isolated dataset gives you a reliable measure of how your skill prompt performs.

AI Skill Kit dataset creation

A data-driven approach to skill development relies on the collection of a high-quality dataset to develop and test the skill. When you use AI Skill Kit, you can also use the existing capabilities of the ServiceNow AI Platform to create a high-quality dataset.

When collecting data for this purpose, create datasets that are:

1. Representative of the skill's intended deployment environment. The data should:
   - Seek to reflect the expected distribution of inputs in the deployment environment.
   - Capture variance along several identified axes, for example, input length, urgency.
   - Include any examples of inputs that are known to be important to the use case.
   - Consider edge cases that might be rare but are suspected to cause problems, for example, long inputs.
2. Sized appropriately for the team's risk appetite.
   - It's possible to develop and deploy a skill with little data. However, a lack of data creates more uncertainty about how the skill performs in deployment.
   - Produce confidence intervals for any associated performance scores and prompt comparisons.
3. Isolated from the data used for developing and writing the prompts.
   - Split the collected data into development and testing sets so that some data is reserved for evaluation.
   - If you use all the data during the process of developing the prompt, your final evaluation of the skill is biased, meaning that it over-reports performance. This bias is because of a phenomenon known as prompt overfitting.

Prompt development guidelines

Write a skill prompt that is specific, clear, and grounded in context so that the model is more likely to return the output that you expect.

Prompt design guidelines

Base prompt development decisions on the model outputs that a prompt generates across many different inputs. The following guidelines can help you get started with prompt design.

1. Be specific

   Define your desired outcome clearly. Be specific about the task that you want the model to fulfill. Clearly identify the inputs that you're providing to the model, and specify the output you're expecting from the model (including formatting).

2. Include the right context

   Provide background information and context relevant for fulfilling the task. This information can generate a more focused response.

3. Use clear language

   Use precise and unambiguous language while writing the prompt.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Include demonstrations

   If possible, experiment with providing completed examples, or demonstrations, in the prompt after the instructions to illustrate what you want the model to produce. Demonstrations can increase the likelihood of generating a desirable output. However, the performance changes depending on the demonstrations selected.

5. Start simple and test variations

   Break down complex tasks into smaller and clearer instructions. Have a controlled and iterative approach. Experiment with different structures.

Other considerations

- Subtle differences in wording can lead to substantial differences in performance. Trying to reason about how a large language model (LLM) may “interpret” the instructions in a prompt only gets you so far. Which specific choice of prompt wording works best depends on the underlying model and should ideally be chosen based on evidence (that is, looking at lots of outputs).
- In data-constrained settings, iteratively develop several candidate prompts using the development data, then measure the performance of each candidate prompt on the test set, choosing the best one.

Prompt evaluation guidelines

Evaluate a skill prompt during development and again before deployment, using batches of test data and metrics that suit your use case.

Evaluation approach

To determine the effectiveness of your prompt, you should evaluate batches of test data. You should copy the model-generated responses and perform evaluations outside of AI Skill Kit.

During prompt development

Ongoing, improvised evaluation should take place alongside the development of the prompt. This ongoing evaluation enables you to adapt the prompt based on observed model outputs. Testing a change to a prompt against one or two examples can be tempting. To avoid reacting to noise, look at larger batches, and consider the statistical significance of the performance differences that you observed.

Chance of Seeing Better Performance from the Worse of Two Prompts

Data used in evaluation	"True" Underlying Accuracy Gap			
	5%	10%	15%	20%
N=10	30%	21%	14%	9%
N=25	28%	16%	8%	3%
N=50	24%	10%	3%	0.6%
N=100	18%	4%	0.5%	0.02%
N=250	9%	0.4%	<0.01%	<0.001%
N=500	3%	0.01%	<0.001%	<0.0001%

The approximate probability of observing better performance from the less accurate prompt among two (2) candidates, tabulated as a function of the evaluation dataset size (N) and the "true" underlying accuracy gap between the prompts (as measured on "infinite" data).

Final performance evaluation

Before you deploy a skill, you should test the prompt on a representative batch of data that was isolated from the development process, that is, "test" data. You want to use isolated test data because of a phenomenon known as prompt overfitting. Iteratively editing a prompt based on the model outputs generated on the same data that is used for testing can lead to significant overestimates of performance. This result is because the prompt can become overspecialized to the specific examples used in development. Even though the effect is typically less dramatic than what occurs when fitting machine learning model parameters to a test dataset, it's rooted in the same underlying principles, and should be avoided.

Evaluation metrics

Selecting the right metrics for evaluation is an important consideration. The following list provides a few approaches, each of which may be more or less appropriate depending on the use case.

- Classification-based assessment of short generations

  This approach requires labeled records, and it works best when the labels are short, well-defined "right answers," for example, true or false, multiple-choice, or category selection. In these cases, the model outputs can usually be parsed and formatted, then metrics like precision, recall, F1 scores, and so on can be directly calculated.

- Assessment of longer generations

  Many generative AI use cases require longer model generations, and there are many possible "right answers." In these cases, the output can be scored (by human evaluators) along several different axes, for example:

  - Faithfulness

    Is the generated text faithful to the context provided in the skill prompt? (The opposite of faithfulness is hallucination, which is to say that the model injects out-of-context information.)

  - Correctness

    Is the generated text correct relative to the skill instruction?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Helpfulness

  Is the generated text helpful relative to the task that the skill performs? (Helpfulness is subjective but it's important to try to measure. Doing so properly requires a solid understanding of the needs of the people who ultimately use the skill.)

- Fluency

  Is the generated text grammatically correct? Does it have any typos, issues with coherency, and so on?

Note: It's useful to score these properties on a scale, such as 1 through 5, rather than with yes or no.

Deploying and monitoring the skill

After you evaluate the prompt, you can deploy the custom skill and monitor its effectiveness.

AI Skill Kit deployment and monitoring

Build and evaluate the skill in a non-production instance. After you're satisfied with the final performance evaluation on a batch of test data in the non-production instance, you can begin to move a skill toward deployment.

1. Identify where the skill should be available to end users. Configure the deployment settings accordingly.
2. Perform end-to-end user testing in the non-production instance with different users and inputs.
3. After the results are acceptable, deploy the skill to the production instance.
4. Monitor the skill.

Example use case for AI Skill Kit

As an AI developer, you can create custom skills with AI Skill Kit. For this example, create a custom skill for child incident summarization.

As an AI developer, you must create a skill for child incident summarization. Creating this skill can help you organize and understand multiple incidents that are related to the same parent.

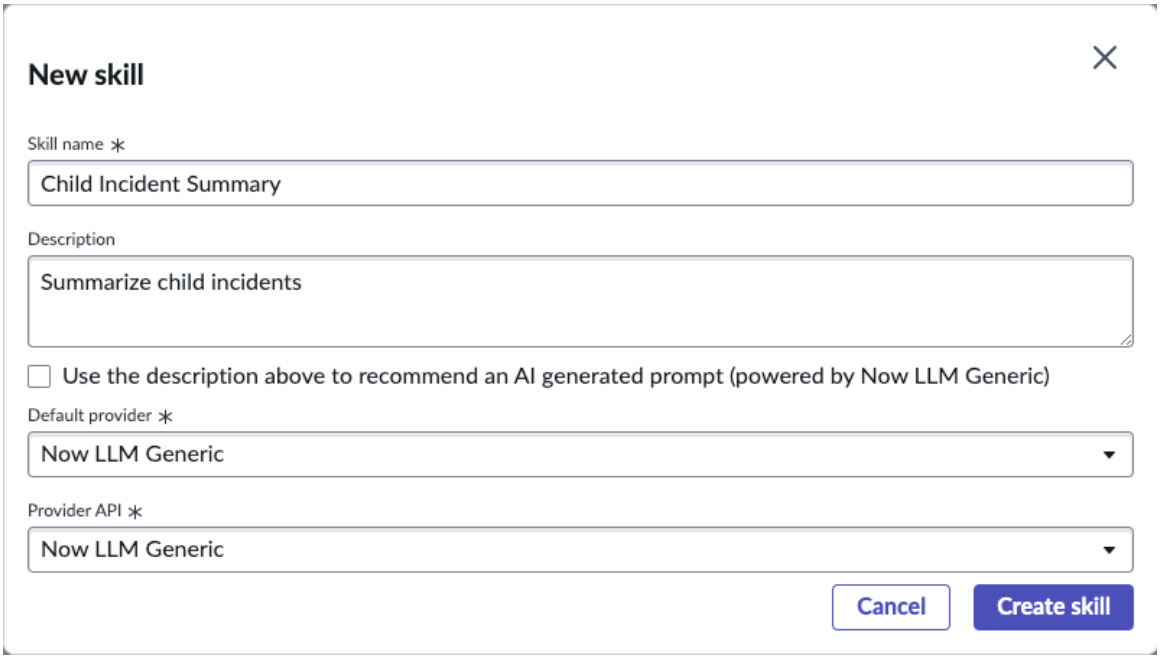
Create and configure the skill

To create the skill:

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select **Create new skill**.
3. On the form, fill in the fields. The following information is used to fill in the form for this example:
   - Skill name: `Child incident summarization`
   - Description: `Summarization of child incidents`
   - Default provider: `Now LLM Generic`
   - Provider API: `Now LLM Generic`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a skill modal



4. Select **Create skill**.

After you create the skill, you must configure the skill settings.

1. Select **Configurations**.
2. Select the model that you want to use. For this example, you can select `llm_generic`.
3. Select a temperature between 0 and 1 to determine the randomness and creativity of the output, such as 0 . 2.

Develop the prompt

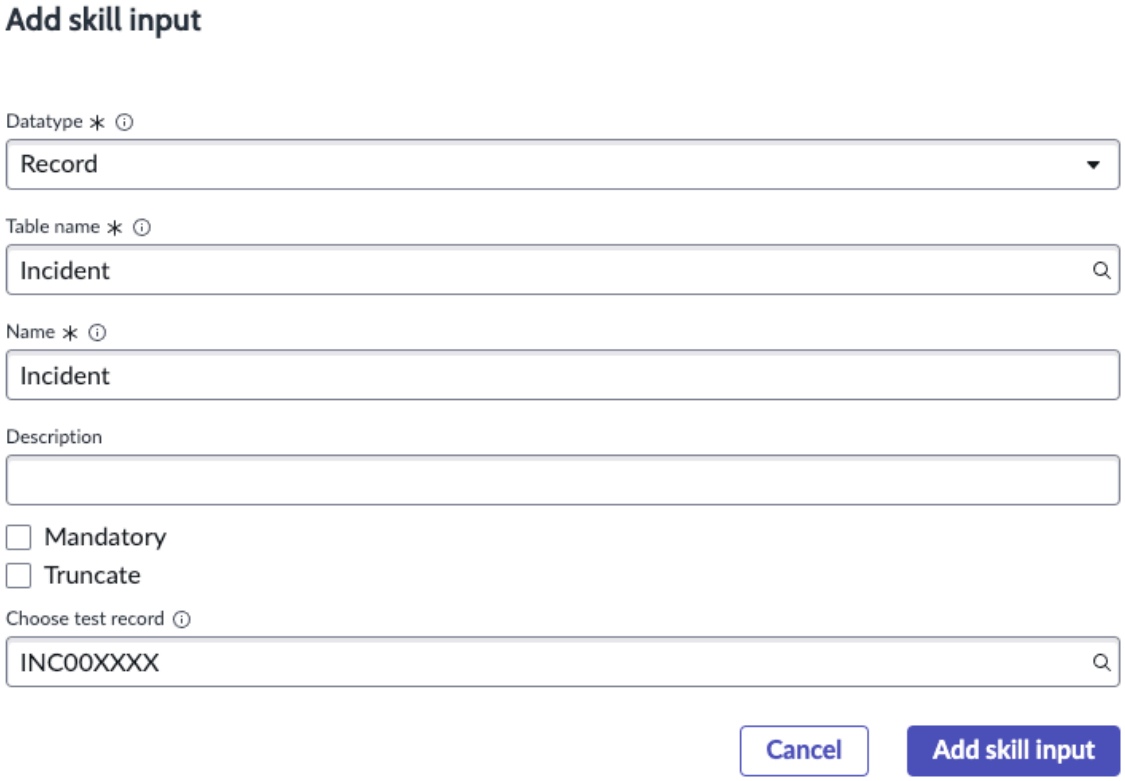
After you create the skill and configure the settings, you must develop the prompt. To follow this example, you can use the following prompt:

```
You are a customer service representative. Summarize the child
incidents of the below given parent incident. The summary
should contain key issues and impact across the child incidents,
highlighting any patterns, recurring problems, or significant
outliers. When summarizing, please consider the following: Parent
incident short description: {{incident.short_description}} Parent
incident description: {{incident.description}} Here are the child
incident details: {{ChildIncidents.output}}
```

Select the **Inputs** for the skill. For this example, the record is selected as the input.

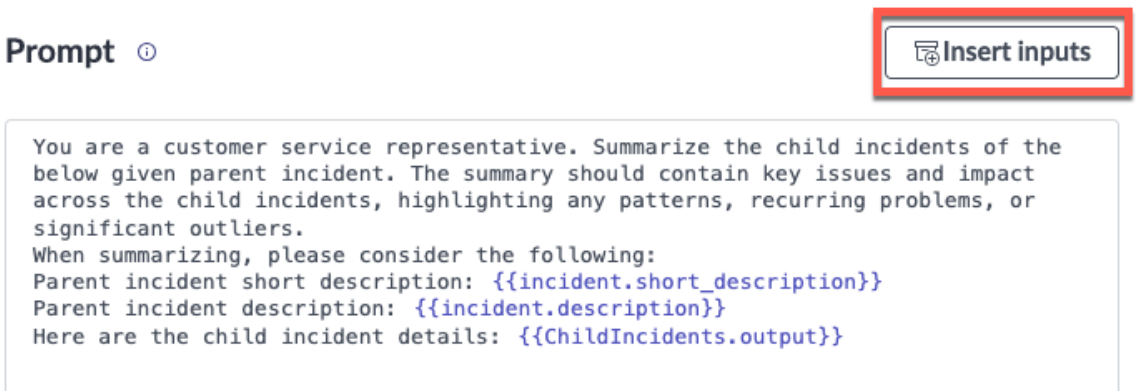
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add skill input modal



Select **Insert inputs** for the prompt.

Prompt modal



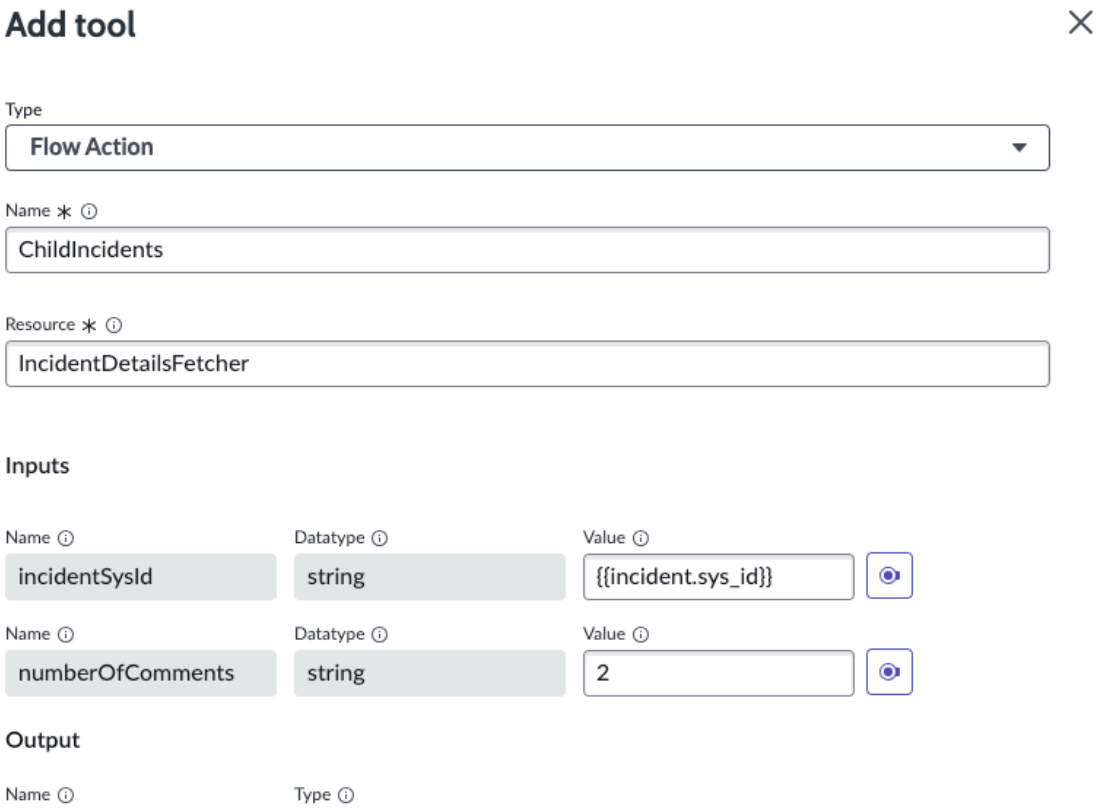
For this example, the following is used:

```
Parent incident short description: {{incident.short_description}}
Parent incident description: {{incident.description}} Here are
the child incident details: {{ChildIncidents.output}}
```

Select the tools for the skill. For this example, select **Flow Action** and the *`IncidentDetailsFetcher`* flow resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add tool modal



Configure the skill deployment options

The next step is to configure the skill deployment options. These options enable you to choose where to find the skill in AI Admin Hub.

1. Select the **Skill settings** tab.
2. Select **Deployment Settings**.
3. Enable the admin to enable the skill from the Core UI by selecting the **UI Action** check box.
4. Select **Save**.

Test and publish the skill

Test your skill prompt to verify that it pulls in the correct type of data.

1. Select **Run tests**.
2. Choose a record or incident.
3. Select **Run test**.

Look at the response.

To see the data that was brought into the prompt from your skill inputs and tools, you can look at the **Grounded prompt** tab.

If the output is correct, select **Finalize prompt**. After you finalize the prompt and you are ready to implement it, select **Publish**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the skill

After you test, finalize, and publish your skill, an admin must activate it in AI Admin Hub. To learn more about activating skills, see Activate a skill.

Configuring AI Skill Kit

Configure prompts and skills for AI Skill Kit.

Configuration overview

To use AI Skill Kit, you must update your Otto plugins in the Application Manager. For example, update your ServiceNow Otto for ITSM plugin to the latest version.

After you install the plugin, configuring a skill in AI Skill Kit has two parts. First, you must configure how to deploy the skill. Next, you must configure the prompt.

Configure a skill prompt

Configure a skill prompt to set its large language model (LLM), the randomness of its responses, and its token limits.

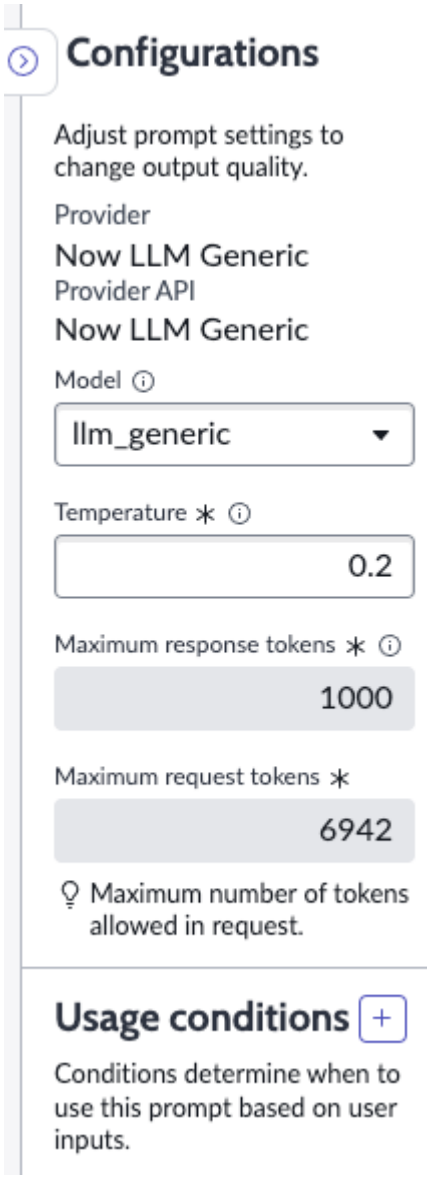
Before you begin

Role required: sn_skill_builder.admin

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill that you want to configure.
3. Select **Configurations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. On the form, fill in the fields.

Configurations form

Field	Description
Model	Large language model (LLM) to use for the prompt.
Temperature	Randomness and creativity of the output. A higher value increases randomness. The value must be from 0 through 1.
Maximum response tokens	Maximum number of tokens that the model can return. If you're using Now LLM Service, the maximum is 1,000.
Maximum request tokens	Maximum number of tokens allowed in a request.
Structured output	Option to return prompt responses in a consistent JSON format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only Google Gemini and Azure OpenAI support structured output. This option is not available when using Now LLM Service.

5. Add **Usage conditions** to determine when to use the prompt.

What to do next

After you configure your skill prompt, you can test it. To learn more about testing skills, see Test a prompt.

To learn more about configuring the skill, including models and tokens, see AI Skill Kit FAQs on the ServiceNow Community.

Configure deployment and skill settings

Configure where a skill appears in AI Admin Hub, review general information, set security controls, choose a provider, and add evaluation metrics.

Before you begin

Role required: sn_skill_builder.admin

About this task

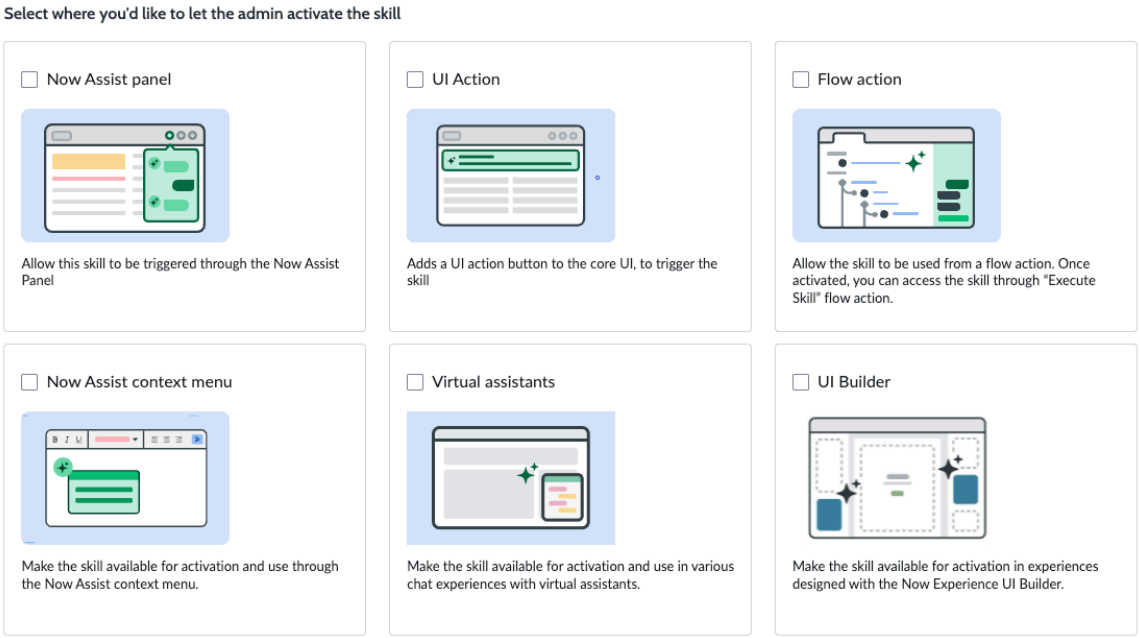
The **Deployment and skill settings** tab contains five sections that you can configure in any order:

- **Deployment settings**: Choose where the admin can find and activate the skill in AI Admin Hub.
- **General information**: Review or edit the skill name and description.
- **Security controls**: Restrict which roles can run the skill.
- **Providers**: View the language model providers available for the skill.
- **Evaluation metrics**: Add metrics that measure the quality of skill responses.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill that you want to configure.
3. Select the **Deployment and skill settings** tab.
4. Configure the **Deployment settings** section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Under **Now Assist features**, fill in the fields.

Deployment settings form

Field	Description
Workflow	High-level category for the skill, such as **Technology**, **Employee**, **Creator**, or **Platform**. You can also select **Other** if none of the categories fit. The workflow that you choose is where the skill appears in the AI Admin Hub console.
Product	Product that the skill operates within, such as ITSM, ITOM, HR Service Delivery, or AI Admin Hub.
Feature	Feature that the skill is used in, such as Agent Chat, Knowledge, or Virtual Agent. You can also define a custom feature.
Name	Name of the feature.
Description	Description of the feature.

Under **Select where you'd like to let the admin activate the skill**, select one or more activation points.

- **Now Assist panel**
- **UI Action**
- **Flow action**
- **Now Assist context menu**
- **Virtual assistants**

  For more information about Now Assist in Virtual Agent, see Assistants overview.

- **UI Builder**

5. Review the **General information** section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This section shows the information that you added when you created the skill. You can edit the skill name and description here.

6. Configure the **Security controls** section to restrict which roles can run the skill.

   For the procedure, see Configure security controls for a skill.

7. Review the **Providers** section.

   The **Providers** section lists the language model providers available for the skill. Each provider is tagged as **Default** or **Not supported** where applicable.

   > **Important:** The runtime model depends on the configuration in AI Admin Hub and may differ from what's shown in the **Providers** section.

8. **Optional:** Add one or more **Evaluation metrics** to measure the quality of skill responses.

   (Optional) Evaluation metrics attached in this section apply to every prompt test that you run on the skill.

   > **Important:**
   >
   > LLM-judged evaluation metrics consume additional Now Assist assists during prompt testing. Metric execution is billed as a custom call at one assist per 1,000 output tokens, so metrics that produce longer output consume more assists.
   >
   > Script-based metrics (metrics with a script instead of a judge prompt) don't consume assists.
   >
   > For details about Now Assist consumption during prompt testing, see Test a prompt.

   a. In the **Evaluation metrics** section, select the add icon +.

   b. From the list of available metrics, select the metric that you want to add.

      (Optional) Metrics are grouped by category. Each metric shows the language model provider that runs the metric, such as **Amazon Bedrock**, **Now LLM Generic**, or **Multiple LLMs**. Metrics that run as scripts don't display a provider tag.

      For descriptions of the available metrics, see Evaluate a prompt.

   c. Review the metric details.

      Metric detail tabs

Tab	Description
About	Description of the metric, how it works, when to use it, and its output format.
Judge Prompt / Script	Prompt that a language model uses to judge the response, or script that evaluates the response, depending on how the metric is implemented.

   d. Select **Add**.

9. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
After you configure the deployment and skill settings, you can publish your skill. To learn more about publishing skills, see Finalize and publish a skill.

Configure security controls for a skill

Define an access control list (ACL) and role restrictions for every skill. The ACL limits which user roles can access and run the skill, and role restrictions limit the roles that the skill runs with.

About this task
Existing skills without an ACL continue to run. However, if you edit the skill and republish it, you must add an ACL.

If you try to execute a skill when you don't have permission, you see an error that you aren't authorized.

Before you begin
Role required: sn_skill_builder.admin

Procedure
1. Navigate to **All** > **AI Skill Kit** > **Home**.
   A dialog box that explains ACLs appears. You can select **Got it** or **View skills without ACLs**.
2. Add an ACL and role restrictions to an existing skill.
   a. Select the skill that you want to add an ACL to.
   b. Select the **Deployment and skill settings** tab and then select **Security controls**.
   c. Select **Add ACL**.
   d. Select an option.

Options for ACL roles

Option	Description
Any authenticated user	Any logged-in user can access and run the skill.
Select roles	Select the roles that a user must have to execute the skill. **Note:** If you select multiple roles, a user needs only one of the roles to run the skill.

   e. Add role restrictions.
   f. Select **Apply**.
3. Add an ACL to a new skill.
   a. Create a skill.
   b. In the **Configure security controls** section, select an option for the access control list.
   c. Apply role restrictions to the skill.
   d. Continue creating the skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using AI Skill Kit

Use AI Skill Kit to create and publish prompts and custom skills for Otto.

Building a custom skill in AI Skill Kit is a sequential process. The following steps take you from an empty skill through to activation, where end users can trigger it from the platform.

Create a skill

Create a skill or clone an existing base system skill. Clone a Otto skill if it's close to what you need but requires modification.

- Create a skill
- Clone and edit a ServiceNow skill

Build the prompt

A prompt is an instruction template sent to the AI model when the skill runs. Define what information the skill receives as inputs, write the prompt text, and optionally add tools that gather additional context before the prompt executes.

- Create a prompt
- Add a tool
- Add a retriever
- Add a web search
- Use prompt assistance

Test and evaluate

Before publishing, test your prompt against real records on your instance to verify the output. You can also run a formal evaluation, which measures output quality against expected results using correctness and faithfulness scores.

- Test a prompt
- Evaluate a prompt

Publish and activate

When your skill is ready, finalize the prompt and publish it. Publishing makes the skill visible to a Otto admin, who then activates it in AI Admin Hub to make it available to your users.

- Finalize and publish a skill
- Activate a skill

Call a skill from a script

After a skill is published, you can call it from a server-side script, so that you can integrate the skill into automated workflows or business rules. For more information, see Call a custom skill from a script.

Create a skill

Create a custom skill for Otto. Custom skills extend the generative AI capabilities of Otto to fit your own use cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

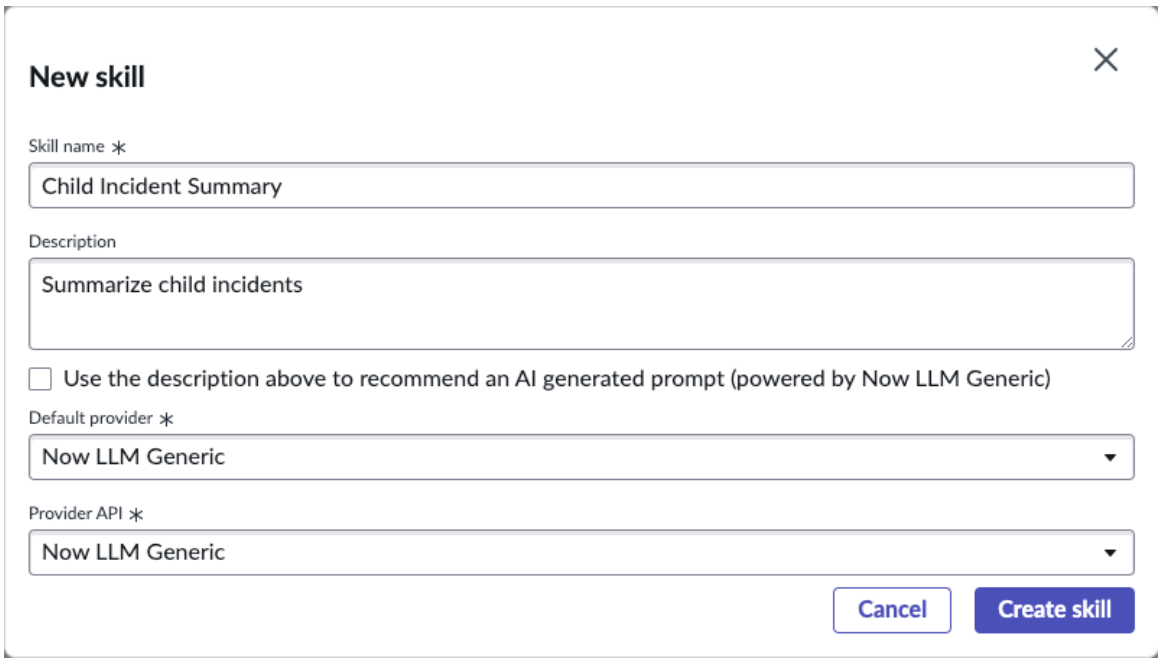
Before you begin

Role required: sn_skill_builder.admin

Note: When you update AI Skill Kit also update Generative AI Controller so that your skills continue to work as expected.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select **Create new skill**.
3. On the form, fill in the fields.



New skill form

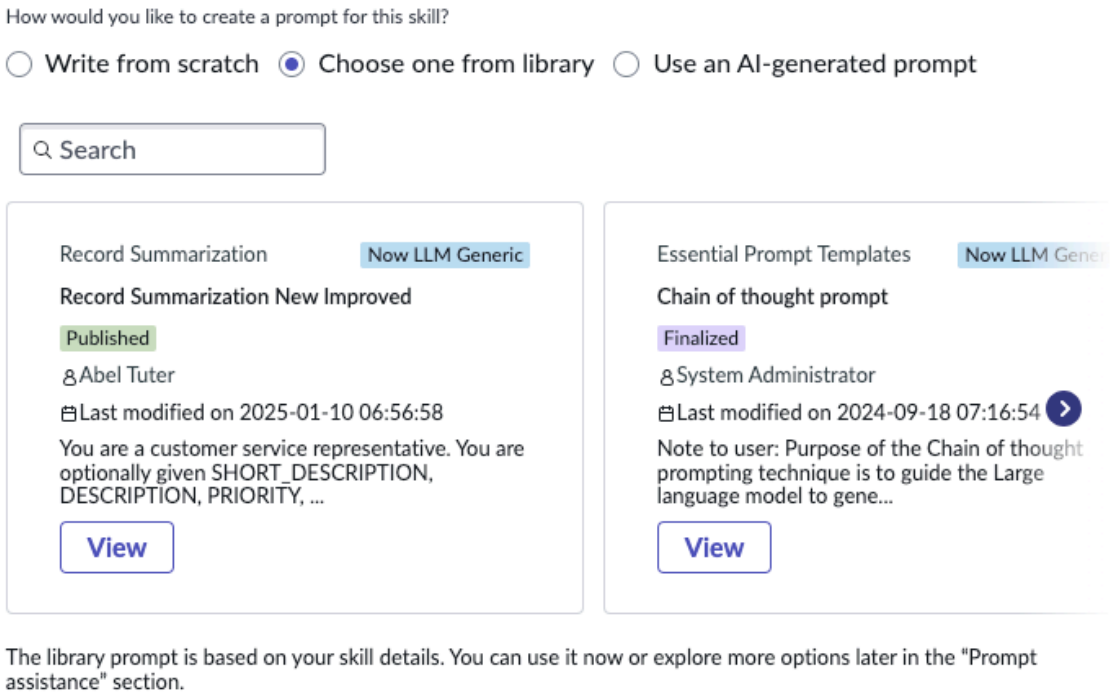
Field	Description
Skill name	Name of the skill.
Description	Description of the skill.
Default provider	Available providers: ○ Now LLM Service ○ External LLM You can use Now LLM Service, Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all generative AI skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the AI Admin Hub console. For more information, see Large language models on the ServiceNow AI Platform. ▪ Spokes ▪ Custom LLM For more information on setting up a custom large language model (LLM), see Configure a generic large language model (LLM) connector

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Available prebuilt spokes that enable you to connect with an external LLM: ○ Microsoft Azure OpenAI Generative AI Spoke ○ OpenAI Generative AI Spoke ○ Aleph Alpha ○ IBM watsonx ○ Google Gemini (MakerSuite and Vertex AI) **Note:** The spokes don't consume Integration Hub transactions. The spokes consume assists.
Provider API	Provider of the API for the selected LLM.
User access	○ Any authenticated user Any logged-in user can access and run the skill. ○ Select roles Select the roles that a user must have to execute the skill. **Note:** If you select multiple roles, a user needs only one of the roles to run the skill.
Role restrictions	Roles that the skill runs as. Access control lists (ACLs) determine which user roles can trigger the skill, while role restrictions determine the roles that the skill operates with when it runs.

4. Select how you want to create the prompt for the skill.
   - Write from scratch
   - Choose one from library
     a. Find the prompt that you want to use.
     b. Select **View**.
     c. Select **Use prompt**.
   - Use an AI-generated prompt

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Next**.
6. **Optional:** Add skill inputs and outputs.
7. Select **Go to summary**.
8. Select **Finish**.

What to do next

After you create the skill, you must configure it. To learn more about configuring a skill, see Configure a skill prompt.

If you don't need to set any configurations for your skill, you can create your skill prompt and tools. To learn more, see Create a prompt and Add a tool.

Clone and edit a ServiceNow skill

Clone an eligible skill provided in ServiceNow Otto applications in AI Skill Kit so that you can edit its prompt or change its AI service provider. Editing the prompt lets you control the format and content of the large language model (LLM) response.

Before you begin

Role required: sn_skill_builder.admin

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select ***ServiceNow*** **skills**
3. Select the ***ServiceNow*** skill that you want to clone.
4. Select **Clone Skill**.
5. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clone skill form

Field	Description
Skill name	Name of the skill.
Description	Description of the skill.
Default provider	Available providers: ○ Now LLM Service ○ External LLM ▪ Spokes ▪ Custom LLM For more information on setting up a custom large language model (LLM), see Configure a generic large language model (LLM) connector Available prebuilt spokes that enable you to connect with an external LLM: ○ Microsoft Azure OpenAI Generative AI Spoke ○ OpenAI Generative AI Spoke ○ Aleph Alpha ○ IBM watsonx ○ Google Gemini (MakerSuite and Vertex AI) **Note:** The spokes don't consume Integration Hub transactions. The spokes consume assists.
Provider API	Provider of the API for the selected LLM.

6. Select **Clone**.

Note: When you clone a skill, you can't change the skill outputs, tools, or deployment settings.

7. Select the edit icon to add skill inputs.

Edit inputs form

Section	Description
Base input table fields	Each skill relies on a base input table and input fields with descriptions to provide context for the LLM to generate a response.
Rule conditions	Rule conditions determine when the input template is used. By default, record state determines which input template the LLM uses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Section	Description
Additional input data sources	You can add input data sources such as related tables, activity streams, and relationships to provide more context to the LLM. You can also add rule conditions to these additional data sources.

8. **Optional:** Select **Clone prompt** to edit the prompt.
   The list shows all prompts that use the same supporting skill for each provider.
9. Add **Prompt usage conditions**.
   Prompt usage conditions determine when a prompt runs.
10. To test the prompt, select **Run test** and add test values.
11. Select the **Skill settings** tab.
12. **Optional:** In the **General information** section, select the toggle to change the default provider.

What to do next

Create your skill prompt. To learn more about creating a prompt, see Create a prompt.

After you clone and edit the skill and prompt, you can evaluate your prompt. To learn more about evaluating a prompt, see Evaluate a prompt.

Create a prompt

After you create a custom skill, create a prompt. The prompt defines the instructions that the skill sends to the LLM and the skill inputs that it uses.

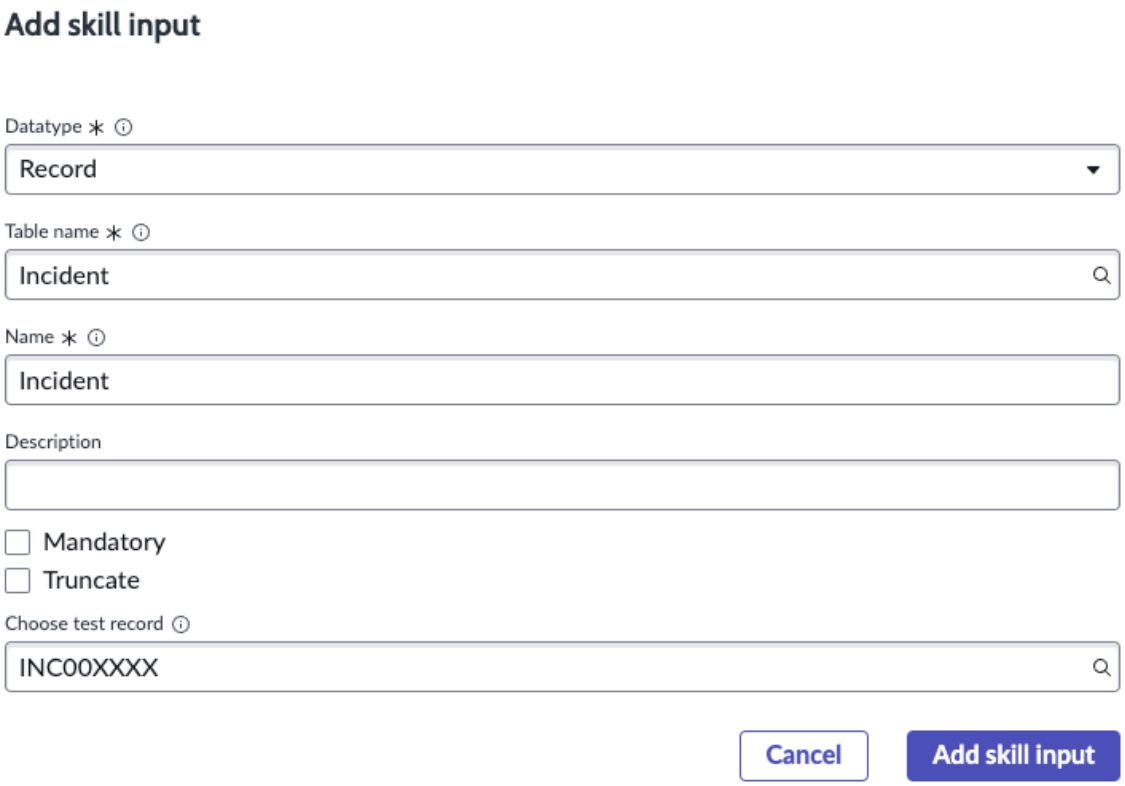
Before you begin

Role required: sn_skill_builder.admin

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill that you want to create a prompt for.
3. Select the edit icon and name the prompt.
4. Write the prompt.
5. Select **Skill Inputs**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Skill input options

Input type	Description
Datatype	○ Record ○ String ○ Numeric ○ Boolean ○ Simple Array ○ JSON Object ○ JSON Array
Name	Name of the input.
Description	Description of the input.
Mandatory	Option to require a value for the input when the skill runs.
Truncate	Option to shorten the prompt context to fit the model context length when the prompt is too large.
For records	
Table name	Name of the table that contains the test record.
Choose test record	Record used to test the prompt.
For String, Numeric, Boolean, Simple Array, JSON Object, and JSON Array	
Test values	Values used to test the prompt.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Add skill input**.
7. Select **Insert inputs**.
   The input options change depending on the data type that you select.
8. Search for the inputs that you want to use for the prompt.
   For example, you can search for the incident short description or priority.
9. If you're not ready to finalize the prompt and publish the skill, select **Save** or **Save as**.

> **Note:** Skills can have multiple prompts. Usage conditions determine which prompt is executed. If no conditions are met, the default prompt is executed. To configure prompt usage conditions, see Configure a skill prompt.

What to do next
After you create a prompt, test it. To learn more about testing your prompt, see Test a prompt.

Add a tool

Add and manage tools visually in the Tools editor, including decision branching, to execute different tools for your skill. Adding decision branches between tools enables you to define the conditions that must be met for a tool to run. If no conditions are met, the default branch's step is executed.

Before you begin
Role required: sn_skill_builder.admin

About this task
A tool is a utility that is configured to convert skill inputs into skill outputs. The tool outputs can be referenced in a prompt template to introduce context to a prompt. The input for a tool can be a skill input or the output of another tool.

You can use the Tool editor to configure tools and link them to each other.

Decision nodes enable you to execute different tools, based on the logic of the branch. A decision node can contain multiple branches but needs one default branch.

Procedure
1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill you want to add a tool to.
3. Select the **Tool editor** tab.
4. Select the (+) icon to add a node.
5. Select the type of node that you want to add.

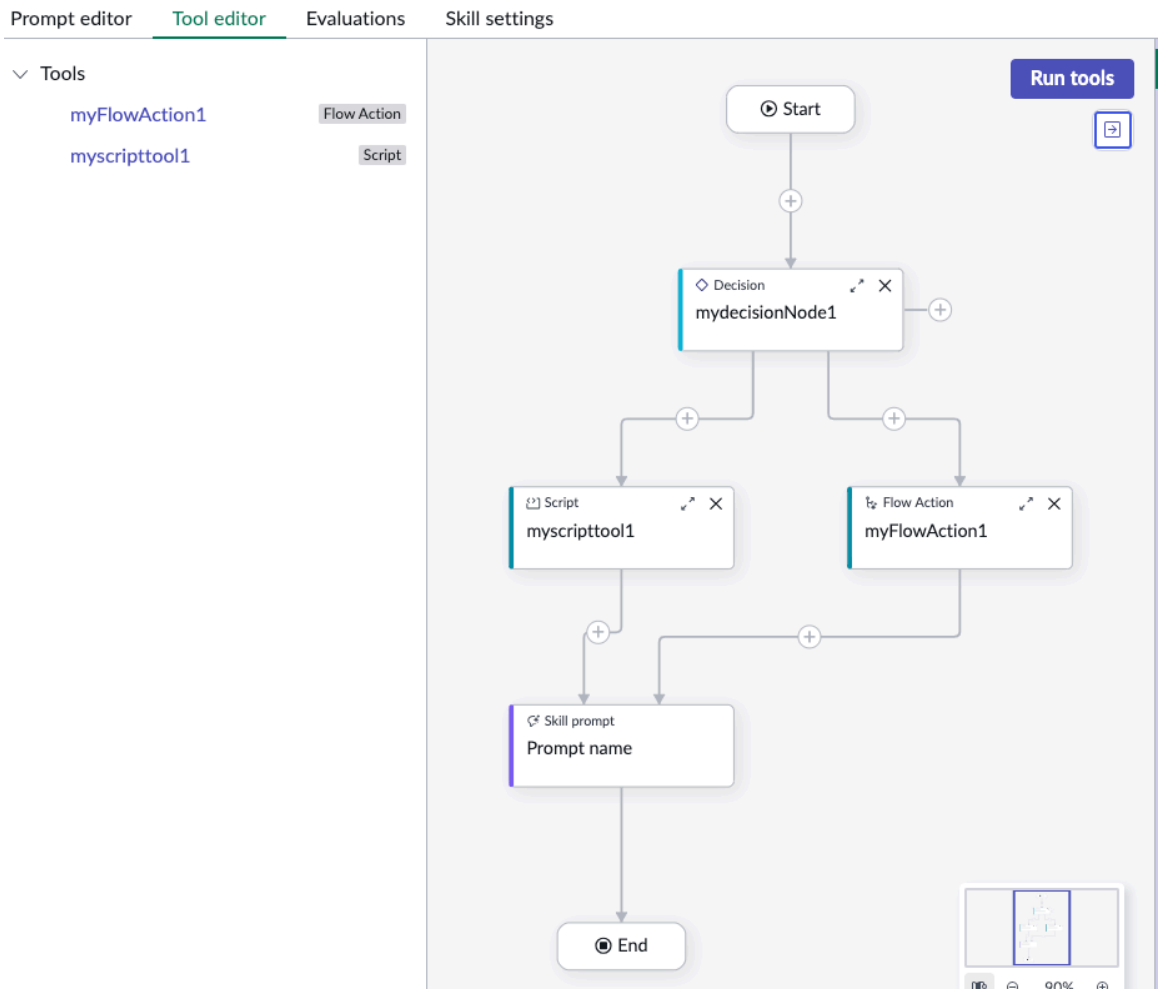
Add a node

Node type	Steps
Tool node Types of tools: ○ Script ○ SubFlow ○ Flow Action ○ Retriever	**a.** Select a tool type. **b.** Name the tool. **c.** Select a condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node type	Steps
○ Skill ○ Web search **Note:** If you select Google as your web search tool provider, the web search tool uses Grounding with Google Search, offered under a Global Standard deployment. Because grounding is not data resident, Google's global infrastructure routes traffic to a global data center for each web search request. This processing location may be different from the data processing location that you chose for your ServiceNow instance. Consider your organization's data policies before enabling skills that have Google web search tools. ○ Predictive Intelligence	
Decision node	**a.** Name the node. **b.** Select **Add branch** **i.** Name the branch. **ii.** Select a Destination node. **iii.** Set the conditions. **c.** Select a Destination node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Add**.
7. Select **Run tools** to test the tools.

Add a retriever

Add a retriever to your skill to augment your prompts with relevant context from AI Search results.

Before you begin

Role required: sn_skill_builder.admin

About this task

Using a retriever in a skill enhances the relevance and coherence of a response by pulling relevant information from a source and then feeding it to a large language model (LLM) to create the final output. This process doesn't require model fine-tuning.

A retriever enables the chatbot to access external knowledge by fetching relevant background information, resulting in more factual, in-depth, and informed responses.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Create a skill or select the skill that you want to add a retriever to.
3. Select the **Tool editor** tab.
4. Select the (+) icon to add a node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Tool node**.
6. Select **Retriever** from the drop-down menu.
7. Select **Configure retriever**.
8. On the form, fill in the fields.

Add tool form

Field	Description
Name	Name of the retriever.
Search query	Information to search for. The value can be static text or a skill input.
Search space type	○ Table-based ○ Search-profile-based
Search profile	A group of search sources.
Search sources	Tables in ServiceNow that have been indexed and can be used for search.
Fields returned	Fields to return from the search sources and send to the LLM.
Limit	Maximum number of results to return.
Search criteria	○ Hybrid ○ Semantic ○ Keyword **Note:** If you choose Hybrid or Semantic, you can make selections for chunking and reranking. To learn more about chunking and reranking, see Configure retriever chunking and reranking.

9. Select **Next**.
10. Select an embedding model.
    To learn about embedding models, see Configuring your embedding model.
11. If you selected **Hybrid** or **Semantic** search criteria, select a semantic index.
    A semantic index enables you to search for data based on contextual meaning.
12. **Optional:** If you selected **Hybrid** or **Semantic** search criteria, select **Advanced** to change the document matching threshold.
    The document matching threshold is the threshold for semantic matching. The default value is 0. You can input any value from 0 to 1. You can get more precise results with a higher value.
13. Select **Next**.

Note: If you selected **Hybrid** or **Semantic** search criteria, see Configure retriever chunking and reranking to complete setting up your retriever.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

14. Review the retriever tool information.
15. Select **Add tool**.

Configure retriever chunking and reranking

Configure chunking and reranking for a retriever that uses hybrid or semantic search to control how retrieved content is split, ranked, and passed to the LLM.

Before you begin

Role required: sn_skill_builder.admin

About this task

To set up the chunking and reranking options for a retriever, you must have a retriever tool added to your skill with the **Hybrid** or **Semantic** search criteria. The following steps come after the semantic configuration in Add a retriever.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill that you're adding a retriever to.
3. Add a retriever.
4. On the form, fill in the fields.

Chunking and reranking form

Field	Description
Max number of chunks per document	Maximum number of chunks to return per document. The default value is 10.
Chunking strategy	○ Fixed size Fixed size breaks down the full text into smaller passages. You can choose the passage size limit in number of words or number of sentences. ○ Small to big Small to big enables you to choose the top K best-matched indexed chunks and expand them to include surrounding chunks. Then the expanded chunks are linked together into a large text and broken into smaller passages. Don't use the small to big chunking strategy if you're using full text or truncate index chunking configuration.
Chunking unit	○ Words ○ Sentences
Chunk size	Size of the returned chunks. The default value for word size is 750. The default value for sentence size is 40.
Expanded snippet size	Size of the expanded chunks included when you select the small to big chunking strategy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Top K results	Number of chunks that the reranker returns. If this field is empty, the reranker returns the number of results set in the retriever Limit field.

5. Select **Next**.
6. Select the type of condition to evaluate when the tool runs.
7. Select **Next**.
8. Review the selections that you made for the tool and select **Add tool**.

Add a web search

Add a web search as a tool in AI Skill Kit to include web search results in your skill prompts.

Before you begin

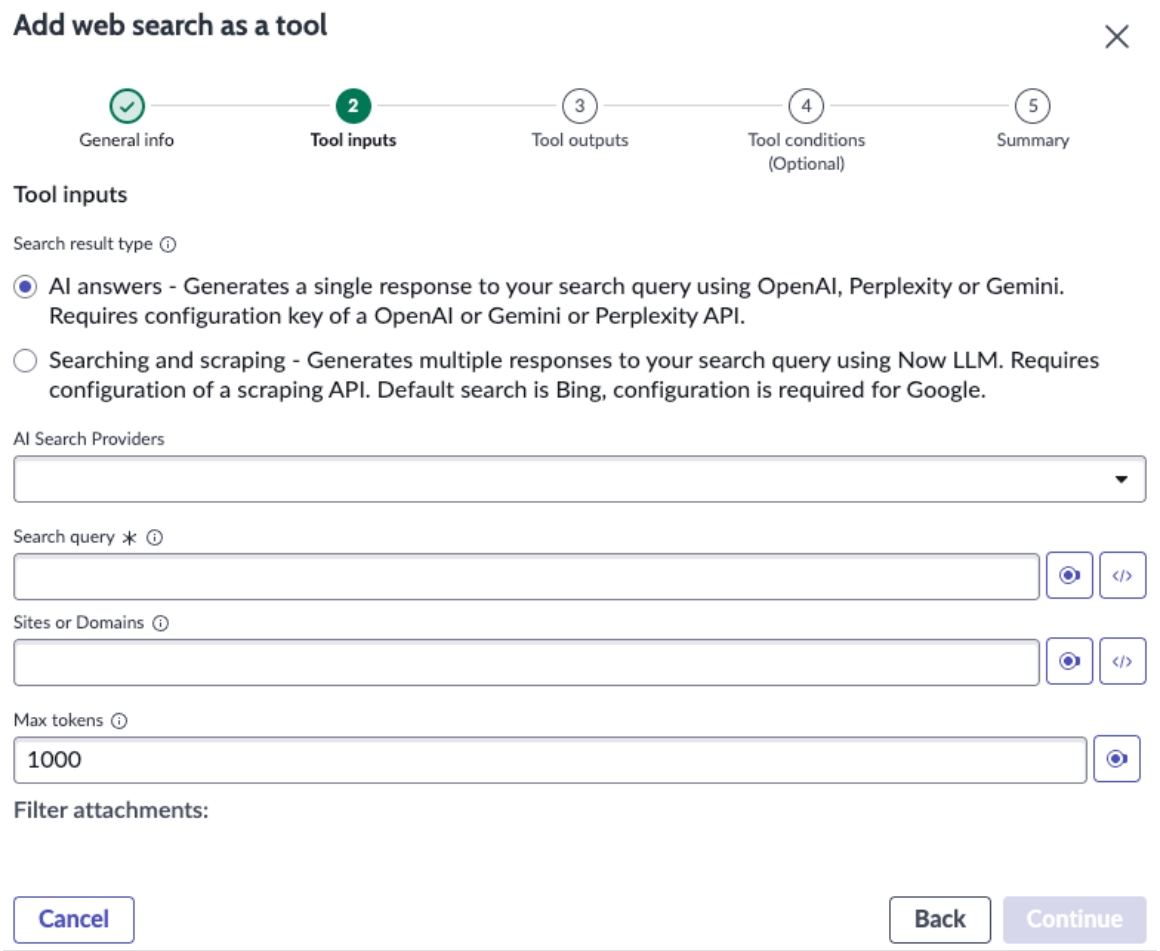
Role required: sn_skill_builder.admin or admin.

A search engine API key from your provider must be configured on the ServiceNow AI Platform.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Create a skill or select the skill that you want to add web search to.
3. Select the **Tool editor** tab.
4. Select the (+) icon to add a node.
5. Select **Tool node**, and then **Add**.
6. Select **Web Search** in the **Tool type** field.
7. Select **Configure tool**.
8. On the General info form, enter a name in the **Name** field and select **Web Search** in the **Resource** field.
9. Select **Continue**.
10. On the Tool inputs form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Web search configuration form

Field	Description
Search result type	**AI answers** is the type of result that you want from the search. **AI answers** generates a single response to the search using Perplexity, OpenAI, or Gemini.
AI search providers	The AI search provider used to perform the search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you select Perplexity or OpenAI, you must complete the API key setup in the AI Search answers OneExtend capability table. For more information on that process, see Configure AI search answers capability for web search. Azure OpenAI appears as an option, but it doesn't support web search. If you select Google as your web search tool provider, the web search tool uses Grounding with Google Search, offered under a Global Standard deployment. Because grounding is not data resident, Google's global infrastructure routes traffic to a global data center for each web search request. This processing might differ from the data processing location chosen for your ServiceNow instance. Consider your organization's data policies before adding a web search tool with Google as the provider.
Search query	Word, words, or phrase to search for.
Sites or domains	This field appears but it's not supported.
Max tokens	This field appears but it's not supported.

11. Select **Continue**.
12. On the Tool outputs form, select **Continue**.
13. On the Tool conditions (optional) form, select **Continue**.
14. On the Summary screen, select **Add tool**.

Add Predictive Intelligence

Add Predictive Intelligence as a tool in AI Skill Kit. Predictive Intelligence models predict values, estimate outcomes, and identify patterns that you can use to route work, populate forms, and estimate wait times.

Before you begin

Role required: sn_skill_builder.admin

Procedure

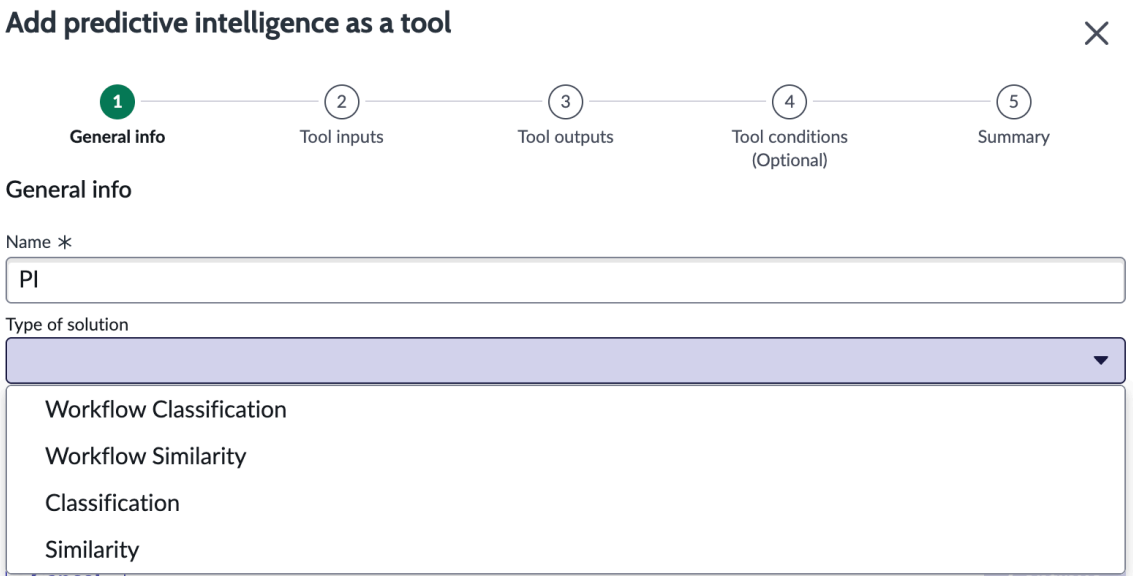
1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Create a skill or select the skill that you want to add predictive intelligence to.
3. Select the **Tool editor** tab.
4. Select the (+) icon to add a node.
5. Select **Tool node**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Predictive Intelligence**.
7. On the form, fill in the fields.

Predictive intelligence form

Field	Description
Name	Name of the tool.
Type of solution	○ Workflow classification ○ Workflow similarity ○ Classification ○ Similarity



8. Add tool inputs.
9. Add tool outputs.
10. **Optional:** Select tool conditions.
11. Select **Add tool**.

Add Document Intelligence

Add Document Intelligence as a tool in AI Skill Kit to extract structured data from documents as part of your skill's execution flow.

Before you begin

Role required: sn_skill_builder.admin

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Create a skill or select the skill that you want to add Document Intelligence to.
3. Select the **2. Add tools** tab.
4. Select the (+) icon to add a node.
5. Select **Tool node**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Document Intelligence**.
7. On the form, fill in the fields.

Add document intelligence form

Field	Description
Name	A name to identify the tool.
Action	**Ask a Question** Ask a question about the file content. **Extract information** Pull structured data and insights from file content. **Summarize files** Generate a summary of the file contents.

8. Add tool inputs.
9. Add tool outputs.
10. **Optional:** Select tool conditions.
11. Select **Add tool**.

Use prompt assistance

Use prompt assistance to start your prompt from an example in the prompt library or from a prompt that ServiceNow Otto generates.

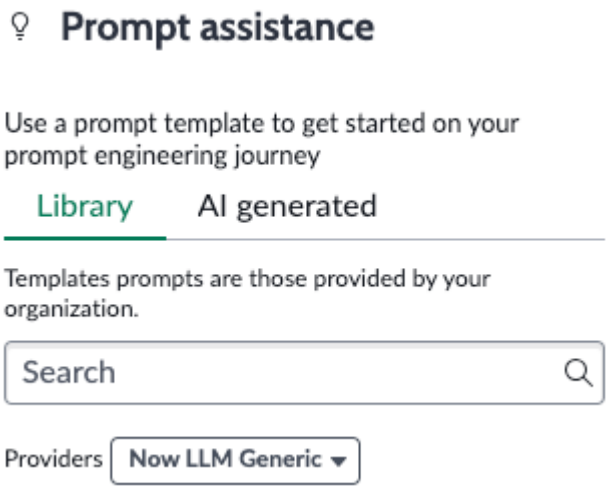
Before you begin

Role required: sn_skill_builder.admin

Procedure

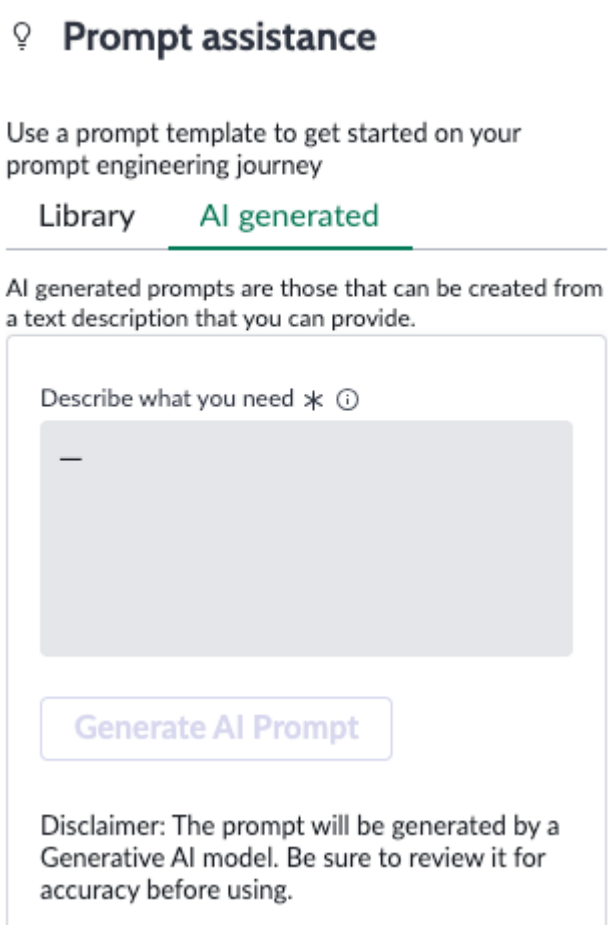
1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Create a skill or select the skill that you want to use prompt assistance for.
3. Select the prompt assistance icon .
4. Select the **Library** tab to search for a prompt from the prompt library.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5.

6. Select the **AI generated** tab to generate a prompt from a description of what you need.



Test a prompt

After you create a prompt for your custom skill, test it before you finalize it to verify that it returns the expected results.

Before you begin

Role required: sn_skill_builder.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill that you created the prompt for.
3. In the Test prompt section, select **Run tests**.
4. Select a test record, such as an incident.
5. Select **Run test**.

> **Important:**
>
> Testing a skill consumes at least one Now Assist assist for the base prompt call.
>
> If the skill has LLM-judged evaluation metrics attached on the **Deployment and skill settings** tab, each metric execution consumes additional assists. Metric execution is billed as a custom call at one assist per 1,000 output tokens. Script-based metrics (metrics with a script instead of a judge prompt) don't consume assists.
>
> For information about adding evaluation metrics, see Configure deployment and skill settings.

Prompt results

Tab	Description
Response	Result that the large language model (LLM) returns for the prompt.
Grounded prompt	Prompt with the data from your skill inputs and tools filled in. Use this view to verify that your skill inputs and tools return the correct data.

6. **Optional:** If the skill is deployed as a flow, turn off the *com.glide.oneapi.fdih.async.quick.mode* system property, and then turn on flow reporting.
   This property controls whether flow execution details are generated when running flows, subflows, and actions from a custom skill. You can use flow execution details to test and troubleshoot your flow, subflow, or action. For more information about the system property, see Workflow Studio flow system properties.
7. **Optional:** Refine the prompt and repeat testing as needed.
8. **Optional:** Select the run test history icon to see the results from your previous run tests.

What to do next

After you test your prompt, finalize the prompt and publish the skill. To learn more about publishing a skill, see Finalize and publish a skill.

If you have not configured the deployment settings for your skill, see Configure deployment and skill settings.

Evaluate a prompt

Use the AI Skill Kit evaluation tools to measure how your skill prompts perform against a dataset, using automated metrics and human feedback.

Before you begin

Role required: sn_skill_builder.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill that you want to evaluate.
3. Select the **Prompt performance** tab.
4. Select the **Evaluation runs** tab.
5. Create a dataset from a table or data collection.

Create a dataset

Method	Steps
Create a dataset from a table	**a.** Give the dataset a name and description. **b.** Select **Table**. **c.** Find the table that you want to use. **d.** Select the maximum number of records that you want to use. **e.** Add conditions. **f.** Select **Generate Preview**. **g.** Select the mappings. **h.** Select **Create**.
Create a dataset from a data collection	**a.** Give the dataset a name and description. **b.** Select **Data Collection**. **c.** Select a data collection that you created in AI Data Kit. **d.** Select **Generate Preview**. **e.** Select the mappings. **f.** Select **Create**.

6. Select the add icon + for **Evaluation Runs**.
7. Give the evaluation run a name and description.
8. Select one or more prompts that you want to evaluate.
9. Select **Save & Next**.
10. Select a dataset.
11. Select **Save & Next**.
12. Expand the **Quality** tab.
13. Select the metrics that you want to evaluate.

Evaluation metrics

Evaluation method	Metric	Description
Human	Human Feedback	Human evaluation is the default option available for all prompt executions that generate a response. You can rate the response with a thumbs up or thumbs down, based on your satisfaction. You

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Evaluation method	Metric	Description
		also have the option to provide more detailed feedback to explain your evaluation choice.
Automated	Correctness	The correctness metric assesses the generated response's accuracy, completeness, pertinence, and writing quality relative to the given instruction. This metric helps to check that the text accurately reflects the instruction, covers all important points, remains relevant, and is well written.
Automated	Correctness with Golden Response	The correctness with golden response metric uses a predefined reference to assess the generated response's accuracy, completeness, pertinence, and writing quality relative to the given instruction. This metric helps to check that the text accurately reflects the instruction, covers all important points, remains relevant, and is well written. Use this metric when a reference response is available.
Automated	Faithfulness	The faithfulness metric assesses whether a generated response accurately reflects the information and context provided in the given instruction. This metric helps to check that the text contains no hallucinations, fabricated facts, or unsupported conclusions, maintaining alignment with the source material.

14. Select **Save & Next**.
15. Review the evaluation choices that you made.
16. Select **Save & Evaluate**.
17. **Optional:** Give a human evaluation.
    a. Select **Human evaluation**.
    b. Select a record to use in the evaluation.
    c. Expand the prompt and read the result.
    d. Select the thumbs up or thumbs down icon to give your evaluation.
    e. Add more information and select **Submit**.

Finalize and publish a skill

Finalize at least one prompt and publish your custom skill so that a Otto admin can activate it.

Before you begin

Role required: sn_skill_builder.admin

About this task

Publishing a skill is a two-part process. First, you must finalize at least one prompt. Finalizing a prompt marks it as ready for use and is required before the skill can be published. Then you publish the skill, which changes its state from Draft to Published and makes it visible to a Otto admin for activation in AI Admin Hub.

Tip: Make sure your deployment settings are configured before publishing. After it's published, the skill appears in AI Admin Hub under the workflow category you selected. To learn more, see Configure deployment and skill settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Home**.
2. Select the skill that you want to publish.
3. Make any necessary changes to the prompt and test it.
   To learn more about testing your prompt, see Test a prompt.
4. In the **Skill contents** sidebar, select the prompt that you want to finalize.
5. Select the lock icon (**Finalize prompt**) next to the prompt name to finalize the prompt.

   The lock icon is located in the header row of the prompt editor, next to the **Manage prompt** button. Selecting it marks the prompt as finalized and removes the lock icon from view. You must finalize at least one prompt before you can publish the skill.

   Note: If you edit a finalized prompt, you must finalize it again before republishing.

6. Repeat the previous two steps for each additional prompt that you want to finalize.
7. Select **Publish skill**.

   The skill status changes from Draft to Published. The skill becomes visible in AI Admin Hub and ready for an admin to activate.

What to do next

A Otto admin must activate the skill before users can trigger it. To learn more about activating a skill, see Activate a skill.

To create a copy of a published skill to use as a starting point for a new one, see Clone and edit a ServiceNow skill.

To set a prompt as the default for a skill, use the **Set as the default prompt** toggle in the prompt editor. To learn more about managing prompts, see Create a prompt.

Activate a skill

After you create and publish a custom skill, you must activate it in AI Admin Hub. Activating the skill enables you to trigger the skill within the UI.

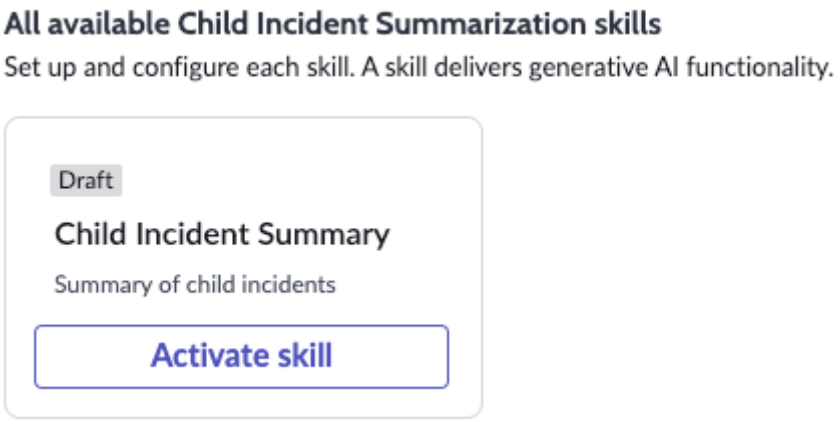
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Features**.
2. Find the custom skill that you created.
3. Select **Activate skill**.
   Make sure you are in the correct application scope when you activate the skill. To learn more about application scopes, see Application scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Some skills might need to be reviewed and approved by a data steward before you can activate it.

What to do next

You can enable AI Guardian for your skills. To learn more about AI Guardian, see AI Guardian

Call a custom skill from a script

Call a custom skill from a UI action script so that you can run the skill and use its output in your instance logic.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **UI Actions**.
2. Create a UI action.
   For more information on creating UI actions, see Create a UI action.
3. Add your script.

   The following script is an example. You can replace the variables with your data.

```
var inputsPayload = {};

// create the payload to deliver input data to the skill

inputsPayload[‘input name’] = {

  tableName: 'table name',

  sysId: 'sys_id',

  queryString: ''

};

//create the request by combining the capability sys ID and the
 skill config sys ID
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var request = {

    executionRequests: [{

        payload: inputsPayload,

        capabilityId: ‘capability sys id’,

        meta: {

            skillConfigId: ‘skill config sys id’

        }

    }],

    mode: 'sync'

};

//run the custom skill and get the output in a string format
try {
var output =
 sn_one_extend.OneExtendUtil.execute(request)['capabilities'][r
equest.executionRequests[0].capabilityId]['response'];
var LLMOutput = JSON.parse(output).model_output;
} catch(e) {
 gs.error(e);
 gs.addErrorMessage('Something went wrong while executing the
 skill.');
}
action.setRedirectURL(current);
```

AI Skill Kit reference

Look up the roles, general guidelines, and log tables that support custom skill development in AI Skill Kit.

AI Skill Kit roles

Certain roles are required to use AI Skill Kit functionality.

Role types in AI Skill Kit

Three separate role concepts apply when you build and deploy a custom skill. Understanding the difference helps you plan access before you start and troubleshoot permission errors after you deploy.

Roles required to use the AI Skill Kit

Users need specific roles to perform activities in AI Skill Kit, such as installing the plugin, building a skill, or activating a published skill. These roles are assigned to the people on your team who build and manage skills. For a list of the roles required for each activity, see the Roles required for common tasks table.

Roles required to trigger skills

Roles that a user must have to trigger a published skill on your instance. These roles are configured within the skill configuration as part of its access control list (ACL).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ACLs are separate from the roles required to build the skill. To learn more, see Configure security controls for a skill.

Roles that a skill runs under

The roles that a skill operates with while it runs, which control what data and actions the skill can access on behalf of the triggering user. These are configured on the skill as role restrictions. Role restrictions are also separate from the roles required to build the skill. To learn more, see Configure security controls for a skill.

Two roles ship with AI Skill Kit:

- sn_skill_builder.admin for building, editing, and publishing skills.
- sn_skill_builder.model_admin for managing the LLMs available to skills.

The platform admin role is also required at two points: to install AI Skill Kit and to activate a published skill in AI Admin Hub. In many deployments, one person holds all three roles.

Note: The ACL and role restriction concepts apply to the skill's runtime users, not to the people building the skill. If you're planning access for your build team, you only need the roles listed in the Roles required for common tasks table.

Roles required for common tasks in AI Skill Kit

Most work in AI Skill Kit requires the sn_skill_builder.admin role, including creating, cloning, editing, configuring, testing, evaluating, and publishing skills, and calling skills from scripts.

Two activities require the platform admin role instead: installing AI Skill Kit and activating a published skill in AI Admin Hub.

Triggering an activated skill from the UI requires whatever roles are configured in the skill's ACL. To learn more, see Configure security controls for a skill.

Skill kit admin (sn_skill_builder.admin)

Users with this role can create, update, and publish skills in AI Skill Kit. This role is required to use AI Skill Kit.

Contains roles

List of roles contained within the role.

None.

Groups

None. This role is not assigned to any groups by default.

Tasks requiring this role

The *sn_skill_builder.admin* role is required for the following tasks:

- Create a skill
- Clone and edit a ServiceNow skill
- Create a prompt
- Configure a skill prompt
- Configure deployment and skill settings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure security controls for a skill
- Add a tool
- Add a retriever
- Add a web search
- Use prompt assistance
- Test a prompt
- Evaluate a prompt
- Finalize and publish a skill

Special considerations

This role grants access to the AI Skill Kit application and all skill authoring functionality. It does not grant the ability to activate skills in AI Admin Hub. Activating skills requires the *admin* role.

When configuring access control lists (ACLs) for a skill, the roles you specify in the ACL determine which users can invoke the skill. The *sn_skill_builder.admin* role only controls who can author skills, not who can use them. To learn more about configuring skill ACLs, see Configure security controls for a skill.

Field of use for AI Skill Kit

AI Skill Kit is included in various ServiceNow Otto packages that cover your ability to build Otto skills.

The following table clarifies how custom skills can be created and deployed in each of your environments.

Expected field of use

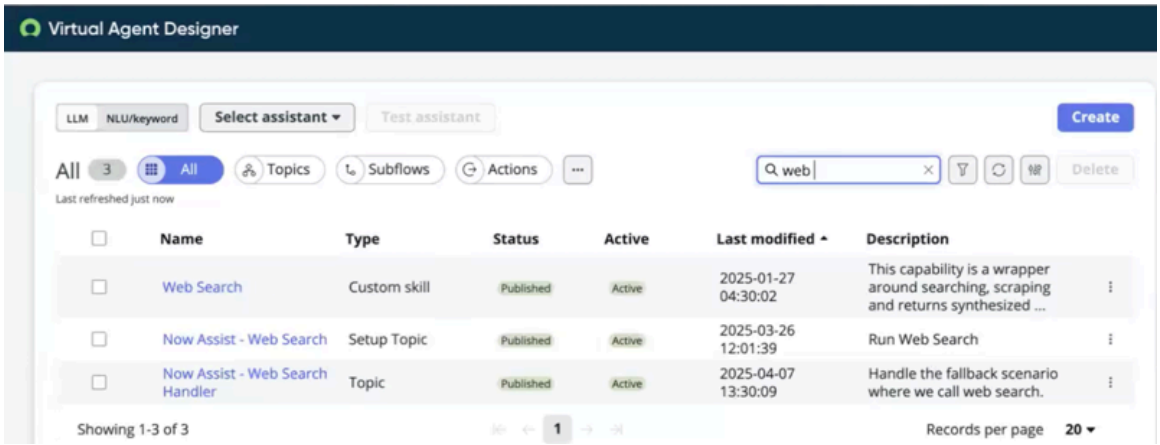
Workflow extensibility	AI Skill Kit enables you to supplement your use of licensed, prebuilt Otto skills, such as incident summarization. AI Skill Kit also enables you to create workflow-related skills within the scope of your Otto purchases. For example, within ITx for ITSM Pro/Enterprise Plus, within ITx and HR for customers with ITSM, and HRSD Pro/Enterprise Plus.
Non-duplicative	Refer to the Now Assist Overview to see the prebuilt skills that are currently available for purchase in ServiceNow Otto packages. You must build from the purchased skills instead of attempting to create duplicative versions of licensable ServiceNow skills without purchase.
Custom tables	Custom skills can be built using AI Skill Kit to enable generative AI functionality on the custom tables that are provided in your licenses.

Web search custom skill

The web search custom skill performs an internet search to answer a query. Web search runs when the LLM and AI Search can't provide results or whenever web search mode is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

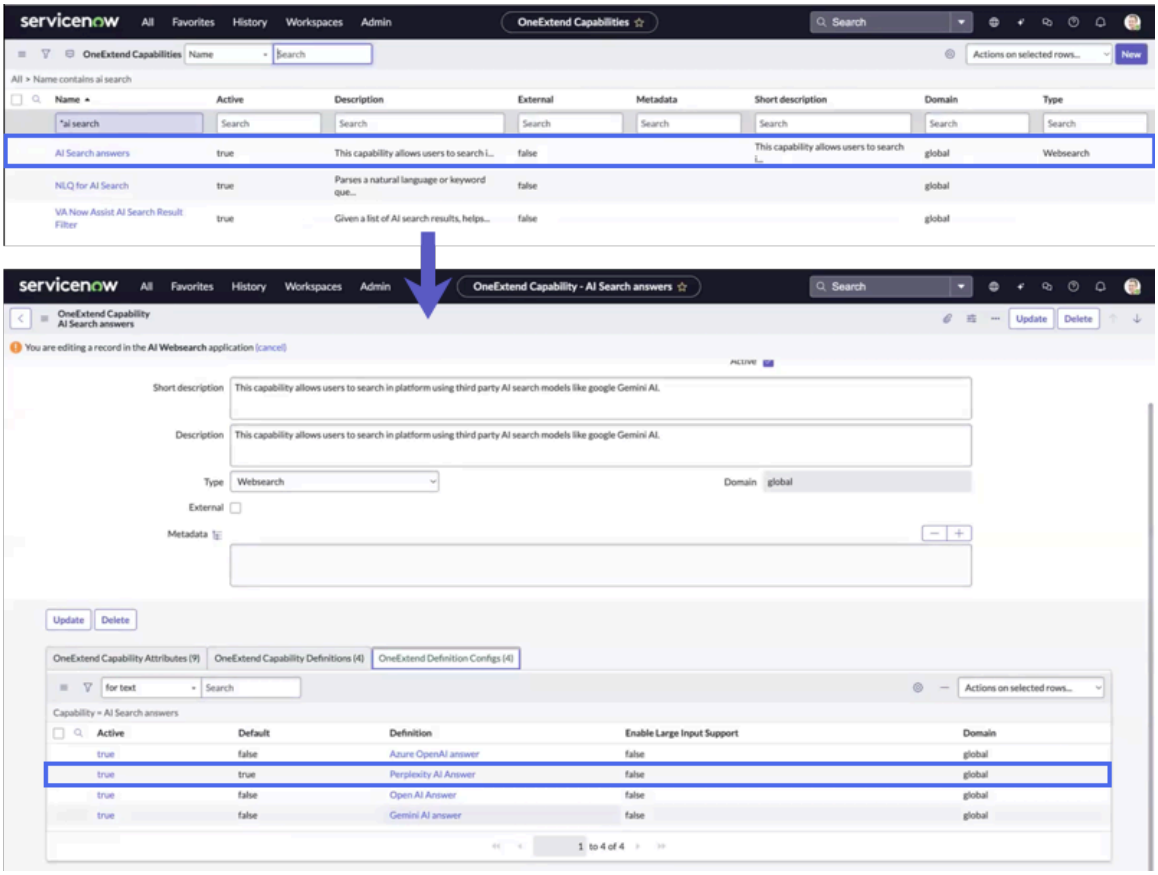
The web search custom skill is based on a prebuilt topic block in Virtual Agent Designer, and is available when you turn on Otto in Virtual Agent. This feature is automatically triggered when both AI Search and the LLM can't find information to answer an end user's query. This feature can also be manually triggered whenever end users select the Web search results icon to enter into web search mode. After web search activates, a third-party AI service performs the search and returns an answer.



For more information about the web search mode end-user display and functionality, see Web search.

Web Search AI choices are available in the OneExtend Definition Configs related list within the *`AI Search answers`* entry in the OneExtend Capabilities [sys_one_extend_capability_list] table. Select one of the AI definitions there, such as Perplexity, and set its value to `true`. Activate a matching AI credential by navigating to **All** > **Connections & credentials** > **Credentials**, and setting the matching API key (such as *`Perplexity API key`* active value to `true`).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information on how to work with the *AI Search answers* OneExtend capability, see Configure AI search answers capability for web search.

For more information on how to add web search as a tool in the AI Skill Kit, see Add a web search.

AI Admin Hub

ServiceNow Otto uses generative AI to enhance user productivity and efficiency through conversation and proactive experiences.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows and AI agents. For more information see ServiceNow product tiers.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring AI Admin Hub

Learn how ServiceNow Otto Admin brings generative AI capabilities to the ServiceNow AI Platform. With ServiceNow Otto Admin, you can improve the productivity and efficiency in your organization, deliver better self-service, recommend actions and provide answers, and empower your users to search more effectively.

ServiceNow Otto Admin overview

ServiceNow Otto is a growing cross-platform family of generative AI features, which are tasks that a large language model (LLM) can perform. Generative AI features are based on the initial training and architecture.

A skill delivers a feature plus the use case to the user. An example of a skill is chat summarization within a customer workspace. ServiceNow Otto products provide features and skills that are tailored to meet the needs of users in different workflows.

ServiceNow Otto framework

ServiceNow Otto products include some or all of the following foundational platform tools for ServiceNow Otto. For more information, see ServiceNow Otto skills in the Platform workflow.

- Administrators install plugins, manage skills, and analyze usage and performance with the Overview tab in AI Admin Hub.
- Users can take advantage of ServiceNow Otto skills by using the ServiceNow Otto panel on the instance.
- Use ServiceNow Otto for AI Search to generate answers for AI Search.
- Use ServiceNow Otto for Mobile to run generative AI skills in a mobile environment.
- Use to create conversational catalog experiences and author topics that use LLM topic discovery.
- Developers can use the Generative AI Controller to integrate generative AI features in custom flows and conversations by using your own third-party large language model (LLM) licenses.

Overview tab in AI Admin Hub

The AI Admin Hub console provides quick and effortless access to the important information that you need to set up, configure, and monitor ServiceNow Otto applications and features.

x ServiceNow Otto Admin overview

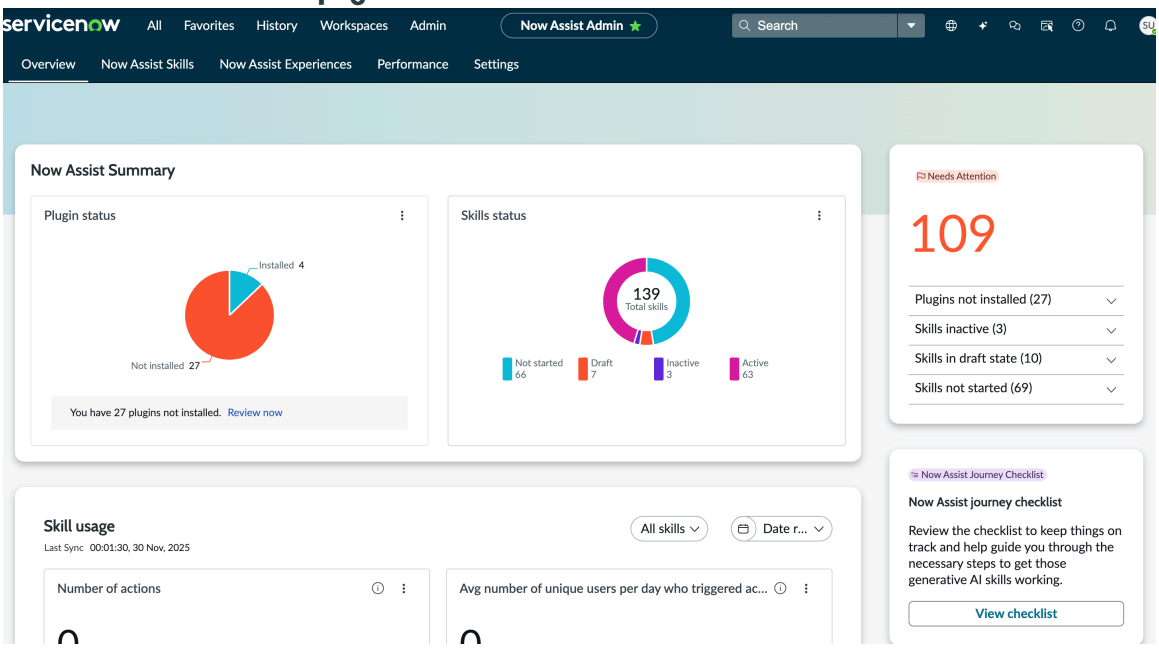
AI Admin Hub overview tab

Begin your exploration of the ServiceNow Otto features and skills in the AI Admin Hub console. This console has everything you need to install the plugins, configure the skills, and learn about the different generative AI features on the ServiceNow AI Platform.

The following example shows the AI Admin Hub Overview page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Admin Hub Overview page



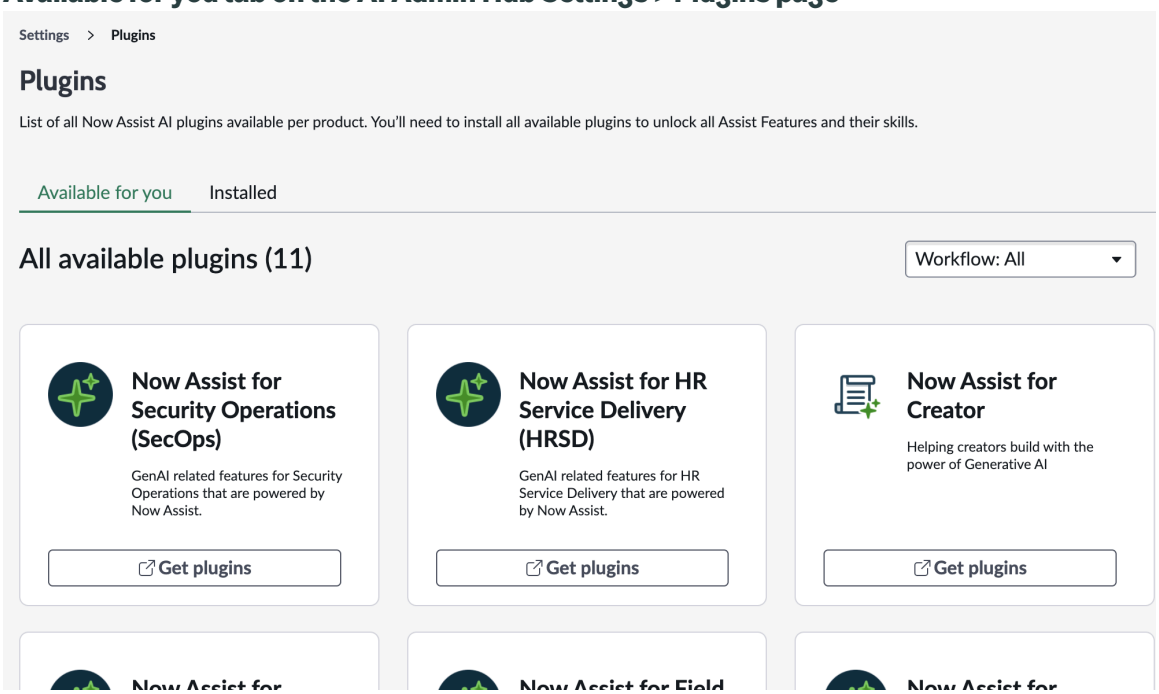
AI Admin Hub workflow

Take five steps to begin using the AI Admin Hub console.

1. **Install plugins.**

   On the **Available for you** tab of the Settings page, you can review the available plugins and install the ones that are relevant to your business needs. Each plugin contains the skills that you can activate to enable generative AI features on your instance. The following diagram shows the **Available for you** tab.

   ### Available for you tab on the AI Admin Hub Settings > Plugins page

2. **(Optional) Turn on the Now Assist panel.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

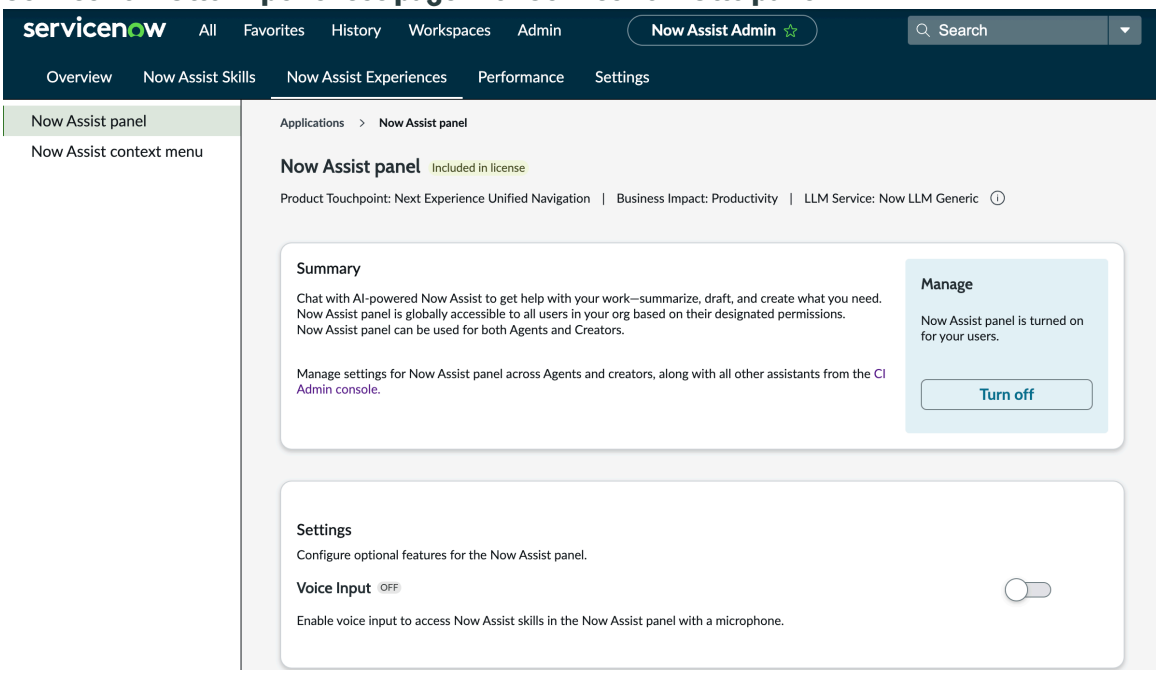
The ServiceNow Otto panel integrates the ServiceNow Otto skills into the Next Experience UI. By turning on the Now Assist panel directly from the AI Admin Hub console, you enable agents to access skills from anywhere on the ServiceNow AI Platform.

For more information about the ServiceNow Otto panel, see ServiceNow Otto panel overview.

This step is optional because the skills can also display in-product in the Core UI and in Workspaces.

You can turn the ServiceNow Otto panel on from the ServiceNow Otto Experiences page of the Admin console.

ServiceNow Otto Experiences page with ServiceNow Otto panel

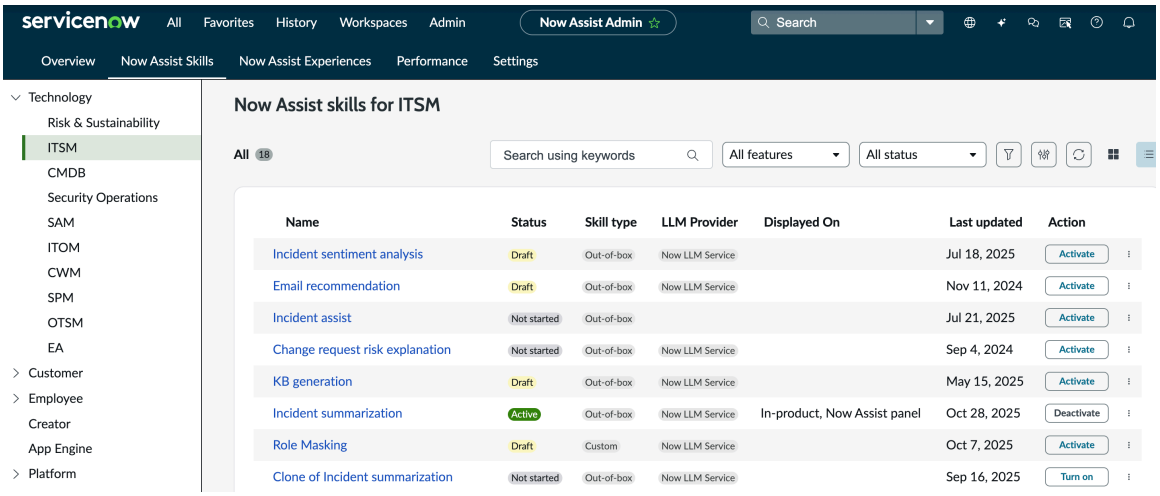


3. Activate skills.

Skills are features that are created for a specific use case in a ServiceNow Otto application. Use the ServiceNow Otto Skills page to explore the skills that are available with your installed plugins. The following diagram shows the available features and skills in the Technology workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

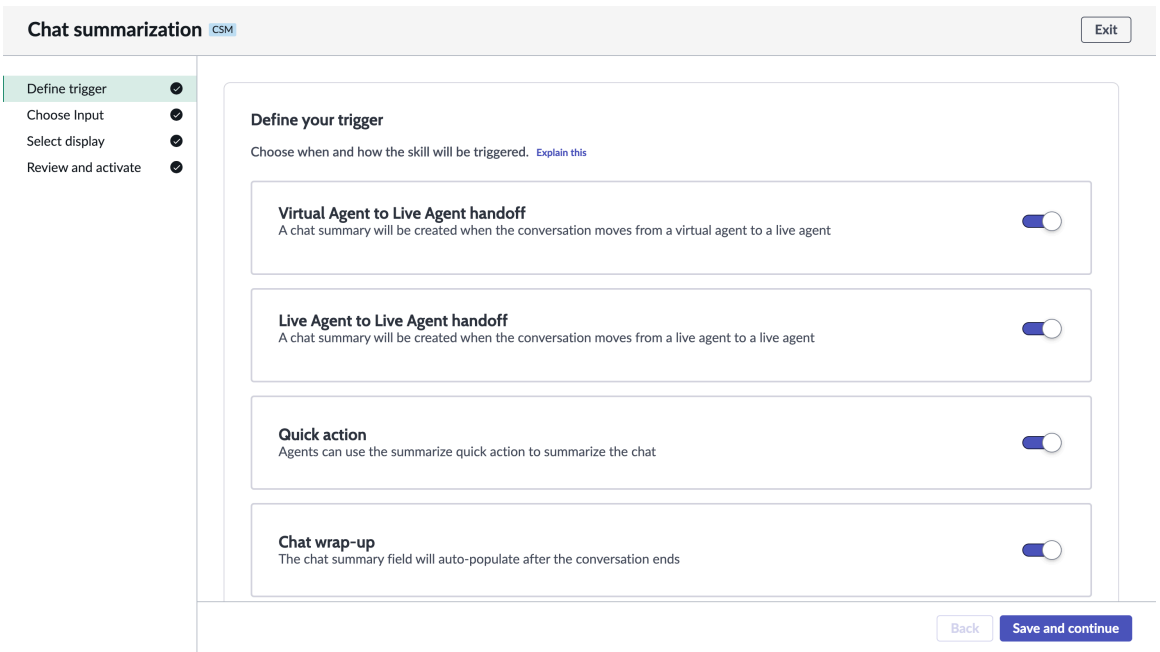
Available ServiceNow Otto features and skills in the Technology workflow



After deciding which skills best fit your business needs, you can activate them from the console. Some skills require configuration so that you can customize the skill to your needs, such as determining the skill inputs and triggers. You can select the skills that you want to configure in the AI Admin Hub Features page.

