The agent helps users add or remove members of Microsoft 365 distribution list groups. It finds the group, validates the people to add or remove, confirms the action with the user, and records the request in an incident.

Workflow

The agent helps the user add or remove members of a Microsoft 365 distribution list group.

1. Enter a query in natural language such as "Add Abel to ITSM group" to retrieve the details and understand the request.
2. Ask the user for the group name or group email, if it was not already provided.
3. Look up the group, and if it isn't found, tell the user and offer to try another group name.
4. Confirm whether the user wants to add or remove members, and collect the names or email addresses.
5. Validate the names and email addresses, asking the user to correct any errors or choose between ambiguous matches.
6. Ask the user to explicitly confirm the add or remove action.
7. Create an incident if the user didn't provide one, and then start the process to add or remove the members.
8. Display a confirmation message with the results.

Password reset AI voice agent

This AI voice agent helps users reset their password during phone-based interactions.

Workflow

The agent sends a password reset link through email or SMS to ensure a successful reset.

1. Ensure you have the name of the password reset application. If not provided, ask the user to describe or name the application.
2. Call the application search tool with the provided name to retrieve possible matches.
3. If the tool returns multiple matches, ask clarifying questions.
4. Confirm the selected application and explicitly ask for the delivery method.
5. Send or read out the password reset link based on the confirmed method.

Configuration

Post incident review AI agent

This AI agent generates a post-incident review report for the user to review and revise after a major incident report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

A post-incident review (PIR) report is a comprehensive document created after a major incident or disruption has been resolved. Its purpose is to analyze what happened, understand the root causes, and assess the impact of the incident, while also providing actionable recommendations for preventing future occurrences. The report should contain 4 sections: Executive Summary section, Customer / Service Impact section, Detailed Technical Summary section, and Action items & Prevention section.

1. Collect the details about the major incident, including short description, description, assignment group, assigned to, category, subcategory, service, configuration item, resolution notes, business impact, and activities.
2. Collect child incidents and related records.
3. Generate a post-incident review report with four sections.
4. Collect feedback on the report from the user.
5. Update the incident record.
6. Acknowledge the result and conclude the conversation.

Configuration

Field	Description

Request catalog item AI voice agent

This AI voice agent assists users in finding and delivering catalog items. If the item is not categorized as software, then the catalog link is sent through approved channels such as email or SMS. If the item is software, this agent will help create the request.

Workflow

The agent operates only within approved channels and never creates, modifies, or deletes catalog items.

1. Ask the user to describe the catalog item.
2. Search for matching items.
3. If multiple matches, ask clarifying questions.
4. Confirm the selected item.
5. Determine item type:
   - If the item is software, proceed to request creation
   - If the item is not software, proceed to link delivery
6. If software item:
   - Collect any required inputs (if applicable)
   - Submit the catalog request on behalf of the user
   - Confirm submission to the user
7. If non-software item:
   - Confirm delivery channel
   - Send the catalog item link through the confirmed channel

Schedule change request AI agent

This AI agent schedules a change request.

Workflow

All dates contain the time.

1. Retrieve the planned start date and the planned end date from the change.
2. If the change did not have a planned start and end date, ask the user to provide them.
3. Retrieve the available schedule slots.
4. Schedule the change.

Configuration

Standard change template proposal AI agent

Provided with a change request, this AI agent searches for similar changes and returns a list of similar changes to use for a proposal record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

When the user chooses the changes that are appropriate for the template, this agent generates the content for multiple fields and creates a proposal template record.

1. Ask for the change request number.
2. Fetch similar change requests.
3. Use the Fetch standard change mandatory fields tool to return the fields and value list of the selected changes.
4. Analyze the field values to create template values.
5. If the user approves, generate the template.
6. Use the template to create a change template proposal record.

Configuration

Standard change template recommender AI agent

This AI agent helps users create and submit change requests. Invoke it whenever the user asks to log, create, submit, initiate, or help with a change record of any type (standard, routine, scheduled, maintenance, infrastructure, software, database, security, or any changes specific to IT service management).

Workflow

The agent guides users through the process of selecting a change type and providing appropriate options based on their selection. It retrieves historical template data, suggests templates, and generates links for creating changes.

1. Ask the user what kind of change they want to make: Standard, Normal, or Emergency.
2. For Normal or Emergency changes, generate the change link.
3. For a Standard change, ask the user to choose a template, then generate the change link.

Configuration

Submit account unlock catalog AI voice agent

This AI voice agent helps users unlock accounts by invoking a tool call to submit an account-unlock catalog request.

Workflow

1. Make sure you have the name of the account that needs to be unlocked. If not provided, ask the user to provide it.
2. Confirm the correct account with the user and inform user that you will proceed to submit the unlock catalog request.
3. On confirmation, call the tool to create the unlock catalog request.
4. Always confirm with user before submitting.

Note: The agent must execute all steps in sequence and must not skip any step, even if it believes it already knows the information.

Troubleshoot Outlook issue AI voice agent

This AI voice agent troubleshoots Microsoft Outlook issues. It also sends a troubleshooting article link to the user by email when requested.

Workflow

1. Greet the user and ask them if they need any help with Microsoft Outlook.
2. Fetch the KB articles related to user query and answer in a concise manner
3. Use the KB articles to answer the follow up questions.
4. If you are unable to answer any question, offer to transfer to an agent.
5. If they are satisfied and want no more details, politely end the conversation. If they are not satisfied, offer to transfer to an agent.
6. If they want to be transferred, do so and end the conversation.
7. If there are multiple steps, give each step one at a time and wait for the user to confirm they are ready for the next step.

Calculation creation AI agent

This AI agent creates a calculated metric definition record using the formula passed in the input.

Workflow

The agent helps users complete tasks related to calculation creation.

1. If the final formula is empty, tell the user it can't be calculated.
2. With the formula and name given in the input context, create a calculated metric definition and show the response to the user.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Calculation operand AI agent

This AI agent identifies and returns relevant metric definitions and emission factors from existing sources. It replaces generic references with precise metric definitions and emission factor names in the input formula.

Workflow

The agent helps users complete tasks related to calculation operand.

1. Use the formula stored in {emissions_formula} and copy it into ${emissions_formula_internal}. Store both values in memory.
2. Read the formula from left to right, consuming one sub-expression at a time.
3. Identify each unresolved element, one at a time, within the current sub-expression.
4. Search metric definitions and show results.
5. Search emission factor and show results.
6. Continue within the current sub-expression.
7. Continue to the next sub-expression.
8. When all sub-expressions are resolved, present the final {emissions_formula} without additional commentary.

Configuration

Field	Description

Operational Technology Manager (OTM)

Operational Technology Manager AI agents

The following AI agents are available for Operational Technology Manager.

OT Excel import task AI agent

The OT Excel import task AI agent imports Operational Technology (OT) device data from a spreadsheet into the Configuration Management Database (CMDB). The agent validates the imported records, creates remediation tasks for invalid records, and imports the valid records.