The following example shows a step in the guided setup of the skill activation process, which is choosing where to display the skill. Skills can be displayed in-product, including the Core UI and Workspaces, or in the ServiceNow Otto panel. You can choose either or both locations. The following diagram shows the process for chat summarization activation in AI Admin Hub.

Chat summarization activation in AI Admin Hub

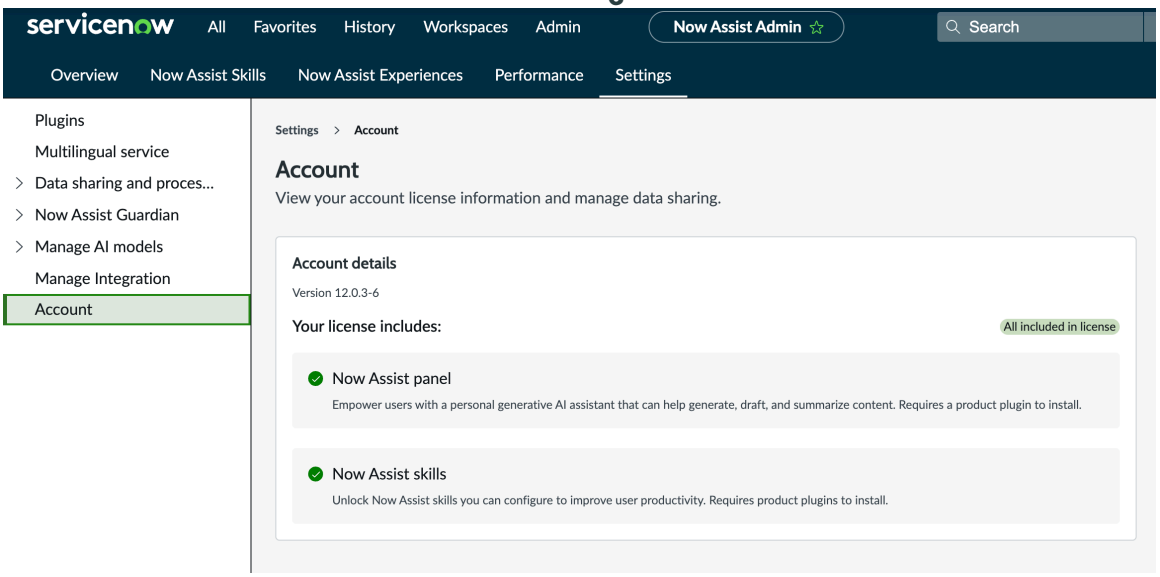


4. Review your ServiceNow Otto account settings.

The ServiceNow Otto Admin console Settings page enables you to set up language support, if you have Dynamic Translation enabled on your instance, and review your account details. Get up-to-date information about what plugins are available to you and the status of data sharing on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

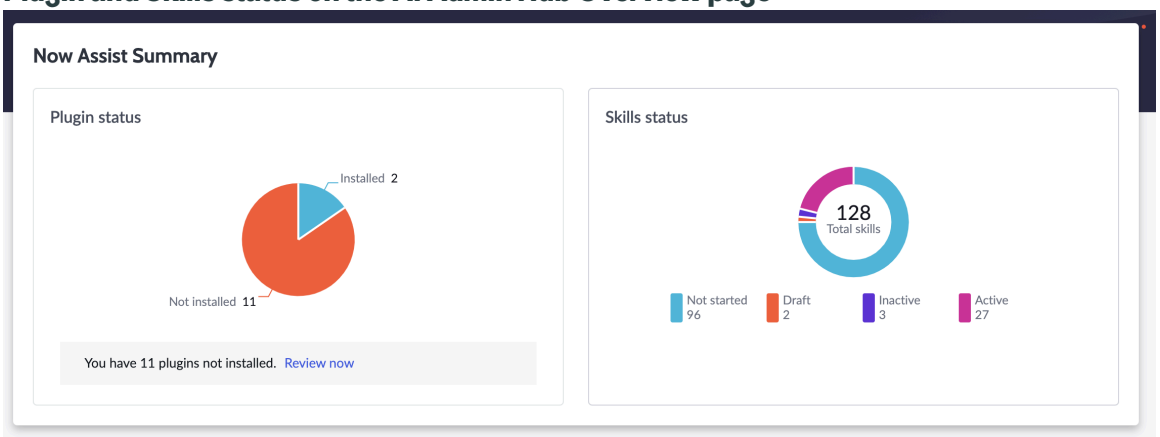
ServiceNow Otto Admin console account settings



5. Monitor and analyze skill performance.

Use the metrics available on the Overview page to review the summaries, performance information, and issues that need your attention. The following example shows the current plugin status, as well as the number of active skills.

Plugin and Skills status on the AI Admin Hub Overview page

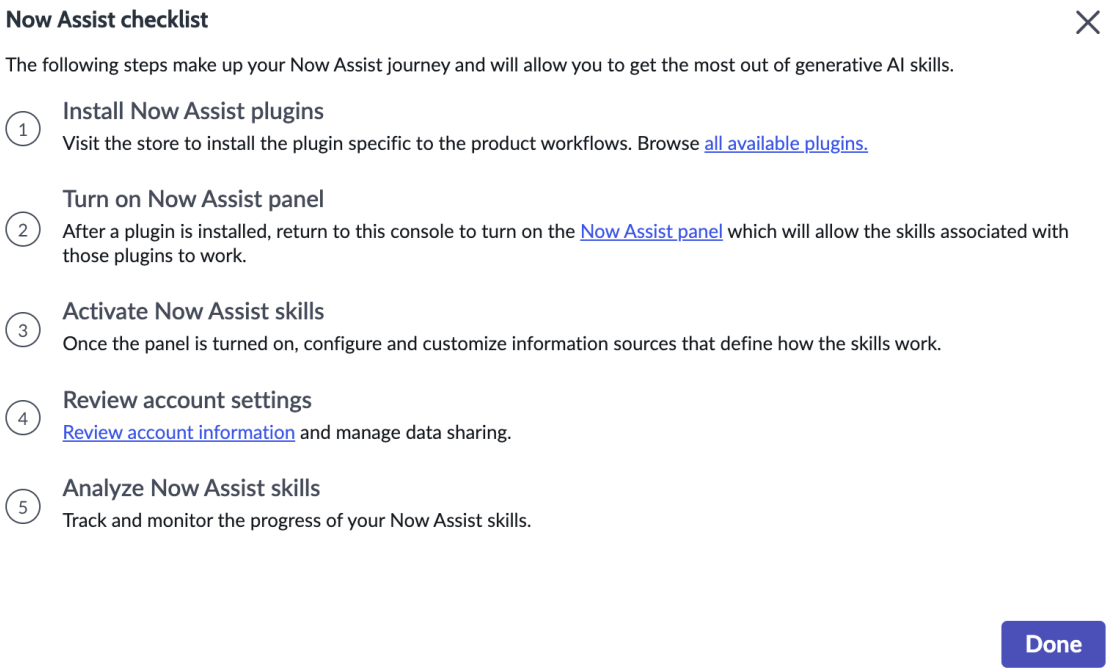


The AI Admin Hub console contains the **ServiceNow Otto journey checklist** with additional instructions for implementing ServiceNow Otto on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto journey checklist

You can consult the following checklist from the AI Admin Hub console Overview page at any time to guide your implementation of ServiceNow Otto applications, features, and skills.



Learn more about the ServiceNow Otto journey

- Get an overview of the ServiceNow Otto framework.
- Discover the ServiceNow Otto panel.
- Explore the ServiceNow Otto skills available.
- Activate and configure a ServiceNow Otto skill using the AI Admin Hub console.
- Analyze and monitor ServiceNow Otto skill usage and performance.

ServiceNow Otto Experiences

Explore ServiceNow Otto panel and ServiceNow Otto context menu under the **ServiceNow Otto Experiences** tab of ServiceNow Otto Admin.

ServiceNow Otto panel

With the ServiceNow Otto panel, you can get assistance from generative AI experiences to solve customer issues faster. Use this conversational interface to summarize a chat, case, or incident, get help, or generate resolution notes so that you can get the context of this information more quickly.

You must fulfill the following conditions to use the ServiceNow Otto panel:

- Next Experience must be enabled. For more information, see Considerations for activating Next Experience.
- You must have the now_assist_panel_user role.
- Your role must be applied to at least one active ServiceNow Otto skill to use skills in the ServiceNow Otto panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are three versions of ServiceNow Otto panel chats: standard, enhanced, and premium. Select one of the versions to learn more:

- Standard chat - provides conversational support assistance within a standard, static chat window. To activate the ServiceNow Otto panel standard chat, see Activate the ServiceNow Otto panel standard chat.
- Enhanced chat - provides conversational support assistance within a dynamic window that gives a more intuitive and personalized experience. You must activate the ServiceNow Otto panel enhanced chat and configure your ServiceNow Otto instance to use the enhanced chat. See Activate the ServiceNow Otto panel enhanced chat for more information.
- Premium chat - provides conversational support assistance within a fully agentic chat experience that enables the assistant to reason across multiple sources and execute complex workflows without leaving the conversation. You must activate the ServiceNow Otto panel premium chat and configure your ServiceNow Otto instance to use the premium chat. See Display your assistant on Platform or ServiceNow Studio for more information.

If you want to use assistants, you must activate them. See Assistants overview for information on activating assistants.

Note: Voice input is automatically activated when you activate the ServiceNow Otto panel. As of the Zurich Patch 4 release, voice input is configured in the Configure Next Experience accessibility preferences.

Warning: Do not modify or remove the default AI disclaimer. If you modify or remove the default AI disclaimer, you're responsible for communicating to end users that they are interacting with an AI system and any associated risks. ServiceNow is not responsible for the effects of any changes made.

For help with installation, see Solving installation and configuration issues with ServiceNow Otto.

Standard chat

With the ServiceNow Otto panel standard chat, you can get assistance from generative AI experiences to solve customer issues faster. Use this conversational interface to summarize a chat, case, or incident, get help, or generate resolution notes so that you can get the context of this information more quickly.

Note: Next Experience must be enabled to use the ServiceNow Otto panel. For more information, see Considerations for activating Next Experience.

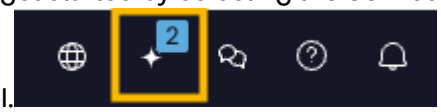
ServiceNow Otto panel overview

Agents can use the ServiceNow Otto panel to interact with and get assistance from generative AI. On the ServiceNow Otto panel, you can increase your productivity and efficiency by using the generative AI experience to summarize a chat, case, incident, or generate resolution notes.

Conversational aspects of the ServiceNow Otto panel, such as skill detection, are powered by Now LLM Service.

Note: ServiceNow Otto skills must be enabled to appear on the ServiceNow Otto panel. For more information, see Generative AI skills.

Let's get started by selecting the ServiceNow Otto icon to display the ServiceNow Otto panel.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a number in a square appears, it indicates how many messages you missed when the ServiceNow Otto panel was closed.

ServiceNow Otto panel

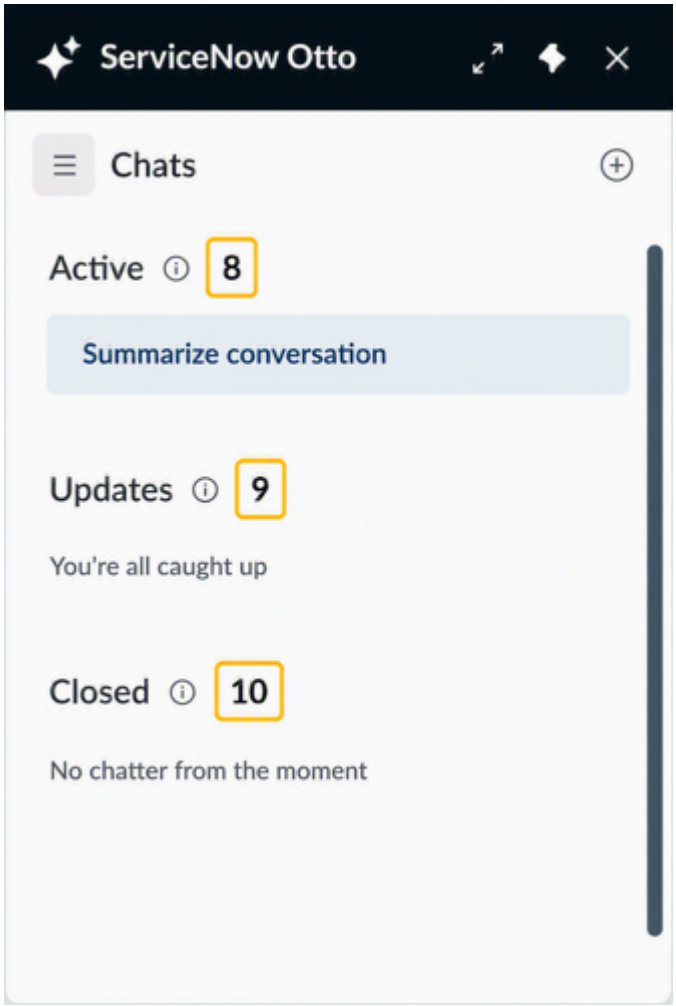
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The ServiceNow Otto panel includes:

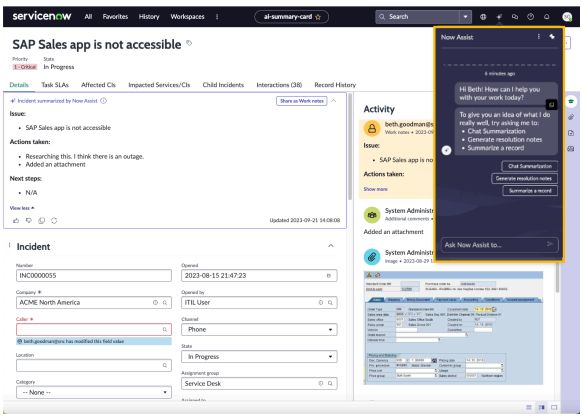
Item number	Description
1 - Enter modal button	Expands the chat into a 90% screen-size window.
2 -	Positions, or pins, the ServiceNow Otto panel to the screen.
3 - Display chats button	Displays the Chats window.
4 - Option buttons	Displays the available options.
5 - Copy message button	Copies the ServiceNow Otto panel message.
6 - Reply to ServiceNow Otto... field	Enter actions.
Voice Input	If Voice Input is activated, select the microphone icon or the keyboard shortcut to use your voice to interact with the ServiceNow

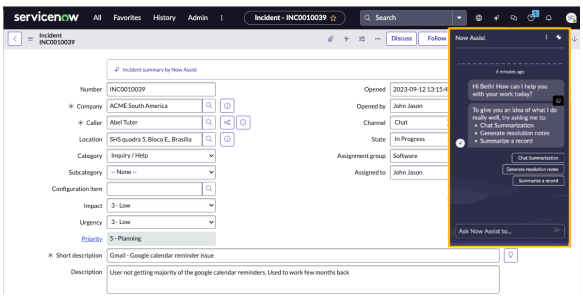
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item number	Description
	Otto panel. After you speak, there's a pause while the system transcribes the text and then displays it on the screen. See Enable voice input for ServiceNow Otto panel for information on enabling Voice Input. See Next Experience keyboard shortcuts for the ServiceNow Otto menu (Voice Input mode) shortcuts for Microsoft and macOS.
8 - Active chats	All active chats display in the Active chats section. in the Active chats section of the ServiceNow Otto. You can create additional chats by selecting the + icon in the heading.
9 - Updates	Displays important updates and reminders.
10 - Closed chats	Displays all closed chats. If you select one of the closed chats, you can see that chat's history.

ServiceNow Otto panel is available on Next Experience and ServiceNow Studio. The following screenshots show the ServiceNow Otto panel in a workspace and on Core UI screens under Next Experience.

ServiceNow Otto panel

Next Experience	Core UI
	




Navigating from the ServiceNow Otto panel

Navigate from the ServiceNow Otto panel without leaving the current conversation by entering a navigation request in the **Ask ServiceNow Otto to...** field. If you enter "navigate me to active incidents," ServiceNow Otto displays a button that enables you to view the active incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chat summarization

Quickly learn the details of a chat by reading a chat summarization. The chat summarization gives you enough details about the chat so that your requester doesn't have to repeat the same information to you.

To generate a chat summarization from the ServiceNow Otto panel, select **Chat Summarization** or enter `summarize chat` in the **Ask ServiceNow Otto to** field.

Note: You can also generate a chat summarization by using the `/summarize` quick action in Agent Chat.

Case or incident summarization

Quickly learn the details of a case or incident by reading a case summarization. The summarization gives you enough details about the interaction so that your requester doesn't have to repeat the same information to you.

You can generate a case or incident summarization from the ServiceNow Otto panel for ServiceNow Otto for CSM, ServiceNow Otto for HRSD, or ServiceNow Otto for ITSM:

- For ServiceNow Otto for CSM, select **Summarize record** or enter `summarize a record` in the **Ask ServiceNow Otto to** field.
- For ServiceNow Otto for HRSD, select **Summarize record** or enter `summarize a record` in the **Ask Service Now Otto to** field.
- For ServiceNow Otto for ITSM, select **Summarize incident** or enter `summarize an incident` in the **Ask ServiceNow Otto to** field.

Conversation Help

Get specific and accurate answers to your queries by using the Get Help skill option on the ServiceNow Otto panel. This skill is available to everyone entitled to ServiceNow Otto capabilities.

For more information about the ServiceNow Otto Conversational Help skill which represents as Get Help on the ServiceNow Otto panel, see Now Assist Conversational Help.

Resolution notes generation

Quickly learn the details of how an interaction was resolved by generating and reading resolution notes.

To generate resolution notes from the ServiceNow Otto panel, select **Generate resolutions notes** or enter `generate resolutions notes` in the **Ask ServiceNow Otto to** field.

Streaming responses

After you enter a question or request on the ServiceNow Otto panel, ServiceNow Otto gathers information from Knowledge Base articles, external content, product documentation, catalog items, and workflows and combines them into a synthesized, comprehensive answer. Instead of waiting for the entire message to render, the synthesized response streams in real time and stops streaming after the entire message has been delivered. An animated sparkle icon (✦) appears while the response is generated and changes to the static sparkle icon after the response has fully loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enhanced chat

ServiceNow Otto panel enhanced chat is a conversational support experience within a dynamic window that also includes the ability to have multiple active conversations and superior search capabilities. Use ServiceNow Otto panel enhanced chat to improve your productivity and efficiency by leveraging generative AI to perform tasks such as summarize a chat, case, or incident, request help, generate resolution notes, among others.

Agents can use the ServiceNow Otto panel enhanced chat to interact with and get assistance from generative AI. You can move the chat window by selecting the header and dragging the chat window to the desired location. You can resize the chat window by using the window's edges to resize to your desired size or use the toolbar icons.

Conversational aspects of the ServiceNow Otto panel, such as skill detection, are powered by Now LLM Service.

Note: To use the full capabilities of ServiceNow Otto panel enhanced chat, AI Search must be enabled for your portal. Without it, ServiceNow Otto panel enhanced chat functions in a limited capacity. Basic conversational interactions such as predefined topic flows and simple questions and answers are available, but knowledge article retrieval, AI responses grounded in instance content, and semantic search capabilities require AI Search. For more information, see Enable and configure AI Search in Service Portal.

Prerequisites

You must fulfill the following conditions before using the ServiceNow Otto panel enhanced chat:

- Next Experience must be enabled. For more information, see Considerations for activating Next Experience.
- You must have the now_assist_panel_user role.
- Your role must be applied to at least one active ServiceNow Otto skill to use skills in the ServiceNow Otto panel.
- ServiceNow Otto panel enhanced chat must be activated before you can use it. See Activate ServiceNow Otto panel enhanced chat for more information.
- ServiceNow Otto skills must be enabled to appear on the ServiceNow Otto panel. For more information, see ServiceNow Otto skills.
- If you want to use assistants, you must activate them. See Activate ServiceNow Otto assistants for information on activating assistants.
- If you want to use voice input, you have to enable voice input Enable voice input for ServiceNow Otto panel.

  Note: Voice input is automatically activated when you activate the ServiceNow Otto panel. As of the Zurich Patch 4 release, voice input is configured in the Configure Next Experience accessibility preferences.

ServiceNow Otto panel enhanced chat overview

Let's get started by selecting the ServiceNow Otto icon ✦ to display the ServiceNow Otto panel.

ServiceNow Otto subheader elements (continued)

Element	Description
	(☰). Any unread chat or notification appears with a red dot next to it and the chat title appears in bold. Additionally, if you switch to a new chat while another active chat is ongoing, a pop-up message on the Chats icon (☰) appears: `Your previous chat was saved. You can revisit all of your past chats and continue ones that are still active.` The following list includes the chat sections that you may see in the chats area. • Active: Chats where you can continue the conversation. If applicable, active chats move to the Closed chats section after two hours of inactivity. This 2 hour time limit can be configured within the Messaging Channels {sys_cs_channel.list} table. To change the inactivity time limit, from the Messaging Channels {sys_cs_channel.list} table, select the **NASS** record and populate the **Conversation Idle Timeout** field with your preferred active chat time limit. If you have no active chats, `No chatter at the moment` is displayed. If more than 12 active chats are running, a **Show more** link appears to view more chats. Selecting **Show more** displays an additional 10 chats. • Updates: Updates for important notifications and reminders can be configured to display. When *`sn_nowassist_va.nass_notification_enabled`* is set to `true` (the default), simple (nonactionable) ServiceNow Otto panel notifications appear on your portal home page. After selecting a notification, you're redirected to this Updates section. If you have no updates, `You're all caught up` is displayed. If more than four updates are available, a **Show more** link appears to view more updates. Selecting **Show more** displays an additional 10 updates. **Note:** If *`sn_nowassist_va.nass_notification_enabl`* is set to `false`, the Updates section doesn't appear. • Closed: Closed chats can be configured to display. A message closes when the designated time has passed (2 hours of

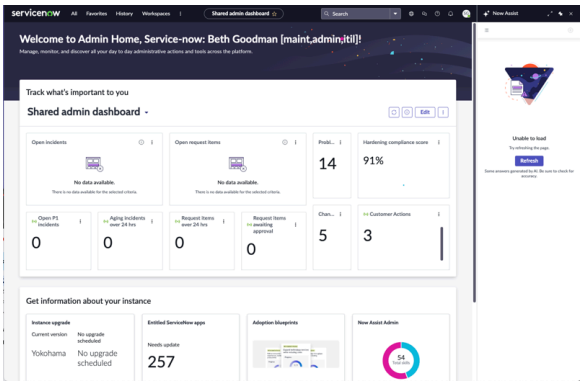
ServiceNow Otto subheader elements (continued)

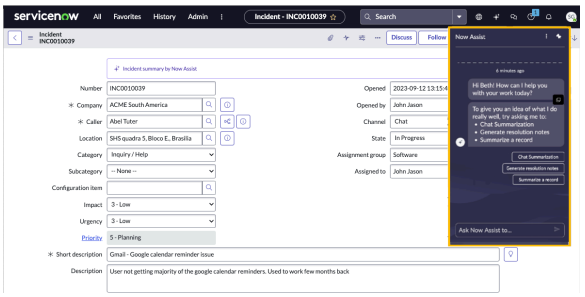
Element	Description
	inactivity) or you receive the following response in the chat: `It looks like you're finished with this chat, so I'll go ahead and close it.` Turn on closed chats by selecting the **Show closed chats** check box within **Conversational Interfaces** > **Assistants** > **[Selected Assistant Name]** > **Chat experience** > **Closed chats**. After being turned on, closed chats are displayed for as long as they’re available within the Conversations (sys_cs_conversation) table. Closed chats appear in a read-only mode and can’t become active again. If more than four closed chats are available, a **Show more** link appears to view more closed chats. Selecting **Show more** displays an additional 10 closed chats. After a conversation has closed, you can’t reopen it. Hovering over a closed chat displays the delete icon (). Confirm the chat deletion on the Delete this chat? modal to permanently delete the chat from the interface.
2. [Chat name]	The name of the conversation. If you select a promoted asset or query, that asset's title appears as the chat name. If instead you enter an utterance into the **Reply to ServiceNow Otto** field, your initial utterance becomes the chat name. The chat name appears in both the Now Assist subheader and **Chats list** > **Active** section.
3. New chat ( )	A new conversation begins. You may be prompted with a greeting message along with any promoted conversational assets such as topics, subflows, and/or actions, or suggested queries.
4. Feedback icons panel	You can indicate if the response was helpful by selecting the like thumbs up icon or if the response wasn't helpful, you can select the dislike thumbs down icon . You can also copy the response by selecting the copy message icon .

ServiceNow Otto panel is available on Next Experience and ServiceNow Studio. The following screenshots show the ServiceNow Otto panel in a workspace and on Core UI screens under Next Experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto panel

Next Experience	Core UI
	




Agentic conversations

> **Note:** Admins must first enable AI agents before end users can experience agentic conversations. ServiceNow Otto panel discovers and executes agentic workflows. For more information on agentic workflows, see Agentic workflows and Multiple conversations in ServiceNow Otto AI agents.

When you ask a question to the ServiceNow Otto panel enhanced chat, the agent understands the query and begins a flow. When you submit a message with multiple questions or requests, ServiceNow Otto panel enhanced chat answers the multiple questions consecutively in its response. It can reason, plan, and execute across AI agents, ServiceNow Otto panel topics, conversational actions and subflows, catalogs, Knowledge Base articles, custom skills, and any ServiceNow Otto supported skills to help you. You receive on-screen messages to let you know where the agent is in the agentic processing flow prior to receiving the response. After the processing has completed its flow, a View AI Steps section header appears, where the processing flow steps can be expanded and viewed. You can stop the agentic processing flow at any time by selecting the End flow icon ( ). After an action starts, it can't be stopped. Selecting the End flow icon only stops the proceeding processing steps.

Navigating from the ServiceNow Otto panel

You can navigate from the ServiceNow Otto panel without leaving the current conversation by entering a navigation request in the **Ask ServiceNow Otto to...** field. If you enter "navigate me to active incidents," ServiceNow Otto displays a button that enables you to view the active incidents.

Chat summarization

Quickly learn the details of a chat by reading a chat summarization. The chat summarization gives you enough details about the chat so that your requester doesn't have to repeat the same information to you.

To generate a chat summarization from the ServiceNow Otto panel, select **Chat Summarization** or enter `summarize chat` in the **Ask ServiceNow Otto to** field.

> **Note:** You can also generate a chat summarization by using the `/summarize` quick action in Agent Chat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case or incident summarization

Quickly learn the details of a case or incident by reading a case summarization. The summarization gives you enough details about the interaction so that your requester doesn't have to repeat the same information to you.

You can generate a case or incident summarization from the ServiceNow Otto panel for ServiceNow Otto for CSM, ServiceNow Otto for HRSD, or ServiceNow Otto for ITSM:

- For ServiceNow Otto for CSM, select **Summarize record** or enter `summarize a record` in the **Ask ServiceNow Otto to** field.
- For ServiceNow Otto for HRSD, select **Summarize record** or enter `summarize a record` in the **Ask ServiceNow Otto to** field.
- For ServiceNow Otto for ITSM, select **Summarize incident** or enter `summarize an incident` in the **Ask ServiceNow Otto to** field.

Conversation Help

Get specific and accurate answers to your queries by using the Get Help skill option on the ServiceNow Otto panel. This skill is available to everyone entitled to ServiceNow Otto capabilities.

For more information about the ServiceNow Otto Conversational Help skill that represents as Get Help on the ServiceNow Otto panel, see ServiceNow Otto Conversational Help.

Resolution notes generation

Quickly learn the details of how an interaction was resolved by generating and reading resolution notes.

To generate resolution notes from the ServiceNow Otto panel, select **Generate resolutions notes** or enter `generate resolutions notes` in the **Ask ServiceNow Otto to** field.

Streaming responses

After you enter a question or request on the ServiceNow Otto panel, ServiceNow Otto gathers information from Knowledge Base articles, external content, product documentation, catalog items, and workflows and combines them into a synthesized, comprehensive answer. Instead of waiting for the entire message to render, the synthesized response streams in real time and stops streaming after the entire message has been delivered. An animated sparkle icon (✦) appears while the response is generated and changes to the static sparkle icon after the response has fully loaded.

Fallback options

Note: For more information about where and how to enable fallback options, see Manage an assistant chat experience.

A fallback state can occur whenever search results are unavailable. Scenarios where search results are unavailable include when ServiceNow Otto didn't understand the query, complaint small talk was found, or an error occurred. When search results are unavailable, the **Search the web** fallback option may appear. If you select the **Search the web** fallback option, the web search mode is triggered and uses the internet to search for the results.

Note: Only the last query entered into the conversation is considered when entering web search mode via this **Search the web** fallback option.

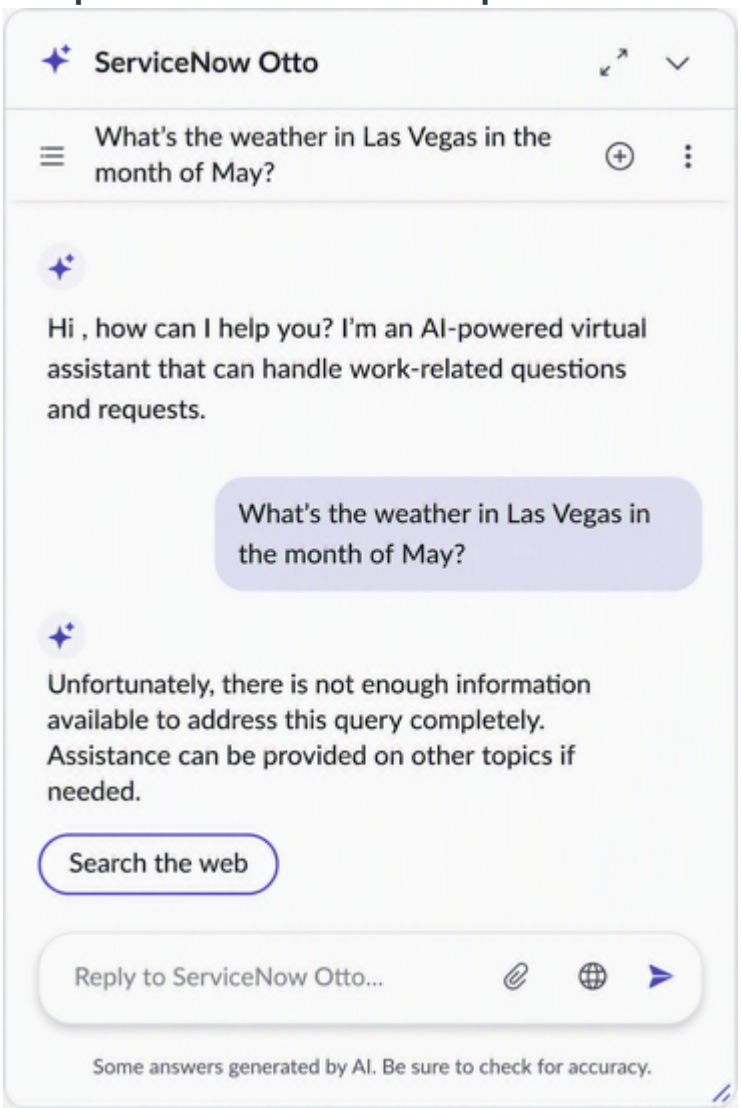
Example of Search the web fallback option



Premium chat

ServiceNow Otto panel premium chat is an AI chat experience built into your ServiceNow environment. Ask questions, get answers from your organization's knowledge, and take action on records. It supports file uploads, web search, and multi-step agentic tasks, so you can handle more complex requests without leaving the panel.

Important:

- Next Experience must be enabled to use the ServiceNow Otto panel. For more information, see Considerations for activating Next Experience.
- ServiceNow Otto panel must be activated before you can use it. See Display your assistant on Platform or ServiceNow Studio for more information.
- To use assistants, you must activate them first. See Assistants overview for information on activating assistants.
- To use the full capabilities of ServiceNow Otto panel, AI Search must be enabled for your portal. Without it, ServiceNow Otto panel functions in a limited capacity. Basic interactions such as predefined topic flows and simple questions and answers are available without AI Search. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item number	Description
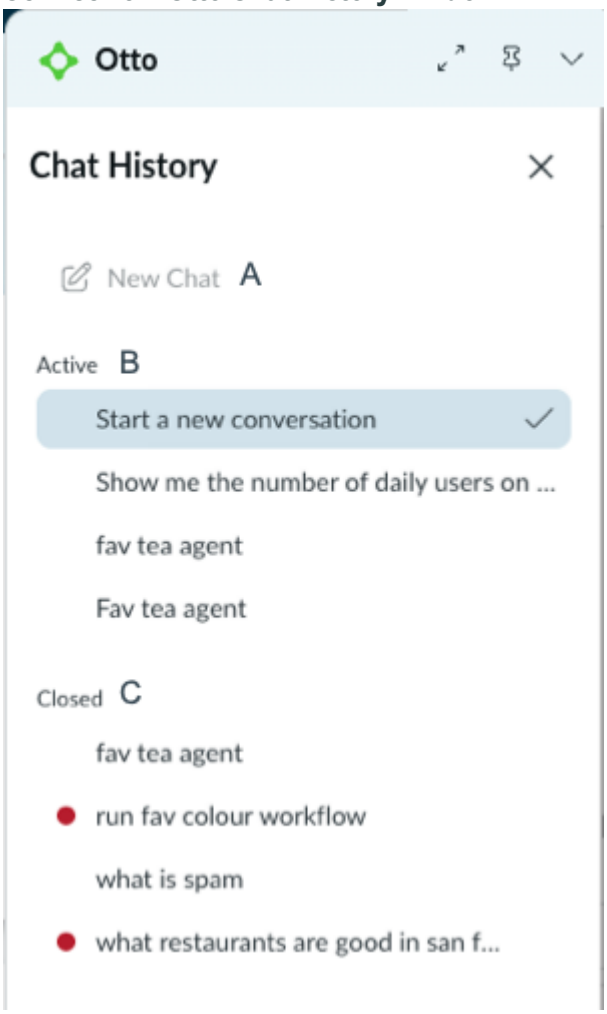
	language questions about it, generate summaries, and recommend or execute actions based on what it sees. For example: • Upload a screenshot of an error message and ask, "What error is shown here?" • Upload a photo of a damaged device and ask ServiceNow Otto to create an incident When referencing visual content, the assistant can identify specific image regions in its response. Uploaded files are retained only during your active session and cleared automatically when the session ends. Supported file formats are: • PDF • JPEG • PNG • TXT • PPTX • DOCX • XLSX • CSV You can upload a maximum of 10 files per conversation and a total upload limit of 50 MB. You can change the model provider at the instance level by navigating to **ServiceNow Otto Admin** > **Skills** > **Settings**. If the provider is set to anything other than Azure, the Add files & images option isn't visible. Include Web If you select the Include Web option, the assistant's search is expanded to include internet results alongside internal knowledge base articles and catalog items. Your prior conversation context carries over when Include Web is enabled. However, sensitive personal information such as your name, email address, and phone number is removed before being shared externally. To help answer location-aware or company-specific questions, publicly available information such as your location and company name may be included in the web search. Responses indicate which parts of the answer come from web sources, and citations for web results show the page title and web link. The Include Web setting is preserved if you return to a past conversation that had it enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item number	Description
10 - ServiceNow Otto message	Indicates that the answers are generated by AI. AI-generated responses may contain inaccuracies, so review them before you act on them.

If you select the Chat History icon , the Chat History window appears:

ServiceNow Otto Chat History window



The Chat History panel displays the following items:

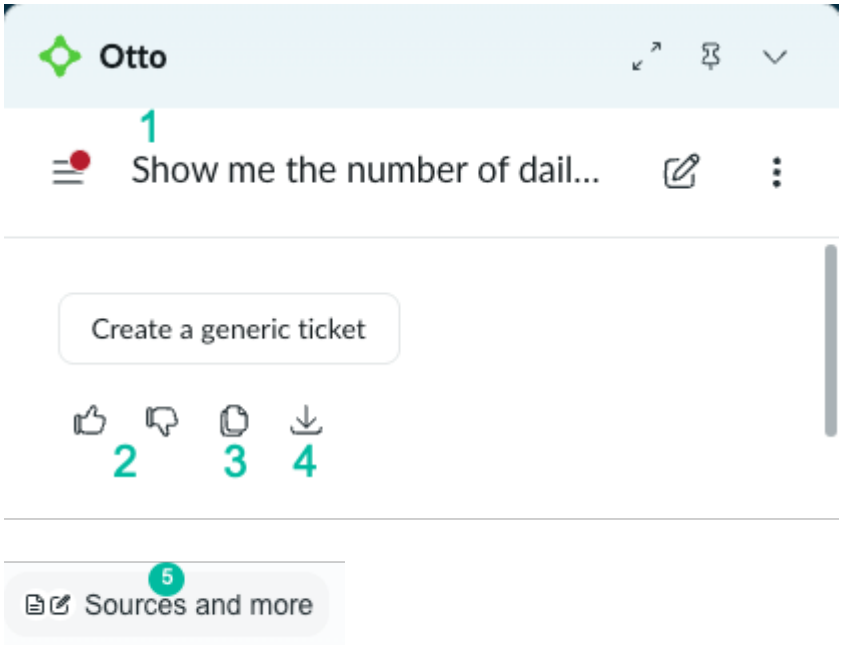
Item	Description
A - New Chat	Start a new conversation. You may be prompted with a greeting message along with any promoted conversational assets such as topics, subflows, and actions, or suggested queries. If more than 6 promoted topics are enabled, the first 6 topics appear along with a View all topics option that displays the complete list.
This record	Conversations related to the current record you're viewing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
	This section appears only when you're viewing a specific record, such as an incident or case. When you open the ServiceNow Otto panel while on a record, the most recent conversation associated with that record is automatically displayed. Conversations in this section are identified by the record number prefix in the conversation title—for example, INC0012345 — My laptop won't turn on. The same conversation may appear in both This record and Active sections if it's still in progress. When you navigate to a different record, the This record section updates to show conversations for the new record. When you navigate to a home page or list view, this section is hidden.
B - Active	Chats where you can continue the conversation. Unread chats are indicated with a red dot. Active chats include both record-specific conversations and general conversations. Record-specific conversations may also appear in the This record section if you're currently viewing that record. Active chats move to the Closed chats section after two hours of inactivity. Configure this 2-hour time limit in the Messaging Channels [sys_cs_channel] table. To change the inactivity time limit, select the **NASS** record from the Messaging Channels [sys_cs_channel] table and populate the **Conversation Idle Timeout** field. If more than 12 active chats are running, a **Show more** link appears. Selecting **Show more** displays an additional 10 chats. When you navigate to a record page, the panel displays the most recent conversation associated with that record in the This record section of Chat History. If you navigate away and return to the same record, the panel restores that conversation automatically. If you switch to a different record, the This record section updates to show conversations for the new record. Conversations tied to a specific record are identified by the record number prefix in the conversation title — for example, INC0012345 — My laptop won't turn on.
C - Closed	A chat closes when the designated time passes (2 hours of inactivity) or you receive this response: `It looks like you're finished with this chat, so I'll go ahead and close it.` Turn on closed chats by selecting the **Show closed chats** check box in **Conversational Interfaces** > **Assistants** > **[Selected Assistant Name]** > **Chat experience** > **Closed chats**. After being turned on, closed chats are displayed for as long as they're available in the Conversations [sys_cs_conversation] table. If more than four closed chats are available, a **Show more** link appears. Selecting **Show more** displays an additional 10 closed chats. Closed chats can't be reopened. Hovering over a closed chat displays the delete icon.

The ServiceNow Otto feedback icons panel consists of these elements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: If search results involve personalized or user-specific information, you can't access more than 10 results even if they're available.

ServiceNow Otto feedback icons panel

Element	Description
1 - [Chat name]	The name of the conversation. If you select a promoted asset or query, that asset's title becomes the chat name. If instead you enter a prompt into the **Reply to ServiceNow Otto** field, your initial prompt becomes the chat name. The chat name appears in both the ServiceNow Otto subheader and **Chats list** > **Active** section.
2 - Thumbs up (like) Thumbs down (dislike)	Select the thumbs up icon if the response was helpful, or the thumbs down icon if it wasn't.
3 - Copy	Copy the response.
4 - Download 	Displays a menu with options to download the conversation as a PDF or DOC file.

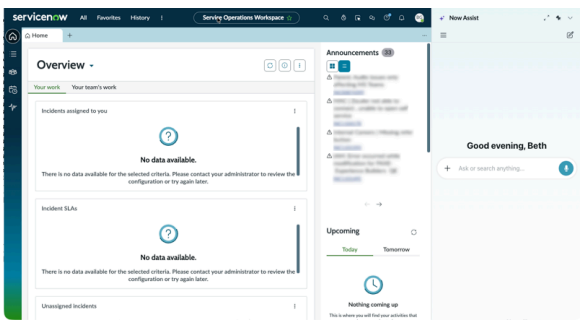
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

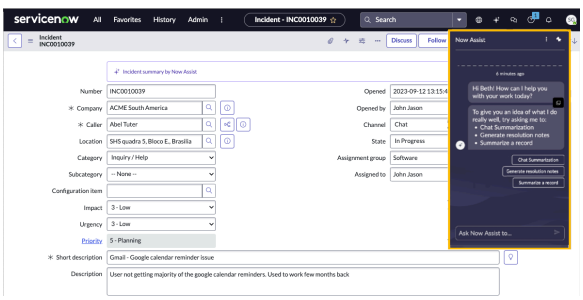
ServiceNow Otto feedback icons panel (continued)

Element	Description
5 - Sources and more 	Opens a panel showing the sources used to generate the response, along with related content. From the panel you can select **View all results** to navigate to the global search page.
Interactive view (or)	**Note:** This icon appears in the subheader only when the interactive view is available. Open or close the interactive view. The interactive view appears to the right of the conversational chat area. The drop-down selector displays the names of all interactive views opened in the current conversation, including Knowledge Base articles, catalog forms, org charts, and other applicable widget views. Interactive view is only available in the following scenarios: • An organizational chart is available to view. • A document was uploaded and you choose to preview the document. • A file was generated and you select the file name to show the preview of the file output.

ServiceNow Otto panel is available on Next Experience and ServiceNow Studio. The following screenshots show the ServiceNow Otto panel in a workspace and on Core UI screens under Next Experience.

ServiceNow Otto panel

Next Experience	Core UI
	


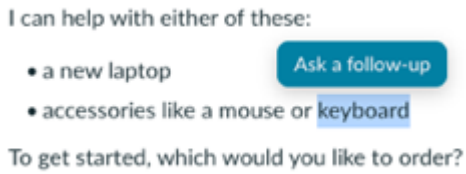


Asking a follow-up question

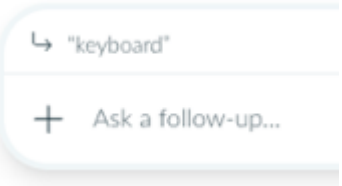
Follow these steps to ask a follow-up question about specific text:

1. Highlight the text you want to ask about.
2. Select **Ask a follow-up**.

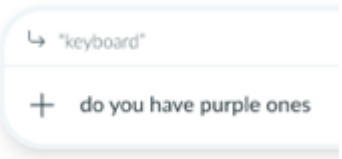
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Your highlighted text appears above the input bar.



4. At the Ask a follow-up prompt, enter the question you'd like to ask about the specific text.



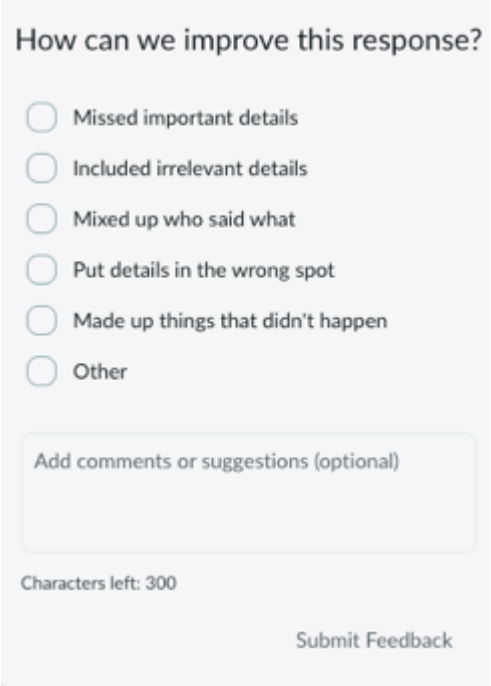
Response feedback

Each Virtual Agent response includes a feedback icons panel. The feedback icons panel appears on the latest Virtual Agent response and whenever you hover over any Virtual Agent response. You can indicate if the response was helpful by selecting the like thumbs up icon .

If the response wasn't helpful, select the dislike thumbs down icon . When you select the thumbs up or thumbs down icon, you are prompted to provide detailed feedback by selecting one or more reason check boxes. You can also select **Other** to add comments or suggestions (up to 300 characters). After making your selection, select **Submit** to submit your feedback, or select **X** to close the dialog without submitting feedback. All submitted feedback is captured, stored, and made available through analytic dashboards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of additional feedback panel from thumbs down icon



Depending on the context of the response, an additional go to search results icon may appear in the feedback icons panel. This icon appears alongside synthesized responses in Virtual Agent, clarifying questions in Virtual Agent, and regular search results or Virtual Agent fallback topics whenever a synthesized response is unavailable. Selecting the go to search results icon redirects you to the search results page and begins a search query using the last five chat utterances you entered. Additionally, a copy message icon ( ) appears on received Virtual Agent responses.

Multi-intent requests

When your request combines information from both internal and external sources, ServiceNow Otto breaks it into steps and handles each part separately before delivering a combined response. For example, if you ask ServiceNow Otto to find a product online and then order it through your company's catalog, ServiceNow Otto searches the web for the product information and executes the catalog item as separate steps. It then combines the results into a single cohesive answer. You receive on-screen processing messages as each step completes.

Agentic conversations

Administrators must first turn on AI agents before end users can experience agentic conversations. ServiceNow Otto panel discovers and executes agentic workflows. For more information on agentic workflows, see Agentic workflows and Multiple conversations in AI agents.

When you ask a question to the ServiceNow Otto panel, the agent interprets the query and begins a flow. When you submit a message with multiple questions or requests, ServiceNow Otto panel answers them consecutively. It can reason, plan, and execute across AI agents, ServiceNow Otto panel topics, conversational actions and subflows, catalogs, and Knowledge Base articles. It also works with custom skills and any ServiceNow Otto supported skills to help you. You receive on-screen messages showing where the agent is in the agentic processing flow before receiving the response. After the processing completes, a View AI Steps section header appears where you can expand and view the processing flow steps. You can stop the agentic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

processing flow at any time by selecting the End flow icon ( ). After an action starts, it can't be stopped. Selecting the End flow icon only stops the subsequent processing steps.

If your question is unclear or could apply to multiple topics, ServiceNow Otto evaluates your request and may ask for clarification before responding. This helps you receive a focused, relevant answer rather than an overwhelming list of results. If the assistant is confident it understands your intent, it responds immediately without asking for clarification. If no relevant answer is found, the assistant displays a message and suggests an alternative, such as contacting support.

You can explore a response in more depth without asking your original question again. Follow-up requests such as "show more detail," "compare sources," "summarize by theme," or "what's missing?" remain anchored to the same retrieved context. The context resets when you start a new conversation. You can also start a follow-up conversation in the ServiceNow Otto panel directly from a search result in workspace. When viewing a search result, select the follow-up option to open the ServiceNow Otto panel with the result as context for your next question.

Processing messages are short status updates that appear on-screen while ServiceNow Otto works on your request. They reflect what ServiceNow Otto is actively doing at each step, such as searching for information or analyzing a document, and update as each step completes. Processing messages don’t appear for simple interactions such as greetings, which are handled instantly.

When an agentic workflow requires your input before it can continue, the processing messages pause and no loading indicator is displayed. After you provide the requested input, a new processing message appears to indicate that ServiceNow Otto has resumed processing your request.

When you view search results in a workspace, you can continue exploring a topic by asking a follow-up question in the ServiceNow Otto panel. Select **Ask a follow-up** from the search result to open the ServiceNow Otto panel and then enter your follow-up question in the input bar.

Context switching

The ServiceNow Otto panel keeps separate conversation contexts for the records you view. You can have focused conversations about different records without losing your work.

When you open the panel on a record, such as an incident, case, or any ServiceNow form, new conversations that you create are automatically tied to that record. Selecting New Chat creates a conversation tied to the record only when you're viewing that record.

Each record keeps its own set of conversations. These conversations appear in the This record section of Chat History, and each title starts with the record number, for example, INC0012345 — My laptop won't turn on.

You can access conversations that aren't tied to a record or page from any page in your ServiceNow instance. They appear in the Active section of Chat History but not in the This record section. Use them for questions or tasks that don't relate to a specific record.

When you switch between records, the panel shows the conversations for the record you're viewing. For example, suppose you're in a conversation tied to Record A and you go to Record B. The panel shows the conversations tied to Record B and any active conversations that aren't tied to a record.

In LUX workspaces, the panel keeps a separate conversation context for each workspace and record combination. When you switch to a different workspace or record, the panel updates automatically to show conversations for your current context, so you can pick up where you left off.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you open the panel or move between pages, the panel uses this priority to decide which conversation to show:

- On a record: The panel shows the most recent conversation tied to that record. If the record has no conversations, the panel shows active conversations that aren't tied to a record.
- Returning to a previous context: If you leave a record and return later, the panel restores your most recent conversation from that context, so you don't have to repeat information.

Navigating from the ServiceNow Otto panel

You can navigate from the ServiceNow Otto panel without leaving the current conversation by entering a navigation request in the **Ask ServiceNow Otto ...** field. If you enter "navigate me to active incidents," ServiceNow Otto displays a button that enables you to view the active incidents.

Chat summarization

Quickly learn the details of a chat by reading a chat summarization. The chat summarization gives you enough details about the chat so that your requester doesn't have to repeat the same information.

To generate a chat summarization from the ServiceNow Otto panel, select **Chat Summarization** or enter `summarize chat` in the **Ask ServiceNow Otto to** field. You can also generate a chat summarization by using the `/summarize` quick action in Agent Chat.

Case or incident summarization

Quickly learn the details of a case or incident by reading a case summarization. The summarization gives you enough details about the interaction so that your requester doesn't have to repeat the same information.

You can generate a case or incident summarization from the ServiceNow Otto panel for ServiceNow Otto for CSM, ServiceNow Otto for HRSD, or ServiceNow Otto for ITSM:

- For ServiceNow Otto for CSM, select **Summarize record** or enter `summarize a record` in the **Ask ServiceNow Otto to** field.
- For ServiceNow Otto for HRSD, select **Summarize record** or enter `summarize a record` in the **Ask ServiceNow Otto to** field.
- For ServiceNow Otto for ITSM, select **Summarize incident** or enter `summarize an incident` in the **Ask ServiceNow Otto to** field.

Resolution notes generation

Quickly learn the details of how an interaction was resolved by generating and reading resolution notes.

To generate resolution notes from the ServiceNow Otto panel, select **Generate resolutions notes** or enter `generate resolutions notes` in the **Ask ServiceNow Otto to** field.

Streaming responses

After you enter a question or request on the ServiceNow Otto panel, ServiceNow Otto gathers information from Knowledge Base articles, external content, product documentation, catalog items, and workflows. It combines them into a synthesized, comprehensive answer. Instead of waiting for the entire message to render, the synthesized response streams in real time and stops streaming after delivery. An animated sparkle icon (✨) appears while the response is generated and changes to the static sparkle icon after the response has fully loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synthesized responses include inline citations that identify the sources used to generate the answer. Up to three inline citations appear within the response. Select a citation to open the source in a new browser tab. To view all sources and related results, select **Sources and more**. External links, such as those from web search results, open in a new browser tab. Your current tab and ServiceNow Otto conversation are not affected.

Single search results

When your request returns a single result, ServiceNow Otto displays a card with the most relevant fields for that record. Fields with no information are hidden automatically to keep the response easy to read. The fields displayed are either configured by your administrator or determined automatically based on your query.

- People results: The card includes available contact and profile details. Select **View profile** to open the full profile in interactive view or select the org chart icon to view the person's position in the org chart.
- Records (such as incidents or assets): Select the link in the card to open the full record. The record opens in the current tab and the ServiceNow Otto panel automatically collapses to pinned mode. If the record can't open in the current tab, it opens in a new browser tab instead.
- Actions and topics: Select the card to launch the corresponding action or topic directly in the chat.
- Catalog items: Select the card to open the catalog form. To open the form in the current tab, select the pop-out icon. The ServiceNow Otto panel collapses to pinned mode. If the form can't open in the current tab, it opens in a new browser tab instead. If the catalog form contains links to additional content, selecting those links loads the new content within the same interactive view and a back button appears. Select the back button to return to the previously viewed content.
- Knowledge Base articles: Select the card to open the article. To open the article in the current tab, select the pop-out icon. The ServiceNow Otto panel collapses to pinned mode. If the article can't open in the current tab, it opens in a new browser tab instead. This works for both internal and external knowledge base sources. If the article contains links to additional content, selecting those links loads the new content within the same interactive view and a back button appears. Select the back button to return to the previously viewed content.

When only one result is found, the **View all** link doesn't appear at the end of the response. Records displayed in the response are not shown as citations in the sources panel.

Switching between interactive views

A conversation can contain more multiple interactive views — for example, a Knowledge Base article and a catalog form opened during the same conversation. Use the drop-down selector in the interactive view header to switch between them. The header displays the name of the most recently opened interactive view.

The drop-down selector shows all eligible sources opened in the current conversation:

- Knowledge Base articles
- Catalog forms
- Organizational charts
- Other applicable widget views

When you open a second interactive view, a message confirms you can use the drop-down to switch. Each view appears as a thumbnail card in the chat - the currently visible view shows Hide and others show Show. Selecting a view from the drop-down updates the cards accordingly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you select KB articles, catalog sources, or file previews from the search panel and open them in the interactive view, they also appear in the drop-down selector for quick navigation.

Viewing and downloading generated files

After ServiceNow Otto generates a file, it appears in a thumbnail card. You can select the download icon to download the generated file or select the file name to open it in the interactive view. Downloaded files use plain Microsoft Office templates with no ServiceNow branding applied.

These files generated by ServiceNow Otto display in an interactive viewer for these formats:

- Microsoft Word (.doc, .docx)
- Microsoft PowerPoint (.ppt, .pptx)
- Microsoft Excel (.xls, .xlsx)
- PDF

For unsupported file types, either a fallback file reader opens the file or an error message appears. You can navigate between file previews and other interactive view content—knowledge articles, catalog items, and more—without losing your conversation context.

Submitting catalog requests

You can submit catalog requests directly from the ServiceNow Otto panel without leaving the chat experience.

To submit a catalog request:

1. Open the ServiceNow Otto panel.
2. Find a catalog item through chat.
3. Select the item and a catalog form opens inline in the interactive view.
4. Complete the required form fields.
5. Select **Submit**. A confirmation message appears and your request record is created.

Catalog submission confirmation

After you successfully submit a catalog item, a confirmation message appears with a **View Details** button that opens your submitted request record. The **View Details** button behaves in the following ways:

- In ServiceNow Otto panel: Select **View Details** to open the submitted request record in the current tab. The ServiceNow Otto panel automatically shrinks to pinned mode.
- In pop-out windows: If you select the pop-out icon on a submitted catalog form, the new window displays the submission confirmation page with your request details. It doesn't open a blank form to start over.

Unsaved catalog form changes

If you start filling out a catalog form in the ServiceNow Otto panel and navigate to other content before submitting, such as selecting another catalog item or knowledge article, a confirmation modal appears asking whether you want to stay or leave without saving.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To continue working on the catalog form, select **Stay**. The modal closes, and you return to the catalog form with your progress intact.
- To discard changes and view new content, select **Leave without saving**. The form closes, your unsaved data is discarded, and the content you selected appears in the interactive view.

Note: The discard warning modal doesn't appear when you switch conversations using Chat History. It only appears when navigating to different content within the same conversation.

Multiple search results

When your request returns multiple results from Knowledge Graph, ServiceNow Otto displays them in a table. Empty columns are hidden automatically to keep the table easy to read. The columns displayed are determined automatically based on your query.

- People results: Use the horizontal and vertical scrollbars to view additional rows or columns. Select a person's name to open their profile in interactive view or select the org chart icon to view their position in the org chart.
- Record results (such as incidents or assets): Select a record number to open the full record in the current tab. The ServiceNow Otto panel automatically reverts to pinned mode. If the record can't open in the current tab, it opens in a new browser tab instead.

A **View all** link appears at the end of the response. Selecting it opens a summary page showing all records in the current tab and the ServiceNow Otto panel reverts to pinned mode. If the records can't open in the current tab, they open in a new browser tab instead.

If your results include more than one type of record (for example, people and incidents), a separate **View all** link appears for each record type. Records displayed in the response are not shown as citations in the sources panel. When results include a mix of records and text content (such as knowledge base articles), ServiceNow Otto may display both a table and bullet points or text in the same response and related records appear above the Sources and more link. Select a record group — such as users or assets — to open the corresponding list in the current tab.

Note: If you're using ServiceNow Otto in a portal, records and View all results open in a new portal tab.

Fallback options

A fallback state can occur whenever search results are unavailable. Scenarios where search results are unavailable include when ServiceNow Otto couldn't interpret the query, compliant small talk was found, or an error occurred. When search results are unavailable, the **Search the web** fallback option may appear. If you select the **Search the web** fallback option, the web search mode is triggered and uses the internet to search for the results. Only the last query entered into the conversation is considered when entering web search mode via this **Search the web** fallback option. For more information about where and how to enable fallback options, see Manage an assistant chat experience.

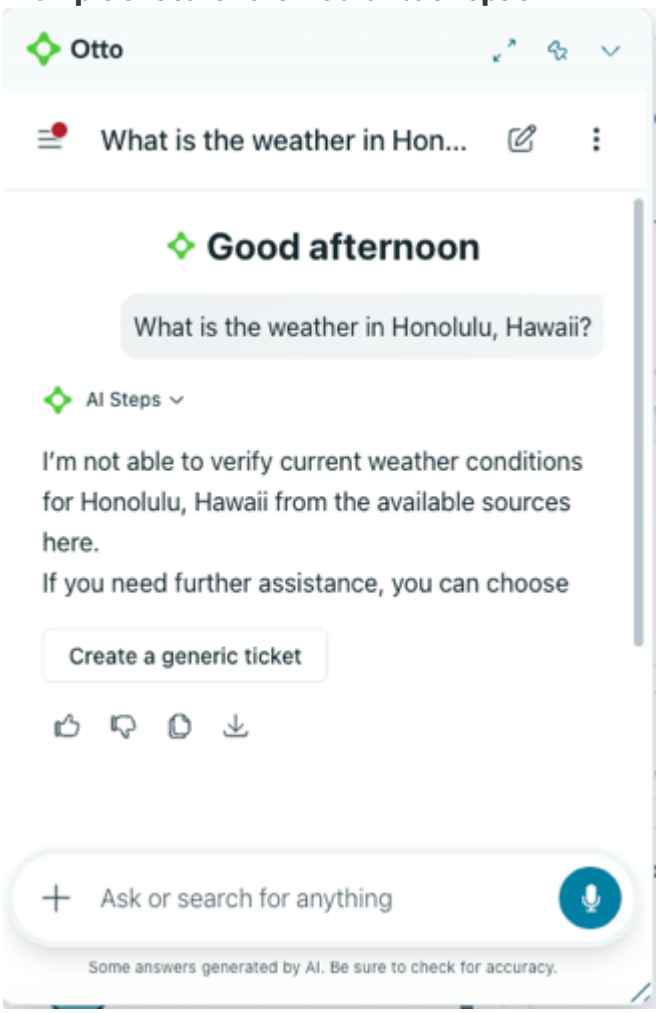
If ServiceNow Otto can't find relevant results for your query, or if an answer is based on limited evidence, ServiceNow Otto displays a message to let you know. It may also suggest ways to improve your results, such as rephrasing your query, broadening your search scope, or specifying a time frame or source.

If ServiceNow Otto can't find relevant results in your organization's internal content, an **Include the Web** button appears in the chat. Selecting it reruns your query with web results included and turns on Include Web mode for the rest of the conversation. Unlike the Search the web fallback

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

option, which only applies to your most recent query, selecting **Include the Web** expands all subsequent responses to include web results.

Example of Search the web fallback option



ServiceNow Otto context menu

The ServiceNow Otto context menu uses generative AI to help agents summarize, create, and edit written content, thus streamlining their writing tasks.

Agents produce various types of content, including emails and chat replies. The ServiceNow Otto context menu uses generative AI to assist agents in summarizing, creating, and editing emails and chat replies. Agents can preview AI generated content, scroll through previously created content, and refine the text using the AI. The ServiceNow Otto context menu can be triggered from any application or field in a ServiceNow workspace where the ServiceNow Otto context menu is enabled.

The ServiceNow Otto context menu unlocks the power of generative AI and is available in Next Experience for:

- Customer Service Management (CSM)
- Human Resources (HR)
- IT Service Management (ITSM)
- Strategic Portfolio Management (SPM)
- IT Operations Management (ITOM)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow Otto context menu isn’t available with Core UI.

Using the ServiceNow Otto context menu

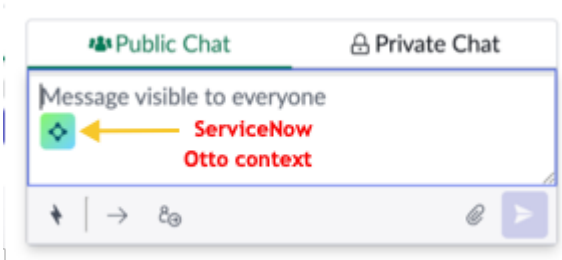
The ServiceNow Otto context menu is available on any field where the floating ServiceNow Otto button ( ) appears. If you start typing in the field, a menu appears with the available ServiceNow Otto context menu actions. The ServiceNow Otto context menu helps you summarize, create or modify existing documentation.

You can configure the Advanced filter to hide or show the ServiceNow Otto Context Menu quick actions option using the wwna_quick_actions table. To view more variable set configuration options, see ServiceNow Otto context menu variable set configuration.

Chat window using the ServiceNow Otto context menu

You can use the ServiceNow Otto context menu when communicating with users in Agent Chat:

If it takes too long to generate text or the Now LLM Service isn't available, an error message appears.

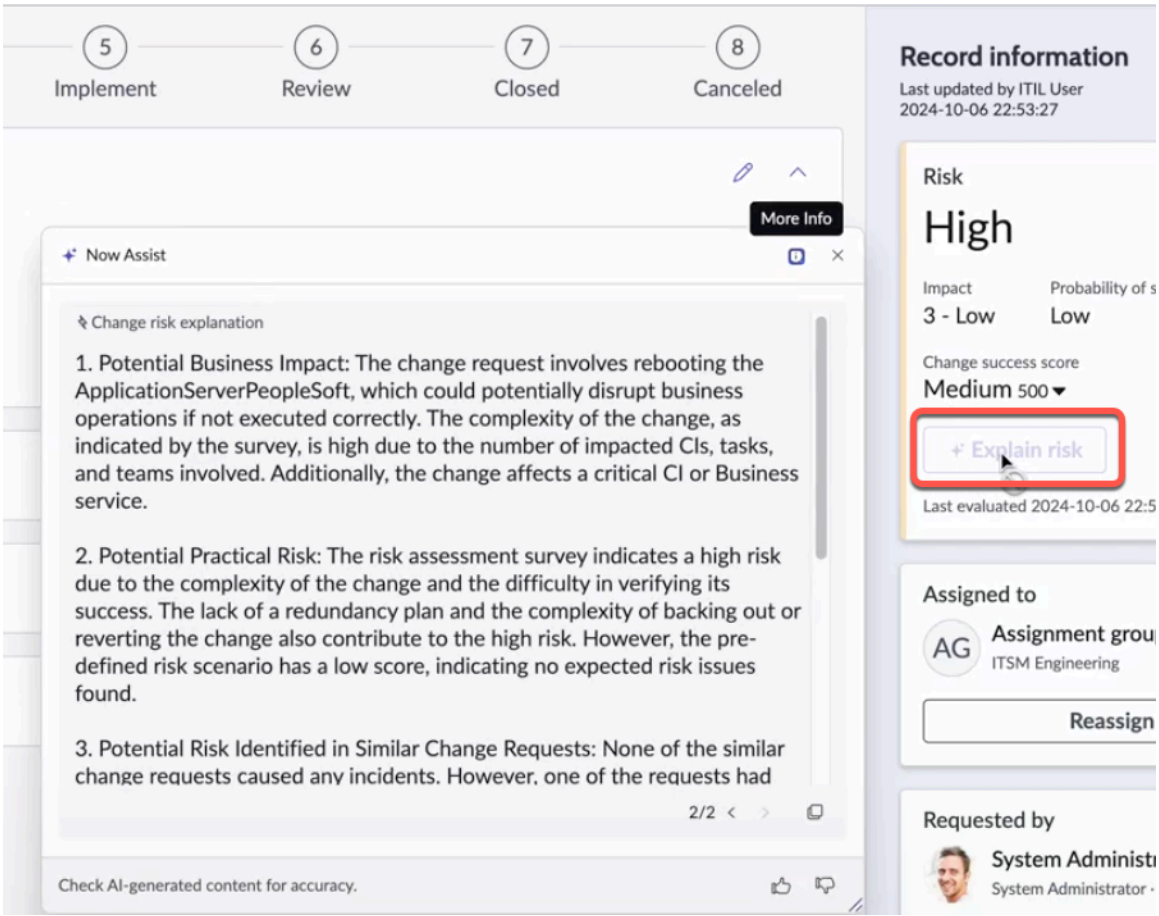


Change request risk explanation using the ServiceNow Otto context menu

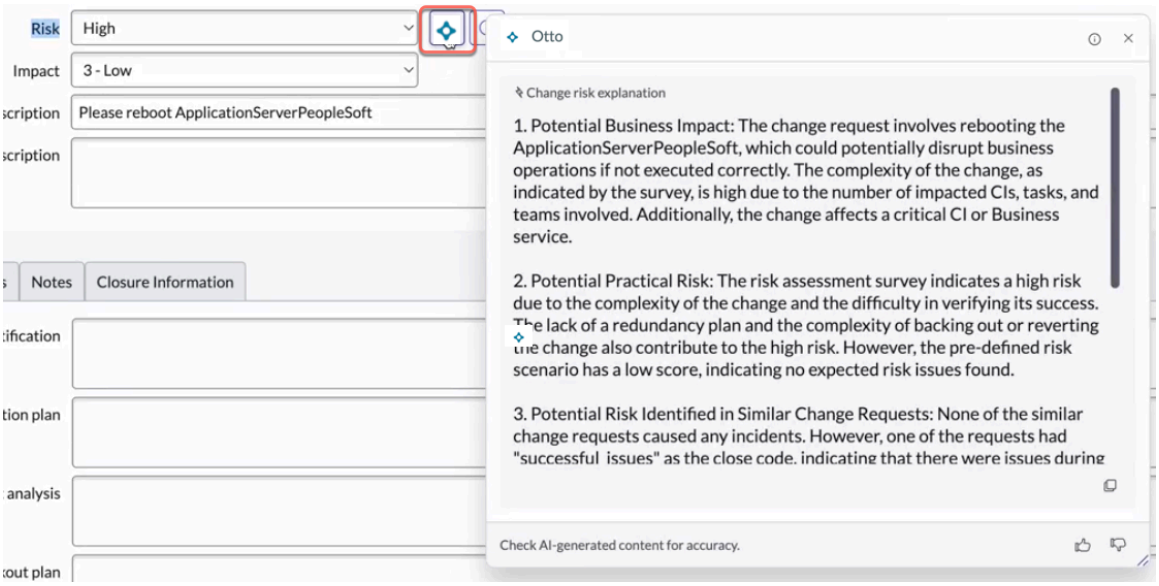
The ServiceNow Otto context menu makes the change request risk explanation available on the workspace and on UI16 after assessment and calculation.

When the risk is assessed and calculated, you’ll see the **Explain risk** button with the ServiceNow Otto icon on the workspace. It shows the risk explanation in a dialogue box on the Record information section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When the risk is assessed and calculated, you'll see the ServiceNow Otto icon against the **Risk** field on UI16, showing the risk explanation in a dialogue box.



Note: The risk explanation that is presented in the dialogue box is assessed and calculated on the change request form.

For more information about risk assessment and calculation, see Risk assessment.

Content editing in Knowledge Base articles using the ServiceNow Otto content menu

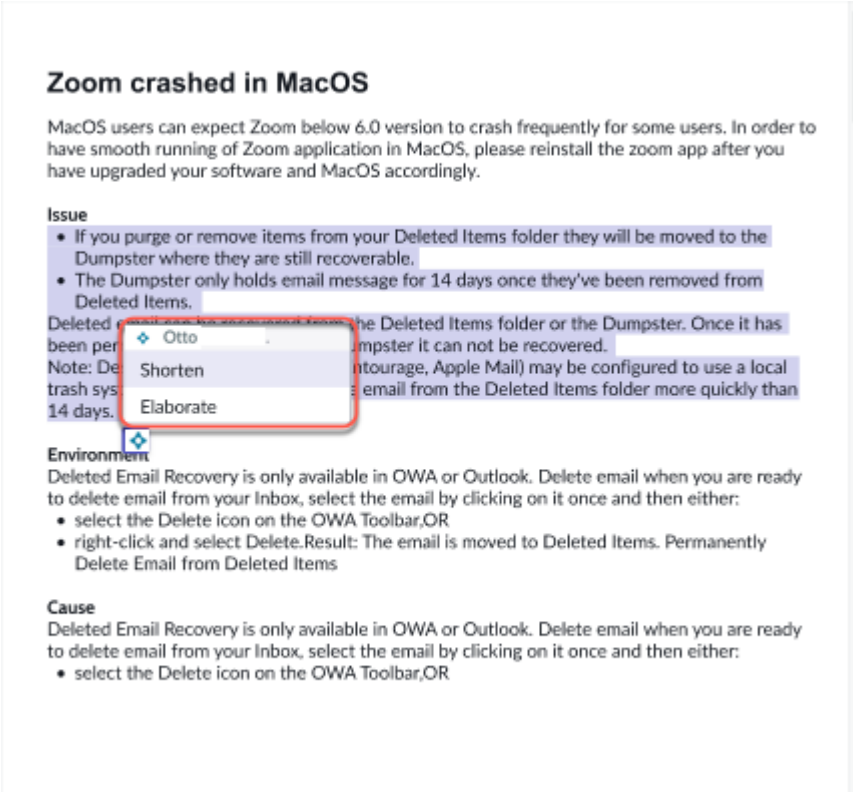
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow Otto context menu enables generative AI assisted content editing capabilities for Knowledge Base authoring and to provide resolution notes in workspaces and UI16.

When you open a knowledge article and select the content in it, you'll see the ServiceNow Otto icon pop-up and float along with your mouse device.

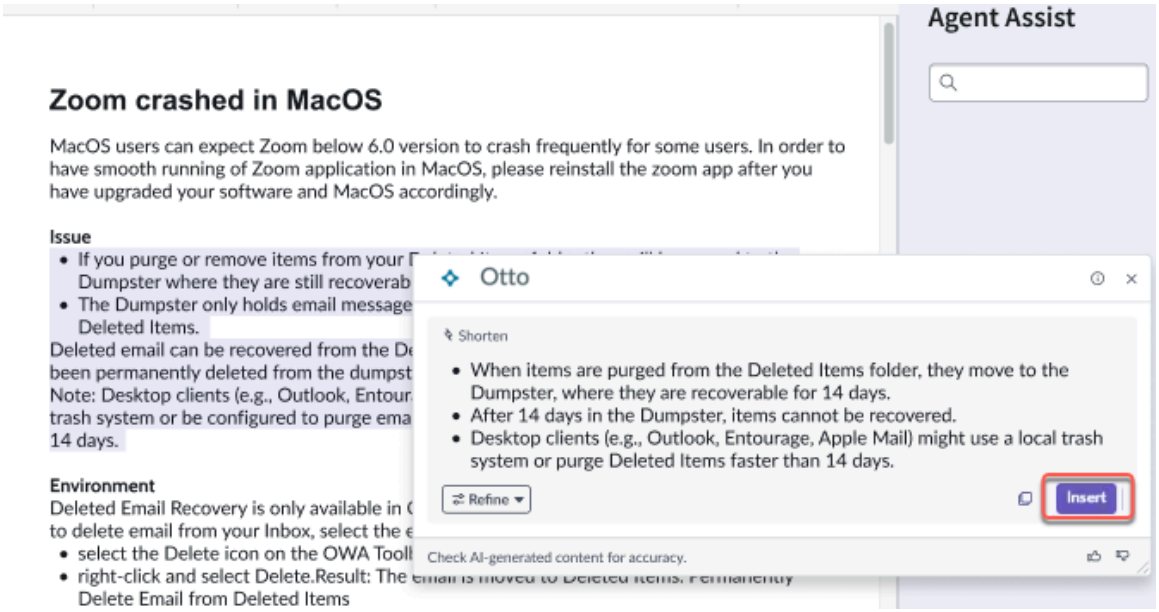
When you hover over the ServiceNow Otto icon, you'll see the following menu options to help you edit the content:

- **Elaborate**: Generative AI details the selected text.
- **Shorten**: Generative AI shortens the selected text.



You can insert the generative AI elaborated or shortened content into the Knowledge Base articles, using the **Insert** button and update or publish them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



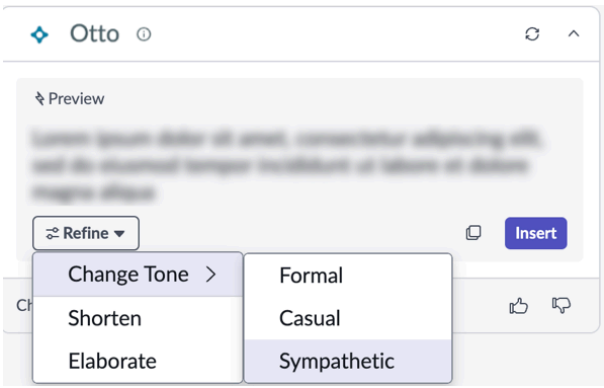
For more information about generating Knowledge Base articles using the ServiceNow Otto context menu, see Edit an article using the ServiceNow Otto context menu.

Change Tone using ServiceNow Otto context menu

The ServiceNow Otto context menu enables users to change the tone of their content. Users can choose between casual, formal, and sympathetic tone to enhance their content further, using the generative AI capabilities.

When you hover over the ServiceNow Otto icon or select **Refine** menu, you see **Change Tone** menu option.

You can further choose a preferred tone and select **Formal**, **Casual**, and **Sympathetic**. Review the changes and select **Insert** to finalize the new text.



Note: If you don't see the change tone option for your application or product, reach out to ServiceNow.

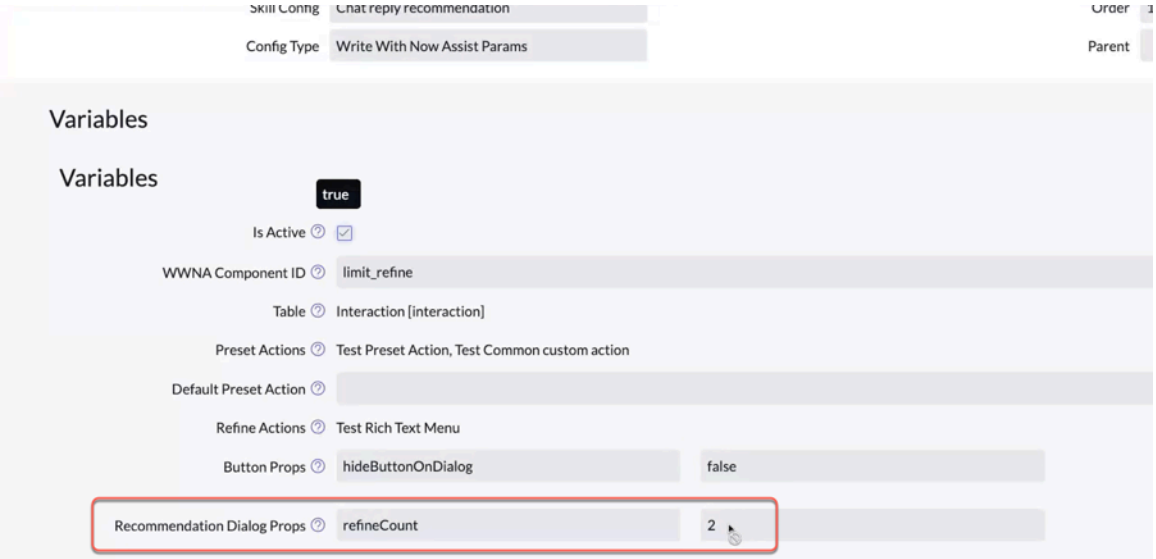
Limit the number of content refinement calls using the ServiceNow Otto context menu

Configure and limit the number of content refinements to the skill per session using the ServiceNow Otto context menu. By default, the maximum number of refinements isn't set and you can configure to limit it.

You can configure the refinement calls limitation at the **Recommendations Dialog Props** field in the **Limit refinements** record using the `refineCount` property.

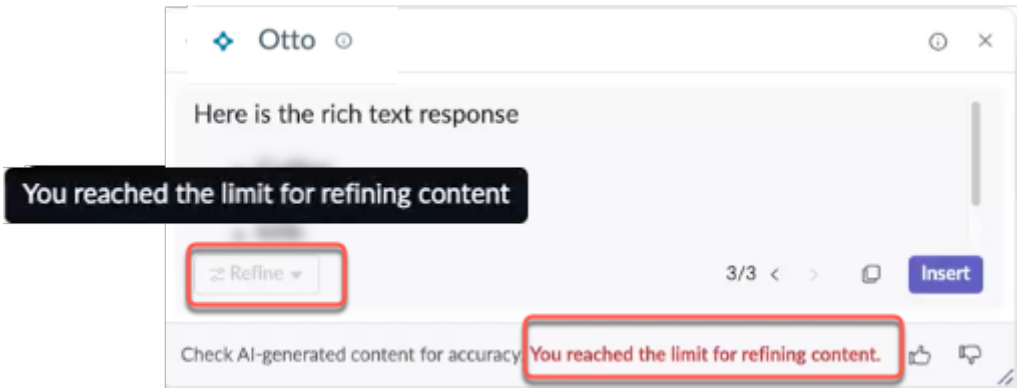
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Limit refinements** record is available in the ServiceNow Otto config var set record in the ServiceNow Otto Skill context menu application.



You can set the refineCount as follows:

- The default value of the property is **-1**. If the value is less than 0, then the number of refinements to the skill are unlimited.
- If you provide 0 as the value, then the refine button will be disabled and the `You reached the limit for refining content.` message is displayed.



- If you configure it with a value greater than 0, you'll be able to refine the content according to the set value. For example, if you set the refineCount to 2, then you will be able to refine the content only twice.

Create knowledge article with open prompt

Use ServiceNow Otto context menu to create inline knowledge article using open prompts. See Generate KB article with ServiceNow Otto context menu.

Set the minimum word count for the ServiceNow Otto icon

You can set a minimum word count required for the ServiceNow Otto icon to appear, to control when the icon is displayed based on content length. To set the minimum word count, update the value for the `minSelectedWordCount` property.

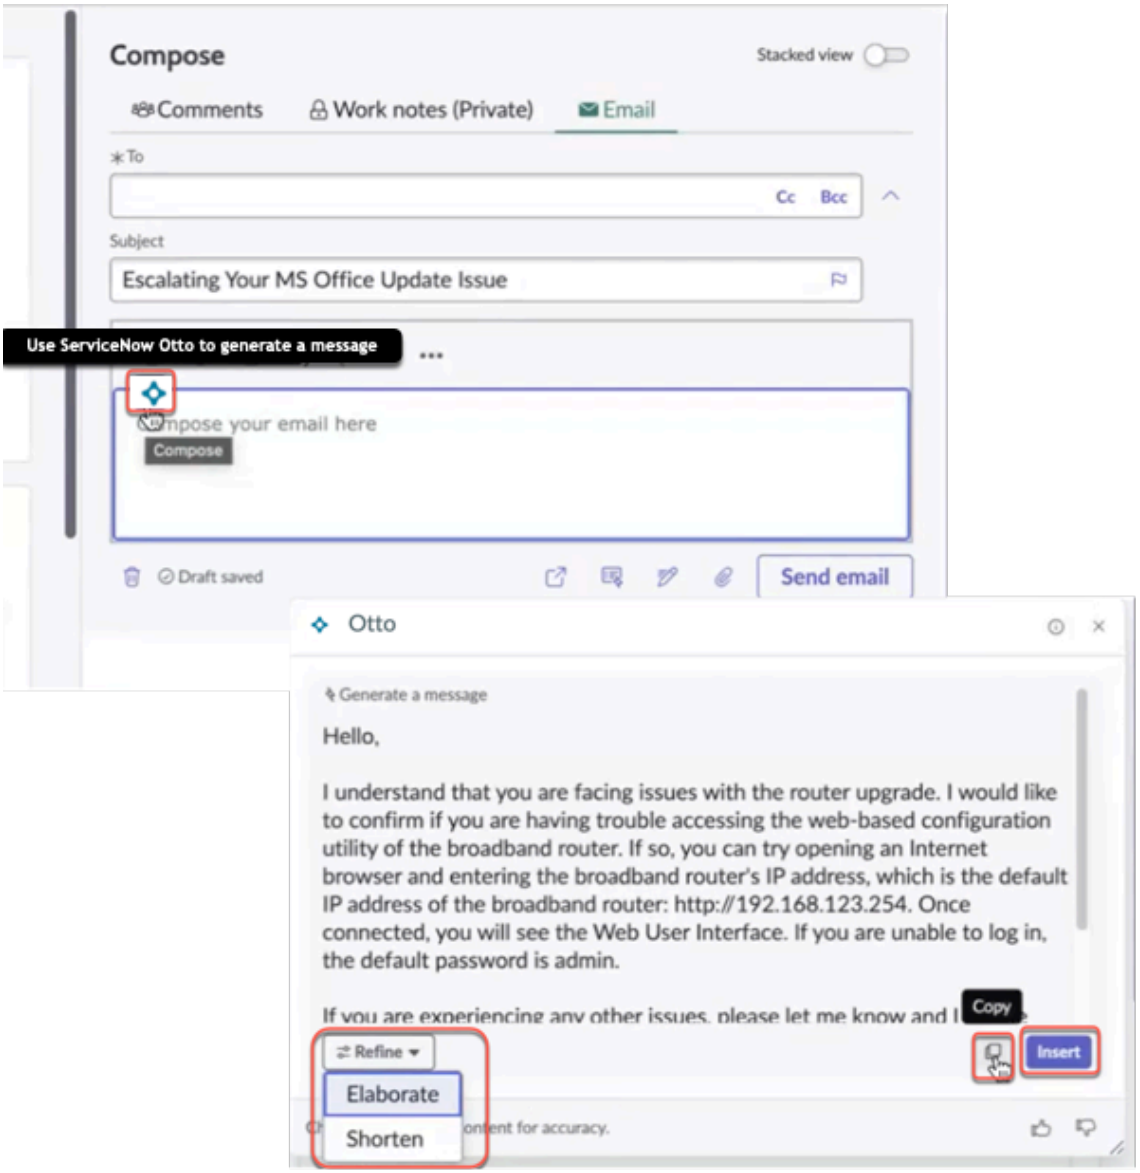
Email recommendations using the ServiceNow Otto context menu

Use the ServiceNow Otto context menu to compose or respond to emails with recommendations from ServiceNow Otto with generative AI template suggestions. The ServiceNow Otto context menu enables users to generate email response recommendations in new, forward, reply, or reply all scenarios.

Compose email

While you compose a new email, you see the ServiceNow Otto context menu icon ( ) that displays the message `Use ServiceNow Otto to generate a message`. When you select the icon, generative AI generates a message recommendation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

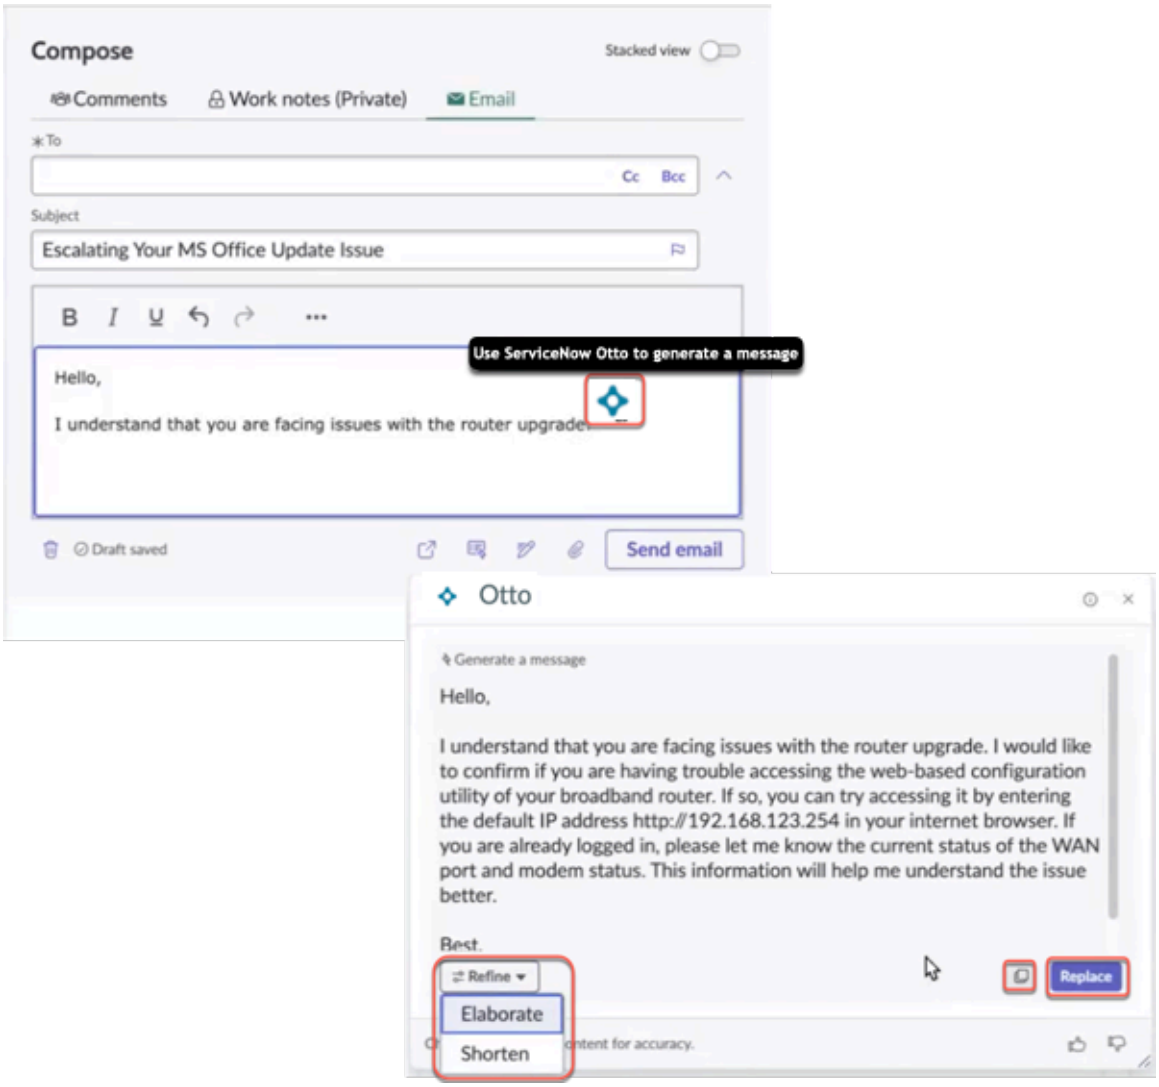


You can refine the generated text either by selecting the **Elaborate** or **Shorten** context menu options on the ServiceNow Otto Admin model. You can also copy the new text or **Insert** the generated text into the email body.

Complete draft emails

You can use the ServiceNow Otto context menu to finish your drafted emails. You can enter some text and use generative AI to help you with complete your drafts by selecting the ServiceNow Otto context menu icon ( ) that displays the message `Use ServiceNow Otto to generate a message`. When you select the icon, you see that generative AI is generating the message for you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can further refine the generated text by selecting **Elaborate** or **Shorten** context menu options on the ServiceNow Otto admin model. You can also copy the new text or select **Replace** to replace the generated text into the email body.

View inline citations

You can select the LLM response and view the all the related information sources like KB articles, emails, related records, etc.

Select the numbered citations to view details along with the link to the source. You can also select the **Show sources** option to view the list of all the related resource links.

Select **Replace** to add the source information in the email body as plain text. The numbered citation and all the source links will not be copied.

You can also select a record from the context menu inline citation to navigate directly to the record page. The record page has the referenced section highlighted, for easy identification.

Summarize records with the Now Assist context menu

Use the ServiceNow Otto context menu to generate a record summary for the page, using Generative AI application assisted summarization capabilities in workspaces and UI16. The Now

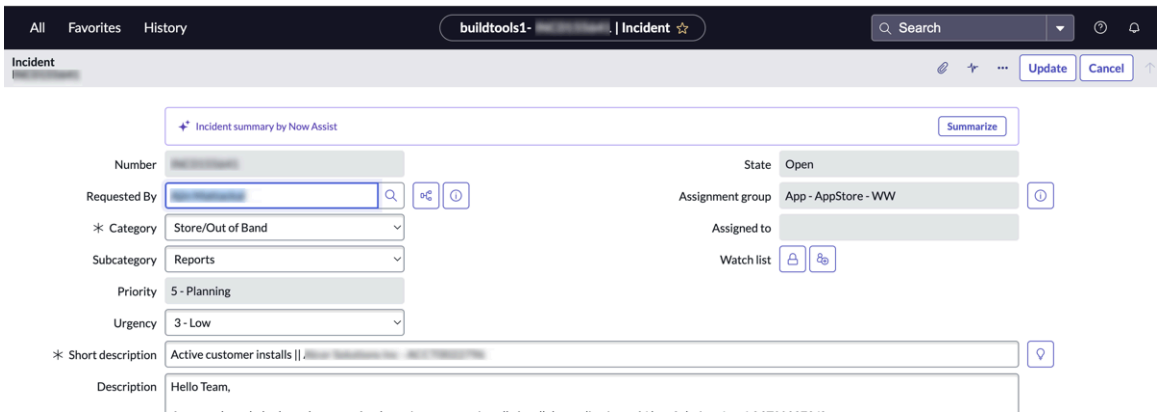
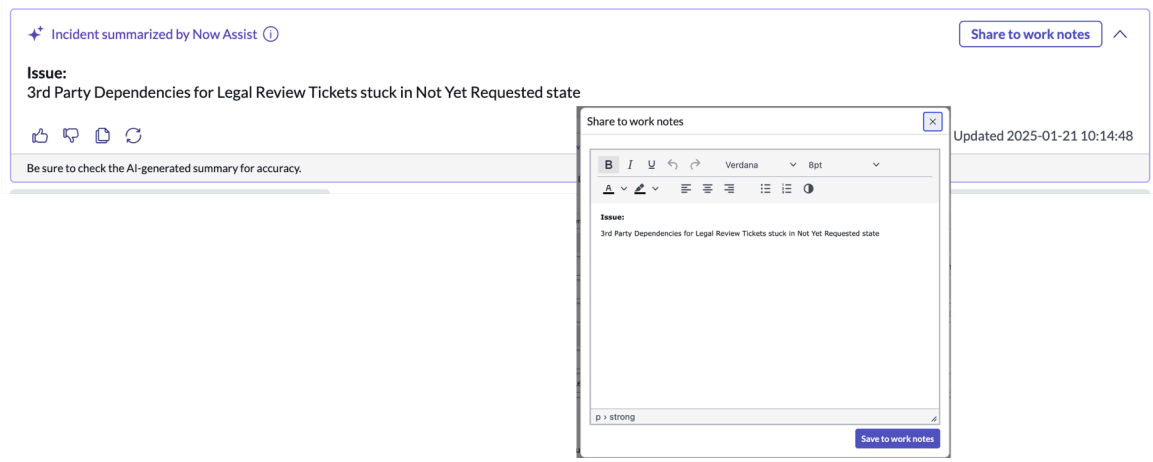
Assist context menu can generate a new summary, expand or collapse the summary card, share the summary to work notes, regenerate, or copy the summary.

Go to any record page to access the Now Assist context menu icon ( ) with the message `Incident Summary by Now Assist`. Select **Summarize** to use generative AI to generate a record summary.



You can use the **Share to work notes** button to share the summary to work notes. You can also expand or collapse the summary card as required.



To provide feedback, use the feedback icons ( ) or ( ) If you're not satisfied with the provided summary, use the regenerate icon ( ) to regenerate the summary. You can also copy the summary to the clipboard using the copy icon ( )

Improve Docs content in Strategic Portfolio Management with ServiceNow Otto context menu

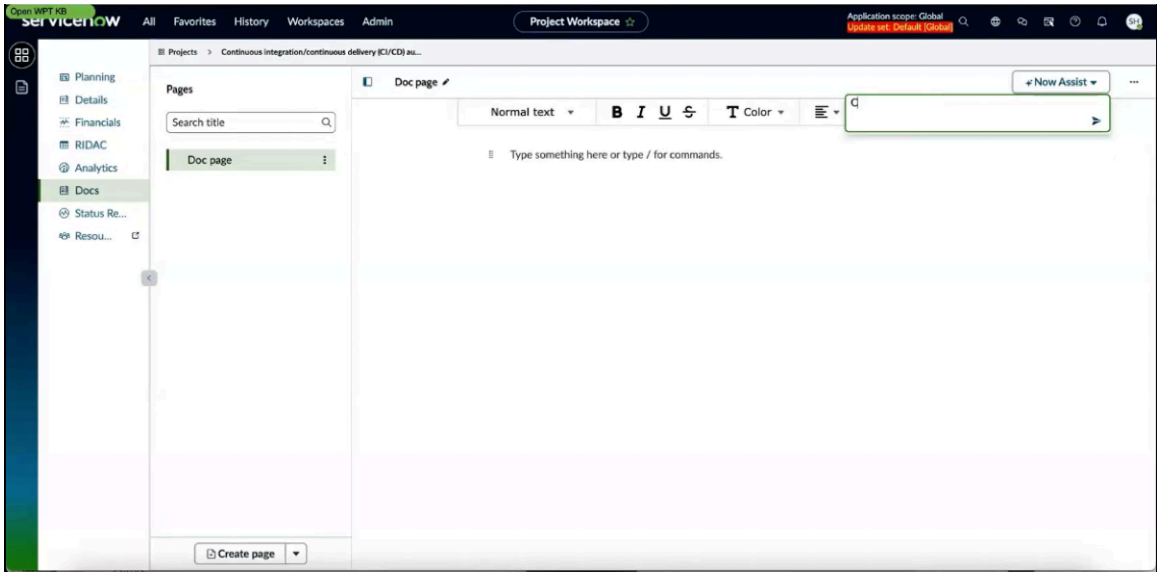
Use the ServiceNow Otto context menu to start conversations and raise queries, using generative AI capabilities and custom built in skills in Strategic Portfolio Management.

You can now interact with ServiceNow Otto directly from the docs section in Strategic Portfolio Management, Strategic Planning Workspace, Portfolio Planning Workspace, and Project Workspace to ask open-ended queries, create new content, add context, or improve existing sections. This helps you draft faster, refine ideas, and keep your work relevant without leaving the page.

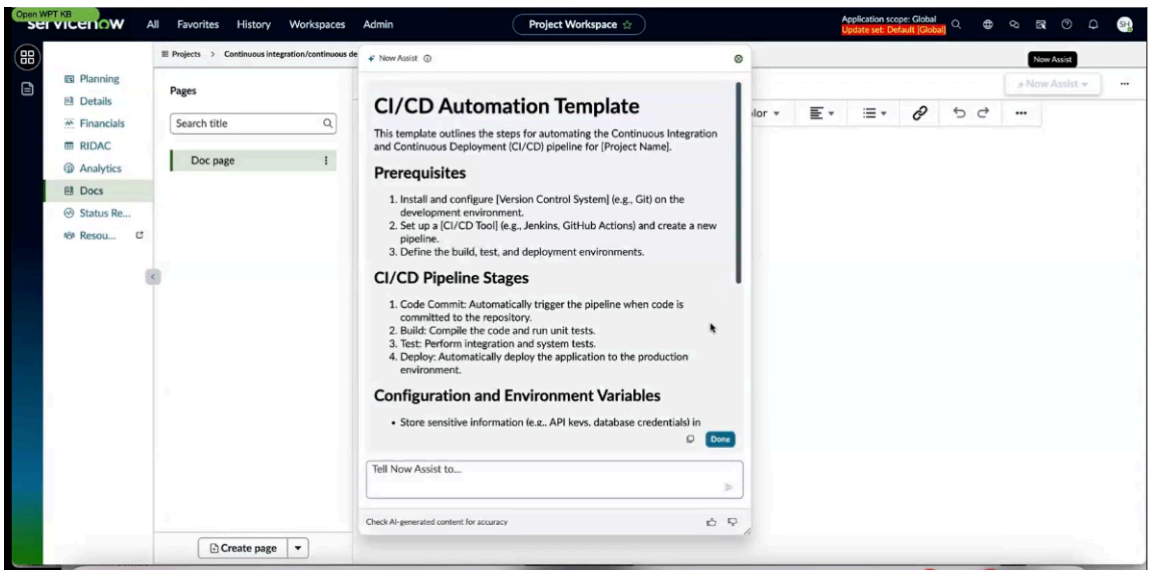
To access this feature, go to any doc page within Strategic Portfolio Management, Portfolio Planning Workspace or Project Workspace.