Workflow

The agent helps the user import OT devices from a spreadsheet into the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create an OT Excel import task record and share a link to it with the user.
2. Ask the user to attach a spreadsheet of OT device data to the import task record, using the template available in the **Attachments** panel as a guide.
3. After the user confirms the spreadsheet is attached, process it into the SG OT Excel Stagings table.
4. Share any failure messages so that the user can correct and re-upload the spreadsheet.
5. Ask the user to wait until the import task state changes to **Staging import succeeded**.
6. After the user confirms, validate the staged records and report how many are valid, partially valid, and invalid.
7. If any records are invalid, offer to create remediation tasks for them.
8. If any records are valid or partially valid, ask whether to import them into the CMDB, and start the import if the user confirms.
9. Tell the user that the import runs in the background and that the task state changes to CMDB import complete when it finishes.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Lead outreach AI agent

This AI agent sends outreach and follow-up emails to new leads on behalf of sales agents. It selects the email template based on how many emails the lead has already received, and disqualifies the lead when three emails go unanswered.

Workflow

The agent helps sales agents engage new leads by sending outreach and follow-up emails without asking for confirmation at each step.

1. Fetch the lead details and the emails already sent to the lead.
2. If the lead has received two or fewer emails, select the next email template in sequence, starting with the outreach email and followed by each follow-up email.
3. Personalize the email with the lead's name and the lead owner's name, and include any previously sent emails in chronological order.
4. Send the email to the lead.
5. Create a follow-up event for the next email.
6. Update the lead stage to Contacted if it isn't already set.
7. If the lead has received more than two emails without responding, work with other AI agents to disqualify the lead.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Appointment management AI agent

This AI agent manages appointments with leads on behalf of sales agents. It reads lead emails, checks the lead owner's availability, and either books an appointment or proposes two open time slots. It also cancels appointments when a lead asks and sends a confirmation email.

Workflow

The agent helps sales agents schedule or cancel appointments with leads based on the lead's email, without asking for confirmation at each step.

1. Read the lead's email to determine whether the lead wants to book or cancel an appointment, and identify any preferred date, time, or time zone.
2. Fetch the lead owner's available time for the requested period, and stop with a message to the user if no time is available.
3. If the lead requests a specific time and the lead owner is free for a 30-minute meeting, create a lead task and an appointment for that time.
4. Send the lead a confirmation email on behalf of the lead owner with the appointment time and time zone, and a note that a meeting invite follows.
5. If the requested time isn't available or the lead gives no specific time, send the lead an email on behalf of the lead owner that offers two available 30-minute slots.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. If the lead asks to cancel, cancel the upcoming appointment and send the lead a confirmation email, or ask for clarification if no upcoming appointment exists.
7. After canceling an appointment, work with other AI agents to disqualify the lead.

Configuration

Field	Description

Lead disinterest AI agent

This AI agent handles lead disqualification and opt-out requests for sales agents. After the sales agent confirms, it cancels the lead's upcoming appointments, closes the related tasks, and disqualifies the lead.

Workflow

The agent helps sales agents disqualify leads that aren't interested or have opted out.

1. Share the lead details, a summary of the emails sent to the lead, and the reason for disqualification, if available.
2. Ask the user to confirm whether to disqualify the lead.
3. If the user confirms, cancel all upcoming appointments with the lead.
4. Close all tasks related to the lead.
5. Update the lead stage to Disqualified.

Configuration

Inbound email AI agent

This AI agent analyzes the latest email that a lead sends in response to outreach and helps sales agents decide how to move forward. It classifies the response and then books a demo, disqualifies the lead, cancels the appointment, or drafts answers to the lead's questions.

Workflow

The agent helps sales agents respond to leads by analyzing the lead's latest email and taking the matching action without asking for confirmation at each step.

1. Fetch the lead details and update the lead stage to Nurturing if it isn't already set.
2. Fetch the latest email from the lead, and notify the user and stop if no email is found.
3. Classify the response as interest in booking or rescheduling a demo, not interested, cancellation of a scheduled demo, or additional questions when the intent is unclear.
4. If the lead wants to book or reschedule a demo, work with other AI agents to start the appointment booking.
5. If the lead isn't interested, work with other AI agents to disqualify the lead.
6. If the lead wants to cancel a scheduled demo without rescheduling, cancel the appointment.
7. If the lead has additional questions, prepare a response and show the questions and the response to the user.

Opportunity AI agent

This AI agent helps the user read, create, update, and summarize opportunities and their related records, such as accounts, contacts, touchpoints, opportunity tasks, line items, and meetings. It previews changes to opportunities, accounts, contacts, and line items and makes them only after the user approves.

Workflow

The agent helps users manage opportunities and their related records through natural-language requests.

1. Identify the action the user wants to take and the record it applies to, and ask a clarifying question if the request is unclear or not supported.
2. Use the record the user names, or the record open in the workspace if the user doesn't name one.
3. Retrieve and present the matching records or an opportunity summary, showing the first 10 results when more exist.
4. When creating an opportunity, help the user choose a sales cycle type and a stage that belongs to it.
5. Preview changes to opportunities, accounts, contacts, and line items, and apply them only after the user approves.
6. Apply changes to touchpoints, opportunity tasks, competitors, associated contacts, and meetings directly.
7. Report the result, including the reason for any failure, and provide up to three next steps the user can take.

Order Management AI agents

The following AI agents are available for Order Management.

Move order voice AI agent

This Sales Customer Relationship Management voice agent helps users relocate a telecom service to a new address by validating the consumer, verifying serviceability at the target location, and creating a move order.

Workflow

1. Confirm the user wants to move a telecom service to a new address, and extract any details already mentioned (current location, product offering, new address).
2. Verify the current user is a valid consumer in the system.
3. Fetch the consumer's services at their current location for the specified product offering.
4. Confirm the existing service location is valid.
5. Check if the target address already exists for the consumer. Create it if it doesn't exist.
6. Verify the product offering is available at the new location.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Build the product offering list from the consumer's active services and create the move order with the current location, new location, and consumer details.
8. Inform the user of the move order number on success, or that creation failed, and ask if they need further help.

Configuration

Order enrichment AI agent

This Sales Customer Relationship Management agent identifies enrichment tasks for order line items and their children using historic data, confirms the task list with the user, and creates them.

Workflow

1. Fetch the details for the given top-level order line item and all its children.
2. For each order line item, check for existing historic enrichment tasks. If none exist, identify the available tasks instead.
3. Display the proposed tasks grouped by order line item. If rejected, let the user provide their own task list per line item, validate it, and confirm again (repeating until satisfied).
4. Once confirmed, create the enrichment tasks for each order line item.
5. Mark the trigger task as closed complete. If no tasks were created, reset all order line item states back to new.
6. Display a summary of all steps taken, including created task numbers grouped by order line item, or note that none were created.

Order fulfillment AI agent

This Sales Customer Relationship Management agent identifies fulfillment tasks for a domain order by checking historic tasks from similar orders, confirms the task list with the user, and creates them.

Workflow

1. Fetch the details for the given domain order number.
2. Check for existing historic fulfillment tasks for the order and display any that are found.
3. Present the task list and ask the user to confirm. If rejected, let the user provide their own task list, validate it, and confirm again.
4. Create the fulfillment tasks in the system.
5. Update the trigger task status to completed.
6. Display a mandatory summary of all steps taken, including each created task's name and sys_id.