Select the ServiceNow Otto icon ( ) and enter your query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The query response is generated in a new ServiceNow Otto window. You can use the input field to provide follow-up query responses and instructions.



You can also select the ServiceNow Otto icon ( ) and use the **Summarize** option from the drop-down menu to use generative AI for generating a record summary.

The ServiceNow Otto icon ( ) along with the text input field is also displayed when you select any text from the docs page.

You can also see the option to **Summarize**, **shorten**, **elaborate**, or **change tone** for the selected content.

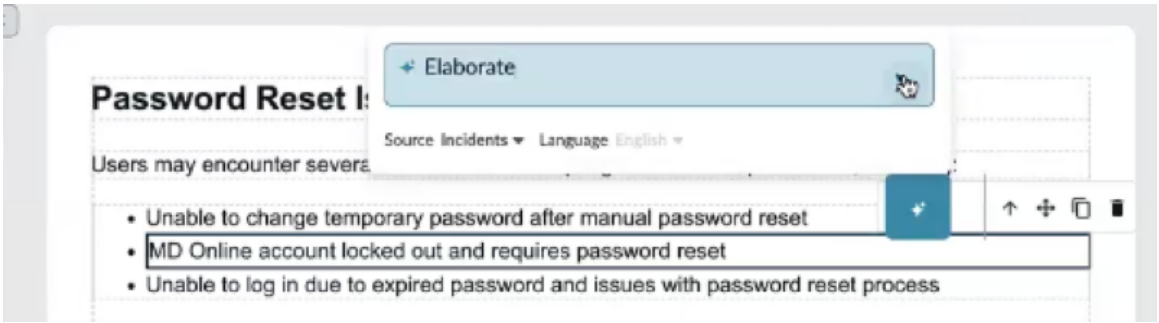
7. Select the text to further refine the content with ServiceNow Otto context menu pop-over variant.



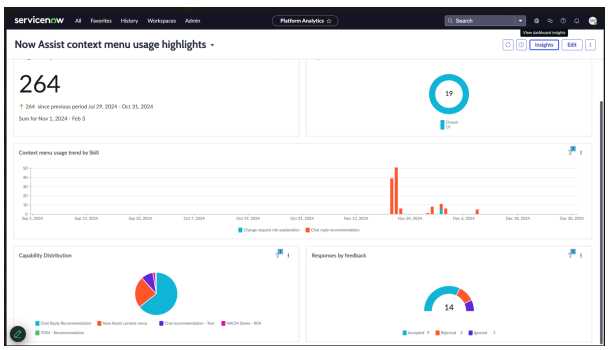
8. Type or select a menu option and press enter.
   Using the ServiceNow Otto context menu open prompt inline and pop-over variant you can quickly produce high-quality, accurate, and lucid knowledge articles, saving time and improving support in Knowledge Management.

ServiceNow Otto context menu usage dashboard

Use the ServiceNow Otto context menu dashboard to monitor the use of Now Assist context menu across the different applications.

The ServiceNow Otto context menu usage dashboard provides insights into usage patterns, frequency, and effectiveness of the context menu actions for the users and helps you refine the functionalities accordingly. The dashboard contains indicators that reveal:

- Usage metrics
- Usage based on application
- Usage based on skills
- Capacity distribution
- Responses by feedback



The ServiceNow Otto context menu usage dashboard enables you to filter the data based on the usage date. You can choose from the standard options or provide a custom range and select apply to filter the data.

Use ServiceNow Otto context menu for custom skill deployment

Use the ServiceNow Otto context menu to deploy the custom skills created using Now Assist skill kit.

AI practitioners can use ServiceNow Otto skill kit to create a custom skill to provide custom solutions, with Now Assist's generative AI capabilities.

ServiceNow Otto allows the administrators to choose the custom skills for deployment. Use ServiceNow Otto context menu as a preferred channel to deploy a custom skill, when you configure deployment setting in ServiceNow Otto skill kit. For more information, see Configure deployment and skill settings.

You must also select ServiceNow Otto context menu as a display option when you activate the skill in ServiceNow Otto Admin. For more information, see Activate an AI skill.

To complete the activation process, create a new ServiceNow Otto context menu configuration. For more information, see Create ServiceNow Otto context Menu configuration

Create ServiceNow Otto context Menu configuration

Create ServiceNow Otto context Menu configuration to deploy and activate a custom skill.

Before you begin

To configure custom skills in action, ensure that the skill is activated in ServiceNow Otto.

Role required: sn_skill_builder.admin

Procedure

1. Navigate to **All** > **ServiceNow Otto Admin** > **ServiceNow Otto Experiences** > **ServiceNow Otto Context Menu**.
2. Select **Configurations** tab in the ServiceNow Otto context menu home page.
3. Select **Create New**.
4. Enter values for the following fields on the Configure ServiceNow Otto context menu form.
   - Workflow
   - Product
   - Name
5. Select **Start Configuration**.
6. Provide the following details in the **General details** page, on the configuration form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Name
- Description
- Table name

7. Select a location where you want to add the trigger for the ServiceNow Otto context menu. The options are:
   - Record form field: Select this option to add the trigger on UI16 form
   - Custom location: Select this option to add the trigger on any other desired location.
8. If you select Record form fields, add the form fields where you want the ServiceNow Otto context menu icon.

   Note: ServiceNow Otto context menu can only be set up at the table level. Currently, it doesn't support filtering or configuring options based on specific record conditions.

9. If you select custom location, choose the context menu display type.
   Choose between the following options of display:
   - Modeless window: A draggable and resizable dialog box.
   - Embedded card: A fixed window displayed on the page.

   If you select **Custom location**, ensure that you have completed the UIB Now Assist context menu component configurations. For setup information see Now Assist context menu UIB Setup.
10. Select **Save and continue**.
    You will land on the Configure experience page.
11. Select options for the following fields on the Configure experience page:
    - Actions
    - Refinement actions
    - Turn on to prevent access refinement action
    - Maximum refinements
    - Actions for generated content
    - Enable users to provide feedback on the recommendations

    Provide the same information for each of the form fields you have selected.

    If you proceed without providing the required values for each form field, system will prompt you to provide configuration.
12. **Optional:** When prompted, select **Yes, apply** on the Apply Configurations prompt if you want to apply the same configurations.
13. Select **Save and continue** once you review and edit the values, if required.
    You will land on the Review and activate page.
14. Select an option from the **Select a record to test the configurations** drop-down menu.
15. Select **Preview** and **Done**.

Create multiple ServiceNow Otto context menu skill configurations

Create multiple ServiceNow Otto context menu configuration for the same field and table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You can now have multiple ServiceNow Otto context menu configurations on the same record form and field. You just have to create the required configuration and add to the form or field.

Role required: admin

Procedure

1. Navigate to **All** > **ServiceNow Otto Admin** > **ServiceNow Otto Experiences** > **ServiceNow Otto Context Menu**.
2. Select **Configurations** tab in the ServiceNow Otto context menu home page.
3. Select **Create New**.
4. Enter values for the following fields on the Configure ServiceNow Otto context menu form.
   - Workflow
   - Product
   - Name
5. Select **Start Configuration**.
6. Provide the following details in the **General details** page, on the configuration form:
   - Name
   - Description
   - Table name

   The UI now allows you to add multiple configurations to the same field without any errors. This is applicable only if you select Record form field.
7. Select Record form field as the location, to add the trigger for the ServiceNow Otto context menu on the UI16 form.
8. Add and select one or multiple form fields in the **Form Fields** field.
9. Select **Save and continue**.
   You will land on the Configure experience page. You will see a table that lists the skill configurations along the order value, for the selected record field. The precedence is always given to the configuration with the lowest order value.

   Note:
   - In case there is a conflict due multiple configurations to the same field in a table,the precedence is give to the configuration with the lowest order value.
   - In case there are multiple configurations, but the order value is same, the configuration with the most recently modified date is applied to field.
10. Select options for the following fields on the Configure experience page:
    - Default Action
    - Actions
    - Refinement actions
    - Turn on to prevent access refinement action
    - Maximum refinements
    - Actions for generated content
    - Enable support for extended tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide the same information for each of the form fields you have selected.

Note:

- To disable the inheritance model for child tables, toggle off the **Enable support for extended tables** button. This model applies the parent table's configurations to a child table if the child table does not have its own configuration.
- Do not merge configurations. Use only the child table configuration and retrieve configurations from the child table.
- Apply the merging logic to use the lowest value configuration for the fields.

If you proceed without providing the required values for each form field, system will prompt you to provide configuration.

11. Select **Save and continue** once you review and edit the values, if required.
    You will land on the Review and activate page.
12. Select an option from the **Select a record to test the configurations** drop-down menu.
13. Select **Preview** and **Done**.

Analyzing AI performance

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy , which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal .

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring AI Analytics

Learn how AI Analytics enables users with the AI Analytics Viewer or AI Analytics Admin role to monitor the usage, adoption, and performance of generative AI features and capabilities.

AI Analytics overview

The AI Analytics dashboard is built on the Platform Analytics experience. The dashboard contains indicators and breakdowns that provide actionable insights into the usage, adoption, and performance of your AI assets, including AI Guardian, ServiceNow Otto context menu, and AI search. AI skills and features are activated and managed in AI Admin Hub.

Note: The Value Insights dashboard page is no longer available in AI Analytics. For AI value insights, use the Value tab in AI Control Tower. See Value tab in AI Control Tower.

AI Analytics users

Users

User	Description
AI Analytics Admin	AI Analytics admins monitor usage, adoption, and performance of your AI assets, including AI Guardian, ServiceNow Otto context menu, and AI search. They also configure skill-dashboard mappings to view individual skill usage and performance indicators.
AI Analytics Viewer	View the dashboard pages to monitor usage and performance indicators.

AI Analytics benefits

AI Analytics benefits

Benefit	Feature	Users
Monitor usage and adoption of generative AI skills, AI Guardian, ServiceNow Otto context menu, and AI search.	• Usage and adoption • • Skills performance • AI Guardian analytics • ServiceNow Otto context menu analytics • User search analyzer	AI Analytics Admin or AI Analytics Viewer

What to explore next

To learn more about configuring and using AI Analytics, see:

- Configuring AI Analytics
- Using AI Analytics
- AI Analytics reference

Configuring AI Analytics

Configure the AI Analytics dashboard to view usage, value, and performance indicators for generative AI features on your instance.

Configuration overview

AI Analytics requires at least one ServiceNow Otto product, for example, ServiceNow Otto for Customer Service Management (CSM), to be installed and configured on your instance. See Installing AI Analytics for more information.

The following is an optional configuration task used to map an AI skill to a dashboard.

Map a skill to a dashboard to view skill usage and performance indicators.

Domain Separation

AI Analytics supports domain separation only for indicators using the following data collection jobs.

- [GenAI Analytics] Daily Data Collection
- [GenAI Analytics] Historical Data Collection
- [Now Assist Analytics] Daily Data Collection
- [Now Assist Analytics] Historical Data Collection

See Approaches to Performance Analytics with domain separation for more information on applying domain separation configuration.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Be sure to check the Run as field in the data collection job records has a valid user.

Installing AI Analytics

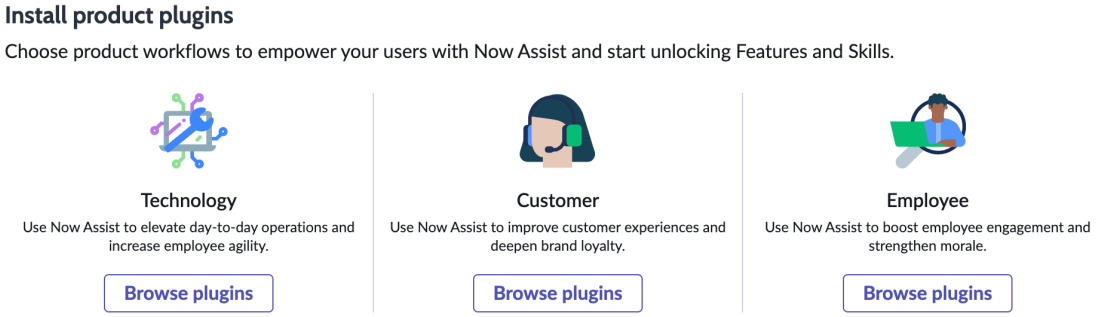
You can install the AI Analytics application (sn_na_analytics) with any of the ServiceNow Otto products if you have the admin role.

Installation requirements

You must be on Brazil Patch 0 or later.

AI Analytics is included as a dependency for all ServiceNow Otto products. It is not recommended to install the application by itself. Instead, you can install ServiceNow Otto products from the AI Admin Hub or directly from the ServiceNow Store. For details, see Install plugins for ServiceNow Otto.

AI Admin Hub console plugin installation



Compatibility matrix

AI Analytics has a dependency on AI Admin Hub. Be sure to have the compatible version of the AI Admin Hub console based on the following compatibility matrix.

AI Analytics version	AI Admin Hub console version	Release
AI Analytics 2.0.14	AI Admin Hub 5.0.7	Brazil Patch 1
AI Analytics 1.1.11	AI Admin Hub 4.1.16	Brazil Patch 0

Map a skill to a dashboard

Map an AI skill to a dashboard to view skill performance indicators and skill details.

Before you begin
Be sure to map a dashboard with a skill in the same domain.

Note: You can only map a skill to a dashboard. Mapping a feature (that consists of multiple skills) is currently not supported.

If you're mapping a skill to a custom dashboard, be sure to share appropriate access to the dashboard. See Share a Platform Analytics dashboard for more information.

Roles required: sn_na_analytics.admin and sn_nowassist_admin.nsa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **All** menu and enter `sn_na_analytics_configuration.list`.
   The Now Assist Analytics Configuration [sn_na_analytics_configuration] table

   appears.
2. Create a new mapping by selecting **New**
3. On the form, fill in the fields.

AI Analytics Configuration record form

Field	Description
Dashboard	The Dashboard that you want to map to a skill. Use the lookup icon ( ) to search for and select the dashboard.
Application	The application that contains the record.
Document Table	Table that contains configured skills. Use the lookup icon ( ) to search for and select the Now Assist Skill Config [sn_nowassist_skill_config] table.
Document Id	The Skill that you want to map to the dashboard. Use the lookup icon ( ) to search for and select the skill that you want to map to the dashboard.
Active	Check box used to enable or disable the mapping.
Order	Order to set that determines the priority of the mapping in cases where multiple skills are mapped to the same dashboard.

4. Select **Submit**.

What to do next

After you've completed the mapping, go to the Skill details page and select the skill from the drop-down list to verify that the mapped dashboard is displayed.

Using AI Analytics

The AI Analytics dashboard provides indicators and breakdowns that help monitor the performance of generative AI features, capabilities, and skills active on your instance.

Access the dashboard by navigating to **All** > **AI Admin Hub** > **Performance**.

You must have one of these roles to view the dashboard:

- Now Assist Analytics Admin [sn_na_analytics.admin]
- Now Assist Analytics Viewer [sn_na_analytics.viewer]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following pages explain the available analytics in more detail.

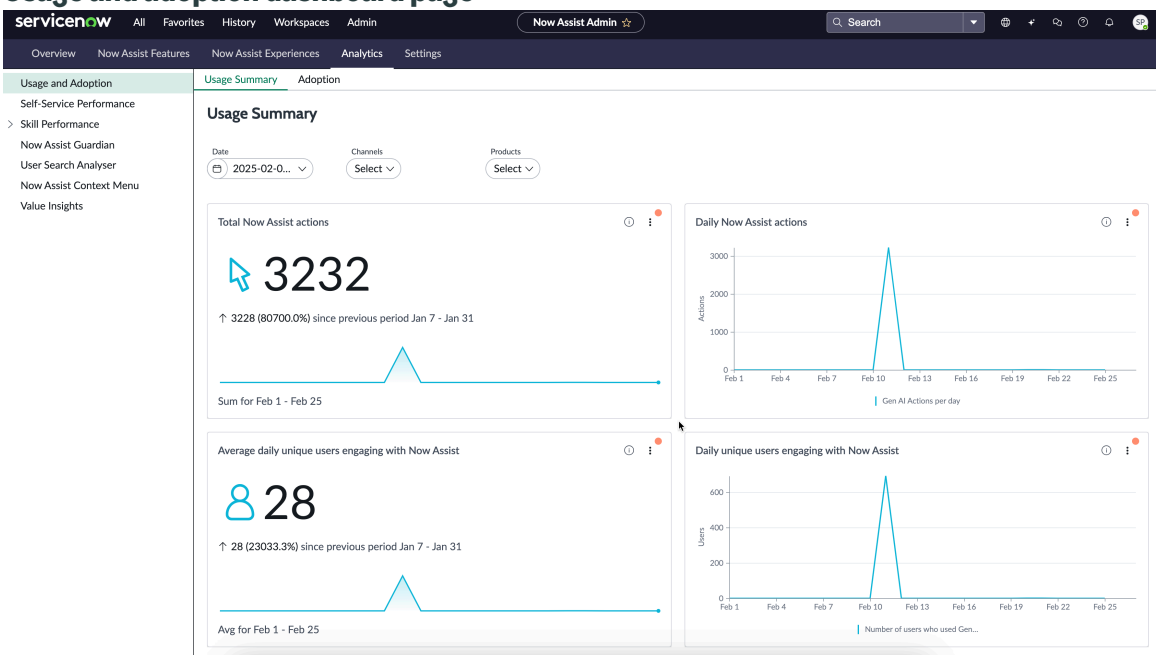
Usage and adoption

The Usage and adoption dashboard page contains key usage and performance indicators that help you evaluate AI adoption in your organization.

The Usage and adoption dashboard page is the landing page for the dashboard. The Usage and adoption dashboard page contains two tabs that provide insights on usage summary and adoption.

The Usage summary page includes indicators on total and daily AI actions, skill distribution and engagement trend, and daily unique users who have used AI skills. The Adoption page tracks the departments with the highest AI usage, comparison of actions by department, and feedback and error details. Use the date range, channel, and product filters to view usage and adoption indicators for the selected period, channel, and product, respectively. The default date range is 30 days.

Usage and adoption dashboard page



The indicators on the Usage and adoption dashboard page provide the following insights. See AI Analytics dashboard indicator details for information on data source and calculations behind each indicator on the page.

- Skills engagement trend for a selected period can reveal skills that have been used more frequently or less frequently.
- Total and daily actions for a selected period can reveal the scale of AI actions executed. The trend line in the visualization shows periods of increased or declining engagement.
- Average and daily unique users can reveal user engagement with AI skills.

Usage summary indicators

Total AI actions

This area of the dashboard shows the total number of AI actions in the selected date range. A single use of an AI skill represents an action. Select a filter combination to view the number of actions by products or channels. For example, you can view the number of AI actions executed through the ServiceNow Otto for

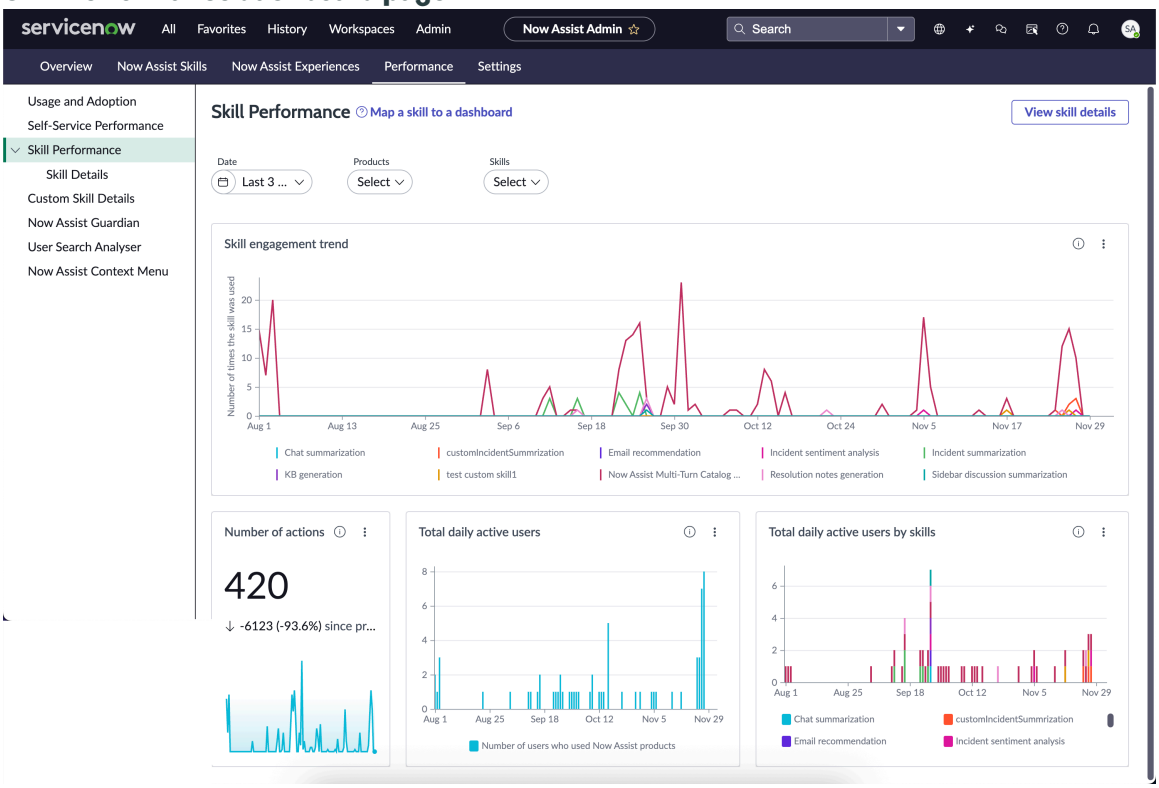
Skills performance

Use the Skills performance dashboard page to view usage and performance indicators of active AI skills.

The Skills performance dashboard page contains indicators that help you analyze the usage and performance of active skills. Use the **Date range**, **Product**, and **Skills** filters to break down by date range, product, and skill, respectively. The filter selection applies to all visualizations on the page. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

Skill Performance dashboard page



The indicators on the Skills performance dashboard page provide the following insights. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

- Skills usage trend visualization for a selected period can reveal skills that have been used more frequently or less frequently.
- The Number of actions visualization for a selected period can reveal the scale of AI skill executions. The trend line comparison shows the increasing or decreasing trend from the previous period.
- The Total daily active users indicator shows a breakdown of daily active users by product and skill.

Select the **View skill details** button to view the usage and performance indicators of skills mapped to a dashboard.

Skills performance indicators

Skills engagement trend

This area of the dashboard shows the skill usage in a trend chart for the selected filters. The visualization is interactive. Hover over the trend lines to see the number

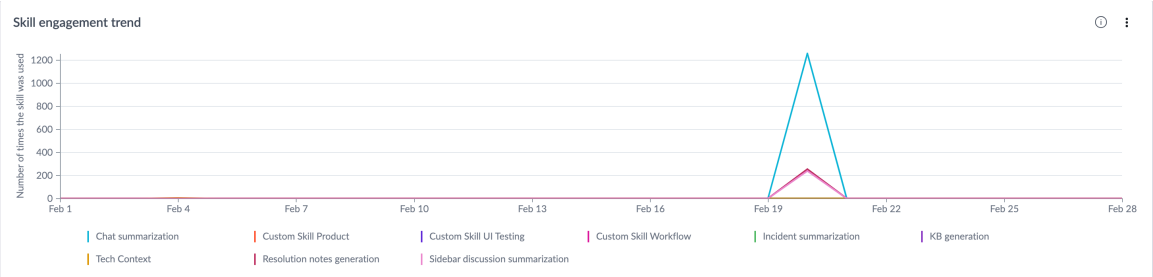
of times that each skill was used. Selecting one or more skills in the legend removes the trend line for those skills. You can compare and contrast skill usage levels in a date range to understand in-demand skills, and skills that are low on usage and need further analysis.

Skills usage trend indicator



Number of actions

This area of the dashboard shows the number of AI actions for the selected date range, product, and skill. A single use of a skill represents an action. The headline number is an indicator of the scale of skill usage across products. The trend line comparison shows the increase or decrease in the number of actions from the previous period.

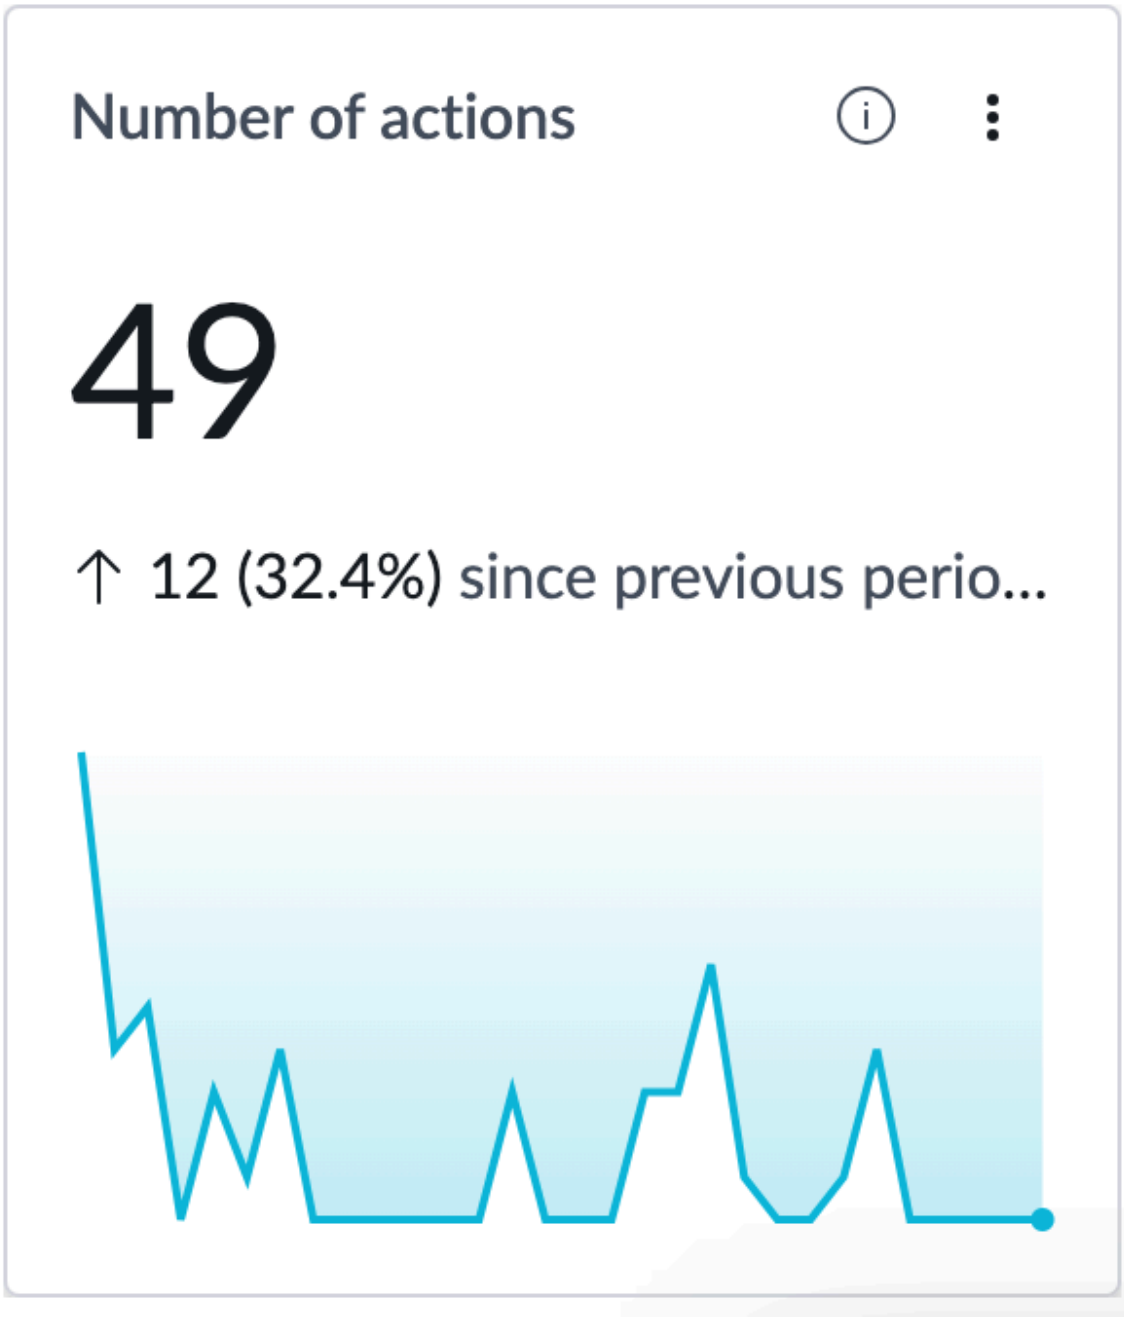
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Number of actions indicator

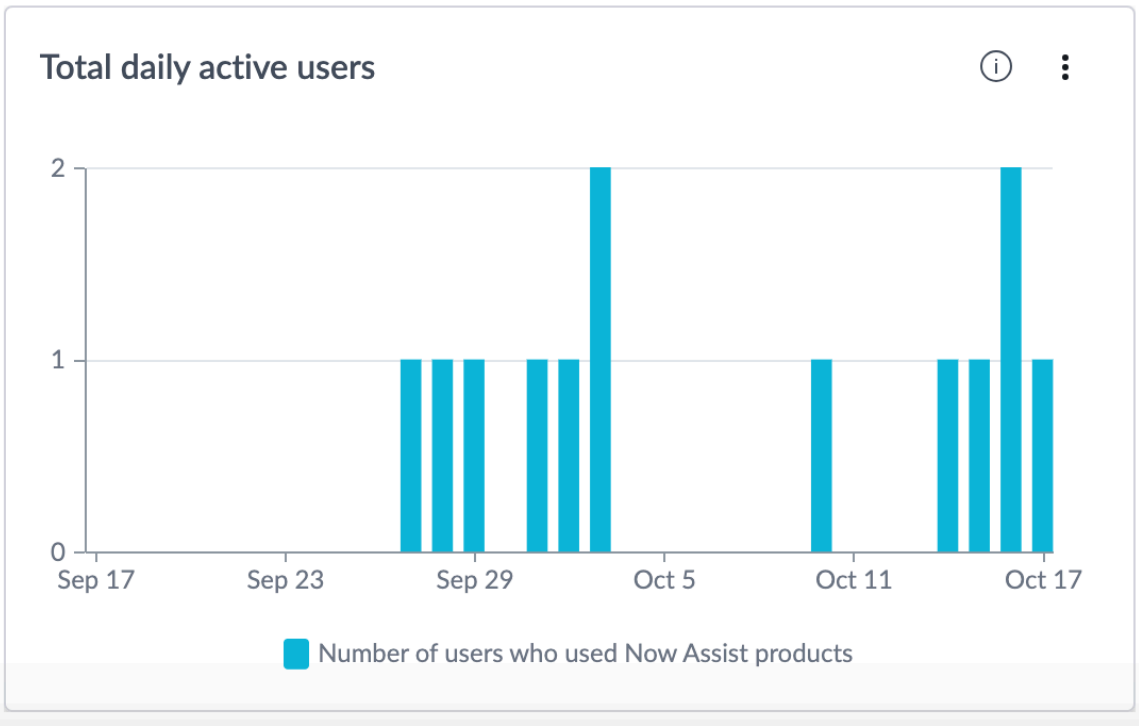


Total daily active users

This area of the dashboard shows the cumulative number of daily active users who have used ServiceNow Otto products with one or more active skills. Select a filter combination to see skill usage patterns. For example, you can visualize the number of users who have used the Chat Summarization skill across all products in the last month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

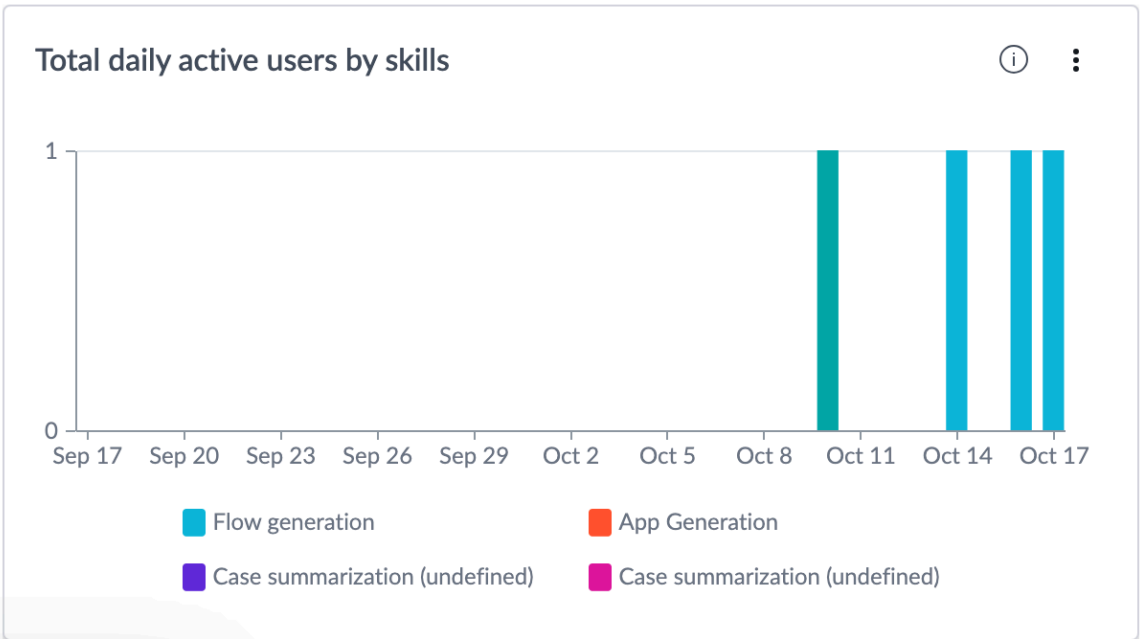
Total daily active users indicator



Total daily active users by skills

This area of the dashboard shows the number of daily active users who have used AI skills in the selected date range. When you hover over a date in the visualization, a pop-over shows all active skills with the count of users against each skill. Select a filter combination to visualize patterns in user activity.

Total daily active users by skills indicator



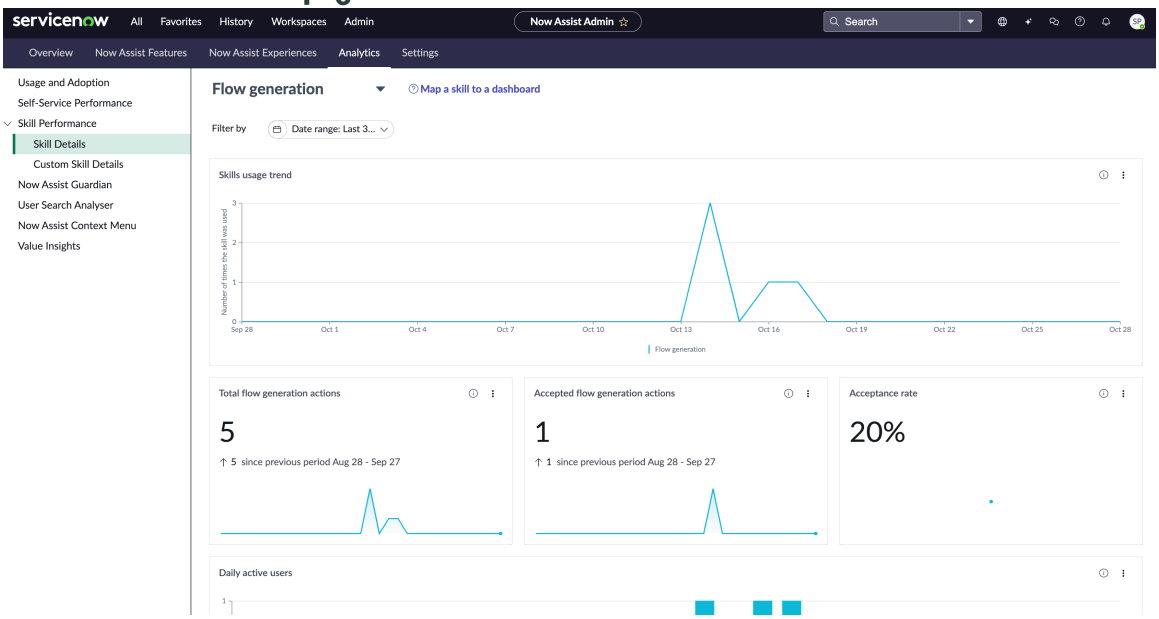
Skill details

Use the Skill details dashboard page to view usage and performance indicators of a skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Skill details dashboard page contains indicators pertaining to a specific skill. The indicators provide insight into skill usage and performance. Select a skill from the drop-down list to view the indicators. The drop-down lists both active and inactive skills. Each skill has a subtitle that identifies the skill family that it belongs to, for example, ITSM, HR, and so on. Use the date range filter to view skill usage and performance over a certain period. The date range filter selection applies to all visualizations on the page. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

Skill details dashboard page



The indicators on the Skill details dashboard page provide the following insights. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

- Skill engagement trend visualization for a selected period can reveal patterns in skill usage.
- Acceptance rate visualization shows how well the skill met the requirements of users who used the skill. A high acceptance rate for a skill is an indicator of good performance. A low acceptance rate among skill users indicates that the skill doesn't meet the requirements either fully or partially.
- The number of actions visualization for a selected period can reveal the scale of the skill executions. The trend line comparison shows the increasing or decreasing trend from the previous period.
- The daily active users visualizations show a breakdown of daily active users by skill to help you see user activity on the skill.

Skill details indicators

The indicators on skill details pages might differ based on the skill selected. For example, summarization skills might have different set of indicators compared to generation skills because each skill is mapped to its own dashboard that contains a set of indicators related to the skill.

The AI Analytics dashboard comes with some default skill-to-dashboard mappings to get you started. The default dashboards are visible to users with the AI Analytics Viewer [sn_na_analytics.viewer] role. You can create your own dashboards and map them to skills. See Create a dashboard with the in-line editor and Map a skill to a dashboard for more information on creating custom dashboards and mapping them to skills, respectively.

The following indicators are for the Flow Generation skill.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accepted flow generation actions indicator

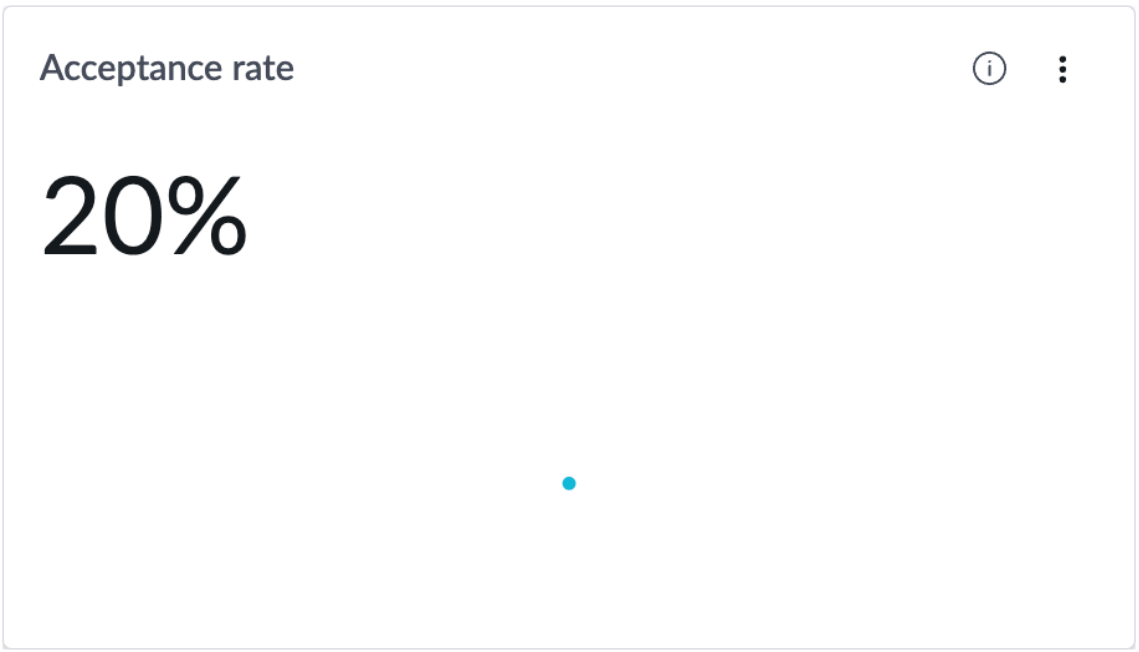
Acceptance rate indicator

This area of the dashboard shows the acceptance rate of Flow Generation skill based on user acceptance of the flow. The percentage is calculated using the formula: (Total number of accepted flow generation actions/Total number of flow generation actions) x 100.

Acceptance rate indicator



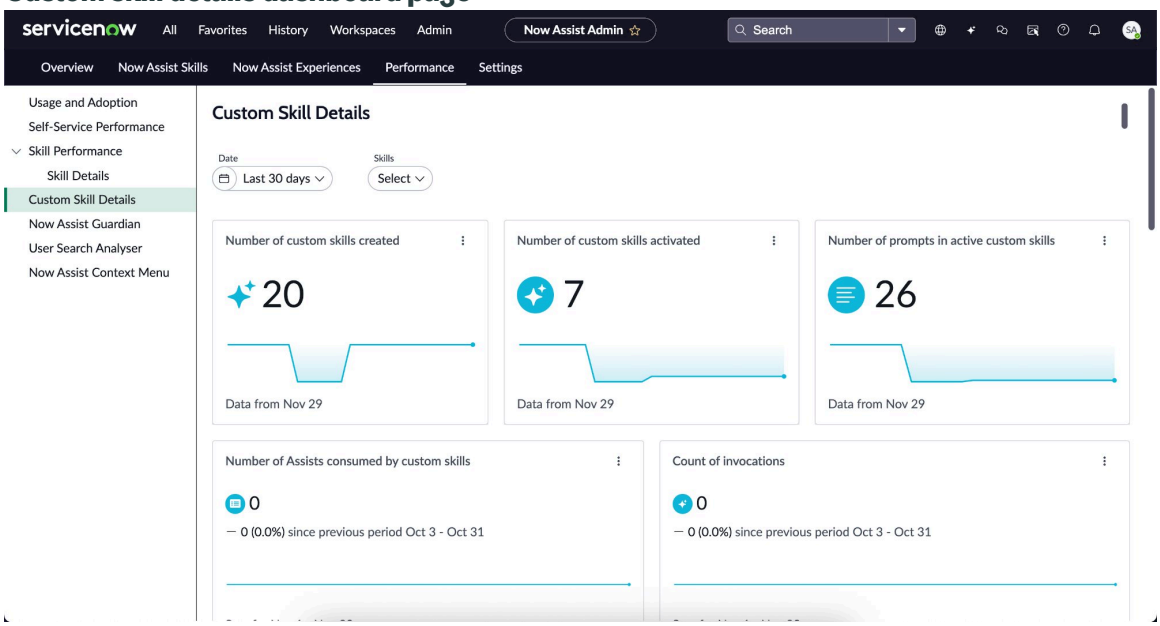
Custom skill details

Use the Custom skill details dashboard page to view usage and performance indicators of custom skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Custom skill details dashboard page contains indicators pertaining to a custom skill. The indicators provide insight into skill usage and performance. Select a skill from the Skills drop-down list to view the indicators. The drop-down lists both active and inactive skills. Each skill has a subtitle that identifies the skill family that it belongs to, for example, ITSM, HR, and so on. Use the date range filter to view skill usage and performance over a certain period. The date range filter selection applies to all visualizations on the page. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

Custom skill details dashboard page



The indicators on the Custom skill details dashboard page provide the following insights. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

- Skill engagement trend visualizations for a selected period can reveal patterns in skill usage across workflows, products, and features.
- The daily unique users visualization shows a breakdown of daily unique users by the selected skill to help you see user activity and engagement with the skill.
- Acceptance rate visualization shows how well the skill met the requirements of users who used the skill. A high acceptance rate for a skill is an indicator of good performance. A low acceptance rate among skill users indicates that the skill doesn't meet the requirements either fully or partially.
- Skills feedback visualization shows that the feedback recorded based on user response to each skill execution in the selected date range.

Skill details indicators

The Custom skill details page contains a common set of indicators that give you insights into custom skills. Only those skills where the skill family is Other or the category is Custom are shown in the skills filter on the page.

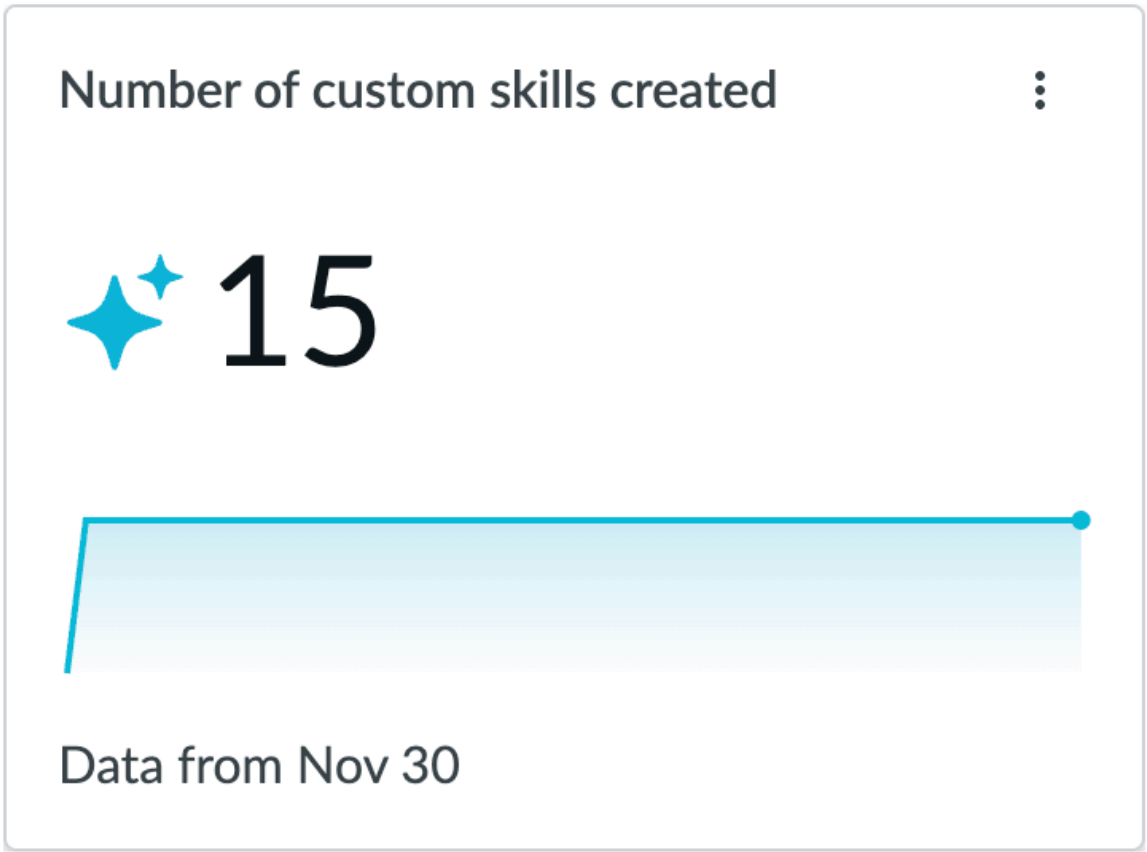
The following indicators are common across all custom skills.

Number of custom skills created

This area of the dashboard shows the number of custom skills created by the users in the selected date range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Number of custom skills created indicator

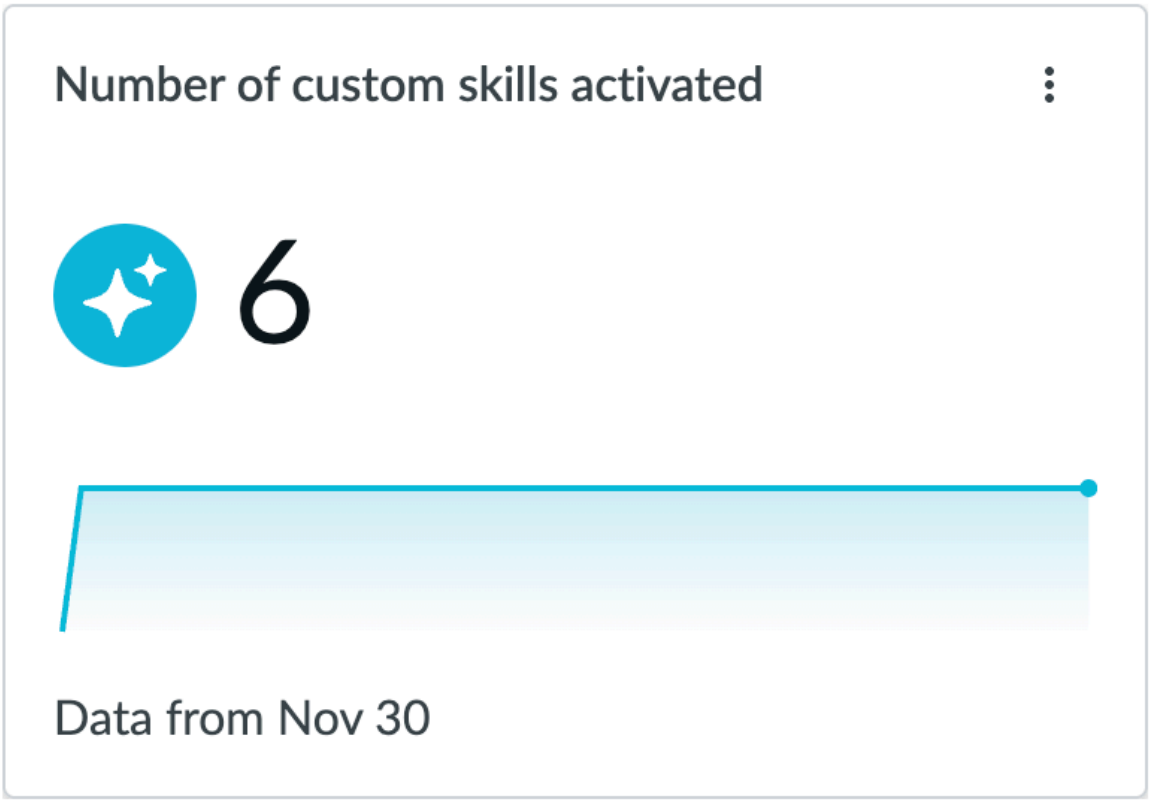


Number of custom skills activated

This area of the dashboard shows the number of custom skills activated by the users in the selected date range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

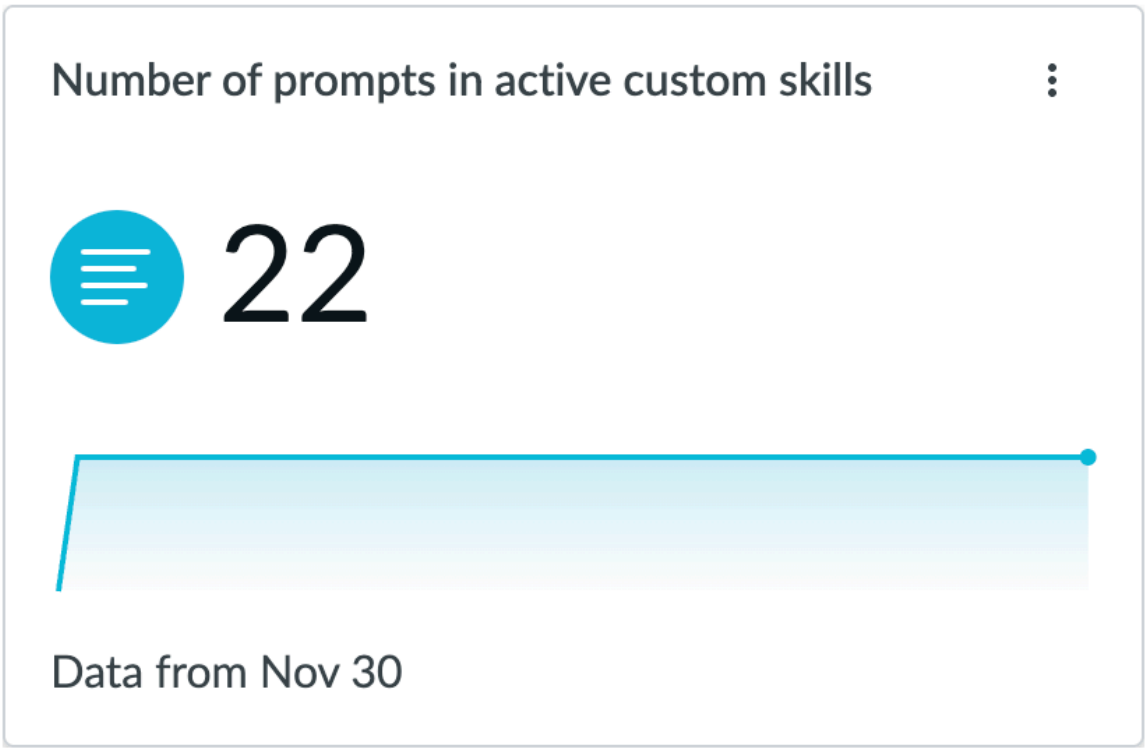
Number of custom skills activated indicator



Number of prompts in active custom skills

This area of the dashboard shows the number of prompts in active custom skills in the selected date range.

Number of prompts in active custom skills indicator



Number of Assists consumed by custom skills

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

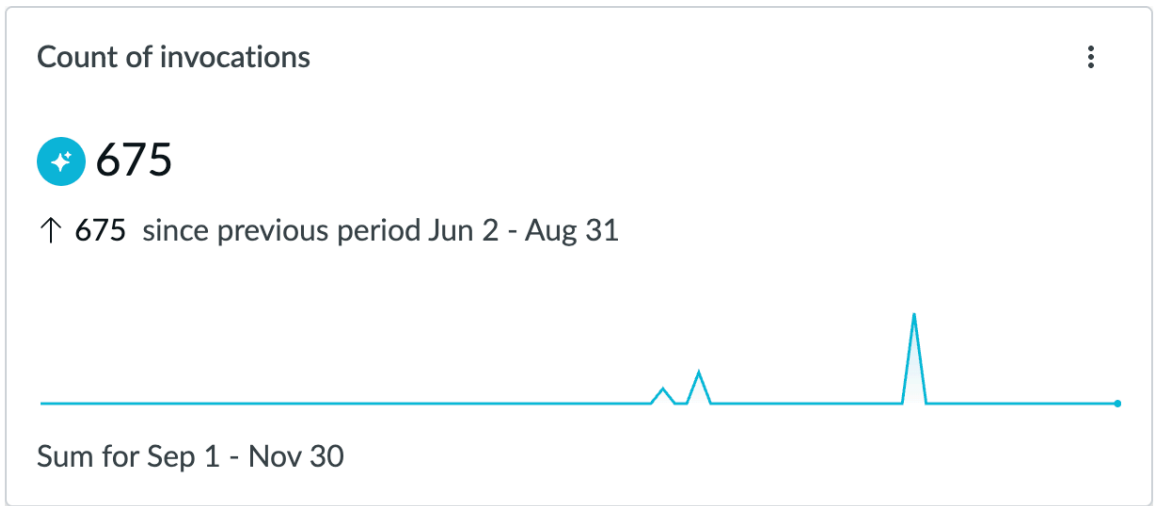
This area of the dashboard shows the number of Assists consumed by custom skills in the selected date range.

Number of Assists consumed by custom skills indicator

Count of invocations

This area of the dashboard shows the count of invocations for the custom skills in the selected date range.

Count of invocations indicator

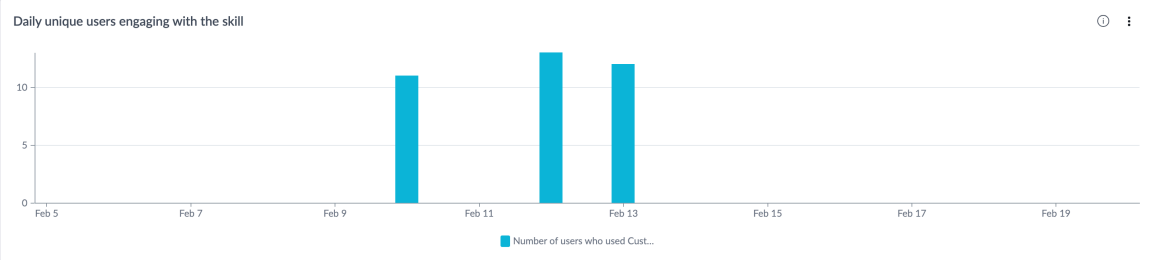


Daily unique users engaging with the skill

This area of the dashboard shows the number of unique users per day who engaged with the skill in the selected date range. The bar chart shows a trend of increase or decrease in the number of unique users to help you understand periods of high and low skill engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

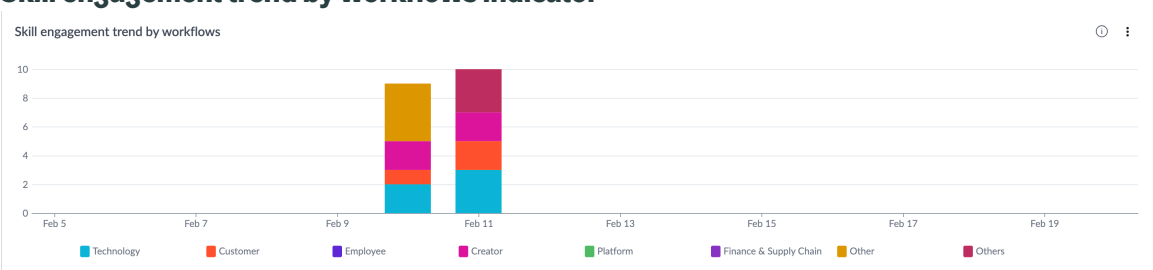
Daily unique users engaging with the skill indicator



Skill engagement trend by workflows

This area of the dashboard shows the skill usage across workflows in a bar chart for the selected date range. The visualization is interactive. Hover over the bars to see the number of times the skill was used in each of the workflows.

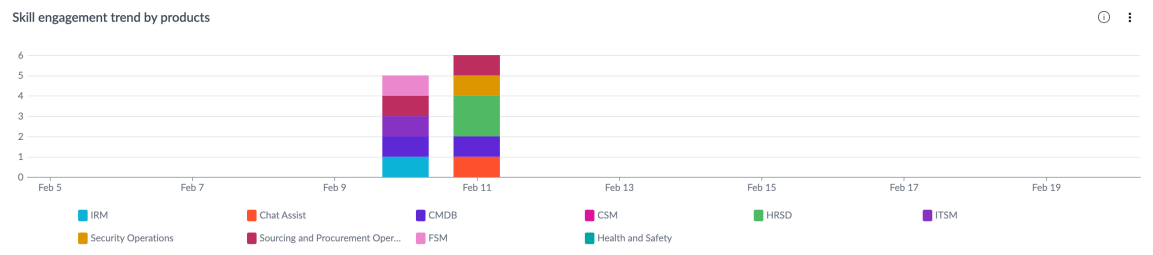
Skill engagement trend by workflows indicator



Skill engagement trend by products

This area of the dashboard shows the skill usage across ServiceNow Otto products in a bar chart for the selected date range. The visualization is interactive. Hover over the bars to see the number of times the skill was used in each of the products.

Skill engagement trend by products indicator



Skill engagement trend by features

This area of the dashboard shows the skill usage across ServiceNow Otto features in a bar chart for the selected date range. The visualization is interactive. Hover over the bars to see the number of times the skill was used in each of the features.

Skill engagement trend by features indicator

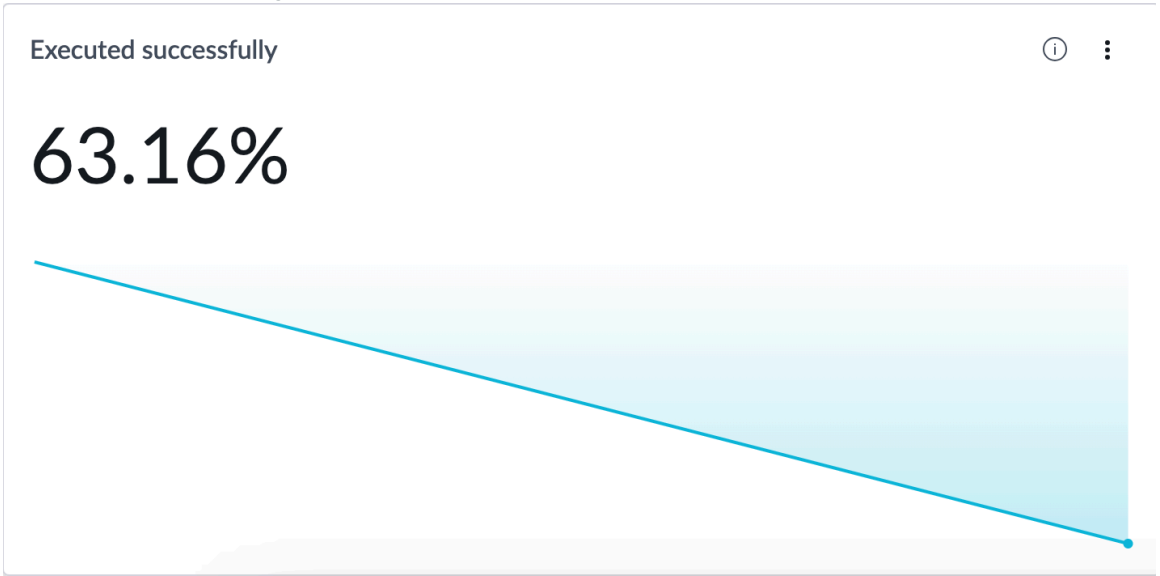
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Executed successfully

This area of the dashboard shows the acceptance rate of the selected skill based on user feedback. The percentage is calculated using the formula: (Total number of accepted skill executions/Total number of skill executions) x 100.

Executed successfully indicator



Skills feedback

This area of the dashboard shows the feedback recorded for each execution of the selected skill. User feedback is categorized into the following:

- Accepted (edited & non-edited): The user accepted the skill output with or without further edits to the output.
- Rejected: The user rejected the skill output.
- Canceled: The user canceled the skill execution.
- Ignored: The user didn't take any action based on the skill output.

Skills feedback indicator

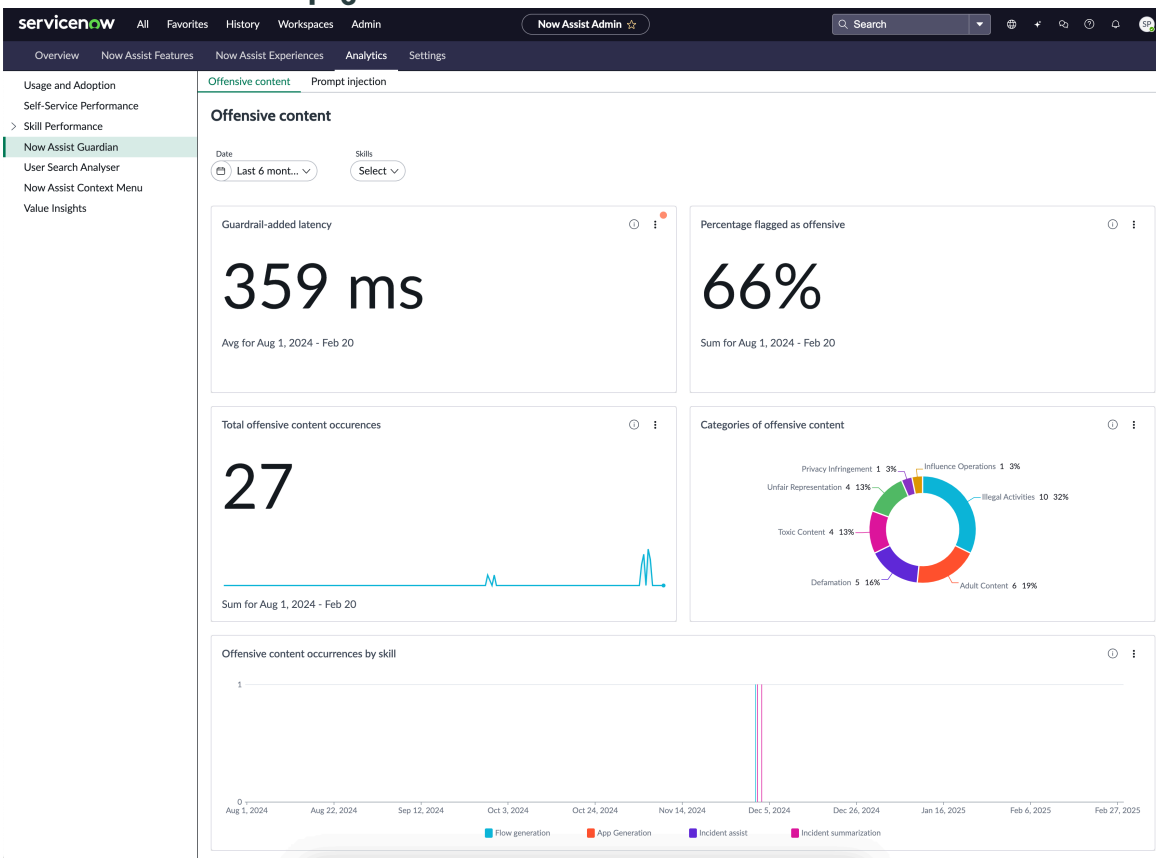
AI Guardian analytics

Monitor the performance of guardrails enabled through AI Guardian.

The AI Guardian analytics dashboard helps admins monitor and evaluate the effectiveness of offensive content and prompt injection guardrails in tracking and analyzing requests sent to large language models (LLM) and their responses.

AI Guardian dashboard page



The indicators on the AI Guardian dashboard page provide the following insights.

- Average latency as a result of active offensive content and prompt injection guardrails. High latency could mean increased guardrail activity in the period.
- Count and percentage of offensive content and prompt injection occurrences.
- Skills where offensive content and prompt injection occurrences were detected.

Apply the filters on the dashboard to view guardrail activity for skills in a date range. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

Offensive content indicators

Guardrail-added latency

This area of the dashboard shows the average latency as a result of the active offensive content guardrail for the selected skills and date range.

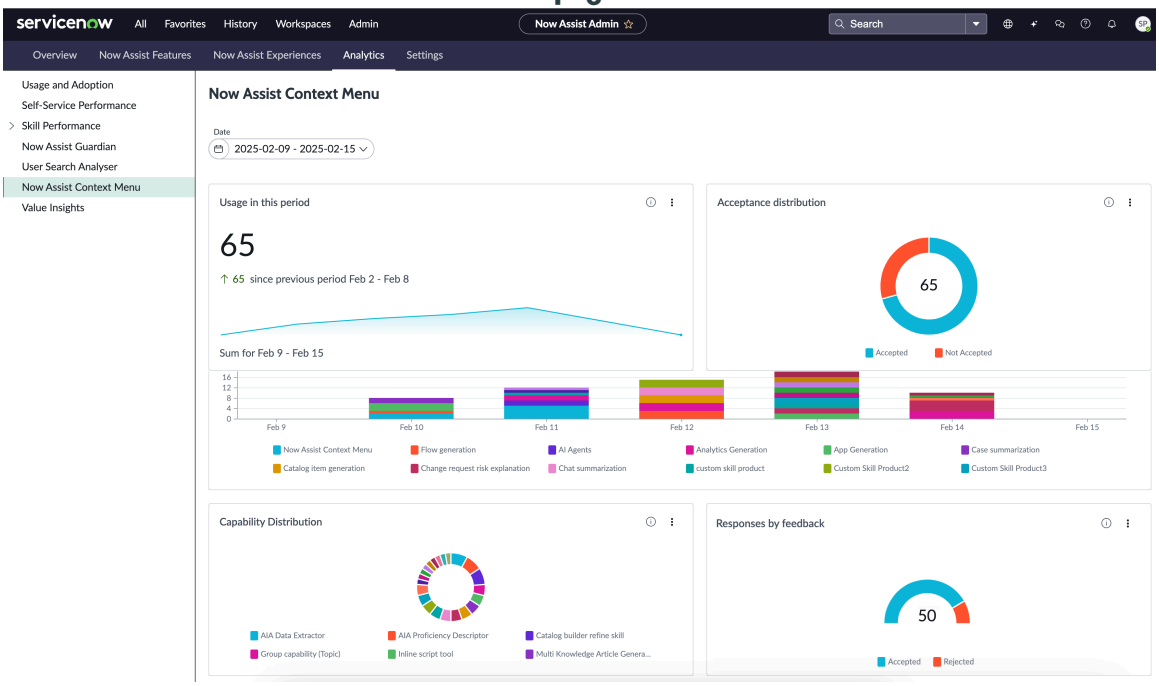
ServiceNow Otto® context menu analytics

Monitor the usage and performance of the ServiceNow Otto context menu.

The ServiceNow Otto context menu dashboard helps admins to evaluate the effectiveness of context menu actions in assisting agents with summarizing, creating, and editing emails and chat replies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Otto context menu dashboard page



The indicators on the context menu dashboard page provide the following insights. See AI Analytics dashboard indicator details for information on the data and calculations behind each indicator.

- Count and distribution of context menu actions in a date range. This indicator reveals the scale of usage, and the most and least used actions.
- Acceptance and feedback on context menu actions. This indicator reveals actions that were accepted or rejected by the users with a positive or negative feedback.
- Usage trend chart reveals patterns in usage of context menu actions over a date range.

ServiceNow Otto context menu indicators

Usage in this period

This area of the dashboard shows the total number of the context menu actions used in the selected date range.

Usage in this period indicator

Acceptance distribution

AI Analytics dashboard indicator details

Indicator details help you understand the data and calculations behind an indicator that is presented in the form of a visualization on the dashboard.

AI Analytics indicators contain the following details: indicator type, data source, calculation, available breakdowns, unit, and so on.

To access these indicators, navigate to **Platform Analytics Administration** > **Indicators**. You must have the Now Assist Analytics Admin [sn_na_analytics_admin] role to access the indicators.

These indicators collect data at a daily frequency. Data is only available for dates before the current date. If you want to see results from the current day, you must wait until the next day.

Note: The Generative AI Usage Log [sys_gen_ai_usage_log] table is maint-only.

Usage and adoption indicator details

AI Admin Hub Settings

Configure general settings for all Now Assist applications from the **Settings** tab in the AI Admin Hub console.

As you begin to explore Now Assist, use **Settings** in the AI Admin Hub console to activate the plugins. See Install plugins for ServiceNow Otto.

Turn on the Now Assist panel, review multi-language support, data sharing and processing, and AI Guardian features, and view the Now Assist account settings. You can also manage the large language model integrations under **Settings**.

Configure multilingual service for ServiceNow Otto applications

Turn on multilingual service for user-entered text with native translation or Dynamic Translation in ServiceNow Otto applications.

Before you begin

To see a list of all available languages supported in ServiceNow Otto, see Multilingual service for Now Assist.

To use Dynamic Translation, you must install and activate the application and install at least one language pack. For more information, see Activate Dynamic Translation and Activate a language. From the Zurich release, Dynamic Translation has available support in specific regulated markets. For details see KB0743854 on the Now Support portal.

Role required: sn_generative_ai.nsa_admin

About this task

There are two translation services available to translate user-generated content in ServiceNow Otto applications. For more information on the differences between the two, see Multilingual service for Now Assist. In that documentation, you can also find the steps for adding another language to your service if it is not preconfigured.

After you have enabled either Dynamic Translation or native translation, translations will be available for in-product experiences, Virtual Agent, and the ServiceNow Otto panel.

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Settings**.
2. On the left-hand panel, select the **Multilingual service**.
3. In the native translation or Dynamic Translation tab, toggle the switch to **On**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A modal displays, confirming your choice and stating that streaming of LLM (large language model) responses will be unavailable when Dynamic Translation is active.

Note:

When Dynamic Translation is inactive, streaming is available. The modal message displayed will change according to the status of the Dynamic Translation.

4. You can enable both Dynamic Translation and native translation.
   Native translation is applied first. If the language is not supported through native translation, then Dynamic Translation will be applied.
5. **Optional:** To enable the preferred language from the available languages supported in the model providers selected in AI Control Tower, select **Edit** and then select the check-box next to the languages you want to use for translation.

   (Optional) See Multilingual service for Now Assist for more information about adding new languages for your preferred model to support.

   To update your choice, select **Save**.

Result
Multilingual service is enabled for ServiceNow Otto applications.

Multilingual service for Now Assist

Now Assist applications use the multilingual capabilities of large language models (LLMs) to translate user-generated content.

Multilingual service overview

You can configure the multilingual services for Now Assist applications to communicate with your users in their preferred languages. The LLM detects the language used based on the user's language choice in their Language & Region preferences or the contents of the text, such as a conversation message.

Multilingual support is enabled for multiple LLM providers, such as Now LLM Service, Microsoft Azure OpenAI, Anthropic Claude on AWS, and Google Gemini. Azure OpenAI offers the most language support on the ServiceNow AI Platform.

How the different multilingual services work

The inherent multi-language capabilities of the LLM is called native translation. In native translation, text is sent as-is to the model and the model responds in the user's language. For example, if a user sends a message in Spanish, the multilingual LLM supports Spanish, so it receives the Spanish input directly from the user. It then generates a response in Spanish, regardless of the language used in the source material it uses to create that response.

For Dynamic Translation, once non-English content is detected, the translation service translates the content to English before sending the request to the large language model (LLM). After the LLM returns a response, the response is translated back into the user's preferred language for them to see. For example, a user enters a message in Slovenian. Dynamic Translation translates the Slovenian to English before giving the message to the LLM. The LLM generates a response in English, and then Dynamic Translation translates that response to Slovenian to show to the user.

If you enable both native translation and Dynamic Translation, native translation has preference and is used first.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have native translation enabled, the LLM checks the user's language to see if it is supported. If the language is supported, only native translation is used and no Dynamic Translation occurs. A small number of languages are not yet natively supported by all models. Now Assist Dynamic Translation is automatically applied to address this for unsupported languages. Additionally, if you have native translation enabled, then LLM requests that return outputs in the fallback language will not be translated by Dynamic Translation. Otherwise, they'll be returned as-is to the user. This process helps increase skill performance and decrease latency.

Note: If you want to add a language that is not part of the regularly configured languages, you can do so. See the section below, Adding languages beyond the P1, P2, and P3 language groups.

Native translation

Supported languages are categorized into three basic groups.

P1 languages have the strongest native support across most model providers, meaning high-quality translation and generative capabilities with fewer errors. Nuance, idioms, and context are usually handled well because these languages are deeply integrated into the models.

P2 languages are supported natively by smaller ServiceNow models and most external providers, but not always by every model (e.g., some exceptions for Canadian French and Dutch). Accuracy is good, but there may be occasional gaps in nuanced understanding compared to P1 languages.

P3 languages include a broader set of languages supported by major providers like Microsoft Azure OpenAI, Google Gemini, and Anthropic Claude on AWS, but not natively by ServiceNow's own large models. While coverage is comprehensive, these languages generally have less training depth, so subtle tone or idiomatic expressions may be harder to capture perfectly.

- P1
  - English
  - French
  - German
  - Italian
  - Spanish
  - Brazilian Portuguese
- P2
  - Canadian French
  - Japanese
  - Dutch
- P3
  - Swedish
  - Finnish
  - Czech
  - Hebrew
  - Hungarian
  - Korean
  - Norwegian

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Polish
- Portuguese
- Russian
- Simplified Chinese
- Traditional Chinese
- Thai
- Turkish
- Arabic
- Danish

Specific models vary in their support.

- ServiceNow Large Language Model v1 (Llama 3.3 70B) only supports English natively.
- ServiceNow Large Language Model v2 (GPT-OSS) supports English, French, German, Spanish, and Italian natively.
- ServiceNow Small Language Model v1 (Mistral Nemo 12B) and v2 (Apriel) supports all P1 and P2 languages.
- Microsoft Azure OpenAI GPT-4.1 and GPT-4.1-mini support more than 80 languages, including P1, P2, and P3.
- Google Gemini 2.5 Flash/2.5 Pro currently does not support French Canadian natively.
- Anthropic Claude 4.0 Sonnet currently does not support French Canadian or Dutch natively.

Adding languages beyond the P1, P2, or P3 language groups

Some providers, such as Azure OpenAI, offer additional language support beyond the P1, P2, and P3 language groups previously described. You can configure your instance to include additional languages.

Note: Before adding a language that is not in the P1, P2, or P3 groups, you should confirm whether the language is supported by the provider. If you add a language that isn't supported, you may get unexpected results. The LLM could fail to detect the language, and/or it could not be able to translate effectively.

Ensure the language is on the sys_language table.

Create a record for the language if necessary. The record should include the language name and code. The *`Active`* field should be set to true.

Enable the language for the Now Assist model.

- Go to the sys_generative_ai_model_config table and open the record for the model you want to add the language to, such as gpt_small by Azure OpenAI.

  Note: The model for AI Search is named E5FT. If you want to make changes to the language support for AI Search, you can configure that record. After, you need to reindex all sources in the new language.

- In the *`Supported languages`* list, add the language and save the record.

Activate the language for Now Assist applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Go to **All** > **Now Assist Admin** > **Settings** and open the **Multilingual service** tab.
- Scroll to the provider you edited, then select the edit button.
- Select the language you added and save.

  Note: If you don't see your language as an option, ensure that the language is on the sys_language table and *Active* is set to true.

Note: If semantic search is not working even after installing a language and enabling it for AI Search, you may need to clear the embedding model cache. To do so, run the following: `GlideCacheManager.flush("ais_semantic_embedding_model_cache");`.

Dynamic Translation

Dynamic Translation for Now Assist uses the Microsoft Azure OEM translation service through ServiceNow. Most languages available as a language pack on the ServiceNow platform are supported by Microsoft Azure OEM. Self-localized languages (languages other than the default language packs) aren't supported.

- For the list of available language packs, see Activate a language.
- For more information about Microsoft Azure OEM, see Microsoft Azure OEM for Dynamic Translation in Now Assist.

Choosing a translation service

There are different factors that can go into your decision to use one translation service over the other, such as latency and quality of translation. Your entitlements determine what is available to you, but there are no additional costs associated with native translation service.

Note: The native translation service is included in Pro Plus and Enterprise licenses, by default.

For more information on tracking Now Assist usage, see Monitoring Now Assist usage.

Enabling translation for Now Assist

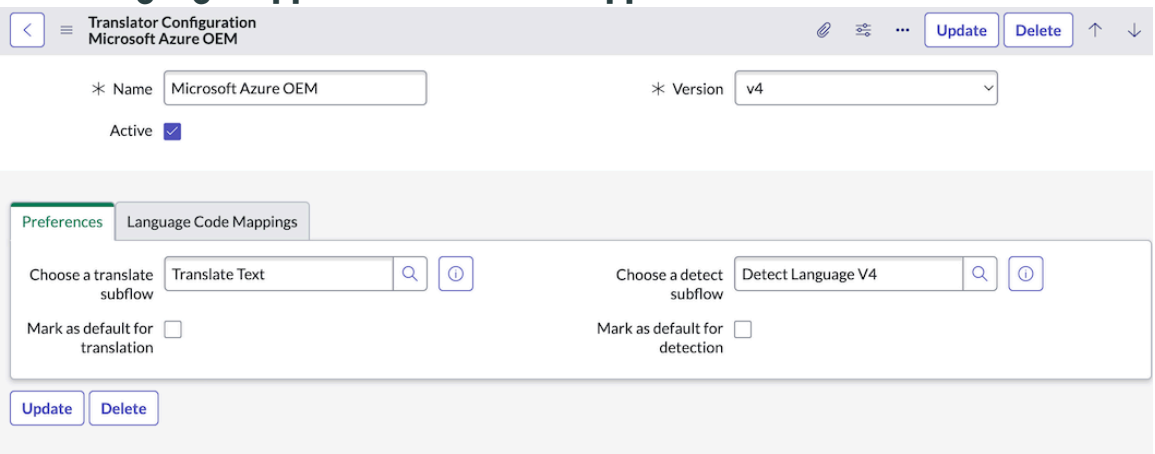
For more information on turning on multilingual services for Now Assist applications, see Enable translation for Now Assist applications.

Microsoft Azure OEM for Dynamic Translation in Now Assist

Support multi-language input in Now Assist applications with the Microsoft Azure OEM translator service included in Generative AI Controller.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multi-language support for Now Assist applications



When dynamic translation in the Generative AI Controller is enabled, your users' input text is handled by Microsoft Azure OEM (com.snc.microsoft_oem_translation_spoke) as follows:

1. The language of the text is detected.
2. The text is dynamically translated to English, then provided to Now Assist.
3. Now Assist returns a response in English.
4. The English response is translated to the user's preferred language and displayed in the UI.

For more information about enabling dynamic translation in this context, see Configure multilingual service for ServiceNow Otto applications and Enable Dynamic Translation for capabilities in Generative AI Controller.

From the Zurich release, this spoke has available support for specific regulated markets, subject to conditions. For information see KB0743854 on the Now Support portal.

Activation

The Microsoft Azure OEM translator service is included with Generative AI Controller. Microsoft Azure OEM requires Dynamic Translation tables, so Generative AI Controller activates Dynamic Translation if it isn't already active.

Microsoft Azure OEM appears as a row in the Translator Configurations (sn_dt_translator_configuration) table. This record is not editable. The connection credentials of this translator service are already configured. For more information about this integration, see https://www.servicenow.com/company/media/press-room/gen-ai-now-platform.html.

If you try to update this record in the Translator Configurations table, the following error is displayed: "The Microsoft Azure OEM translator configuration is used in Generative AI flows. It cannot be edited".

With the Xanadu Patch 3 release, the Microsoft Azure OEM translator includes support for Exclusion Framework in Dynamic Translation. Also the API used by flows and subflows is automatically updated to v4.

The application scope for Microsoft Azure OEM is sn_ms_oem.

For more information, see Dynamic Translation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Languages supported

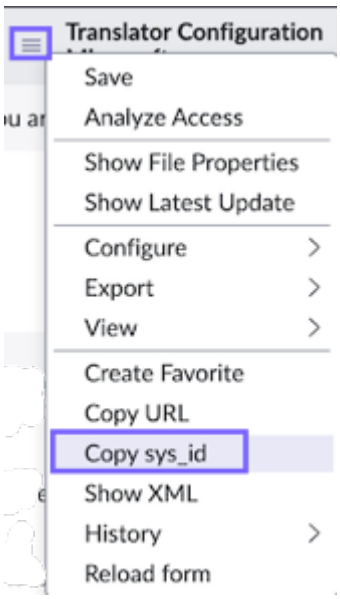
The Microsoft Azure OEM service supports all of the languages available as language packs on the ServiceNow platform, except I18N: Latin American Spanish Translations. Self-localized languages (languages other than the default language packs) aren't supported.

For the list of available language packs, see Activate a language.

Alteration or deactivation

You can use a different machine translation service in Generative AI Controller, rather than the provided Microsoft Azure OEM translator configuration. If you want to switch to a translation service provider of your choice, you can update a system property as follows.

1. With the admin role, create an account with a third-party machine translation service provider and configure it in your instance. For details see Integration with other translation services.
2. Open the record for your translation service provider by navigating to the Translator Configurations [sn_dt_translator_configuration] table, then selecting the appropriate row.
3. Copy the sys id of the record by opening the form context menu and selecting **Copy sys_id**.



4. Navigate to the sys_properties table and select New to create a system property.
5. Enter values in the System Property - New record form as follows.

System Property - New record form

Field	Value
Name	com.snc.gen_ai.translator_configuration.sys_id
Value	Enter the translator configuration sys id that you copied in the previous step.

6. Select **Submit**.

Alternatively, you can deactivate Dynamic Translation in this context using another sys property. For information see Disable Dynamic Translation for LLM Virtual Agent conversations.

Data sharing and processes

Data sharing and processes topic description.

Configure Now Assist privacy policies

Configure privacy policies to anonymize data in Now Assist.

Before you begin

You must have the following applications installed on your instance:

If you do not have a data steward, see Assign the data steward role documentation.

Role required: sn_generative_ai.data_steward

About this task

The Now Assist **Privacy Policies** enables you to review and configure how personally identifiable information (PII) is de-identified in Now Assist.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Settings**.
2. In the navigation pane, go to **Data sharing and processing** > **Privacy policies**.
3. Select **View detail** of the privacy polic you want to review.
   Review the policy details and current active patterns in the pop-up window.
4. **Optional:** Select **Edit in Data Privacy**.
   See Configuring Data Privacy for ServiceNow Otto for more information on configuring Now Assist policies.

Opt out of data sharing for Now Assist

Data sharing improves ServiceNow AI products. You can opt out of data sharing from the Now Assist Admin console Settings page.

Before you begin

Important: Data sharing is not available for GCC or self-hosted instances. You don't need to opt out because data sharing is never enabled. If you have any questions, reach out to your account representative.

If you do not have a data steward, see Assign the data steward role documentation.

Role required: sn_generative_ai.data_steward

Note: The **Opt out** button appears only if you've installed at least one Now Assist application or plugin. For a list of all Now Assist applications, see Exploring AI Admin Hub.

About this task

By opting out of the ServiceNow customer data sharing program, you can no longer provide data to improve ServiceNow AI products. By sharing data with the ServiceNow AI development program, you provide relevant data to help improve prediction accuracy, user experience, tailor products to your business needs, and reduce hallucinations for your activated Now Assist skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can choose to opt out a ServiceNow instance from data sharing from the AI Admin Hub console if you don't want to participate. Repeat the opt-out process for all instances that use the Now Assist functionality.

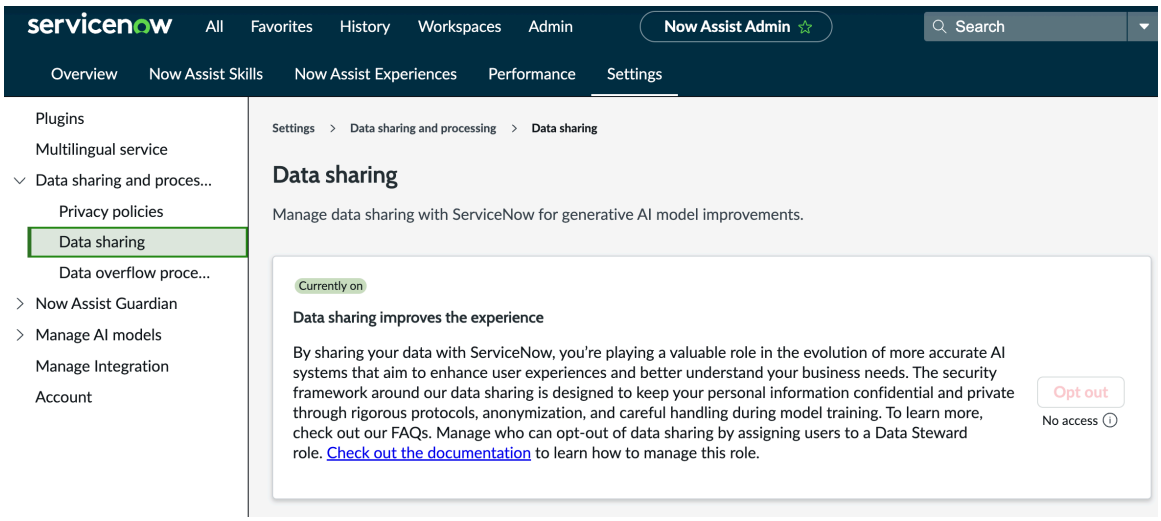
Opting out can take up to five business days to process.

Note: You must opt out of data sharing to turn off ServiceNow ability to gather Customer data for AI and data products.

Procedure

1. Change the current session scope by selecting the Globe icon in the top right next to the search bar and setting Application Scope to Generative AI Controller.
2. Navigate to **All** > **Now Assist Admin** > **Settings**.

   If you're already in the AI Admin Hub console, select the **Settings** tab.
3. In the Settings panel, select the **Data sharing and processing** > **Data sharing** tab.



4. Select **Opt Out**.
5. In the confirmation window, select **Opt Out**.

Result

Your data sharing preference is saved on the instance. If you want to opt back in to data sharing, you must consult with your account executive.

Configure Now Assist data overflow processing

Configure where Now Assist data is processed during periods of high traffic.

Before you begin

Role required: sn_generative_ai.data_steward

About this task

By default, Now Assist data is handled in ServiceNow datacenters. During periods of high network traffic, data can be "burst" to Microsoft Azure datacenters to help keep consistent load times and avoid capacity overflow errors. Users with the data steward role can opt out of or into this behavior from the Now Assist Admin console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Settings**.
2. In the navigation pane, go to **Data sharing and processing** > **Now overflow processing**.
3. Select either **Opt out** or **Opt in**.
   Instances are opted in by default. You can change this setting at any time.

Assign the data steward role

Select a data steward to make decisions about data sharing with ServiceNow in Now Assist applications.

Before you begin
Role required: sys_admin

About this task
A data steward is responsible for determining whether prompts, inputs, and responses with generative AI in Now Assist applications on your instance are shared with ServiceNow.

The ServiceNow customer data sharing program allows you to provide data to improve ServiceNow AI products. This data helps improve prediction accuracy, enhance user experience, tailor products to your business needs, and reduce hallucinations for your activated Now Assist skills.

The following steps explain how to assign a role to a specific user. Another option is to make a group, such as "AI Data Stewards," assign the role to the group, and then put the user in that group. See Assign a role to a group for more information.

Procedure

1. Navigate to **All** > **User Administration** > **Users** and then open a user record.
2. In the Roles related list, select **Edit**.
3. In the collection of roles, select the sn_generative_ai.data_steward role, and then select the **Add** ( ) icon.
4. Select **Save**.

Result
Once the data steward has the correct role, they can review the data sharing information on the Now Assist Admin console in the **Settings** tab under **Data privacy and sharing** > **Data sharing**.

AI Guardian

AI Guardian is built on the ServiceNow Small Language Model (SLM) and monitors generative AI interactions to detect offensive content, prompt injection attacks, and sensitive topics.

AI Guardian Overview

Generative AI is an emerging technology. Human interactions are unpredictable, and outputs generated by large language model (LLM) are probabilistic, which means that they're based on probabilities. Running the same input twice may generate two different outputs. Managing this risk is an important consideration when implementing generative AI on your instance. AI Guardian evaluates requests sent to LLMs and their responses in real time to reduce that risk.

Guardrails

AI Guardian provides three guardrails. Each guardrail has a different scope of applicability:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guardrail	What it detects	Scope
Offensiveness detection	Offensive or harmful content in AI inputs and outputs	Specific Now Assist skills and workflows
Prompt injection detection	Attempts to override LLM instructions or expose restricted information	All generative AI applications and features
Sensitive topic filters	Subjects not suited for AI responses, such as workplace safety or employee compensation	Virtual Agent conversational skills only (requires HR Service Delivery)

Note: The scope of each guardrail differs. Prompt injection detection applies to all generative AI applications and features. Offensiveness detection applies only to supported Now Assist skills and workflows. Sensitive topic filters apply only to Virtual Agent conversations and require HR Service Delivery.

Offensive content

Due to the probabilistic nature of generative AI, it's possible for an LLM to generate offensive content. If there's offensive content in the input of the request, offensive content can also occur in the response. Examples of offensive content include language that is toxic, defamatory, or fraudulent.

When offensive content is detected, AI Guardian logs the event. You can also configure it to block the content. This guardrail applies to specific Now Assist skills and workflows.

Prompt injection

Prompt injection is a type of security attack where someone tries to override the normal instructions of an LLM to access restricted information or cause unintended behaviors. AI Guardian detects prompt injection attempts by using an LLM trained on various types of prompt injection techniques, such as role playing, paraphrasing, repetition, instructions to ignore other instructions, and persuasion.

Note: Due to the probabilistic nature of the model and evolving attack techniques, AI Guardian may not identify every prompt injection attempt in some cases.

Prompt injection protection applies to all generative AI applications and features on your instance. It is not limited to specific skills or workflows.

Filtered subjects

Certain subjects, such as workplace safety employee compensation, or personal well-being may not be best suited for generative AI responses. You can activate filters that detect these kinds of subjects in Virtual Agent conversations and redirect users to the Sensitivity Detection: Fallback Virtual Agent topic instead of generating an AI response.

Note: Sensitive topic filters are available only with HR Service Delivery and apply only to Virtual Agent conversational skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Logging and blocking

AI Guardian logs detected events for offensiveness and prompt injection. You can access logs from **Now Assist Admin** > **Settings** > **Now Assist Guardian**. Log dataincludes information about the request, the conversation that contains the offensive content, and any user feedback.

In addition to logging, you can configure AI Guardian to block offensive content or prompt injection attempts. When blocking is enabled and content is detected, you see a standard error message instead of the generated response. The standard error message displays that the request couldn't be completed, and you don't see what the AI generated. Before enabling blocking, review logs for a period of time to understand how frequently these issues occur in your environment.

Redirection for sensitive filtered topics

After a filter detects a sensitive topic, AI Guardian redirects you to the Sensitivity Detection: Fallback topic in Virtual Agent. This topic can redirect you to a live agent or help you create an HR case.

You can override the redirection by selecting **Proceed, not sensitive**. Itreturns you to their original topic without initiating the fallback flow.

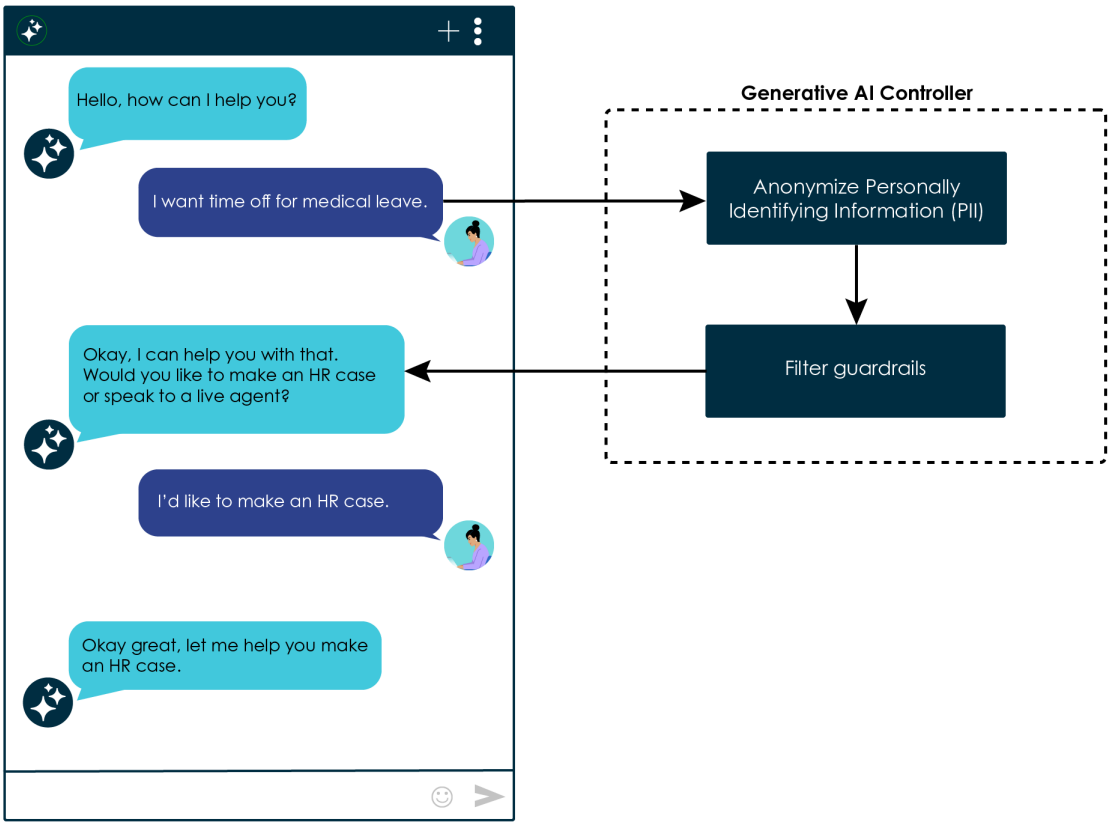
Note: After you continue with the fallback topic, for example, by starting the flow to create an HR case, Virtual Agent does not continue detecting sensitive topics in that conversation.

AI Guardian at runtime

All skills that use AI Guardian remove personally identifiable information (PII) before the request reaches the LLM. You can configure what type of data is anonymized. For more information see, Configuring Now Assist for Data Privacy.

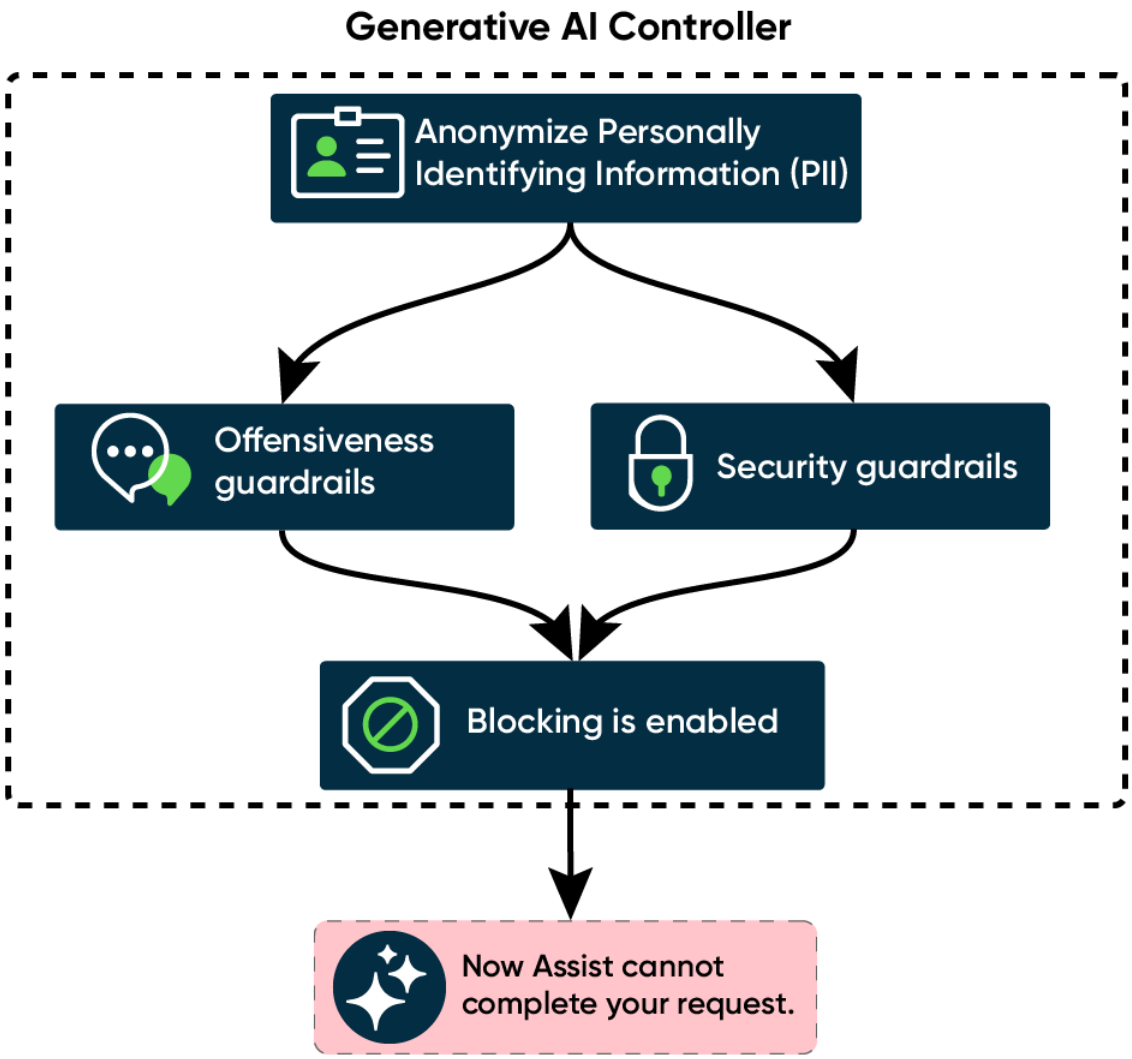
For conversational skills, semantic search processes requests to determine whether a filter has been detected. If so, the user is redirected to a Virtual Agent topic that asks if they want to make an HR case or speak to a live agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For catalog item generation and agent skills, such as summarization and resolution note generation, offensiveness and prompt injection guardrails run on inputs and outputs of requests. If either is detected, AI Guardian logs the request. If you've chosen to block this content, then a standard error message appears, and the user doesn't see the result of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Safety categories captured in AI Guardian logs

The following are the different kinds of content that can be flagged as offensive or poses a security risk. You can identify what categories are being caught in the **AI Guardian** *logs for the different guardrails.*

Category	Category ID	Description
Toxic Content	O1	Should not: Promote hate speech, incite violence like child abuse or bullying or engage in personal attacks or harassment. Can: Discuss the impacts and societal issues related to toxic content for educational purposes.
Unfair Representation	O2	Should not: Assist in perpetuating stereotypes or encourage discrimination or bias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Category ID	Description
		Can: Discuss issues of representation and promote awareness and inclusivity.
Adult Content	O3	Should not: Display sexually explicit material or content inappropriate for minors including pornography, erotic chat and sexual activity. Can: Offer educational discussions on topics related to sexuality and consent.
Erosion of Trust in Public Information	O4	Should not: Spread misinformation or disinformation undermining public trust such as misleading medical advice, illegal drugs and advice. Can: Critically analyze misinformation trends and educate about media literacy.
Propagating Misconceptions/ False Beliefs	O5	Should not: Disseminate unverified, misleading information, conspiracy theories, science denialism, historical revisionism, or content that could lead to radicalization. Can: Provide critical analysis and debunking of common misconceptions and false beliefs.
Risky Financial Practices	O6	Should not: Promote unethical trade practices such as multi-level marketing, deceptive lending practices, or gambling. Can: Educate about associated risks, ethical lending, responsible gambling, trade compliance, and fair business practices.
Trade and Compliance	O7	Should not: Involve labor issues, engage in unethical trade affairs, contribute to unfair labor practices or promote fraudulent trade practices. Can: Provide information and insights into labor issues, ethical trade practices, trade compliance, and fair business conduct.
Dissemination of Dangerous Information	O8	Should not: Spread fake news, propagate social media rumors, disclose government secrets or leak financial data and other contents that contributing to public panic or national security. Can: Educate about the dangers of such information and promote safety.
Privacy Infringement	O9	Should not: Involve doxxing, unauthorized data sharing, or surveillance like private information inferring or leaking. Can: Discuss the importance of privacy rights and digital security.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Category ID	Description
Security Threats	O10	Should not: Spread malware or encourage terrorism or other security threats such as weapon generation, cyberattack or chemical harms. Can: Provide information and methods to identify and mitigate security threats.
Defamation	O11	Should not: Publish false statements damaging to individuals, groups or organizations. Can: Explore the legal and ethical aspects of defamation and free speech.
Fraud or Deceptive Action	O12	Should not: Engage in academic dishonesty, perpetrate scams, promote pseudo-pharmaceuticals, or disseminate fake online content. Content should not deceive or defraud individuals. Can: Educate about recognizing and preventing fraudulent activities.
Influence Operations	O13	Should not: Manipulate public opinion or disrupt societal harmony for political or ideological purposes like surveillance or campaign. Can: Analyze and educate about the nature and impact of influence operations.
Illegal Activities	O14	Should not: Promote or provide guidance on engaging in illegal actions, such as crimes or terrorism. Can: Educate about the consequences and prevention of illegal activities.
Persuasion and Manipulation	O15	Should not: Involve persuasion or manipulation techniques that promote self-harm, psychological manipulation, or any form of harm to individuals' well-being. Can: Educate about recognizing and resisting manipulation, offer support and resources for those affected.
Violation of Personal Property	O16	Should not: Enagge in violating an individual's personal property,malicious mimicking, plagiarism, copyright infringement or identity forgery. Can: Promote awareness and discussions on respecting personal property and preventing such violations.

Skills that support offensive detection

Supported skills by workflow

Workflow	Application	Supported skills
Technology	ServiceNow Otto for Configuration Management Database (CMDB)	• Configuration item (CI) summarization • Manage duplicate CIs • Service Graph Connector diagnosis
Technology		• Alert analysis • Alert investigation
Technology	ServiceNow Otto for IT Service Management (ITSM)	• Change request risk explanation • Change request summarization • Chat reply recommendation • Chat summarization • Incident assist • Incident summarization • KB generation • Resolution notes generation • Sidebar discussion summarization
Technology	ServiceNow Otto for Security Incident Response (SIR)	• Post-incident analysis • Resolution notes generation • Security incident recommended actions • Security incident summarization
Technology	ServiceNow Otto for Strategic Portfolio Management	• Multi feedback summarization • Planning item doc summarization • Project doc summarization • Project summary emails • Story generation • Write planning item
Customer	ServiceNow Otto for Customer Service Management (CSM)	• Case summarization • Chat recommendation • Chat summarization

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported skills by workflow (continued)

Workflow	Application	Supported skills
		• Email recommendation • KB generation • Resolution notes generation • Sidebar summarization
Customer		• KB generation • Sidebar summarization • Work order task summarization
Customer		• Case summarization • Disputes intake via Virtual Agent
Customer		• Government case summarization • Chat summarization
Employee	ServiceNow Otto for Health and Safety	Incident summarization
Employee	ServiceNow Otto for HR Service Delivery (HRSD)	• Case summarization • Chat summarization • KB generation • Resolution notes generation
Employee		Legal request summarization
Employee		• Contract analysis • Contract metadata extraction
Creator		Catalog item generation
Finance & Supply Chain	ServiceNow Otto for Accounts Payable Operations (APO)	Record summarization
Finance & Supply Chain	ServiceNow Otto for Supplier Lifecycle Operations (SLO)	Supplier case summarization
Finance & Supply Chain	ServiceNow Otto for Sourcing and Procurement Operations (SPO)	Record summarization

Activate offensiveness protection for generative AI

Activate offensiveness detection to log or block offensive content generated by AI skills and workflows.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

About this task

Generative AI output is probabilistic, which means that the same input can produce different outputs. Some of the AI generated content may be offensive, which includes toxic, sexist, or other harmful language. AI Guardian enables you to detect offensive content in both inputs and outputs, and logs the event when it is detected. You can also cofigure it to block offensive material so that users see a standard error message instead of the generated response.

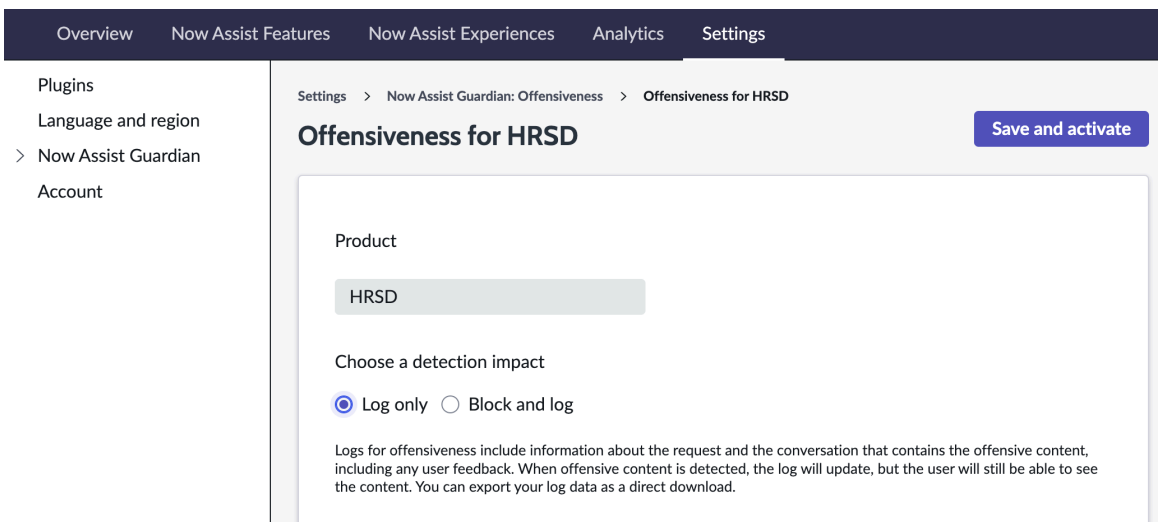
Note: Offensiveness detection applies only to specific AI skills and workflows.. For more information about the list of skills that support offensiveness detection, see Now Assist Guardian.

You can export logs for review. For more information, see Export Now Assist Guardian logs.

Procedure

1. Navigate to **All** > **AI Admin Hub** > **Settings**.
2. In the side panel, select the **Now Assist Guardian** > **Offensiveness** tab.
3. Go to the **Available for you** tab to see which workflows you can choose from.

   Offensiveness guardrails that are already activated appear in the **Active** tab.
4. Select **Activate** for the workflow that you want to enable offensiveness detection.
5. Select your impact detection.
   - Select **Log only** to record the events when offensive content is detected. The content is still shown to the user.
   - Select **Block and log** to record the event and prevents the content from being shown to the user. The user sees a standard error message instead.



6. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Offensiveness detection guardrail is enabled on your instance for the selected workflow. Events are logged when offensive content is detected or generated.

What to do next
You can enable offensiveness detection for separately for each supported generative AI application and workflow. Repeat this task for each workflow on which you want offensiveness protection enabled.

To change the detection impact for an active workflow, select more options (⋮) icon in the list of active workflows and then select **Edit**.

To deactivate offensiveness protection for a workflow, select more options (⋮) icon in the list of active workflows and then select **Deactivate** .

Configure prompt injection attack protection

Activate or deactivate prompt injection attack detection to protect all generative AI applications and AI-generated text and conversations.

Before you begin
Role required: sn_generative_ai.nsa_admin

About this task
Prompt injection attacks are a type of cybersecurity attack where someone tries to override the initial instructions of an LLM to cause unintended behaviors. AI Guardian detect and log these prompt injection attack attempts across all generative AI applications and features. You can also configure the prompt injection detection guardrail to block the AI-generated response when an attack is detected in addition to logging it.

You can export logs for review. For more information, see Export Now Assist Guardian logs.

Procedure
1. Navigate to **All** > **Now Assist Admin** > **Settings**.
2. In the side panel, go to **Now Assist Guardian** > **Prompt Injection**.
3. Select the toggle to activate or deactivate prompt injection attack detection.
4. **Optional:** Under **Detection impact**, select the options icon (⋮) and then select **Edit** to change how detected attacks are handled.

   (Optional) You can choose whether prompt injection attacks are blocked as well as logged.

Result
Prompt injection detection is configured on your instance. When enabled, you see a standard error message when an attack is detected.

Configure sensitive topic filters

Set up filters in AI Guardian to redirect Virtual Agent users to a live agent or HR case when a sensitive subject is detected in a conversation.

Before you begin
Role required: sn_nowassist_admin.nsa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

AI Guardian detects sensitive subjects in Virtual Agent conversations and redirect users to the Sensitivity Detection: Fallback Virtual Agent topic instead of continuing the conversation with generative AI. You can activate and configure the subjects that trigger this redirection, and add sample phrases to improve detection accuracy.

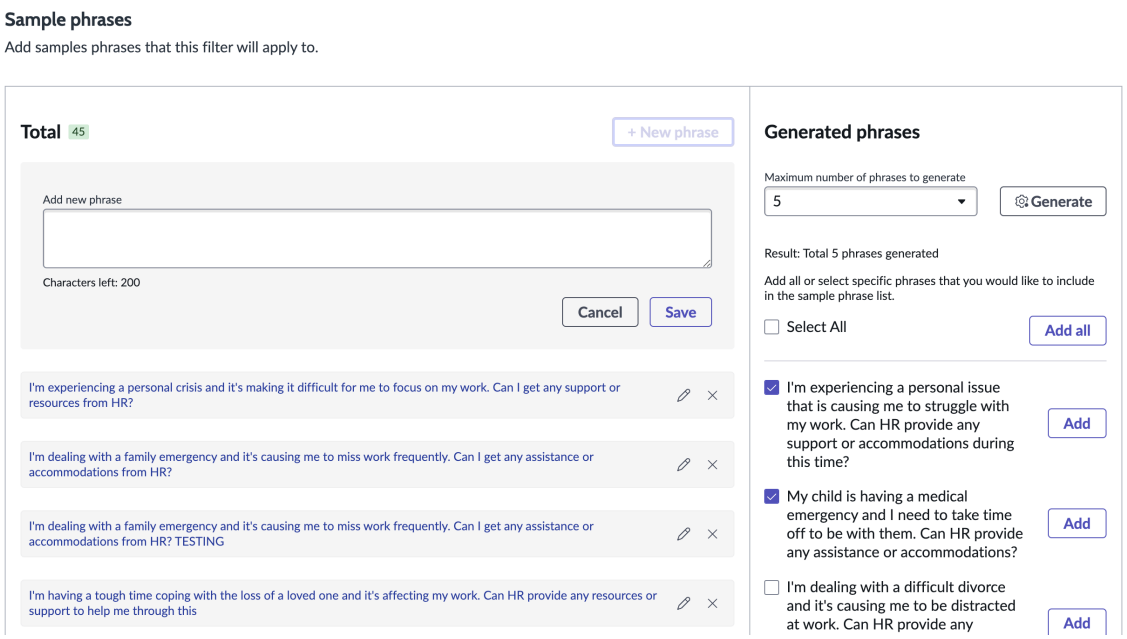
Note: The sensitive topic filter guardrail is available only with HR Service Delivery and applies only to Virtual Agent conversational skills.

See Now Assist Guardian for more information.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Settings**.
2. Navigate to **Now Assist Guardian** > **Filters**.
3. Go to the **Available for you** tab to see which filters are available.
4. Select **Activate** on the filter you want to enable.
5. Review and generate sample phrases.

   Sample phrases tell the LLM what kind of text the filter should detect. The more sample phrases you provide, the more accurately the LLM detects these topics.



Option	Description
Add a phrase	**a.** Select **New phrase** to add a phrase manual ly. **b.** Enter text in the Add new phrase text box. **c.** Select **Save**.
Generate a phrase using generative AI	**a.** In the **Generative samples** panel, select the maximum number of phrases to gener ate from the list. **b.** Select **Generate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	c. Select the check box next to the phrase and select**Add** to add individual sample phrase. **d.** Select the check box next to each phrase and then select**Add all** to add multiple phrases together.
Edit a phrase	**a.** Select the pencil icon and start editing the phrase. **b.** select **Save**.
Delete a phrase	Select the delete icon to remove the phrase.

6. Select **Save and Continue**.
7. Choose which Virtual Agents you want to enable the sensitive topic filters for by selecting the checkbox next to the Virtual Agent name.
8. Select **Save and Continue**.
9. Review the fallback topic for when a filter is detected.

   By default, when a sensitive topic is detected, the user is redirected to the Sensitivity Detection: Fallback topic, which prompts the user to create an HR case or speak to a live agent. You can preview the topic from the guided setup.
10. Select **Save and continue**.
11. Review your filter configuration in the final step.

    If you want to make any changes, use the step navigation panel to return to a previous step.
12. Select **Activate** to activate the filter.

Result
The sensitive topic filter is activated and appears in the **Active** tab of the **Filters** section of AI Guardian settings. When the filter detects a sensitive topic in a Virtual Agent conversation, the user is redirected to the Sensitivity Detection: Fallback Virtual Agent topic.

What to do next
To modify the filter configuration after activation, go to the **Active** tab of the AI Guardian settings options and select the more actions icon (⋮) in the **Actions** column.

Export AI Guardian logs

Export logs from AI Guardian to get insights into how often different guardrails are being detected and used.

Before you begin
Role required: sn_generative_ai.nsa_admin

About this task
AI Guardian creates logs for all three guardrails available. Reviewing the logs can help you determine how often offensive content is generated, prompt injection attack attempts occur, or sensitive topics are detected.

See Now Assist Guardian for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Settings**.
2. Use the more options menu item (⋮) and select **Export**.
   a. For the offensiveness guardrail, go to **Now Assist Guardian** > **Offensiveness**.

      Use the list in the **Active** tab to choose which workflow you want to export logs for.

   b. For the prompt injection guardrail, go to **Now Assist Guardian** > **Prompt Injection**.

Result
The log is exported as a .csv file to your computer.

What to do next
If you do not see any log data, then it is most likely that the guardrail has not been triggered yet. If you believe you should be seeing data but aren't, reach out to Now Support.

Configuring a Guardrail Service Provider

AI Guardian supports default guardrails and third-party or custom guardrail service providers to extend AI content monitoring with your organization's AI governance policies.

Guardrail Service Provider overview

AI Guardian includes default guardrails to detect offensive content, block prompt injection attacks, and filter sensitive topics. In addition to these guardrails, AI Guardian supports third-party guardrail service providers. You can also create your own custom guardian using the Bring Your Own Guardrail (BYOG) feature to monitor and detect malicious content.

Custom guardian evaluates prompts and responses in real time, just like the default guardrails. You can set each custom guardrail to log events, block content, or both based on your specific security or content policies.

ServiceNow supported third-party guardrail service providers

AI Guardian supports the following cloud AI service providers:

- ServiceNow guardrail: The default provider built into the platform. No additional configuration is required.
- Third-party providers: Integrate with supported cloud AI safety services. Following are the supported providers:
  - Microsoft Azure Content Safety
  - Amazon Bedrock
  - Google Model Armor
- Custom (BYOG): Create your own guardrail to apply your organization's specific compliance, security, or content policies.

Only one guardrail service provider can be active at a time. The selected provider monitors and evaluates all Now Assist interactions for harmful, offensive, or prompt injection content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom guardrails for AI Guardian

The Bring Your Own Guardrail (BYOG) feature lets you create and connect a custom guardrail in AI Guardian. A custom guardrail connects to an external endpoint that you control, allowing you to apply policies specific to your organization. It evaluate prompts and responses in real time, the same as default guardrails. You can configure each custom guardrail to log events, block content, or both.

Setting up a custom guardrail involves three steps:

1. Create a connection and credential alias for the custom guardian and complete its setup. The alias supports Basic Auth, OAuth 2.0, and API Key credential types.

   For more information, see Create a Connection & Credential alias.

2. Create a custom guardian in the Generative AI Custom Guardian Transformer [sys_generative_ai_custom_guardian_transformer_list.do] table.

   For more information, see Create a custom guardian.

3. Select your preferred guardrail service providers to monitor content.

   For more information, see Setup a Guardrail Service Provider.

Create a custom guardian

Create your own custom guardian to monitor and detect requests sent to LLM.

Before you begin

Configure a connection and credential alias for your preferred provider. For more information, see Create a Connection & Credential alias.

Role required: admin

Procedure

1. Navigate to **All**, and then enter `sys_generative_ai_custom_guardian_transformer_list.do` in the filter to go to the Generative AI Custom Guardian Transformer [sys_generative_ai_custom_guardian_transformer_list.do] table.
2. Select **New**.
3. In the **Name** field, enter the name of the custom guardian.
4. Create a request transformer script.

   a. In the **Request Transformer** filed, enable the **Turn on ECMAScript 2021 (ES12) mode** toggle to create script.

   The following example shows the request transformer script for the custom guardian request structure.

```
((function(inputs) {
 /*
 inputs structure: {
  prompt: object, The textual content that needs to be
 evaluated with guardian
  threshold_setting: object
  connection_attributes: object
 }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 write code here to construct the request body and any custom
 headers needed using the inputs object.
 */
 // construct body using the inputs like input.prompt and so
 on.
 var body = {};
 //construct headers using the inputs
 var headers = {};
 return {
  body: body,
  headers: headers
 };
})(inputs);
```

5. Select the **Active** option.
6. Create a response transformer script.

   a. In the **Response Transformer** filed, enable the **Turn on ECMAScript 2021 (ES12) mode** toggle to create script.

   The following example shows the response transformer script for the custom guardian response structure.

```
(function(inputs) {
 /*
 write code here to transform the custom guardian response
 into standard guardian response format expected by platform
 inputs structure: {
  response_body: object,
  threshold_setting: object
 }
 */
 // write code here to populate the response object.
 var guardianResponse = {};
 //Set flagged to true, if the guardian has flagged the text.
 Categories are optional and are for logging purpose only
 // if transformer setting is Prompt Injection, expected
 response format: {security:{flagged:false,categories:[]}}
 // if transformer setting is Offensiveness, expected
 response format: {safety:{flagged:false,categories:[]}}
 // if transformer setting is ALL, expected response format:
 {safety:{flagged:false,categories:[]},security:{flagged:fals
e,categories:[]}}
 return guardianResponse;
})(inputs);
```

7. In the **Guardian Setting** field, select a guardrail of your choice.
   - Select **All** to handle the detection of both offensiveness and prompt injection together.
   - Select **Offensiveness** to enable the detection of offensive or harmful content.
   - Select **Prompt Injection** to enable the detection of prompt attacks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your LLM can evaluate both offensiveness and prompt injection in a single request, select All. If not, create separate guardrail records for each offensiveness and prompt injection.

8. In the **Connection And Credential Alias** field, select the alias that you want to integrate with your custom guardian.
9. Set up the custom guardian token limit.
   a. Navigate to **All** > **System Definition** > **Tables**.
   b. Select the **Gen AI Control Setting Data [sys_gen_ai_control_setting_data]** table.
   c. In the Related Links section, select **Show List**.
   d. Search for the **Custom Guardian Token limit** record in the **Gen AI Control Data** column.
   e. Update the **Value** field of the Custom Guardian Token limit record with the maximum number of tokens per request.
   The token limit defines the maximum number of tokens the guardrail can process in a single evaluation. If the request content exceeds this limit, the content splits into smaller parts. Each part is evaluated separately against the guardrail rules.

   For example, if the token limit is 1000 and the request content is 2500 tokens, the system splits it into three parts and evaluates each one individually.

Setup a Guardrail Service Provider

Select a guardrail service provider of your choice in AI Guardian to monitor and detect Now Assist interactions for harmful, offensive, and prompt injection content.

Before you begin
Role required: sn_nowassist_admin.nsa_admin

About this task
AI Guardian supports multiple guardrail service provider types to monitor and detect harmful content. Select a provider based on your organization's requirements. Only one provider can be active at a time.

Procedure
1. Navigate to **All** > **Now Assist Admin** > **Settings**.
2. Navigate to **Now Assist Guardian** > **Guardrail service providers**.
3. In the **Set default provider** section, select a service provider from the list of guardrail service providers.
4. Select **Save and activate**.

Result
The selected guardrail service provider monitors and evaluates all Now Assist interactions for harmful, offensive, or prompt injection content.

Manage AI models

Access and select the LLM (large language model) provider used for various Now Assist skills. The selection impacts all the skills within the capability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin, sn_nowassist_admin.nsa_admin

This feature is available in AI Admin Hub version 6.2 and Yokohama patch 6 onwards.

To enable the model provider selection, ensure that the skill is available in that region. The configuration controls for the approved model providers and corresponding compliant skills for specific regions are approved in AI Control Tower by the AI steward. For example, to update the model provider for Now Assist Q&A Genius Results, ensure that all the skills under Conversational skills are available and active in the region.

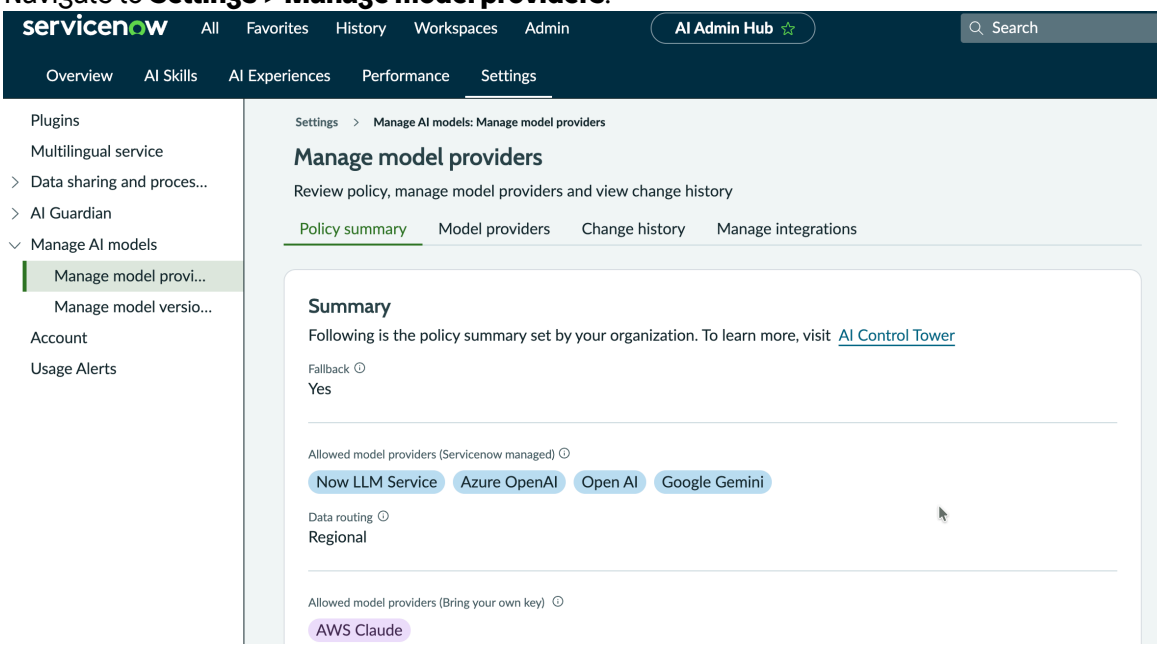
As per the AI Control Tower settings, the model provider selection is available at multiple levels, including skill, skill group, and instance levels in AI Admin Hub. Therefore, in a situation where a skill is not compliant or a model provider is unavailable in a particular region, AI Admin Hub console presents the admin persona with alternate region scope options seeking approval permissions to proceed with model provider selection. For example: You opt to switch to another model provider to use a particular Now Assist skill. Consider, the region scope must be changed to global location for the skill to work. Here, you can proceed only after consenting to the region scope change.

Note: For regulated markets:

- The **Manage LLM** option will not be available to customers on the AI Admin Hub user interface.
- Only Now LLM Service skills will be available to customers. Any skill that leverages external providers (e.g., Azure) will be hidden on the AI Admin Hub console. With the exception of NSC region, skills leveraging Azure OpenAI is available to the users.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Settings**.
2. Navigate to **Settings** > **Manage model providers**.



3. Review these on the **Manage model providers** page:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Policy Summary set by your organization about skills using non-compliant model providers.

  Note: Note the routing and fallback exception details. These details are also derived from the AI Control Tower configurations.

- Model providers assigned to the Now Assist skills and skill groups.
- Policy and skill updates by the AI steward in AI Control Tower under the **Change History** tab.

Manage model providers

Edit or customize the model provider for a skill or skill group at the instance level from the list of supported third-party model providers, including the default Now LLM Service. You can also review the model policy set by your organization, and view the change history here.

Before you begin

Confirm that network access to the provider endpoint is allowed by your instance's proxy or firewall rules.

Role required: admin

About this task

The Now LLM Service is no longer the default model provider for new or inactive AI assets. A third-party LLM is now selected by default, while existing configurations using the Now LLM Service continue unchanged. The Now LLM Service is still available for manual selection.

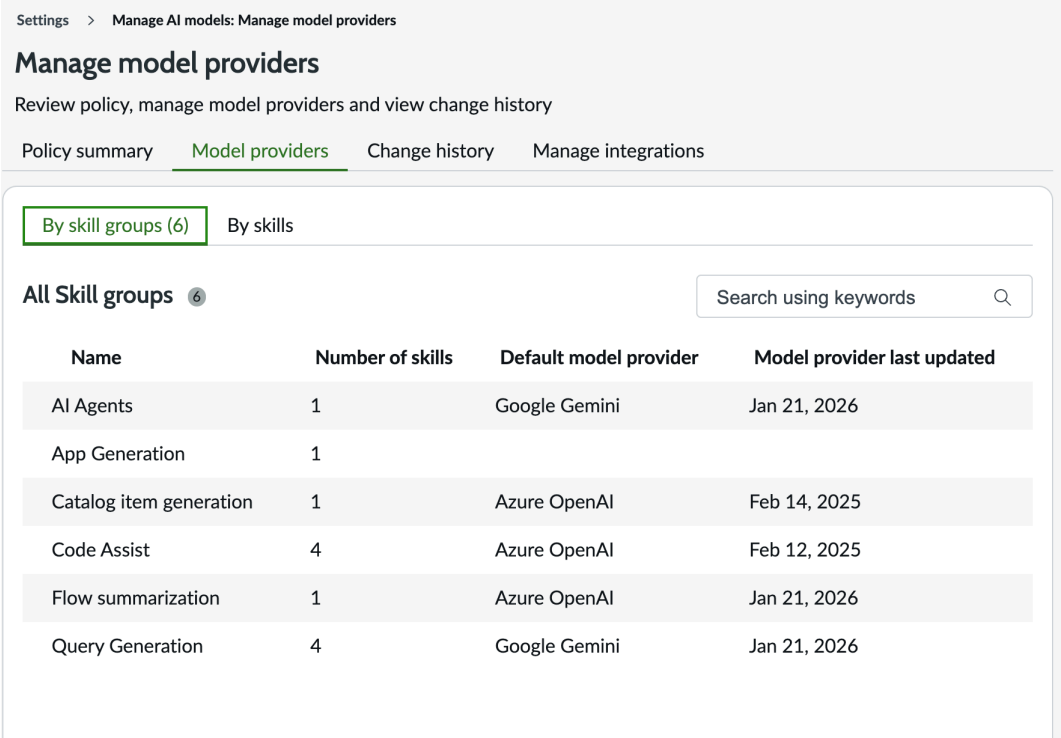
Starting with the September 2026 release, Now LLM Service is being prepared for future deprecation. The Now LLM Service is no longer the default model provider for new or inactive AI assets, and it is no longer selected by default in AI Control Tower. A third-party LLM is now selected by default for AI assets, while existing configurations using the Now LLM Service continue unchanged. The Now LLM Service is still available for manual selection. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Let's take an example of editing the model provider for skill group.

Procedure

1. Navigate to **All** > **AI Admin Hub**.
2. Navigate to **Settings** > **Manage AI models**.
3. Select **Manage model providers**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Edit model provider** to edit the model provider for the instance or customize it to update it at the skill or skill group level.
5. Select **Instance** scope to update the model provider for all the skills and skill groups in the instance.

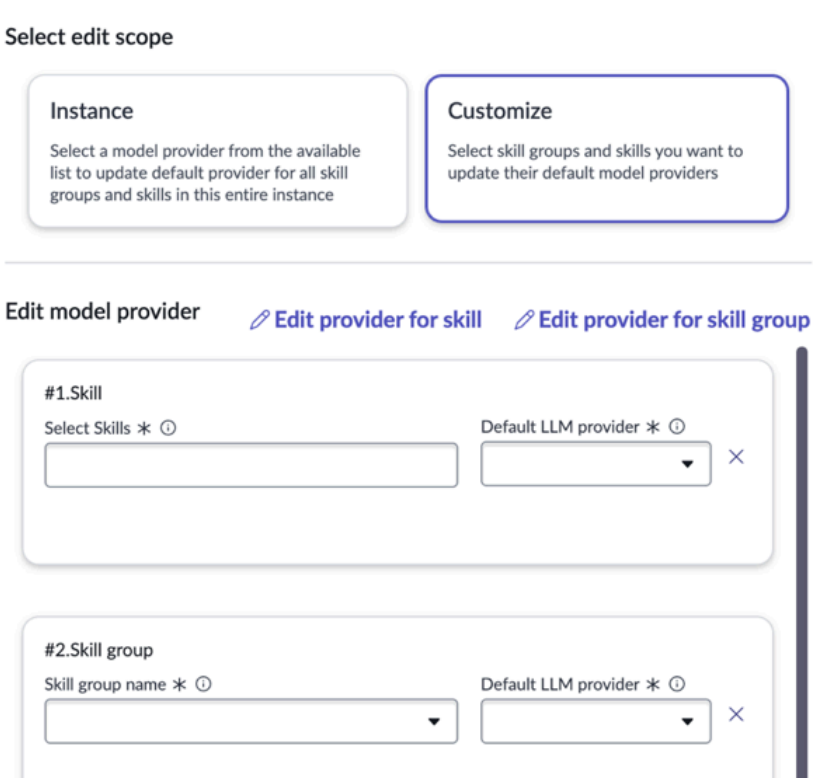
   a. Choose the **Default model provider** and select **Save and activate** to update your selection. The impacted skills and skill groups will display alongside.

   b. Select **Save** to update the model provider.
   You will receive a confirmation message if you have reviewed the change and the impact.

   Note: The agreement acceptance message is displayed only for the first time user.

6. Edit the model provider for a skill or skill group, after selecting the instance level model provider.
   This customization will override the instance level selection and update all capabilities associated with that group.
7. Select **Customize** to select the model provider for a particular skill or skill group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. Select the **Default model provider** for specific skill or skill group.
Select the skill group as **AI agents** to change the model provider for **Now Assist in Virtual Agent**.

b. Select **Save and activate** to update your selection.

Note: The Websearch AI search answers skill is only compatible with Google Gemini as the LLM provider. If you want to change the LLM provider to Azure OpenAI for this skill, see Configure AI search answers capability for web search for more information.

8. Select **Cancel, go back** to revert or **Yes, activate** to save the updates.
The status summary of skills for which the model provider change updated successfully or failed, displays.
9. Review and accept the consent modal message to accept the terms for changing the region scope of the selected model provider.
There are certain market regions restricted for particular model providers. The region scope must be changed to global location for the skills to be able to use the selected model provider.
10. Select **Yes, activate** to accept and apply the selection.
You receive a message confirming model provider selection. The selection will also notify if any of the skills within that capability are not updated with the selection.

Note: The skill and skill level customizations are overwritten once you update the model providers at the instance level.

You can also select **Cancel, go back** to review or reject the changes.

11. Follow similar steps for editing the model provider for a particular skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage Integration

Choose the preferred integration type for configuring the available model providers. There are two ways to configure a model provider in AI Admin Hub. You can either select Original Equipment Manufacturer (OEM) or Bring Your Own Key (BYOK).

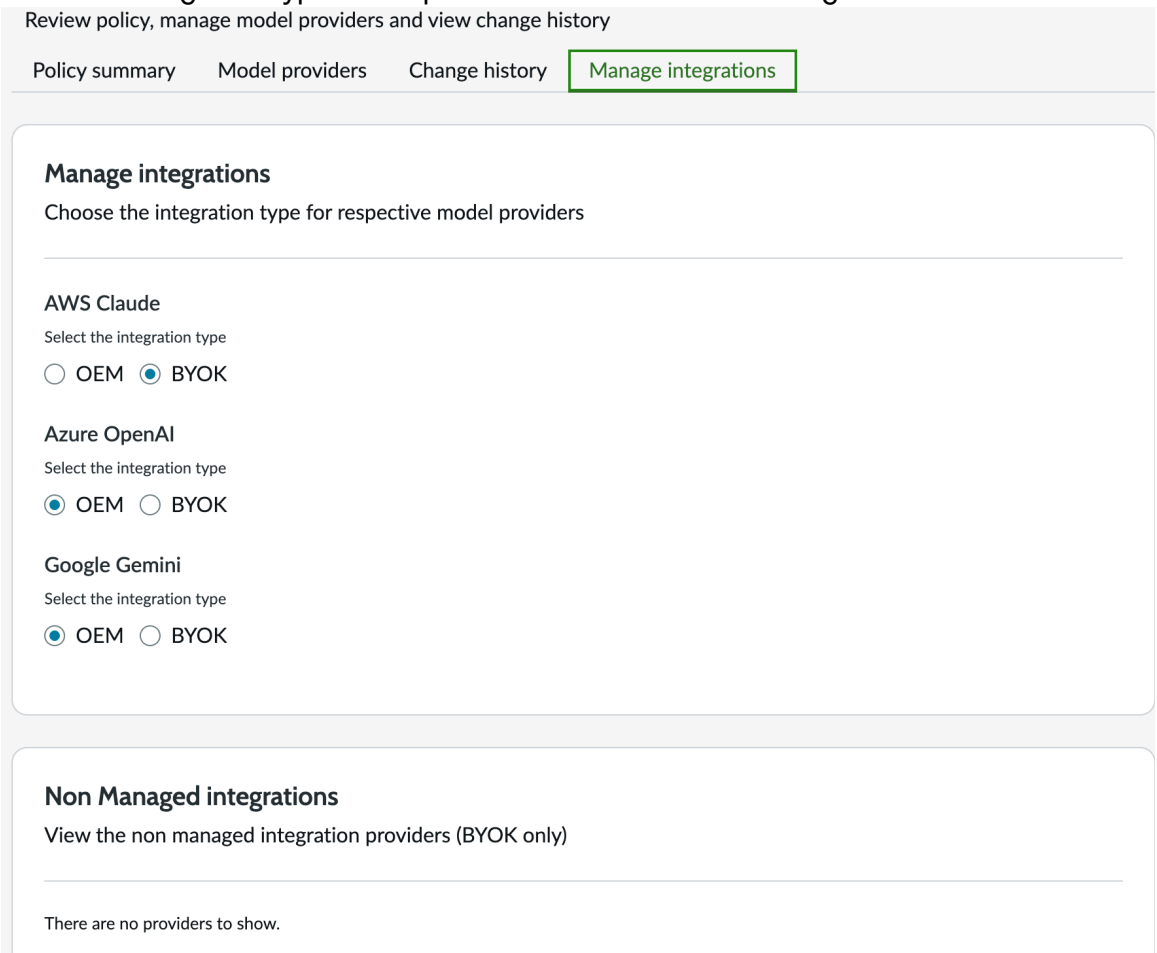
Before you begin

Role required: admin

With **Bring Your Own Key (BYOK)** option, you can apply your own license key to use the Generative AI application capabilities from the given provider. The alternate option is **OEM** where, ServiceNow® uses license from the provider to access the Generative AI application capabilities.

Procedure

1. Navigate to **All** > **Now Assist Admin**.
2. Navigate to **Settings** > **Manage integration**.
3. Change the model provider to use either the ServiceNow® key or **Bring Your Own Key (BYOK)** across all the third party model providers.
   This enables **Bring Your Own Key (BYOK)** selection for third party model providers across all features except AI Agents.
4. Select the integration type for the providers that allow such a configuration.



You can find the providers that allow BYOK type integration only, under **Non Managed integration** section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage version

Manage the version of the model providers across skills and instance levels. You can change and update versions for the out-of-box and custom skills.

Before you begin

Confirm that network access to the provider endpoint is allowed by your instance's proxy or firewall rules.

Role required: admin

About this task

To learn more about default and target model versions, see Default and target model version.

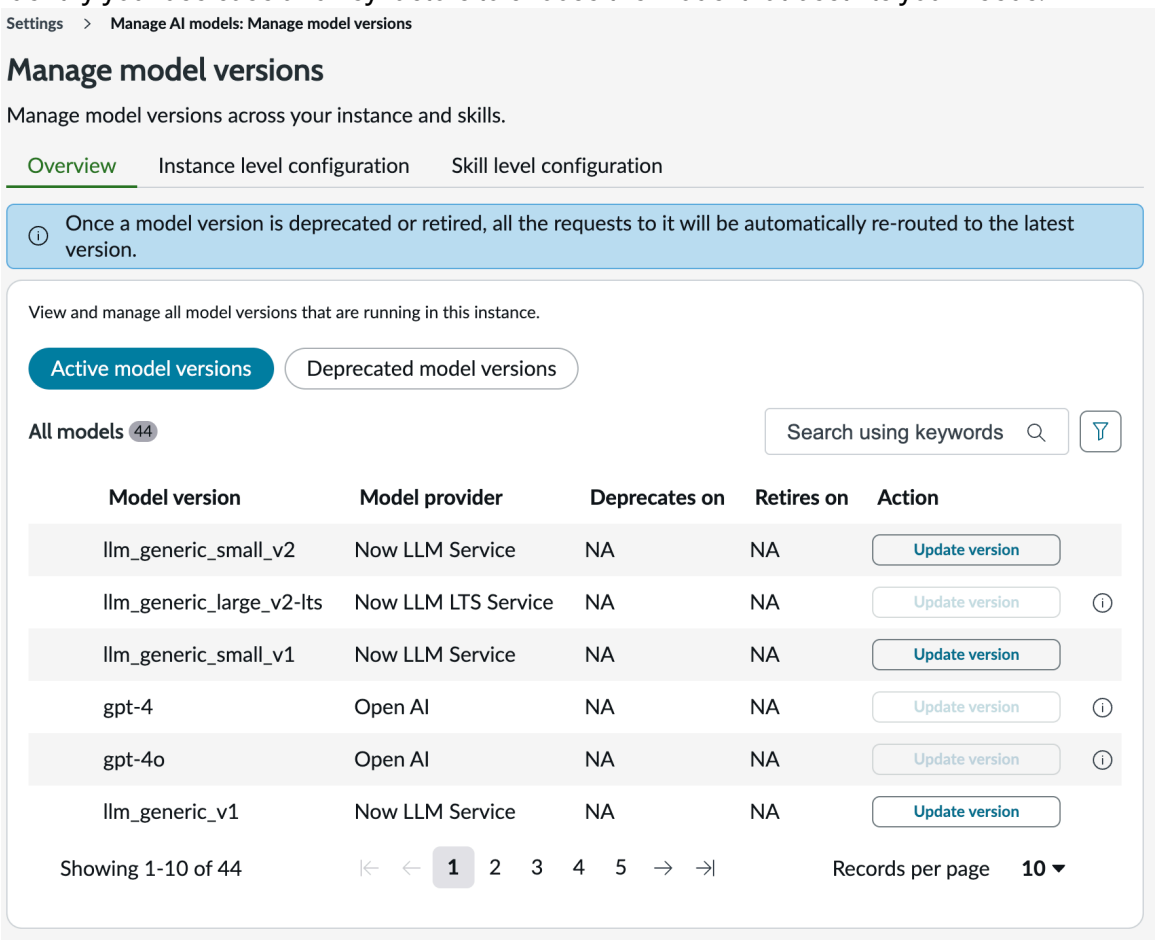
Note: Confirm that the model name you enter exactly matches the name configured in your external provider's console. A mismatch may cause the provider configuration to fail.

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Settings**.
2. Select **Manage AI models** > **Manage model version**.
3. On the **Overview** tab, review the summary of the active, deprecated, retiring model versions, and recommended actions, providing effective version management system to the admins.

   Note: Model versions in the following states aren't available for selection: deprecated, retired, in review, rejected.

4. Identify your use case and key factors to choose the model that best fits your needs.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. View or update the model version instantly under the **Overview** tab.
6. Edit the model provider version for out-of-box or custom skills for the instance. Customize it to update it at the skill or skill group level, under the respective tabs. Customizing the model version for skills replaces the instance-level model version currently assigned to each provider. This action is typically reserved for specific situations.
7. Select **Instance level configuration** to manage the model provider version for the skill across the instance.

   a. Select **Out-of-box skills** to set the target model version against the current version of the applicable model providers, for the default skills.

   b. Select **Custom skills** to set the target model version against the current version of the applicable model providers, for the custom skills.

Model preview program

To reduce the wait time around enabling new models on the platform, the model onboarding is process and life cycle is accelerated with the model preview program. Models that are enabled with the model preview program feature are highlighted with the badge 'Preview'.

This program aims to provide an opportunity for the user to explore and experiment with the new models even before they are generally available.

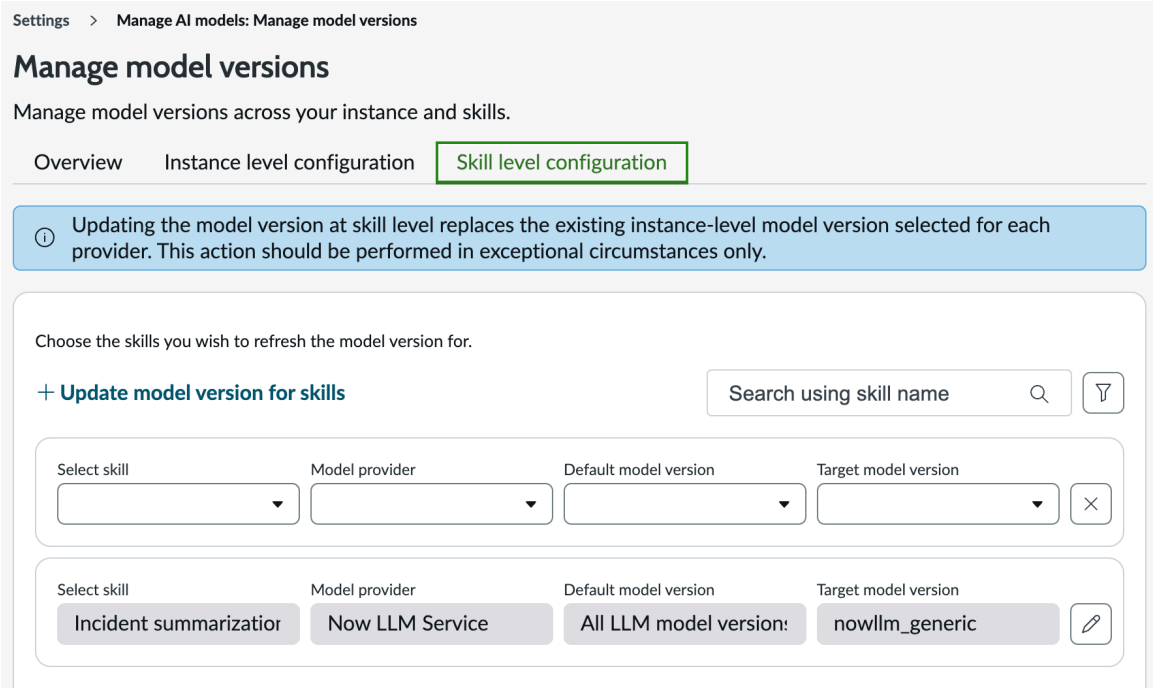
- The preview models are enabled to provide early access to custom skill users as soon as the new models are available.
- The admin can choose to opt-in or out of the program. A toggle is presented in AI control tower allowing the user to opt in to the preview program. The toggle defaults to off.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Save and activate** to update your changes.

d. Select **Update model version** to override ServiceNow shipped mappings or create a default and target model versions mapping.

8. Select **Skills** to manage the model provider version at the skill level.



a. Search or select the skills you want to refresh the model version for, and the applicable model provider.

b. Select the default and the target model provider version.

c. Select **Save and activate** to update your changes.

d. Select **Update model version for skills** to override ServiceNow shipped mappings or create a default and target model versions mapping, at the skill level.

What to do next

Model preview program

Review Now Assist account

Review your Now Assist license details on the Account page of the AI Admin Hub console to make sure that you're up to date on what's available to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

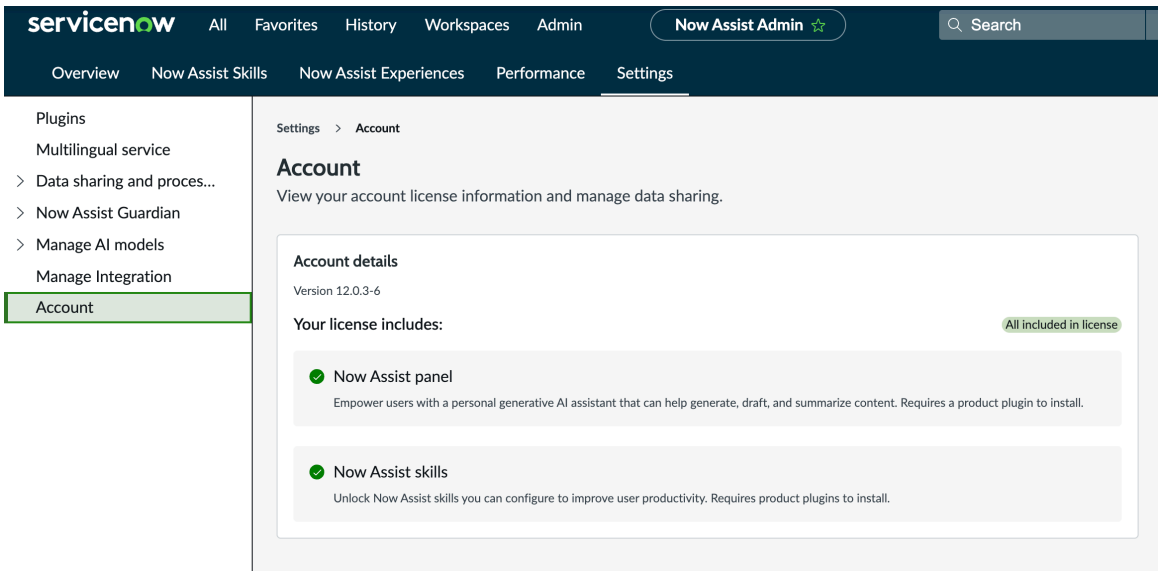
Before you begin
Role required: sn_generative_ai.nsa_admin

About this task
From the Account page, you can review the licensing information to verify which plugins and features you're entitled to and what their status is.

Procedure
1. Navigate to **All** > **Now Assist Admin** > **Settings**.

   If you're already in the AI Admin Hub console, select the **Settings** tab.

2. In the Settings page, select **Account**.



3. In the Account details section of the panel, review what is included with your Now Assist license.

What to do next
Turn on the skills that you want for your Now Assist workflow applications so that you can use generative AI capabilities across the ServiceNow AI Platform. For more information, see Configuring Now Assist Admin features.

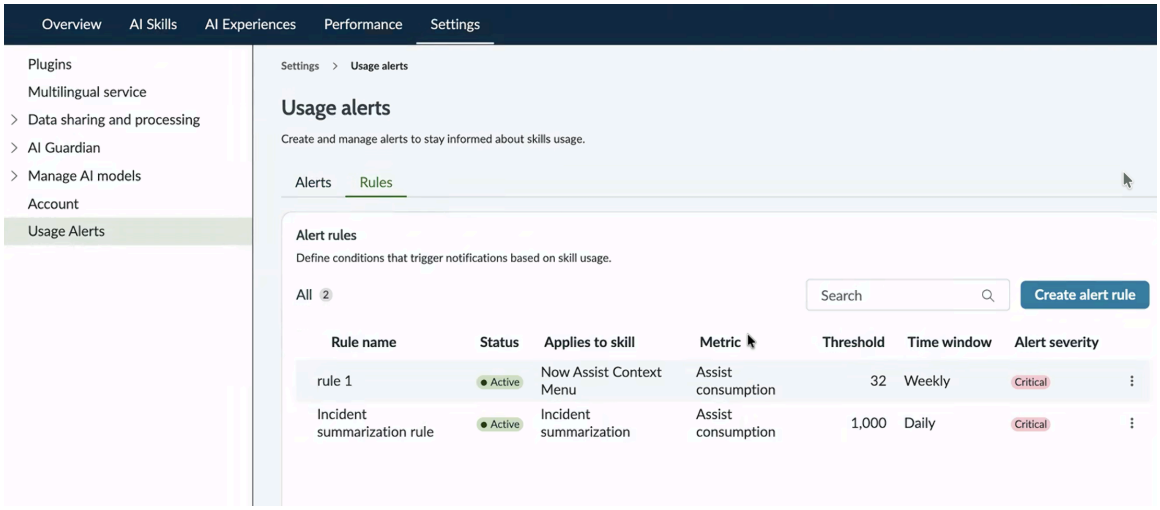
Usage alerts

Define threshold-based rules at the skill levels to monitor and manage assist consumption and skill execution counts when limits are reached. The solution aims to prevent resource exhaustion, and provide clear, actionable insights through an alerts feed and a rule management interface.

Set up a rule engine and usage alert system in AI Admin Hub to receive prioritized notifications both in the instance and via email when thresholds are exceeded. This setup allows you to receive early warnings for unexpected or excessive usage. You can also investigate consumption spikes and adjust rules before limits are reached.

Important: The minimum version required is Australia patch 4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Key features:

- Explore the severity filter tabs (All, Critical, Warning, Info) for the alerts feed to triage, on usage alerts interface
- Directly navigate from an alert to the detail page of the affected skill
- Edit a rule that triggered an alert, directly from the alerts feed
- Dismiss an alert from the active feed without deleting the associated underlying rule
- Create and update alert rules through a modal form

Note:

Domain separation: Rules can only be edited, enabled, turned off, or deleted within the domain where they were created. To modify or remove a rule, first change the domain of the instance to the original domain of the rule. If you don't do this, the options to edit or delete the rule will remain turned off.

Create alert rule

Create alert rules to track the usage of generative AI skills in AI Admin Hub and notify you in the instance and via email, when the set thresholds are reached.

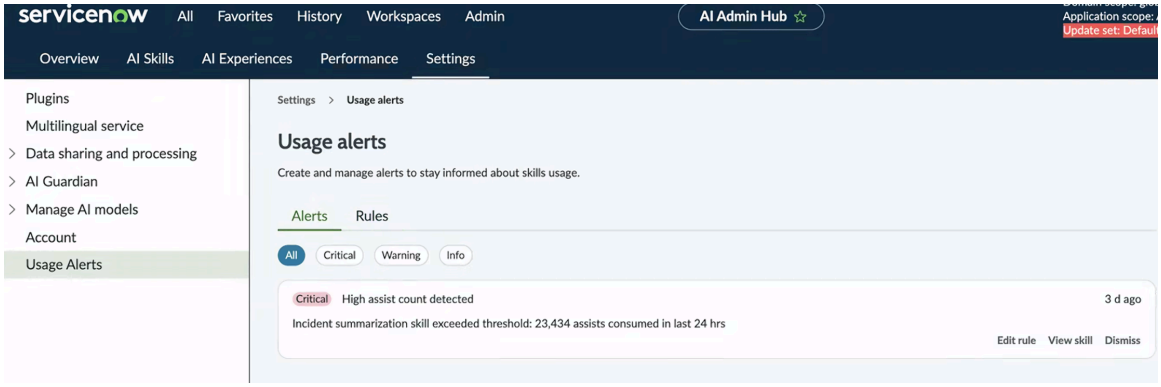
Before you begin

Role required: sn_nowassist_admin

Procedure

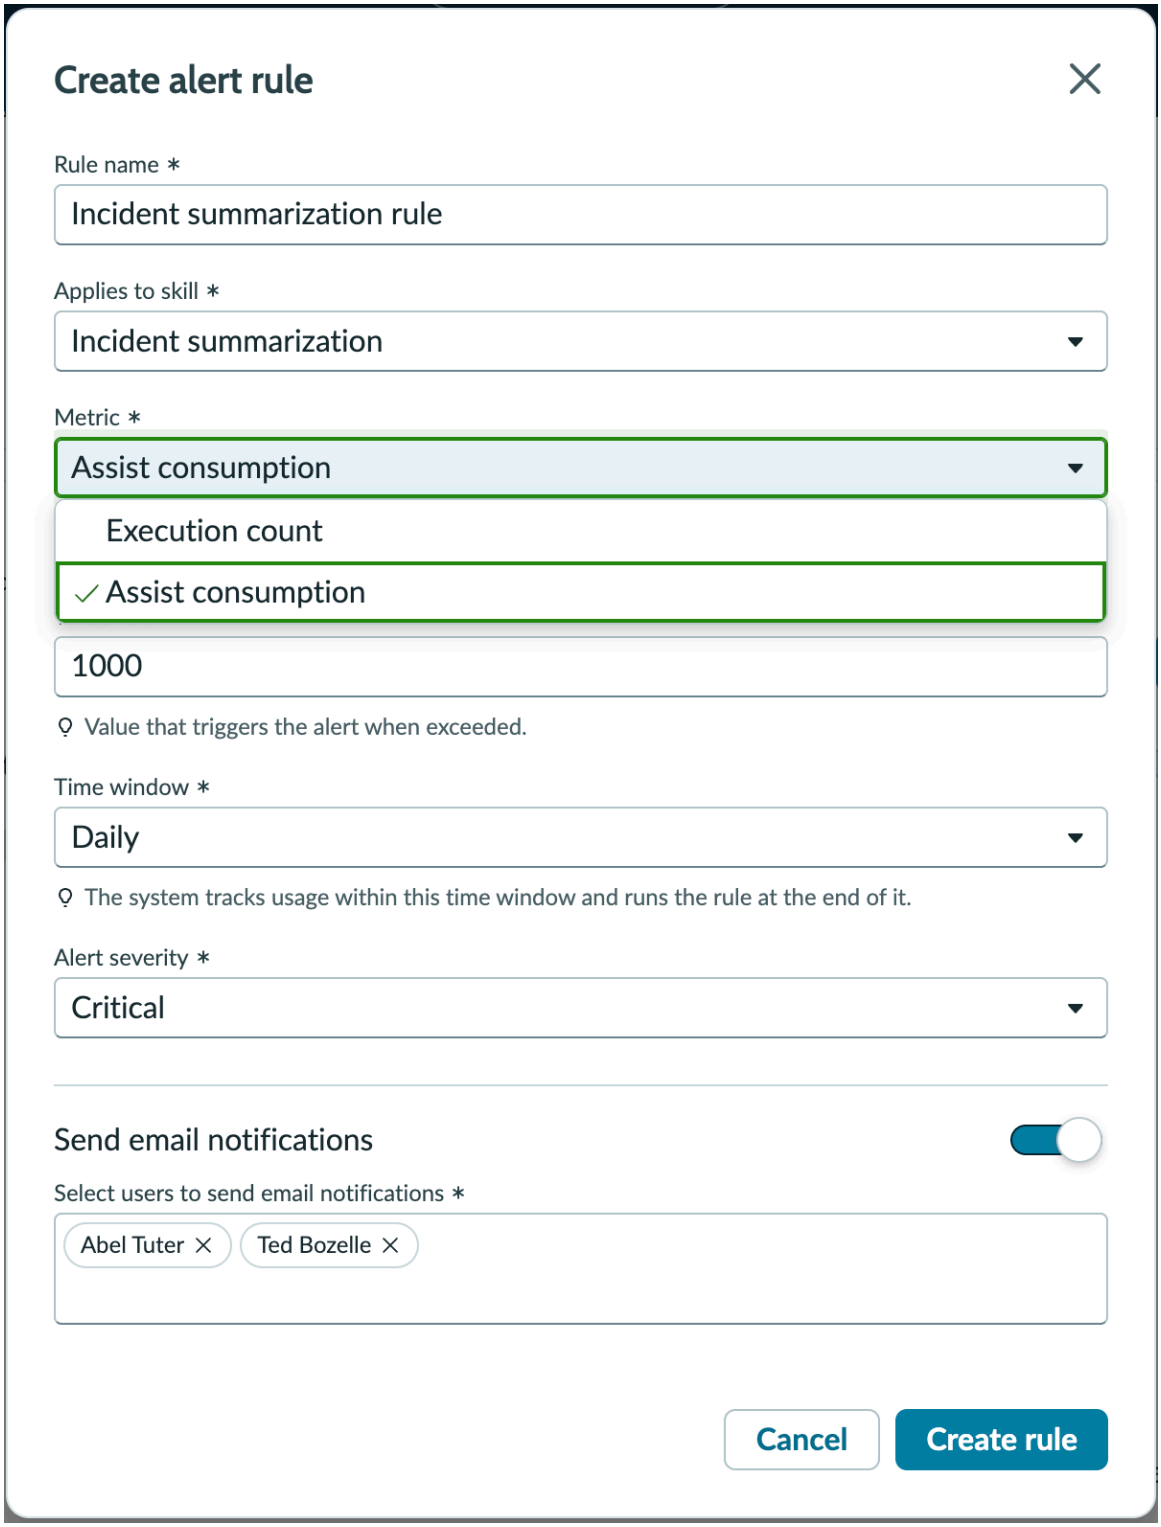
1. Navigate to **Admin** > **AI Admin Hub** > **Settings**.
2. Go to **Usage Alerts**.
3. Select **Alerts** to view previously created alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Rules** to view and create alert rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. Enter a rule name for the alert you're creating.

b. Select the skill you want to apply the alert rule to.

c. Select the usage metric or the usage criteria.

- assist consumption: assists consumed in the given time frame
- execution count: number of times the affected skill is executed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Enter the threshold value for the selected metric.

e. Select an alert timeline window for the rule execution frequency.
For example: If you choose 'daily', the rule will send an alert every day when the threshold is met.

f. Select the severity of the alert notification.
You can choose from All, Critical, Warning or Info type of notification severity. This is displayed with the email notification received.

g. Choose to get notified via email using 'Send email notifications' toggle.
If you opted in, you can select one or more users with an email address.

h. Enter email recipients to be notified with the alert.

i. Select **Create rule** to submit or **Cancel** to revert.

Configuring Now Assist Admin features

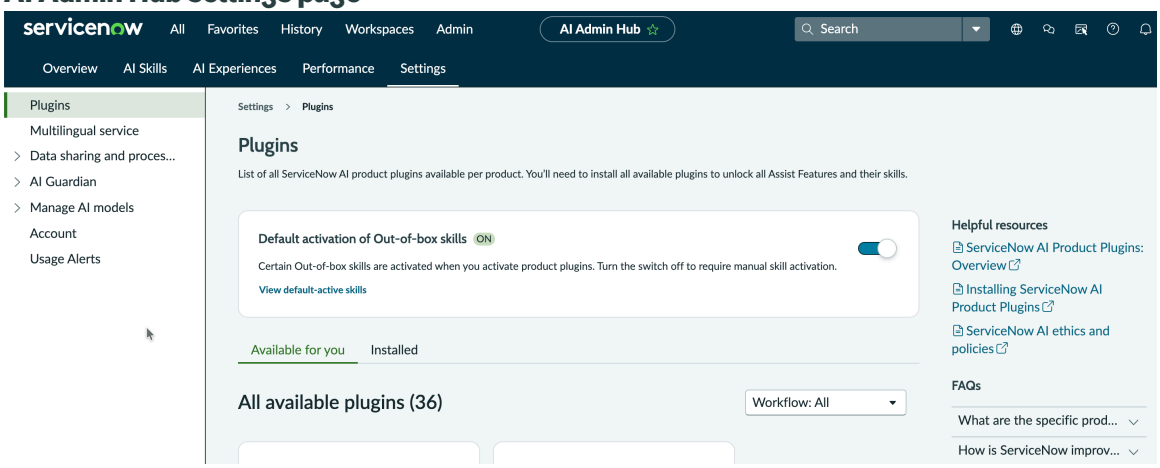
Use the AI Admin Hub console to activate the various Now Assist applications and skills that you're entitled to.

Configuration overview

Install and activate the plugins, turn on the Now Assist panel, and view the account settings. You must install at least one Now Assist application before you can configure any skills.

The following example shows the Settings page with four available plugins to install, including ServiceNow Otto for HRSD and ServiceNow Otto for Creator.

AI Admin Hub settings page



Install plugins for ServiceNow Otto

Install plugins for ServiceNow Otto to enable generative AI on your instance.

Before you begin
Role required: sn_nowassist_admin.nsa_admin

Follow these instructions to get started with AI Admin Hub:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

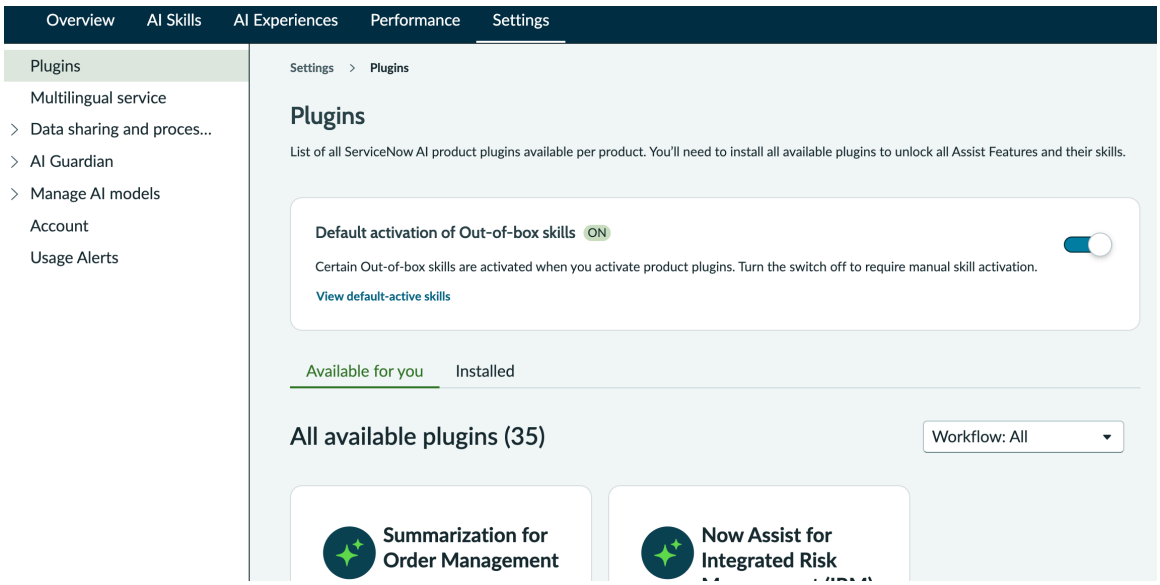
1. To get started with ServiceNow Otto, you must install at least one generative AI application on your instance.
2. License any ServiceNow generative AI software from the ServiceNow Store and install it through the Application Manager to access AI Admin Hub.
3. The AI Admin Hub console guides your implementation, starting with installation.
4. Check out the ServiceNow Otto Journey Checklist for more information.

About this task

Deactivate switch in AI Admin Hub

Note, that certain out-of-box skills are automatically enabled by default with plugin activation. You can turn off the toggle switch before installing the plugin to disable the default 'on' setting. With this feature you can prevent skills configured for default activation from auto-activating when installed or updated.

Explore 'View default-active skills' to find the list of skills currently activated by default. You can review them, activate or deactivate them individually. Hidden skills are displayed and accessible within the Additional Details section.



Generative AI applications often function interdependently. ServiceNow Otto Suites help reduce runtime errors and update issues by bundling compatible versions of generative AI applications together during installation and updates.

For more information about how ServiceNow Otto Suites work, see Now Assist suite versions.

For details about available ServiceNow Otto Suites and their compatibility with ServiceNow AI Platform versions, see Now Assist Suite release notes.

Procedure

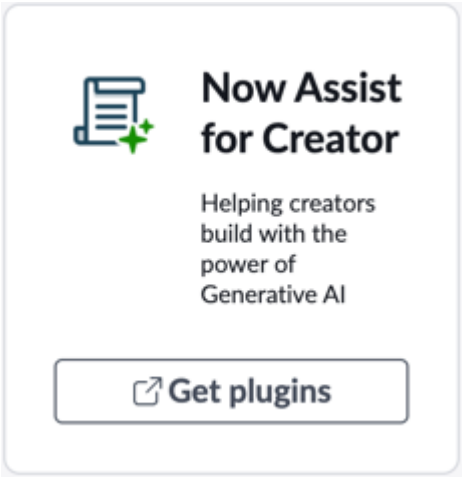
1. Navigate to **All** > **AI Admin Hub** > **Settings**.

   If you're already in AI Admin Hub, select the **Settings** tab.

2. On the **Settings** page, select **Plugins**.

   Plugins appear as cards. Review all ServiceNow Otto plugins on the **Available for you** tab. Plugins that you have already installed appear on the **Installed** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. **Optional:** If you don't already have a license for the plugin, request a license from the ServiceNow® Store.

   a. Select **Get plugins** on the card for the plugin that you want to install.

   b. In the confirmation window, select **Install Plugin** to open the ServiceNow Store page for the plugin in a new browser tab.

   c. Request the license.
   For additional information, see Getting apps and trials from the ServiceNow Store.

4. Navigate to **Admin** > **Application Manager** > **Available for you**.
5. Find and select the ServiceNow Otto application you want to install.
6. Select **Install**.
7. In the **Select suite version** drop-down menu, select a ServiceNow Otto Suite version.

   The available suite versions are compatible with your instance. If you have other generative AI applications already installed on your instance, they might require update for suite compatibility. For more information about ServiceNow Otto Suite compatibility, see Now Assist suite versions.

   If you haven't installed a ServiceNow Otto Suite version yet, you have the option to choose **none** in the version selector. This option enables you to begin using ServiceNow Otto Suites at a time that works best for your organization.

8. **Optional:** If you have available application customizations, use the **Customized ver.** drop-down menu to select which customization to use.
   Your customizations might not be compatible with a new application version. Update the application in a non-production instance, then make any necessary changes to your customization and validate compatibility before making updates in production instances. For more information about managing customizations, see Manage customizations to applications.
9. **Optional:** Include demo data if it's desired and available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the option to install demo data next to each ServiceNow Otto application you want demo data for.
The option to install demo data isn't available for all applications.

b. Turn on the **Load demo data for selected apps** toggle switch.

10. Select **Continue** to review the installation details.

Trouble?
If any applications display "Installation blocked," it means that application version isn't licensed yet. Either uninstall the application or license the required version.

11. Install the application now or schedule installation for a later time.

Installation option	Procedure
Install now	**a.** Leave the default option to **Install now** selected. **b.** Select **Install**.
Install later	**a.** Select the option to **Install later**. **b.** Enter a start date and start time. **c.** Select **Schedule**.

12. Return to the AI Admin Hub console.
13. In the dialog box, select **Refresh**.
14. Either close the dialog box to review all of your plugins or select **View all (Plugin) Assists and Skills** to review the features of your new plugin.

Result
Your plugin is successfully installed.

If you encounter issues installing or updating applications, see this knowledge article for steps that may address your issue. Otherwise, you can make a Support case.

What to do next
Activate the ServiceNow Otto panel standard chat or Activate an AI skill.

Now Assist suite versions

The Application Manager uses Now Assist suite versions to verify compatibility between multiple Now Assist applications in one instance.

Now Assist Suite overview

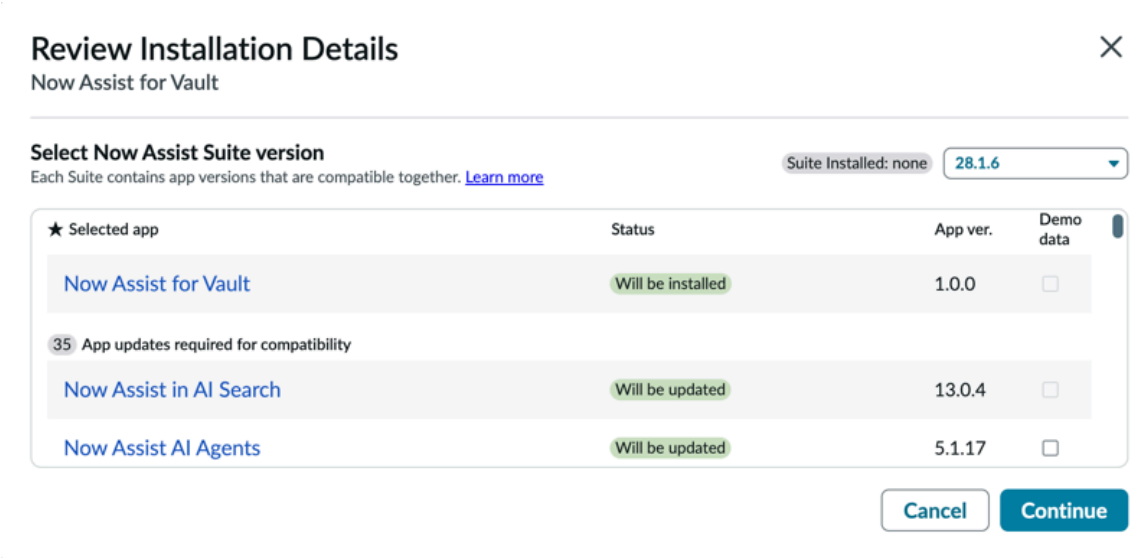
Now Assist applications often function interdependently, which can result in runtime errors when one Now Assist application is dependent on a specific version of another one. Now Assist suites help reduce runtime errors by bundling compatible versions of Now Assist applications together. Suite versions are independent from the application versions that they contain.

The Application Manager uses Now Assist suite versions to verify compatibility between every new Now Assist application version you install and all Now Assist application versions already present on your instance. This verification happens when installing new applications for the first time and when updating application versions. The installation details for Now Assist applications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

enable you to select a Now Assist suite version and review which applications, if any, need to be updated or procured for suite compatibility.

Now Assist installation details



A Now Assist application version might be included in multiple Now Assist suite versions based on its compatibility with other applications. When you install or update a Now Assist application, you can choose any suite version that the application is compatible with. Based on the Now Assist suite version you choose, multiple applications might be updated.

Example: Install a Now Assist Suite version

Some Now Assist applications are part of multiple Now Assist suites because they're compatible with multiple other Now Assist application versions.

Note: The following examples are for illustrative purposes only. They might not reflect actual Now Assist suite versions. For details about available Now Assist Suite versions and their compatibility with ServiceNow AI Platform versions, see Now Assist Suite release notes.

Assume that you want to install ServiceNow Otto for ITSM for the first time. You have the following Now Assist applications installed on your instance already:

- ServiceNow Otto for ITOM (version 1.5.0)
- ServiceNow Otto for Creator (version 27.1.1)

When you start to install ServiceNow Otto for ITSM, you can select different Now Assist suite versions based on the versions of ServiceNow Otto for ITSM that are compatible with your instance. You can choose from Now Assist suite 4.0.0, 3.0.0, or 2.0.0.

Now Assist suite 4.0.0

The latest available Now Assist suite version is selected by default. The following information is displayed when Now Assist suite version 4.0.0 is selected:

Example Now Assist suite 4.0.0

Now Assist application	Version	Status
ServiceNow Otto for ITSM	9.0.1	Will be installed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example Now Assist suite 4.0.0 (continued)

Now Assist application	Version	Status
ServiceNow Otto for ITOM	2.0.3	Will be updated
ServiceNow Otto for Creator	27.2.2	Will be updated

Now Assist suite version 4.0.0 includes the latest versions of ServiceNow Otto for ITSM, ServiceNow Otto for ITOM, and ServiceNow Otto for Creator.

If you want to update to the latest version of ServiceNow Otto for ITSM and ServiceNow Otto for ITOM now, Now Assist suite version 4.0.0 could be a good option.

Note: Test application updates in a non-production environment to verify expected functionality before making updates in production instances.

Now Assist suite 3.0.0

The following information is displayed when you select Now Assist suite version 3.0.0:

Example Now Assist suite 3.0.0

Now Assist application	Version	Status
ServiceNow Otto for ITSM	9.0.1	Will be installed
ServiceNow Otto for ITOM	2.0.2	Will be updated
ServiceNow Otto for Creator	27.2.2	Will be updated

Now Assist suite 3.0.0 includes the latest version of ServiceNow Otto for ITSM (9.0.1). It also includes a newer (but not the latest) version of ServiceNow Otto for ITOM and the latest version of ServiceNow Otto for Creator.

ServiceNow Otto for ITSM version 9.0.1 and ServiceNow Otto for Creator version 27.2.2 are both in Now Assist suites 3.0.0 and 4.0.0. The difference between Now Assist suite versions 3.0.0 and 4.0.0 are the versions of ServiceNow Otto for ITOM that are available. Which version of ServiceNow Otto for ITOM you want can help you decide between updating to Now Assist suite 3.0.0 or 4.0.0.

Now Assist suite 2.0.0

The following information is displayed when you select Now Assist suite version 2.0.0:

Suite 2.0.0

Now Assist application	Version	Status
ServiceNow Otto for ITSM	8.0.0	Will be installed
ServiceNow Otto for ITOM	1.5.0	Up to date
ServiceNow Otto for Creator	27.1.1	Up to date

Now Assist suite 2.0.0 includes versions of ServiceNow Otto for ITOM and ServiceNow Otto for Creator that are already installed on your instance. The latest version of ServiceNow Otto for ITSM isn't part of Now Assist suite 2.0.0, but a previous version (8.0.0) is.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this case, you can choose to install the older version of ServiceNow Otto for ITSM, and not update your other Now Assist applications yet.

Note: Not updating the suite version might not be an option. Depending on compatibility of a new Now Assist application, you might have to update your Now Assist suite version to complete installation.

Activate the ServiceNow Otto panel standard chat

Activate the ServiceNow Otto panel standard chat to enable your agents to use AI skills, such as task summarization or navigation, in a side panel on the user interface.

Before you begin

You must install at least one AI application before you can turn on the ServiceNow Otto panel.

Role required: sn_generative_ai.nsa_admin

About this task

You must have the now_assist_panel_user role to have access to the ServiceNow Otto panel once you turn it on.

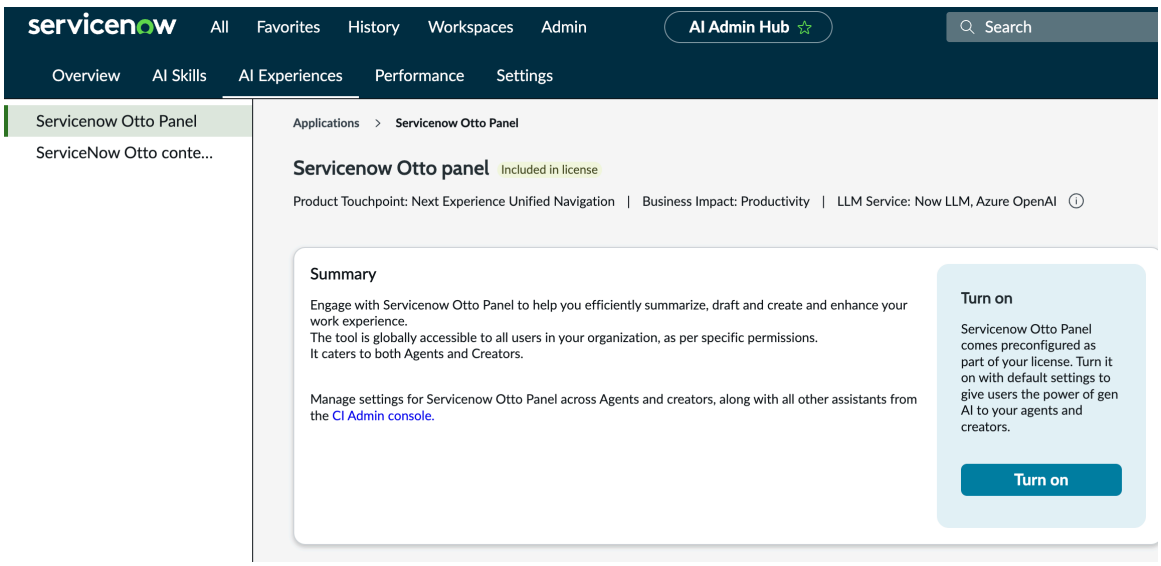
To learn more about the ServiceNow Otto panel, and how it can assist your agents, see ServiceNow Otto panel.

Procedure

1. Navigate to **Admin** > **AI Admin Hub**.

   If you're already in AI Admin Hub, select the **AI Experiences** tab.

2. Select *`ServiceNow Otto`* **panel**.
3. Select **Turn On**.



4. In the Turn on ServiceNow Otto Panel dialog box, select **Turn on**.
5. If you want to use assistants, you must activate them.
   See Activate ServiceNow Otto panel assistants for information on activating assistants.

What to do next

For help with installation, see Solving installation and configuration issues with ServiceNow AI features.

© 2026 ServiceNow, Inc. All rights reserved.

For examples of the ServiceNow Otto panel in action for ServiceNow Otto applications, see the following topics:

- Summarize a chat conversation by using ServiceNow Otto for Customer Service Management (CSM)
- Summarize a Sidebar discussion by using ServiceNow Otto for IT Service Management (ITSM)
- Summarize an issue using ServiceNow Otto for Integrated Risk Management (IRM)
- Generate a knowledge article from HR Agent Workspace with ServiceNow Otto for HRSD

Activate ServiceNow Otto panel enhanced chat

Activate the ServiceNow Otto panel enhanced chat to enable your agents to use ServiceNow Otto skills, such as task summarization or navigation, in a side panel on the user interface.

Before you begin

You must install at least one ServiceNow Otto application before you can turn on the ServiceNow Otto panel.

Role required: sn_nowassist_admin.nsa_admin

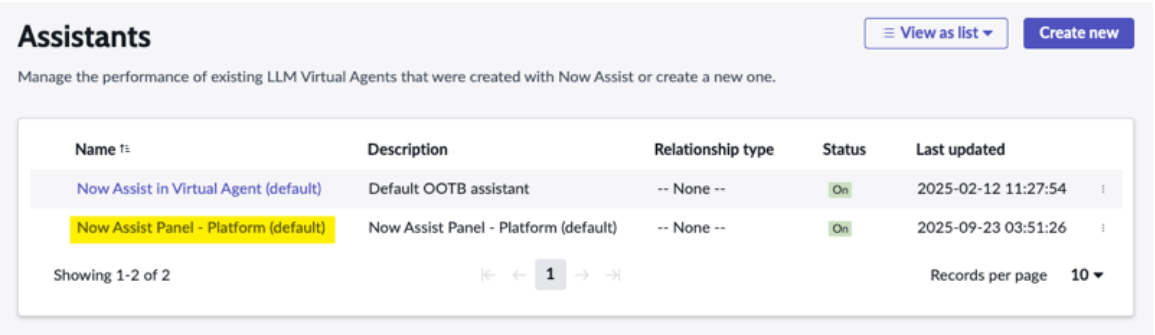
About this task

You must have the now_assist_panel_user role to have access to the ServiceNow Otto panel once you turn it on.

To learn more about the ServiceNow Otto panel, and how it can assist your agents, see ServiceNow Otto panel.

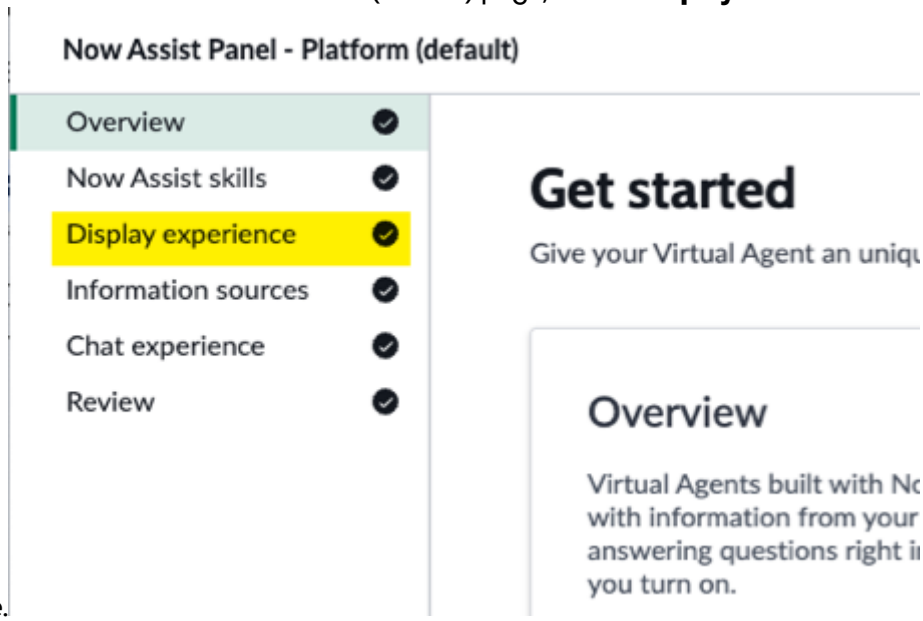
Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistants**.
2. On the Assistants page, select **ServiceNow Otto Panel - Platform (default)**.

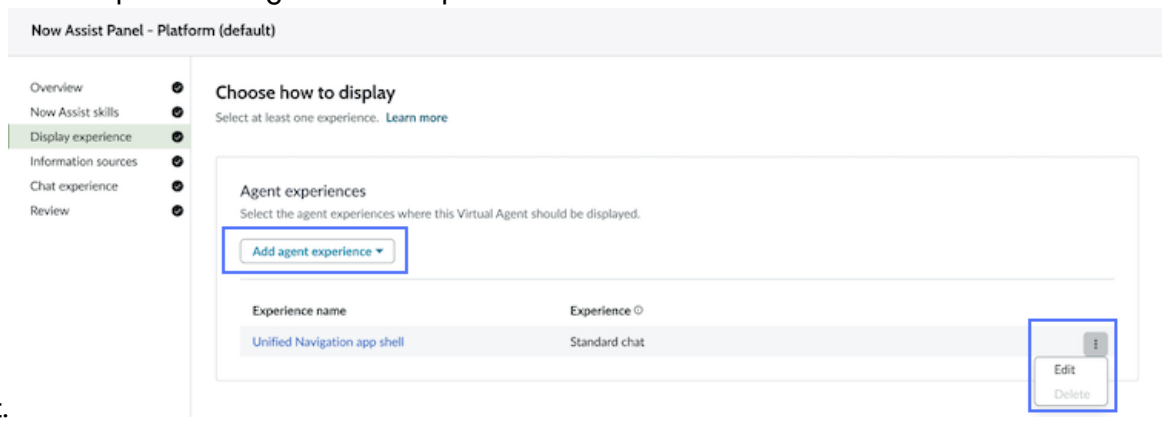


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the ServiceNow Otto Panel - Platform (default) page, select **Display experience**.



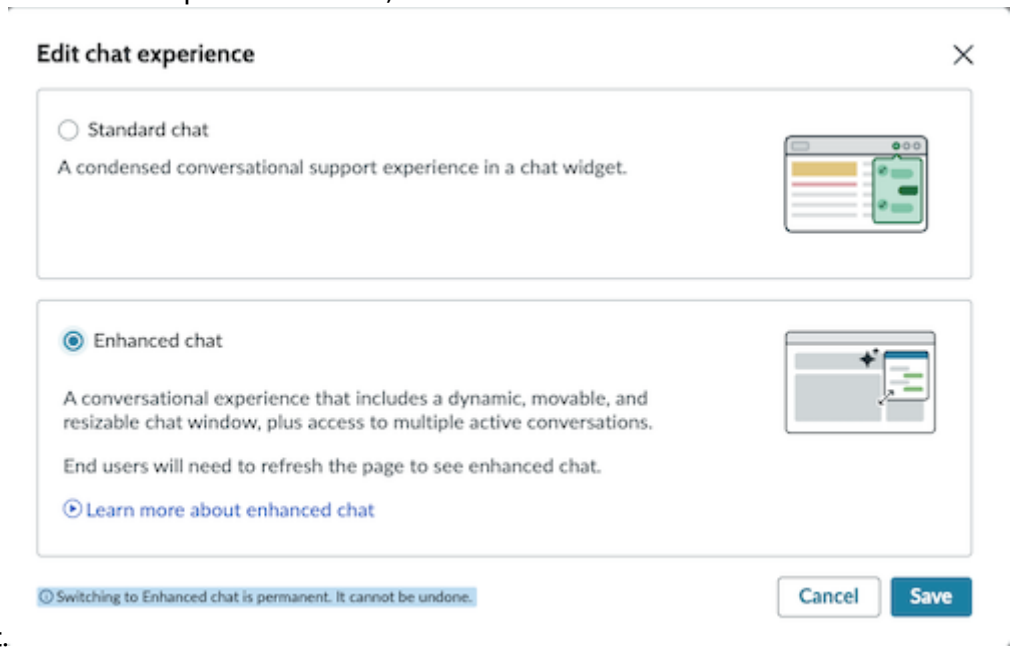
4. Select the **Add agent experiences** drop-down menu and then select **Unified Navigation app shell**.
5. Select the ellipsis to change the chat experience from standard chat to enhanced chat.



Important: Switching to enhanced chat is permanent and can't be undone after you have selected **Save** and then **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the Edit chat experience screen, select Enhanced



chat.

7. Select **Save**.
8. If you want to use assistants, you must activate them.
   See Activate ServiceNow Otto panel assistants for information on activating assistants.

What to do next

For help with installation, see Solving installation and configuration issues with ServiceNow AI features.

For examples of the ServiceNow Otto panel in action for ServiceNow Otto applications, see the following topics:

- Summarize a chat conversation by using ServiceNow Otto for Customer Service Management (CSM)
- Summarize a Sidebar discussion by using ServiceNow Otto for IT Service Management (ITSM)
- Summarize an issue using ServiceNow Otto for Integrated Risk Management (IRM)
- Generate a knowledge article from HR Agent Workspace with ServiceNow Otto for HRSD

Activate ServiceNow Otto panel assistants

You must activate ServiceNow Otto panel assistants before using them.

Before you begin

Role required: admin

Note: Voice input is automatically activated when you activate the ServiceNow Otto panel.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistants**.
2. On the Assistants screen, select *ServiceNow Otto* **Panel - Platform (default).**
3. In the more actions icon, select **Active**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable voice input for ServiceNow Otto panel

Give users the option to use their voice when interacting with the ServiceNow Otto panel to make the panel more accessible. Voice input enables you to use the panel without needing to use a keyboard.

Before you begin

Note: Voice input is automatically activated when the ServiceNow Otto panel is activated. As of the Zurich Patch 4 release, voice input is configured in Enable additional chat features and not with this option.

You must have installed at least one ServiceNow Otto application with a skill that uses the ServiceNow Otto panel. See ServiceNow Otto panel for more information about supported skills.

Role required: sn_generative_ai.nsa_admin

About this task

You can give users the option to use voice input in the ServiceNow Otto panel. This feature provides an additional input method to interact with ServiceNow Otto skills in English. Once it's enabled, users can choose to activate this feature in their personal accessibility preferences by toggling on **Enable voice input for the ServiceNow Otto panel**. See Configure Next Experience accessibility preferences for more information about setting personal accessibility preferences.

Voice-to-text input can help users with mobility impairments access generative AI skills without using a keyboard. This feature can also be useful to blind or low-vision users, neurodivergent users, non-native language speakers, and mobile users on the go, such as field service agents.

The voice input feature is not supported in regulated markets.

Procedure

1. Navigate to **All** > **ServiceNow Otto Admin** > **ServiceNow Otto Experiences**.

   If you're already in the AI Admin Hub console, navigate to the ServiceNow Otto Experiences page.

2. Go to the ServiceNow Otto panel tab.
3. In the Settings section, turn on the toggle for **Voice Input**.

Result

Users can choose whether they can use their voice to interact with the ServiceNow Otto panel in their Next Experience accessibility preferences.

Configure disambiguation

Configure the disambiguation property that controls when the assistant asks clarifying questions before responding to a ServiceNow Otto for Virtual Agent or ServiceNow Otto panel user request.

Before you begin

Role required: admin

About this task

Disambiguation or clarification helps the assistant handle situations where the user's request is ambiguous. Rather than returning an overwhelming list of results, the assistant evaluates the request using a confidence scoring system and asks clarifying questions if needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the filter navigator field, enter `sys_properties.list`.
2. In the selection fields, select **Name** from the drop-down list and enter `sn_aia.type_2_disamb` in the Search field.
3. Configure the disambiguation property:

   If you have
   - ServiceNow Otto for Virtual Agent or
   - ServiceNow Otto panel standard chat or
   - ServiceNow Otto panel enhanced chat

   then use this configuration:

Property	Possible values	Default value	Definition
sn_aia.type_2_disamb	off/low/high	off	○ off - clarification is disabled. The assistant responds directly to all queries without asking follow-up questions. ○ low - clarification is triggered for highly ambiguous queries. ○ high - clarification is triggered more frequently, covering a broader range of ambiguous queries.

   If you have ServiceNow Otto panel premium chat, then use this configuration:

Property	Possible values	Default value	Definition
sn_aia.type_2_disamb	off/on	off	○ off - clarification is disabled. The assistant responds directly to all queries without asking follow-up questions. ○ on - clarification is triggered for ambiguous queries.

4. To view the disambiguation data, in the filter navigator field, enter `sys_generative_ai_log`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure response feedback

Configure the response feedback options that appear when users select thumbs up or thumbs down on a ServiceNow Otto for Virtual Agent or ServiceNow Otto panel response.

Before you begin

Role required: admin

Procedure

1. In the filter navigator, enter `sys_now_assist_deployment_config_attributes.list` to display the ServiceNow Otto for Virtual Agent Deployment Config Attributes table.
2. In the search fields, select **Name** from the drop-down list and enter `granular` in the Search field.
3. To change negative granular feedback settings, select **is_negative_granular_feedback_enabled** with ServiceNow Otto for Virtual Agent (default) as the Deployment Configuration.
4. On the next screen, set the value to **true** to enable negative granular feedback or **false** to disable it.
5. Select **Submit**.
6. To change positive granular feedback settings, select **is_positive_granular_feedback_enabled** with ServiceNow Otto for Virtual Agent (default) as the Deployment Configuration.
7. On the next screen, set the value to **true** to enable positive granular feedback or **false** to disable it.
8. Select **Submit**.
9. To configure the feedback options, in the filter navigator, enter `sys_now_assist_message_bundle.list` to display the ServiceNow Otto Message Bundles table.
10. In the search fields, select **for text** from the drop-down list and enter `granular` in the Search field.
11. Do one of the following:
    - To create a new granular feedback selection, select **New**.
    - To change an existing granular feedback option, select the option.
12. Complete the fields: **Description**, **Message**, **Message Key**, **Bundle Id**, **Application**, **Active**, **Order**.
13. Select **Submit**.
14. For more information on accessing the stored feedback data, see Granular Feedback and Analytics in ServiceNow Otto for Virtual Agent (KB3060968).

Configure processing messages

For ServiceNow Otto panel premium chat, configure processing messages to control the status updates that appear in the chat interface while ServiceNow Otto works on a request. You can customize the text of processing messages to better reflect your organization's terminology or the specific actions your AI agents perform.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the filter navigator field, enter `sys_properties.list`.
2. In the selection fields, select **Name** from the drop-down list and enter `processing_messages` in the Search field.
3. If you have ServiceNow Otto panel premium chat, configure sn_aia.og_ao.enable_processing_messages to enable or disable processing messages.

Using AI Admin Hub

Use AI Admin Hub to explore the various Now Assist plugins, skills, and associated Generative AI application features you are entitled to.

Activate an AI skill

Activate AI skills by configuring settings such as display locations. After the skills have been activated, they can be used across the ServiceNow AI Platform based on the availability and display settings you choose.

Before you begin

Role required: sn_generative_ai.nsa_admin. For information about roles, see AI Admin Hub roles and Roles and responsibilities for AI administration.