Invoice dispute AI voice agent

This AI voice agent helps customers resolve discrepancies between invoiced quantities and received quantities by creating dispute cases.

Workflow

The agent scope is strictly limited to quantity disputes only. It must escalate to a live agent for other issues such as pricing issues, payment issues, tax questions, delivery problems, and billing address changes.

1. If the user requests help beyond the agent's capabilities or encounters repeated issues, always offer live agent support as option.
2. Extract all available information from the user's first statement (invoice number, product, date, quantity received).
3. Search with all available parameters to find the invoice. If multiple possible invoices are found, clarify with customer.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Clarify with the customer which line on the invoice has the disputed quantity.
5. Create an invoice case.

Invoice dispute intake assistant AI agent

This AI agent helps requesters identify the correct invoice, confirm dispute details, and submit invoice disputes related to quantity issues. It guides users step by step through invoice identification, validation, and dispute submission to ensure a smooth and accurate experience. The agent also analyzes the sentiment of the user throughout the conversation.

Workflow

This agent can resolve quantity-related invoice disputes only. If you show frustration or ask for help beyond its capabilities, the agent offers a transfer to a live agent.

1. The agent checks the current page URL for an invoice number. If none is available, it looks up your invoices and asks which invoice you want to dispute.
2. The agent validates the invoice and asks which invoice line is in dispute.
3. The agent identifies the issue and captures the disputed quantity details.
4. The agent creates an invoice case and validates the dispute.
5. If the agent finds no quantity discrepancy, it offers you the option to upload a delivery ticket as proof or to connect with a live agent.
6. If you upload a delivery ticket, the agent processes it and checks whether it supports your disputed quantity. You can re-upload the delivery ticket up to three times.
7. When the dispute is validated, the agent offers you resolution options, such as a credit note or an order for the remaining quantity.
8. When you select a resolution option, the agent resolves the invoice case.

Invoice dispute support assistant AI agent

This agent helps users efficiently identify, review, and answer questions related to invoice disputes. It validates information, maintains data integrity, and answers questions regarding the invoice case.

Workflow

The agent can offer assistance to the user for resolving or closing invoice disputes and fetching similar invoice cases to help with invoice case resolution.

1. Identify and confirm the invoice number with the customer.
2. Use the Validate invoice case and fetch invoice tool to validate the invoice case number.
3. Provide the user with a list of options. These include finding similar cases, viewing invoice details, validating the invoice dispute, or closing the case. When closing the case, the user can issue a credit note for the missing quantity, place an order for the remaining quantity, or close the case as an invalid dispute.

Manage order operations AI agent

This AI agent helps customers change an order by requesting faster delivery, increasing quantities, changing the shipping address, or combining these changes. The agent checks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

inventory, delivery, and pricing, then resolves the case within a price threshold, creates a quote, or hands off to a specialist.

Workflow

The agent validates the order and the requested changes, checks whether the changes fit within the price threshold, and either resolves the case, creates a quote, or hands off to a specialist.

1. The agent retrieves your order and confirms the order number.
2. The agent identifies what you want to change and which order line the change applies to.
3. The agent collects the details for each change: a new shipping address, an increased quantity, or a faster delivery date. You can combine these changes in one request.
4. The agent confirms the changes with you and creates an order case.
5. The agent validates inventory, delivery, and location feasibility for the requested changes, shows you the results, and asks you to accept or decline each result.
6. If you accept all the changes, the agent checks the pricing. If the changes are within the standard pricing threshold, the agent resolves the case.
7. If the changes exceed the threshold, the agent asks whether to create a quote. If you agree and then accept the quote, the agent resolves the case with the quote.
8. If the changes can't be processed, or you decline the quote, the agent updates the case and offers to connect you with a live agent. The agent transfers you only after you confirm.
9. The agent summarizes the outcome and shares the case details with you.

Order capture AI agent

The Order capture AI agent helps you create orders from quote lines or uploaded files, and manage, investigate, and update existing orders. For example, you can apply discounts, change quantities, fix shipping addresses, remove lines, create cases, and undo changes.

Workflow

The agent runs in three modes: Quote Ingest, File Upload Ingest, and Manage Order. It creates orders from quote lines or uploaded files, and it helps you investigate and update existing orders.

1. The agent detects the mode from your input: a quote starts Quote Ingest mode, an uploaded file starts File Upload Ingest mode, and an order number or open order starts Manage Order mode.
2. In Quote Ingest mode, the agent reads the quote lines, groups them into orders by account and any configured order-splitting rules, and creates the orders.
3. In File Upload Ingest mode, the agent extracts order data from the uploaded file, maps the file columns to order fields, and creates the orders in bulk.
4. During ingest, the agent records any line it can't resolve, such as an unknown product or account, as an item for you to resolve in Action Center.
5. After ingest, the agent gives you a summary of the created orders with a link to each order.
6. In Manage Order mode, the agent uses the currently opened order as context and shows you the actions available for the order's current state.
7. After you select an action, the agent validates the order and line-item data and applies the change, such as a bulk discount, a quantity update, a shipping address fix, a line removal, or a new case.
8. When an action is reversible, the agent offers to undo it.

Order exception AI voice agent

This AI voice agent helps customers change an order after they place it. Customers can request faster delivery, a higher quantity, or a different shipping location, in any combination, for one order line. The agent creates one case for the requested changes and can connect the customer to a live agent.

Workflow

The agent captures every change the customer asks for on one order line, validates new shipping locations, creates one case, and hands off to a live agent when it can't complete the request.

1. Listen to the customer's request and identify each change they want: faster delivery, a higher quantity, a different shipping location, or any combination of these.
2. Retrieve the order by product name, order number, or a list of the customer's recent orders, and confirm the order with the customer.
3. Retrieve the order line items and confirm the line to change. The agent handles one line per case.
4. Ask only for missing values, such as the new quantity, the required delivery date, or the new shipping location.
5. Validate a new shipping location and confirm the matching address with the customer.
6. Ask whether the customer wants to change anything else on the same line before submitting.
7. Read back all requested changes for a final confirmation, and create one order case for them.
8. Share the case number and a summary of the original and requested values.
9. End the conversation. If the customer asks for more changes after the case is created, or the agent can't complete the request after three attempts or a tool failure, transfer the customer to a live agent with the case and conversation summary.

Telco order fulfilment template creation AI agent

This Sales Customer Relationship Management AI agent generates a task plan template using the provided specification and dependency JSON.

Workflow

The agent creates a task plan template for telecom order fulfillment based on a provided specification.

1. Retrieve and display the available order intent types.
2. Ask the user to select the required actions for the template, which can be multiple actions provided as a comma-separated list, and wait for their response.
3. Create the task plan record using the selected actions along with the specification, attachment, and task dependency information.
4. Display a summary of the created template, including the task number, number of tasks, and number of task dependencies.
5. Provide the confirmation URL and let the user know the template must be confirmed and published using that link.

CPQ AI agents

The following AI agents are available for Configure, Price, Quote (CPQ).

Quote AI agent

This AI agent helps sales agents create, update, and finalize quotes. It validates products against the catalog, adds and configures line items, applies discounts, and generates the quote document. When started from an opportunity, it reads the opportunity line items and notes to build the quote without manual input.