About this task

Activate the skills that are most relevant to your use cases and business needs. For a full list of available skills, see Generative AI skills.

From the Brazil Patch 1 release, one-step activation is available for default skills using default settings. With this streamlined activation method, the only decision you must make is where to display your skill. If you need granular or custom configuration, the multi-step guided setup wizard is available from Advanced setup. One-step activation isn't available with Next Experience in this release, or with copied or custom skills.

Procedure

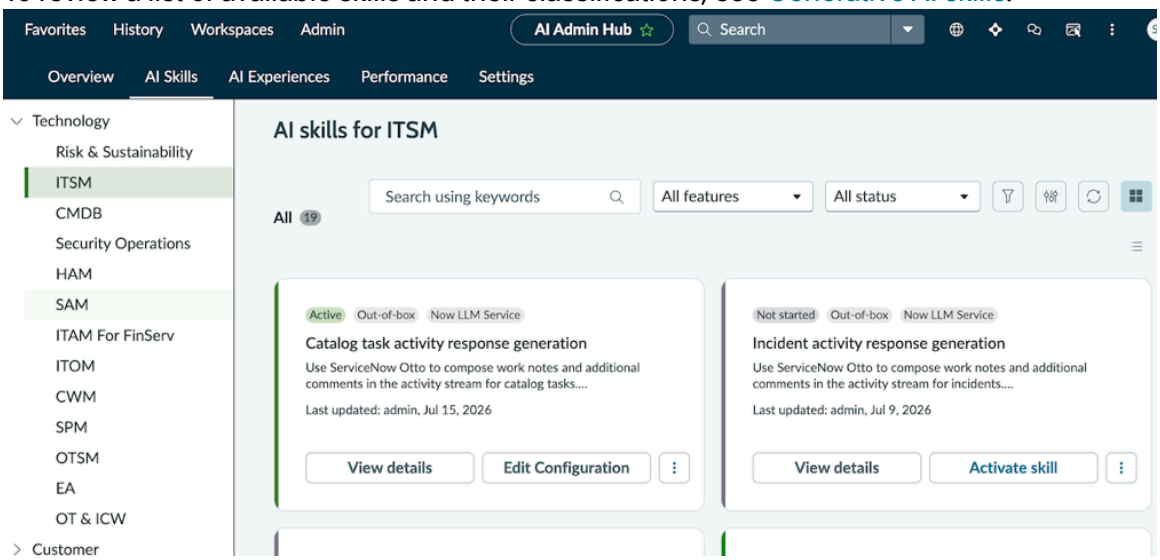
1. Navigate to **All** > **AI Admin Hub** > **Skills**.

   If you're already in AI Admin Hub, select the **AI Skills** tab.

2. On the navigation panel, select a workflow where your skill is classified, such as **Technology** or **Customer**.

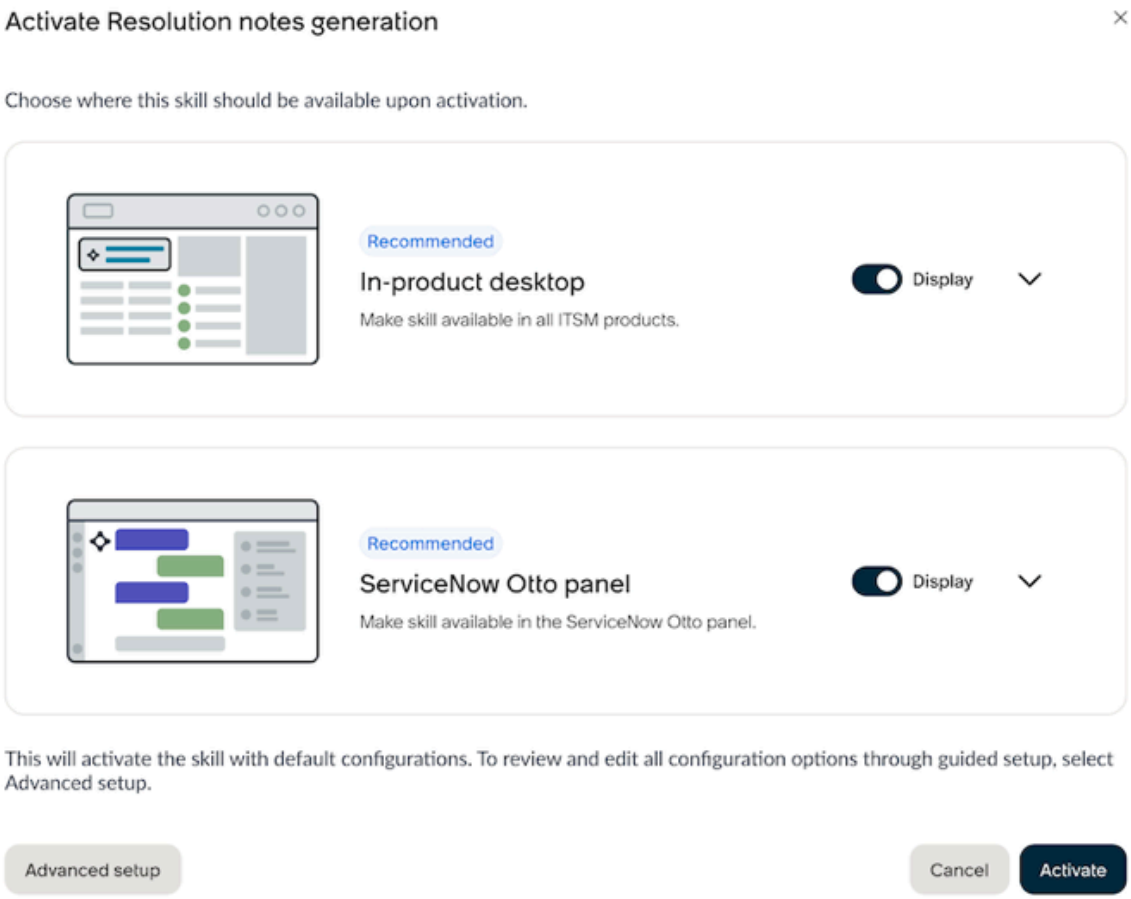
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To review a list of available skills and their classifications, see Generative AI skills.



3. On the card for the skill you'd like to activate, select **Activate Skill**.
   You can choose between one-step activation or Advanced setup on the modal window.
4. **Optional:** One-step activation: Choose the locations in your instance where you want the skill to be available using the toggle switches, and then select **Activate**.
   Your skill is activated and displayed in your instance.

(Optional)



5. **Optional:** Advanced setup: Open a multi-step guided wizard by selecting **Advanced setup**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced setup steps

Step	Description
Choose inputs	Choose the table and fields that are used as inputs to the skill. Depending on the skill, inputs may be read-only (so they can't be customized).
Define availability	Customize how and when the skill capability will exist and be available. You can choose to make the skill always available. To customize the skill availability, set conditions using the condition builder.
Define access	Define access by selecting ACLs and role restrictions.
Select display	Choose where to display your skill. Slide the toggle to on to enable a display location.
Review and activate	Complete your skill by reviewing the details you have set.

Each skill configuration has steps that are shown in the guided setup. The exact steps vary from skill to skill. A symbol next to each step indicates whether the step is completed, partially completed, or not completed. After configuring a step, select **Save and continue** to proceed to the next step. Return to a previous step by selecting **Back**.

Note: Some configuration options are read only.

6. Choose inputs: Choose the table and fields that are used as inputs to the skill (depending on the skill, inputs may be read-only, so they can't be customized).
7. Define availability: Customize how and when the skill capability will exist and be available.

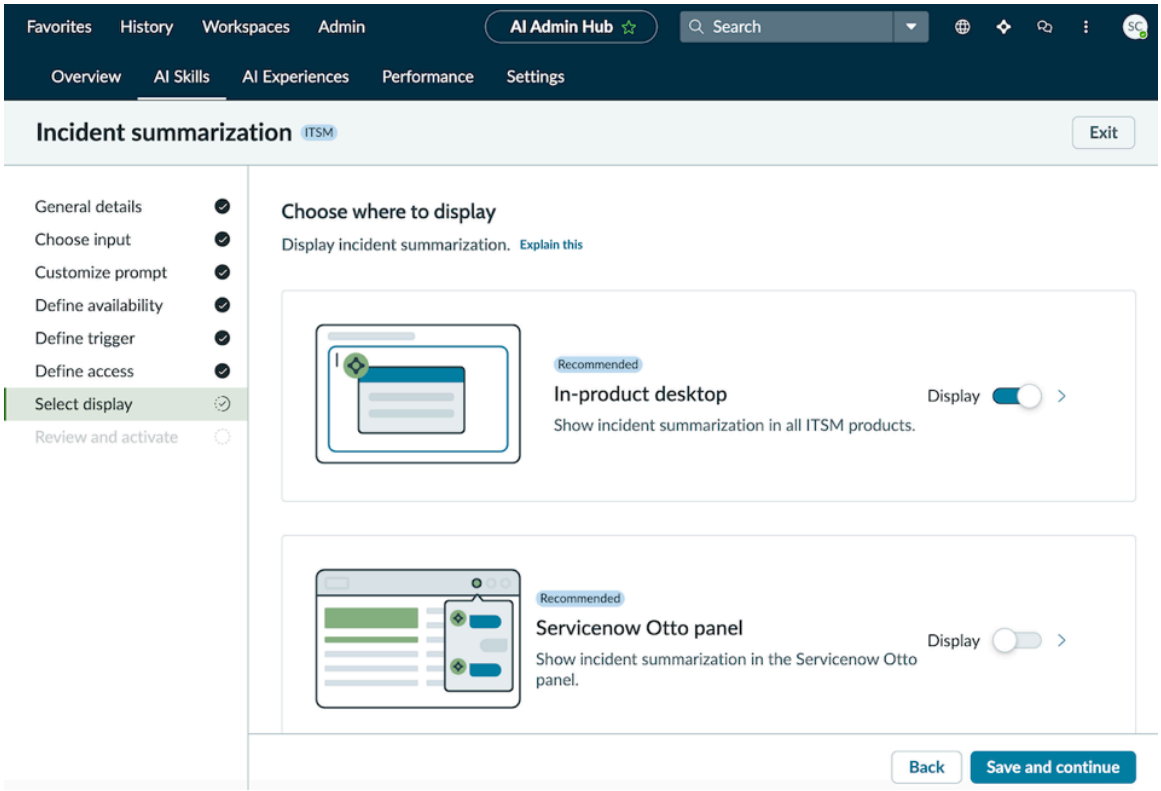
Options for Define Availability	Description
Skill is always available	The skill is available without conditions.
Customize skill availability	The skill is available only when conditions are met. Select appropriate conditions from the condition builder. Example: `[Actual start] [On] [Today]`.

8. Define access: Configure the access controls by updating ACLs and roles.
   Roles can be added by entering the name of the role in the User roles field. Existing roles can be removed by selecting the X icon in the role bubble. You must have at least one role specified, but you can add as many as you like.
9. Select display: select the instance location where you'd like to display the skill.

   Options vary from skill to skill. Some options are only available for certain skills.

   - **In-product desktop**: When selected, Now Assist skills are displayed on forms and workspaces.
   - **ServiceNow Otto panel**: When selected, the AI skills are available in the ServiceNow Otto panel. If you don't see this option, you must activate the ServiceNow Otto panel. For more information, see Activate the ServiceNow Otto panel standard chat.
   - **Core UI**: When selected, the AI skill will display as a UI action in the Core UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. Review and activate: Review your the details of your configuration, then select **Activate** to complete.

What to do next

Use the ServiceNow Otto applications and skills that you've activated.

Configure chat summarization and chat reply recommendation skills in the AI Admin Hub console

Define the triggers, inputs, and display location for chat summarization and chat reply recommendation by using the guided setup in the AI Admin Hub console. The activation steps are conceptually same for both the skills.

Before you begin

Role required: sn_generative_ai.nsa_admin

Procedure

1. Navigate to **All** > **Now Assist Admin Console** > **Features**.

   If you're already in the AI Admin Hub console, select the **Now Assist Features** tab.

2. On the navigation panel, select a workflow that has chat recommendation, either **Technology** or **Customer**.

   Each workflow contains feature sets.

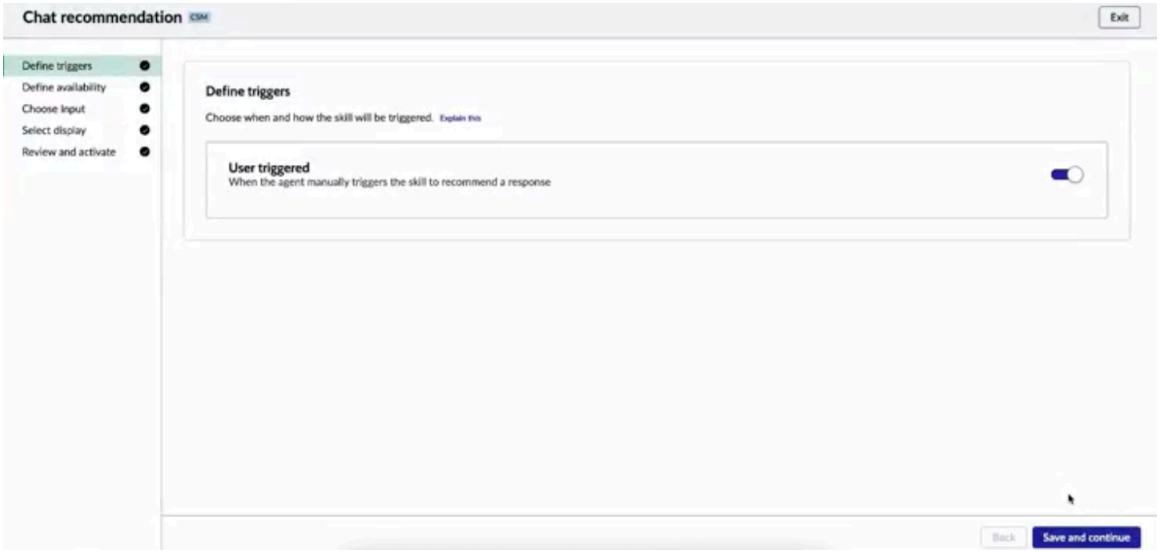
3. On the Chat feature card, select **View details**.
4. In the All available Chat skills section of the chat recommendation card, select **Activate Skill**.
5. Go to **Define Trigger**, the first step in the guided setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, many of the options in the setup are configured for the most common use cases. You might need to select the step in the guided setup navigation to go back and change the configurations in previous steps. You can also use **Back** to navigate through the steps.

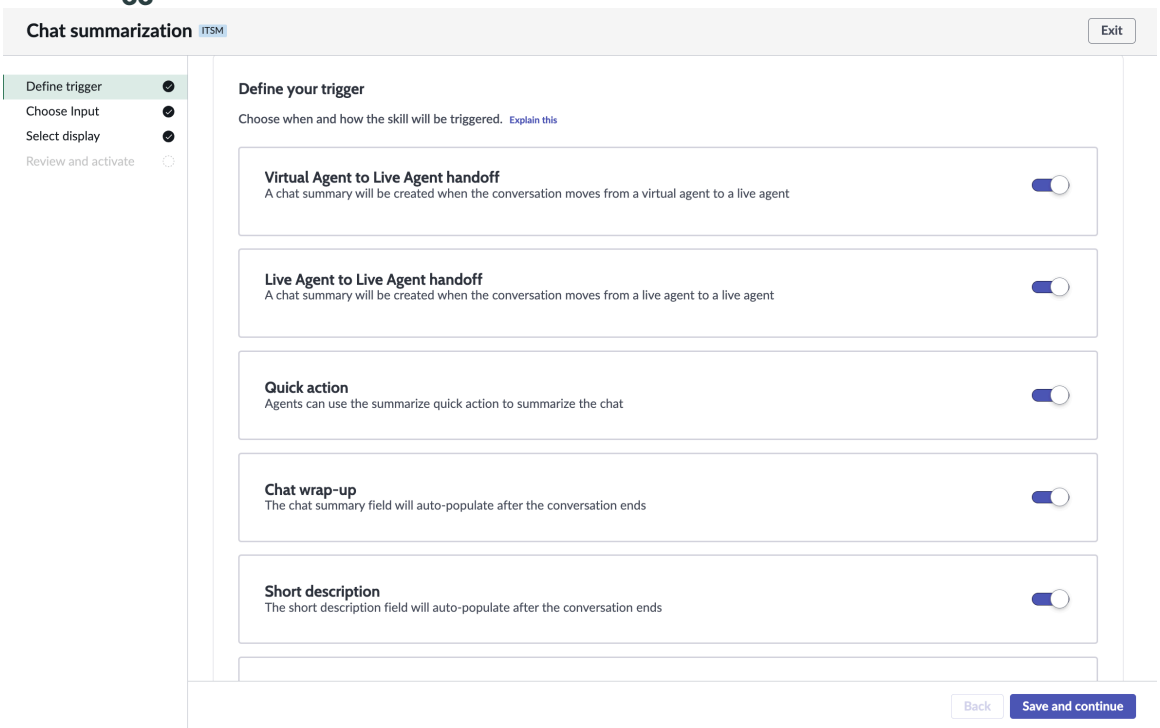
6. Using the toggles, select the actions trigger the chat recommendation skill.

Define triggers for chat recommendation



7. Using the toggles, select the actions trigger the chat summarization skill.

Define triggers for chat summarization



8. Select whether you want the summary to be formatted with bullet points.

By default, the summaries are written with bullet points, but you can turn off this format so that the generated summary uses paragraphs instead.

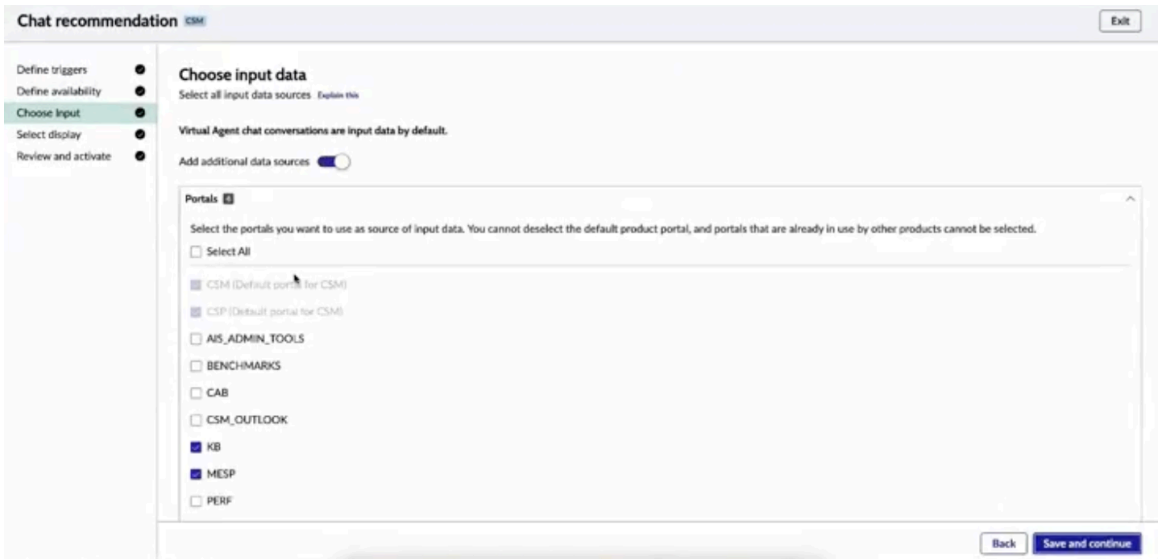
9. Go to **Define availability**, the next step, by selecting **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Customize when and how the skill capability will exist and be available.

11. Select **Customize skill availability** if you want to define the skill to be available for a certain domain.
12. Go to **Choose Input**, the next step, by selecting **Save and continue**.
13. Select any additional data sources that you want the Large language model (LLM) to take into account when generating a recommendation.
14. Select a portal for the data source to allow chat summarization/recommendation to be generated for the conversation occurring on that portal.

    This is a mandatory step. The admin must specify a portal and enable a specific channel on **Choose Input** page, to enable the skill for chats sent in the selected portal/channel. Else the agent will receive an error message, "Chat summaries won't appear until your IT administrator completes all the required steps involved in the setup".



15. Select **Save and continue**.
16. Go to **Select display**, the last step, and select where you would like to display the skill.

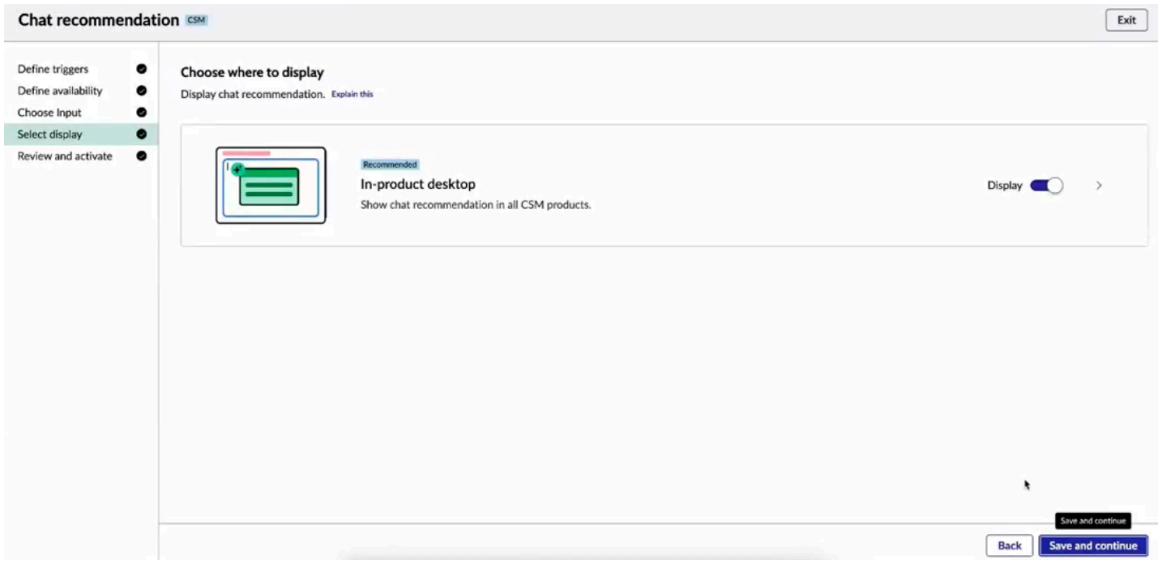
    You can select both in-product, Now Assist panel, or both.

    Note: Chat recommendation is not available in the Now Assist panel.

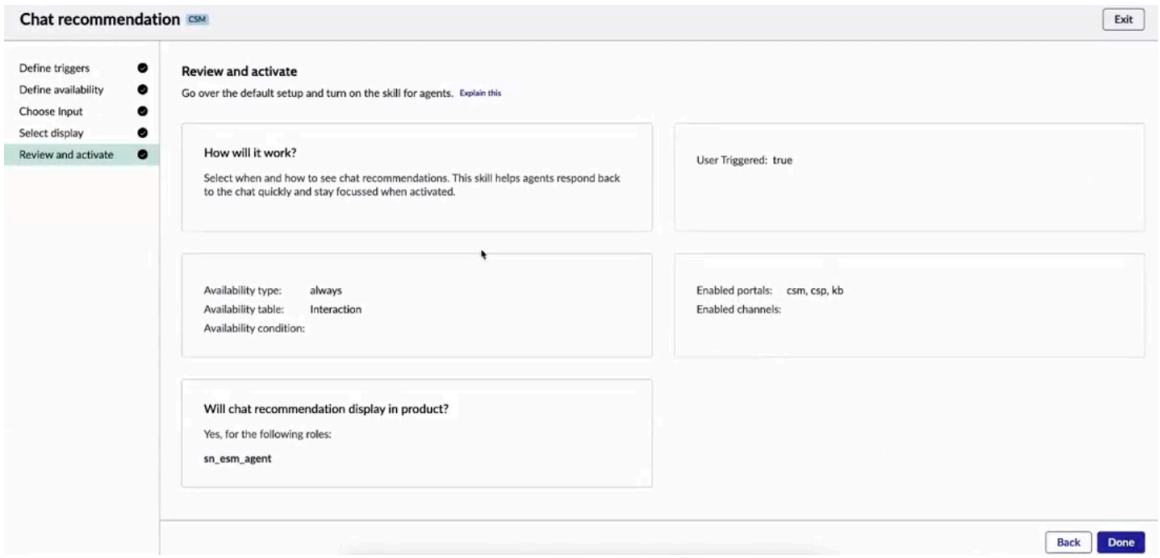
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **In-product desktop**: When selected, Now Assist skills are displayed on forms and workspaces.
- **Now Assist panel**: When selected, Now Assist skills are available in the Now Assist panel. Select the down arrow to identify the roles that can use the skill. Select the arrow next to toggle, to select roles who can access the skill. You can add roles by entering the name of the role in the **User roles** field. You can remove existing roles by selecting the X icon in the role bubble. You must have at least one role specified, but you can add as many roles as you like.

Note: You can use different roles for chat recommendation in different workflows. You can see which workflow you're configuring by checking the label next to the skill name at the top of the guided setup, such as "ITSM" or "HRSD."



17. Review your choices and complete the configuration by selecting **Activate**.



Result

Chat recommendation or reply recommendation for the workflow is active on the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Analyze your skill performance and usage on the AI Admin Hub console to help determine the success of the skill. Learn more about tracking your Now Assist usage at Monitoring Now Assist usage in Subscription Management.

Configure email reply recommendation in the AI Admin Hub console

Configure the email recommendation Now Assist skill to enable agents to draft email replies based on contextual information.

Before you begin
Role required: sn_generative_ai.nsa_admin

About this task
The email recommendation skill is available in multiple workflows. The exact steps and the order in which they appear for the guided setup for the skill vary depending on the workflow.

Procedure
1. Navigate to **All** > **Now Assist Admin** > **Now Assist Features**.

   If you're already in the AI Admin Hub console, select the **Now Assist Features** tab.

2. On the navigation panel, select a workflow, such as **Technology**.

   Each workflow contains feature sets. The available workflows for email recommendation are Customer (CSM) and Employee (HRSD).

3. On the feature card that is associated with the skill you'd like to activate, select **View details**.
4. In the All available skills section, select **Activate Skill**.

   If you have already activated the skill and want to edit the configuration, in the Active skills section, select the more options menu item (⋮). Then select **Edit**.

5. In the **Write with Now Assist** step, choose whether you want the Now Assist context menu to be active and then select the actions you want to be available.

   After each step, select **Save and continue**. For more information about these choices, see Skill inputs and triggers for Now Assist for HRSD.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Choose when you want the skill to be available.

   You can select **Skill is always available** if you don't want to place any restrictions on when the skill is available for use. If you want to add conditions, select **Customize skill availability**. Selecting this option opens up a condition builder for you to select fields and values that determine whether someone can use the skill.

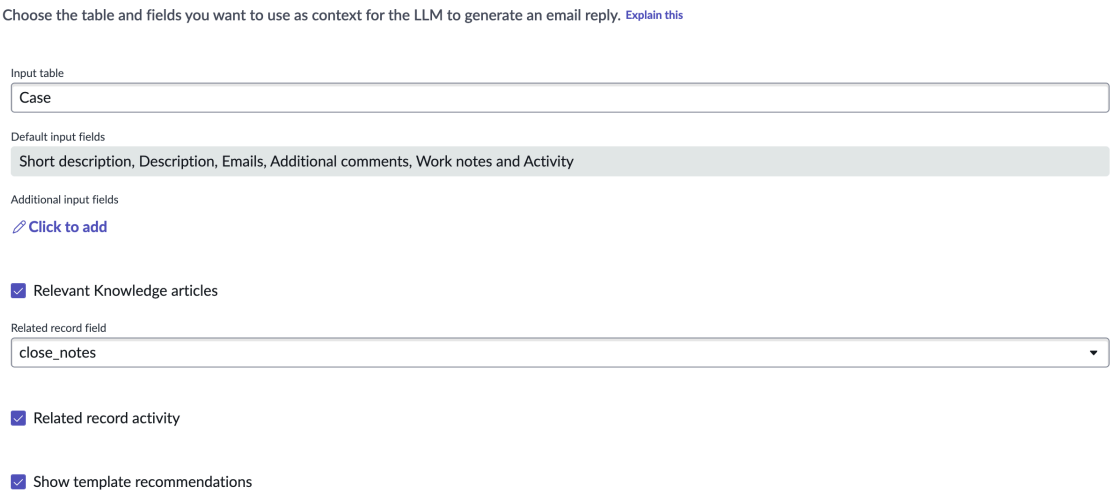
7. Choose the inputs or email parameters, including input data and whether you want to display template suggestions.

   Some options may be read-only in certain workflows.

   Additional context can improve the quality of the email recommendation. In the **Additional input fields** field, you can choose any fields not already selected in the **Default input fields**. You can include Knowledge articles by selecting the check box. You can choose a field from related records, such as resolution notes, in the **Related record field**. If there's no value for the related record field or you don't select one, you can also opt to include activity from related records.

   If you select **Show template recommendations**, then agents see a list of template suggestions generated by Now Assist when they go to select a template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. In the next step of the skill configuration, select where you'd like to display the skill.

   You can select both in-product, Now Assist panel, or both.

   - **In-product**: When selected, Now Assist skills are displayed on forms and workspaces.

     For the skills that appear in-product, select the down arrow to identify the roles that can use the skill.

   - **Now Assist panel**: When selected, Now Assist skills are available in the Now Assist panel. If you don't see this option, you must activate the Now Assist panel. For more information, see Activate the ServiceNow Otto panel standard chat.

     For the skills that appear in the Now Assist panel, select the down arrow to identify the roles that can use the skill.

   Roles can be added by entering the name of the role in the User roles field. Existing roles can be removed by selecting the X icon in the role bubble. You must have at least one role specified, but you can add as many as you like.
9. Review your choices and select **Activate** to complete the configuration.

Result
Agents can generate email drafts with generative AI.

Edit an AI skill

Edit the configuration of an AI skill to choose the inputs or triggers and the display location of the skill output.

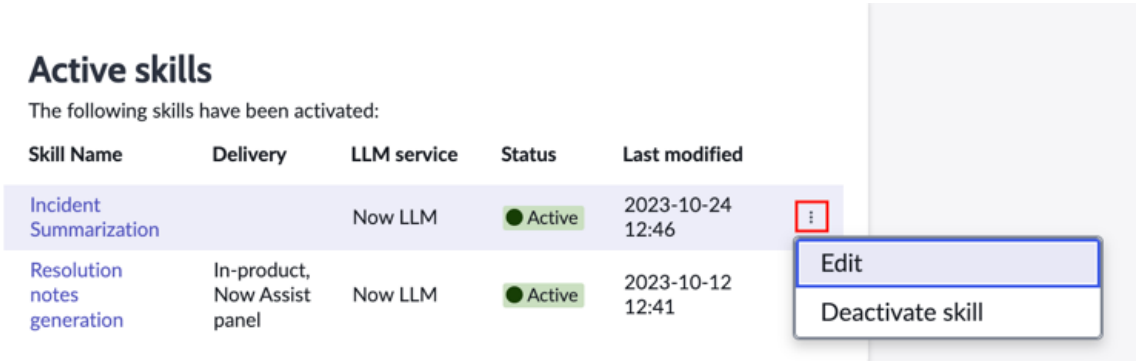
Before you begin
Role required: sn_generative_ai.nsa_admin

Procedure
1. Navigate to **All** > **AI Admin Hub** > **AI Skills**.
   If you're already in the AI Admin Hub console, select the **AI Skills** tab.
2. Select a workflow on the navigation panel, such as **Technology**.

   Each workflow contains skill sets.
3. On the feature card associated with the skill you'd like to edit, select **View details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Under **Active skills**, select the more options icon ⋮ next to the skill that you want to configure, then select **Edit**.

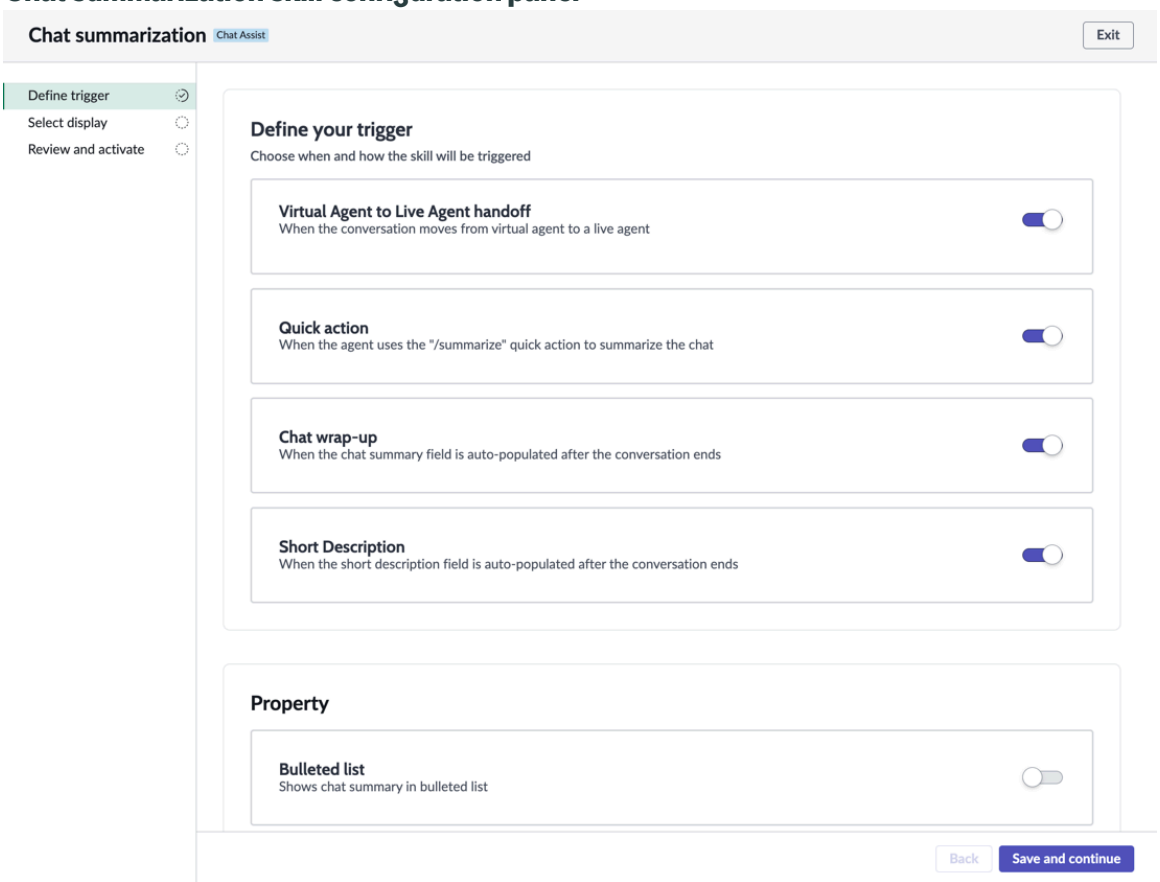


The first step in the guided setup for the skill is displayed.

Each skill configuration has a number of steps shown in the guided setup. The exact steps vary from skill to skill. A symbol next to each step indicates whether the step is completed, partially completed, or not completed.

Note: Some configuration options are read-only.

Chat summarization skill configuration panel



5. Proceed to the next step when you've finished configuring the current step by selecting **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can return to a previous step by selecting **Back**.

6. Apply the new settings after reviewing your changes by selecting **Done**.

Result
The skill is activated with your preferred settings. You can now install other plugins or activate other skills.

Make a copy of an AI skill

Create a copy of an AI skill using the **Make a copy** function in AI Admin Hub. With a copy of the skill, you can experiment with skill settings and tailor the skill to fit your business needs.

Before you begin
Role required: sn_generative_ai.nsa_admin

About this task
The skills that come with the generative AI applications have default configurations that are optimized to serve the most common use cases. To change the skill settings you can edit a skill in AI Admin Hub, or you can create a copy of the skill. Creating a copy leaves the original skill configuration intact in case you want to use it later or want to create another copy from the original. You can activate and configure copies of skills using the same guided setup as the default skills.

Note:

- The **Make a copy** function is not available for all AI skills.
- In a default scenario, only one version of a skill can be active at a time. When you create and activate a copy of a skill, any previously activated version of the skill is deactivated.

Procedure

1. Navigate to **All** > **AI Admin Hub** > **Skills**.

   If you're already in AI Admin Hub, select the **AI Skills** tab.

2. In the navigation pane, select the workflow of the skill that you want to copy, such as Technology or Customer.
3. On the card that contains the default skill you want to copy, select the more options icon then select **Make a copy**.
4. As an alternative to the previous step, select **View details**, then on the details tab select **Make a copy** from the More actions drop-down list at **Edit configuration**.
5. In the modal window, select **Make a copy** to confirm.

Result
A copy of the skill is generated and you're taken to the guided setup.

What to do next
Continue the steps in the guided setup to activate the skill. For more information, see Activate a Now Assist skill.

If you're making a copy of the case or incident summarization skill and would like to learn more about your options, see the documentation for configuring record summarization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure case or incident summarization in the AI Admin Hub console

Configure case or incident summarization by using the guided setup in the AI Admin Hub console. You can choose the input tables and fields, and also customize the prompt output for copies of the record summarization skills.

https://player.vimeo.com/video/996395898?h=e609c55303&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

You can only customize the input data and prompt output for a copy of a record summarization skill. To learn more about making a skill copy, see Make a copy of an AI skill. After you create a skill copy, you can learn the steps to complete the skill setup here.

Role required: sn_generative_ai.nsa_admin

About this task

Default settings for record summarization skills are optimized for general use cases. Review your goals for incorporating generative AI on your instance to determine whether you want to make changes and what those changes are. After you have made a plan, you can create a copy of a skill and modify the input sources and prompt output.

Procedure

1. In the **Name of the skill** field, enter the skill name.

   The default name adds (copy) to the end of the original skill name. For example, Case summarization (copy). Changing the name to be more specific makes it easier to identify later if you want to make changes.

2. **Optional:** Add a description for the skill.
3. Go to the next step by selecting **Save and continue**.
4. Choose the input fields and data sources for each input template.

   The default options are selected for you. Some options are read only. After you make any changes to the input template, you can save your work by selecting **Save template**.

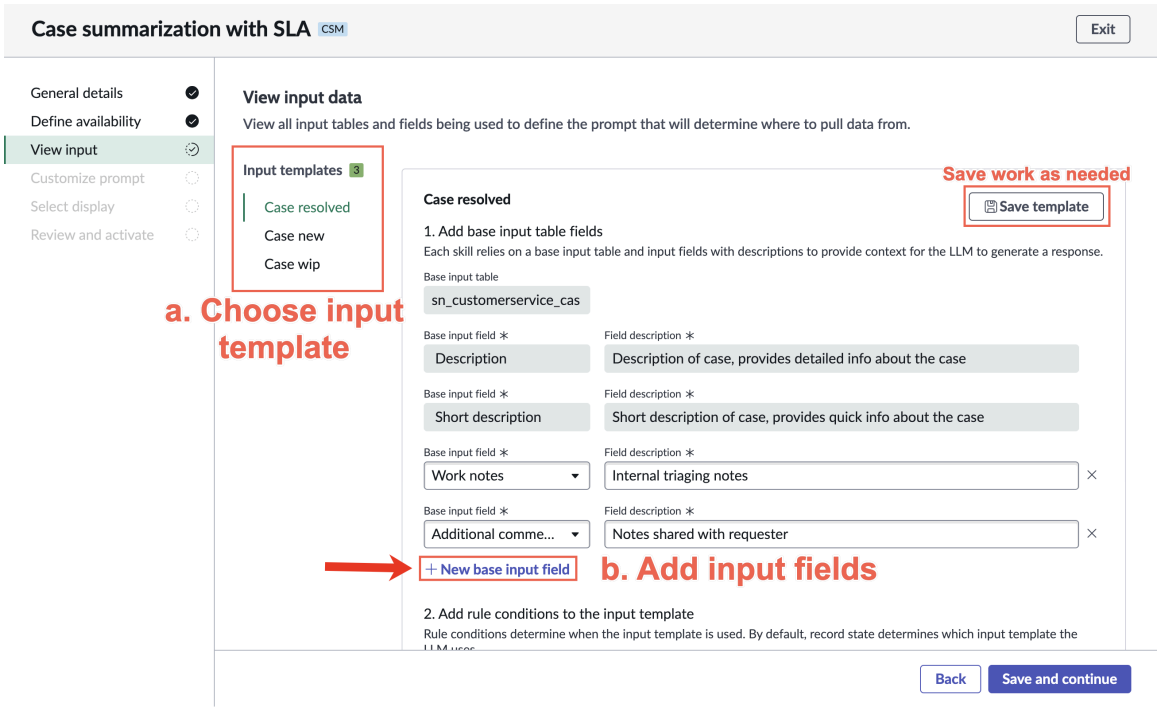
   a. Select an input template.

      The three default input templates are for new records, records that are in progress, and closed records.

   b. Add the base input table fields by selecting **New base input field**, choosing a field, and entering a field description.

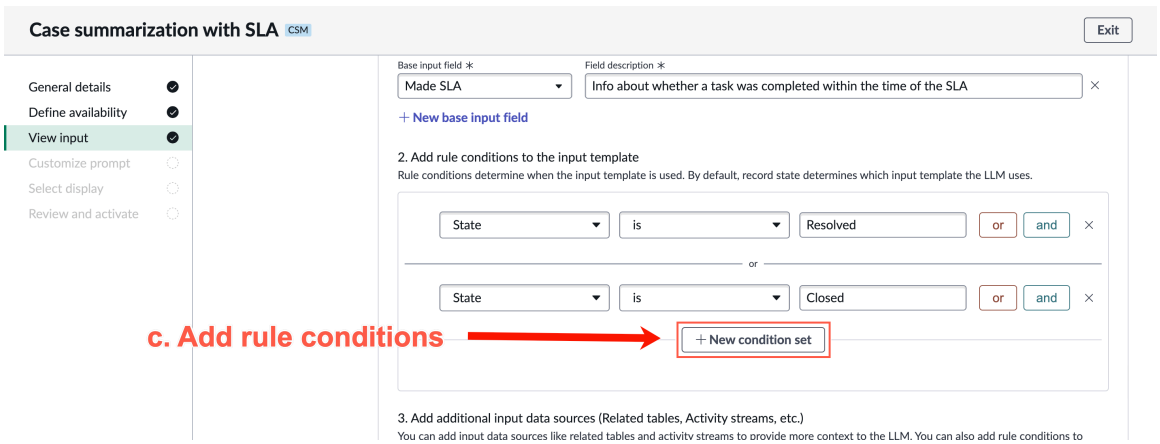
      Each base input table field requires a description. The description informs the large language model (LLM) what the field is for and how the information should be interpreted. The more information you provide in the description, the more context the model can work with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Add or modify the rule conditions for the base table.

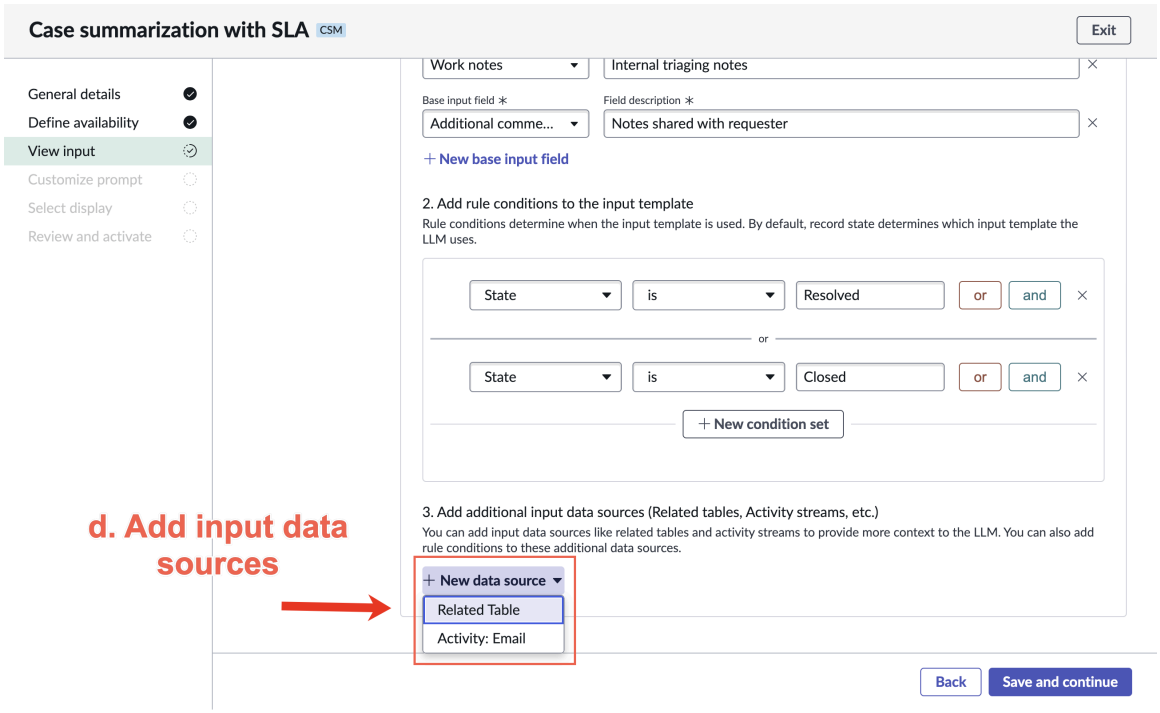
The rule conditions determine when the input template is used. Record summarization is only available to the records that match the rule conditions of an input template.



d. Optional: Add additional input data sources by selecting **New data source** and choosing either **Related Table** or **Activity: Email**.

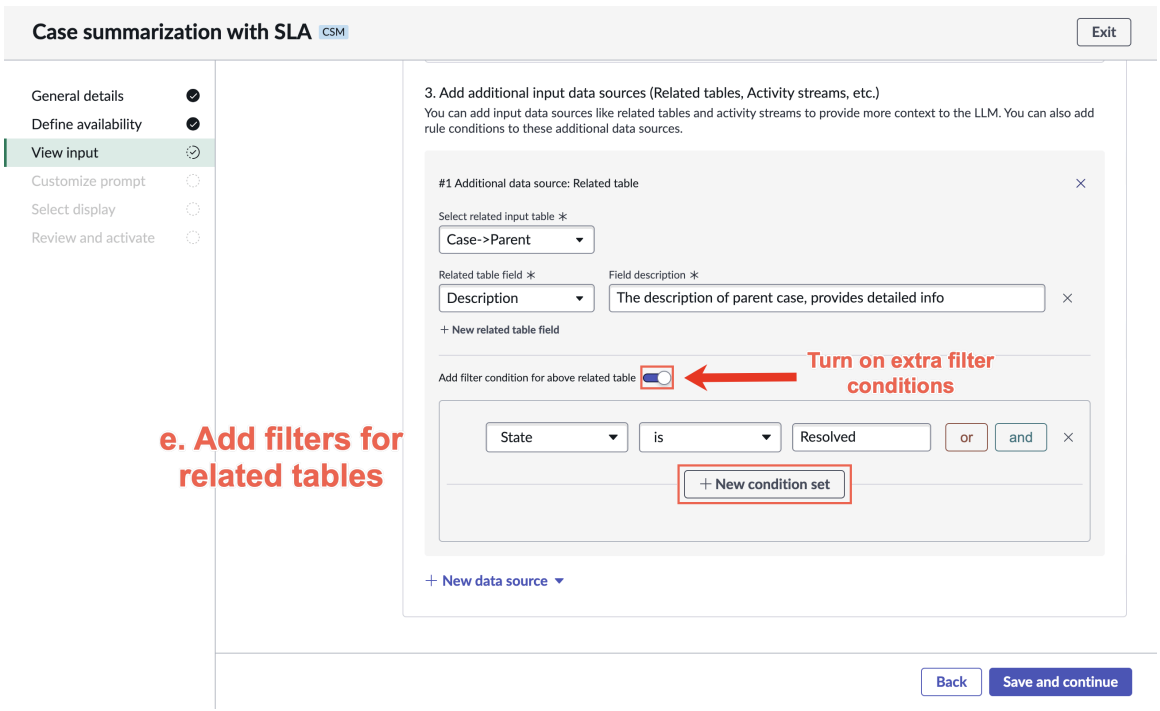
(Optional) Each related table is configured with input fields and descriptions. More specific descriptions for related tables help provide more context to the LLM. Activity fields, such as Email, don't have input fields that you can configure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Optional: Add a filter condition to the related table.

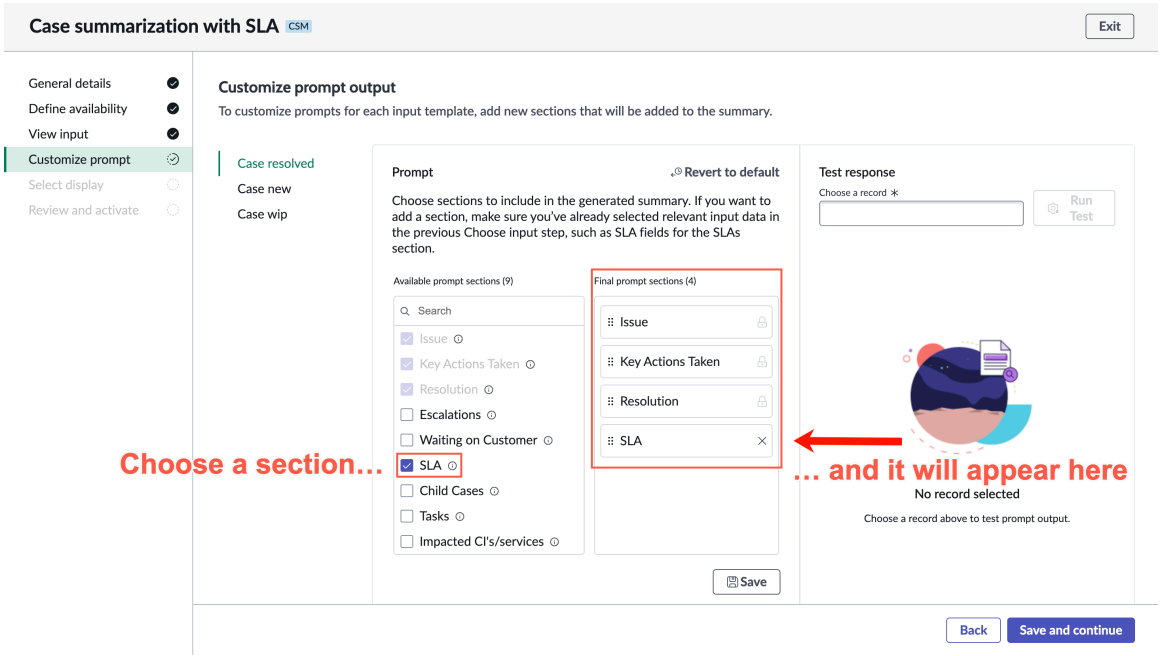
(Optional) You can add more rule conditions to the related table. These rule conditions determine whether the data from the additional data source is incorporated into the summary. You can generate summaries on cases that don't match additional data source rule conditions as long as the base table rule conditions are met.



5. Select **Save and continue**.
6. Choose prompt output sections to appear in summaries by moving a prompt section in the Available prompt sections list to the Final prompt sections list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can reorder sections by dragging the boxes in the Final prompt sections list. Some input templates have sections that are marked with the lock icon ( ). These sections must appear in the final summary, but you can still reorder them with any sections you have added.



7. In the Test response panel, select a record from the **Choose a record** field.
8. Generate a summary for the chosen record by selecting **Run Test**.

> **Important:** Each time that you test your prompt output, the operation counts as an assist that is tracked by your Now Assist subscription. To track your Now Assist usage, Monitoring Now Assist usage in Subscription Management.

Running multiple tests with different records can help confirm that you're satisfied with the results.

9. Select **Save and continue**.
10. Choose when the skill is available by selecting either **Skill is always available** or **Customize skill availability**.

    If you choose **Customize skill availability**, you can use the condition builder to add conditions that restrict when the skill is available. For example, you could make the skill only available for certain assignment groups.

11. Select **Save and continue**.
12. Choose where you want record summarization to be available by selecting the toggle next to your preferred display option.

    You can select both in-product, ServiceNow Otto panel, or both.

    - **In-product**: When selected, Now Assist skills are displayed on forms and workspaces.

      For the skills that appear in-product, select the down arrow to identify the roles that can use the skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **ServiceNow Otto panel**: When selected, Now Assist skills are available in the Now Assist panel. If you don't see this option, you must activate the Now Assist panel. For more information, see Activate the ServiceNow Otto panel standard chat.

  For the skills that appear in the Now Assist panel, select the down arrow to identify the roles that can use the skill.

You can add roles by entering the name of the role in the **User roles** field. You can remove existing roles by selecting the X icon in the role bubble. You must specify at least one role, but you can add as many roles as you like.

13. Select **Save and continue**.
14. Review your choices and select **Activate** to complete the configuration.

Result

Your customized version of case or incident summarization is active on the instance.

What to do next

Analyze your skill performance on the AI Admin Hub console to help determine the success of the new version of the skill. Learn more about tracking Now Assist usage at Monitoring Now Assist usage in Subscription Management.

Analyzing Now Assist usage

Use the Now Assist analytics and monitoring tools in the Overview page to review the summaries, skill usage information, and issues that need your attention.

AI Admin Hub Overview page

After you activate and begin using the skills, you can measure their usage over time with graphs that display important metrics. The console Overview page contains the information about skill performance, including the task completion over time, and a summary of which skills are active or available.

The following example shows the AI Admin Hub Overview page.

AI Admin Hub reference

Reference topics include information about user roles, data usage, and domain separation for AI Admin Hub.

Default and target model version

Model version is the large language model version a skill uses to route requests to process users' queries. Default model version is where all the requests route to by default. This is pre-set by ServiceNow®. A target model version is chosen to route your requests to a different version at run-time, rather than using the default version.

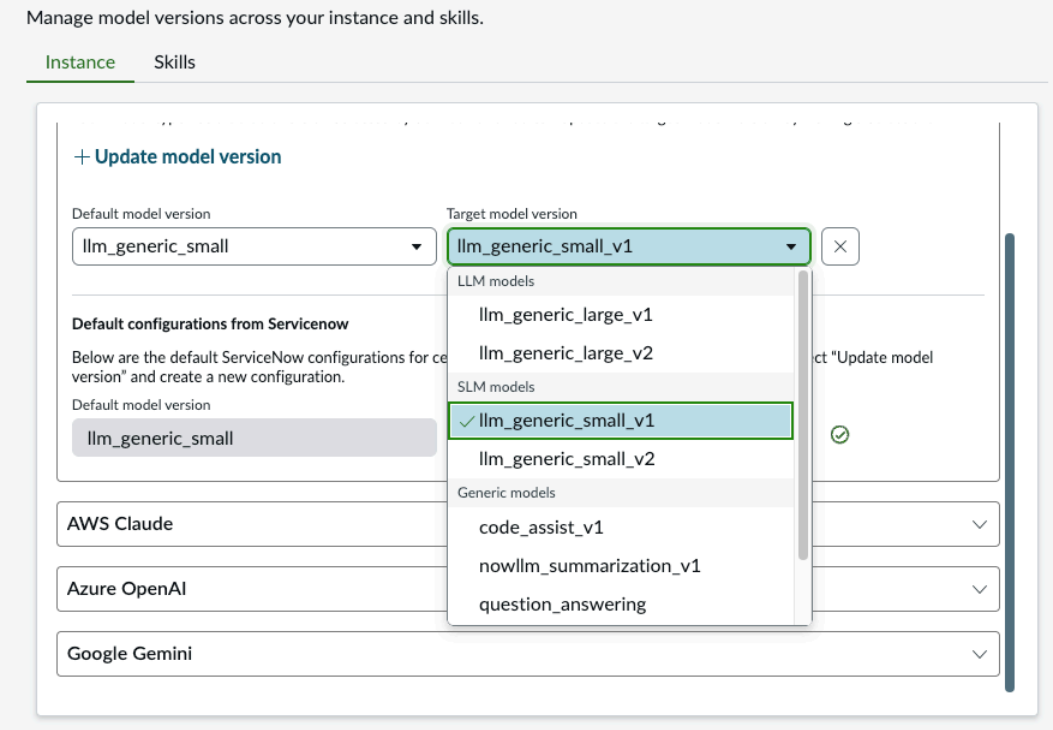
Updating the target model version at the instance level

Note:

- Model versions in the following states aren't available for selection: deprecated, retired, in review, rejected.
- Confirm that the model name you enter exactly matches the name configured in your external provider's console. A mismatch may cause the provider configuration to fail.
- Confirm that network access to the provider endpoint is allowed by your instance's proxy or firewall rules.

A default mapping of default and target model version is pre-configured. If you update the target model version for a selected default model version, all the associated skills with this version mapping at the current instance level, get impacted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Updating the target model version at the skill level

If you update the target model version for a selected default model version at the skill level, the mapping is updated for that skill only. Customizing the model version for skills overrides the instance-level model version currently assigned to each provider. This action is typically reserved for specific situations.

Domain separation in the AI Admin Hub console

Domain separation is supported for the AI Admin Hub console. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

In the AI Admin Hub console, generative AI capabilities are organized into skills. Each skill can be configured differently for each domain or you can create a variant of a skill for a domain. By default, all skills exist in the global domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in the AI Admin Hub console

You must enable domain separation on your instance first before you can use it for Now Assist skills.

Now Assist works with domain separation. When you use Now Assist in a domain-separated environment, users are only able to access data within their domain. For example, if a user uses the summarization skill, Now Assist only uses material that exists within the user's domain when generating that summary. When a skill is domain separated, only users who are in that domain can use the skill that you have configured for that scope.

If you're a service provider that hosts multiple clients in the same instance, you can set up domain separation to separate tenant data, processes, and administrative tasks. However, Assist consumption is tracked according to instance without differentiating between tenants. You can track your Now Assist usage in the Subscription Management dashboard.

If you want a domain to have a different version of an existing skill, you can reconfigure and activate the skill or create a variant in the preferred domain. See the section on granting access to Now Assist skills to a domain.

Use cases

You can configure the inputs, roles, triggers, and prompts when you’re activating or editing a skill or a later variant of the skill.

Some use cases include the following examples:

- Use the **Activity** field as an input in the incident summarization in one domain but only use the **short description** and **description** fields in another domain.
- Grant certain roles access to the Now Assist panel in one domain while another domain has no role restrictions.
- Trigger the generative AI capabilities by using quick actions in Agent Chat in only one domain.
- Create a variant of a skill to test one prompt in one domain while another domain uses the default prompt for the skill.

Granting a domain access to Now Assist skills

Domain separation is possible at the skill level and at the individual configuration level. When using the guided setup in the Now Assist Admin console, each configuration option has its own record that you can separate by domain. To create a record in a different domain, you must set up the skill while in the scope of your preferred domain.

1. Navigate to the Now Assist Skill Config (sn_nowassist_skill_config) table.
2. Add the Domain field to the list. If it isn't present, select the gear icon at the top of the list and add the Domain field into the Selected column, then select **OK**.
3. Find the skill that you want to enable on a domain-by-domain basis. Set Active to false on the skill that is in the global scope. You might need to change the scope to edit the record.
4. Change your current domain to the domain that you want to enable the skill in.
5. Navigate to **All** > **Now Assist Admin Console** > **Features**.
6. Navigate to the skill that you want to activate according to domain and select **Activate skill**.
7. Configure the skill as usual. For more information, see Activate an AI skill.
8. Return to the Now Assist Skill Config (sn_nowassist_skill_config) table. There should be a new record in the current domain. Open the new record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. In a different browser tab, return to the Now Assist Skill Config table and open the deactivated skill record in the global domain.
10. Compare the global skill record to the one created within your domain. Records on the related list may not be present in the domain-specific skill. If they are not there, you must recreate those records in your domain and attach them to the related list in your domain-specific skill.
11. Repeat the process for each skill and each domain where you want to have the skill available.

Domain separation for service providers

Fetch end points in Now Assist Conversational Help skills

The Now Assist Conversational Help skills architecture solves latency by fetching answers hosted at the nearest location, which is best suited to the user.

Fetching solutions hosted on multiple geographical location

The possible solutions to users queries posted on Now Assist Conversational Help skills are hosted on three main locations: Japan, EMEA and the US.

For optimal performance, the central instance should be situated in the same geographic area as the user's instance. To achieve this alignment, we utilize DISH service, a tool within the user's instance, that helps identify the correct endpoint. The Now Assist Conversational Help skills uses the Mimir lookup service feature, inside the different data centers.

The DISH service communicates with the Mimir lookup table to determine the end points matching the user's location. Once we obtain this endpoint, it gets securely stored in the sys-service table within the customer instance. Moving forward, all the users' queries are routed through the specific endpoint, ensuring consistency and reliability. The Get Help skill uses the endpoint present in the sys-property `com.snc.get_help.endpoint`.

Note: The Now Assist Conversational Help skill version is stored in sn_ads_now_help.com.snc_now_help_skill.version, ensuring backward compatibility within the conversational shared services.

AI Admin Hub roles

Certain roles are required to use AI Admin Hub functionality. The base admin (sys_admin) role does not automatically grant or include the following roles, so assign these directly to users who require them.

Now Assist Admin [sn_nowassist_admin.nsa_admin]

Can create and update the AI Admin Hub experience by editing and configuring skills.

Contains Roles

User data usage policy for Now Assist

Now Assist is designed to keep user data safe and secure. You can also mask sensitive data or opt-out of sharing data for model improvements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How your data is sent and stored

Your AI workloads are securely sent using Transport Layer Security (TLS) 1.2 from your ServiceNow instance to one of three centralized ServiceNow compute hubs (datacenters with GPUs for AI workloads), where the AI prediction processing takes place. The data used to generate the response is deleted from the compute hubs after the response has been generated. The result is then returned to the ServiceNow instance.

The input and output data isn't cached or stored on the compute hub and is transient.

Your data isn't commingled with other customer data when using Now LLM Service for generative AI.

Also, there's no commingling of data for domain-separated instances when you use Generative AI services.

When appropriate, ServiceNow might leverage third-party endpoint services (for example Azure OpenAI Service) to augment Now LLM Service to power Now Assist capabilities. Azure OpenAI is a third-party model, but policies same as the company's, apply, as it's hosted in our compute hubs.

Further, to confirm quality of service, ServiceNow might use Azure-hosted GPUs for Now LLM Service capacity bursting in case of high customer demand. Data processed by third-party endpoints isn't subject to use or access by third-party providers and are operated within the ServiceNow network boundary.

Mask sensitive data

Sensitive data can be masked before sending it to LLMs using Now Assist for Data Privacy. To learn more, see Configuring Data Privacy for ServiceNow Otto.

After you enable the plugin, it's designed to mask sensitive data before it's sent to the LLM, but could result in less accurate results because the specific data isn't included within the prompt.

Note: This plugin, within the context of generative AI products, doesn't mask the sensitive data that exists in records within your instance, nor does it help prevent new sensitive data from being stored on the instance itself.

ServiceNow might use Retrieval Augmented Generation (RAG) for selected AI features (for example NowAssist for AI Search) and passes information to the LLM based on what the requester can access within the system. If a user searches for something in the portal using Now Assist in AI Search, AI Search finds the article and then sends that to the LLM as a part of the prompt. Because AI Search knows what the user has access to, it won't send an article that the user isn't able to access.

Note: For some features, such as case summarization, the agent generating the summary might have more permissions than other people who have access to the record. If they choose to paste that summary to the work notes, the agent should check to confirm that the data they're sharing in the work notes is appropriate to share with others who have access to that record.

Opt out of data sharing

Data Sharing helps ServiceNow to continuously advance and improve its Now LLMs, based on the latest customer usage. If you no longer want to participate in the customer data-sharing program, you're able to opt out.

To opt out, follow the instructions in Opt out of data sharing for Now Assist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Troubleshoot an AI skill

Run diagnostics for a skill on the AI Admin Hub console to get information about the status of your skill configuration. The availability of diagnostics depends on the skill.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

About this task

Certain skills have diagnostic scripts that you can run from the AI Admin Hub console. These diagnostic scripts check for successful skill execution and setup of the underlying capability definitions. If you've made a copy of a skill, you will not be able to run diagnostics on the skill copy.

Procedure

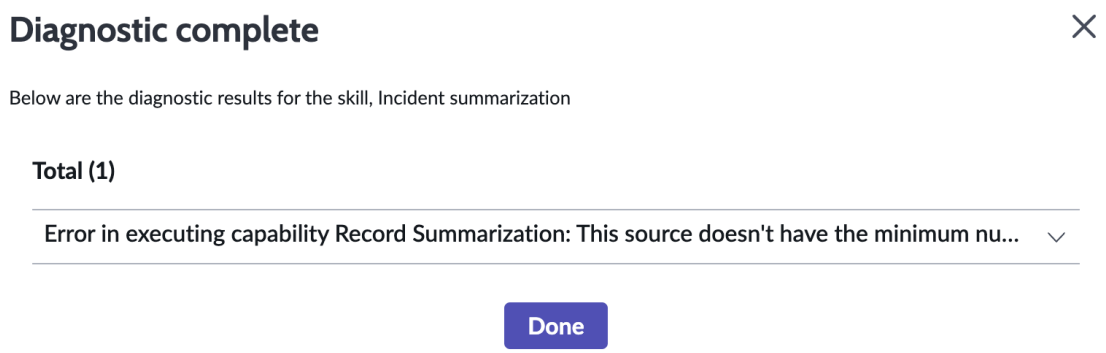
1. Navigate to **All** > *AI Admin Hub* > **Skills**.

   If you're already in the AI Admin Hub console, select the **AI Skills** tab.

2. In the navigation pane, select the workflow of the skill that you want to troubleshoot, such as **Technology** or **Customer**.
3. In the All skills or Active skills section, locate the card for the skill you want to troubleshoot.
4. Select the more options icon ⋮ for the skill, then select **Run diagnostics**.

   Note: **Run diagnostics** is grayed out or not visible when this option is unavailable.

5. After the diagnostics are complete, review the results of each test.



What to do next

If you have identified any problems with your skill configuration, you can edit the skill from the AI Admin Hub console.

If editing the skill does not solve the issue, you can contact ServiceNow Support for additional help.

ServiceNow Otto panel system properties

Use system properties to customize ServiceNow Otto panel. Some properties are available on a system properties form, but some lesser-used properties are available only from the System Property [sys_properties] table.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Note: Controls are available to enable or disable data collection and data processing.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Content Understanding

Content Understanding brings generative AI to document and visual processing, so you can extract, analyze, summarize, and answer questions about the content in your files.

Content Understanding is a suite of multimodal AI features designed to analyze unstructured content such as PDFs, forms, and images. It transforms this content into structured, actionable data within the ServiceNow AI Platform. This suite includes a variety of skills, and agents that deliver answers, information, summaries, and more to enhance your workflows. By converting information from files into usable values, Content Understanding minimizes the need for manual data entry in your processes.

Skills

Content Understanding includes the following skills:

Extract information from documents skill

Extracts specific fields, tables, and answers to questions from documents and images. You can configure this skill and its use cases in the AI Admin Hub.

Attachment summarization skill

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summarizes the contents of record attachments alongside the record summary in workspaces such as ServiceNow Otto for ITSM and ServiceNow Otto for HRSD.

AI agents

Content Understanding includes Content insights AI agent. You can add this agent to an agentic workflow to process documents and images. You can configure this agent in AI Agent Studio.

Configuration and usage of skills and AI agents

The following table lists where each skill and AI agent is configured, along with where you can interact with them.

Content Understanding skills and AI agents

Capability	Configured in	Where to interact
Extract information from documents skill	AI Admin Hub	Workspace integrations
Attachment Summarization skill	AI Admin Hub	ITSM Workspace, ServiceNow Otto for HRSD Workspace
Content insights AI agent	AI Agent Studio	ServiceNow Otto for Virtual Agent (conversational) or trigger-based

Content Understanding benefits

Content Understanding includes AI-powered skills and AI agents that extract, process, and summarize information from documents and images. Each capability delivers a distinct benefit for administrators and end users.

Capabilities and benefits

Capability	Type	Benefit
Information extraction	Skill	Transforms unstructured content in documents into structured fields, enabling teams to capture data without the need for manual entry.
Attachment Summarization	Skill	Condenses long attachments into concise summaries, so agents grasp the key points quickly.
Content insights AI agent	AI agent	Analyzes documents and images to extract relevant insights, enabling users to act on findings without reviewing source material.

Extract information from documents

The Extract Information from documents skill (Information Extraction skill) uses generative AI to automatically extract content from documents and images, and to respond to questions about that content.

With the Information Extraction skill, you can extract specific fields, tabular data, and answers about documents or images. You can then integrate the extracted data into your workflows. The skill transforms unstructured files, such as invoices, purchase orders, and contracts, into structured data that populates ServiceNow records, eliminating the need for manual data entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You configure this skill in the AI Admin Hub. You can define one or more use cases that specify what to extract from a particular type of document. For example, a use case for purchase order forms extracts date and number, captures an itemized list with prices, and answers questions about specific terms in the descriptions.

Important: The Extract Information from documents skill can't be cloned. To use the skill, create a new use case or copy an existing one. For more information, see Set up a use case or Copy a use case.

Define the information to extract

Within a single use case, you can define any combination of the following:

- Specific fields to extract, such as a date or a document number.
- A table structure with multiple columns to capture repeating line items.
- Questions for generative AI to answer based on the text and images in a document.

Benefits

The Extract information from documents skill provides the following benefits:

- Populates ServiceNow records with data extracted from documents.
- Reads both text and images in a document.
- Runs automatically or routes results to a reviewer for validation, depending on the automation mode.

Note: The Extract information from documents skill uses generative AI to process documents. Results may be inaccurate or incomplete. Review extracted data before using it in production workflows.

Scenarios

The Extract information from documents skill supports the following scenarios:

Field population

Extracts values from an uploaded document and writes them to the fields of a record.

Assisted review

Presents predicted values to a reviewer for validation before saving them to a record.

Related topics

Use cases in Information Extraction skill

Automation modes

Content extraction methods

The Extract information from documents skill (Information Extraction skill) supports three extraction methods—field, table, and Q&A—each suited for different types of document data. Understanding which method to use helps you capture and store the right information in ServiceNow.

The Information Extraction skill uses AI-assisted parsing to extract data from documents (invoices, purchase orders, and contracts) and then populates records in ServiceNow. Select a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

method or combination of methods that matches the type of information you want to capture and store in ServiceNow tables.

Field extraction

Field extraction captures specific, isolated data points from a document—values that appear exactly once—and maps each to a single field on a ServiceNow record.

Use field extraction for data such as:

- Invoice numbers, purchase order numbers, or document identifiers
- Vendor or customer names
- Dates, such as an invoice date, due date, or contract start date
- Monetary totals or tax amounts
- Addresses or other contact details

You can bundle related single fields into a logical group. For example, a Billing Address group can capture Street, City, State, and ZIP from the same region of a document.

Table extraction

Table extraction captures dynamic, multi-row data from documents where the number of entries varies between documents, such as invoice line items or expense report details. A table acts as a two-dimensional grid of rows and columns that captures a list of related records.

Use table extraction for data such as:

- Invoice or purchase order line items (quantity, description, unit price, total)
- Expense report breakdowns
- Parts lists or bills of materials
- Multi-page flight itineraries or timesheet entries

Q&A extraction

Q&A extraction uses generative AI to answer open-ended, natural language questions about the contents of a document. It is suited for unstructured text that does not fit neatly into a predefined field or table schema. The extraction processes meaning rather than matching a fixed pattern.

⚠ **Warning:** Q&A extraction uses generative AI and may produce inaccurate or incomplete results. Review all AI-generated output before using it to populate records.

Use Q&A extraction for questions such as:

- The reason for termination
- Special shipping or delivery terms
- The designated project manager
- Narrative clauses or conditional language from contracts

You can also use Q&A extraction to categorize documents.

Selecting an extraction method

Use the following guidance to choose the appropriate extraction method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extraction method selection guidance

Extraction method	When to use	Example
Field extraction	Use when the data point appears once and has a well-defined type.	A number, date, or name.
Table extraction	Use when the document contains a list or grid of repeating items where the row count is unknown or varies across documents.	Line items in an invoice or purchase order.
Q&A extraction	Use when the information is embedded in narrative text and requires interpretation rather than pattern matching.	An answer based on contract terms or policy text.

You can combine multiple methods within a single use case to handle all of the data types present in a document.

Use cases for the Information Extraction skill

Predictions in Information Extraction skill

A prediction is the value that the Information Extraction skill infers for each field, table, or question in a use case. Predictions drive automation decisions and can be applied automatically or reviewed by a person, depending on the use case configuration.

How predictions are generated

A prediction is the value that the Information Extraction skill infers for a field, table, or question in a specific use case. When you submit a document for processing, the skill processes its content and generates a prediction for each field, table cell, and question set in that use case.

A prediction shows what the skill identifies as the correct value based on the content in the document. Whether a prediction is applied without review or reviewed by a person depends on the automation setting for the use case. To understand how automation settings control whether predictions are applied automatically or sent for review, see Automation modes.

Prediction sources

Prediction sources by use case element

Use case element	Prediction
Field	A single value recognized in the document, such as an invoice number or a date.
Table	Row-level values extracted from a tabular structure in the document, such as line items.
Question	An answer generated from the document content in response to a configured question.

Use cases in Information Extraction skill

Use cases in the Information Extraction skill define what documents to process and what information to extract, so generative AI can accurately retrieve structured data from unstructured documents.

A use case defines the document type to process and the specific information generative AI extracts from it. A single use case applies to all documents that share a common set of values to extract, even when those documents aren't in the same format.

Common use cases

Invoice processing

Extract line items, invoice numbers, totals, and vendor details from PDFs or scanned vendor invoices. For an example implementation, see ServiceNow Otto for Accounts Payable Operations (APO).

HR onboarding

Extract fields such as national IDs, tax declarations, and emergency contacts from employee documents.

Field service

Extract data from purchase orders, equipment maintenance sheets, or work orders to pre-populate service tasks.

Use case structure

A use case consists of the use case record and its related fields, tables, questions, any integrations, and workflows.

- Fields identify specific information within documents relevant to predictions.
- Tables extract information from cells within table columns.
- Questions generate answers based on an analysis of the text and images within a document.

Use case setup

Use case setup includes defining the use case name and details, specifying fields, tables, and questions, configuring integrations and flows, and testing the use case.

The following guidelines help improve extraction precision and relevance.

Identify your requirements

Clearly describe the specific field, table, or answer you want to extract.

Use field prompts

Use the relevant field prompts and descriptions customized for your use case. This guides the extraction process.

Follow the recommended format

To improve accuracy, follow the format provided in the on-screen **Field Assistance** tab. This produces consistent results.

Adjust descriptions

Field descriptions may change during test executions. Reviewing changes helps improve your extraction results.

Follow

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case–based extraction flow

Schema definition

You create a use case by defining a schema — a set of specific fields, tables, and questions that you need from that document.

Intelligent extraction

Rather than using rigid templates, generative AI uses the use case to identify the document's structure and extract the target information. Results may vary and human review is recommended before using extracted data in automated workflows.

Workflow automation

After generative AI extracts the data, it populates the required fields in your ServiceNow® workflows, such as ITSM, Field Service Management for Telecommunication, or ServiceNow Otto for HRSD.

Note: When full automation mode is enabled, fulfiller verification is skipped.

Automation modes

Automation modes in the Information Extraction skill determine whether predictions are accepted automatically or routed to a human agent for review before a document task completes.

The Extract information from documents skill (Information Extraction skill) generates predictions for every field, table, and question configured in a use case, regardless of automation mode. The subsequent steps depend on whether the use case is set for full automation.

Automation mode comparison

Automation mode	Description	Suitability
Full automation	Predictions are accepted directly with no review. This mode eliminates the need for manual review by relying entirely on automated predictions. The document task is completed immediately and the integrated workflow continues. **Note:** If any essential fields lack a prediction, you have an option to halt the extraction process. This functionality enables a Human-in-the-Loop (HITL) review to start when crucial predictions are absent, ensuring accuracy and reliability in the data extraction process.	Use this mode when prediction accuracy is consistently high and the risk of errors is low.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation mode comparison (continued)

Automation mode	Description	Suitability
Agent review	The document task is forwarded to a human agent, who validates or corrects the predicted values. The task is completed, and the integrated workflow continues, only after the agent's review.	Use this mode when errors could lead to significant costs, or when prediction reliability has not yet been established.

Information Extraction skill workflow

Information Extraction is a skill that analyzes documents to provide values for defined fields, table columns, and questions in a use case. It populates ServiceNow records with extracted data from documents.

Processing stages

When a document enters a workflow, the Information Extraction skill examines its content and retrieves the requested information according to the use case. The use case defines what to extract from a document and where to write the results. After a use case is configured, the skill follows these stages at run time:

Stage 1: Document task creation

A trigger — such as a document upload, an inbound email, or an attachment added to a record — creates a document task.

Stage 2: Prediction

The Information Extraction skill processes the document and returns a prediction for each field, table column, or question in the use case.

Stage 3: Review or automation

In full automation mode, the predictions populate the fields in the target table. In agent review mode, the document task goes to a fulfiller, who validates or corrects the predicted values.

Stage 4: Completion

After the document task is complete, the predictions populate the target fields and the integrated workflow continues.

Attachment Summarization

The attachment summarization skill summarizes a record's attachments alongside the record summary, so agents can review key content without opening each file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With the Attachment Summarization skill, agents can view a concise summary of each attachment alongside the record summary. The skill is available in the ServiceNow Otto for IT Service Management (ITSM) and HR Service Delivery workspaces.

Uses of the Attachment Summarization skill

- Triage records that contain one or more attachments.
- Highlight key points of an attachment alongside the record summary.
- Reduce the time agents spend reviewing attachments to find relevant context.

Key capabilities and features

- Supported file types: Processes common file formats such as PDFs, DOCX, TXT, XLSX, CSV, PPTX, JPEG, and PNG.
- Automated triage: When configured, it triggers automatically as soon as a file is uploaded, appending the summary directly to the incident's work notes or activity stream.
- Knowledge Builder: Can analyze attachment content to suggest relevant knowledge articles or extract resolution steps.

Related topics

Configure Attachment Summarization skill

Content insights AI agent

The Content insights AI agent understands documents and images, answers questions, extracts structured data, and summarizes content within a single interface.

The Content insights AI agent processes context from user inputs and attached documents or images. It generates the requested information based on this content and returns it with any relevant task details. You can incorporate the agent into an agentic workflow to enhance document and image understanding within a multi-step automated process.

You configure the Content insights AI agent in AI Agent Studio. Sometimes, the AI agent uses a use case that extracts relevant fields and saves them to the target table. The use case is configured within the Information Extraction skill in the AI Admin Hub.

Note: AI-generated output may be inaccurate. Review all content the agent generates before using it in business processes.

You can provide documents or images to the agent in either of the following ways:

Reference a record

Provide a record number, such as INC0010003, or a sys_id and table name. The agent retrieves all attachments from that record.

Upload a file directly

Upload a document or image directly in the chat window.

Supported content

The Content insights AI agent processes documents and images, such as PDF, DOCX, PNG, and JPEG files.

Agent capabilities

The agent provides three capabilities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question and answer (QnA)

Ask specific questions about documents and images and get accurate answers with citations.

Key information extraction (KIE)

Extract structured data using predefined templates.

Document summarization

Get concise summaries of document and image content.

Note: Interact with the agent directly. The agent orchestrates the underlying tools automatically.

Extract information from documents

Use cases in Information Extraction skill

Configuring Content Understanding

Configure the capabilities in Content Understanding to extract, analyze, and answer questions about your document and visual content.

Configuration depends on the capability you want to use. The Extract information from documents skill (Information Extraction skill) and Attachment Summarization are configured in the AI Admin Hub. The Content insights AI agent is configured in AI Agent Studio. Use the following topics to set up and configure Content Understanding:

- Configure Information Extraction skill
- Configure Content insights AI agent
- Configure Attachment Summarization skill

Configure Information Extraction skill

Configure the Extract information from documents skill (Information Extraction skill) to define how AI agents identify and pull structured data from unstructured sources. Use this configuration to control extraction behavior, map output fields, and integrate results into your workflows.

The Information Extraction skill processes unstructured documents and returns structured field values that AI agents can use in downstream workflows. You configure the skill by activating it and defining use cases that map document content to output fields.

Note: AI-generated extraction results may not always be accurate. Review extracted data before using it in automated decisions or business processes.

The Extract Information from documents skill can't be cloned. To set up the skill, activate the skill and configure a use case. See Activate the Extract Information from documents skill and Set up a use case.

Activate the Extract Information from documents skill

Activate the Information Extraction skill, so AI agents can analyze and extract information from documents using generative AI.

Before you begin

Before activating the Information Extraction skill (also known as Extract Information from documents skill), make sure the Content Understanding application is installed.

Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Content Understanding skills are enabled by default and are automatically available to users with the appropriate application roles. This default behavior functions as follows:

- New users: When you install a ServiceNow Otto (plugin) product, it automatically enables the designated skills.
- Existing users (starting with Australia Patch 1): There is no change to skills that are currently enabled or customized. A skill is turned on if the ServiceNow Otto plugin is installed, but the skill was never turned on, and an admin has never adjusted its roles. A skill is not turned on if it was previously turned on and then turned off, or if an admin has adjusted its roles.

If a skill was previously turned on and then turned off, or if an administrator adjusted its roles, perform this task to reactivate it.

Note: This task doesn't apply to the multimodal chat skill. The multimodal chat skill enables chat responses about the content of uploaded documents and images. It is used only on the server side by the Content insights AI agent and by the question answering capability in ServiceNow® Otto for Virtual Agent, and it doesn't require configuration in the AI Admin Hub.

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Skills**.
2. In the workflow list, select **Platform** > **Other**.
3. Search for the Extract information from documents skill.
4. Select **Activate skill**.

What to do next

Set up a use case

Set up a use case

Create a use case to define the information to extract from a document for processing.

Before you begin

Several predefined use cases are available within their defined workflow areas. Check whether the available use cases meet your requirements before creating a new one. For more information, see Content Understanding integrations.

Activate the Information Extraction skill. For more information, see Activate the Extract Information from documents skill.

Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager]

About this task

In a use case, specify the document type to process, the fields and tables to detect, the questions to ask, and where to store the results.

After you define a use case, you can begin processing documents for it in the related workflows.

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Skills**.
2. In the workflow list, select **Platform**.
3. From the Platform skills list, search for **Extract information from documents skill**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the options menu ( ), and then select **Edit**.
5. Select **New use case**.
6. Define a use case.

   a. Enter a name for the use case.

   b. Select a target table to store the document processing results for the use case.

   c. Select the language of the files to process for the use case.

      If the files contain multiple languages, select the primary language.

      For more information, see Languages supported by Content Understanding.

   d. Select a large language model (LLM) that will make predictions for the documents processed with this use case.

      For more information, see Large language models used by Content Understanding.

   e. **Optional:** Turn on image mode to process images more efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) Image mode sends pages to the LLM as images to use the visual capability of the multimodal LLM and any of the languages supported by it.

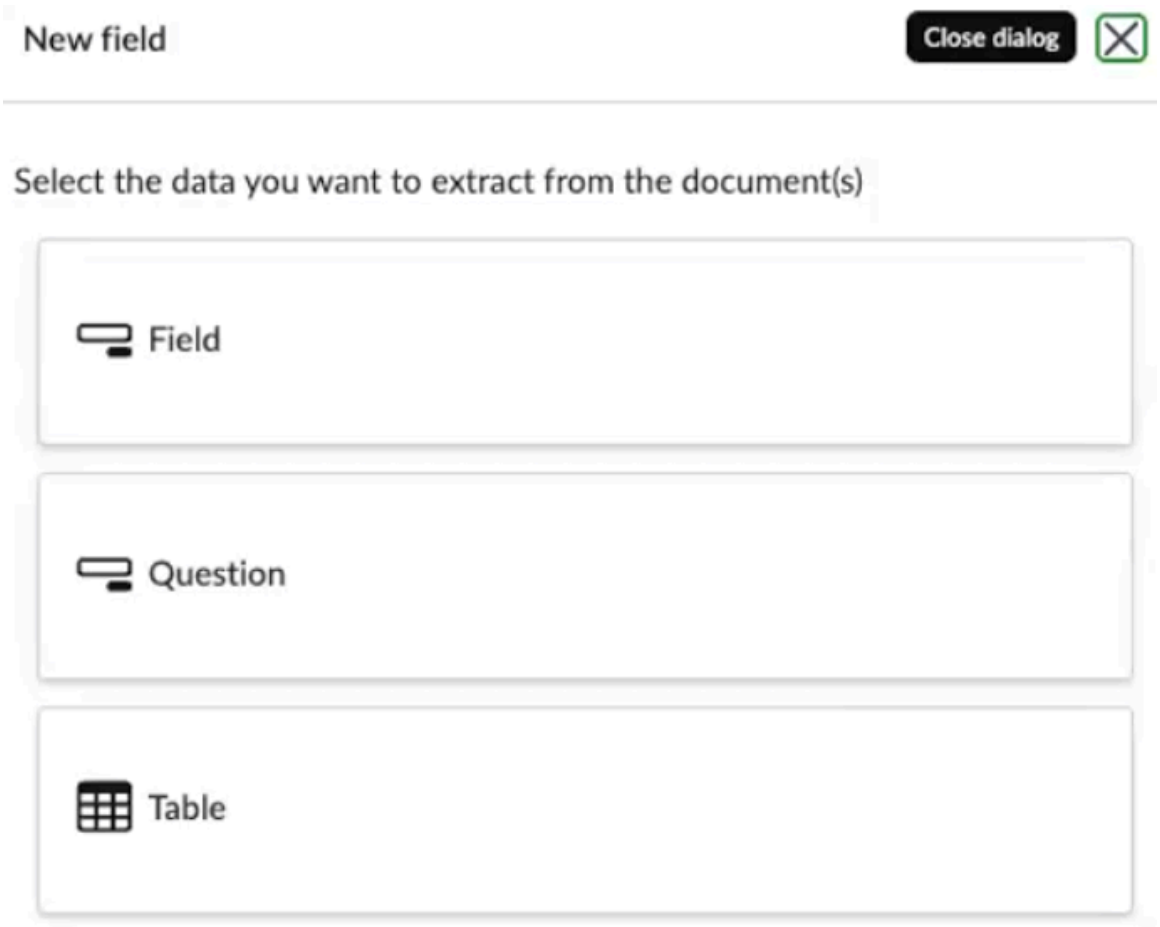
Note: Selecting image mode reduces the page count limit to 10 pages per file.

The image mode option is available when a multimodal LLM is selected.

Note: Now LLM Service is a text-only model and doesn't support image mode.

f. Select **Save and continue**.

7. Define information fields, questions, or tables.



a. Select **Add a field**.

b. Select the type of information to extract from the document.

You can choose one of the following:

Field

Fields are used to extract a single piece of information in the document. For example, a document number or a customer name.

Question

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define a question to ask about the document.

Table

Tables are used to extract lists or tables of information. A table can have multiple columns. The number of list items or table rows doesn't have to be known in advance.

A field form displays based on the information type you selected.

c. On the form, fill in the fields.

The type of form depends on the type of field:

- Field form fields
- Question form fields
- Table form fields

d. Select **Save**.
The field, question, or table is added to the Information list for the use case.

e. Select **Save and Continue**.

What to do next

1. Test a use case
2. Add integration
3. Review and activate

Test a use case

Test a use case with a sample document to verify how well it extracts and processes information. Upload a document from a record or your device, then review the test outputs before saving your results.

Before you begin

Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager]

Procedure

1. Select **Test a new document**.
2. Select a document:

Document upload options

Option	Description
Upload from record	**a.** Select **Upload from record**. **b.** Enter search criteria in the search field. **c.** Select a record from the list. This option appears only when a target table is selected for the use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Upload from this device	**a.** Select **Upload from this device**. **b.** Select **Add file**. **c.** Select a file and select **Open**. **d.** Select **Upload**.

3. Select **Continue**.

   Tip: Select the **Open in a new tab** button ( ) to view the document in a larger workspace on a separate browser tab.

   The Test Outputs screen appears.
4. Review the performance of the skill for the test document.
5. Select **Save and continue**.

What to do next

1. Add integration
2. Review and activate

Add integration

Connect a use case to a workflow by adding an integration. Integrations automate document task creation or value extraction based on triggers in the target table.

Before you begin

Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager] role

Procedure

1. Select **Add integration**.

   This option is available when a target table is selected for the use case.

   If you have already defined one or more integrations and you want to add another, select **New integration**.
2. Enter a name for the integration.
3. Select the type of integration you want to use.

   The `Process task` type creates an integration point to automatically create and process document tasks based on specific triggers happening in the target table.

   The `Extract values` type creates an integration point to automatically propagate the extracted values to the target table when extraction has been completed.
4. Use the conditions to select certain fields as specific triggers for the integration.

   Conditions are available if you selected `Process task` in the previous step. For more information on conditions, see OR conditions.
5. Select the **Create Flow** option to create a flow for this integration in Workflow Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: This option should be selected, unless you're planning to write your own custom script to set up the integration. Be sure the integration is activated on Workflow Studio. For more information, see Building flows.

6. Select **Save**.
7. Select **Save and continue**.

What to do next
Review and activate

Review and activate

Review your configuration selections before completing the setup for a use case. Return to any previous step to make changes before finalizing.

Before you begin
Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager]

Procedure

1. Review the configuration selections you've made for the use case.
2. **Optional:** Select **Back** to return to a previous step and make a change.
3. Select **Complete setup**.

Related topics

Review predictions in Information Extraction skill

Turn on full automation mode

Turn on Full automation mode to automatically complete and submit document tasks without an agent review. Full automation mode is turned off by default in document extraction use cases.

Before you begin

- Set up a use case for the Information Extraction skill. For more information, see Configure Information Extraction skill.
- Role required: DocIntel Manager [sn_docintel.manager]

About this task
The extraction mode determines how Content Understanding processes document tasks for a use case. For more information, see Automation modes.

Warning: AI may not always produce accurate, complete, or appropriate information. By choosing to bypass the agent review, there is no way to check the accuracy of the predicted values before using the data in your workflows.

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Skills**.
2. In the workflow list, select **Platform**.
3. In the Platform skills list, find the Extract Information from documents skill and select **Edit** in the options menu ( ).
4. Select the use case you would like to configure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the settings icon ().
6. On the Extraction mode screen, select the **Full automation mode (no agent review required)** option.
7. **Optional:** Select the **Any required field is missing in the document** option to turn off the automation and require an agent review when any of the required fields are missing in the document.
8. Close the Settings box.

Manage use case

Administrators can manage an existing use case by changing the LLM, editing configuration details, creating a copy, deactivating, or deleting it.

About this task

- Change the language models for a use case
- Copy a use case
- Edit a use case
- Deactivate a use case
- Delete a use case

Change the language models for a use case

Select the LLM and file language for a use case to control how documents are processed for information extraction. Change these settings when the default model doesn't suit your use case.

Before you begin

- Set up a use case for the Information Extraction skill. For more information, see Set up a use case.
- Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager].

About this task

Language models detect information in documents and make predictions for information extraction.

Third-party LLM providers are available for skills and AI agents in addition to Now LLM Service. For more information on LLMs, see Manage AI models.

For each use case, only one LLM can be enabled at a time. The selected LLM processes documents for the use case.

For image files that need optical character recognition (OCR) to detect the text in them, OCR models are used to support different language groups. The language selected during use case setup helps the OCR model to detect text in the images.

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Skills**.
2. In the workflow list, select **Platform**.
3. In the Platform skills list, find the applicable skill.
4. Select **Edit** in the options menu ( ) for that skill.
5. Select the use case to configure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the Settings icon ( ).
7. Select the **Manage LLMs** tab.
8. Select the LLM to use for predictions on documents processed with this use case.

   For more information, see Large language models used by Content Understanding.
9. **Optional:** Turn on image mode to process images more efficiently.

   (Optional) Image mode sends pages to the LLM as images to use the visual capability of the multimodal LLM and any languages it supports.

   The image mode option is available when a multimodal LLM is selected.

   Note: Selecting image mode reduces the page count limit to 10 pages per file.
10. Select the **Language of the files** processed for the use case.

    If the files contain multiple languages, select the primary language.

    For more information, see Languages supported by Content Understanding.
11. Select **Save**.

Result
The selected LLM and file language are saved for the use case.

Copy a use case

Copy an existing use case to use as a starting point for a similar one. The copy includes the original fields, tables, questions, integrations, and flows.

Before you begin
Role required: sn_docintel.manager or sn_docintel.admin

Procedure
1. Navigate to **All** > *AI Admin Hub* > **Skills**.
2. In the workflow list, select **Platform**.
3. In the Platform skills list, locate the skill that contains the use case you want to copy.
4. In the options menu ( ), select **Edit**.
5. In the options menu ( ) for the use case you want to copy, select **Make a copy**.
6. In the confirmation dialog, select **Make a copy**.
7. Select **Continue**.
8. In the **Name** field, enter a name for the use case.
9. Select **Make a copy**.

Result
The copied use case appears in the use cases list.

What to do next
Edit the new use case to make any necessary changes, then test it to confirm it works as expected. For steps to edit a use case, see Edit a use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit a use case

Update an existing use case to modify its name, fields, tables, questions, integrations, and flows. Use cases marked as read-only must be copied before you can edit them.

Before you begin
Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager] role

About this task
Use cases marked as read-only can't be edited. To edit a read-only use case, first make a copy of it. For more information, see Copy a use case.

Procedure
1. Navigate to **All** > **Now Assist Admin** > **Skills**.
2. In the workflow list, select **Platform**.
3. In the Platform skills list, find a applicable skill.
4. Select **Edit** in the options menu ( ) for that skill.
5. In the row of the use case you want to edit, select **Edit** in the options menu ( ).
6. Make changes as needed.

   For more information on use case setup, see Set up a use case.

Deactivate a use case

Deactivate a use case to stop it from being applied during document processing when it is no longer relevant to your document intelligence workflows.

Before you begin
Role required: DocIntel Admin role [sn_docintel.admin] or DocIntel Manager role [sn_docintel.manager]

Procedure
1. Navigate to **All** > *AI Admin Hub* > **Skills**.
2. In the workflow list, select **Platform**.
3. In the Platform skills list, find a applicable skill.
4. Select **Edit** in the options menu ( ) for that skill.
5. In the row of the use case you want to deactivate, select **Deactivate** in the options menu ( ).
6. In the confirmation box, select **Yes**.

Result
The use case is deactivated and isn't applied during document processing.

Delete a use case

Delete a use case and its associated fields, tables, questions, integrations, and flows from a skill when the use case is no longer needed.

Before you begin
Role required: DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager] role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Admin Hub* > **Skills**.
2. In the workflow list, select **Platform**.
3. In the Platform skills list, find a applicable skill.
4. Select **Edit** in the options menu ( ) for that skill.
5. In the row of the use case you want to delete, select **Delete** in the options menu ( ).
6. In the confirmation dialog, select **Delete**.

Result
The use case is deleted, including its associated fields, tables, questions, integrations, and flows.

Configure Content insights AI agent

Configure the Content Insights AI agent to control which roles can access it, how it is triggered, and which chat assistants surface it.

Before you begin
Role required: AI Agent Admin [sn_aia.admin]

About this task
The Content Insights AI agent requires configuration before users can interact with it. You define access roles, triggers, and the chat assistants that surface the agent.

Procedure

1. Open AI Agent Studio.
2. Locate the Content Insights AI agent.

   Select **Explore All** or **AI agents** to browse the list of agents, or search for the agent by name.
3. Select the Content Insights AI agent.
4. From the options menu ( ), select **Duplicate** to create an editable copy.

   Note: All edits apply to the copy. The original agent remains unchanged.
5. In the **Define security controls** section, select **Define user access**.
6. Select edit ( ).
   The Edit ACL dialog opens.
7. Add the roles that require access to the agent, and then select **Update**.

   Determine which roles on your instance must use the agent, and add those roles. For example, you might add a requester role or a fulfiller role.
8. In the **Add triggers** section, select **Add triggers**.
   The Add a trigger dialog opens.
9. Select a trigger and then select **Add**.

   You add triggers to define the conditions or events that start the agent. For example, add a trigger for an inbound email.
10. In the **Select channels and status** section, configure the channels and status for the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Turn on the **Allow** toggle to enable the agent on ServiceNow Otto for Virtual Agent.

b. In the **Chat assistants** field, select an assistant to add the agent to.

11. Select **Save and test**.

12. Test and deploy the agent.

a. Run a test on the testing page.

b. Deploy the agent.

Result

The Content Insights AI agent is deployed and available to users with the access roles you defined. The agent activates through the triggers and channels you configured.

Configure Attachment Summarization skill

Configuring Attachment Summarization skill to automate key information extraction from documents.

Attachment Summarization is an AI-powered skill available through IT Service Management and ServiceNow Otto for HR Service Delivery (HRSD). It automatically reads and summarizes the content of uploaded documents, extracting key information in near real-time and significantly reducing manual triage time for agents.

For more information, see Customize a ServiceNow Otto for IT Service Management (ITSM) Incident Summarization skill or Configure attachment summary.

Attachment Summarization

Using Content Understanding

Use Content Understanding to process and extract meaning from unstructured content in your ServiceNow instance. This section provides an overview of the workflow and links to the tasks required to complete the process.

Related topics

Use Content insights AI agent

Use Information Extraction skill

The Information Extraction skill generates predictions from activated use cases. In agent review mode, you review and correct predictions before the extracted values populate your records.

After you activate a use case in agent review mode, review and correct the predictions that the Information Extraction skill generates before the extracted values populate your records.

Review predictions in Information Extraction skill

After a use case is activated in agent review mode, you can review the predictions generated by the Information Extraction skill and, if needed, modify them before submitting.

Before you begin

Role required: fulfiller

About this task

When a use case runs in agent review mode, each document task remains open until a fulfiller validates the predicted values before the extraction completes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In full automation mode, the review step is skipped and the predictions are applied directly. However, if any required fields are missing predictions, you can pause the extraction process to initiate a Human-in-the-Loop (HITL) review, ensuring accuracy in data extraction.

For more information, see Automation modes.

After you activate your use case, the skill processes documents and generates predictions each time the trigger conditions are met. Each execution creates a document task.

Procedure

1. Navigate to the Document Tasks [sys_di_task] table.

   Tip: To access the Document Tasks table directly, use the following URL format:

   ```
   https://<instance-name>.service-now.com/sys_di_task_list.do
   ```

2. Open the document task that you want to review.
3. Select **Show in Doc Intel**.

   The **Extract Information** workspace opens.

4. Review each prediction, and then accept the value if it's correct or edit it if it isn't.
5. Submit the document task.

Result

After you submit the reviewed values, the second workflow is triggered. This workflow extracts data from the document and populates the fields in the target ServiceNow table.

What to do next

Some workflows incorporate Content Understanding directly into their workspace, so the review happens in that workflow's interface. For other use cases, an administrator can create a UI action to embed the skill in the workspace that the relevant fulfillers use.

Set up a use case

Use Content insights AI agent

Use the Content Insights AI agent to generate information from your inputs, attached documents, or images

Use the Content insights AI agent to:

- Ask questions about documents and images
- Extract key information from documents
- Summarize documents and images

Ask questions about documents and images

Use question and answer (QnA) to ask the Content Insights AI agent specific questions about document or image and get cited answers. QnA is the agent's default mode.

Before you begin

Role required: sn_aia.admin

About this task

Use QnA when you:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Have a specific question about document or image.
- Want to classify or categorize a document.
- Want to extract values without a predefined template.
- Are asking multiple questions about one or more attachments.

QnA requires a document or image, provided by record reference or upload, and your specific question.

Note: The agent may produce inaccurate results. Review all AI-generated answers before using them.

Procedure

1. Configure the Content Insights AI agent.
   For more information, see Configure Content insights AI agent.
2. Open the ServiceNow Otto panel or ServiceNow Otto for Virtual Agent.
3. Start a conversation with the agent by typing an utterance.
   Include the document, image, incident, or record that you need the agent to process.
4. Ask your question in natural language.
   - Ask clear, specific questions, such as `What is the total invoice amount?` rather than `Tell me about the invoice.`
   - Use simple language and avoid complex logic or conditionals.
   - Combine multiple questions into a single query, such as `What is the effective date, termination clause, and governing law?`
   - Frame requests as questions starting with words such as `What`, `Who`, `When`, or `How much`.
5. Review the AI-generated response.
   Verify the answer against the source document before using the results.

Result

The agent displays the answer with citations from the source document or image.

Example: Example utterances

With uploaded documents:

- `What is the main obligation in this document?`
- `Who are the parties in the attached file?`
- `What type of document is this?`
- `What are the confidentiality terms in this PDF?`

With record references:

- `What is the subject of the document attached to incident INC001234?`
- `Who is the client in the file attached to record TASK123456?`
- `What are the payment terms in the document linked to TASK456789?`
- `What is shown in the screenshot attached to INC001234?`

With an attachment sys_id:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `What is the governing law in attachment sys_id abc123?`
- `Who wrote the document with sys_id 123 from table abc?`

Extract key information from documents

Use key information extraction (KIE) to extract structured data from documents with a predefined template, for processing standardized documents such as invoices, contracts, or forms.

Before you begin

Before using KIE, verify that a use case (task definition) is created and configured for your document schema. Have the task definition name, the names of the keys to extract, and either the sys_id of the task definition or search terms that match its name.

Role required: sn_aia.admin

About this task

Use KIE when you:

- Have a predefined task definition (template) for your document type.
- Want to extract specific, structured fields consistently.
- Are processing multiple documents of the same type.

Note: If you request an extraction, for example "extract X and Y," without providing a task definition, the agent treats the request as a question-and-answer (QnA) request instead.

Procedure

1. Configure the Content Insights AI agent.
   For more information, see Configure Content insights AI agent.
2. Open the ServiceNow Otto panel or ServiceNow Otto for Virtual Agent.
3. Start the AI agent by entering an initial message.
   Include the document that the agent should process.
4. Specify the task definition.

   Provide the task definition sys_id for the fastest processing, or use search terms that match your task definition name. For example:

   - `Extract the values in the attachment of incident INC001234. Use task definition sys_456.`
   - `Extract data from attachment sys_123 of record INC001234. Use task definition sys_987.`

   If you don't provide a task definition, the agent prompts you for a sys_id or search query. For example, entering `Extract the values in the attachment of incident INC001234` causes the agent to ask for a task definition before proceeding.

5. Confirm the task definition when prompted.
   When the agent displays search results, confirm which task definition to use before extraction proceeds.

Result

The agent displays the extracted values and provides a link to the full extraction results. Processing time varies with document size and schema complexity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summarize documents and images

Use the Content Insights AI agent to generate a concise summary of document or image from a record reference or uploaded attachment.

Before you begin
Role required: AI Agent Admin [sn_aia.admin]

About this task
Use summarization when you need a high-level overview of document or image, are reviewing multiple attachments, or need to understand a document's purpose before reviewing its details.

Summarization requires only a document or image, provided by record reference or upload.

Procedure

1. Configure the Content Insights AI agent.
   For more information, see Configure the Content Insights AI agent.
2. Open the ServiceNow Otto panel or ServiceNow Otto for Virtual Agent.
3. Start the AI agent by entering a request.
   Provide the document or image that you want the agent to process.
4. Request a summary using clear language.
   Include the word "summarize" or "summary" in your request, and specify which document or attachment to summarize.

Result
The agent displays a concise summary of the document or image.

Example: Example utterances

Basic requests:

- `"Summarize these attachments."`
- `"Provide a summary of the uploaded document."`
- `"What does this file contain? Summarize it."`

With record references:

- `"Summarize the attachment from incident INC001234."`
- `"Summarize the document attached to record TASK123456."`
- `"Summarize the images attached to INC001234."`

With an attachment sys_id:

- `"Write a summary of the attachment with sys_id ABC123."`
- `"Give me a summary of attachment sys_id 12234 from table incident."`

Content Understanding Reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Content Understanding.

- Data normalization
- Limitations in Content Understanding

Content Understanding personas

Personas define the roles that interact with Content Understanding and the actions each role performs.

Content Understanding personas

Persona	Description
Admin	Activates capabilities, configures use cases (fields, tables, questions, extraction mode), and manages related integrations and flows. Requires the DocIntel Admin [sn_docintel.admin] or DocIntel Manager [sn_docintel.manager] role.
Fulfiller or human agent	Works a record, such as a case or task, and uses Document Q&A or attachment summarization to get context from an attachment without opening the file. Reviews a document task when its use case is not set for full automation, and validates or corrects the predicted values before the task is completed. For more information, see Automation modes.
Requester or end user	Submits the record or request associated with a document and may also need quick answers about an attachment's content. Uses Document Q&A conversationally in Virtual Agent, or views attachment summaries alongside a record.

Languages supported by Content Understanding

Use this reference to identify which languages the Content Understanding application supports for text-based and image-based files, and which optical character recognition (OCR) model applies to each language group.

For text-based files, the AI recognizes any language supported by the selected or default model, as described in the model card for the LLM. For more information on LLMs, see Large language models used by Content Understanding.

For image files that require OCR to detect text, OCR models support different language groups. The language selected during use case setup helps the OCR model detect text in the images. For more information, see Set up a use case.

The following OCR models are available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCR models for Content Understanding

OCR model	Languages supported
Latin model (Default)	English, Dutch, French, German, Italian, Portuguese, and Spanish
CJ model	Japanese and Chinese (simplified)

Large language models used by Content Understanding

The Content Understanding application uses large language models (LLMs) to support generative AI and agentic AI capabilities.

Available LLMs

You can select the LLM when creating a use case. The LLM can also be selected for the AI agent to use when processing documents and images.

Multimodal LLMs support image mode by processing multiple types of inputs — such as text, sound, and images — to generate a text response. Processing may take longer for image inputs.

Note: The Content insights AI agent requires a multimodal LLM. The text-only Now LLM Service is not supported for the AI agent.

AI-generated outputs may be inaccurate or incomplete. Review all AI-generated content before use.

The following table lists the available LLMs for Content Understanding.

LLM options for Content Understanding

LLM	Highlights
Now LLM Service - Large	Text-only model that supports natural language understanding, automation, and decision support.
Now LLM Service - Small	Text-only model that enhances text-based automation and content generation in ServiceNow workflows.
Google Cloud - Gemini Large	Multimodal model with advanced reasoning and problem-solving capabilities.
Google Cloud - Gemini Small	Multimodal model with strong performance in summarization, rewriting, and content transformation.
Azure OpenAI - GPT Large	Multimodal model with strong performance on tasks involving analysis, summarization, and multi-step problem solving.
Azure OpenAI - GPT Small (default)	Multimodal model optimized for routine workflows, including summarization, paraphrasing, and question and answer tasks.
Amazon Bedrock - Claude Large	Multimodal model with strong context management for long documents and dialogs.
Amazon Bedrock - Claude Small	Multimodal model with lower latency and higher efficiency for real-time applications.

For more information, see Large language models on the ServiceNow AI Platform.

Content Understanding forms

Reference forms provide fields for viewing and updating Content Understanding records, including fields, questions, and tables.

Available forms

- Field form fields
- Question form fields
- Table form fields

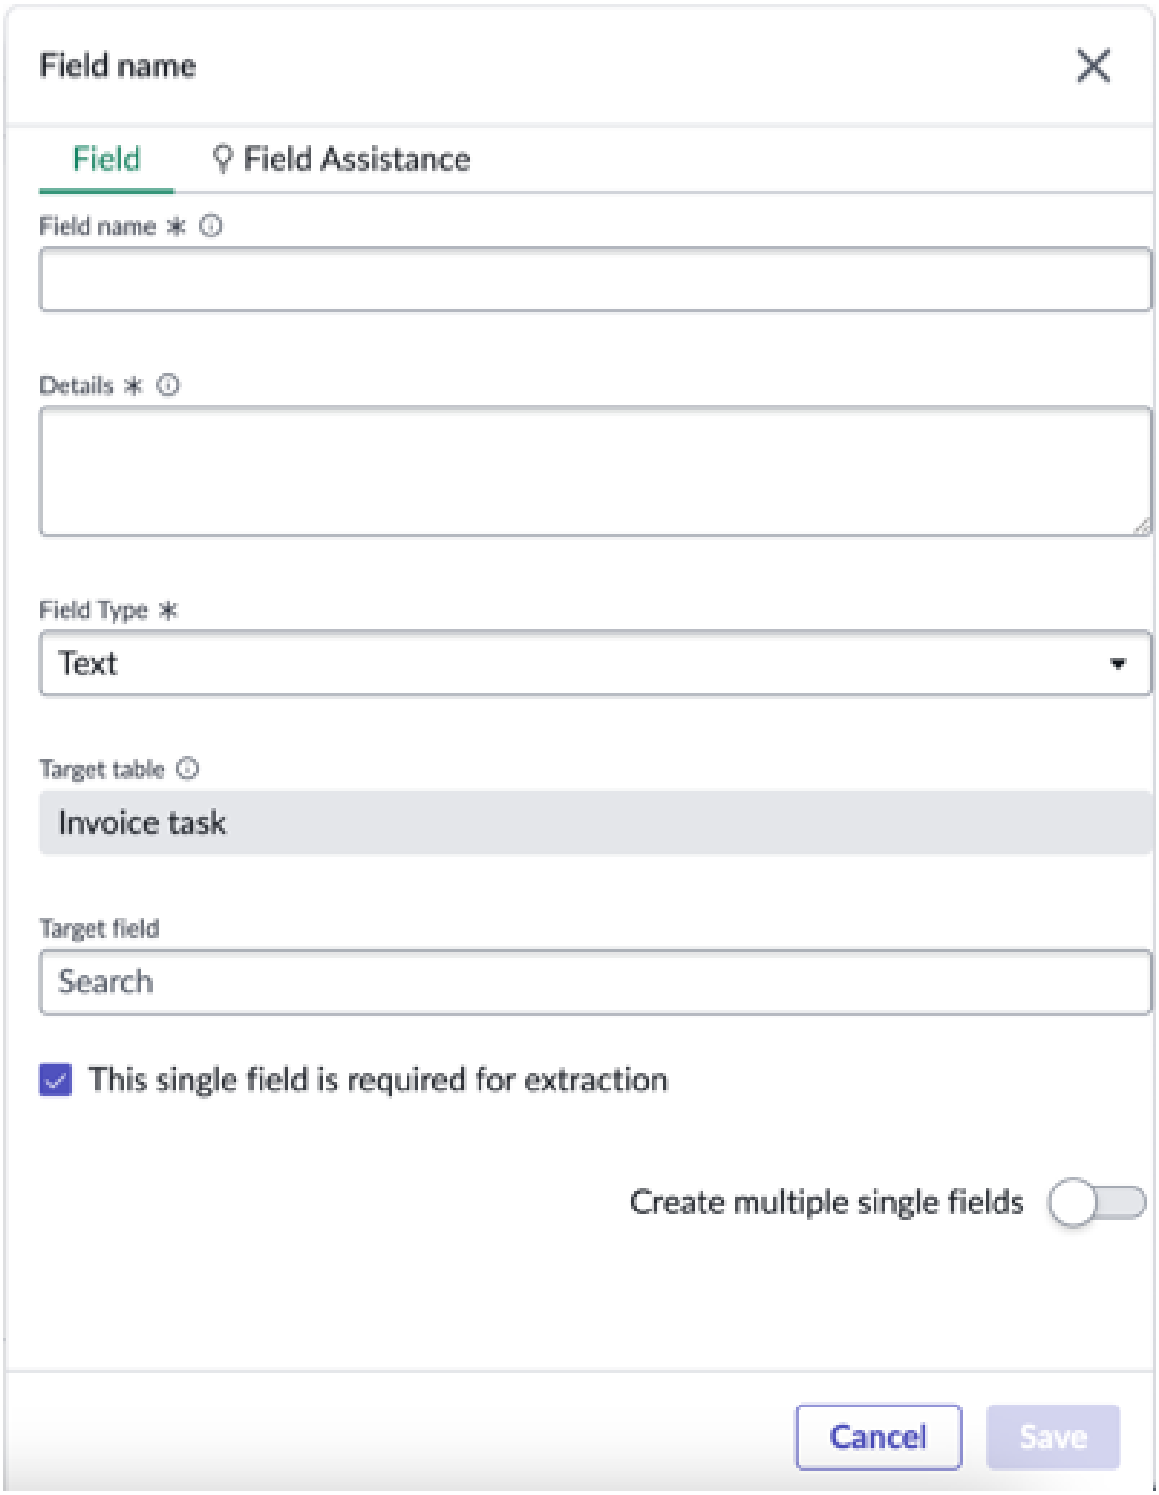
Field form fields

The field form defines the information to extract from a document, including the field name, type, and target table.

The following fields are available when configuring a use case for document extraction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field form for document extraction



Field form

Field	Description
Field name	Name of the field to extract. State the information to extract clearly and concisely. For example: `Order number`
Details	Description of the information to extract. The field name and description together

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field form (continued)

Field	Description

	determine what text the system extracts from the document.
	
	Include relevant context or additional details to identify the correct information. This may include keywords. For example, `The contract number or the number of the reference contract.`
	
	Include examples of the information to extract. For example, `AGR-2023-0042`, `CON2039739`, or `BV-22122KEY`.
	
	Example field configuration:
	`Field name: Currency`
	`Details: The currency in which the contract is denominated. Only valid for Order Forms. Otherwise, leave it empty (''). If the currency symbol is '$', answer 'USD'. Examples: 'USD', 'EUROS', 'GBP', etc.`
	
	Tip: Select the **Field assistance** tab for additional guidance on forming an effective field.

Field Type	Type of field, such as text or date. For more information, see Field types in Content Understanding. Some field types convert the extracted value into a standard format. For more information, see Data normalization.
Target table	Table that stores the document processing results for this use case.
Target field	Field on the target table to align with. **Note:** The use case must include a selected target table before this field is available.
This single field is required for extraction	Marks the field as required. Required fields must have a value and can't be left empty or cleared.
Create multiple single fields	Keeps the form open after saving. Select this option when adding more than one field to the use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question form fields

The Question form contains fields that define a question and how its answer is extracted from a document in a use case.

Question form fields

Question form

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question form

Field	Description
Question	The question about the document that generative AI uses to extract information. This question is displayed to the agent when reviewing answers in the Document Intelligence workspace. **Tip:** Select the **Question assistance** tab for guidance on formulating effective questions.
Field Type	Type of field — for example, text or Boolean. For descriptions of available field types, see Field types.
Provide an explanation for the answer	Option to have generative AI provide an explanation, based on the document text, that supports a yes or no answer. This field appears only when the **Field Type** field is set to **Boolean (True/False)**.
Target table	Table that stores the document processing results for this use case.
Target field	Field on the target table to align with. **Note:** The use case must include a selected target table before this field is available.
This single field is required for extraction	Option to mark a question as required. Required questions must be answered and can't be left empty or cleared.
Create multiple single fields	Option to keep the form displayed on the screen. Select this option when adding more than one question to the use case.

Table form fields

The Table form contains fields for defining a table and its columns for document extraction in a use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table form fields

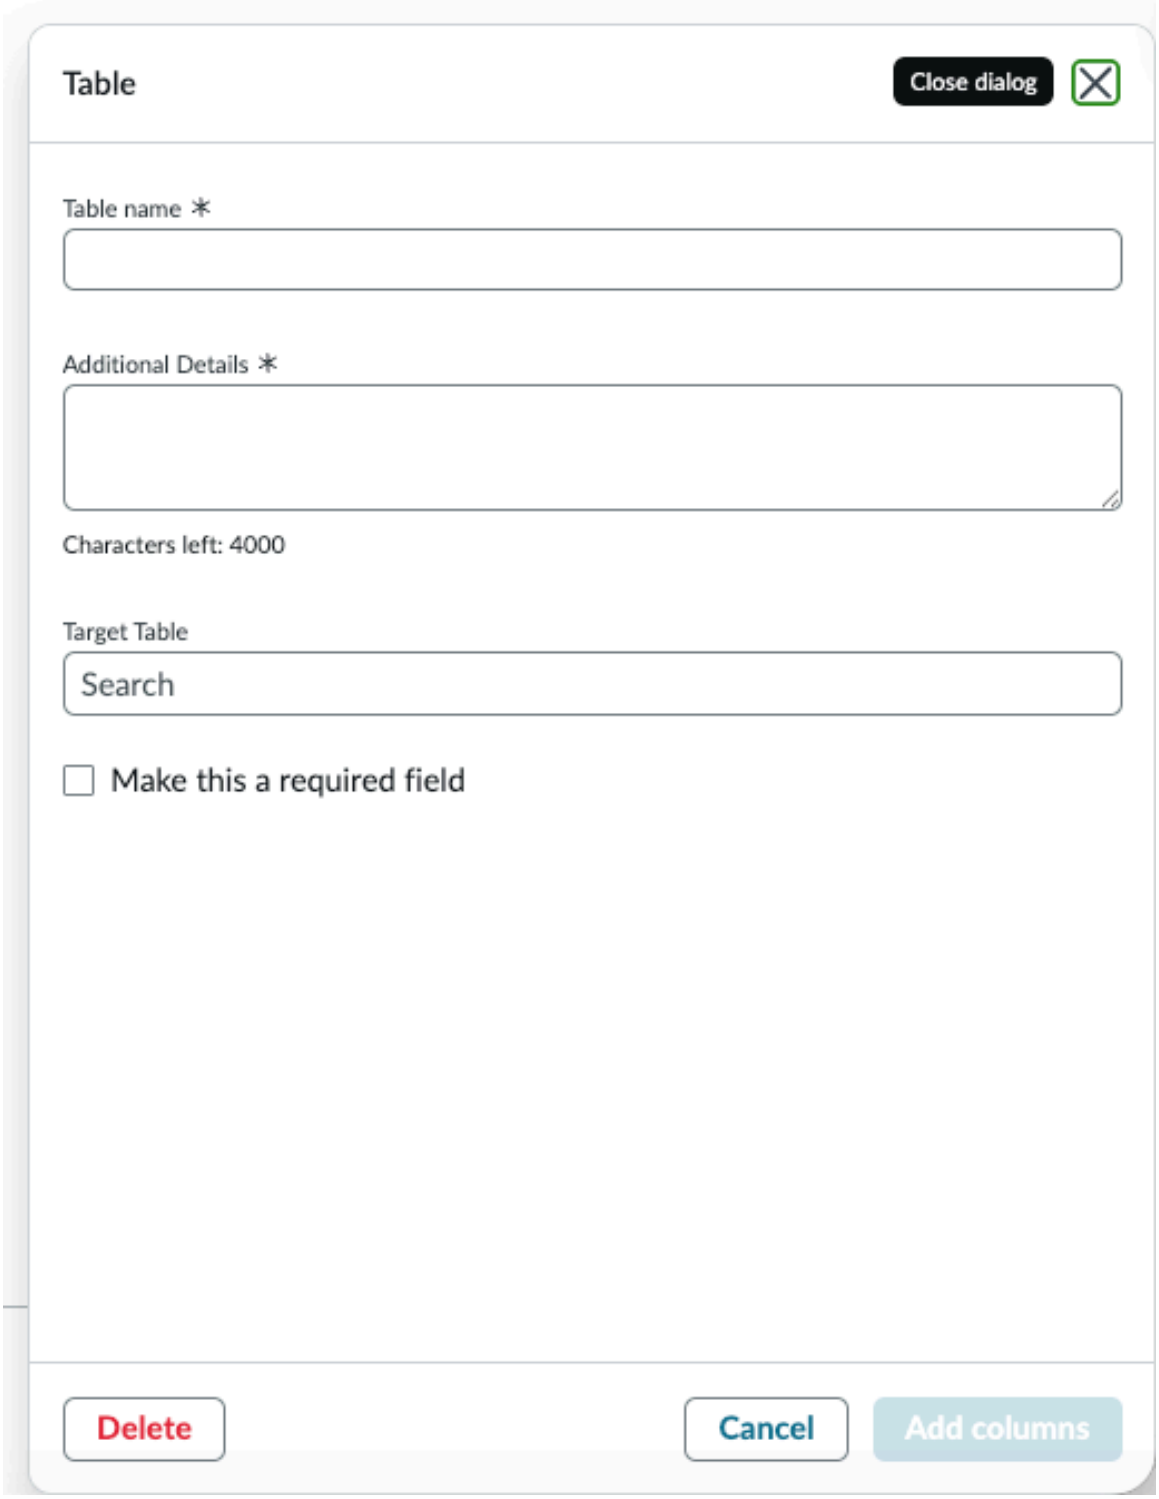

Table form

Field	Description
Table name	Name of the table.
Additional Details	Description of the table information to extract. Along with the table name, the description helps the large language model (LLM) predict which table fields to extract from the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table form (continued)

Field	Description
	Include any relevant context or additional details to identify the correct information.
Target table	Table that stores the document processing results for these table fields.
Parent mapping to field	Field on the target table to align this table with. Select a target table before configuring this field.
This table is required for extraction	When selected, the table is required for extraction. Required fields must be completed and cannot be left empty or cleared.
Column title	Name of the column header in the table.
Column type	Type of field in the table column — for example, a text or date field. For more information, see Field types in Content Understanding. Some field types convert the extracted value into a standard format. For more information, see Data normalization.
Select target field	Field on the target table to align with. **Note:** The use case must include a selected target table.
New column	Option to add a column to the table.
Create multiple tables	When selected, keeps the form open after saving. Select this option when adding more than one table to the use case.

Field types in Content Understanding

Field types determine what kind of information is extracted from a document and how that information is stored or displayed in a use case.

The following field types are available to administrators when configuring fields for use cases.

Note: Some field types convert the extracted value into a standard format. For more information, see Data normalization.

Field types

Field type	Description
Boolean (True/False)	True or false value. In document Q&A, this value appears as a "yes" or "no" answer. If enabled by the administrator, the answer may include an AI-generated explanation, which may not always be accurate. Available for questions defined in the use case setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Description
Date	Date displayed in the format extracted from the document. Available for fields and tables defined in the use case setup.
Decimal	Number with up to two decimal places (for example, 12.5 or 12.55). Available for fields and tables defined in the use case setup.
Float (floating point number)	Number with up to seven decimal places (for example, 12.0 to 12.0000000). Available for fields and tables defined in the use case setup. Integer	Whole number (for example, 12). Available for fields and tables defined in the use case setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Description
	Reference	Reference to a field on another table. For example, the **Caller** field on the incident table is a reference to the User [sys_user] table. For more information, see Reference field type. Available for fields and tables defined in the use case setup. Text	Text value. Available for fields, tables, and questions defined in the use case setup. 
Content Understanding integrations

Content Understanding integrates with ServiceNow® solutions to extract, analyze, and summarize information documents.

Content Understanding connects with the following ServiceNow products and capabilities:

Note: Content Understanding integrations extend beyond the products listed here. For information about additional available integrations, contact your ServiceNow administrator or visit the ServiceNow Store.

Content Understanding integrations

Product	Integration capability	Learn more
Contract Lifecycle Management (CLM)	Contract metadata extraction and contract analysis. The skills for contract metadata extraction and contract analysis are only available with the Now Assist in Contract Management application.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content Understanding integrations (continued)

Product	Integration capability	Learn more
Accounts Payable Operations (APO)	Invoice data extraction. Extract invoice details from PDFs submitted through email or supplier portal and automatically process the digitized invoice within Accounts Payable Operations (APO).	ServiceNow Otto for Accounts Payable Operations (APO)
Operational Sustainability Management (formerly ESG Management)	ESG information extraction. Extract ESG-related information from invoices to support Operational Sustainability Management (ESG) initiatives and regulatory compliance.	Filter citations documents for Operational Sustainability Management (formerly ESG Management).
IT Service Management (ITSM)	Attachment summarization. Agents can view a summary of attachment content along with the record summary in ITSM. Attachment summarization is available in Now Assist for ITSM.	Customize a ServiceNow Otto for IT Service Management (ITSM) skill
ServiceNow Otto for Virtual Agent	Document chat. Agents can receive chat responses based on document content. Document chat is available in ServiceNow Otto for Virtual Agent.	Upload documents in a chat

Related topics

Data normalization

Data extracted from documents is converted into a standard format. This ensures that values appear consistently across all fields, making the data easier to group, analyze, and integrate with other applications.

Data normalization supports integration with other applications on the ServiceNow AI Platform.

Field types

The following field types are converted to support data normalization:

Supported field types for data normalization

Field type	Description
Date	Standard date format. For example, YYYY-MM-DD.
Reference field	A field that uses a field in another table as a standard. Content Understanding matches the extracted data to the standard. For example, a use case has a reference field called **Vendor** that points to the Name column in the Company table as the reference. When processing a document task, Content Understanding extracts "Degas Dairy Products, Inc" from the document and fills the **Vendor** field with that value. Content

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported field types for data normalization (continued)

Field type	Description
	Understanding compares the value to the company names in the reference table and finds "Degas Dairy Products, Inc" as a match. In the document task, "Degas Dairy Products, Inc" is matched to "Degas Dairy Products, Inc" in the reference. Integer	Whole number. For example, 12.
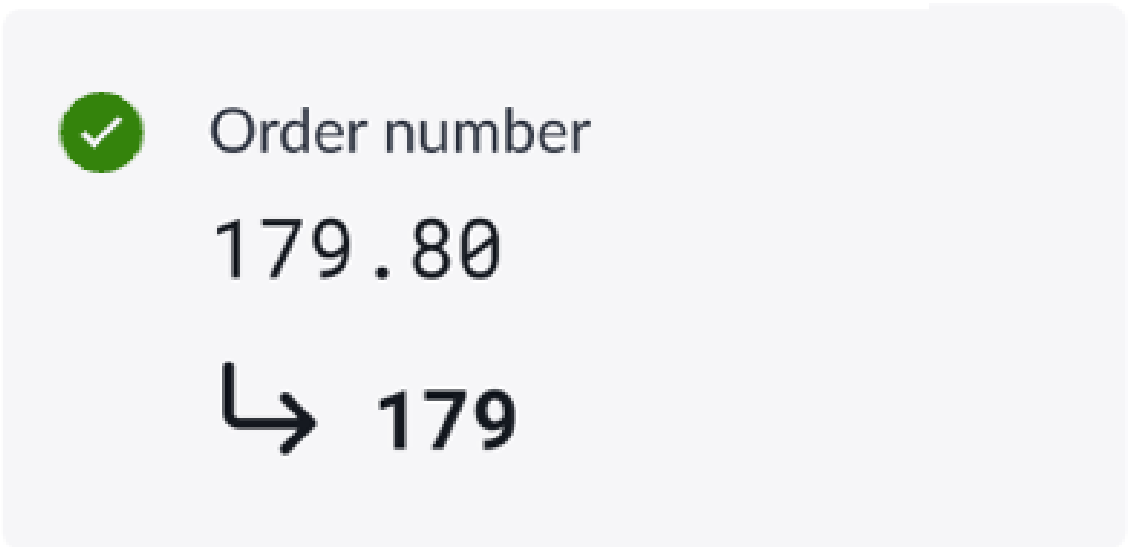
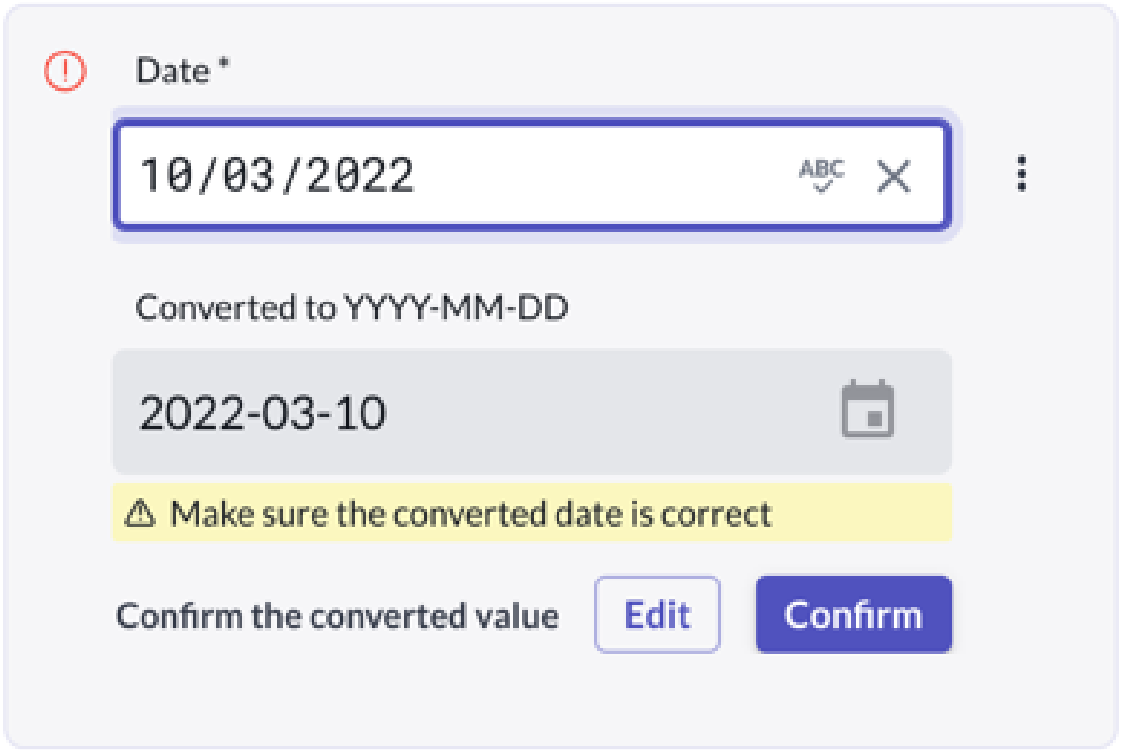
Decimal	Number with up to two decimal places. For example, 12.5 or 12.55.
Floating point number	Number with up to seven decimal places. For example, 12.0 to 12.0000000.

Display

A completed data extraction field shows the converted value next to it.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can adjust the converted date value by selecting **Edit**.

Note: In some cases, the data extracted from the document may not be in a valid format to be converted. For example, if Content Understanding read the letter O instead of a number 0 in a date field (11.12.2o23), then it would not be converted. In this case, edit the field to the correct format.

Ambiguous data

When a document contains ambiguous data, Content Understanding uses the default setting in the use case configuration to determine the correct interpretation. The value requires clarification before it can be converted into a normalized format.

For example, consider a use case with a Date field. The default interpretation of ambiguous dates is set to "Month first." A document containing the date 1/2/2024 is interpreted as January 2, 2024, rather than February 1, 2024.

In such cases, you may need to confirm or correct the interpretation of ambiguous dates. Depending on the configuration of the field within the use case, automated document processing may pause so you can verify that the conversion is accurate.

Limitations in Content Understanding

Review the file format, size, page count, and language limitations that apply to skills and AI agents in Content Understanding.

Information extraction skill limitations

The following table lists the limitations for the Information Extraction skill in Content Understanding.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Information extraction skill limits

Limit	Description
File formats	The supported file formats are JPEG, PNG, PDF, and DOCX. **Note:** Encrypted files aren't supported.
File size limit	The file size limit is 20 MB.
Page count limit	When image mode is enabled, the suggested upper boundary is 50 pages per file, with a minimum of 10 pages. Actual performance varies based on the following factors: • Model constraints: Some models limit the number of images per request. For example, some models allow a maximum of 20 images per request. • File complexity and size: Documents with dense text or large images consume more tokens and memory, which can affect processing time and efficiency. • Platform payload limits: The upper limit for data passed to the language model is 32 MB. Because image sizes vary, the exact page count that fits within this limit varies by document. Because these constraints depend on your configuration, document characteristics, and the model used, test your documents by gradually increasing the page count to identify the effective limits for your use case. If image mode is enabled, the page count limit is 10 pages per file. If image mode is inactive, the page count limit is: • 200 pages per file if no tables are defined for the use case. • 20 pages per file if a table is defined for the use case. Image mode is selected during use case setup. For more information, see Set up a use case.
Maximum number of fields per use case	The maximum number of fields per use case is 50.
Supported languages	For image files that require OCR (optical character recognition) to detect text, OCR models support different language groups. For more information, see Languages supported by Content Understanding. For text-based files, the skill recognizes any language supported by the selected or default model, as described in the model card for the LLM. For more information on LLMs, see Large language models used by Content Understanding.

Limits for the Content insights AI agent

The following table lists the limitations for the Content insights AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content insights AI agent limits

Limit	Description
File formats	The supported file formats are JPEG, PNG, PDF, DOCX, XLSX, CSV, TXT, and PPTX.
File size limit	The file size limit is 20 MB.
Page count limit	For each document task, the page count limit is 200 pages per file. If the AI agent extracts data based on a use case that includes a table, the limit decreases to 20 pages per file.
Supported languages	For image and text-based files, the AI agent recognizes any language supported by the selected or default model, as described in the model card for the LLM. For more information on LLMs, see Large language models used by Content Understanding.

ServiceNow AI Lens

With ServiceNow AI Lens, which is a ServiceNow® AI application, you can use generative AI to scan, extract, comprehend, and synthesize data to optimize your workflows.

Important:

- Some ServiceNow AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base . Be sure to check for availability updates in future releases.
- Some ServiceNow AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Don't scan any personally identifiable information, such as medical reports, financial reports, or other sensitive data, when using ServiceNow AI Lens as you don't want to expose the large language model (LLM) to any sensitive information.
- ServiceNow AI Lens currently uses Azure OpenAI GPT-4o LLM.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about scripts (and associated script records) in which ServiceNow Otto for code generation is called. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring ServiceNow AI Lens

ServiceNow AI Lens is a ServiceNow® AI application that uses generative AI to scan images and screens, extract information, understand visual data, and take action—such as automatically filling in forms with scanned information—to help improve your workflows.

ServiceNow AI Lens overview

Get an overview of the capabilities and a few use cases of ServiceNow AI Lens.

https://player.vimeo.com/video/1167899406?h=604dc8792d&badge=0&autopause=0&player_id=0&app_id=58479

The ServiceNow AI Lens application extracts and analyzes data from screens or the screenshots of documents such as a scanned handwritten note or an email that you capture or files that you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

upload. ServiceNow AI Lens is integrated with the ServiceNow® forms so that you can create or update forms on the ServiceNow instance by auto-filling data.

By connecting to a ServiceNow instance, you can also use ServiceNow AI Lens in a standalone mode to see a preview of the extracted data or get insights about your use cases. For more information, see ServiceNow AI Lens features.

You can leverage Lens actions to customize the Lens behavior by providing default context, trigger options, and transform response logic for a table. When Lens is triggered to auto-fill a form on this table, it uses the configuration defined in the Lens action to auto-fill the form with the transformed LLM response. You can also define context, trigger options, and post processing instructions in a Lens action, which is used when Lens is triggered from desktop to show preview of extracted data and post process the LLM response. For more information, see Define ServiceNow AI Lens behavior with Lens actions.

Extract data from documents such as an image, a scanned handwritten note, web page, or a Microsoft Word document, and autofill catalog item forms in the Service Portal. For example, autofill a new vendor onboarding form by extracting key details such as vendor name, address, contact email, and banking information from multiple artifacts, including Excel files, emails, images, and PDF documents. For more information, see Autofill catalog item forms on Service Portal using ServiceNow AI Lens.

Trigger ServiceNow AI Lens from the Now Mobile® application to extract data from documents such as an image, a scanned handwritten note, web page, or a Microsoft Word document, and auto-fill fields in a form. For more information, see Trigger ServiceNow AI Lens from Now Mobile® and autofill forms.

Get started with ServiceNow AI Lens directly from your browser - no downloading or installation required or by downloading and installing the desktop application for Windows and macOS

Benefits of ServiceNow AI Lens

ServiceNow AI Lens can do the following tasks automatically for you:

- Fill in a form without having to do it manually. ServiceNow AI Lens can scan and extract the visual data to auto-fill in your forms. For example, it can scan the invoice receipt to auto-fill the fields on the expense submission form.
- Scan and identify the information from handwritten notes or images. For example, ServiceNow AI Lens can scan a sequence diagram to generate a script.
- Search for specific information from images. For example, ServiceNow AI Lens can look for a specific clause in a scanned legal contract.
- Process the screenshots of multiple images or files at once. For example, ServiceNow AI Lens can extract the data from multiple screenshots of an error or a Microsoft Excel file to get insights on the data at one time.

ServiceNow AI Lens skill

ServiceNow Otto for Platform includes the AI-powered ServiceNow AI Lens skill to read, understand, respond, and act on visual data such as hand-written texts, images, and websites and take powerful actions to boost productivity.

Admins can enable the ServiceNow AI Lens skill in the AI Admin Hub console. Once enabled, users can perform the following actions:

- Create or update ServiceNow records by auto-filling forms using the extracted data.
- Preview the extracted data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Provide instructions to extract data in a specific way or to get a specific output.
- Capture multiple screenshots to gather insights from multiple images.

Beyond individual user actions, the ServiceNow AI Lens skill can be used by the AI Agents to incorporate any of these capabilities—data extraction, form auto-filling, and visual analysis—as part of a larger AI Agent workflow or automated workflow step.

To view the procedure to enable the ServiceNow AI Lens skill, see Activate the ServiceNow AI Lens skill.

The ServiceNow AI Lens application requires a Workflow Data Fabric (previously known as Automation Engine) license and a ServiceNow Otto license.

Available LLMs

You can use Azure OpenAI, Google Gemini, or Anthropic Claude on AWS as the AI model provider for ServiceNow AI Lens skill. You can set skill-level preferences in the AI Admin Hub console. For more information, see Large language models on the ServiceNow AI Platform.

- Configure ServiceNow AI Lens
- Using ServiceNow AI Lens
- ServiceNow AI Lens reference

ServiceNow AI Lens features

Learn about the various ServiceNow AI Lens features to help you get started with analyzing and gathering insights from the visual data.

ServiceNow AI Lens offers the following features:

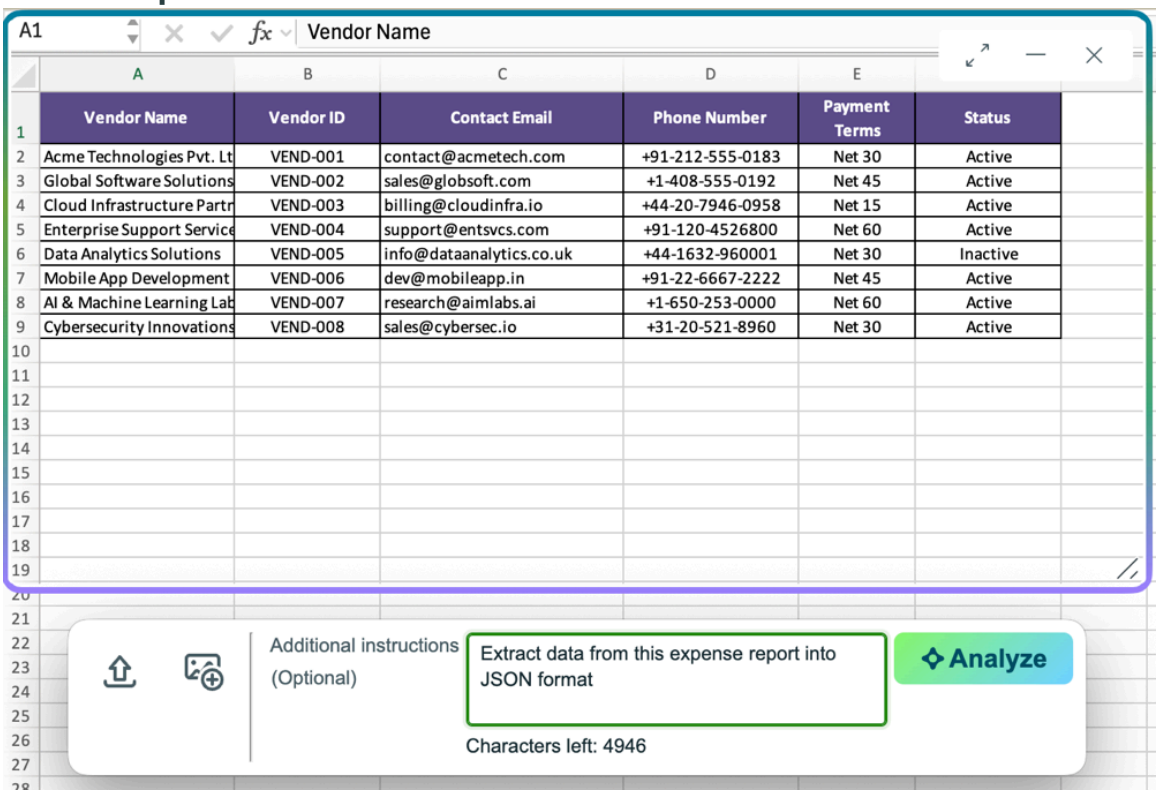
Capture data

Scan and get actionable insights from visual data such as images, scanned handwritten notes, Excel sheets, web pages, or any document that provides visual data.

For example, ServiceNow AI Lens can scan an email and auto-fill the fields on the Incident form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scan and capture data from email

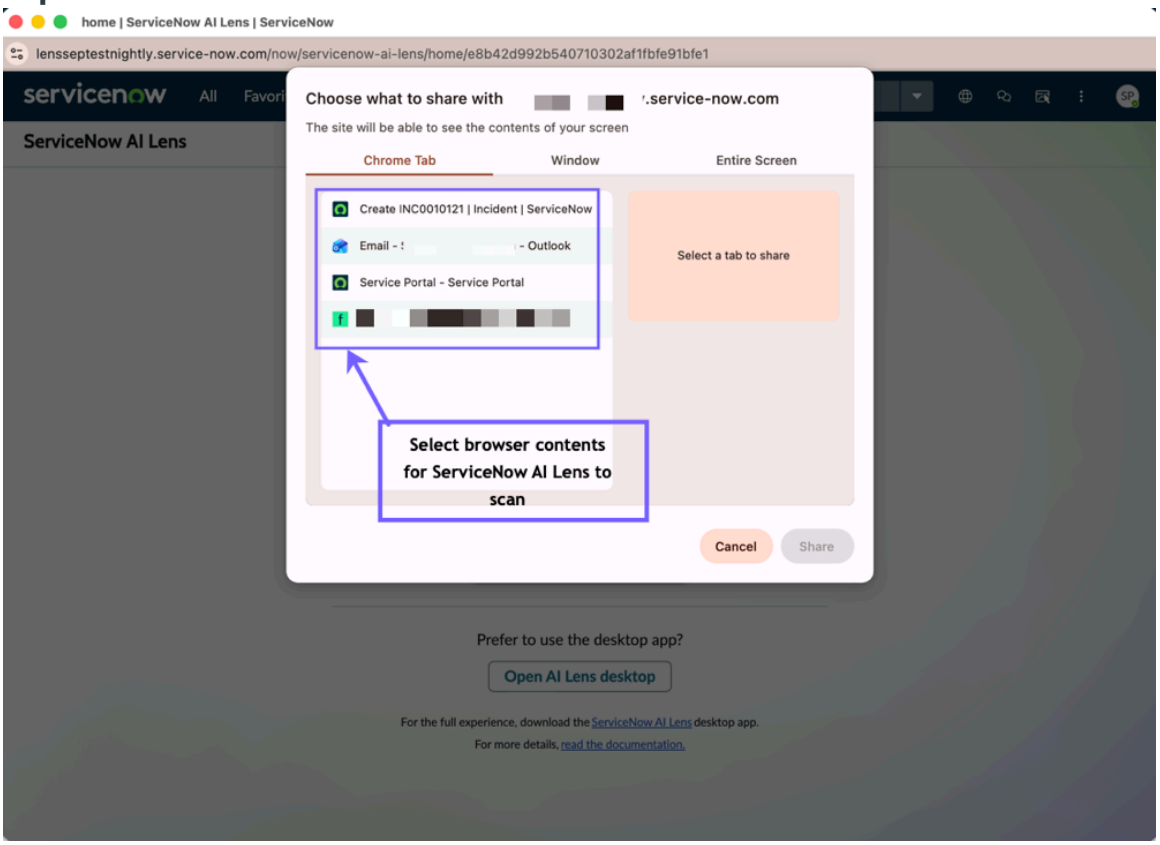


Use ServiceNow AI Lens from your browser or the desktop application

Get started with ServiceNow AI Lens directly from your browser — no downloading or installation required. Capture your screen or upload one or more files, and let ServiceNow AI Lens analyze the contents and auto-fill your form fields. For the full range of capabilities, open the ServiceNow AI Lens desktop application if it is already installed, or download and install it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Capture browser contents



Use your browser to upload files

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upload files

Get actionable insights from the files that you upload. You can upload files by adding or dragging and dropping.

For example, upload copies of all expense bills from your business trips in the last six months. Instruct ServiceNow AI Lens to organize the expense amounts under their respective headings such as food, airfare, cab, and laundry.

File upload window

Provide instructions to analyze data in a specific way

Provide instructions to analyze the data in the screenshots or files after selecting the Edit ( ) icon and entering additional instructions. For example, you can capture screenshots or upload copies of expense bills from your business trips in the last six months. Provide instructions to arrange the expense bill amounts by date and expense category.

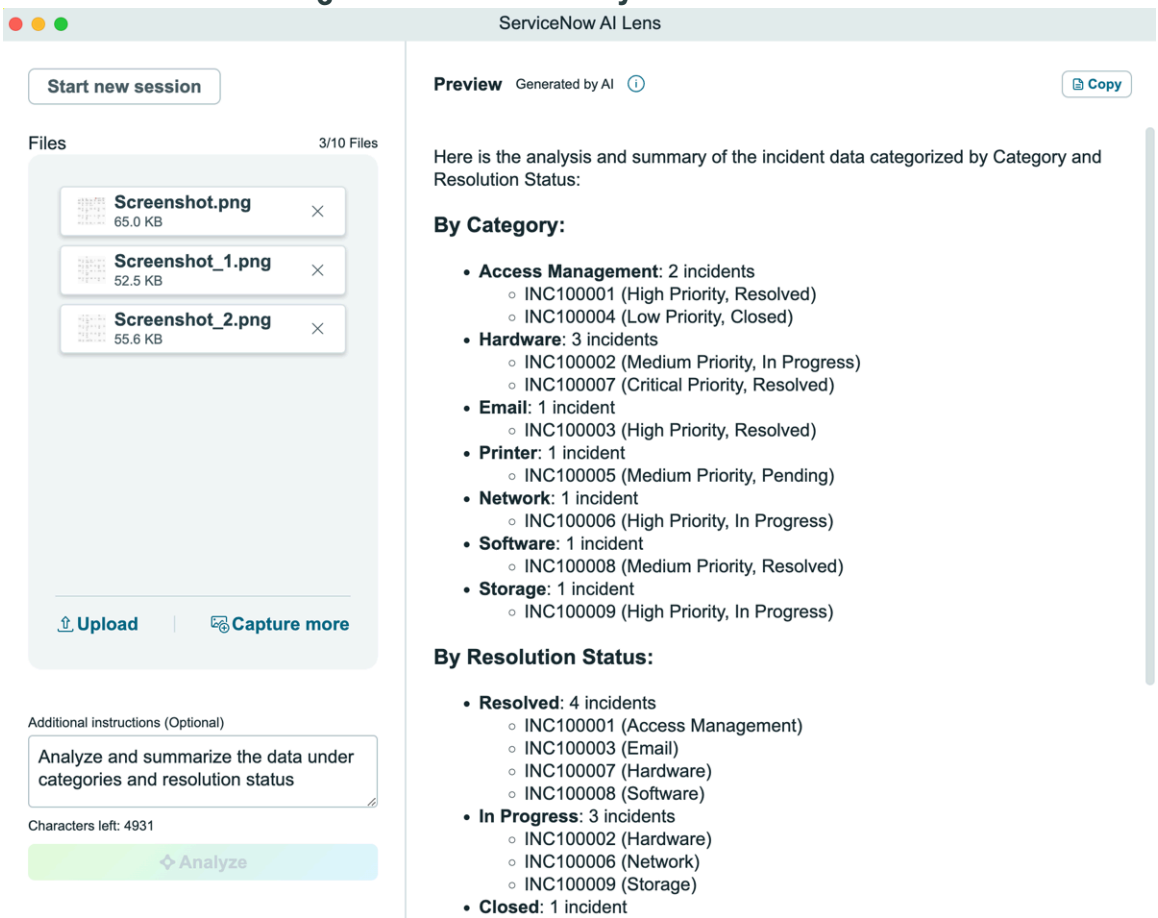
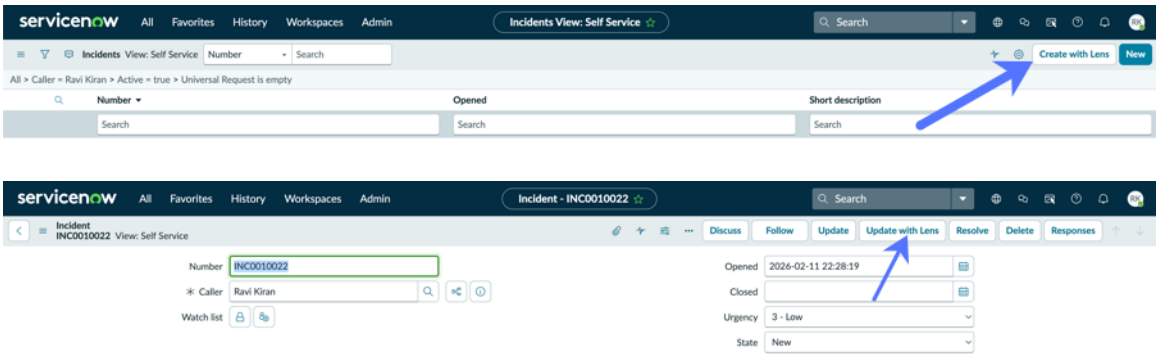
Preview window showing consolidated summary



Launch from ServiceNow instance

Launch ServiceNow AI Lens from a ServiceNow instance to fill the extracted data automatically into the form fields while you're creating or updating records.



Use Lens actions to customize Lens behavior

You can use Lens actions that define Lens behavior depending on how ServiceNow AI Lens is triggered and what context is set. You can define default instructions, trigger options, custom context, transform response logic, and post processing instructions for the Lens execution. With Lens actions, you can customize how a classic form is auto-filled using ServiceNow AI Lens or what data must be extracted for preview and post process the LLM response. For more information, see Customize ServiceNow AI Lens behavior by creating a Lens action.

For example, you can define a Lens action that is used when Lens is triggered from an instance to populate a form of a particular table. You can also define which form fields must be populated.

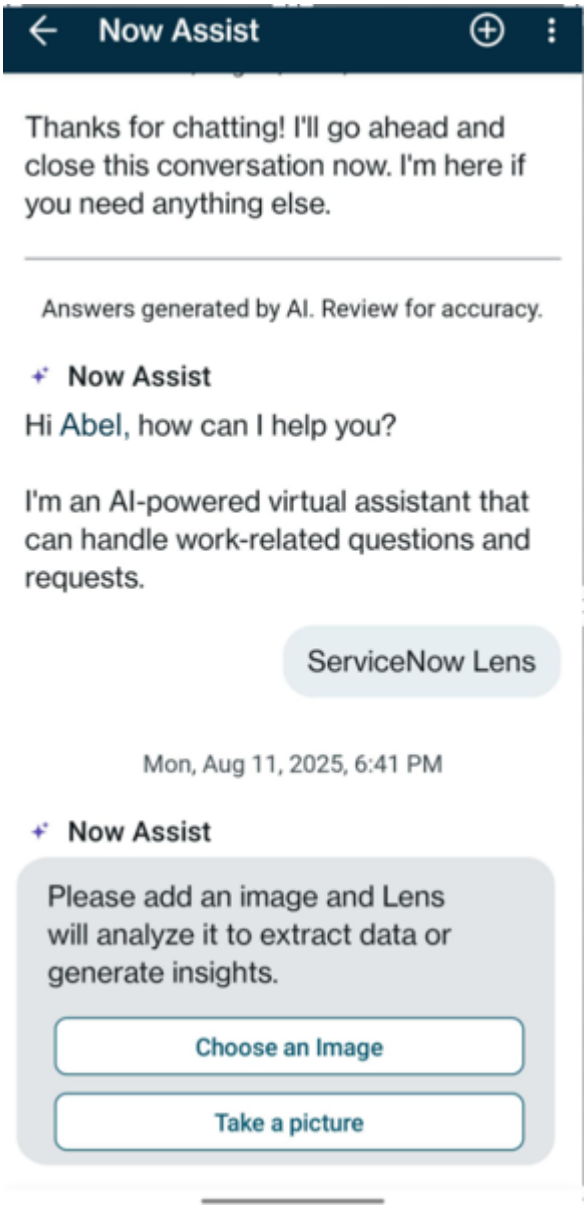
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use as a back-end service

As part of your integration logic, configure a Lens action as one of the steps to invoke a ServiceNow AI Lens service from any part of the ServiceNow AI Platform, such as a workspace form or a portal.

For your own use cases, you can leverage Lens actions for using Lens as a service in the following ways:

- Client service: Launch the Lens client to scan and analyze images. For example, you can configure a UI action on a workspace form or a service portal to launch the Lens client. For more information, see KB2492775.
- Server service: Use Lens as a service to analyze the provided images without launching the Lens client. For example, you can call Lens service from a Script Include or flow action to get the LLM response after analyzing the visual data. For more information, see Script include - AILensActionService.

Attach images to a record

View the captured images attached to the record that is auto-filled using ServiceNow AI Lens. You can later refer the attached images to understand the

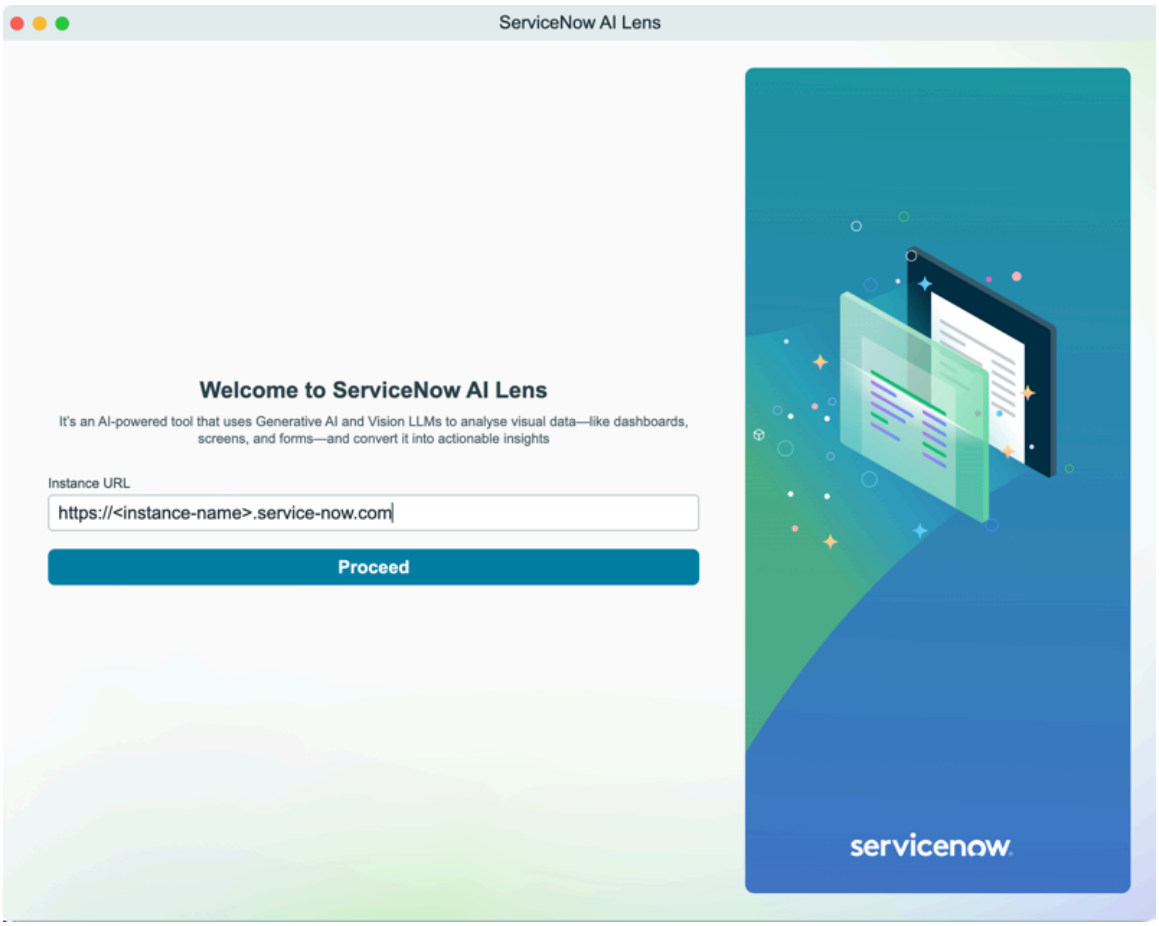
source of the record data. For more information, see Customize ServiceNow AI Lens behavior by creating a Lens action.

Use as a standalone application

Use ServiceNow AI Lens as a standalone application for previewing extracted data or getting insights. You must connect to a ServiceNow instance before you start using ServiceNow AI Lens. For more information, see Extract and analyze data with ServiceNow AI Lens desktop app.



Autofill form fields in the Now Mobile® application

Trigger ServiceNow AI Lens from Now Mobile® application to extract data from artifacts and autofill fields in a form on the Now Mobile® application.. For more information on creating or updating records in the Now Mobile® application, see ServiceNow AI Lens for mobile. You can add a ServiceNow AI Lens button to input form screens to allow users to quickly extract data from attachments and complete forms faster. For more information, see Configure Lens launcher button.

Autofill Catalog Item forms in Service Portal

Autofill Catalog Item form fields by triggering ServiceNow AI Lens from Service Portal. ServiceNow AI Lens extracts data from one or more artifacts and auto fills the relevant fields in the form.. For more information on using ServiceNow AI Lens in the Service Portal, see Auto-fill catalog item form in the Service Portal.

The ServiceNow AI Lens application includes the skills that are listed in the following table.

ServiceNow AI Lens skill supported interfaces

Interface	Skill
• Core UI • Desktop	ServiceNow AI Lens skill

Licensing requirements

The ServiceNow AI Lens application requires a ServiceNow Pro Plus or Enterprise Plus license.

Application information

Enable the ServiceNow AI Lens (com.sn_ai_lens) app plugin to use the ServiceNow AI Lens skill.

This store app has the following dependencies:

- ServiceNow AI Lens Core (sn_app_lens_core)
- ServiceNow Otto for Platform (sn_genai_platform)

ServiceNow AI Lens skill

This skill provides generative AI capabilities to read, understand, respond, and act on visual data such as hand-written texts, images, and websites and take powerful actions to boost productivity.

This skill is a Platform skill that is enabled by the admin from the ServiceNow AI Lens skill card and enables users to perform the following actions:

- Create or update ServiceNow records by auto-filling forms using the extracted data.
- Preview the extracted data.
- Provide instructions to extract data in a specific way or to get a specific output.
- Gather insights from multiple images.

Availability

This skill is available in the workflow and product listed below.

AI products and workflows

Workflow	Product
Platform	ServiceNow AI Lens

Licensing requirements

The ServiceNow AI Lens application requires a ServiceNow Pro Plus or Enterprise Plus license.

Configure ServiceNow AI Lens

If you have the admin role, you can enable the ServiceNow AI Lens application (sn_ai_lens) to extract and comprehend data for various workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To get started with ServiceNow AI Lens, you must have:

- A ServiceNow Pro Plus or Enterprise Plus license.
- Your ServiceNow® subscription must include access to AI capabilities.
- ServiceNow AI Lens is supported on the following family releases:
  - Australia Patch 1 or later
  - Zurich Patch 1 or later
  - Yokohama Patch 6 or later

Role required: admin

About this task

ServiceNow AI Lens isn't a standalone store application that you can install directly. To enable ServiceNow AI Lens on your instance, you must install other generative AI applications, such as ServiceNow Otto for IT Service Management (ITSM) or ServiceNow Otto for Customer Service Management (CSM).

- Review the ServiceNow AI Lens application listing in ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Refer to the document to see the prebuilt skills that exist and are currently available for purchase in AI packages and to review the number of assists consumed.
- Perform these steps in your ServiceNow instance.

By enabling the ServiceNow AI Lens application (sn_ai_lens), you can view the ServiceNow AI Lens and download modules in your ServiceNow instance.

The following items are installed with ServiceNow AI Lens:

- Roles
- Tables

For more information, see Components installed with ServiceNow AI Lens.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. In the search field, under the heading **Search your licensed applications and plugins**, enter the name of the ServiceNow Otto application that you want to install.
   For example, you can enter ServiceNow Otto for IT Service Management (ITSM).
3. Press **Enter**.
   The ServiceNow Otto application listing appears.
4. Select the ServiceNow Otto application card.
5. Select **Install**.

Result

The ServiceNow AI Lens and ServiceNow AI Lens Core applications are installed.

What to do next

Turn on the ServiceNow AI Lens skill to extract, comprehend, and synthesize visual data to optimize your workflows. For more information, see Activate the ServiceNow AI Lens skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the ServiceNow AI Lens skill

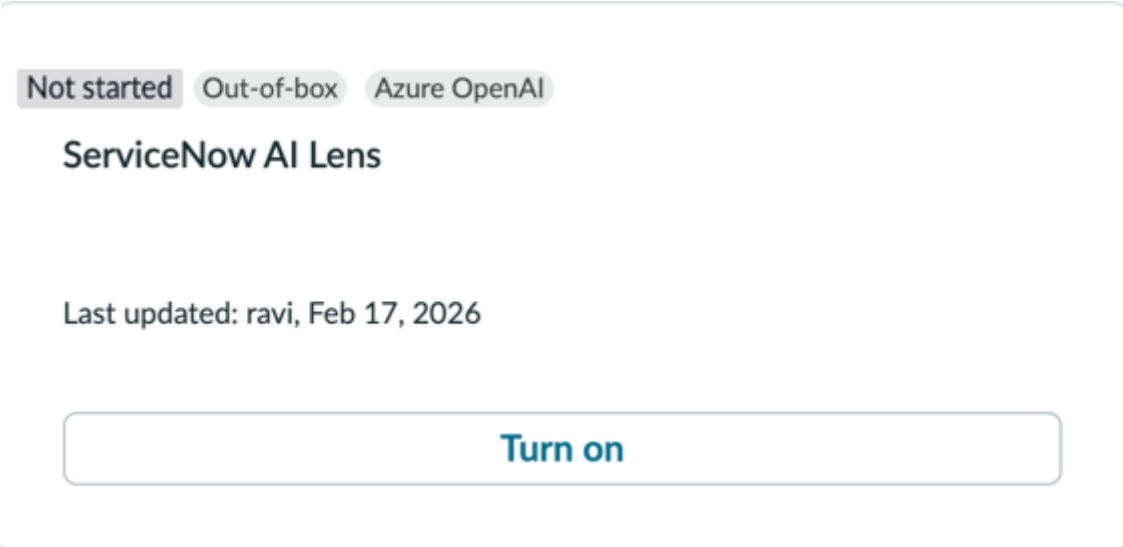
Activate the ServiceNow AI Lens skill to start using generative AI to scan and analyze visual data such as scan artifacts such as images, scanned handwritten notes, Excel sheets, web pages and optimize your workflows.

Before you begin

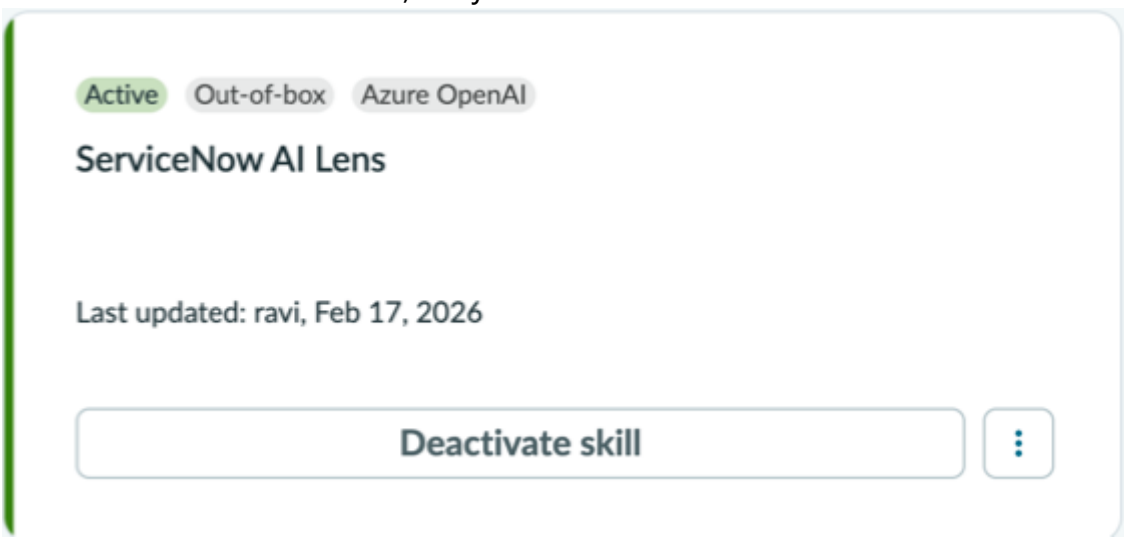
- Confirm that the ServiceNow AI Lens application is installed. For more information, see Configure ServiceNow AI Lens.
- Perform this task in your ServiceNow instance.
- Role required: admin

Procedure

1. Navigate to **All** > *AI Admin Hub* > **AI Skills**.
2. In the workflow list, select **Platform**.
3. In the Search using keywords field, enter ServiceNow AI Lens, and press **Enter**.
4. On the tile for the ServiceNow AI Lens skill, select **Turn on**.



5. On the Successfully activated dialog box, select **Back to skills**.
6. On the ServiceNow AI Lens card, verify that the ServiceNow AI Lens skill is activated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Download ServiceNow AI Lens and set launch preference

Download the ServiceNow AI Lens installer for your operating system and set your preferred way to launch ServiceNow AI Lens — from your browser or the desktop application.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > *ServiceNow AI Lens* > **Downloads and Preferences**.
2. In the ServiceNow AI Lens downloads and preferences page, do any of the following actions to download the required application for macOS or Windows:
   - Select the Download icon .
   - Select the Copy link icon , and in the browser address bar, right-click and select the **Paste and Go** option.

   A dialog box might prompt you to save or open the file.

   Note: Depending on your browser setting, the browser might automatically save the file to your Downloads folder.

3. Under **Default app on launch**, select how you want ServiceNow AI Lens to open when you start a session:
   - **Browser (no installation required)**: Opens ServiceNow AI Lens in your browser.
   - **Desktop app**: Opens the ServiceNow AI Lens desktop application.

     Note: You can change your launch preference at any time by navigating to **All** > *ServiceNow AI Lens* > **Downloads and Preferences**.

4. Execute the application installation file (.msi file) or (.pkg file).
5. Follow the on-screen instructions to install the application.
6. From the Privacy & Security settings on your macOS system, grant ServiceNow AI Lens permission to record your screen.

What to do next

Use ServiceNow AI Lens to capture screens, extract and comprehend data, and take further actions. For more information, see Using ServiceNow AI Lens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up auto-login for ServiceNow AI Lens

Pre-configure your organization's ServiceNow® instance URL so that it appears ready-filled when users launch the ServiceNow AI Lens desktop application, and enable auto-login so that users can skip signing in on subsequent launches.

Before you begin

Role required: admin

ServiceNow AI Lens must be installed on the user's machine. For more information, see Download ServiceNow AI Lens and set launch preference.

Procedure

1. On the user's machine, open the `app-config.json` file from the following location depending on the operating system:
   - **Windows:** `<username>\AppData\Roaming\servicenow-lens\app-config.json`
   - **Mac:** `/Users/<username>/Library/Application Support/servicenow-lens/app-config.json`

   Note: The folders in the file path may be hidden by default. Unhide them before navigating to the `app-config.json` file.

2. In the `app-config.json` file, enter your organization's ServiceNow® instance URL as the value for the `instanceUrl` field.

```
{
  "instanceUrl": "https://<your-instance>.service-now.com"
}
```

   Note:
   - The `app-config.json` file is unique to each user on the machine. If ServiceNow AI Lens is installed for all users, the administrator must update the `instanceUrl` field in each user's `app-config.json` file individually. If it is installed for a specific user only, that user can update their own `app-config.json` file.
   - If you change the instance URL on the login screen and successfully sign in, AI Lens saves the new URL. The next time you launch ServiceNow AI Lens, the updated URL appears in the `instanceUrl` field.

3. To enable auto-login, perform the following steps.

   a. Navigate to **All** > **System Definition** > **All Properties**.

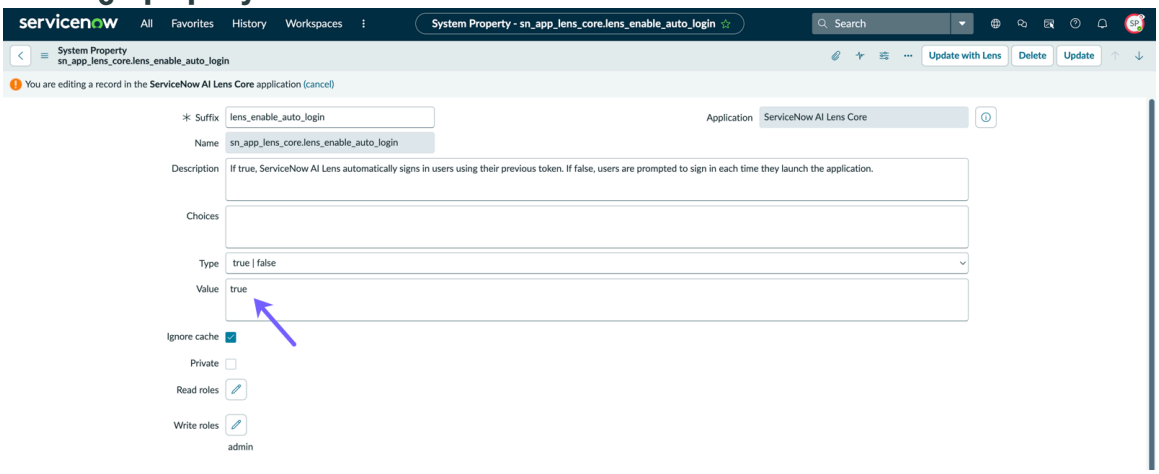
   Tip: If your instance can't navigate to **All Properties**, in the search field, enter `sys_properties.list` and press **Enter**.

   b. Search for *`sn_app_lens_core.lens_enable_auto_login`* property.

   c. In the **value** field, set the value to **true**, and select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-login property value



Note: When this property is enabled, ServiceNow AI Lens automatically signs in users on subsequent launches without showing the login screen. If a user signs out or their sign-in expires, the login screen reappears with the instance URL already filled in. If you manually update the `app-config.json` file after your first login, you will be prompted to sign in again.

Define default instructions for ServiceNow AI Lens

Create a system property to define default instructions for ServiceNow AI Lens execution on a specific form.

Before you begin

Role required: admin

About this task

You can define default instructions for specific forms to create or update records using ServiceNow AI Lens in a ServiceNow instance. This helps streamline the request process by eliminating the need for users to manually enter the same instructions each time. The defined instructions are automatically included in all ServiceNow AI Lens requests for that form or table.

When users provide additional instructions through the ServiceNow AI Lens UI, those instructions are appended to the default instructions. If there is a conflict between user input, application-generated instructions, and system-defined defaults, ServiceNow AI Lens instructs the LLM to prioritize the user-provided input.

Procedure

1. In the filter navigator, enter *`sys_properties.list`* and press **Enter**.
2. Select **New**.
3. On the System Property form, fill in the details.

Default instructions system property

Field	Description
Name	sn_lens.prompt.<tablename> Replace <tablename> with the internal name of the table. For example, sn_lens.prompt.incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Value	Enter the default instructions. For example - Suggest a suitable start date for this incident based on the incidence type and urgency.

4. Select **Submit**.

Define ServiceNow AI Lens behavior with Lens actions

As a Lens admin, you can create Lens actions in ServiceNow AI Lens to customize Lens behavior by providing default instructions, configuring context, and more.

Use Lens actions to define default instructions, trigger options, custom context, and post processing instructions for the Lens response. With Lens actions, you can achieve the following goals:

- Trigger ServiceNow AI Lens from a desktop, ServiceNow instance, or Virtual Agent (from a mobile device or a portal)
- Auto-fill a form on the ServiceNow instance
- View the gathered insights in an editable preview
- Trigger flows, subflows, or actions after Lens execution
- Invoke AI agents
- Run ServiceNow AI Lens as a back-end service
- Auto-map the column headers of an Excel sheet with the columns of a ServiceNow table, and then insert the Excel sheet data into the ServiceNow table.

Whenever ServiceNow AI Lens is launched from an instance, it checks if any active Lens action is available for the table. If available, it uses the logic defined in Lens action during execution. The Lens action can only be used by the users or groups or roles that are assigned to the Lens Actions record.

Refer to the following examples to understand the different use cases of setting up the Lens actions.

- Example: Scan documents to auto-fill the Insurance Request form
- Example: Extract structured data from vendor agreements
- Example: Auto-fill user records on a user table
- Auto-map Excel sheet column headers with ServiceNow table columns

Customize ServiceNow AI Lens behavior by creating a Lens action

Create a Lens action to define custom context, trigger options, and default instructions for the ServiceNow AI Lens execution.

Before you begin

Role required: lens_admin

About this task

Learn about the various Lens trigger options for ServiceNow AI Lens.

Lens trigger options

Goal	Trigger From	Trigger For
Auto-fill a form with a custom context and default instructions when triggered from the instance. When ServiceNow AI Lens is triggered from the instance in the context of the Lens action, the default instructions are always applied and specific form fields are extracted. To view the procedure to define default instructions, see Define default instructions for ServiceNow AI Lens.	Instance	Form
Auto-fill a form with a custom context and default instructions when triggered from the ServiceNow AI Lens desktop app. You can trigger ServiceNow AI Lens from the desktop app directly in context of the Lens action instead of launching Lens from the instance. The default instructions are always applied and specific form fields are extracted.	Desktop	Form
Auto-map the column headers of an Excel sheet with the columns of a specified table, and then insert the Excel sheet data into the table. To view the procedure to auto-map the column headers of an Excel sheet with the columns of a table, and insert Excel data into the table, see Auto-map Excel sheet column headers with table columns.	Desktop	Excel Mapping
With the help of a client script or server script, run ServiceNow AI Lens as a back-end service.	Instance	Service
View the gathered insights in the preview window of ServiceNow AI Lens by	Desktop	Others

Lens trigger options (continued)

Goal	Trigger From	Trigger For
providing custom context and perform post processing steps.		

When ServiceNow AI Lens is triggered from the instance or desktop to auto-fill a form, it uses an active Lens action associated with the target table.

For example, if a user selects **Create with Lens** from Incident table list, ServiceNow AI Lens checks for an active Lens action record for the Incident table where **Trigger From** is set to Instance and **Trigger For** is set to Form. If a matching action record exists, Lens executes in the context of that action.

Procedure

1. Navigate to **All** > *ServiceNow AI Lens* > **Lens Actions**.
2. Select **New**.
3. Enter a name and description for the Lens action in the Name and Description fields respectively.
4. In the **Trigger From** field, select one of the following options.

Option	Description
Desktop	Option to specify that this action must be used when ServiceNow AI Lens is triggered from the ServiceNow AI Lens desktop app.
Instance	Option to specify that this action must be used when ServiceNow AI Lens is triggered from a ServiceNow instance.

5. To save the changes, right-click the form header and select **Save**.
6. Set up the Lens action by filling the fields in the Lens Actions form, under the Customize heading.

Lens Actions form

Field	Description
Trigger For	○ **Form** - Lens action is used when ServiceNow AI Lens is triggered to auto-fill a form. Apply a transformation logic to the Lens response before the form is auto-filled by using the #unique_921_Connect_42_transform-response option. This option is available when you select **Desktop** or **Instance** from the Trigger From list. ○ **Service** - Lens action is used when ServiceNow AI Lens is used as a service. Select this option to trigger Lens from an instance to auto-populate a **Workspace form**, or to trigger it using Virtual Agent or Script Include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This option is available when you select **Instance** from the Trigger From list. ○ **Others** - Lens action is used when ServiceNow AI Lens is triggered to display a preview of extracted data and perform post processing steps, if applicable. This option is available when you select **Desktop** from the Trigger From list. ○ **Excel Mapping** - Option to specify that you can use this Lens action to attach an Excel sheet and let ServiceNow AI Lens auto-map its column headers with the columns of a table. After the auto-mapping is done, you can view and change the mapping, and insert the Excel sheet data to the table. This option is available when you select **Desktop** from the Trigger From list.
Order	Execution priority of the Lens action for a given table: ○ **1**: Highest priority ○ **999999**: Least priority The default value is set to 100. For example, if any user is assigned to two Lens action records for the same table, the Lens action with the least number is used during Lens execution.
Table	Table to which this Lens action applies. Selected table provides context during Lens execution when specific fields are selected or script is provided. For example, Incident table.
Request Context	Option to provide enhanced context during Lens execution by selecting specific fields or providing custom schema via script. ○ **Supported Fields** - Selected fields for providing enhanced context for Lens execution. ○ **Advanced** - Script to generate a custom schema object for providing enhanced context for Lens execution.
Fields	Table fields that you can select to provide enhanced context for Lens execution. Select fields to help Lens determine what information to extract from images. Only fields supported by Lens are available for selection. For more information, see Field types supported. This field appears only when **Supported Fields** is selected from the **Request Context** choice field.
Pre Processing Script	Script to generate a custom schema object to provide enhanced context for Lens execution. Custom schema help Lens determine what information to extract from images.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears only when **Advanced** is selected from the **Request Context** choice field. Example sample script: `function preProcessRequest(lensActionRecord, inputJSON) { // Initialize the schema object var schemaObj = {}; /* This is a utility method to generate schema object, users can pass tableName and formFields as an array of fields for the given table to generate custom schema that is passed to the LLM. //Return schemaObj adhering to the structure defined in example // tableName = 'incident' tableName = inputJSON.tableName; //formFields - array of fields for the given table. //formFields = ['short_description', 'comments', 'impact']; fieldsToProcess = inputJSON.formFields; schemaObj = new global.AILensSchemaUtil().generateSchema(tableName, fieldsToProcess); */ return schemaObj; } var schemaObj = preProcessRequest(lensActionRecord, inputJSON);`  Parameters accepted by the `preProcessRequest` method:  ○ **lensActionRecord** (Input) - GlideRecord of the Lens action that is executed.  ○ **inputJSON** (Input) - Optional JSON object that users can pass through service APIs.  ○ **schemaObj** (Output) - Returned JSON object of custom schema.  Example of the returned schemaObj object:  `schemaObj = { "schemaPayload": { "type": "json_schema", "json_schema": { "name": "schema_extraction", "schema": {`

Field	Description

	<pre>"type": "object",
	"properties": {
	"short_description": {
	"type": "string",
	"label": "Short description"
	},
	"comments": {
	"type": "string",
	"label": "Additional comments"
	},
	"impact": {
	"type": "choice",
	"label": "Impact",
	"choiceValues": ["1", "2", "3"],
	"choiceLabels": {
	"1 - High": "1",
	"2 - Medium": "2",
	"3 - Low": "3"
	}
	}
	},
	"required": [
	"short_description",
	"comments",
	"impact"
	],
	"additionalProperties": false
	}
	}
	},
	"fieldLabels": ["short_description",
	"comments", "impact"] //Optional key
	}</pre>

Default Additional Directions	Default instructions that are supplied to AI in addition to the user-provided instructions. For example, `Summarize this paper by extracting the title, author name, publication date in the dd-mm-yyyy format, abstract, and keywords`
Transform Response	Option to specify the transformation script for transforming the Lens response before auto-filling the form. This field appears only when **Form** is selected from the **Trigger For** choice field.
Transformation Script	Script that transforms the Lens response before populating the form. This field appears only when the **Transform Response** option is selected. Sample script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	``
	function
	 transformResponseScript(lensActionRecord,
	 lensResponse) {
	  // Initialize the schema object
	  var transformResponse = {};
	
	  //Add your code here
	
	  //Return schemaObj adhering to the
	 structure defined in example
	  return transformResponse;
	}
	var transformResponse =
	 transformResponseScript(lensActionRecord,
	 lensResponse);
	``
	
	Parameters accepted by the `transformResponseScript` method:
	
	○ **lensActionRecord** (Input) - GlideRecord of the Lens action that is executed.
	○ **lensResponse** (Input) - JSON object of the Lens response provided after Lens execution.
	○ **transformResponse** (Output) - Returned JSON object of transformed schema.
	
	Example of the returned transformResponse object:
	
	``
	transformResponse = {
	  "short_description": "Service Degradation
	 Error in Order Processing System",
	  "description": "The Order Processing API
	 v2.1 encountered a service degradation issue
	 in the Production environment",
	  "urgency": "1"
	}
	``

Enable Post Processing	Option to specify advanced processing instructions after Lens execution is complete. This field appears only when **Others** or **Service** is selected from the **Trigger For** field.

Post Processing Script	Script that is run asynchronously after Lens execution to further process the Lens response, such as triggering a flow, subflow, actions, or AI Agent.
	
	This field appears only when the **Enable Post Processing** option is selected.
	
	``
	function
	 postProcessResponse(lensActionRecord,
	 lensResponse, lensExecutionRecord) {
	
	  //Add your code here
	
	``

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	`}`
	`postProcessResponse(lensActionRecord, lensResponse, lensExecutionRecord);`
	
	Parameters accepted by the `postProcessResponse` method:
	○ **lensActionRecord** (Input) - GlideRecord of the Lens action that is executed.
	○ **lensResponse** (Input) - JSON object of the Lens response provided after Lens execution.
	○ **lensExecutionRecord** (Input) - GlideRecord of the Lens execution record.

Wait for processed response	Option to wait for ServiceNow AI Lens to display the output of post-processing on the Preview window. If enabled, it waits for the post processing output. Else, it doesn't wait for post processing output but post processing continues in the background.
Max wait time (seconds)	The maximum time ServiceNow AI Lens waits to display the output of post-processing. If the output doesn't appear within this duration, the session times out while the post-processing continues in the background until completion.
Attach Captured Images To Record	Option to attach the captured images to the record that is auto-filled using ServiceNow AI Lens. This option is enabled by default.

7. To assign users or groups or roles to the Lens action, under the Assigned Users and Groups or Roles heading, select **New**, and then use any one of the following methods.

Method	Steps
Assign one or more roles to the Lens action	Select **Enable Roles** and perform the following steps. **a.** Select the Unlock Roles ( ) icon. **b.** Select the Look up icon and then select a role. Repeat the step to add more roles. **c.** Select the Lock Roles icon .
Assign one or more users to the Lens action	**a.** To assign yourself, select the Add Me icon . **b.** To assign one or more users, select the Unlock Users ( ) icon. **c.** Select the Look up icon and then select a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

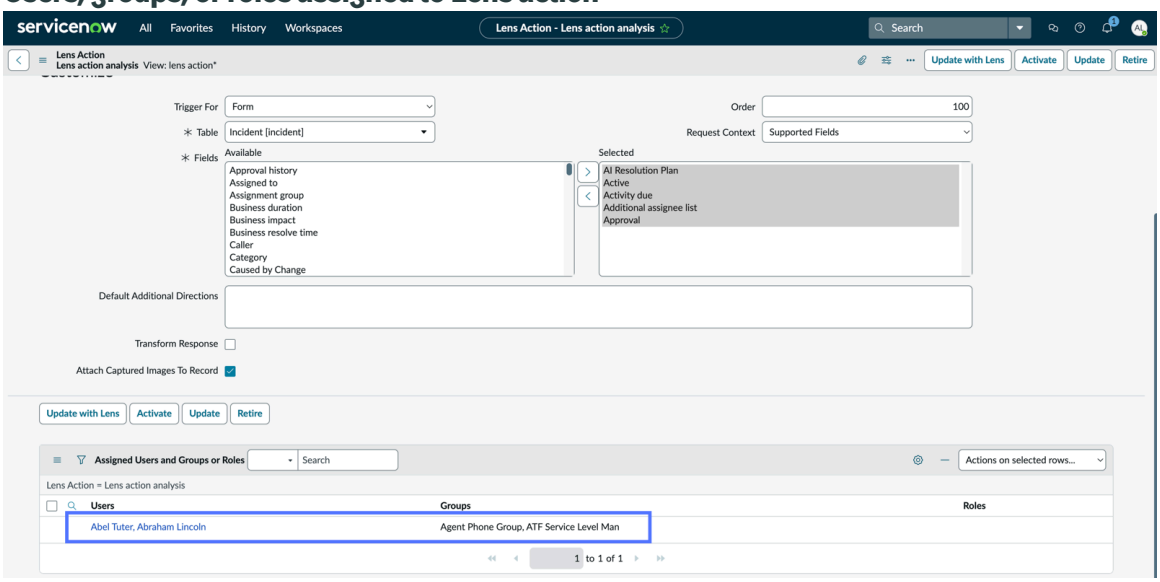
Method	Steps
	d. Repeat the step to add more users. **e.** Select the Lock Users icon .
Assign one or more groups to the Lens action	**a.** Select the Unlock Groups icon. **b.** Select the Look up icon and then select a group. Repeat the step to add more groups. **c.** Select the Lock Groups icon .

You can assign any one of the following combinations to the Lens action:

- Assign roles to the Lens action.
- Assign yourself and one or more groups to the Lens action.
- Assign one or more users and groups to the Lens action

8. Select **Submit**.
   The users or groups, or roles are assigned to the Lens action.

Users, groups, or roles assigned to Lens action



9. Select **Update**.
10. **Optional:** Update the assignment of users or groups or roles to the Lens action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment type	Steps
Roles	**a.** Under the heading **Assigned Users and Groups or Roles**, select the role. **b.** To remove a role, select a role and then se lect (×) **c.** Assign one or more new roles. For more in formation, see #unique_921_Connect_42_ assign-roles-to-lens-action
Users	**a.** Under the heading Assigned Users and Groups or Roles, select the user. **b.** To remove a user, select a user and then se lect (×) **c.** Assign one or more new users. For more in formation, see #unique_921_Connect_42_ assign-users-to-lens-action
Groups	**a.** Under the heading Assigned Users and Groups or Roles, select the group. **b.** To remove a group, select a group and then select (×) **c.** Assign one or more new groups. For more information, see #unique_921_Connect_ 42_assign-groups-to-lens-action

11. Select **Activate** for activating the Lens action.
    The Lens action will be available on the ServiceNow AI Lens desktop application landing page.

Example: Scan documents to auto-fill the Insurance Request form

Enable customers to scan documents related to car accident on their desktop to auto-fill the Insurance Request form on the ServiceNow instance.

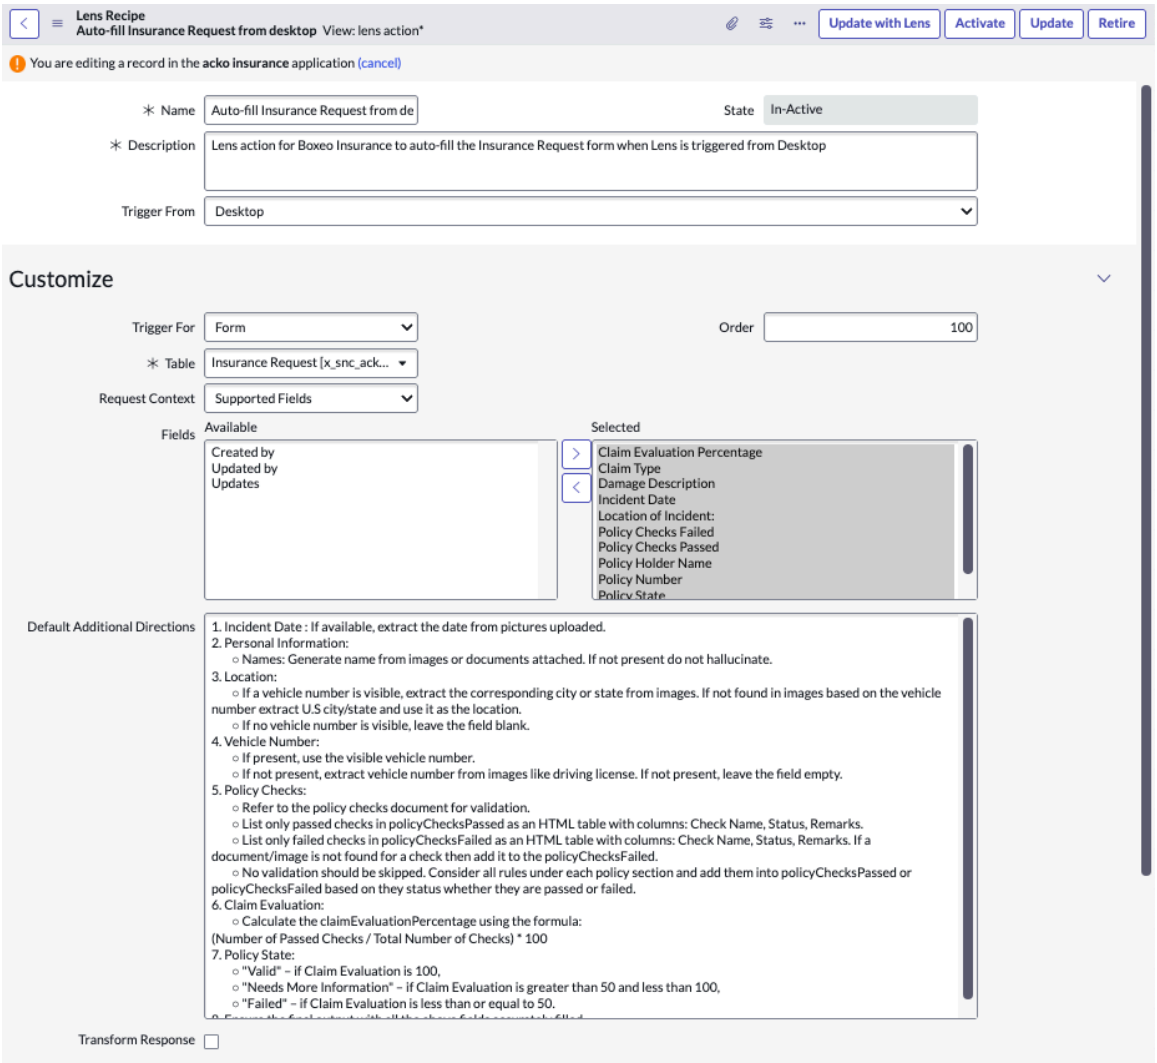
Before you begin

Role required: lens_admin

About this task

You can define in the Lens action that ServiceNow AI Lens must be triggered from the desktop to auto-fill the Insurance Request form. Lens action includes the fields that must be updated with the extracted data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **ServiceNow AI Lens** > **Lens Actions**.
2. In the **Name** field, enter `Auto-fill Insurance Request from desktop`.
3. In the **Description** field, enter `Lens action for Boxeo Insurance to auto-fill the Insurance Request form when Lens is triggered from Desktop`.
4. From the **Trigger From** option, select Desktop.
5. In the form header, right-click and select **Save**.
6. From the **Trigger For** option, select Form.
7. In the **Table** field, select the Insurance Request table.
8. In the **Request Context** field, select Supported Fields to provide context.
9. From the **Fields** field, move fields to the Selected list.
   `policy_number, location_of_incident, policy_holder_name, vehicle_number, policy_state, policy_checks_failed, policy_checks_passed, incident_date_time, damage_description, claim_type, claim_evaluation_percentage`
10. In the **Default Additional Directions** field, enter the following directions for the AI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

```
1. Incident Date : If available, extract the date from pictures
 uploaded.
2. Personal Information:
 ○ Names: Generate name from images or documents attached. If
 not present do not hallucinate.
3. Location:
 ○ If a vehicle number is visible, extract the corresponding
 city or state from images. If not found in images based on
 the vehicle number extract U.S city/state and use it as the
 location.
 ○ If no vehicle number is visible, leave the field blank.
4. Vehicle Number:
 ○ If present, use the visible vehicle number.
 ○ If not present, extract vehicle number from images like
 driving license. If not present, leave the field empty.
5. Policy Checks:
 ○ Refer to the policy checks document for validation.
 ○ List only passed checks in policyChecksPassed as an HTML
 table with columns: Check Name, Status, Remarks.
 ○ List only failed checks in policyChecksFailed as an
 HTML table with columns: Check Name, Status, Remarks. If a
 document/image is not found for a check then add it to the
 policyChecksFailed.
 ○ No validation should be skipped. Consider all rules under
 each policy section and add them into policyChecksPassed
 or policyChecksFailed based on they status whether they are
 passed or failed.
6. Claim Evaluation:
 ○ Calculate the claimEvaluationPercentage using the formula:
(Number of Passed Checks / Total Number of Checks) * 100
7. Policy State:
 ○ "Valid" - if Claim Evaluation is 100,
 ○ "Needs More Information" - if Claim Evaluation is greater
 than 50 and less than 100,
 ○ "Failed" - if Claim Evaluation is less than or equal to 50.
8. Ensure the final output with all the above fields accurately
 filled.
```

11. Add users or groups who can use this Lens action.

a. In the Assigned Users and Groups related list, select **New**.

b. Select the required users or group of users that have the lens_user role.
Only the assigned users or group of users can leverage the Lens action during Lens execution.

c. Select **Submit**.

12. Select **Update**.

13. Select **Activate** for activating the Lens action.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Extract structured data from vendor agreements

Enable compliance analysts to digitize and review several vendor agreements. Instead of manually entering details, they can launch ServiceNow AI Lens directly from the desktop, scan agreements, and adjust extracted values in the preview window before saving.

Before you begin

Role required: lens_admin

About this task

You can define in the Lens action that ServiceNow AI Lens must be triggered from the desktop to scan the documents saved on the user system. With the post processing option, you can edit the extracted information in the preview window before saving and trigger post processing to create related list records.

Procedure

1. Navigate to **All** > **ServiceNow AI Lens** > **Lens Actions**.
2. In the **Name** field, enter `Extract data from vendor agreements`.
3. In the **Description** field, enter `Digitize and review several vendor agreements`.
4. From the **Trigger From** option, select Desktop.
5. In the form header, right-click and select **Save**.
6. From the **Trigger For** option, select Others.
7. In the **Request Context** field, select Advanced.
8. In the **Pre Processing Script** field, enter the script to generate custom schema object for providing enhanced context.