Workflow

The agent helps sales agents build a complete quote from an opportunity or an account, from adding products through to the final quote document.

1. Ask for an opportunity number or account name if neither was provided.
2. Create the quote, and when it starts from an opportunity, bring in the opportunity line items and suggest more products based on the opportunity notes and comments.
3. Look up each requested product in the product catalog, and ask you to choose when there are several matches.
4. Configure configurable products using natural language requirements, and add other products to the quote as line items.
5. Apply line or quote discounts that you request or that your description of the deal suggests, after confirming the discount details with you.
6. Generate the quote document and share the link when no line item, configuration, or discount work is pending.
7. Send an email notification summarizing the quote to the sales agent.

PRM AI agents

The following AI agents are available for Partner Relationship Management (PRM).

Service Exchange

Service Exchange AI agents

The following AI agents are available for Service Exchange.

Registration error monitor AI agent

This AI agent checks a registration number and connection against the Service Exchange error table, and then provides a detailed summary of any reported Service Exchange errors. This summary helps users or other AI agents make informed decisions and take appropriate action to resolve registration issues.

Workflow

The agent helps a user check a registration number and review any related Service Exchange errors.

1. Ask the user for the registration number to check, in the format REG followed by seven digits, for example REG0010010.
2. Look up the given registration number and connection in the Service Exchange error table.
3. Summarize any Service Exchange errors found for that registration number and connection.
4. Present the summary to the user so they can decide on next steps.

Registration initiator AI agent

This AI agent initiates the registration process and manages its early stages, including creating the registration record.

Workflow

The agent helps initiate a new Service Exchange provider registration and manages its early stages.

1. Verify the provider count and check for any outstanding health issues before proceeding.
2. Collect and verify the provider's company, contact, and URL details.
3. Create the provider and registration records once the details are verified.
4. Run the Service Exchange Pre-Onboarding suite against the new registration.
5. Check the registration state and report the result, including a link to any related issues, to the user.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Registration monitor AI agent

This AI agent monitors registration task state changes, validates system configurations, and posts audit results to work notes.

Workflow

The agent monitors a registration task's lifecycle events and posts audit results to its work notes.

1. Check the onboarding version and registration record associated with the task.
2. Verify the related settings record, transport queue record, and consumer configuration.
3. Validate the consumer-side registration settings and summarize the results.
4. Post a success or failure update to the registration task's work notes based on the audit outcome.

Security Incident Response

Security Incident Response AI agents

The following AI agents are available for Security Incident Response.

EDR AI agent

This Security Incident Response agent retrieves host details or isolates a host associated with a security incident.

Workflow

1. Identify the configuration item (CI) from the security incident using hostname, IP address, or device identifier. If no CI is found, inform the user and stop. Run the get host details action. If the request fails, inform the user and stop.
2. Identify the CI and security incident from user input. If no CI is found, ask the user how to proceed. Run the isolate host action. If the request fails, ask the user how to proceed.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Learn more about Security Incident Response at .

Exchange online integration handling AI agent

This Security Incident Response agent searches for and deletes emails related to a security incident.

Workflow

1. Run an email search based on the incident context. If no search criteria exist, ask the user how to proceed. Wait for user confirmation that the search is complete before fetching results.
2. Only available after a search has been performed. If the search returned no emails, stop. Otherwise, run the deletion, wait for user confirmation that it is complete, and fetch results.

Configuration

Field	Description

Learn more about Security Incident Response at .

Observable analysis AI agent

This Security Incident Response agent performs threat lookups, observable enrichment, sighting searches, and block requests against observables in a security incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Retrieve the incident's observables (URLs, IPs, file hashes, email addresses, etc.). Run threat lookup, observable enrichment, or both as requested. Wait for the user to confirm that the capability execution is complete before fetching and displaying results.
2. Retrieve observables and run a sighting search to find internal and external sighting information. If the search times out, retrieve results after the user manually confirms completion.
3. Retrieve observables identified as malicious. If none exist, inform the user and stop. Run the block request and wait for user confirmation that execution is complete.

Configuration

Security incident activities handling AI agent

This Security Incident Response agent manages security incident core activities, ensuring efficient and effective handling of incidents, problems, change requests, and security incident response tasks. It is intended for use by security incident management teams.

Workflow

1. Generate a description for an incident, change request, problem, or response task. Prompts user to review and approve the content before creation. If a response task is created, collect the outcome from the user and log it.
2. Confirm recipient addresses, generate the subject and body, and present for user review and approval before sending.
3. Update the state as requested. No further action is taken.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Used in agentic workflows	Resolve security incident

Learn more about Security Incident Response at .

Security incident resolution AI agent

This Security Incident Response agent walks the user through resolving a security incident by generating and executing a resolution plan.

Workflow

1. Fetch the security incident details and resolution plan. End if already closed or resolved.
2. Summarize the incident's current state, including any resolution steps already completed, and show it to the user.
3. Present the resolution plan for user review. Iterate on revisions until the user approves.

Security incident retrieval AI agent

This Security Incident Response agent searches for security incidents using filters and optionally summarizes individual incidents.

Workflow

1. Extract search filters from the user's request and confirm any ambiguous values.
2. Run the search and display results.
3. Offer to summarize a specific incident or modify the search filters. Summarization requires exactly one incident number.
4. Ask if the user needs anything else. Route out-of-scope requests to other agents.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Learn more about Security Incident Response at .

Security incident shift handover AI agent

This Security Incident Response agent adds a security incident to a shift handover report, walking the user through each section for review.

Workflow

1. Get a valid security incident number from the user if one is not provided.
2. Run the pre-processor to find active shift handover records for the user. If none exist, inform the user and end.
3. If multiple shift handover records exist, ask the user to select one.
4. Validate the selected handover record and generate its content. If validation fails, ask for a valid record number.
5. If the security incident is already in the report, inform the user and get confirmation before adding it again.
6. Walk through each section of the report. For each section, show the content, collect approval or revisions, and save to the database before moving to the next section.
7. After all sections are processed, show a summary of saved and skipped sections.

Security incident wrap up generator AI agent

This Security Incident Response agent can close a security incident by performing all pre-closure validations. It can also generate close notes, generate post incident analysis, post work note, and update the state of the security incident to close it.

Workflow

1. If the user explicitly requests closing as a false positive, follow the short path. Otherwise, follow the full closure path.
2. Retrieve the incident details. If already closed or cancelled, inform the user and end.
3. If the user explicitly requests closing as a false positive, close the incident immediately and end.
4. If the user doesn't explicitly requests closing as a false positive, warn the user if open response tasks or mandatory assessments will be affected. Get approval before continuing.

Security metrics analysis AI agent

This Security Incident Response agent calculates and analyzes security incident response metrics for an individual analyst or a team over a specified time range.

Workflow

1. Determine whether the user is asking about an individual analyst or a team (group), and extract the time range. Convert dates to GlideDate or GlideDateTime format.
2. Run the Calculation tool with the analyst or group name and date range. Results are displayed automatically.
3. Ask if the user wants a deeper look at a specific metric: security incident volume, MTTR, or MTTA. If accepted, run the Analysis tool for the selected metric.
4. If analysis completed successfully, ask if the user wants improvement suggestions. If accepted, run the recommend tool using the analysis results.
5. Ask if the user needs anything else. Route out-of-scope questions to other agents.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

ServiceNow AI Platform

ServiceNow AI Platform AI agents

The following AI agents are available for ServiceNow AI Platform.

Access Analysis AI Agent

The Access Analysis Agent lets you ask whether a user, group, or role can access something on your ServiceNow instance. It uses guided, conversational workflows in the ServiceNow Otto® panel.

Access Analysis Agent overview

The agent evaluates whether a user, group, or role can access a table, record, field, Client Callable Script Include, UI page, AI agent, or Agentic Workflow. It returns one of three results:

Access Analysis Agent results

Result	What it means
Passed	The entity has access. The agent names the ACL (or ACLs) that grant it.
Blocked	The entity does not have access. The agent names the specific ACL, role, security attribute, or condition that's stopping it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access Analysis Agent results (continued)

Result	What it means
Undefined	No ACL evaluated the operation at all, so the platform's default behavior applies. This is different from Blocked — there's no rule actively denying it, there's simply no rule granting it either.

The agent may ask clarifying questions before it evaluates anything. It never guesses at which record you meant.

Once enabled, the Access Analysis Agent supports:

- Reading the table, record, or user you're currently viewing so you can ask an access question right from that page without naming or navigating to it
- Evaluating whether a user can access a resource
- Evaluating whether a group can access a resource
- Evaluating whether a role can access a resource
- Answering questions that cover more than one operation on the same entity and resource in one response
- Evaluating access to AI agents and Agentic Workflows themselves, not just traditional tables and fields
- Saving completed evaluations so you can find and review them again later

Prerequisites and setup

Ensure the following requirements are met before using the AI agent:

- Access Analyzer is installed on your instance and active.
- The Access Analysis Agent is installed on your instance.
- AI Agent Studio is available on your instance.
- The Now Assist panel is available on your instance.
- You are signed in with a role that has access to the agent. For more information, see Required role below.

Required role

Required role: `access_analyzer_admin` or `user_admin`.

Unlike some Now Assist agents that are open to every session role, the Access Analysis Agent is gated behind two specific roles: `access_analyzer_admin` and `user_admin` roles. These roles keep the agent's use in line with who already has visibility into ACL structure and security configuration on your instance.

Within that gate, the agent evaluates access using the permissions your current session already holds when it looks up the underlying records. It does not escalate or borrow elevated privileges to answer your question.

Accessing the Access Analysis Agent

To confirm the agent is installed and see its configuration:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Go to the **AI Agents** tab.
3. Select **Access Analysis Agent**.

To start using the agent day to day, open the Now Assist panel from the sidebar on any ServiceNow page and start a new interaction. See the procedures below for how to phrase your questions.

Evaluate whether a user, group, or role can access a resource

Use this operation to check whether users can access a table, record, field, Client Callable Script Include, UI page, AI agent, or Agentic Workflow.

1. Ask the agent your question, naming the user, group, or role and the resource you're asking about. For example:
   - "What can user ABC access?"
   - "Can user ABC access resource X?"
   - "Does the ITIL group have write access to changes?"
   - "What can the itil role do on the incident table?"
2. If the agent can't uniquely identify the entity or resource you named, it asks a clarifying question. If your question matches more than one type of entity, the agent lists each match with its type and asks you to confirm.
3. The agent returns a Passed, Blocked, or Undefined result, along with the specific ACL, role, security attribute, or condition that determined the outcome.

Note: You can ask about more than one type of access in the same question, for example both read and write access to the same resource, or a full breakdown of everything a role can do on a table.

Learn why an operation was blocked

Use this operation when you already know an operation is blocked and want the specific reason, rather than re-asking the original question.

1. After receiving a Blocked result, ask a follow-up like "Why is user ABC blocked from report_view on incidents?"
2. The agent identifies the specific ACL, data condition, security attribute, or role gap that caused the block and explains it in plain language.

Ask about access without leaving the page you're on

Use this operation to ask about access while viewing a record, list, or user, without typing out what you're asking about.

1. While viewing a record, list, or user page, open the ServiceNow Otto® panel. Ask your access question without naming a resource, for example: "Can user ABC access this?".
2. The agent uses the page you're viewing as the resource for the evaluation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you name a resource directly in your question, the agent uses that resource instead of the page you're viewing. Because the page you're on can change between questions, the agent runs a fresh evaluation rather than reusing an earlier answer, even if you ask what looks like the same question twice in one conversation.

Review a past evaluation

Use this operation to find an access evaluation you ran previously, instead of running it again.

1. Open the Now Assist panel.
2. Ask the agent to show your previous evaluations, or reference the user, group, or role from an earlier question.

The agent retrieves the saved result from your earlier evaluation.

AI Analytics Q and A AI agent

This AI agent answers natural language questions about AI Analytics. It covers KPI definitions, dashboard widgets, source tables, data flows, deflection log states and scenarios, the deflection and metric frameworks, and ServiceNow platform scripts.

Workflow

Use this agent for any question about AI Analytics metrics, dashboards, or underlying data architecture.

1. Receive the user's question and pass it to the Now Assist Analytics Q and A skill exactly as written, without paraphrasing.
2. Retrieve the skill's grounded answer, which draws from verified platform documentation covering metrics, dashboards, source tables, and scripts.
3. Present the skill's answer to the user exactly as returned, preserving all identifiers, links, and formatting without summarizing or rewording it.
4. If the skill returns no usable answer, respond that there is not enough information to answer accurately and direct the user to the documentation or their platform admin.

AICT security analyzer AI agent

This AI agent generates context for a detected AI security event by aggregating asset, prompt, cross-threat, and correlation data. It then computes a confidence score from detection strength, event risk, and authorization signals.

Workflow

For all threats, the agent deterministically executes outcomes in a single finalization step: creating a security incident for critical severity findings with no open duplicate, saving a triage record capturing the full verdict and rationale, and triggering an AI insight for platform-wide visibility after the triage record is committed.

1. Retrieve the detected AI security event record and gather its full context, including the related asset, prompt, cross-threat indicators, and recent threat correlation.
2. If the event context indicates an error, finalize the analysis immediately with the error details and stop.
3. Calculate a confidence score using detection strength, event type risk, prompt authorization signals, and any cross-threat or correlation overrides.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Finalize the analysis by determining severity and creating a security incident with no open duplicate. Save a triage record with the full rationale, and trigger an AI insight for platform-wide visibility.
5. If finalization fails, present the error and its details to the user.

Configuration

AICT AI asset description auto-populator AI agent

This AI agent generates and applies descriptions to AI assets using vendor, model, and manufacturer metadata.

Workflow

This autonomous agent processes AI assets missing descriptions, creates contextual descriptions based on their technical specifications, and directly updates the asset model without requiring human approval.

1. Receive the JSON objective containing an array of AI assets with vendor, model name, manufacturer, and category information.
2. For each asset, generate a professional description focusing on functional purpose and capabilities.
3. Batch all generated descriptions and apply them directly to the asset records via a single update operation.
4. Report the final status, including number of assets updated, skipped, and failed.
5. Return a summary of outcomes with before-and-after details for audit tracking.