   Example

   Here is the example of returned custom schema object:

```
schemaObj =  {
  "schemaPayload": {
    "type": "json_schema",
    "json_schema": {
      "name": "schema_extraction",
      "schema": {
        "type": "object",
        "properties": {
          "vendorName": {
            "type": "string",
            "label": "Vendor Name"
          },
          "contractTitle": {
            "type": "string",
            "label": "Contract Title"
          },
          "contractReferenceNumber": {
            "type": "string",
            "label": "Contract Reference Number"
          },
          "contractStartDate": {
            "type": "string",
            "label": "Contract Start Date"
          },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          "contractEndDate": {
            "type": "string",
            "label": "Contract End Date"
          },
          "renewalTerminationClauses": {
            "type": "string",
            "label": "Renewal / Termination Clauses"
          }
        },
        "required": [
          "vendorName",
          "contractTitle",
          "contractReferenceNumber",
          "contractStartDate",
          "contractEndDate"
        ],
        "additionalProperties": false
      }
    }
  },
  "fieldLabels": ["vendorName", "contractTitle",
 "contractReferenceNumber", "contractStartDate",
 "contractEndDate"]  //Optional key
}
```

9. In the **Default Additional Directions** field, enter directions for the AI, such as `Leave the fields empty if you don't find the relevant information. Don't hallucinate. Enter the date in the DD-MM-YYYY.`
10. Select the **Enable Post Processing** option.
11. In the **Post Processing Script** field, enter the script to provide the post processing logic for the Lens response after the Lens execution is complete.

    Example
    You can provide a post processing logic to pass the data extracted to a subflow for creating related list records.
12. **Optional:** Select the **Wait for processed response** field to enable the ServiceNow AI Lens to wait for ServiceNow AI Lens to display the output of post-processing on the Preview window. If enabled, it waits for the post processing output. Else, it doesn't wait for post processing output but post processing continues in the background.
13. **Optional:** In the **Max wait time (seconds)** field, specify the maximum time ServiceNow AI Lens waits to display the output of post-processing.

    Note: If the output doesn't appear within that duration, the session times out while the post-processing continues in the background until completion.

14. Add users or groups who can use this Lens action.

    a. In the Assigned Users and Groups related list, select **New**.

    b. Select the required users or group of users that have the lens_user role.
    Only the assigned users or group of users can leverage the Lens action during Lens execution.

    c. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

15. Select **Update**.
16. Select **Activate** for activating the Lens action.

Example: Auto-fill user records on a user table

Enable service agents to create user records by extracting specific information from identity documents using ServiceNow AI Lens, directly from the ServiceNow instance.

Before you begin
Role required: lens_admin

About this task
A service agent must onboard multiple users by scanning their official ID cards (for example, government-issued ID). Instead of manually entering each user's details, the agents can trigger ServiceNow AI Lens from the instance to automate data extraction and auto-fill specific fields defined in the Lens action record.

You can define in the Lens action that ServiceNow AI Lens must be triggered from the instance to create user records and provide default directions.

Procedure
1. Navigate to **All** > **ServiceNow AI Lens** > **Lens Actions**.
2. Select **New**.
3. In the **Name** field, enter `Auto-fill the user records`.
4. In the **Description** field, enter `Lens action to auto-create the user records on the ServiceNow instance`.
5. From the **Trigger From** option, select Instance.
6. In the form header, right-click and select **Save**.
7. Confirm that the Form option is selected in the **Trigger For** field.
   The Form option is selected by default.
8. In the **Table** field, select the User [sys_user] table.
9. Confirm that Supported Fields is selected in the **Request Context** field.
   The Supported Fields value is selected by default, and it provides context.
10. From the **Fields** field, move the fields to the Selected list.
    `userID, first_name, last_name, title, and date_of_birth`
11. In the **Default Additional Directions** field, enter `User ID must always be in lower case and uses the firstname.lastname format. Enter Date of birth in the dd-mm-yyyy format.`
12. Add users or groups who can use this Lens action.
    a. In the Assigned Users and Groups related list, select **New**.
    b. Select the required users or group of users that have the lens_user role.
       Only the assigned users or group of users can leverage the Lens action during Lens execution.
    c. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. Select **Update**.
14. Select **Activate** for activating the Lens action.

Auto-map Excel sheet column headers with ServiceNow table columns

Use ServiceNow AI Lens to map the column headers of an Excel sheet that you specify with ServiceNow® table columns and then insert the Excel sheet data into the table.

Before you begin

Role required: lens_user

Ensure that the Lens action for this purpose is already defined. To view the steps to define a Lens action, see Define a Lens action. Ensure that the values in the Lens action form are exactly as specified in the following table.

Lens action Excel mapping configuration options

Field	Option you must select
Trigger From	Desktop
Trigger For	Excel Mapping
Table	Name of the table with which the Lens action will auto-map the Excel sheet column headers.
Request context	Supported Fields
Fields	Columns of the table

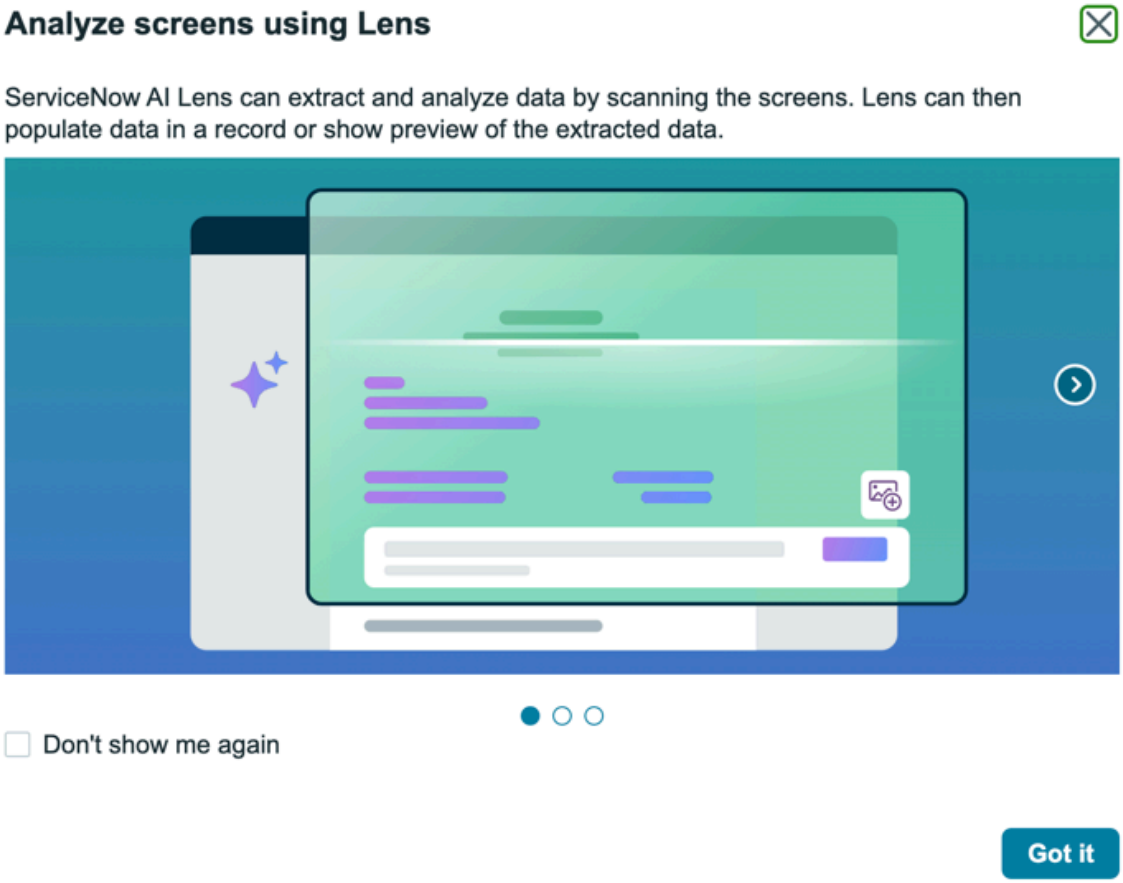
Tip: A preconfigured Lens action that is designed to auto-map Excel sheet column headers with table columns is available by default on your instance. The name of the Lens action is `Import Excel Sheet data to custom table`. To use the Lens action, create a copy of this Lens action, and customize to create your own Lens action for this purpose.

Procedure

1. From your system, launch the ServiceNow AI Lens desktop application.
2. On the login page, in the **Instance URL** field, enter the ServiceNow instance URL.

   Example
   For example, `https://<instance name>.service-now.com`.
3. Select **Proceed**.
4. Log in to your ServiceNow account by entering your username and password.
5. **Optional:** On the onboarding journey widget, complete the onboarding and select **Got it**.

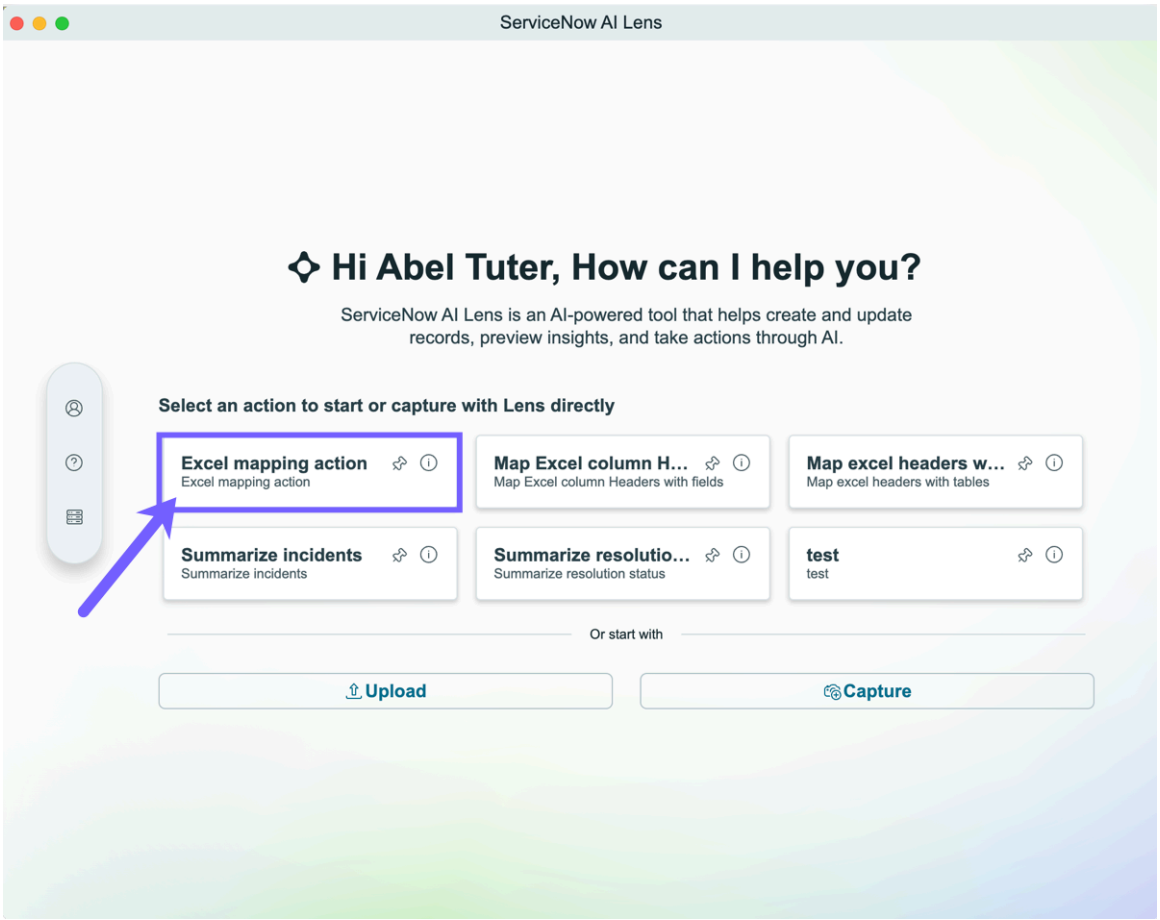
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you launch the ServiceNow AI Lens for the first time, the onboarding journey widget appears. You can select **Don't show me again** to hide the widget the next time you launch ServiceNow AI Lens.

6. Select the Lens action that you have defined for Excel mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The **Proceed with Lens** button is disabled.

Note: The **Proceed with Lens** button is disabled because to auto-map Excel sheet column headers with the table columns, ServiceNow AI Lens requires you to only attach an Excel sheet.

7. Attach an Excel sheet by selecting **Upload** and then perform any one of the following file upload methods on the Upload file window.

File upload window

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: You can change the mapping by selecting one or more different table columns under the Imported as field heading.

10. Select **Submit**.
    The Excel sheet data is inserted into the table.

Enabling ServiceNow AI Lens in Virtual Agent

You can enable ServiceNow AI Lens in Virtual Agent so that ServiceNow AI Lens can be triggered from Virtual Agent conversation.

By enabling ServiceNow AI Lens in Virtual Agent, you can trigger AI-powered ServiceNow AI Lens to scan an image for getting insights, recommendation, resolution steps, and more.

Enable AI Search

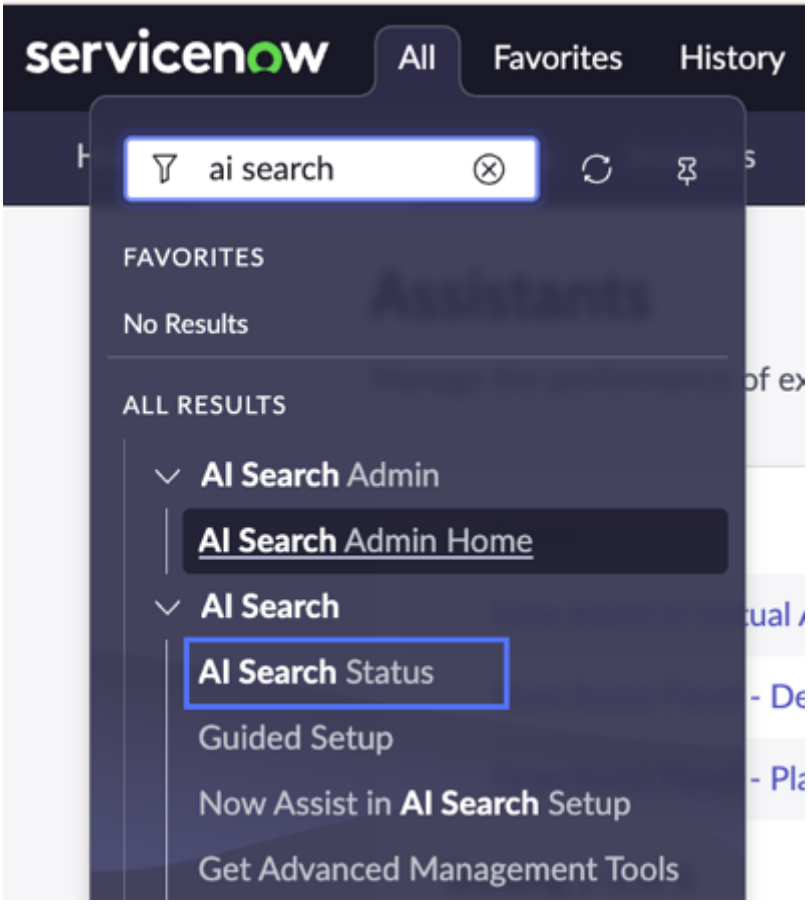
Enable the AI Search application on your instance so that you can use ServiceNow AI Lens skill to gather insights from an image using generative AI.

Before you begin
Role required: ais_admin or admin

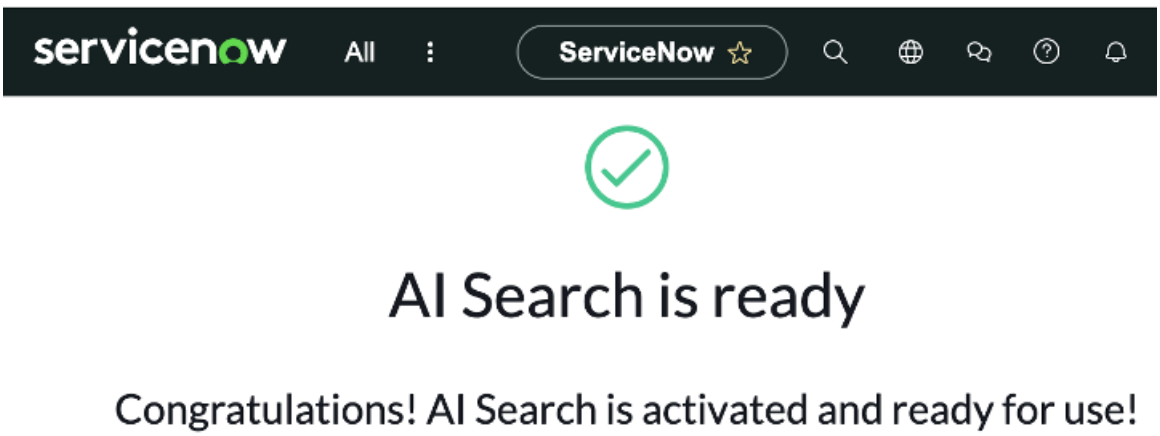
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Search** > **AI Search Status**.



2. If AI search is not enabled, select **Request AI Search**.
   After AI Search is activated in your instance, you will see the following success message.



Enable the default Now Assist assistant for ServiceNow AI Lens

Enable the default Now Assist in Virtual Agent assistant so that you can use ServiceNow AI Lens in Virtual Agent.

Before you begin

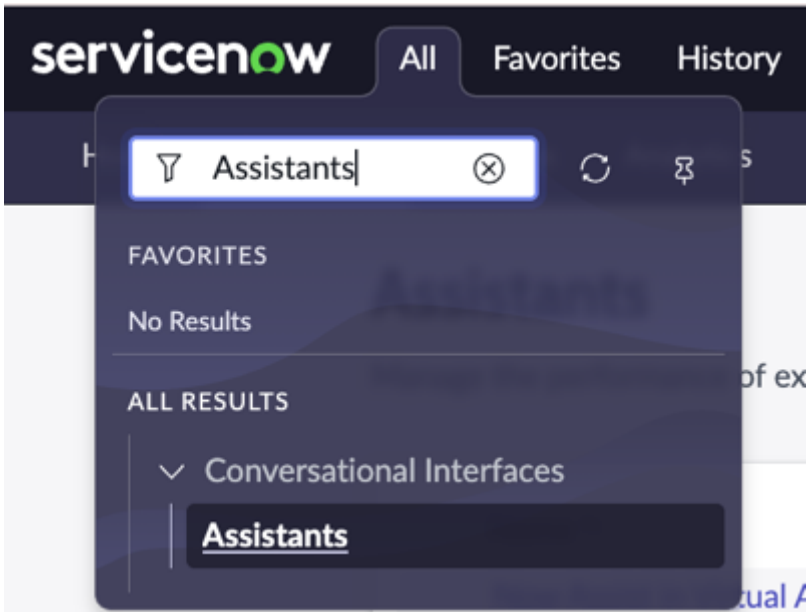
If you have another assistant configured for your specific use case or industry, you can skip this procedure and follow Enable other assistants in ServiceNow AI Lens topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

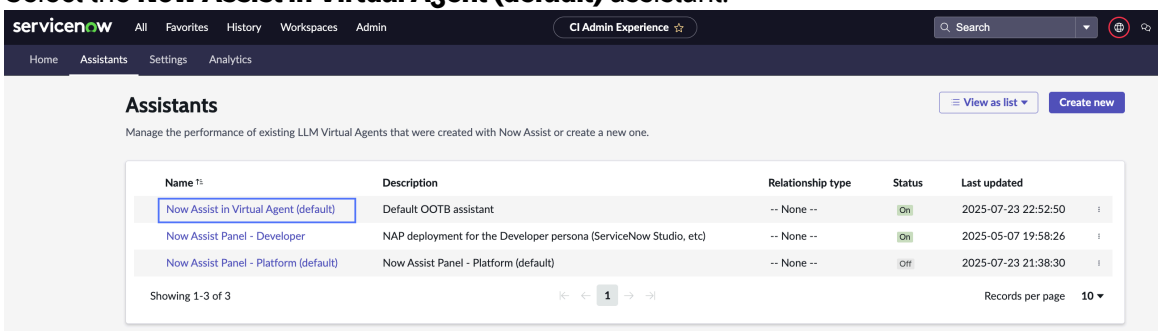
Role required: virtual_agent_admin or admin

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistants**.



2. Select the **Now Assist in Virtual Agent (default)** assistant.



3. On the Overview tab, select **Save and continue**.
4. On the Now Assist Skills tab, ensure that **Now Assist Topics** is selected.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

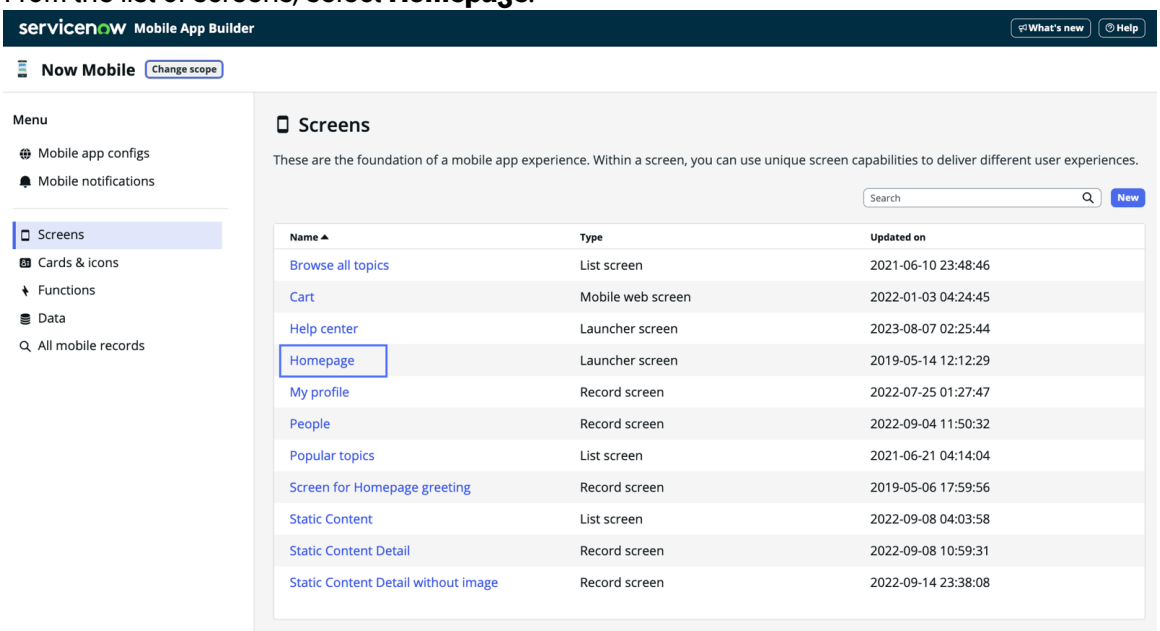
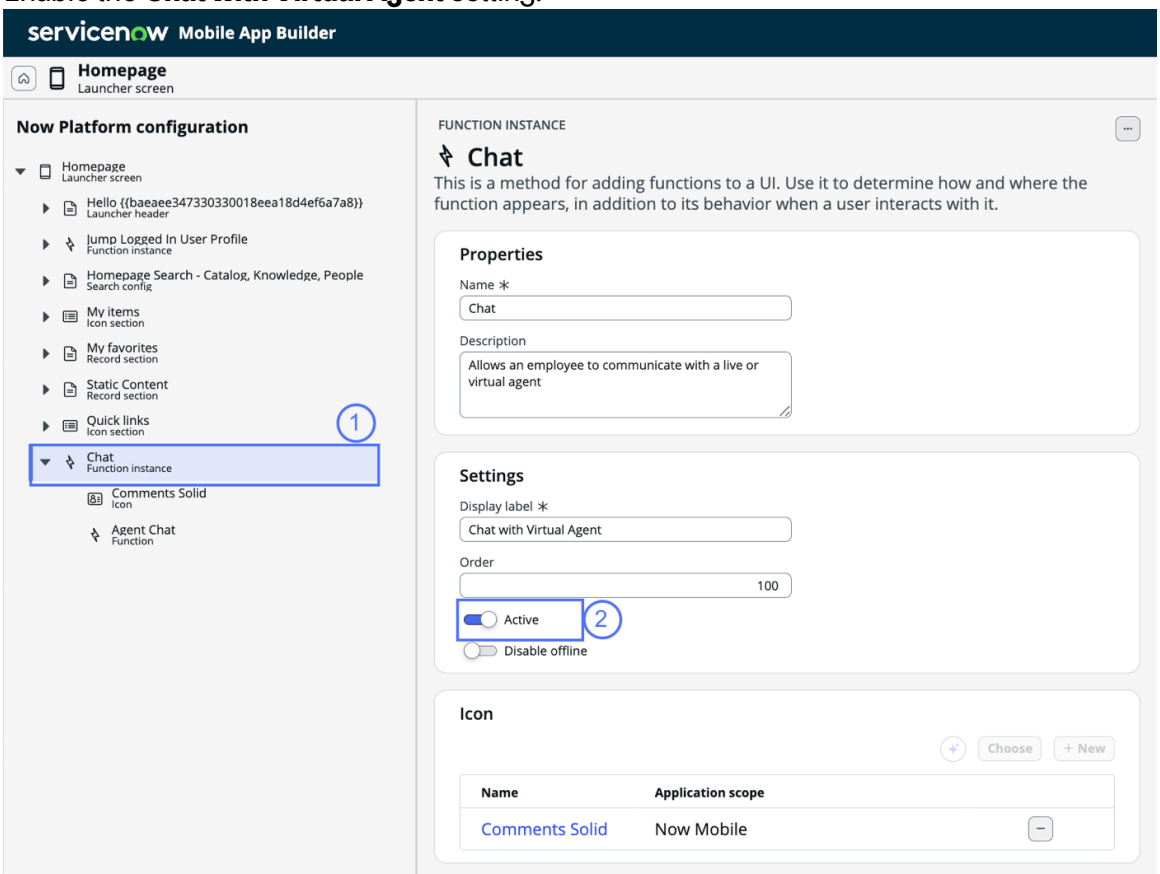
3. From the list of screens, select **Homepage**.



4. From the Now Platform configuration list, select the **Chat** function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Enable the **Chat with Virtual Agent** setting.



Using ServiceNow AI Lens

If you have a lens_user role, and have activated the ServiceNow AI Lens skill, you can use the ServiceNow AI Lens application to capture screens or upload files, extract and comprehend data from the captured screenshots or uploaded files, auto-fill form fields, or preview the extracted data.

Using ServiceNow AI Lens overview

Use ServiceNow AI Lens to do the following tasks:

- Create or update a record directly from your browser by capturing your screen — no installation required. For more information, see Create a record directly from your browser or Update a record directly from your browser.
- Create or update a record in the ServiceNow instance by auto-filling data that is scanned from captured images or extracted from the files that you upload. For more information, see Create or update a record in an instance by using ServiceNow AI Lens.
- Trigger ServiceNow AI Lens in the context of Lens actions to auto-fill a form on the ServiceNow instance or view preview of extracted data. For more information, see Trigger ServiceNow AI Lens from the desktop app.
- Autofill the fields in a catalog item request form in the Service Portal. Launch ServiceNow AI Lens from the catalog item request form, then scan and extract data from artifacts such as Excel files, emails, or images of handwritten notes. For more information, see Auto-fill catalog item form in the Service Portal.
- Scan visual data, such as handwritten texts and notes, images, applications, and websites. You can use ServiceNow AI Lens as a standalone application to preview the generated outcome

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

according to the instructions that you provide. For more information, see Extract and analyze data with ServiceNow AI Lens desktop app.

- Extract and analyze data from the files that you upload, and show the outcome of the analysis as a preview. For more information, see Extract and analyze data with ServiceNow AI Lens desktop app.
- Trigger ServiceNow AI Lens in the context of Lens actions from a Virtual Agent conversation. For more information, see Extract and analyze data using ServiceNow AI Lens from Virtual Agent.

Create or update a record in an instance by using ServiceNow AI Lens

Create or update a record in the ServiceNow instance by auto-filling the form fields with data that ServiceNow AI Lens extracts from screens and files.

Before you begin

To access the ServiceNow AI Lens functionality, perform the following steps:

- Install ServiceNow AI Lens on your ServiceNow instance. For more information, see Install the ServiceNow Lens in the ServiceNow instance.
- Turn on the ServiceNow AI Lens skill to add the generative AI capability. For more information, see Activate the ServiceNow AI Lens skill.
- Download the ServiceNow AI Lens installer to scan your desktop screen. For more information, see Download and set how you want to launch ServiceNow AI Lens.

Note:

- To use ServiceNow AI Lens from your browser, turn on the ServiceNow AI Lens skill.
- For the full range of ServiceNow AI Lens capabilities, turn on the ServiceNow AI Lens skill, and download and install the desktop application.

Verify that ServiceNow AI Lens has access to record the screen on your system. For more information, see Providing permission to ServiceNow AI Lens.

Don't scan any personally identifiable information, such as medical reports, financial reports, or other sensitive data, when using ServiceNow AI Lens as you don't want to expose the large language model (LLM) to any sensitive information.

Role required: lens_user

About this task

You can create a record in the ServiceNow instance in two ways:

- **From your browser**: Capture a screen or upload files directly from your browser, and let ServiceNow AI Lens analyze the contents and auto-fill the form fields — no download or installation required. For more information, see Using the Lens browser app.

  Note:

  - The screen capture experience may vary depending on the browser that you use.

    Tip: For the best experience, use ServiceNow AI Lens on any Chromium-based browser.

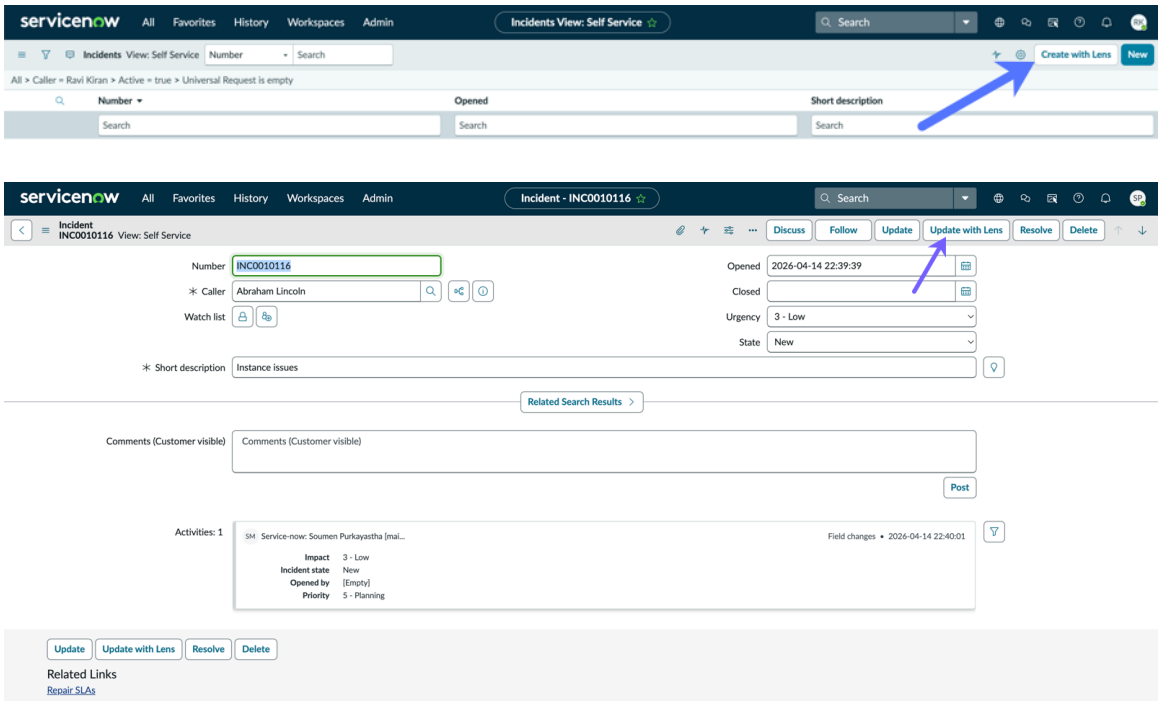
  - The browser-based experience supports single-screen capture.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **From the desktop app**: Use the ServiceNow AI Lens desktop app for the full range of capture and analysis capabilities, such as multi-image capture, auto-map Excel column headers with ServiceNow table fields, and file uploads. For more information, see Using the Lens desktop app.

Procedure

1. In your instance, navigate to the list view of any table, for example, Incidents.
2. Select **Create with Lens** or **Update with Lens**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If pop-up is blocked, ServiceNow AI Lens screen may not open. Confirm that you've already allowed pop-ups from your browser settings.
- On non-production instances, you can control on which tables the **Create with Lens** and **Update with Lens** buttons appear using the following system properties:
  - *sn_app_lens_core.show_lens_action_on_all_tables*: Set to true to show the **Create with Lens** and **Update with Lens** buttons on all tables. Set to false to show it only on specific tables. Default is true.
  - *sn_app_lens_core.lens_inclusion_table_list*: Enter the names of the tables as comma-separated values where you want the **Create with Lens** and **Update with Lens** buttons to appear. Use this property only when the *sn_app_lens_core.show_lens_action_on_all_tables* property is set to false.
  - *sn_app_lens_core.lens_exclusion_table_list*: Enter the names of the tables as comma-separated values where you want to hide the **Create with Lens** and **Update with Lens** buttons, regardless of how the *sn_app_lens_core.lens_inclusion_table_list* property is set.
- On non-production instances, the **Create with Lens** and **Update with Lens** buttons may appear even if the ServiceNow AI Lens skill is not activated. If you select the button, an error occurs. You can activate the skill or hide the button by entering the name of the table in the *sn_app_lens_core.lens_inclusion_table_list* property
- On production instances, the **Create with Lens** and **Update with Lens** buttons are visible only when the ServiceNow AI Lens skill is active and the user has the lens_user role. To hide the buttons on all tables, set *sn_app_lens_core.show_lens_action_on_all_tables* to false and leave *sn_app_lens_core.lens_inclusion_table_list* empty.

3. Create or update a record in the ServiceNow instance by performing any of the following methods.
   - Using the Lens browser app

     The ServiceNow AI Lens browser app opens in a new browser window.
   - Using the Lens desktop app

     The ServiceNow AI Lens desktop app is launched.

ServiceNow AI Lens limitations

Extract and analyze data with ServiceNow AI Lens desktop app

Using the Lens browser app

Capture a screen or upload files directly from your browser, and let ServiceNow AI Lens analyze the contents and auto-fill the form fields — no download or installation required.

Before you begin

Important: Confirm that **Browser** is selected as a default preference in the Downloads and Preferences page. To view the steps, see Set AI Lens to launch with the desktop app

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: lens_user

About this task

When you select **Create with Lens** or **Update with Lens** for a form, the ServiceNow AI Lens browser app opens in a new browser window.

Note:

- The screen capture experience may vary depending on the browser that you use.

  Tip: For the best experience, use ServiceNow AI Lens on any Chromium-based browser.

- The browser-based experience supports single-screen capture. To capture multiple screens, Use ServiceNow AI Lens from the desktop application.

Procedure

1. Select one of the following methods.

   - **Capture screen**

     a. Select **Capture screen**.

     b. Select the screen that you want to capture, and then select **Share**.

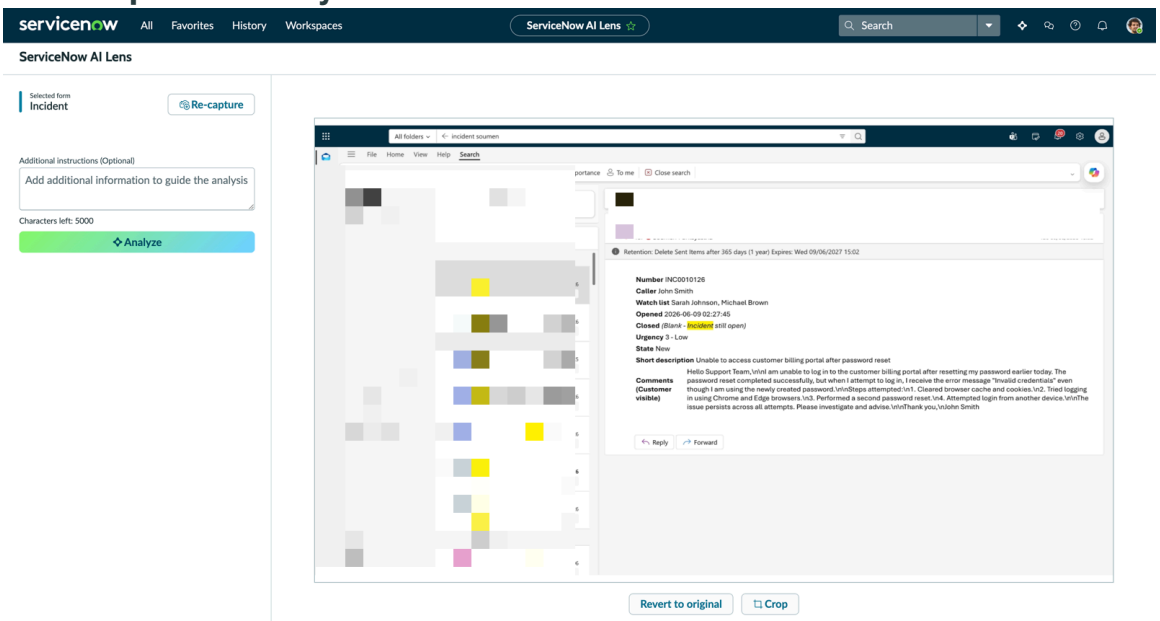
Screen captured for analysis



c. (Optional). To specify the area of the captured screen that you want ServiceNow AI Lens to analyze, select **Crop**, and then use the crop handles.

d. Select **Confirm**.

e. (Optional). Perform the following steps:

- Select **Re-capture** to discard the current capture and capture a new screen.
- Select **Revert to original** to undo the crop and restore the full captured image.
- Select **Crop** to further refine your selection by cropping the already cropped screen.

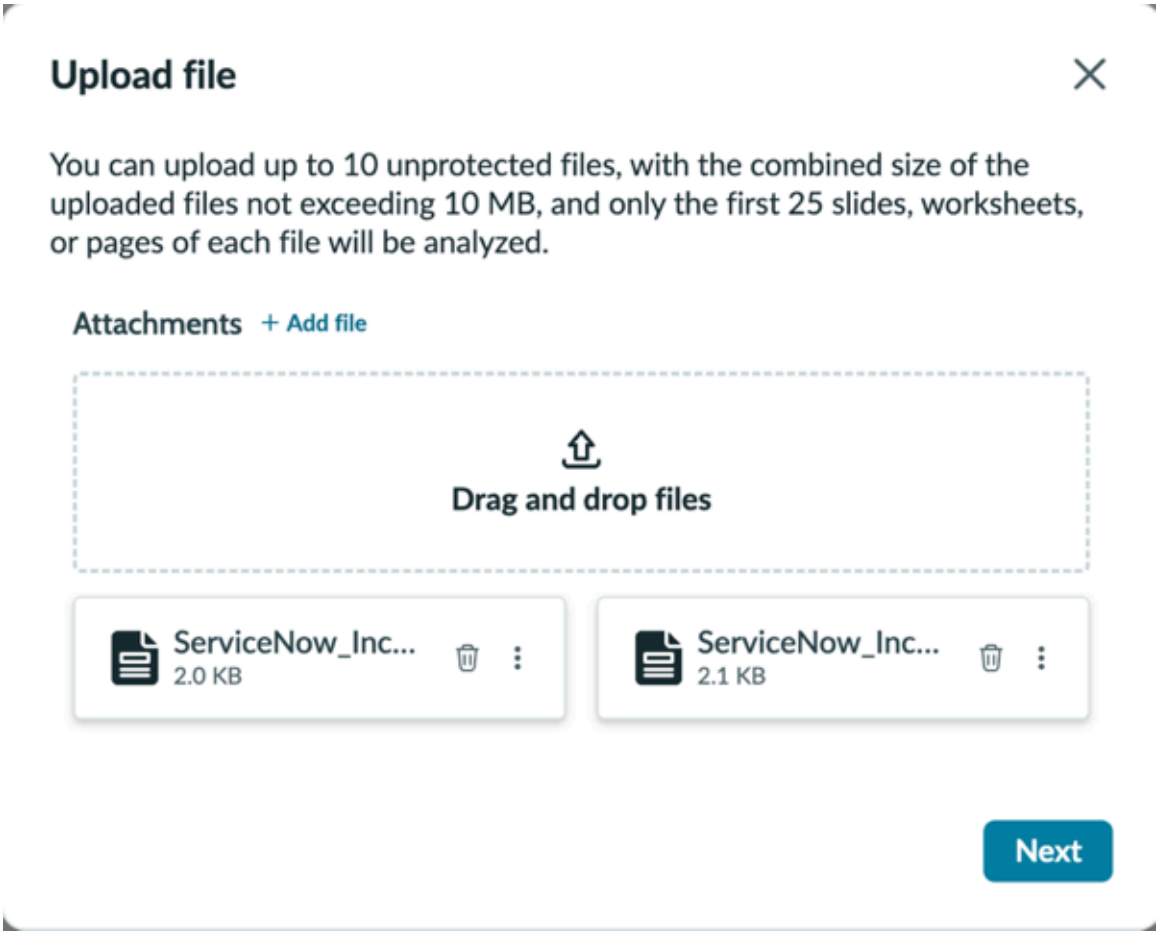
- **Upload**

a. Select **Upload**.

b. Perform any one of the following file upload methods.

- Upload one or more files by selecting the **+Add file** option.
- Upload one or more files by dragging the selected files to the Drag and drop files section and then select **Upload all**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



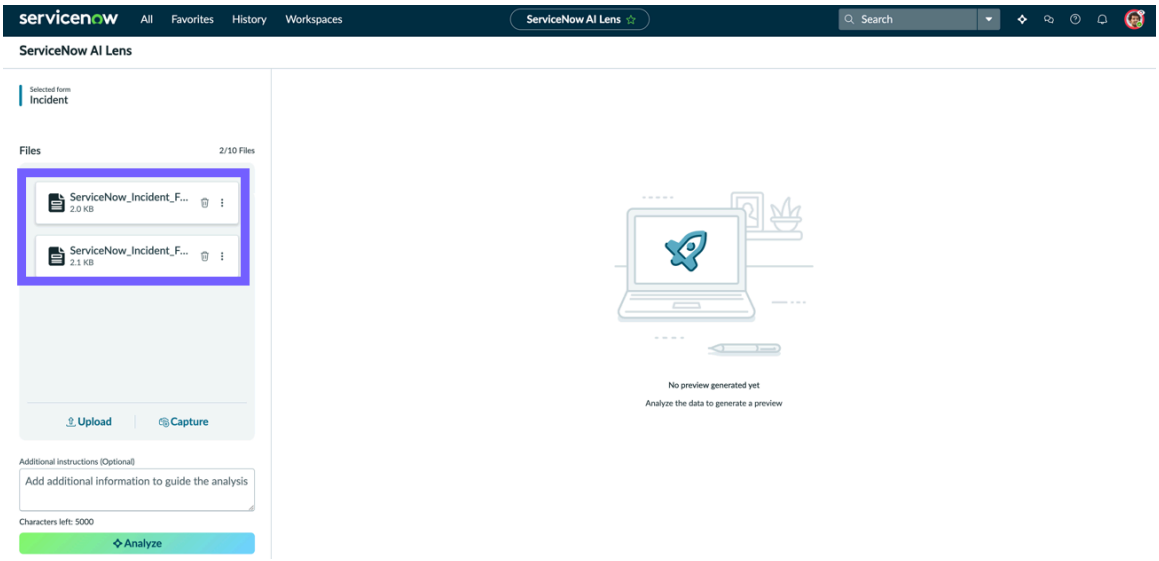
Note:

- You can upload up to 10 unprotected files, with the combined size of the uploaded files not exceeding 10 MB.
- To remove a file that you attached, select the Remove file icon .
- To rename the file that you attached, select the More options icon , and then select **Rename**.

c. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow AI Lens preview window displays the files that you have uploaded

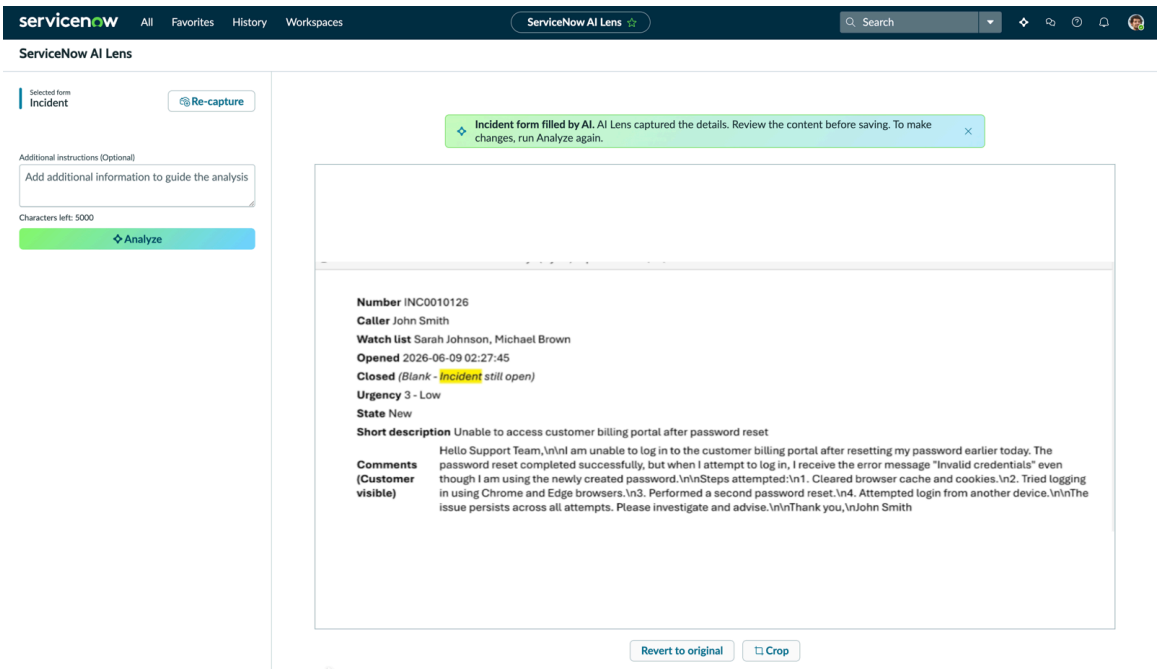


2. To guide ServiceNow AI Lens in extracting the information you need from the uploaded files, enter specific instructions in the **Additional instructions** field.

   The default character limit is 500. Users with the admin role can increase this limit to up to 5000 characters by navigating to the `sn_lens_user_prompt_max_length` system property.

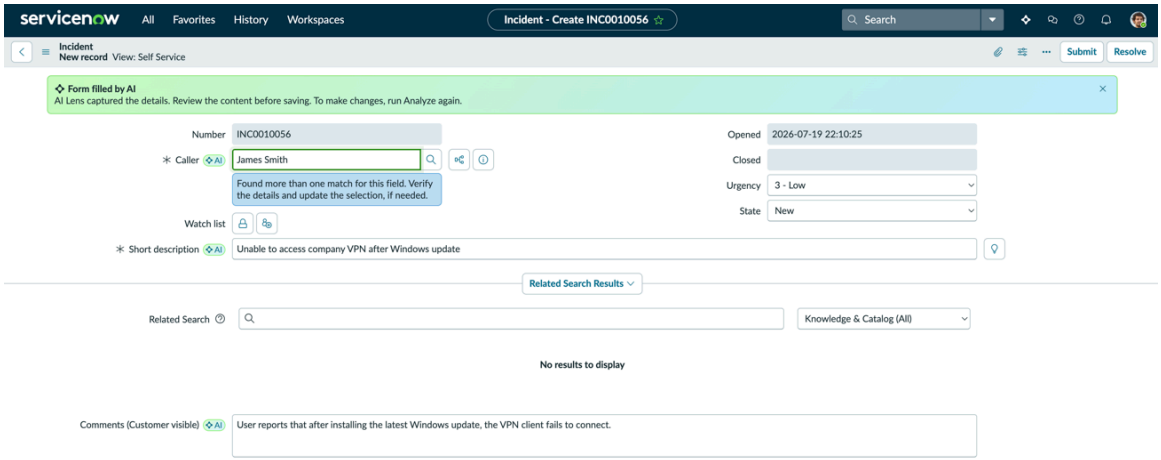
3. To let ServiceNow AI Lens analyze the captured screen, select **Analyze**.

   The form is auto-filled.



4. In the ServiceNow instance, review the text that is auto-filled by AI into your record.
   The fields that are auto-filled by AI are highlighted with the Sparkle icon ✦.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Only the fields that are supported by ServiceNow AI Lens get auto-populated with the extracted data. If you don't have any supported fields in your form, then ServiceNow AI Lens won't update the record. For more information about the supported fields, see Field types supported.

Option	Action
If the auto-filled text looks good	Save the record by selecting **Save**.
If the auto-filled text requires changes	Do one of the following actions: ○ Manually adjust the information in the fields and save the record. ○ In the ServiceNow AI Lens window, provide different instructions or take more screen shots and select **Analyze** so that Service Now AI Lens can extract, comprehend the data again, and auto-fill the data into the record. Save the record by selecting **Save**. You can analyze the artifacts as many times as needed without reloading the form.

Using the Lens desktop app

Use the ServiceNow AI Lens desktop app for the full range of capture and analysis capabilities, such as multi-image capture, auto-map Excel column headers with ServiceNow table fields, and file uploads.

Before you begin

Important: Confirm that **Desktop app** is selected as a default preference in the Downloads and Preferences page. To view the steps, see Set AI Lens to launch with the desktop app

Role required: lens_user

About this task

When you select **Create with Lens** or **Update with Lens** for a form, the ServiceNow AI Lens desktop app is launched.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

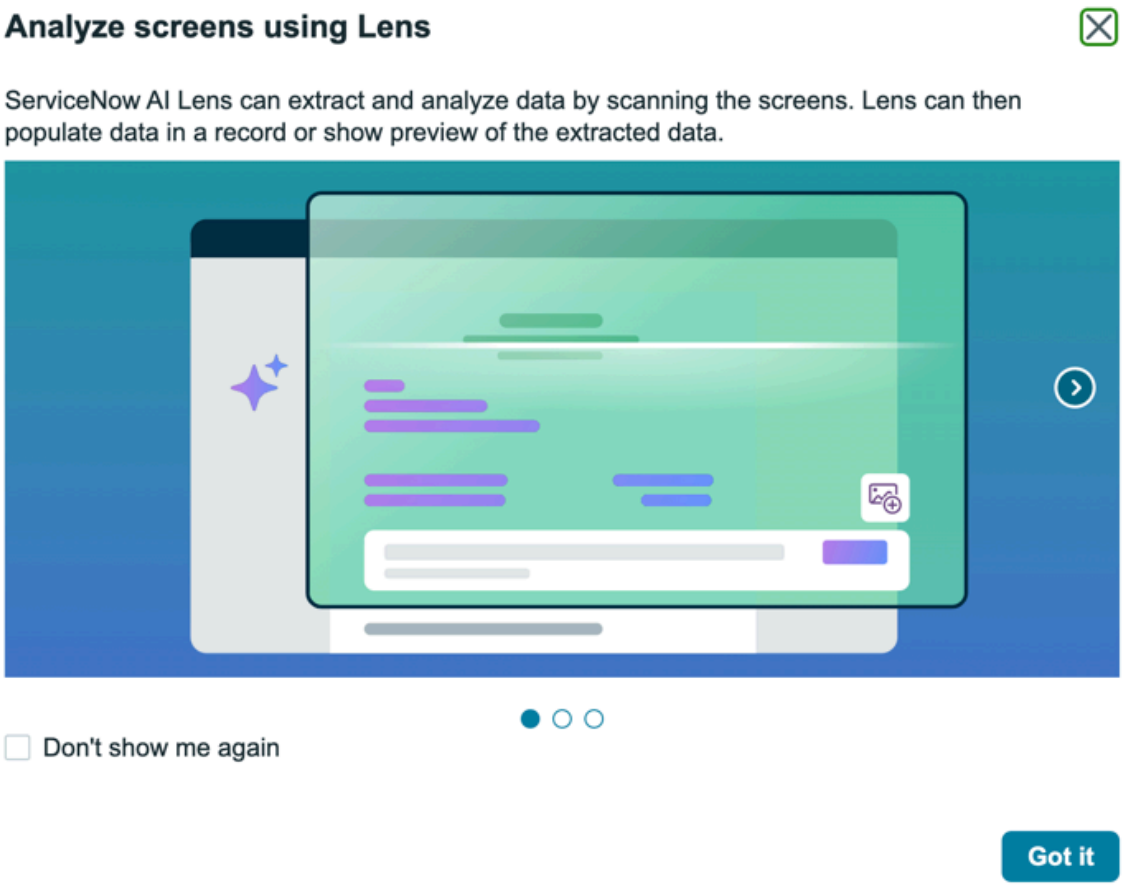
Procedure

1. In the ServiceNow AI Lens.app dialog box, select **Open ServiceNow AI Lens.app**.

   Note:

   - This confirmation dialog appears when you select **Create with Lens** or **Update with Lens** for the first time. You can make this a one-time step by selecting **Always open <instance-name.service-now.com> links of this type in the associated app** before selecting **Open ServiceNow AI Lens.app**.
   - On macOS, when you launch ServiceNow AI Lens desktop app for the first time, your mac asks whether ServiceNow AI Lens can store your login credentials. Select **Always Allow** to avoid entering your credentials every time you open the application.

2. On the onboarding journey widget, complete the onboarding and select **Got it**.



3. Use one of the following methods to extract data from documents.

   Note: A document can be an image, a scanned handwritten note, web page, Excel sheet, or a Microsoft Word document.

   - **Capture screen**

     a. On your system, open one or more documents that you want to scan.

     b. Auto-fill the form on the instance with data extracted from a single screenshot.

        i. Place the ServiceNow AI Lens scanner window on top of the document.

        ii. Resize the ServiceNow AI Lens scanner window by dragging its borders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. (Optional) Auto-fill the form on the instance with data extracted from multiple screenshots.

i. Select the **Multi-capture** button

ii. Select the Capture icon.

iii. Place the ServiceNow AI Lens scanner window over another document or page and then select the Capture icon.

iv. Repeat the step to capture more screenshots, if required.

Note:

- You can capture a total of 10 screenshots with the combined size of all captured screenshots not exceeding 10 MB.
- To enable the desktop app to send large screenshot data to the server, verify that the following system properties are set exactly as shown:

System property

Property name	Type	Recommended value
glide.rest.max_content_length	integer	15
glide.rest.scripted.max_inbound_content_length_mb	integer	15

For more information, see Configure system property.

Note: You must have the admin role to set the system properties.

v. To complete the capture, select the Done icon.

- **Upload**

a. Select **Upload**.

Note:

- You can upload up to 10 unprotected files, with the combined size of the uploaded files not exceeding 10 MB.
- To enable the desktop app to send large data of the uploaded files to the server, confirm that the following system properties are set exactly as shown below:

System property

Property name	Type	Recommended value
glide.rest.max_content_length	integer	15
glide.rest.scripted.max_inbound_content_length_mb	integer	15

For more information, see Configure system property

Note: You must have the admin role to set the system properties.

- To remove a file that you attached, select the Remove file icon.

Auto-fill catalog item form in the Service Portal

Use ServiceNow AI Lens to extract data from documents and auto-fill catalog item forms in Service Portal. For example, auto-fill a new vendor onboarding form by extracting key details such as vendor name, address, contact email, and banking information from multiple documents, that includes Excel files, emails, images, and PDF documents.

Before you begin

Role required: lens_user

About this task

You can auto-fill catalog item forms in the Service Portal in two ways:

- **From your browser**: Use ServiceNow AI Lens to capture a screen from the browser, analyze the contents of the captured screen and auto-fill the form fields in the Service Portal — no download or installation of the desktop app required.

  Note:

  - The screen capture experience may vary depending on your browser.

    Tip: For the best experience, use ServiceNow AI Lens on any Chromium-based browser.

  - The browser-based experience supports single-screen capture.

- **From the desktop app**: Use the ServiceNow AI Lens desktop app for the full range of capture and analysis capabilities, such as multi-image capture and file uploads.

Procedure

1. Navigate to the Service Portal and log in.
   The URL is

   ```
   https://<instance-name>.service-now.com/sp
   ```

   This procedure demonstrates how to request an iPhone from the Service Portal by capturing the browser screen and auto-filling the form.

2. Navigate to the item that you want to request and select it.
3. Select **Fill with Lens**.

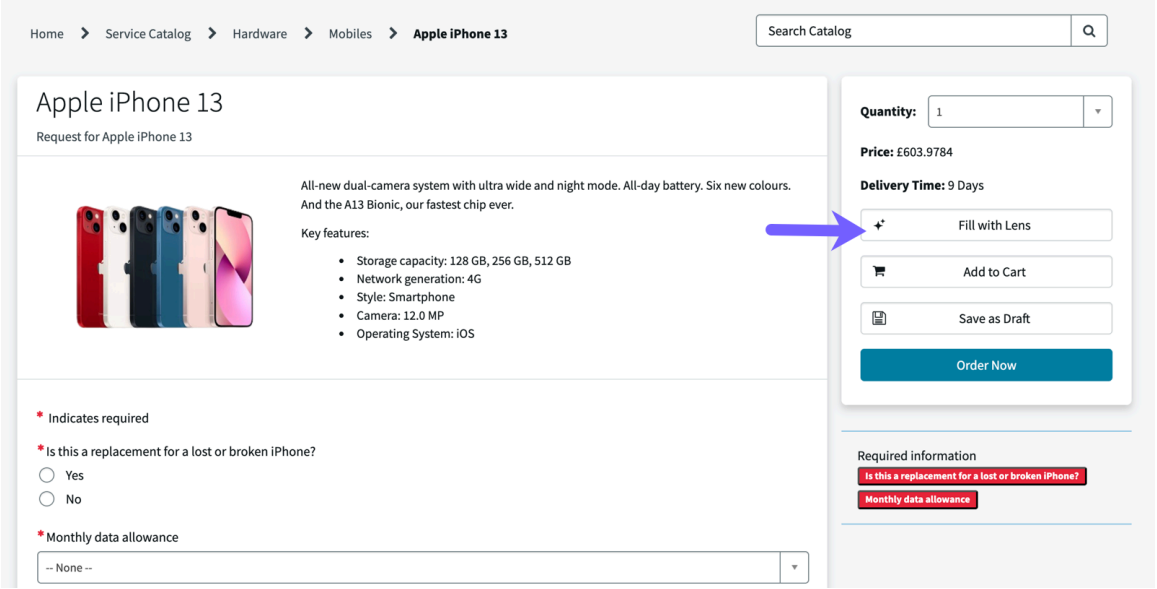
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Auto-fill catalog item forms in Service Portal by performing any of the following methods.
   - Using the Lens browser app

     The ServiceNow AI Lens browser app opens in a new browser window.
   - Using the Lens desktop app

     The ServiceNow AI Lens desktop app is launched.

Using the Lens browser app

Capture a screen or upload files directly from your browser, and let ServiceNow AI Lens analyze the contents and auto-fill the form fields — no download or installation required.

Before you begin

Important: Confirm that **Browser** is selected as a default preference in the Downloads and Preferences page. To view the steps, see Set AI Lens to launch with the desktop app

Role required: lens_user

About this task

When you select **Fill with Lens** on the Service Portal form, the ServiceNow AI Lens browser app opens in a new browser window.

Note:

- The screen capture experience may vary depending on the browser that you use.

  Tip: For the best experience, use ServiceNow AI Lens on any Chromium-based browser.

- The browser-based experience supports single-screen capture. To capture multiple screens, Use ServiceNow AI Lens from the desktop application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select one of the following methods.

   - **Capture screen**

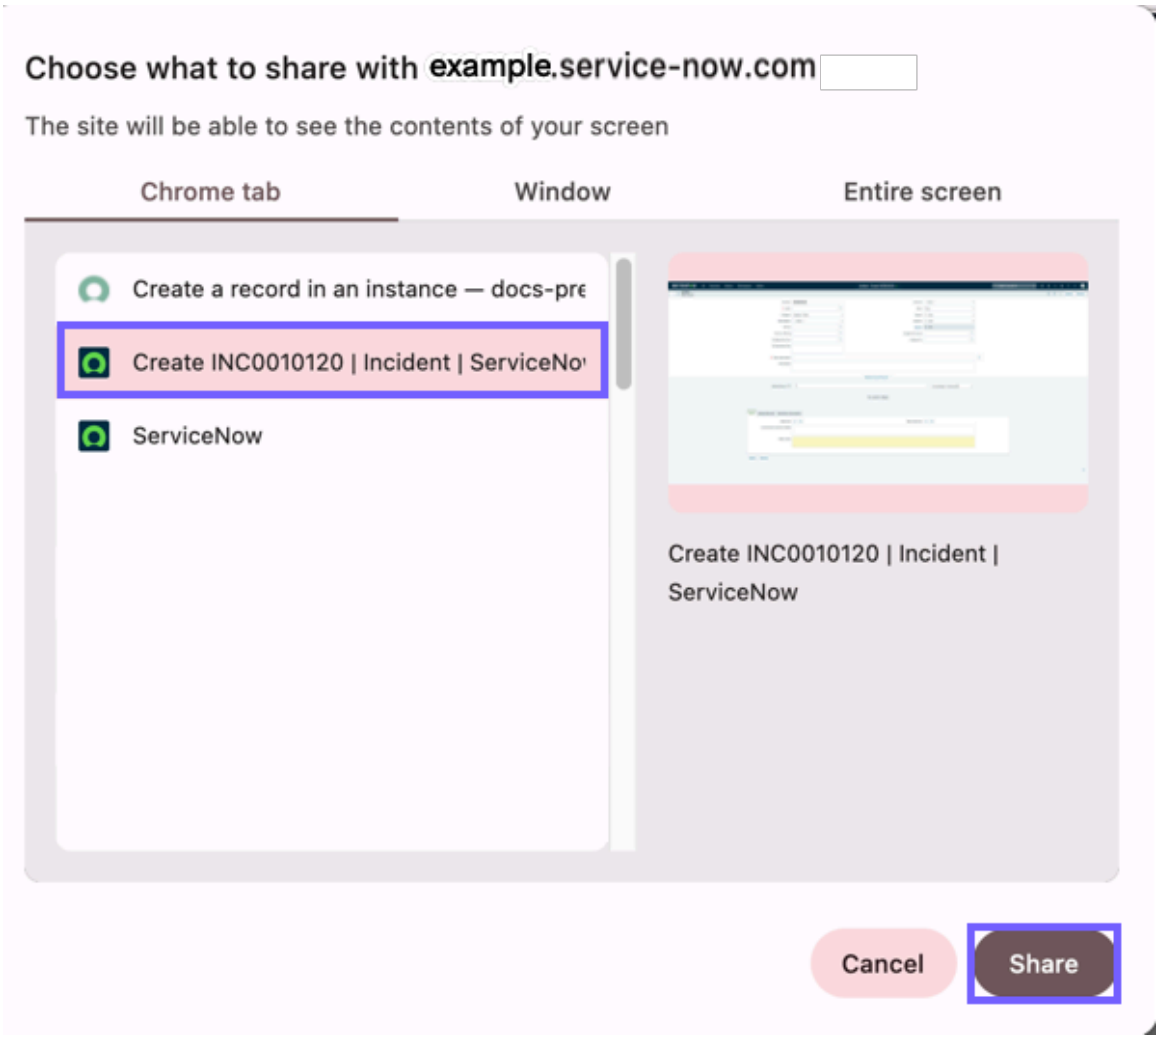
     a. Select **Capture screen**.

     b. Select the screen that you want to capture, and then select **Share**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The screen capture options depend on your browser.
- For illustration purpose, the following steps show the capturing of an Outlook email screen from Chrome tab.



ServiceNow AI Lens shows the captured Outlook email screen that it will analyze.

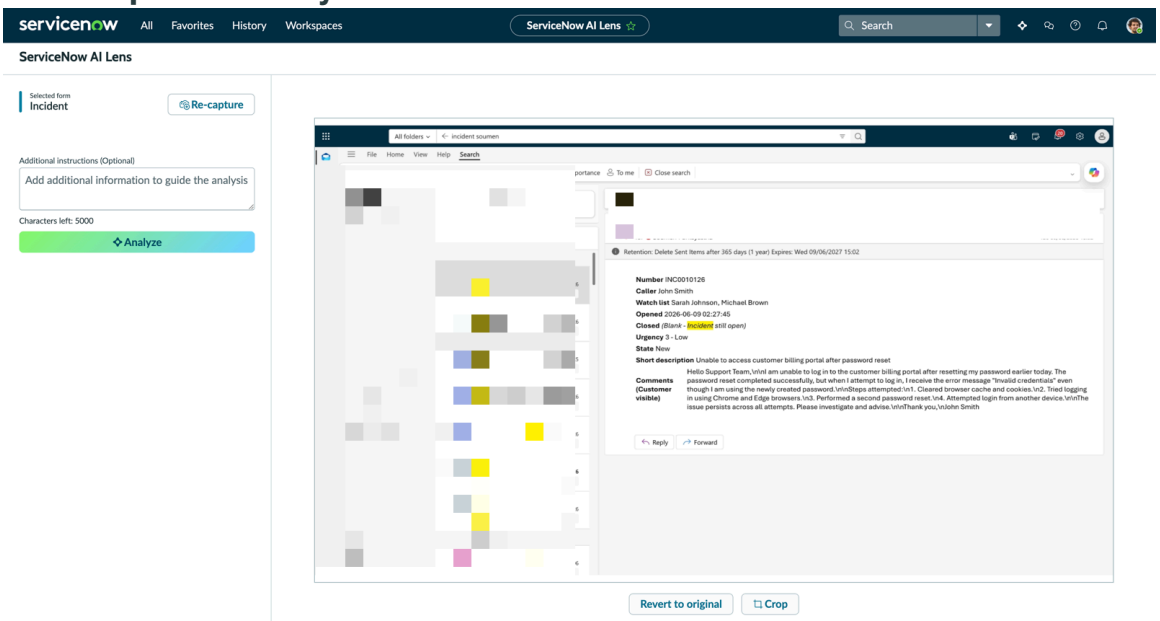
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Screen captured for analysis



c. (Optional) To specify the area of the captured screen that you want ServiceNow AI Lens to analyze, select **Crop**, and then use the crop handles.

d. Select **Confirm**.

e. (Optional). Perform the following steps:

- Select **Re-capture** to discard the current capture and capture a new screen.
- Select **Revert to original** to undo the crop and restore the full captured image.
- Select **Crop** to further refine your selection by cropping the already cropped screen.

- **Upload**

a. Select **Upload**.

b. Perform any one of the following file upload methods.

- Upload one or more files by selecting the **+Add file** option.
- Upload one or more files by dragging the selected files to the Drag and drop files section and then select **Upload all**.

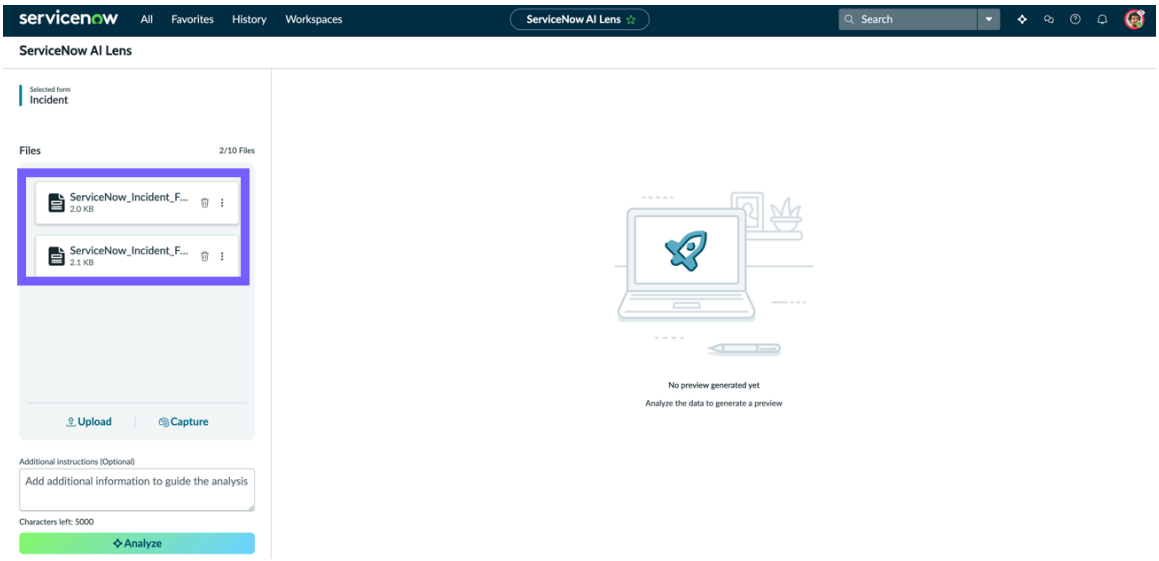
Note:

- You can upload up to 10 unprotected files, with the combined size of the uploaded files not exceeding 10 MB.
- To remove a file that you attached, select the Remove file icon .
- To rename the file that you attached, select the More options icon , and then select **Rename**.

c. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow AI Lens preview window displays the files that you have uploaded

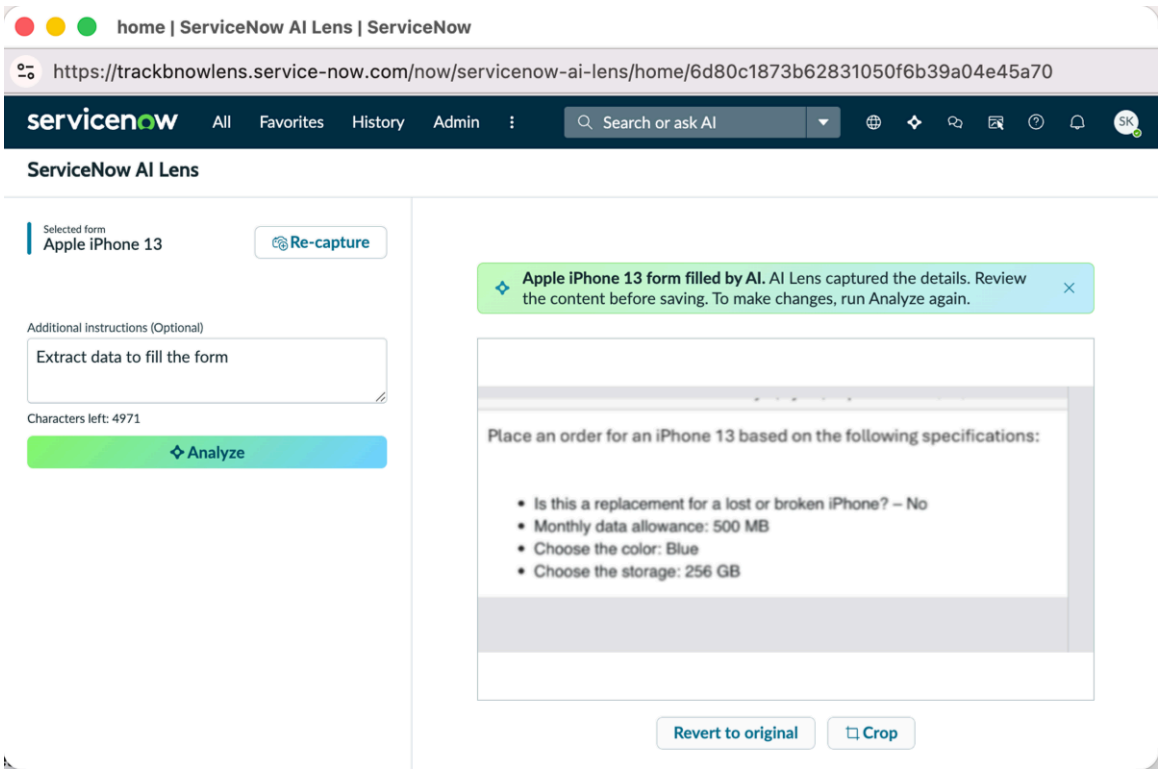


2. To guide ServiceNow AI Lens in extracting the information you need from the uploaded files, enter specific instructions in the **Additional instructions** field.

   The default character limit is 500. Users with the admin role can increase this limit to up to 5000 characters by navigating to the `sn_lens_user_prompt_max_length` system property.

3. To let ServiceNow AI Lens analyze the captured screen, select **Analyze**.

   ServiceNow AI Lens notifies that it has auto-filled the catalog item form fields.



4. Navigate to the catalog item form that you wanted to auto-fill and verify that the fields are correctly filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only the field types that are supported by ServiceNow AI Lens get auto-populated with the extracted data. If the form doesn't have field types that are supported, then ServiceNow AI Lens won't update the record. For more information about the supported fields, see Field types supported.

Option	Action
If the auto-filled text looks good	Save the record by selecting **Submit**.
If the auto-filled text requires changes	Do one of the following actions: ○ Manually adjust the information in the fields and save the record. ○ In the ServiceNow AI Lens window, provide different instructions or take more screen shots and select **Analyze** so that Service Now AI Lens can extract, comprehend the data again, and auto-fill the data into the record. Save the record by selecting **Sub mit**. You can analyze the artifacts as many times as needed without reloading the form.

Using the Lens desktop app

Use the ServiceNow AI Lens desktop app for the full range of capture and analysis capabilities, such as multi-image capture, auto-map Excel column headers with ServiceNow table fields, and file uploads.

Before you begin

Important: Confirm that **Desktop app** is selected as a default preference in the Downloads and Preferences page. To view the steps, see Set AI Lens to launch with the desktop app

Role required: lens_user

About this task

When you select **Fill with Lens** on the Service Portal form, the ServiceNow AI Lens desktop app is launched.

Procedure

1. In the ServiceNow AI Lens.app dialog box, select **Open ServiceNow AI Lens.app**.

   Note:

   - This confirmation dialog appears when you select **Create with Lens** or **Update with Lens** for the first time. You can make this a one-time step by selecting **Always open <instance-name.service-now.com> links of this type in the associated app** before selecting **Open ServiceNow AI Lens.app**.
   - On macOS, when you launch ServiceNow AI Lens desktop app for the first time, your mac asks whether ServiceNow AI Lens can store your login credentials. Select **Always Allow** to avoid entering your credentials every time you open the application.

2. On the onboarding journey widget, complete the onboarding and select **Got it**.

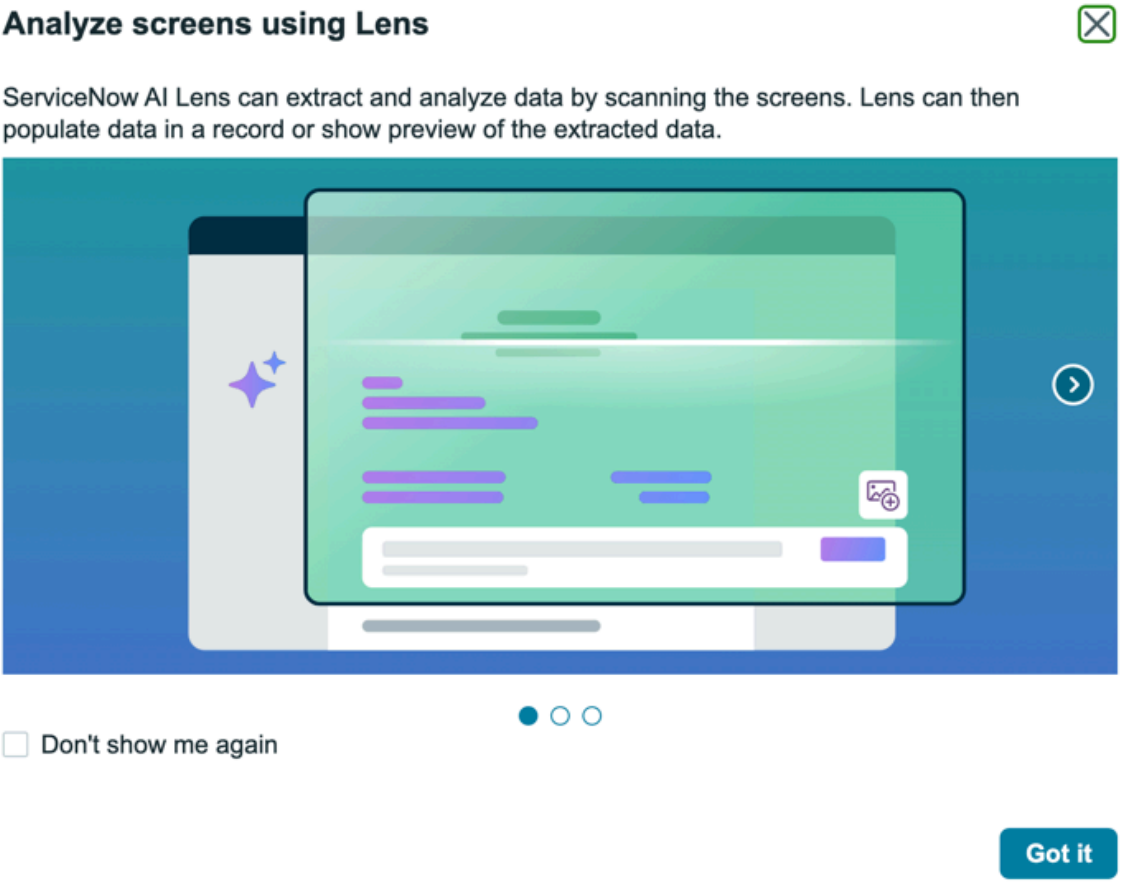
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Use one of the following methods to extract data from documents.

> **Note:** A document can be an image, a scanned handwritten note, web page, Excel sheet, or a Microsoft Word document.

- **Capture screen**

  a. On your system, open one or more documents that you want to scan.

  b. Auto-fill the form on the instance with data extracted from a single screenshot.

     i. Place the ServiceNow AI Lens scanner window on top of the document.

     ii. Resize the ServiceNow AI Lens scanner window by dragging its borders.

  c. (Optional) Auto-fill the form on the instance with data extracted from multiple screenshots.

     i. Select the **Multi-capture** button

     ii. Select the Capture icon .

     iii. Place the ServiceNow AI Lens scanner window over another document or page and then select the Capture icon .

     iv. Repeat the step to capture more screenshots, if required.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You can capture a total of 10 screenshots with the combined size of all captured screenshots not exceeding 10 MB.
- To enable the desktop app to send large screenshot data to the server, verify that the following system properties are set exactly as shown:

System property

Property name	Type	Recommended value
glide.rest.max_content_length	integer	15
glide.rest.scripted.max_inbound_content_length_mb	integer	15

For more information, see Configure system property.

Note: You must have the admin role to set the system properties.

v. To complete the capture, select the Done icon.

- **Upload**

a. Select **Upload**.

Note:

- You can upload up to 10 unprotected files, with the combined size of the uploaded files not exceeding 10 MB.
- To enable the desktop app to send large data of the uploaded files to the server, confirm that the following system properties are set exactly as shown below:

System property

Property name	Type	Recommended value
glide.rest.max_content_length	integer	15
glide.rest.scripted.max_inbound_content_length_mb	integer	15

For more information, see Configure system property

Note: You must have the admin role to set the system properties.

- To remove a file that you attached, select the Remove file icon.

b. Perform any one of the following file upload methods.

- Upload one or more files by selecting the **+Add file** option.
- Upload one or more files by dragging the selected files to the Drag and drop files section and then select **Upload all**.

Trigger ServiceNow AI Lens from the desktop app

Trigger ServiceNow AI Lens from the desktop app by using a Lens action to preview the extracted data and initiate post processing or auto-fill a form.

Before you begin

To access the ServiceNow AI Lens functionality, perform the following steps:

- Install ServiceNow AI Lens on your ServiceNow instance. For more information, see Install the ServiceNow Lens in the ServiceNow instance.
- Turn on the ServiceNow AI Lens skill to add the generative AI capability. For more information, see Activate the ServiceNow AI Lens skill.
- Download the ServiceNow AI Lens installer to scan your desktop screen. For more information, see Download and set how you want to launch ServiceNow AI Lens.

Verify that you've defined the Lens action for this purpose. For more information, see Define a Lens action.

Verify that ServiceNow AI Lens has access to record the screen on your system. For more information, see Providing permission to ServiceNow AI Lens.

You must have create and update access privileges for creating or updating a record using ServiceNow AI Lens.

Don't scan any personally identifiable information, such as medical reports, financial reports, or other sensitive data, when using ServiceNow AI Lens as you don't want to expose the large language model (LLM) to any sensitive information.

Role required: lens_user

About this task

By using Lens actions, you can perform one of the following tasks:

Fill a form

In the Lens action configuration, when **Trigger From** is Desktop and **Trigger For** is Form, and a table is selected, ServiceNow AI Lens can be triggered from the desktop to auto-fill a form. It first shows a preview of the data, and if the preview is editable, you can edit the fields before saving. After you select **Submit** in the preview window, it saves the form with the updated data on the ServiceNow instance.

Preview the extracted data

In the Lens action configuration, when **Trigger From** is Desktop and **Trigger For** is Others, ServiceNow AI Lens can be triggered from the desktop to show preview of the extracted data. If the preview is editable, you can edit the fields before saving. After you select **Submit and close preview** in the preview window, it saves the data and initiates post processing.

Procedure

1. From your system, launch the ServiceNow AI Lens desktop application.
2. On the login page, in the **Instance URL** field, enter the ServiceNow instance URL.

   Example
   For example, `https://<instance name>.service-now.com`.
3. Select **Proceed**.
4. Log in to your ServiceNow account by entering your username and password.

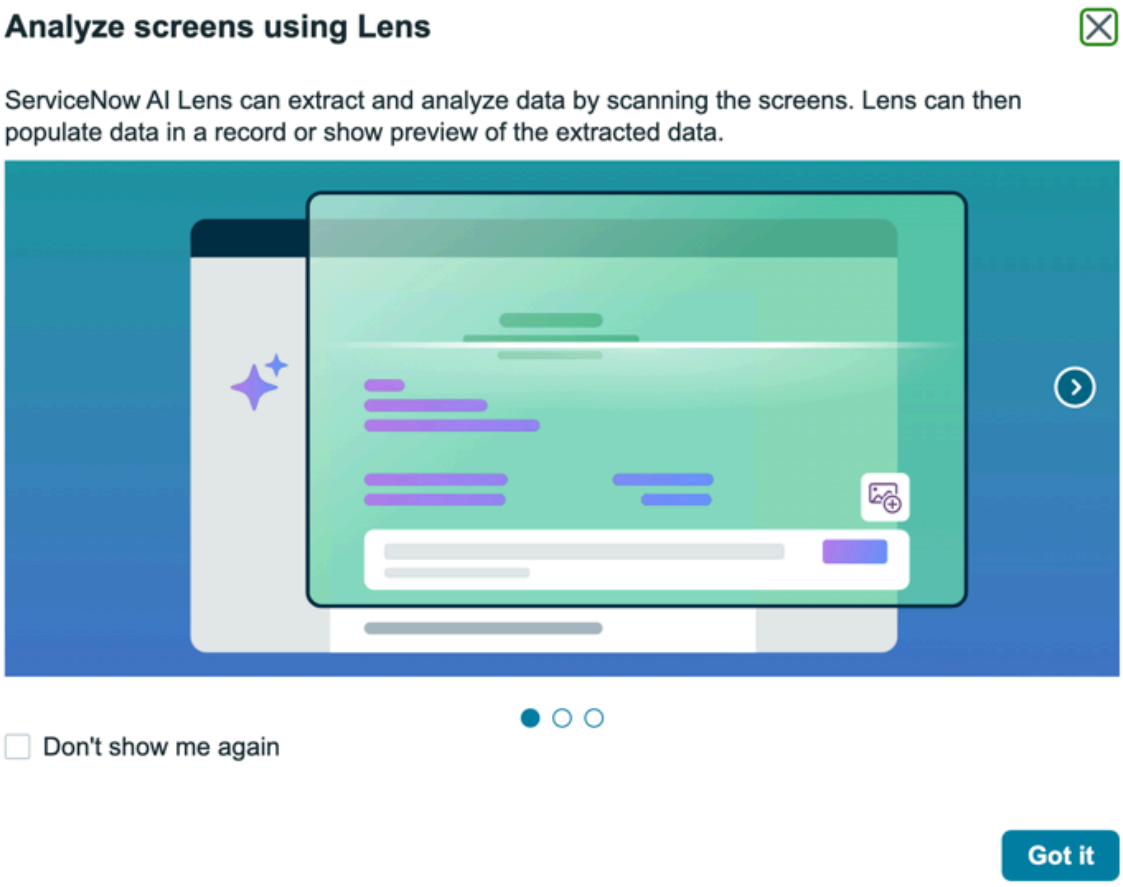
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your account must have the lens_user role.

Note:

- If your administrator has enabled auto-login, you can skip signing in every time you launch ServiceNow AI Lens. After your first login, ServiceNow AI Lens automatically takes you to the home page on subsequent launches as long as your session is active. If your session expires or you sign out, ServiceNow AI Lens shows the login screen again. For more information, see Set up auto-login for ServiceNow AI Lens.
- On macOS, when you launch ServiceNow AI Lens desktop app for the first time, your Mac asks whether ServiceNow AI Lens can store your login credentials. Select **Always Allow** to avoid entering your credentials every time you open the application.

5. **Optional:** On the onboarding journey widget, complete the onboarding and select **Got it**.



If you launch the ServiceNow AI Lens for the first time, the onboarding journey widget appears. You can select **Don't show me again** to hide the widget the next time you launch ServiceNow AI Lens.

6. Select a Lens action.
7. Select **Proceed with Lens**.

Lens scanner opens in a separate window.

8. Perform one of the following methods to enable ServiceNow AI Lens to extract data from documents.
   - Extract data from a single screen.
     a. On your system, open an artifact that you want to scan.

        An artifact can be an image, scanned or handwritten note, website, or application.

     b. Place the ServiceNow AI Lens scanner window on the top of the artifact.

        You can resize the ServiceNow AI Lens scanner window by dragging its borders.
   - Extract data from multiple screenshots.
     a. Select the **Multi-capture** button .
     b. Select the Capture icon .
     c. Place the ServiceNow AI Lens scanner window over another document or page and then select the Capture icon .
     d. Repeat the step to capture more screenshots, if required.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

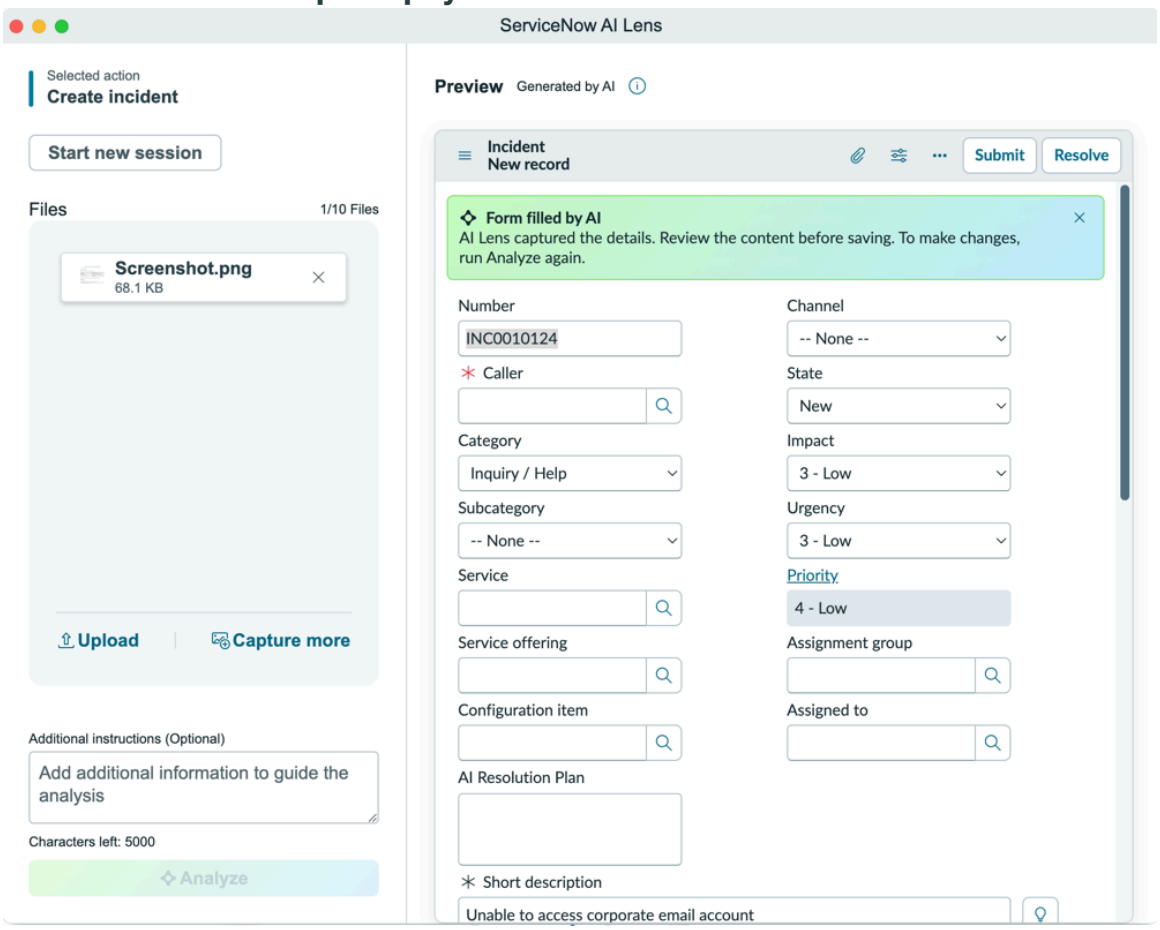
Preview of extracted output displayed in an editable form



11. Depending on the type of Lens action selected, perform the following steps.

Task	Steps
Filling form	**a.** (Optional) In case of editable preview, if necessary, edit the auto-filled field values before saving. **b.** On the form header in the Preview window, select **Submit** to save the filled form on the instance.
Previewing extracted data	**a.** (Optional) In case of editable preview, if necessary, edit the auto-filled field values before saving or copying the values. **b.** (Optional) Copy the previewed data by selecting the Copy icon .

12. End the current session by selecting **Start new session**.

Extract and analyze data with ServiceNow AI Lens desktop app

Extract and analyze data from one or more screenshots that you capture or files that you upload, and then preview the data analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To access the ServiceNow AI Lens functionality, perform the following steps:

- Install ServiceNow AI Lens on your ServiceNow instance. For more information, see Install the ServiceNow Lens in the ServiceNow instance.
- Turn on the ServiceNow AI Lens skill to add the generative AI capability. For more information, see Activate the ServiceNow AI Lens skill.
- Download the ServiceNow AI Lens installer to scan your desktop screen. For more information, see Download and set how you want to launch ServiceNow AI Lens.

Don't scan any personally identifiable information, such as medical reports, financial reports, or other sensitive data, when using ServiceNow AI Lens as you don't want to expose the large language model (LLM) to any sensitive information.

Verify that you have provided permission to ServiceNow AI Lens to record the screen on your system.

Role required: lens_user

Procedure

1. From your system, launch the ServiceNow AI Lens desktop application.
2. On the login page, in the **Instance URL** field, enter the ServiceNow instance URL.

   Example
   For example, `https://<instance name>.service-now.com`.
3. Select **Proceed**.
4. Log in to your ServiceNow account by entering your username and password.
   Your account must have the lens_user role.

   Note:

   - If your administrator has enabled auto-login, you can skip signing in every time you launch ServiceNow AI Lens. After your first login, ServiceNow AI Lens automatically takes you to the home page on subsequent launches as long as your session is active. If your session expires or you sign out, ServiceNow AI Lens shows the login screen again. For more information, see Set up auto-login for ServiceNow AI Lens.
   - On macOS, when you launch ServiceNow AI Lens desktop app for the first time, your Mac asks whether ServiceNow AI Lens can store your login credentials. Select **Always Allow** to avoid entering your credentials every time you open the application.
5. **Optional:** On the onboarding journey widget, complete the onboarding and select **Got it**.

Extract and analyze data using ServiceNow AI Lens from Virtual Agent

Extract and analyze data from an image using ServiceNow AI Lens from a Virtual Agent conversation on a mobile device or a portal. ServiceNow AI Lens can scan an image and then gather insights or provide recommendations as per your instructions.

Before you begin

To access the ServiceNow AI Lens functionality, perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Install ServiceNow AI Lens on your ServiceNow instance. For more information, see Install the ServiceNow AI Lens in the ServiceNow instance.
- Turn on the ServiceNow AI Lens skill to add the generative AI capability. For more information, see Activate the ServiceNow AI Lens skill.
- Enable ServiceNow AI Lens topic for ServiceNow Otto for Virtual Agent. For more information, see Enabling ServiceNow AI Lens in Virtual Agent.

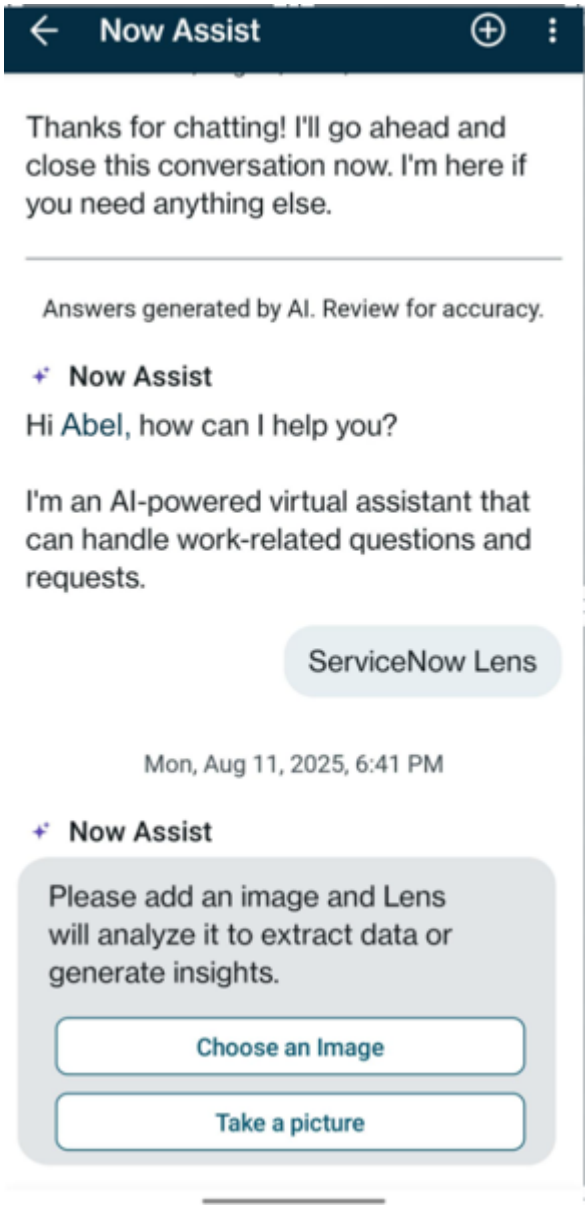
Don't scan any personally identifiable information, such as medical reports, financial reports, or other sensitive data, when using ServiceNow AI Lens as you don't want to expose the large language model (LLM) to any sensitive information.

Role required: lens_user

Procedure

1. Navigate to the home screen on your Now mobile app or a portal.
2. Select the ServiceNow Otto icon .
3. Select **Show all topics** and select ServiceNow AI Lens topic or type ServiceNow AI Lens. You would see a welcome message from ServiceNow AI Lens topic.
4. Select one of the following options:
   - Choose an image
   - Take a picture

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Upload an image or take a picture.
6. Provide instructions on how to process the provided image.
   ServiceNow AI Lens can provide insights, recommendations, resolution steps, and more.
7. **Optional:** Ask follow-up questions.
8. When you are done, type Exit to leave the conversation.

ServiceNow AI Lens reference

Reference topics provide additional information about the roles and tables that are installed with the ServiceNow AI Lens application.

Components installed with ServiceNow AI Lens

Several types of components are installed with the activation of the ServiceNow AI Lens plugin, including user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

Role title [name]	Description	Contains roles
Lens user [lens_user]	Enables you to use ServiceNow AI Lens.	sn_nowassist_admin.user
Lens admin [lens_admin]	Enables you to configure lens actions.	lens_user

Tables installed

Table	Description
Lens Execution (lens_execution)	Whenever a record is created or updated by using ServiceNow AI Lens, a record is created in the execution table. This record includes details such as the table from which the UI action is clicked and the editable fields on the form, which are then passed to the Lens app. **Note:** You can view only records created for or assigned to your user account.
Lens Transaction (lens_transaction)	If a user performs the analyze action on the ServiceNow AI Lens app, the response received from the large language model (LLM) is stored in the transaction table. **Note:** You can view only records created for or assigned to your user account.

System properties installed

These properties exist in the System Properties [sys_properties] table. The admin role is necessary to set system properties.