Configuration

AICT deactivate dormant asset AI agent

This AI agent analyzes and retires dormant AI assets by running comprehensive analysis and creating offboarding change requests.

Workflow

This agent identifies single dormant AI assets, conducts impact analysis, generates offboarding recommendations, and creates a change request to remove the asset from governance without manual intervention.

1. Parse the JSON objective containing the dormant asset details, including asset ID, name, deployment date, and governance record.
2. Run comprehensive analysis on the asset to determine dependencies, impact, and retirement readiness.
3. Generate an offboarding plan detailing steps to retire the asset safely.
4. Create a change request to execute the retirement with all recommended actions and timeline.
5. Return a detailed outcome report with analysis results, change request ID, and confirmation status.

AICT life cycle task reminder AI agent

This AI agent sends automated email reminders to task owners for overdue and dormant life cycle tasks on high-priority AI assets.

Workflow

This agent runs automatically on a schedule or triggered event, identifies overdue assessment tasks across high-priority AI assets, and sends targeted email reminders to assigned task owners.

1. Collect all life cycle tasks from high-priority assets using the Query life cycle Tasks tool.
2. Filter tasks to identify overdue and dormant items based on due date and last activity.
3. For each overdue task, retrieve the task owner contact information and asset context.
4. Compose and send personalized email reminders including task details, asset name, and deadline.
5. Log all reminders sent and report delivery status.

AICT outcome ranker AI agent

This AI agent ranks AI insight outcomes by relevance to each user persona based on their role and responsibilities.

Workflow

This autonomous agent receives persona descriptions and outcome metadata, determines personalized ranking for each outcome relative to user personas, and writes ranks to enable prioritized insight display.

1. Receive a JSON objective containing personas, outcomes, and their sys_ids.
2. Analyze each persona description to understand their role, priorities, and responsibilities.
3. For each outcome, understand its business value and impact based on its ID and description.
4. Rank all outcomes for each persona from most relevant (1) to least relevant (N).
5. Call Populate Outcome Ranks to write all persona-outcome ranks, then trigger prioritization recompute.

Approval assistance AI agent

This AI agent handles all queries related to approval records for the current user.

Workflow

The agent retrieves and filters pending approvals, provides detailed information about requested items, generates evaluation checklists based on knowledge base articles, and supports approval and rejection actions including e-signature management.

1. Analyze the user's message to identify what they are trying to do.
2. Route the request directly to the step that matches the intended action:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Retrieve all pending approvals assigned to the user, applying any filters specified by the user.
- Fetch full details for a specific approval record, always retrieving the most current data.
- Generate and display a checklist evaluation for the approval, grouping criteria by status and providing reference article links.
- Prompt the user to choose an approval action, handle e-signature requirements if applicable, and confirm the result of the action.

Configuration

Using the approval assistance AI agent

This AI agent that enables you to see your list of pending approvals, as well as see the details about your pending approvals. You can then approve or reject requests and tickets in ServiceNow Otto for Virtual Agent.

Roles required: approver_user, sn_request_approver_read, snc_internal

Note: Add the necessary roles to enable reading of other tables whose records go through the approval process. For example, you can add the sn_change_read role to read Change Request records.

The benefit of using the approval assistance AI agent is that you don't need to navigate to a specific page to approve your tickets. You can ask the AI agent about your pending approval requests and then tell the AI agent to approve or reject those approvals. The AI agent will ask follow-up questions and offer context-aware responses to simplify your experience.

Ask you administrator to configure the display fields and the knowledge base (KB) search fields to generate a Gen AI checklist to assist the approval assistance AI agent in making targeted decisions. The checklist uses KB articles and policies to assist the agent in decision making. The checklist fetches information from knowledge base articles about specific requester approval tickets. An approval_admin and admin role are required to configure the agent. For more information, see Configure Service Portal Approval Configuration record.

Note: Provide cross-scope privileges to the Requester Agents - Foundation plugin for tables whose records are restricted within the scope of an application. For more information, see Define cross-scope access to an application resource.

Prerequisites and setup

To use this AI agent, you must have Requester Agents - Foundation (version 3 of the standard plugin) installed on your instance, which is installed with ServiceNow Otto for Platform. You can get these plugins when you install any other ServiceNow Otto application, such as ServiceNow Otto for IT Service Management (ITSM).

The approval assistance AI agent displays data from the Approvals [sysapproval_approver] table. If the user has been assigned to approve a request, the approval record is shown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample prompts

After the agent has been activated in AI Agent Studio, enter phrases such as the following or similar queries to run the AI agent in Virtual Agent and the ServiceNow Otto panel.

- Can you give me a list of pending approvals?
- What are the pending approvals for time off requests?
- Show me a list of pending approval requests by priority.
- Give me details about my approval request?

Performing approval action on an approval record

The approval assistance AI agent shows approval requests that require an action on your part. After the approval information is provided by the agent, select **Approve** or **Reject** for a specific approval record, or type `Approve` or `Reject`. If you reject an approval request, then add a comment about the rejection reason.

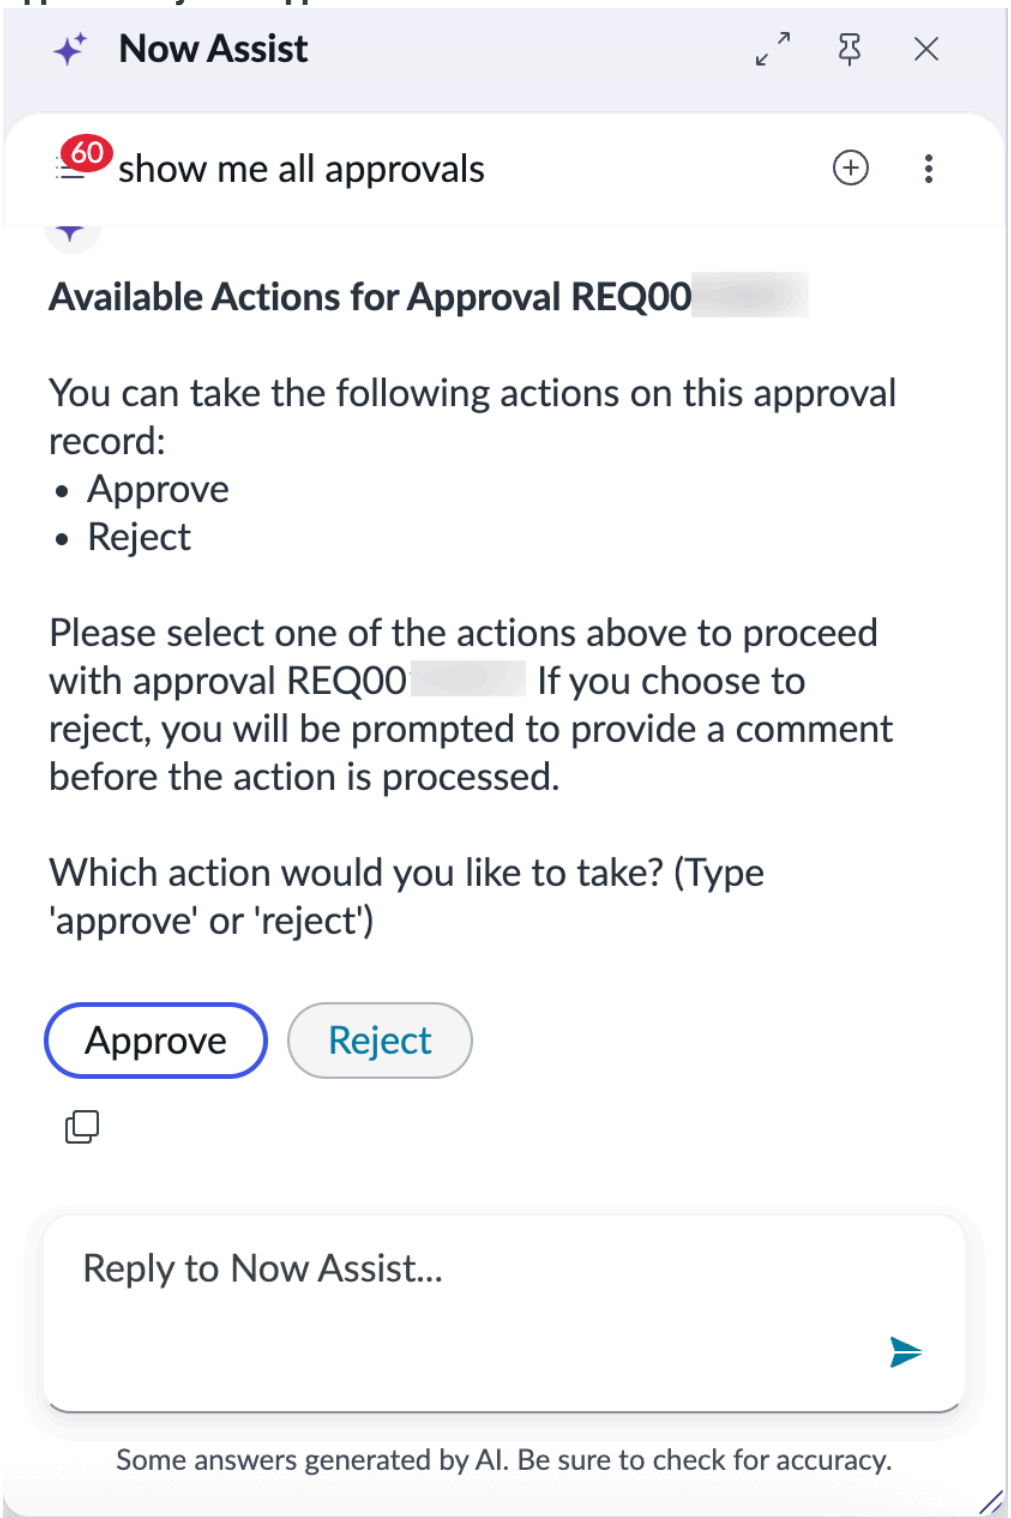
Approve or reject an approval record



Decomposition AI agent

This AI agent takes resolution steps as input, and then analyzes and breaks down each resolution step into a clear, structured set of smaller, actionable substeps. It then creates records based on user preference. This enables precise execution, improves task clarity, and supports automation and auditability of resolution workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent retrieve table configuration, decompose the resolution plan into actionable substeps, create the records and to save the summary in the parent record. It takes resolution steps as input. It does not generate resolution steps on its own.

1. Retrieve the table action policy XML that defines which tables can be acted on autonomously and which require supervision.
2. Retrieve resolution steps from memory.
3. Decompose the steps.
4. Group actionable steps into autonomous and supervised categories. Proceed automatically with autonomous steps. For supervised steps, wait for user input before executing.
5. Finalize the execution set.
6. Create the record.
7. Save activity notes.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Domain Separation AI agent

The Domain Visibility AI agent enables Domain Admins to manage user domain visibility using guided, conversational workflows in the ServiceNow Otto® panel.

Domain Separation AI agent overview

The agent performs validated operations on domain visibility data without requiring direct access to domain visibility tables.

Once enabled, the Domain Visibility agent exposes the following options to the admin:

- List all domain visibility for a user
- Add domain visibility for a user
- Remove domain visibility from a user

Note: The agent interacts directly with the `sys_user_visibility` table. All domain visibility operations (add, remove, list, query) are executed through this table. Admins do not need to open or configure the table manually.

Prerequisites and setup

Ensure the following requirements are met before using the AI agent:

- The Domain Separation plugin is installed on your instance and active. For more information, refer to Domain separation plugin.
- AI capabilities are enabled on the instance.
- You are signed in with a Domain Admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role masking

Required role: Domain Admin.

AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

In the data access settings, you must also add the necessary roles to enable reading of the tables for the records you want to evaluate for readiness. For example, you can add the itil role to the AI agent's list of approved roles so that it can access Incident records.

Accessing the Issue Readiness AI agent

To access the AI agent:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Go to the **AI Agents** tab.
3. Select **Domain Visibility**.

Access the AI agent

1. Open the ServiceNow Otto panel.
2. Start a new interaction.
3. Enter the prompt, "domain visibility help."

The agent displays the available domain visibility operations and guides you through the selected task.

List all domain visibility for a user

Use this operation to view all domains a user can access.

1. Select **List domain visibility** from the agent's options.
2. Provide the name of the user whose domain visibility you want to view.

The agent retrieves all domain visibility entries associated with the user.

Add domain visibility for a user

Use this operation to grant a user visibility to a specific domain.

1. Select **Add domain visibility** from the agent's available options.
2. Provide the requested inputs:
   - **User name**
   - **Domain name**
3. The agent validates that the specified user and domain exist.
4. Confirm the user name and domain name and that you want to add the visibility for the user.

The agent adds visibility for the specified domain to the specified user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can verify this by checking the `sys_user_visibility` table.

Remove domain visibility from a user

Use this operation to revoke a user's visibility to a specific domain.

1. Select **Remove domain visibility** from the agent's available options.
2. Provide the requested inputs:
   - **User name**
   - **Domain name**
3. The agent validates that the specified user and domain exist and that the user currently has visibility to the specified domain.

   If no matching visibility exists, the agent reports that there is nothing to remove.
4. If visibility does exist, confirm the user name and domain name and that you want to remove the visibility for the user.

The agent removes visibility for the specified domain from the specified user.

Note: You can verify this by checking the `sys_user_visibility` table.

Error analysis and remediation AI agent

This AI agent is helps admins and operators investigate Error Framework error codes, analyze root causes, and execute preconfigured remediation actions.

Workflow

The agent helps admins and operators investigate and remediate errors within the ServiceNow Error Framework.

1. Determine whether the user's request is about investigating an error or remediating one. If the user is viewing an Error Framework page, automatically identify the relevant error code for context.
2. For investigation requests, retrieve and summarize matching errors in a compact table, or provide a deeper analysis of a specific error code, including root cause and business impact, when the user asks for it.
3. For remediation requests, gather full context on the error and select the specific action that best matches the root cause, or provide manual steps and state-management options if no automated action is available.
4. Present the proposed action to the user, including the error code, action, reason, and scope, and confirm before proceeding.
5. Execute the approved action, report the results and a tracking link, and suggest any related follow-up actions.
6. If a request falls outside the Error Framework, or asks for an unsupported destructive operation, let the user know and offer to help with a supported task instead.