Note:

To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

System property	Description
sn_app_lens_core.lens_enable_auto_login	If true, ServiceNow AI Lens automatically signs in users using their previous token. If false, users are prompted to sign in each time they launch the application. • Type: Boolean • Default value: false
sn_app_lens_core.sn_lens_repository_url	Repository URL for downloading ServiceNow AI Lens

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System property	Description
	• Type: String • Default value: `https://install.service-now.com/glide/distribution/builds/package/app-signed/`
sn_app_lens_core.show_lens_action_on_all_tables	Property to show or hide the **Create with Lens** or **Update with Lens** button on all tables, depending on whether it's set to True or False. If True, includes all tables except those that are specified in the *sn_app_lens_core.lens_exclusion_table_list* property. If False, includes all tables that are specified in the *sn_app_lens_core.lens_inclusion_table_list* property. • Type: Boolean • Default value: true
sn_app_lens_core.lens_inclusion_table_list	Property to specify the tables that will display the **Create with Lens** or **Update with Lens** button. This list will be considered when the *sn_app_lens_core.show_lens_action_on_all_ta* property is set to False. To specify the names of multiple tables, separate the table names with commas. • Type: String • Default value: None
sn_app_lens_core.lens_exclusion_table_list	Property to specify the tables that will not display the **Create with Lens** or **Update with Lens** button. This list will be considered when the *sn_app_lens_core.show_lens_action_on_all_ta* property is set to true. To specify the names of multiple tables, separate the table names with commas. • Type: String • Default value: None
sn_app_lens_core.show_lens_action_on_all_catItems	Property to show or hide the **Create with Lens** or **Update with Lens** button on all catalog items, depending on whether it's set to True or False. If True, includes all catalog items except those that are specified in the *sn_app_lens_core.lens_exclusion_catItem_lis* property. If False, includes all catalog items that are specified in the

System property	Description
	sn_app_lens_core.lens_inclusion_catItem_lis property. • Type: Boolean • Default value: true
sn_app_lens_core.lens_inclusion_catItem_list	Property to specify the catalog items that will display the **Create with Lens** or **Update with Lens** button. This list will be considered when the *sn_app_lens_core.show_lens_action_on_all_ca* property is set to False. To specify the names of multiple catalog items, separate the catalog item names with commas. • Type: String • Default value: None
sn_app_lens_core.lens_exclusion_catItem_list	Property to specify the catalog items that will not display the **Create with Lens** or **Update with Lens** button. This list will be considered when the *sn_app_lens_core.show_lens_action_on_all_ca* property is set to true. To specify the names of multiple catalog items, separate the catalog item names with commas. • Type: String • Default value: None

Field types supported

Learn about the field types that are currently supported with the ServiceNow AI Lens application.

The following field types are currently supported with ServiceNow AI Lens:

- name
- due_date
- float
- glide_time
- glide_utc_time
- html
- journal
- journals_input
- longint
- password
- password2
- simple_name_values

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- table_name
- translated_html
- translated_text
- boolean
- choice
- decimal
- email
- glide_date
- glide_duration
- insert_timestamp
- integer
- ip_addr
- percent_complete
- phone_number_e164
- price
- script
- script_plain
- string
- string_full_utf8
- url
- reference
- glide_list

For more information about these fields, see Field types reference.

Formatting for date, time, and table name fields

Field	Formatting description
glide_date	• Priority 1 - For a glide_date field type on any record, ServiceNow AI Lens uses the format specified in the date_format field on a user's record of a user running the Lens session. • Priority 2 - If no date_format is specified during user record creation or later, Lens uses the format specified in the system property `glide.sys.date_format`. • Priority 3 - If the system property is not available, the default format `YYYY-MM-DD` is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Formatting for date, time, and table name fields (continued)

Field	Formatting description
glide_time	• Priority 1 - For a glide_time field type on any record, ServiceNow AI Lens uses the format specified in the time_format field on a user's record of a user running the Lens session. • Priority 2 - If no time_format is specified during user record creation or later, Lens uses the format specified in the system property `glide.sys.time_format`. • Priority 3 - If the system property is not available, the default format `HH:mm:ss` is used.
glide_utc_time	The value is populated in the `HH:mm:ss` format.
glide_duration	Duration is populated in the `D HH:mm:ss` format. For example, the duration of 1 day, 2 hours, 30 minutes is populated as 1 02:30:00.
due_date	The value is populated using the formats of glide_date and glide_time, concatenated with a space.
table_name	The value is only populated when the exact internal name of table is identified.

ServiceNow AI Lens limitations

Be aware of a few limitations when you're using the ServiceNow AI Lens application.

Limitations with ServiceNow AI Lens

Limit	Description
Maximum number of images	Maximum number of images that can be uploaded to ServiceNow AI Lens is 10.
Maximum character limit	In the instructions field for the analysis, you can enter up to 500 characters. **Note:** Users with the admin role can increase this limit to up to 5000 characters by navigating to the *sn_lens_user_prompt_max_length* system property.
Themes	When you change the theme on the ServiceNow instance, the theme of the ServiceNow AI Lens is automatically updated. But, if you have already started a ServiceNow AI Lens session and then you change the theme on the instance, the theme doesn't

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Limitations with ServiceNow AI Lens (continued)

Limit	Description
	change automatically until you launch a new session. This behavior is standard for the ServiceNow AI Platform.
Language	When you change the language on the ServiceNow instance, the language of the ServiceNow AI Lens is automatically changed. But, if you have already started a ServiceNow AI Lens session and then you change the language on the instance, the language doesn't change automatically until you launch a new session. This behavior is standard for the ServiceNow AI Platform. When using ServiceNow AI Lens to scan non-English documents—such as invoices in Chinese— you may notice inconsistencies in translation, formatting, or data extraction. These discrepancies result from limitations in how the underlying LLM processes different locales.
Auto-fill	Pre-populated form fields, such as record number, can be overwritten by ServiceNow AI Lens. You must verify the auto-filled form fields before saving the form.
Visibility of the **Create with Lens** button	As a user with the lens_user role, if you don’t have the Write access for the first record of any list, the **Create with Lens** button doesn't appear in the list view of the table. You can sort the records to show a different record on top and reload the list to view the **Create with Lens** button.
Hallucinations	If the large language model (LLM) returns text that doesn’t exist in the source artifacts, the LLM might inject out-of-context information. You must verify that all information aligns with the source material to ensure that there are no fabricated facts or unsupported conclusions.

Script include - AILensActionService

Use the *`AILensActionService`* script include together with Lens actions to leverage ServiceNow AI Lens as a service for extracting information from the provided images and getting answers to your questions.

This script include is part of the ServiceNow AI Lens (sn_ai_lens) store application and is located within the `sn_app_lens_core` scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This script include provides methods that enable the following:

- Calls Lens as a back-end service
- Analyzes and comprehends data from provided images
- Gets response from AI as per provided directions
- Does not require ServiceNow AI Lens desktop app

AILensActionService - AILensActionService()

Creates an AILensActionService instance.

Parameters

Name	Type	Description
None		

The following example shows how to initialize *`AILensActionService`*.

```
var lensService = new sn_app_lens_core. AILensActionService()
```

AILensActionService - invokeLens(String lensActionId, String[] attachmentIds, String userPrompt, Object[] imageArr, Object inputJSON, Object[] additionalContext, Boolean skipACL)

Invokes ServiceNow AI Lens as a service.

Parameters

Name	Type	Description
lensActionId	String	Sys_id of the Lens Actions record created for your use case, or you can select the out-of-the-box option that fits your requirements. Example: 842bfc8e37066210b97528c734924baf This parameter is mandatory.
attachmentIds	String[]	Array of sys_ids for existing image attachments. Example: `["0067e66f93f022108319f9ed1dba108b", "0000e8a42c9a7110f877137af4eab4b5"]` You must pass either `attachmentIds` or `imageArr` parameter.
userPrompt	String	An instruction or question for AI to answer after analyzing the contents of the attachments. Example: `Analyze this production issue and create an incident ticket`
imageArr	Object[]	Array of objects containing name of the screenshot and base64 encoded image data. Example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>[
		    {
		        name: "screenshot1.png",
		        data:
		 "iVBORw0KGgoAAAANSUhEUgAAAAEAAAABCAYAAAA
		fFcSJAAAADUlEQVR42mNkYPhfDwAChwGA60e6kgAA
		AABJRU5ErkJggg=="
		    },
		    {
		        name: "screenshot2.png",
		        data:
		 "iVBORw0KGgoAAAANSUhEUgAAAAEAAAABCAYAAAA
		fFcSJAAAADUlEQVR42mNk+M9Qz0AEYAJMgkU1f5kA
		AAAASUVORK5CYII="
		    }
		];</pre>
		You must pass either `attachmentIds` or `imageArr` parameter.

inputJSON	Object	Additional JSON input parameters that you want to pass in the pre-processing script of the Lens action.
		
		Note: To use Multi-table schema mapping, you must pass at least one table name key and its corresponding value inside the input JSON. For example, { 'tableName': 'sn_ent_model,sn_ent_asset' },
		
		Example:
		<pre>{
		      "type" : "object",
		      "properties" : {
		        "short_description" : {
		          "type" : "string",
		          "label" : "Short description"
		        },
		        "description" : {
		          "type" : "string",
		          "label" : "Description"
		        },
		      },
		      "required" : ["short_description",
		 "comments"],
		   }</pre>

additionalContext	Object	An optional parameter that you can use to pass any extra key–value information while you're performing a Lens service call. The examples show the key–value information that you can pass. • **Example**: <pre>{IsFileUploadEnabled: true}</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• **Example**: As part of the Excel mapping services, you can pass key-value information to: ○ auto-map the column headers of an Excel file with ServiceNow table fields ○ auto-map Excel values to ServiceNow drop-down values ○ auto-map Excel values to referenced records in ServiceNow tables For more information on the various key-values of the Excel mapping service, see Key-values of the Excel auto-mapping services **Key-values of the Excel auto-mapping services** ○ **Schema mapping** — Maps Excel column headers to ServiceNow table fields and identifies the field type of each mapped field. You can also use this option to map Excel column headers from a single sheet to multiple ServiceNow tables. Key-values for schema mapping are: ▪ `mappingStrategy`: Set to `'schema_mapping'` ▪ `rowContextSize`: Number of sample data rows to use for mapping context. Default: `10`. ▪ `randomizeRowOrder`: If `true`, Lens selects rows randomly from the Excel file. If `false`, Lens uses rows in order from the top. ▪ `sheetName`: Name of the Excel Sheet. If no name is specified, the first sheet is chosen by default. ▪ `headerRowNumber`: The row number from which the header with column names start with. **Request example**: `var response = new sn_app_lens_core.AILensActionService().invokeLens('b7fbd8694730c310dbc4964a516d431e', ['0c0b1c6d4730c310dbc4964a516d43f2'], '', [], {}, true, {"mappingStrategy":"schema_mapping", sheetName: "Incident Data",headerRowNumber: 2,"rowContextSize":5,"randomizeRowOrder":false }); gs.info("Lens Response : " + JSON.stringify(response));`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Response example: { "Owner": { "type": "string", "mappings": { "0.8": ["assigned_to", "parent", "epic"] } }, "Age": { "type": "integer", "mappings": { "0.8": ["story_points"] } }, "Status": { "type": "choice", "mappings": { "0.8": ["state", "priority"] }, "choiceValues": ["Retired", "On Boarding", "Working"] }, "Start Date": { "type": "glide_date", "mappings": { "1.0": ["expected_start"], "0.8": ["due_date"] } }, "End Date": { "type": "glide_date", "mappings": { "1.0": ["due_date"], "0.8": ["expected_start"] } }, "Project Assigned":{ "type": "string", "mappings": { "0.8": ["short_description", "task", "description"] } } } **Multi-table schema mapping** Maps Excel column headers from a single sheet to multiple ServiceNow tables simultaneously. ServiceNow AI Lens identifies the relevant fields in each table for each Excel column header and maps the data accordingly. **Request example** var response = new sn_app_lens_core.AILensActionService().invokeLens("3290a3dc2b420310d666fe3db891bfb8", ["566997542b46c310a371f33ec891bfbc"], "", {}, { 'tableName': 'sn_ent_model,sn_ent_asset' }, true, { "mappingStrategy": "schema_mapping",

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

```
        "rowContextSize": 5,
        "randomizeRowOrder": false,
        "headerRowNumber": 2
    }
);
gs.info("Overall Lens Response " +
 JSON.stringify(response));
var res =
 JSON.parse(response.lensResponse);
gs.info("Mapped Object" +
 JSON.stringify(res, null, '   '));
```

- **Choice mapping** — For fields identified as Choice type, maps the unique values from the Excel column to the valid choice values in the ServiceNow table field. Key-values for Choice mapping are:
  - `mappingStrategy`: Set to `'choice_mapping'`.
  - `columnConfigs`: An array of objects that specifies the ServiceNow choice field and the corresponding Excel column to map, including the field name, column header, and optionally the cell values to use instead of reading from the file.

```
Request example: {
    mappingStrategy: 'choice_mapping',

    SheetName:'Incident Data',

    SheetNameheaderRowNumber:2,
    columnConfigs: [
        { field: 'priority', name:
 'Priority' },
        { field: 'state',    name:
 'Ticket Status' }
    ]
}
Response example: [
  {
      "name": "Priority",
      "field": "priority",
      "mappings": [
        { "key": "High",   "value":
 "1", "label": "1 - Critical",
 "score": 1.0 },
        { "key": "Medium", "value":
 "3", "label": "3 - Moderate",
 "score": 0.9 }
      ]
  }
]
```

Multi-column to single field choice mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Maps multiple Excel column headers and their values to a single ServiceNow field. This is useful when related data from separate columns should be consolidated into one field. **Request example** `var response = new sn_app_lens_core.AILensActionService().invokeLens("4b50a72c2b694710c18df2086e91bf84", ["e782e364936103105357f1cfb903d682"], "", {}, {}, true, { "mappingStrategy": "choice_mapping", "columnConfigs": [{ "field": "location", "name": "city" }, { "field": "location", "name": "zip" }, { "field": "location", "name": "state" }] }); gs.info("response " + JSON.stringify(response, null, ' '));`  **Note:** Multi-column to single field mapping also works with Reference mapping.  ○ **Reference mapping** — Maps Excel cell values to the corresponding ServiceNow reference field records. Key-values for Reference mapping are:  ▪ `mappingStrategy`: Set to `'reference_mapping'`.  ▪ `columnConfigs`: Configuration for the specific column being mapped, including the source column name and the target reference table details.  **Request example**: `var response = new sn_app_lens_core.AILensActionService().invokeLens('b7fbd8694730c310dbc4964a516d431e',`

AI agents and agentic workflows

Design, deploy, and evaluate AI agents and agentic workflows that autonomously complete multi-step tasks on the ServiceNow AI Platform.

Agentic AI

AI agents and agentic workflows pursue a goal across multiple steps with limited human intervention, instead of completing one task at a time. To learn what they are, why they matter, and when to use them rather than a generative AI skill, see About AI agents and agentic workflows.

AI Agents library

Use the ServiceNow AI agents library to review all ServiceNow® created AI agents. Use this reference to understand each agent's purpose, workflow, and configuration.

AI Agent Studio

Use the AI Agent Studio environment to create, manage, and test AI agents and agentic workflows. Putting AI agents to work follows four steps: create an agentic workflow that defines the problem and situation your agents work on, create AI agents equipped with the tools to execute the necessary tasks, test the workflow and make adjustments until it performs as expected, and then deploy your agents across your organization.

AI Agent Studio also provides ready-made agentic workflows and AI agents you can use as-is or incorporate into custom workflows, an analytics dashboard for reviewing agent usage and performance, and testing tools that range from single manual executions to automated agentic evaluations. From the Settings page, you can enable AI Guardian to apply offensiveness detection and prompt injection protection to your agents.

To create, test, and deploy AI agents and agentic workflows in one environment, with ready-made options, analytics, and built-in testing, see AI Agent Studio (legacy).

Now Assist agentic workflows

The ServiceNow AI Platform provides prebuilt platform agentic workflows and AI agents that address common scenarios, such as approval assistance, issue readiness, and request status. Additional AI agents are provided with some Integration Hub spokes and plugins, preconfigured and callable from interfaces such as AI Agent Studio and Virtual Agent. These prebuilt workflows and agents give you a faster path to value than building from scratch, and you can incorporate them as-is or customize them to match your processes.

To put prebuilt agentic workflows and AI agents to work for common scenarios such as approvals, issue readiness, and request status, see Agentic workflows.

AI Desktop Actions

AI Desktop Actions extends AI agent capabilities to applications outside the ServiceNow AI Platform. In the no-code Design workspace, you create desktop actions by auto-capturing or manually recording a series of steps you perform on your computer, such as clicking buttons,

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

entering text, or selecting from drop-downs across different applications. You then save that sequence as a reusable desktop action. After you activate a desktop action, it becomes available as a tool in AI Agent Studio, enabling your AI agents to interact with desktop applications as part of an agentic workflow.

To record reusable desktop actions that let your AI agents work in applications outside the ServiceNow AI Platform, see AI Desktop Actions.

ServiceNow® AI agents library

All ServiceNow® AI agents are listed. Depending on your license, not all AI agents may appear in your instance.

Prerequisites and setup

To access an AI agent, you must have either the appropriate ServiceNow Otto plugins installed or have access to the appropriate pricing tier. For more information, see ServiceNow product tiers.

AI agent role filtering

Each AI agent comes with specific user and data access roles by default. These roles vary with the purpose of each AI agent. You can modify these settings as needed on your instance. If an agent is not performing as expected, it may be due to a roles issue. Either it does not have the appropriate user access, or it does not have the appropriate data access.

AI agents use role filtering to determine which users can access them. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define access rules for an AI agent.

In the data access settings, you must also add the necessary roles to enable reading of the tables for the records you want to evaluate for readiness. For example, you can add the itil role to the AI agent's list of approved roles so that it can access Incident records.

AI agents as users

When a Virtual Agent conversation is triggered, any updates or comments in the record's work notes display as the AI agent rather than the user who initiated the conversation.

Accessing an AI agent

1. Navigate to **All** > **AI Agent Studio** > **Agentic Solutions**.
2. Go to the **AI Agents** tab.
3. Select the name of an agent.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy , which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Note: We have controls in place to enable/disable the data collection and data processing.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Accounts Payable Operations (APO)

Accounts Payable Operations AI agents

The following AI agents are available for Accounts Payable Operations.

Inquiry resolution provider AI agent

This AI agent assists with invoice inquiries by providing resolution details based on the invoice and its related data. It is intended for use by Accounts Payable Operations agents handling invoice inquiries.

Workflow

The agent helps users complete tasks related to inquiry resolution provider.

1. Use the "Invoice Inquiry resolution generator and case update" tool to extract invoice details, payment details, invoice lines, and tax lines for the provided invoice inquiry number.
2. Once the plan is displayed to the user, ask the user if they want to close the case.
3. Based on the user's response, either close the case or update the work notes.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Allowed user roles The specific user roles that can access this AI agent.	sn_ap_cm.agent, now_assist_panel_user
Data access roles The specific user identity roles that determine which data the AI agent can access and what actions it can take.	sn_ap_cm.agent, now_assist_panel_user
Triggers	Optional. None defined by default. An admin can specify triggers if desired. For more information, see Add a trigger to an AI agent.
Channels	Configure an assistant for Virtual Agent or ServiceNow Otto panel using Assistant Designer.
Used in agentic workflows	Not applicable.

For more information on Accounts Payable Operations, see Accounts Payable Operations.

Recommend invoice owner AI agent

This AI agent analyzes exception work notes to predict the most likely business owner for an invoice. It works with the Accounts Payable (AP) specialist by suggesting the predicted owner or creating follow-up tasks to validate and resolve ownership.

Workflow

The agent helps users complete tasks related to recommend invoice owner.

1. Execute the "Retrieve recommendation from Exception Record" tool.
2. If there are no invoices present, ask the AP specialist if they want to reach out to a supplier contact with an exception task.
3. If the recommendation mentions processed invoices present but the match score is below the threshold, inform the AP specialist that a recommendation can't be made. Suggest the business owner from the last processed invoice.
4. If the recommendation mentions that the business owner was identified but auto-approval is disabled, ask the AP specialist whether that business owner can be assigned to the invoice.

For more information on Accounts Payable Operations, see Accounts Payable Operations.

Email parser agent

This AI agent identifies and classifies actionable requests, and routes them to the appropriate workflows to create invoice cases.

Workflow

The agent can either send the email or save it as a draft.

1. Based on the context provided, analyze the context and determine the intended action (either send email or save a draft).
2. Analyze the context to determine the type of the email: either New or Reply.
3. Verify that all required parameters corresponding to the determined action and type are explicitly present in the provided input or current conversation context. For example, recipient information and email sys_id.
4. Determine the primary goal and business-appropriate purpose for the email.
5. Construct the email.
6. Execute the final action with all inputs.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Used in agentic workflows	Intent to Action

For more information on Accounts Payable Operations, see Accounts Payable Operations.

Zero touch service desk agent

This AI agent investigates supplier invoice inquiry cases and generates a response for the supplier contact. Fulfillers can review its work in the Agentic Processes panel on the case.

Workflow

The agent helps users complete tasks related to recommend invoice owner.

1. Investigate the invoice inquiry case.
2. Generate a response, which appears in the Review output section.
3. Set the invoice inquiry case state to Awaiting acceptance.
4. Notify the requester about the resolution through the Supplier Collaboration Portal.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. Allowed user roles The specific user roles that can access this AI agent.	sn_ap_fulfiller
Data access roles The specific user identity roles that determine which data the AI agent can access and what actions it can take.	sn_ap_fulfiller
Triggers	For APO, the APO Assignment Rule assigns AP cases (`sn_ap_cm_ap_case`) to the AI L1 APO Service Desk Specialist user and the Accounts Payable AI L1 Support group when all of the following are true: • The sub-category is Invoice inquiry or Payment inquiry. • The state is New. • The assignment group is empty.
Channels	Activity stream, for both inbound and outbound messages.
Used in agentic workflows	The agent runs through the L1 APO Service Desk Specialist (APO - ZTSD Worker Template).

For more information on Accounts Payable Operations, see Accounts Payable Operations.

AIOps and AIOps Leap

AIOps and Leap AI agents

The following AI agents are available for AIOps and AIOps Leap.

Alert automation AI agent

This agent interprets free-text user requests related to alert automation and guides users to the appropriate automation experience. It detects whether the user intends to enrich alerts, group alerts, respond to alerts, or any combination of these actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent helps users complete tasks related to alert automation.

1. Identify requested alert automations, including alert enrichment, alert response, and alert grouping.
2. Provide links to alert automations that fit the query.
3. Create an alert grouping automation record when requested.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Alert impact verification AI agent

This agent is responsible for eligibility validation for a given alert, to perform impact analysis on it.

Workflow

The agent helps users complete tasks related to alert impact verification.

1. Validate the alert's eligibility.
2. Run the 'Display error from validation' tool, which uses as an input the exact error message from the 'Alert validation' tool.
3. Run the 'Valid alert message' tool.
4. Run the 'Fetch alert details' tool.
5. Run the 'Work plan message' tool once.
6. Pass the <alert_number> and <alert_sys_id> values to the next agent.

Configuration

Artifact creation agent AI agent

Assists in creating and viewing artifacts such as problem records, knowledge base articles, and playbooks for an automation opportunity. The agent checks for an automation opportunity number and invokes the artifact creation topic tool to generate the required artifacts.

Workflow

The agent creates automation opportunity artifacts by invoking the artifact creation topic tool with the appropriate context.

Manage alerts AI agent

Responsible for generating reports for a given alert and storing a structured summary with key insights and recommended next steps in the alert record.

Workflow

The agent helps users complete tasks related to manage alerts.

1. Run the 'Autonomous chain' tool using the provided alert_id to generate a structured alert summary.
2. Validate the output from the 'Autonomous chain' tool.
3. Run the 'Update Alert AI Insights and Worknotes' tool.

User impact analysis AI Agent

This agent investigates incidents and cases related to the alerts and affected services.

Workflow

The agent helps users complete tasks related to user impact analysis.

1. Check if <offering_ids> and <service_ids> are NOT defined, then return from the agent silently.
2. If <offering_ids> and <service_ids> are BOTH empty, then return from the agent silently.
3. Run the 'Fetch related issues' tool.
4. Check if <incidents> and <cases>, returned in step 3, are empty.
5. Run the "Format related issues summary" tool.
6. Write the formatted summary to the alert worknote.
7. Pass the <offering_ids> and <service_ids> values to the next agent.

LEAP Ansible Agent AI agent

The LEAP Ansible agent finds the Ansible job template that best matches the problem behind an automation opportunity. It recommends the template to the user and saves it to the discovered job catalog.

Workflow

The agent helps the user find the most appropriate Ansible job template from Ansible Automation Platform to remediate an automation opportunity.

1. Accept the automation opportunity number and retrieve the problem context for that opportunity.
2. Retrieve the full list of available job templates and their descriptions from Ansible Automation Platform.
3. Compare the problem context with the job templates and identify the template that best matches.
4. Retrieve the full configuration of the matched job template.
5. Return the job template name, ID, and relevant configuration details to the user as the recommended remediation job.
6. Save each matched job template to the discovered job catalog for the automation opportunity.
7. Inform the user if no relevant job templates are found.

Configuration

LEAP Ansible Execution Agent AI agent

The LEAP Ansible Execution agent runs the Ansible playbooks mapped to each resolution step of an incident. It launches jobs through Ansible Automation Platform, prompts the user to complete unmapped steps manually, and reports job status on request.

Workflow

The agent helps the user remediate an incident by running the Ansible playbooks mapped to its resolution steps.

1. Identify the incident record and log on the record that execution has started.
2. Retrieve the mapping between the resolution steps and their Ansible jobs, and inform the user if no mapping exists.
3. Work through the resolution steps in order, asking the user to complete any step that has no playbook mapped and to confirm when it's done.
4. For each mapped job, show the user the job template details and collect any required launch inputs in a single form.
5. Launch the job, report the Ansible job ID and its status, and wait for the user to confirm before moving to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Summarize the steps processed, the jobs launched and their status, the manual steps completed, and any failures.
7. Record the overall success or failure status on the incident record.
8. Check job status, show job output, cancel a job, or relaunch a job whenever the user asks.

Configuration

LEAP KB Creation Agent AI agent

The LEAP KB Creation agent creates draft knowledge base articles from the resolution steps of a LEAP automation opportunity.

Workflow

The agent helps the user create a draft knowledge base article for an automation opportunity.

1. Identify the automation opportunity number from the request.
2. Create a draft knowledge base article from the resolution steps of the automation opportunity.
3. Confirm that the article was created, or report the error details if creation failed.

AI Workflow Factory

AI Workflow Factory AI agents

The following AI agents are available for AI Workflow Factory.

Autonomous Engineer

This AI agent helps with implementing ServiceNow applications. The agent accepts requirements, generates a plan with structured work items, and builds all work items in parallel using background AI agents.

Important: Autonomous Engineer uses a different framework than other ServiceNow® AI agents. Review the following workflow and configuration settings for Autonomous Engineer. For more information, see Autonomous Engineer.

Build Agent dependency

Autonomous Engineer uses Build Agent, a separate AI agent part of ServiceNow Otto for Creator, as its execution layer. When you install Autonomous Engineer, Build Agent is installed as a dependency.

Because Autonomous Engineer is powered by Build Agent, both products use the same settings. For more information about these settings, see Build Agent.

Workflow

Autonomous Engineer accepts requirements, generates a structured plan for the user to approve, and builds all work items in parallel using background AI agents.

1. Accept requirements from a natural language prompt or an uploaded file, such as a CSV of user stories.
2. Search the instance for existing artifacts, such as tables, roles, fields, and catalog items, to avoid duplicating them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Interview the user to resolve ambiguous or incomplete details, and then generate a brief for approval.
4. Generate a plan of work items in Agile user story format, with acceptance criteria and test criteria. Group the work items into logical sections and sequence them using a dependency graph.
5. List any steps that require manual action, such as activating plugins, in a pre-flight verification section.
6. Pause for user review and approval of the plan and its work items.
7. Once approved, load the applicable agent pack, and generate a background agent for each work item.
8. Build all work items in parallel, running each work item only after the work items it depends on are complete.
9. For each work item, build the required metadata, and then run Test Agent to generate and run Automated Test Framework (ATF) tests.
10. If tests fail, identify the root cause and retry the work item. Detect stuck or unresponsive agents and retry their work items automatically.
11. Display the status of each work item on the plan dashboard, and highlight the work items that need attention in the dashboard and chat panel.
12. Pause each completed work item for user validation.
13. Generate an update set for the plan when all work items are complete.

Configuration

Autonomous Engineer configuration

Configuration area	Description
Plugins	The Autonomous Engineer plugin is `sn_autonomous_eng`. When you install Autonomous Engineer, the Build Agent plugin is installed as a dependency.
Access	Autonomous Engineer is accessible via the Build Agent chat panel in ServiceNow Studio.
Agent packs	Autonomous Engineer uses agent packs to understand ServiceNow products. You can install different agent packs depending on the implementation you're completing. For more information, see Agent packs for Autonomous Engineer.

IT Asset Management

Asset Management AI agents

The following AI agents are available for Asset Management.

Asset next best action AI agent

This AI agent validates task numbers, identifies task types, and routes workflows to the correct specialized agent for troubleshooting or repair. It processes one task at a time for accurate handling of hardware asset repair order tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent identifies a repair order task type and routes the work to the appropriate specialized agent for completion.

1. Verify that a repair order task number is provided, prompting the user if it is missing.
2. Retrieve the task details and perform validation to confirm the task name, asset information, and status.
3. If validation returns an error, inform the user and end execution.
4. Display the identified task details to the user, including the task name, asset model, and manufacturer.
5. Route to the appropriate workflow: if the task name is Troubleshoot Asset, invoke the evaluate asset AI agent; if the task name is Repair Asset, invoke the repair asset AI agent.
6. Terminate the workflow after the appropriate section has completed execution.

Configuration

Asset sourcing AI agent

This AI agent helps source a requested item by generating and executing sourcing plans through consumption, transfer, and purchase. The agent creates plans autonomously or with user guidance, coordinates with external agents for transfer and purchase orders, and validates sourcing status throughout the process.

Workflow

The agent sources a requested item by executing three independent flows in sequence: auto source, guided source, and user input source.

1. Verify that a requested item number is provided and retrieve the item details, including quantity and model name.
2. Attempt to source the item automatically using the auto source plan flow, consuming, transferring, or purchasing assets as determined by the generated plan.
3. If the item is not fully sourced, generate a guided source plan, present it to the user for confirmation, and execute the approved plan steps.
4. If the item still requires sourcing, generate a user input source plan and prompt the user to confirm transfer and purchase actions as needed.
5. Validate the sourcing status after each phase and notify the user when all requested quantity has been sourced or if quantity remains outstanding.

Evaluate asset AI agent

This AI agent helps troubleshoot asset-related issues using the Web Search tool. It guides users to select a resolution and completes the troubleshooting task on confirmation.

Workflow

The agent helps users troubleshoot asset-related issues.

1. Perform a web search and create a step by step hardware evaluation plan. Provide warranty consideration guidelines and void-prevention measures for different inspection scenarios. Give detailed steps for each issue.
2. Refine and format search results.
3. Display numbered troubleshooting steps to the user, one at a time.
4. If the user indicates that the problem is solved, end the workflow.
5. If the user indicates that the problem is not solved, go to the next troubleshooting step.
6. When all steps are exhausted, end the workflow.

Purchase order creation AI agent

This AI agent is used to create a purchase order.

Workflow

1. Use the Get Destination Stockrooms for requested item tool to retrieve a list of destination stockrooms.
2. Ask the user to select a stockroom if multiple choices are available. If none are available, end the workflow.
3. Use the Get Vendors for requested item tool to retrieve a list of vendors.
4. Ask the user to select a vendor if multiple choices are available. If none are available, end the workflow.
5. If the requested item is software, use the Get Metric Group and License Metric conversational topic tool to help user get a license.
6. If the requested item is not software, use Create purchase order for requested item tool to create a purchase order for the specified stockroom and vendor.
7. Display purchase order to the user.

Repair asset AI agent

This AI agent assists users in resolving issues with assets that are in a defective or pending repair state. It specializes in identifying and suggesting appropriate repair steps by leveraging the Web Search tool. The agent guides users through the repair process, helps them select a suitable resolution, and automatically updates and completes the repair task upon confirmation.

Workflow

The agent helps users to repair assets.

1. Uses the asset manufacturer and model details provided.
2. Determine if the issue is known.
3. If the issue is known, perform a web search and create a step by step hardware evaluation plan. Provide part requirements for each of the suggested repair steps. Give detailed steps for each issue.
4. Refine and format search results.
5. Display numbered repair steps along with part requirements to the user, one at a time.
6. If the user indicates that the problem is solved, end the workflow.
7. If the user indicates that the problem is not solved, ask the user to share the exact query again. Perform a web search based on that query and display the results.
8. End the workflow when the user confirms the steps resolved the issue or when the user remains unsatisfied after the second troubleshooting attempt.

Configuration

Transfer order creation AI agent

This AI agent is used for creating a transfer order to source a requested item.

Workflow

The agent helps users complete tasks related to transfer order creation.

1. Use the Get Destination Stockrooms for requested item tool to retrieve a list of destination stockrooms.
2. Ask the user to select a stockroom if multiple choices are available. If none are available, end the workflow.
3. Use the Get Source Stockrooms tool to retrieve a list of source stockrooms.
4. Ask the user to select a source stockroom if multiple choices are available. If none are available, end the workflow.
5. Use the Create transfer order using input source plan tool to create the Transfer Order Line with the user's selected source and destination stockroom details.
6. Create the transfer order using the Create transfer order with guided source plan tool.
7. Display results to the user.

Care Team Operations

Care Team Operations AI agents

The following AI agents are available for Care Team Operations.

Care Team Operations case creation AI agent

This AI agent streamlines case creation by analyzing user conversations to accurately determine the service definition for each reported issue. It intelligently identifies multiple issues raised in a single conversation and creates separate cases with correct case type and service definition.

Workflow

The agent helps users complete tasks related to care team operations case creation.

1. From the request summaries generated, note the case type for each distinct request.
2. Read the service definitions for Care Team Operations applications for each case type identified in Step 1.
3. Identify the service definition.
4. Identify the category.
5. Create care team operations case.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Learn more about Healthcare Operations at Healthcare Operations.

Care Team Operations case creation AI voice agent

This agent helps healthcare staff report and submit Care Team Operations (CTO) requests. Trigger this agent when a user mentions Care Team Operations, CTO, or asks to submit a care team request.

Workflow

The agent helps users complete tasks related to care team operations case creation voice.

1. Get the requesting unit of the user.
2. Ask the user to describe their issue.
3. Use the Get Relevant Knowledge Articles tool with the query "Case Definition" to classify the issue.
4. Collect any remaining required fields mentioned in the knowledge article one at a time based on <case_type>.
5. Use the Get Service Definitions tool with <case_type> as a JSON array.

Care Team Operations case intake AI agent

This workflow guides users through submitting operational issues by prompting for a clear problem description and ensuring required details—such as location, requesting unit, asset tag, and priority—are captured. It intelligently detects and separates multiple requests in a single user utterance, summarizes each request with its details, and confirms accuracy with the user before proceeding.

Workflow

The agent helps users complete tasks related to care team operations case intake.

1. Fetch requesting units.
2. Prompt for issue details.
3. Identify distinct requests.
4. Classify case types.
5. Get remaining information.
6. Generate request summaries.
7. Validate request summaries.
8. Create Care Team Operations case.

CMDB principal class manager AI agent

Performs actions related to principal configuration item (CI) classes

Workflow

The agent helps users complete tasks related to CMDB principal class manager.

1. Check the CMDB governance access level for the current user.
2. If you have done it before, skip to step 3.
3. List all existing and potential principal CI classes.
4. If the user does not have permission to mark principal classes, skip to step 7.
5. Ask the user whether they want to mark a suggested CI class or unmark a current CI class from the list as principal.
6. If the user specifies a class, mark or unmark the selected CI class as principal.
7. Ask the user if they are done reviewing, or if they want to see details about a specific CI class.
8. If the user has write access, inform the user that they have completed the step of managing principal CI classes.

Configuration item summarization AI agent

This AI agent uses a sys_id to summarize a configuration item (CI) using an existing skill.

Workflow

The agent helps users complete tasks related to configuration item summarization.

1. Collect the sys_id from the administrator or orchestrator.
2. If the sys_id does not exist, inform the user that there is not enough required information.

Contract Management

Contract Management Pro AI agents

The following AI agents are available for Contract Management Pro.

Contract repository AI agent

This AI agent retrieves contract repository details for a specified record, including vendor information, contract model, and document attachment IDs. It also calculates the average lead time for similar contracts when vendor, supplier, or account data exists.

Workflow

The agent retrieves contract repository details and starts metadata and obligation extraction for a specified record. It also initiates asynchronous extraction of key metadata from contract documents, such as effective dates, renewal and termination notice periods, and auto-renewal clauses.

1. Retrieve the contract repository details for the specified record, including vendor, supplier, or account information, the contract model, and whether the obligations plugin is active.
2. Start metadata extraction for the contract document, such as effective date, end date, and renewal and termination notice periods, without waiting for it to finish, and continue even if it encounters an error.
3. If the obligations plugin is active, also start extraction of contractual obligations from the document without waiting for it to finish, and continue even if it encounters an error.
4. If vendor, supplier, or account information is available, calculate the average lead time for similar contracts.
5. Complete these steps automatically without asking the user for any input.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Search contracts AI agent

This AI agent helps legal professionals, procurement teams, sales executives, and compliance officers find and understand legal contracts through conversational search and Q&A. It classifies each query, retrieves matching contract metadata or content, and links directly to results, while declining requests to draft, modify, or legally interpret contracts.

Workflow

The agent searches and answers questions about legal contracts on the user's behalf.

1. Determine if the request is for retrieving an attachment from a contract, and if so, retrieve the attachment directly.
2. Otherwise, classify the query as structured (metadata-based), unstructured (content-based), or a combination of both.
3. Run the appropriate contract search based on that classification and check whether matching results were found.
4. If matching results are found, let the user know they can select "Show" to view them; if not, ask the user to rephrase or broaden their search.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Ask for clarification before acting on an ambiguous query instead of guessing what the user means.
6. Politely decline any request that goes beyond factual contract search, such as drafting, modifying, or legally interpreting a contract, and offer to help with a supported request instead.

Configuration

Field	Description

Core Business Suite

Core Business Suite AI agents

The following AI agents are available for Core Business Suite.

CBS Bulk Upload AI Agent

The CBS Bulk Upload AI agent handles bulk record creation and updates for the Space, Supplier, and Supplier Contact tables.

Workflow

The agent helps users complete tasks related to Core Business Suite bulk upload.

1. Agent informs user that it will help them upload via a guided process.
2. Select the appropriate table based on user input.
3. Prepare template for data upload and present to user for modifications.
4. User uploads file.
5. Validate the file.
6. If no errors, import the data.
7. Display completion summary.

Complaint case research plan AI agent

Analyzes "Under Review" complaint cases to identify previously attempted troubleshooting steps and recommends new solutions from similar closed cases and knowledge articles. Prioritizes relevant suggestions, presents them with source attribution, updates work notes, and creates case task plans based on successful resolution patterns. Filters redundant recommendations and ensures proper workflow integration within case management systems.

Workflow

The agent helps users complete tasks related to complaint case research plan agent.

1. Retrieve case details.
2. Display previously attempted troubleshooting steps, if applicable.
3. Search for similar cases and knowledge articles.
4. Analyze troubleshooting steps and similar cases.
5. Generate a list of unique troubleshooting steps and present it to the customer, including links to sources.
6. Ask customer if they want to add these case tasks to the case.
7. Confirm with user and end the process.

Configuration

Context validator AI agent

The context validator AI agent is designed to validate the record, analyze the sentiment, and get the list of intents from the input record. This agent should be invoked when the record content needs to be validated.

Workflow

The agent helps users complete tasks related to context validator.

1. Get the source record details.
2. Verify the source record.
3. Determine the sentiment of the source record.
4. Handle negative sentiment of the source record.
5. Handle positive or neutral sentiment of the source record.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Create case AI voice agent

This voice agent enables users to log cases using voice input. It guides the user through a structured conversation to capture and validate all mandatory case details, creates the case record, and provides confirmation upon successful submission.

Workflow

The agent helps users log a case from a phone call.

1. Start the conversation politely.
2. Collect the issue details.
3. Validate mandatory information.
4. Generate a short description.
5. Confirm and enrich the details.
6. Create the case record.
7. Confirm case creation.
8. Link the case number and interaction record from the customer's current phone call.

Document verification AI agent

The document verification AI agent verifies the documents on a record to determine if they match the documents listed for the case type. Additionally, they determine if any documents are missing or if document verification has failed. This agent should be invoked when documents need to be verified.

Workflow

The agent helps users complete tasks related to document verification.

1. Get the source record details.
2. Get the case type.
3. Get the list of required documents.
4. Initiate the document verification.
5. Perform the document verification.
6. Compare the valid documents and the list of required documents.
7. Save the list of missing required documents.
8. Communicate to the user the document validation outcome.

Image to task plan template AI agent

This AI agent asks the user to upload an image, extracts the task dependencies from it, and returns the result as JSON.

Workflow

The agent extracts a list of tasks and their dependencies from an uploaded image.

1. Upload the file automatically, without asking the user to upload it or showing the attachment ID in the conversation.
2. Extract the tasks and their dependencies from the uploaded file.
3. Display the extracted tasks, showing which tasks depend on one or more other tasks.

Issue identifier complaint case intake AI agent

This AI agent is used for product and location-based grievances. It helps with intakes, documentation, and processing.

Workflow

The agent helps users complete tasks related to issue identifier complaint case intake.

1. Retrieve user information.
2. Determine complaint type.
3. Verify product or location.
4. Handle multiple matches for products or locations.
5. Extract case information.
6. Display all extracted information and confirm its accuracy.
7. Validate field format.
8. Search for similar open complaints.

Live interaction recommendations AI agent

The agent analyzes the conversation between a customer and a live agent. It recommends actions that help the live agent resolve the customer's issue.

Workflow

The agent helps a live agent during a customer call by surfacing recommendations from the interaction.

1. Show a **Get Recommendations** button when the session starts.
2. Analyze the current interaction when the user selects the button.
3. Display the recommendations, with clarifying options where they apply.
4. Refine the recommendations when the user selects an option or asks a follow-up question.
5. Show the button again so the user can refresh the recommendations as the call continues.

RMA Assistant AI agent

This AI agent helps customers and human agents with RMA case creation and processing for product returns, repairs, and replacements.

Workflow

The agent helps users complete RMA tasks.

1. Acknowledge concerns empathetically.
2. Inform the user, "I understand this isn't fully addressing your needs."
3. Wait for acknowledgment.
4. Transfer to human agent.
5. End chat only after confirmation.
6. If user asks off-topic questions: Inform politely that this is not part of the RMA Case flow and offer to connect to live agent at the end.
7. After live agent chat ends, or if no agents are found, close the flow smoothly with summary.

Triage cases planner AI agent

This AI agent triages cases. It takes appropriate actions based on the record's sentiment and intents. It is intended for agents and end-users who need assistance in resolving queries efficiently, as well as assessing a record for possible case creation.

Workflow

The agent helps users complete tasks related to triage cases planner.

1. Invoke the context validator AI agent to validate the record.
2. If the sentiment is negative, use the case creation AI agent to create a case. If the sentiment is neutral or positive, proceed to step 3.
3. Invoke the informational queries AI agent to process informational intents.
4. Invoke the transactional queries AI agent to process the list of transactional intents.
5. Invoke the case creation AI agent from the team to create the case.
6. Generate a customer reply.
7. Invoke the email response AI agent to generate and send an email response.
8. Generate the execution overview and add it to the case work notes.

Configuration

Field	Description

Triage cases wrap up AI agent

The triage cases wrap up AI agent finalizes the case triage process by synthesizing the execution and posting the summary to the record's work notes.

Workflow

The agent helps users complete tasks related to triage cases wrap up.

1. Gather the record table, record sys_Id, and record number.
2. Gather the AI agents execution summary.
3. Update record work notes with the execution summary, along with the record table, record sys_Id, and record number.
4. Display the AI agents execution summary to the user.

Troubleshooting steps identification AI agent

An AI agent responsible for gathering required context, identifying troubleshooting steps by comparing with KBs, similar cases and standard operating manuals, and proposing additional troubleshooting steps.

Workflow

The agent helps users complete tasks related to troubleshooting steps identification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Retrieve case details and identify troubleshooting actions already attempted by the user to avoid duplication.
2. Search for relevant troubleshooting guidance from similar cases and knowledge articles using the case description. If no relevant results are found, exit with the predefined message.
3. Analyze retrieved cases and knowledge articles to extract actionable troubleshooting steps with correct source attribution.
4. Identify and process any related documents linked to the search results, applying deterministic document selection logic and extracting troubleshooting steps when documents exist.
5. Combine troubleshooting steps from cases, knowledge articles, and documents, then remove steps already attempted by the user or semantically equivalent duplicates.
6. Present only unique, value-added troubleshooting recommendations in a structured format, clearly separating top recommendations, additional suggestions, and a fully hyperlinked sources section.
7. Ask for confirmation before updating work notes, update them only upon approval, display the exact confirmation message when successful, and then exit the workflow.

Configuration

Employee Experience

Employee Experience AI agents

The following AI agents are available for Employee Experience.

Company news & events AI agent

This AI agent keeps users informed by sharing the latest updates on news, events, and announcements.

Workflow

The agent helps users complete tasks related to company news & events.

1. Retrieve latest news and events using extracted filters.
2. If processedNews is empty or an empty response is returned from previous step, inform the user that no information has been found, and end the conversation.
3. Display processedNews to the user.
4. If NextPageToken is not null, ask the user whether they want to see more results, or if they would like more details about a specific news or event.

Enterprise Architecture

Enterprise Architecture AI agents

The following AI agents are available for Enterprise Architecture.

Enterprise Architecture explorer for analysis and queries AI agent

The agent answers questions about Enterprise Architecture data based on Common Service Data Model (CSDM) 5.0 entities and their relationships. It covers business capabilities, business applications, services, infrastructure, integrations, value streams, AI systems, technology standards, and conformance.

Workflow

The agent helps the user explore, analyze, and get answers about their Enterprise Architecture data.

1. Interpret the user's question and identify the architecture entities it refers to. Ask for clarification only when required information is missing, such as which owner field the user means.
2. Retrieve the requested data, such as application rationalization scores, capability health, technology risk, architectural artifacts, relationships between entities, and field-level details.
3. Trace upstream or downstream dependencies from a named item when the user asks about impact or dependencies.
4. For questions about missing relationships, such as applications with no assigned service, combine results from multiple queries to answer the question completely.
5. Try alternative approaches when a query returns no results before reporting that no data was found.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Present the answer in plain text with links to the relevant records, summarizing large result sets and offering to show more.
7. Highlight notable patterns in the data, such as low scores or coverage gaps, and suggest two or three follow-up questions based on the results.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Enterprise Architecture diagrams AI agent

The agent finds a business application by name or ID and generates a hierarchy diagram saved as a named architectural artifact. The agent also summarizes the generated diagram.

Workflow

The agent helps the user generate and review a hierarchy diagram for a business application.

1. Look up the business application that the user names or identifies by ID.
2. If no match is found, ask the user for the correct business application name or ID.
3. If several matches are found, list them and ask the user to select one.
4. Ask the user for an artifact name for the diagram, and ask for a different name if an artifact with that name already exists.
5. Generate the hierarchy diagram for the selected business application.
6. Present a link to the generated diagram so the user can review it.
7. Generate and display a summary of the diagram.

Shift and schedule management AI agent

This AI agent helps managers create, review, update, and delete shifts and schedules, and assign technicians to them. It suggests default shift details, finds technicians by skill or name, and asks the manager to confirm one complete plan before making changes. Managers can also open shifts for technician signup.

Workflow

The agent helps managers create and manage shifts and schedules and assign technicians.

1. Determine whether the manager wants to create, view, change, or delete shifts and schedules, or find technicians.
2. Fill in any missing shift details using standard defaults, and search for technicians by skill or name.
3. Display a summary of the plan and ask the manager to confirm, change, or cancel.
4. After confirmation, create the shifts and schedule, then assign the technicians directly or open the shifts for signup.

Financial Services Operations

Financial Services Operations AI Agents

The following AI agents are available for Financial Services Operations.

ACH dispute return recommendation AI agent

The AI agent guides the human agent through a structured decision-making process to determine the best action for an ACH dispute return task. The ACH dispute return recommendation AI agent analyzes disputed transactions based on merchant analysis and Nacha eligibility. The agent recommends actions based on historical data, and applies predefined rules when data is limited.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The AI agent helps the human agent decide how to resolve an ACH dispute return task.

1. Look up the ACH dispute task and display the case, transaction, customer, dispute amount, and reason code.
2. Check historical records for similar disputes with the same reason code and outcome.
3. Determine a recommended action — deny, file a return, or follow up with the ODFI — based on the merchant analysis and NACHA operating guidelines findings, using historical patterns when enough exist.
4. Present the recommendation and its supporting rationale, then ask the human agent to confirm or disagree.
5. If the human agent disagrees, let them choose an alternative action and provide a reason for the change.
6. Record the final action and reasoning on the dispute task.
7. Close the conversation once the task is updated.

Banking CSR customer insights AI agent

The AI agent answers a customer service representative's questions about a banking customer, presenting account, transaction, and case information in a clear, structured format so the representative can quickly explore relevant customer data.

Workflow

The AI agent helps the CSR explore a banking customer's account, transaction, and case information through natural-language questions.

1. Load the default configuration for the customer insights session.
2. Ask the CSR what they'd like to know about the customer, offering quick-prompt options alongside free-text entry.
3. Look up the answer to each query using the customer's context and the banking domain.
4. Present the results in a clear, per-topic summary using only the most relevant fields, and let the CSR know when nothing matches.
5. Return to asking for the next question, continuing until the CSR ends the session.

Configuration

Banking CSR support AI agent

The AI agent acts as a copilot for a customer service representative on a live banking call or chat, retrieving account, transaction, balance, credit, loan, and policy information in real time and presenting it in a clear, conversational format so the representative can respond quickly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent helps the CSR retrieve banking customer information during a live interaction and keeps the conversation moving.

1. When the CSR opens a new customer interaction, load that interaction's context and reset any prior conversation state.
2. Take the CSR's question — a typed banking query or a request to check for a new customer interaction — and send it, with the current customer context, to the query analysis tool.
3. Update the tracked customer context (name, type, and topic) with what the tool returns.
4. Present the results found, showing the most relevant account, transaction, case, or interaction fields, and note plainly when a value wasn't available.
5. Add related knowledge-base information after the account results whenever the tool returns any.
6. If nothing was found for the request, let the CSR know and offer to try again or check for a new customer interaction.
7. End every response with a quick-action button so the CSR can continue the conversation without typing.

Configuration

Dispute communication AI agent

The agent drafts a customer email about a card dispute outcome. It chooses the message template based on the dispute's final action, fills in the relevant transaction and merchant details, and adjusts the tone to match the template's intended message.

Workflow

The agent helps prepare the customer-facing email for a resolved card dispute.

1. Retrieve the dispute task's full details using the given task ID.
2. Find the email template that matches the dispute's final action.
3. Fill in the template with the dispute's transaction, merchant, and customer details.
4. Adjust the tone and phrasing of the filled-in message to match the template's intended tone, while keeping its structure and formatting.
5. Create an email draft record with the finished content and report the outcome.

Friendly fraud AI agent

The agent guides the human agent through resolving a friendly fraud dispute. It recommends an action based on published guidance and similar past overrides, then supports the agent's decision with real-time context to keep resolutions accurate and compliant.

Workflow

The agent helps the human agent decide how to resolve a friendly fraud dispute.

1. Look up the friendly fraud task and display its case, transaction, customer, and dispute amount details.
2. Retrieve the knowledge article on resolving friendly fraud disputes and use it to determine a recommended action and reason.
3. Record the recommended action and reason on the task.
4. Check historical friendly fraud cases where the recommendation was overridden and surface up to two similar past examples.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Present the recommendation, its reasoning, and any historical insight, then ask the agent to choose a resolution action — decline the dispute, issue a credit and write-off, or proceed with the dispute.
6. If the agent's choice differs significantly from the recommendation, ask them to explain why.
7. Draft rejection communication when the agent declines the dispute, and let the agent know what to do next.
8. Update the task with the resolution taken and confirm with a closing message.

Insurance CSR customer insights AI agent

The agent acts as a copilot for a customer service representative (CSR), answering natural-language questions about a single customer's insurance policies, coverages, claims, billing, and servicing cases, as well as general product and procedural guidance, and presents structured, context-aware answers with follow-up options.

Workflow

The agent helps the CSR look up a single customer's insurance information and related guidance during the session.

1. Ask the CSR what they'd like to know about the customer identified for this session.
2. Classify the question as a general knowledge question, a product-catalog question, or a question about the customer's own records, and confirm it's within scope — insurance policies, coverages, claims, servicing cases, billing, or procedures.
3. If the question refers to a record picked from an earlier list, resolve which record it means, asking the CSR to confirm when it's ambiguous.
4. If the question asks about a sub-record like coverages or beneficiaries without naming the parent policy or claim, first look up the matching parent records and ask the CSR which one to use.
5. Look up the customer's data, relevant product information, and knowledge-base guidance as needed to answer the question.
6. Present the results — as a list, a single record's details, a sub-record breakdown, or a short summary, depending on what was asked — and cite the knowledge-base source when guidance is included.
7. Let the CSR know when nothing was found, then return to asking for the next question.

Insurance CSR support AI agent

The agent gives a customer service representative (CSR) real-time answers during a live insurance call, either from a typed question or from the latest call transcript, retrieving the customer's policy, coverage, claim, and billing data or knowledge-base guidance so the CSR can respond quickly without switching screens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent helps the CSR answer a customer's insurance question during a live call, whether typed directly or picked up from the call transcript.

1. When the CSR selects **Get customer request**, read the latest call transcript to pick up the customer's most recent question; otherwise take the CSR's typed question directly.
2. Classify the question as a general knowledge question, a product-catalog question, or a question about the customer's own records, and confirm it's within scope — insurance policies, coverages, claims, servicing cases, or procedures.
3. If the question refers to a record picked from an earlier list, resolve which record it means, asking the CSR to confirm when it's ambiguous.
4. If the question asks about a sub-record like coverages or beneficiaries without naming the parent policy or claim, first look up the matching parent records and ask the CSR which one to use.
5. Look up the customer's data, relevant product information, and knowledge-base guidance as needed to answer the question.
6. Present the results — as a list, a single record's details, a sub-record breakdown, or a short summary, depending on what was asked — citing the knowledge-base source when guidance is included.
7. Let the CSR know when nothing was found, then offer to pull the next customer request and wait for the next question.

Merchant analysis for disputes AI agent

The agent evaluates the merchant behind a disputed transaction for credibility. It researches the merchant's reputation and regulatory history, weighs the evidence against a set of rules, and recommends whether the merchant is credible, with a rationale the human agent can accept or override.

Workflow

The agent helps the human agent assess whether a disputed transaction's merchant is credible.

1. Look up the merchant details for the disputed transaction and confirm the required task data is present.
2. Display the task's case, transaction, customer, dispute amount, and reason code.
3. Search the web for information about the merchant's reputation, complaints, and regulatory history, prioritizing government and regulatory sources — or fall back to analyzing the case details alone if search is unavailable.
4. Weigh the findings against a set of credibility rules to determine whether the merchant is credible or not.
5. Present the credibility assessment and its rationale, then ask the agent to agree or disagree.
6. If the agent disagrees, ask for their reasoning and record the opposite assessment instead.
7. Record the final credibility outcome and reasoning on the task, and close the conversation.

Nacha operating guidelines check AI agent

The agent determines whether a return code assigned to a disputed transaction is eligible for filing. It checks the case against NACHA operating guidelines' time-frame and documentation requirements and presents its eligibility decision and reasoning to the human agent for confirmation.

Workflow

The agent helps the human agent confirm whether a return code is eligible for filing under NACHA rules.

1. Look up the return code eligibility task and confirm the return code is present.
2. Display the case, transaction, customer, dispute amount, and reason code details.
3. Fetch the NACHA return-code eligibility guidelines and the customer's intake responses for the transaction.
4. Check the return code's eligibility against the guidelines' time-frame limit and Written Statement of Unauthorized Debit (WSUD) requirement.
5. Present the eligibility decision and its rationale, then ask the agent to agree or disagree.
6. If the agent disagrees, ask for their reasoning and reverse the eligibility decision accordingly.
7. Record the final eligibility outcome and reasoning on the task, and confirm closure with the agent.

Governance, Risk, and Compliance

Governance, Risk, and Compliance AI agents

The following AI agents are available for Governance, Risk, and Compliance.

Control objective change AI agent

This AI agent acts as a Compliance Manager that validates if the description and supplemental guidance of a given control objective need updates based on the associated citations. The AI agent recommends new values if changes are required, and updates the control objective record after getting confirmation from the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent helps users complete tasks related to control objective change agent.

1. Greet the user and fetch the control objective based on the provided sys_id.
2. Review the control objective's description and supplemental guidance fields to determine if updates are needed.
3. If the control objective is up to date, provide the user with an option for a manual update.
4. If the control objective is requires an update, provide recommendations.
5. Based on user's responses, update control objectives. Loop if necessary.
6. Inquire about the next item. Loop until finished.
7. Ending message.

For more information on Governance, Risk, and Compliance, see Governance, Risk, and Compliance

Issue action plan AI agent

This AI agent identifies the optimal steps for resolving an issue by referencing the past similar issue details. It presents a step-by-step summarized action plan to the user.

Workflow

The agent helps users complete tasks related to issue action plan.

1. Get record details.
2. Generate an action plan for the issue using the Generate Issue Action Plan tool.
3. Ask for user feedback.
4. If the user chooses to dismiss the action plan, inform the user that they can populate the action plan manually.
5. If the user chooses to edit the action plan, show a message asking for the user's feedback to refine the action plan.
6. Use user feedback to refine the action plan.
7. If the user chooses to accept the action plan, format and save it.

Remediation tasks AI agent

This AI agent identifies the remediation tasks for resolving an issue by referencing the action plan field on the issue record.

Workflow

The agent helps users complete tasks related to remediation tasks.

1. Fetch the sn_grc_issue sys_id or number from the memory, or ask for the issue number.
2. Use the Suggest remediation tasks for the issue tool to generate recommendations.
3. Ask the user to accept, edit, or dismiss the suggestions.
4. If the user chooses to edit the suggestions, refine them based on feedback.
5. If the user accepts the suggestions, create the remediation tasks.
6. End flow when tasks are complete or the user dismisses suggestions.

Report a GRC issue AI agent

This AI agent enriches the given issue description with additional information by looking at historical data and using GRC context. It analyzes, extracts key information (such as issue type, date of occurrence, and so on), and creates a GRC issue.

Workflow

The agent helps users complete tasks related to report a GRC issue.

1. Receive the user's request and gather key information.
2. Review the isIssue field from the tool response and respond to the user.
3. Ask the user for additional or missing issue details according to a template.
4. Interact conversationally to refine the issue.
5. Create an issue when the user is satisfied and selects **Submit**.

Hardware Asset Management

Hardware Asset Management AI agents

The following AI agents are available for Hardware Asset Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware Asset Management sourcing AI agent

This AI agent helps to source a requested hardware item through consume, transfer, and purchase.

Workflow

The agent helps users complete tasks related to hardware asset management sourcing.

1. Prompt the user for an item number, if not already provided.
2. Use the Fetch the details of the requested item tool to retrieve information for the requested item number.
3. If there's no error, inform the user of the required quantity.
4. Execute workflow A, which sources the item. If auto_consume, auto_transfer, and auto_purchase are true, and there are no problems, validate the sourcing for the user. If successful, continue to the next step.
5. Execute workflow B, which generates a guided source plan for the requested hardware. The user must approve this plan. If successful, continue to the next step.
6. Execute workflow C, which generates the input plan for the requested hardware. The user must approve this plan.
7. End workflow when C completes.

Configuration

Impact

Impact AI agents

The following AI agents are available for Impact.

Code fix AI agent

This AI Agent automates the process of analyzing, suggesting, and implementing fixes for code violations or issues detected within code repositories or running scripts. It leverages LLM-driven suggestions while keeping the user in control of approval and refinement.

Workflow

The agent helps users complete tasks related to fixing code.

1. Receive the user's code request.
2. Execute the appropriate tools to detect and handle code violations.
3. Allow user-driven approval, rejection, or refinement.

Integration Hub AI agents

The following AI agents are available for Integration Hub.

Box Spoke AI agents

The following AI agents are available for Box Spoke.

Box document management AI agent

This AI agent manages Box documents. It uploads, moves, and removes files, looks up file IDs, searches content, adds metadata to files, and attaches Box files to ServiceNow records.

Workflow

The agent helps the user find, organize, and use Box documents from ServiceNow.

1. Ask the user what they want to do and collect the details the action needs, such as the file or folder.
2. Search Box content or look up a file ID.
3. Upload a file.
4. Add metadata to a file.
5. Move an owned item to another location.
6. Attach a Box file to a ServiceNow record.
7. Remove a file.
8. Report the outcome to the user, including details of any error.

Workflow

The agent helps the user manage Box user accounts.

1. Ask the user what they want to do and collect the details the action needs, such as the user.
2. Look up the user ID.
3. Create a new user or update an existing one.
4. Enable or disable a user.
5. Add a user to a group.
6. Delete a user.
7. Report the outcome to the user, including details of any error.

Client Software Distribution 2.0 AI agents

The following AI agents are available for Client Software Distribution 2.0.

Catalog item creation AI agent

This AI agent creates service catalog items for applications from Microsoft Intune, Jamf, and Microsoft Endpoint Configuration Manager. It configures the software model, identifies or creates the target groups or collections, and creates the software configuration and catalog item.

Workflow

The agent helps the user create a service catalog item for an application that is managed in Microsoft Intune, Jamf, or Microsoft Endpoint Configuration Manager.

1. Ask the user for the application name if they haven't provided it.
2. Look up the application and, if several match, show them grouped by provider and server and ask the user to choose one.
3. Identify the software model type and configure a Client Software Distribution software model, or ask the user to choose a Software Asset Management software model.
4. Find the install and, where applicable, uninstall groups or collections for the application's provider, and ask the user to choose one when several are found.
5. Offer to create a group or collection when none exists, collecting the required details such as type, limiting collection, deploy purpose, and enforcement deadline.
6. For Microsoft Intune applications, ask whether the deployment is user-based or device-based.
7. Create the software configuration and the catalog item, and report the catalog item's sys_id to the user.

Jamf application targets addition AI agent

This AI agent adds static groups as targets to computer or mobile device applications in Jamf. It identifies the group and application, checks whether the group is already a target, confirms the request with the user, and reports the result.

Workflow

The agent helps the user target a computer or mobile device application in Jamf to a static group.

1. Ask the user for the group type and, if it can't be inferred, whether the application is a computer or mobile device application.
2. Ask for the group name or ID.
3. Look up the group by name and, if several match, ask the user to choose the correct one.
4. Ask for the application name or ID.
5. Look up the application by name and, if several match, ask the user to choose the correct one.
6. Check whether the group is already a target of the application and, if it is, tell the user that no change is needed.

Jamf group deletion management AI agent

This AI agent deletes static computer, mobile device, or user groups in Jamf. It confirms the deletion with the user and, when applications target the group, offers to remove those targets first so that the deletion can proceed.

Workflow

The agent helps the user delete a static group in Jamf.

1. Ask the user for the group type and the group name or ID.
2. Look up the group by name and, if several match, ask the user to choose the correct one.
3. Ask the user to confirm the deletion.
4. Check whether any computer or mobile device applications target the group. If so, list them and ask whether to remove the group as a target from each one.
5. Stop the deletion if the user declines to remove the application targets.
6. Delete the group and report the result, or explain any error that occurred.

Microsoft Endpoint Configuration Manager collection deletion management AI agent

This AI agent deletes device or user collections in Microsoft Endpoint Configuration Manager. It confirms the deletion with the user and, when applications target the collection, offers to remove those targets first so that the deletion can proceed.

Workflow

The agent helps the user delete a device or user collection in Microsoft Endpoint Configuration Manager.

1. Ask the user for the collection type and the collection name or ID.
2. Look up the collection by name and, if several match, ask the user to choose the correct one.
3. Ask the user to confirm the deletion.
4. Check whether any applications target the collection and, if so, list them and ask whether to remove the collection as a target from each one.
5. Stop the deletion if the user declines to remove the application targets.
6. Delete the collection and report the result, or explain any error that occurred.

Coupa Spoke AI agents

The following AI agents are available for Coupa Spoke.

Coupa approval management AI agent

This AI agent retrieves Coupa approvals. It looks up an approval, a list of approvals, and approval details by approval ID.

Workflow

The agent helps the user review approvals in Coupa.

1. Ask the user what they want to do and collect the details the action needs, such as the approval ID or filter criteria.
2. Look up an approval or list approvals.
3. Get an approval's details by approval ID.
4. Present the approval information to the user.
5. Report the outcome to the user, including details of any error.

The agent helps the user manage envelope documents and bring them into ServiceNow.

1. Ask the user what they want to do and collect the details the action needs, such as the envelope ID and document.
2. Look up the documents in an envelope or a document ID by name.
3. Add a document to an envelope or replace an existing one.
4. Attach a Docusign document, or the combined envelope document, to a ServiceNow record.
5. Report the outcome to the user, including details of any error.

Docusign eSignature envelope management AI agent

This AI agent manages Docusign eSignature envelopes. It creates envelopes from templates, manages recipients and field values, sends envelopes and ad-hoc signature requests, waits for signatures, cancels envelopes, and attaches certificates to ServiceNow records.

Workflow

The agent helps the user prepare, send, and track envelopes in Docusign eSignature.

1. Ask the user what they want to do and collect the details the action needs, such as the envelope, template, or recipients.
2. Create a draft envelope from a template or a composite template.
3. Add or remove recipients, and look up recipients or a recipient ID by role name.
4. Look up fields, field IDs, and field values, and set field values.
5. Send the envelope, generate an embedded sending URL, or send an ad-hoc signature request to one or more users.
6. Wait for the signature and attach the completion certificate to a ServiceNow record.
7. Cancel an envelope that is no longer needed.
8. Report the outcome to the user, including details of any error.

GitHub code automation AI agent

This AI agent acts as a coding partner for GitHub repositories. It clarifies requirements, proposes an approach, generates or updates code in context, and commits changes to a working branch and opens a pull request.

Workflow

The agent helps the user plan, write, and commit code changes to a GitHub repository. The user must provide approval at each step.

1. Clarify what the user wants to build or change, including the tech stack, and present a proposed architecture for the user to approve.
2. Confirm the repository owner, repository name, and base branch, asking the user for any that are missing.
3. List the repository's branches and let the user select an existing branch or create a new one from a base branch.
4. Review the repository structure and the files related to the change.
5. Generate or update each file, show the code to the user, and commit it to the working branch only after the user approves.
6. Ask whether there are more changes to make and, when the user is done, offer to create a pull request.
7. Create the pull request if requested and confirm completion with the user.

GitHub source code management AI agent

This AI agent works with GitHub repository content. It creates or updates files, looks up file content, and looks up commits, commit information, and commit comments.

Workflow

The agent helps the user read, change, and review files and commits in a GitHub repository.

1. Ask the user what they want to do and collect the details the action needs, such as the repository, branch, and file path.
2. Look up the content of a file.
3. Create or update a file.
4. Look up the commits on a repository or a commit's information by ID.
5. Look up the comments on a commit.
6. Report the outcome to the user, including details of any error.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Jira Spoke AI agents

The following AI agents are available for Jira Spoke.

Jira audit management AI agent

This AI agent retrieves Jira audit logs for a date range, supporting Jira Cloud, Jira Server version 9 and earlier, and Jira Server version 10 and later.

Workflow

The agent helps the user review Jira audit logs.

1. Ask the user to describe the task.
2. Confirm whether the instance is cloud or server and, for server, whether it's version 10 or later.
3. Ask for the date range to retrieve.
4. Look up the audit logs using the action that matches the instance type and version.
5. Report the outcome to the user, including details of any error.

Jira Service Management service desk management AI agent

This AI agent retrieves Jira Service Management service desk configuration and manages customers. It looks up service desks, queues, issues in queues, request types, and request type fields, adds customers, and finds user account IDs.

Workflow

The agent helps the user explore service desks and add customers in Jira Service Management.

1. Ask the user to describe the task.
2. Look up service desks, queues, or the issues in a queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Look up request types and the fields for a request type.
4. Confirm whether the Jira instance is cloud or server, asking the user rather than assuming, because the required user identifier differs by type.
5. Look up a user's account ID, using an email address for cloud or a username for server.
6. Add customers to a service desk.
7. Report the outcome to the user, including details of any error.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Microsoft Active Directory user management AI agent

This AI agent manages Microsoft Active Directory users. It looks up users, checks whether a user exists or is disabled, enables or disables users, and deletes users.

Workflow

The agent helps the user manage user accounts in Microsoft Active Directory.

1. Ask the user what they want to do and collect the details the action needs, such as the user.
2. Look up a user or check whether the user exists.
3. Check whether a user is disabled.
4. Enable or disable a user after checking the current status.
5. Confirm the user exists and delete the user.
6. Report the outcome to the user, including details of any error.

Microsoft Exchange Online meeting scheduler AI agent

This AI agent schedules meetings in Microsoft Exchange Online. It collects the attendees, subject, date, and time zone, finds times when attendees are available, and creates the calendar event.

Workflow

The agent helps the user find an available time and schedule a meeting in Microsoft Exchange Online.

1. Ask the user for the attendees and look up their email addresses, asking the user to choose when a name matches more than one person.
2. Ask for the meeting title or subject if it isn't provided.
3. Ask for the meeting date or time if it isn't provided.
4. Use the time zone the user mentions or, if none is given, the user's own time zone.
5. Find meeting times when the attendees are available around the requested time or day, and ask the user to pick a slot when the requested time isn't free.
6. Create the calendar event and share the meeting time and a link to the meeting details.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Workday HR goals management AI agent

This AI agent looks up employee goals in Workday HR so that users can review individual objectives.

Workflow

The agent helps the user review employee goals in Workday.

1. Ask the user what they want to do and collect the details the action needs, such as the employee.
2. Look up the goals for the specified employee.
3. Present the goal details to the user.
4. Report the outcome to the user, including details of any error.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Analyze potential impact AI agent

This agent analyzes the potential business and operational impact of a proposed change by identifying affected servers and services. The agent reviews the change request, performs impact analysis, and documents findings in work notes to support informed decision-making and effective mitigation strategies.

Workflow

The agent analyzes a change request to identify and document the potential impact on services and servers.

1. Validate that all prerequisites for the impact analysis are met before proceeding.
2. Retrieve the change request number from the current active page, or prompt you to provide it if unavailable.
3. Extract the affected server IDs from the change request.
4. Identify which services are potentially impacted by mapping affected servers to suggested services using the Service Mapping Candidate skill.
5. Retrieve a combined view of impacted servers and suggested services.
6. Perform a full impact analysis for each suggested service, including cascading effects, using the Service Mapping Candidates Impact skill.
7. Compile the analysis results and update the change request work notes with a consolidated summary.

AWS CloudWatch API AI agent

This AI agent investigates AWS CloudWatch alarm firings end to end by querying alarm configuration, metric time series, log groups, ML anomaly detectors, and Logs Insights. It then synthesizes findings into a structured root cause analysis report with metric analysis, log evidence, and correlated service impact.

Workflow

1. Identify what to investigate.

   The agent uses either the provided CloudWatch alarm name and region or entity name and region.

2. Gather context about the resource and investigate metrics and logs.
3. Return findings, including a summary of probable causes, recommended next steps, and investigation notes.

CSDM business application to infrastructure AI specialist

This AI specialist finds the best matching discovered service for each business application and creates the standard CSDM "Uses::Used by" relationship in the CI relationships table [cmdb_rel_ci].

Workflow

The specialist connects the CSDM business application to infrastructure.

1. Evaluate and rank search results. For each business application, the agent runs an AI semantic search against discovered services and receives up to 30 candidates, ordered by relevance score (0–1).
2. Candidates with a score of 0.3 or higher are automatically connected. The agent creates a "Uses::Used by" relationship in [cmdb_rel_ci]. Candidates with a score of 0.1–0.29 are saved

© 2026 ServiceNow, Inc. All rights reserved.

Kentik analysis AI agent

This AI agent fetches the incident insights report for a Kentik alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Determine what information to retrieve based on the provided information.
2. Use the Get Kentik insights report tool.
3. Return the findings using the Kentik insights report output.

For more information about configuring this AI agent, see Configure observability agents for ServiceNow Otto.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.
Tools	**Flow Action** Get Kentik insights report Alert impact summary
Allowed user roles The specific user roles that can access this AI agent.	evt_mgmt_operator
Data access roles The specific user identity roles that determine which data the AI agent can access and what actions it can take.	evt_mgmt_operator
Triggers	Optional. None defined by default. An admin can specify triggers if desired. For more information, see Add a trigger to an AI agent.

For more information, see ITOM AIOps.

LogicMonitor API AI agent

This AI agent investigates LogicMonitor alerts and monitored entities, assesses entity health, and recommends next steps.

Workflow

1. Identify what to investigate.

   The agent uses a provided LogicMonitor alert or monitored entity.
2. Find the affected entity in LogicMonitor, and check its health, related alerts, and recent changes.
3. Return an assessment, including the probable cause and recommended actions.

For more information about configuring this AI agent, see Configure observability agents for ServiceNow Otto.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. Network SME AI agent

This AI agent investigates network issues and recommends next steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Identify what to investigate.

   The agent uses a provided alert or network identifiers.

2. Request network data from the relevant vendor agents, such as SolarWinds or ThousandEyes.
3. Analyze the returned data to identify the likely cause of the network issue.
4. Return results, including the bottleneck, likely cause, and recommended next steps.

Configuration

New Relic MCP server AI agent

This AI agent queries and interprets observability data from New Relic using the full suite of New Relic MCP server tools.

Workflow

The agent investigates a New Relic alert or answers a direct question using New Relic observability data.

1. Identify what to investigate.

   The agent uses a provided alert or assesses a conversational question.

2. Generate an alert insights report or query the relevant data in New Relic using the appropriate MCP tools.
3. Return the relevant information, such as entity health, service dependencies, log analysis, alert details and history, performance metrics, and change events.

For more information about configuring this AI agent, see Configure observability agents for ServiceNow Otto.

Configuration

Prometheus API AI agent

This AI agent analyzes and investigates Prometheus alerts and answers general Prometheus questions, surfacing infrastructure metrics through instant and range queries.

Workflow

1. Identify what to investigate.

   The agent starts from a Prometheus alert, from an entity name when the alert came from another vendor, or from a user's question.

2. Query Prometheus for the relevant alert details, metric behavior, and target health when investigating an alert.
3. Return the findings, including recommended actions and supporting evidence.

For more information about configuring this AI agent, see Configure observability agents for ServiceNow Otto.

Service map creation AI specialist

This AI specialist discovers service infrastructure from application service candidates using ML analysis, and then it maps and persists the full service topology in CMDB.

Workflow

The agent helps users complete tasks related to service map creation.

1. Call the Get ML Candidate Full Data tool with the candidate number. This returns candidate sys_id, candidate name, server list with host names, and IPs.
2. Call the Get Candidate Running Processes tool with the same candidate number. This returns the running process details, AFP groups, connection data, and key ports.
3. Perform a noise check. Skip candidates flagged as monitoring clients, security clients, or operating system processes.
4. Determine the suggested_name using this priority order: Service Fingerprints (SFPs) if the candidate matches an Application Service Fingerprint in the Discovery Content Library; strong process evidence if no fingerprint exists; technology inference otherwise.
5. Check for existing service topology. If a topology already exists for this candidate, skip creation.
6. Create and save the service topology. Service maps are set to non-operational by default to allow administrator review before activation.
7. Inform the user of all changes.

Configuration

Field	Description

SolarWinds analysis AI agent

This AI agent fetches the details related to a SolarWinds alert by executing SWQL queries against SolarWinds.

Workflow

1. Identify the entity to investigate.

   The agent uses a provided identifier such as a node name, IP address, or application name from a SolarWinds alert.

2. Find the entity in SolarWinds, and query its health, relevant metrics, and relevant alerts.
3. Return the findings, including recommended next steps.

Splunk MCP server AI agent

This AI agent investigates Splunk Cloud and compatible Splunk Enterprise alerts by querying Splunk platform data. It doesn't cover Splunk Observability Cloud.

Workflow

1. Identify what to investigate.

   The agent starts from the details of an alert, such as its Splunk search query.

2. Query Splunk to find the most affected entity, and explain the alert with event details, trends, and ownership data.
3. Return the findings, including root causes analysis and recommended actions.

For more information about configuring this AI agent, see Configure observability agents for ServiceNow Otto.

Configuration

SRE investigate AI agent

This AI agent coordinates investigation activities across multiple observability platforms by orchestrating tool-specific agents. It correlates findings, identifies probable root causes, and synthesizes comprehensive investigation reports.

Workflow

1. Identify what to investigate.

   The agent starts from an alert and a question about it, such as its impact, or from a question about a specific observability tool.

2. Invoke the vendor agents that are relevant to the alert source, such as Dynatrace, New Relic, Kentik, and Splunk, and correlate their findings.
3. Save the investigation report to the alert and display it.

For more information about the supported vendor agents, see Configure observability agents for ServiceNow Otto.

ThousandEyes MCP server AI agent

This AI agent investigates ThousandEyes tests by analyzing metrics, anomalies, network events, and outages. It returns probable causes and recommended next steps.

Workflow

1. Identify the test to investigate.

   The agent uses a provided test name or ID, along with optional alert context such as severity and trigger time.

2. Retrieve the test configuration, metrics, anomalies, and related network events and outages from ThousandEyes.
3. Return the findings, including information such as probable causes and recommended next steps.

IT Service Management

IT Service Management AI agents

The following AI agents are available for IT Service Management.

Additional incident context AI agent

This AI agent retrieves information beyond the incident itself and presents the output in a readable format. This agent is strictly read-only; it can only retrieve and present information. It cannot update, modify, or perform any write operations on any records (such as adding comments, changing fields, reassigning, resolving, or closing incidents).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent retrieves information such as the caller's hardware assets, the caller's recent incidents, similar resolved incidents, and on-call experts.

1. Analyze user request and understand intent.
2. Fetch relevant configuration and data.
3. Guide user through necessary steps or actions.
4. Complete the requested operation.
5. Provide confirmation and next steps.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Agent client collector (ACC) diagnostic AI agent

This agent assists users in resolving ACC errors by providing suggestions based on the error codes found in the ACC Error Reports. It aims to help users resolve errors efficiently and effectively.

Workflow

The agent helps users resolve ACC errors.

1. Determine if the user is asking about errors from an ACC agent or a specific ACC error code.
2. If the user is asking about errors from an ACC agent, retrieve the ACC Error Report for the ACC agent.
3. If the user is asking about a specific ACC error code, retrieve the ACC Error Report for the error code.
4. Extract the error codes and suggestions from the retrieved ACC Error Report.
5. Use the appropriate response template to respond to the user.
6. Allow the user to ask any follow-up questions and try to answer them based on the information in the ACC Error Report, but do not display the output of the report.

Configuration

Categorize ITSM incident AI agent

This AI agent assigns the appropriate category and subcategory to an incident.

Workflow

1. Use the Fetch all data - Categorize ITSM incident AI agent tool to fetch incident details, available categories, and available subcategories.
2. Assign a category and subcategory.
3. Present the recommendation to the user.
4. Update the incident.

Create change request AI agent (autonomous)

This AI agent creates structured change requests from conversational input by autonomously selecting the appropriate change model and template.

Workflow

1. Initiate the workflow when the user selects the **Create with otto** action from the change request list.
2. Request the user to describe the change in a single message, including all available details such as affected configuration items, proposed schedule, implementation details, and so on.
3. Autonomously draft the change request from the user-provided description without requesting additional confirmation or follow-up information.
4. Delegate to the change template and model suggestion child agent (Change template suggestion agent) to autonomously select the best-fit change template and model from the available inventory.
5. If no template matches with sufficient confidence, apply semantic search over past change requests from the user's assignment group. Identify the most relevant template based on frequency and relevance.
6. Provide a summary of the change request proposed with fields automatically populated from the user's input and selected template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. User reviews the proposed change request details and either provides additional information or tells the agent to proceed.
8. Create the change_request record and return the created change request record number with a link to the record.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Change CI suggestion AI agent

This AI agent recommends a list of relevant configuration items (CIs) that can be added as Affected CIs to the current change request.

Workflow

1. Extract the current Change Request number and ask the user to confirm whether to proceed: `Do you need help in identifying configuration items for `{changeRequestNumber}`?`
2. If the user confirms, proceed to the next step; otherwise end the conversation.
3. Ask the user for details about the configuration items.
4. Launch the Get configuration items tool for change based on user input tool and pass the user-provided utterance from the previous step as input.
5. Present this tool's output to the user as a formatted list of CI suggestions.
6. Based on the user's response, launch the associate configuration items to change tool and pass the selectedSysId variable as an input.
7. Display the output to the user.

Change CI suggestion AI agent (latest)

This AI agent autonomously identifies and populates both the primary configuration item (CI) and affected configuration items on a change request without requiring multiple user interactions.

Workflow

1. Get the current Change Request number from the active change record or from the use input.
2. Retrieve the change request context from its field values.
3. Analyze the change details to identify the Primary CI and Affected CI candidates.
4. Present the candidate CIs list to user for identifying a suitable Primary CI or Affected CIs.
5. Automatically update the change request record with the user-selected primary CI and affected CIs.

Change conflict assessor AI agent

This AI agent can assess conflicts for changes. This includes checking mandatory fields and trigger conflict detection, and updating worknotes.

Workflow

The agent shows users a summary of conflicts and impacted services and CIs.

1. Use the Get Change request information tool to retrieve information for the change request.
2. Check the change request for the configuration item field.
3. Check the change request for the planned start date and planned end date fields.
4. Show these values to the user.
5. Verify whether a conflict check has run for the change request. If yes, ask the user if they want to run it again. If no, then run it without asking.
6. Use the Get list of conflicts for the Change Request group by conflict type tool to find conflicts related to the change request.
7. Show results to the user.
8. Update worknotes if the user approves.

Configuration

Change outage assistant AI agent

This AI agent creates outage records for the change request based on the impacted CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Extract the current change request number or ask the user to provide it.
2. Check if both Configuration Item and Affected CIs are missing from the change request. (If both are missing, stop execution and notify the user.)
3. Check if the change request already has an outage created and display it to the user.
4. Validate planned start and end dates.
5. If the user approves, create the outage; otherwise, stop.
6. Review CIs and impacted services with the user.
7. Display the final outage link.

Change request plans AI agent (autonomous)

This AI agent autonomously drafts change plan fields during the readiness phase. Field population is governed by a resolved change policy to ensure consistent behavior without requiring user input.

Workflow

1. Autonomously retrieve the change request record and all available change policy documents.
2. Resolve the applicable change policy by matching the change model field (chg_model) against available policy definitions.
3. If no policy matches on change model, autonomously fall back to matching the change type field (chg_type) against policy definitions.
4. Determine whether a policy document is available for the resolved policy.
5. If a policy document is available, autonomously identify the plan fields defined in the POLICY_EXTRACTION_KEYS schema.
6. Populate only the identified plan fields with content generated based on the policy requirements.
7. If no policy document is available, autonomously apply default field-population logic to draft all plan fields: Implementation plan, Backout plan, Test plan, Justification, and Risk and impact analysis.
8. Update the change request with populated plan fields and return confirmation to the user in a single message.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Change template suggestion AI agent (autonomous)

This AI agent identifies the most relevant change template and model for new change requests by analyzing request details and comparing them against available templates and historical data.

Workflow

This autonomous AI agent runs as part of the Create change request agent. The agent analyzes change request details and automatically selects the most appropriate change template and model from your organization's inventory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Autonomously retrieve the complete inventory of available change templates and models.
2. Analyze the change request details provided by the parent Create change request agent.
3. Apply large language model judgment to identify candidate templates based on relevance to the change request.
4. If a template with sufficient confidence is identified, autonomously select it as the best-fit template and return it to the parent agent.
5. If no template meets the confidence threshold, autonomously perform semantic search over past change requests created by members of the user's assignment group.
6. Rank semantic search results by combining two factors: frequency of past use and relevance to the current request, weighting each factor roughly equally.
7. Return the best-fit template identified through semantic search to the parent agent.

Configuration

Classify service and CI AI agent

This AI agent assigns the appropriate service and offering to an incident. It can also assign the appropriate configuration item.

Workflow

The agent helps users complete tasks related to classify service and ci.

1. Find candidates.
2. Choose recommendations.
3. Present recommendations to the user.
4. Update the incident if meaningful recommendations were found.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Create incident AI agent

Use this AI agent to log IT support requests. It responds to requests such as "create an incident," "raise an incident," "open an IT ticket," or "raise an IT support ticket."

Workflow

bv

This agent first attempts to resolve the problem with self-service solutions. If the problem persists, it drafts a structured IT support incident, confirms the details with the user for accuracy, and creates the official record for tracking.

1. Greet the user and gather information about the issue.
2. Validate and clarify the user's issue.
3. Create a search query based on the details gathered.
4. Use the search query as input for the Show Self-Service Options tool. This conversational tool handles the entire self-service process.
5. Evaluate the outcome. If the issue is solved, workflow is complete. If not, create an incident with the conversation history.
6. Confirm the details with the user.
7. Conclude the conversation based on the outcome.

Configuration

Use the Create incident AI agent

Use the AI agent incident creation workflow to report issues, review resolution plans, and automatically create incident records with duplicate detection.

Before you begin

Role required: none

Note: The AI agent executes the operations as an ITIL user.

Procedure

1. Open the Create Incident AI agent from one of the available contexts:
   - ServiceNow Otto panel
   - Employee Center
   - ServiceNow Otto for Virtual Agent
2. Describe the issue you're experiencing in the provided field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

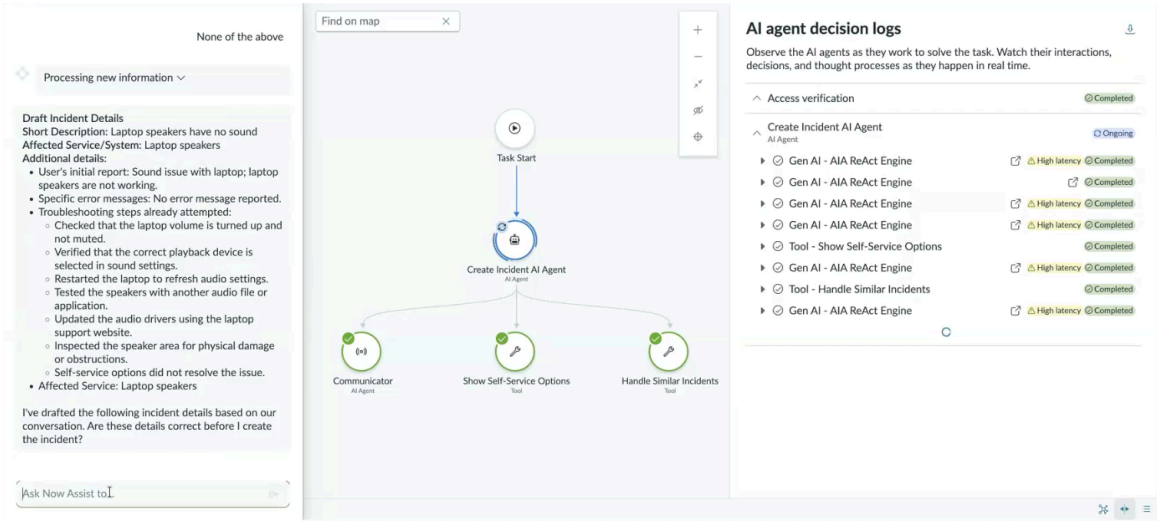
Provide details about the problem, including what you were trying to do, when the issue occurred, and any error messages or symptoms you observed.

3. Submit your issue description to the agent.

   The agent analyzes your input and generates a proposed resolution plan based on the issue description and knowledge base.

4. Review the resolution plan and select **Accept** or **Reject**.

   The agent displays a suggested resolution approach. If you accept the plan, the workflow proceeds to incident creation. If you reject it, you can provide additional guidance or take an alternative approach.



5. Wait for the agent to check for similar existing incidents.

   Note: The similar incidents must have the following conditions:

   - The incident must be active.
   - The caller must be the logged-in user.
   - The incident must have been created within the last 30 days.

   The agent queries the incident database to identify any duplicate or related incidents that might address the same issue. This duplicate detection helps prevent unnecessary incident creation and helps consolidate related issues.

6. Review the incident created by the agent.

   If no duplicates are found, the agent creates a new incident record with all relevant information from your issue description. The incident is ready for assignment to the appropriate support team and includes a complete audit trail of the workflow.

What to do next

Your incident is in the system and assigned to the appropriate team for investigation and resolution. Track the status through your ServiceNow portal or mobile app.

Create incident AI voice agent

This AI agent creates new incidents when the user explicitly mentions they want to create a new incident or report a new issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Check whether the caller already stated their issue during the initial routing or transfer.
2. If more context would help, ask up to two follow-up questions (one at a time).
3. Summarize the issue in one sentence and briefly state any follow-up answers received.
4. Create the incident and read the incident number back to the user and inform them they will receive an email with the details.
5. After confirming the incident number, say: "Is there anything else you'd like help with?"

Configuration

Field	Description

DEX diagnosis AI agent

This AI agent specializes in structured root cause diagnosis of device and application performance issues through a step-by-step process. This agent aggregates device health metrics, event logs and historical incident data, then systematically evaluates each source to isolate relevant evidence.

Workflow

The agent does not perform remediation, but it supports IT support and operations teams by providing a high-confidence diagnosis, highlighting affected components, key data sources, and patterns—ensuring clarity and traceability in issue investigation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Use the Device diagnostic data collector tool to gather issue details, device specifications (OS, version, RAM, CPU, disk space), health metrics (all available categories), and device events (system and service events).
2. Use the Similar incidents retriever tool to find past incidents with related symptoms, affected devices, components, or resolution patterns.
3. Call the Zoom call diagnosis skill ONLY when the issue explicitly indicates Zoom application.
4. Review the collected data and keep only the sources that provide useful information.
5. From the remaining data, identify the most probable root cause with supporting evidence.
6. Present the diagnosis in a bulleted list and include the following: incident number (if available), device information (OS, version, model), root cause with explanation, supporting evidence (metrics, events, patterns), and the confidence level with justification. Use clear headers and structured sections for readability.
7. Display the diagnosis to the user before proceeding.

DEX remediation trigger AI agent

This AI agent receives a resolution plan, checks for remedial actions, and executes the supported ones on end-user devices (Windows OS and MacOS endpoints) to resolve common device and application issues. Remedial actions are concrete, executable fix steps such as restarting services, clearing cache, or cleaning up temporary files.

Workflow

Given an incident with a resolution plan, this agent requests end-user consent for applicable remedial actions and executes the approved ones on the device. It reports per-action status upon completion.

1. Call the Fetch AI supported remedial actions tool.
2. Retrieve and validate the resolution plan and identify AI-supported remedial actions.
3. Get user consent for remedial actions.
4. Execute remedial actions.
5. Return the execution summary in a human readable format and end workflow.

Configuration

DEX resolution plan AI agent

This AI agent generates a resolution plan for the given issue based strictly on the root cause provided. The agent ensures all suggested steps are evidence-based, actionable, and aligned with the diagnosed root cause. No resolution is proposed outside these defined sources.

Workflow

The agent follows a prioritized sequence of approved sources: DEX resolutions (including remedial actions, self-help instructions), past incident resolutions, and knowledge base articles.

1. Retrieve the root cause of the issue and supporting data (incident number, device OS, failing component/metric). If both the root cause and device OS are missing, ask the user for input.
2. Use the Fetch remedial actions and self-help instructions tool to retrieve DEX resolutions.
3. Use the Similar incidents and knowledge articles retriever tool to search for relevant records.
4. Analyze the collected data and construct a resolution plan using DEX resolutions, past incidents, and knowledge articles.
5. From the remaining data, show up to three of the most relevant resolutions, prioritized in this order: remedial actions, self-help instructions, past incidents, and knowledge articles.
6. Display the resolution plan to the user.

Incident category configuration AI agent

This AI agent orchestrates the complete lifecycle of incident category and subcategory configuration for the Choices [sys_choice] table. It supports three interaction modes: guided conversation, file upload (CSV/XLSX), and industry-based recommendations.

Workflow

The agent validates all inputs through dedicated validation tools, detecting duplicates, typos, and structural issues before any changes occur.

1. Greet user and ask if they want to create custom categories or see recommendations for their industry.
2. Depending on the answer, ask user for their industry.
3. Generate recommendations and present them to the user or prompt them for bulk upload.
4. Validate and add recommendations.

Incident context AI agent

This AI agent helps users answer questions related to a given incident using information from the incident record and its related records. This agent is strictly read-only — it can only retrieve and present information.

Workflow

The agent cannot update, modify, or perform any write operations on any records (such as adding comments, changing fields, reassigning, resolving, or closing incidents).

1. Derive incident number from user context or ask user for the number.
2. Use the Get incident details tool to analyze the incident details and rewrite the user's question by replacing references with actual details from the incident.
3. Use the Search across adjacent task records using expanded query tool to find answers that may not be directly linked to the incident itself, such as a system outage.
4. Validate the quality of information returned by the tools.
5. Communicate the results.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Incident knowledge article AI agent

This AI agent can resolve incidents by finding existing similar knowledge articles and attaching them to the incident. It can also create a knowledge article for the incident.

Workflow

1. Use the Resolve and fetch similar knowledge articles tool to retrieve similar knowledge articles.
2. If approved by the user, attach articles to the incident or create a new one.
3. If creating new, use the Generate knowledge article tool to generate a draft knowledge article.
4. If approved by the user, create the knowledge article and provide the hyperlink.

Incident known error article AI agent

This AI agent can find similar known error articles for an incident and attach them to the incident. It can also resolve the incident.

Workflow

1. Use the Fetch similar knowledge articles tool to retrieve similar known error articles. If none are found, ask the user to provide a known error article number.
2. If approved by the user, attach articles to the incident.

Configuration

Incident resolution details AI agent

This AI agent suggests resolution notes for an incident.

Workflow

When approved by the user, the agent updates the incident with resolution notes and the resolution code.

1. Generate resolution notes for the incident.
2. Display, revise, and finalize the resolution notes based on user feedback.
3. Display resolution codes and ask the user to choose one.
4. Decide the next step based on the selected resolution code.
5. If the incident is a duplicate, ask the user to provide the duplicate incident number.
6. Update resolution notes and resolution code.

Incident routing configuration AI agent

This AI agent creates, modifies, and deactivates assignment rules for incident routing.

Workflow

The agent provides end-to-end support, from rule activation and AI recommendations to manual rule creation and bulk changes, with a staged commit workflow that lets users preview before applying.

1. Greet and retrieve configuration status.
2. Display best practices.
3. Set up business rules if none are active.
4. Set up assignment rules if none are active.
5. Review and confirm with the user.
6. Commit changes.
7. Gather routing preferences from the user.
8. Generate and display routing recommendations.
9. Handle user selection and changes.
10. Preview and commit changes, if approved.

ITSM incident resolution plan investigation AI agent

This AI agent gets incident details, reviews similar incidents and knowledge articles, and then generates an incident resolution plan.

Workflow

The agent generates an incident resolution plan and posts it in the incident work notes.

1. Get the details of the incident.
2. Find a list of similar incidents to understand how they were resolved.
3. Find a list of relevant knowledge articles, based on the short description of the incident.
4. Generate an incident resolution plan as a numbered list and add it to the incident's work notes.

Configuration

Field	Description

Link major incident or problem AI Agent

This AI agent automatically identifies and links the most relevant major incident or problem with an incident.

Workflow

The agent analyzes short descriptions, verifies contextual relevance, and updates the linkage while clearly presenting all tool responses to the fulfiller.

1. Use the Get Incident and relevant Problems tool to fetch incident details and relevant problems and major incidents.
2. Compare incident, problem, and major incident short descriptions to find a highly confident match that is contextually relevant to the incident. If no matches are found, end the workflow.
3. Link the problem and/or major incident to the incident.
4. Inform the user.

Manage ticket AI voice agent

This AI voice agent assists users with managing their active incidents and requested items.

Workflow

The agent is capable of fetching ticket details, adding a comment to a ticket, or escalating a ticket's urgency level.

1. Begin by asking the user to describe the ticket they would like to manage.
2. Fetch all the active tickets opened for the user, then from that list find the ticket(s) that best matches the user's description provided earlier and read out its number, short description and opened date.
3. Once you have narrowed down to one ticket, confirm the number and short description with the user, asking them "Is this the ticket you want to manage?".
4. When the user requests updates, use the add comment and escalate ticket tools as appropriate.
5. If a tool returns an error or a precondition is not met, notify the user and stop execution.
6. If the user is satisfied, close the conversation politely. If the user is not satisfied or requests a human, offer to transfer and end the conversation.

Configuration