Explain SLA AI agent

This agent explains Service Level Agreement (SLA) details to the user based on the provided task number. It retrieves the matching SLA using timer configurations, along with SLA breakdown details, task SLA information, and an SLA timeline summary.

Workflow

1. Retrieve the SLA task record.
2. Display a numbered list of questions the user can ask.
3. Use the appropriate tools to retrieve the exact answer and communicate them to the user.
4. Ask the user if they have other questions.
5. Repeat until the user requests to end the conversation.

Image processor AI agent

This AI agent lets users upload image attachments and create task records by analyzing them. I

Workflow

The agent utilizes the document and visual insights AI agent to analyze the image, and the record management AI agent to create the record, and to copy the image attachment to the created record.

1. Call the Upload Image tool and ask the user to upload the image attachment.
2. Get a sys_id for the attachment.
3. Analyze the image.
4. Create a short description of the issue using concise, technical language that directly describes the problem.
5. Search knowledge articles using the short description.
6. Generate a record preview and show it to the user.
7. Once approved, create the record.

Issue readiness AI agent

This AI agent scans the record fields and context of a ticket so it can determine if it is ready for a fulfiller to work on it.

Workflow

1. Retrieve the record details, such as short description, description, activity stream, emails, approval, table name, and similar records.
2. Analyze task details, focusing on information added by fulfillers.
3. Analyze similar records.
4. If any of the following are true, mark the task as NOT READY:
   - A request or question (from a fulfiller) is detected and no clear response or resolution is found in the task record.
   - The approval field's value is "requested" (case-insensitive). (Values such as "not yet requested" or "not requested" don't block readiness.)
   - The task lacks information that is consistently present in similar records (if available) for the same type of request, and that missing information is relevant to fulfill the request (for example, missing steps, confirmations, or outcome).
   - The overall quality or clarity of the task data is poor, such as unclear context that would reasonably block progress.

For more information, see Using the issue readiness AI agent.

Using the issue readiness AI agent

This AI agent analyzes a record's information, determines whether all relevant information is present on the record, and then makes a decision about whether the task is ready for work.

Issue Readiness AI agent overview

Using the AI agent can help fulfillers focus on actionable work by reducing manual checks for missing supporting details or back-and-forth conversations. Instead of having to check whether tasks are waiting on pending approvals or unanswered questions, fulfillers can see what actionable work is available and prioritize it.

Prerequisites and setup

To use this AI agent, you must have the Requester Agents - Foundation plugin installed on your instance, which is installed with any other ServiceNow Otto application, such as ServiceNow Otto for IT Service Management (ITSM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Testing the Issue Readiness AI agent

You can manually test the AI agent execution on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Select the AI agent, start a manual test, and use utterances in the Task field like the ones below.

Sample prompts

After the agent has been activated in AI Agent Studio, enter phrases such as the following or similar queries to run the AI agent in Virtual Agent, the ServiceNow Otto panel, or Microsoft Teams.

- Is INC001234 ready for work?
- Do I have enough details on CSM0001234 to start?

Issue trend analysis AI agent

This AI agent analyzes grouped task data from cases, incidents, problems, or other tables to identify recurring issues and root causes.

Workflow

The agent provides detailed, actionable recommendations through structured analysis.

1. Extract the record type from the user's input.
2. Pass the extracted record types to the Get Task Analysis Config tool.
3. Prompt the user for a timeframe.
4. Acknowledge and use the Compute Trend Analysis tool to analyze the information.

Configuration

Model provider configuration AI agent

This AI Agent helps administrators understand whether their configured third-party LLM providers use OEM (managed by ServiceNow) or bring-your-own-key integration.

Workflow

The agent does not perform update or write operations.

1. Analyze the user's request to determine what they need:
   - View the integration type for a specific LLM provider
   - View all LLM providers and their integration types
   - Explain the difference between OEM and bring-your-own-key integrations.
2. Display the response to the query.

Next action recommendation AI agent

This AI agent identifies the optimal steps for resolving tasks by reviewing similar record details, related list record details, relevant knowledge articles, and web search results.

Workflow

The agent summarizes and presents to the user a step-by-step summarized resolution plan and derived action plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Fetch the record details.
2. Fetch a list of similar records to understand how they were resolved.
3. Fetch a list of related records to find all records from related lists to provide additional context.
4. Fetch a list of relevant knowledge articles based on the short description of the task.
5. Analyze the issue and use the web search tool to provide additional resolution steps based on the web search results.
6. Generate the resolution steps.
7. Display results to the user.

Prioritize work AI agent

This AI agent retrieves user-assigned tasks, scoring them by priority using metadata and Service Level Agreement (SLA) data.

Workflow

The agent generates time-blocked work plans based on calendar availability, iterating with users until approval, and persisting finalized plans to the database.

1. Call the Get user tasks tool.
2. Prioritize the work using the Prioritize work tool.
3. Identify next steps.
4. Generate a work plan.
5. Return the results to the orchestrator.

Record field value prediction AI agent

This AI agent can predict fields for an incoming record.

Workflow

The agent can also provide a summary and justification of the field predictions.

1. Get the record details.
2. Using the table and sys_id, determine if the task is ready to be processed.
3. With the user's input, use the Predict fields for a record or config tool to predict fields.
4. Predict fields on related list records only if a potential related list name is found.
5. Show predictions to the user.
6. Justify predicted fields if asked.
7. Update the record with predicted fields.

Configuration

Record management AI agent

This AI agent can fetch, update, create a record, link a knowledge base (KB) article, and copy an attachment to a record with details provided by the user.

Workflow

1. Fetch the record details and display it to the user.
2. If the user approves, do the following as needed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Update the record.
- Create a record.
- Copy an attachment to the record.
- Display attachment details.
- Link a KB article to the record.

3. Continue with the user as needed to solve the problem.

Request status AI agent

This AI agent answers inquiries about existing tickets that were created by or are currently opened by the logged-in user. It should be triggered only when the user explicitly references an existing ticket (for example, by asking for ticket status, updates, comments, or history).

Workflow

The agent handles only tickets, incidents, tasks, or requests that were created or opened by the currently logged-in user. It does not access or manage items submitted by others. The agent doesn't create new requests.

1. Retrieve the list of tickets that were created or opened by the currently logged-in user.
2. Display ticket details, status, and available actions:
   - Add a comment to the ticket
   - Execute a ticket action
   - Add an attachment to the ticket
3. Perform the action and display confirmation to the user.

For more information, see Using the request status AI agent.

Configuration (continued)

Field	Description
Channels	Configure an assistant for Virtual Agent or ServiceNow Otto panel using Assistant Designer.
Used in agentic workflows	Default VA Workflow

Using the request status AI agent

This AI agent enables you to view your open tickets, check the status of tickets, and add comments through ServiceNow Otto for Virtual Agent, the ServiceNow Otto panel, or Microsoft Teams.

When you ask for the details of a request, you can perform any other ticket tasks configured by your administrator in the Standard Ticket configuration, such as reopening an incident, and resolving a ticket. You don't need to navigate to a specific page to view your tickets. The AI agent can ask follow-up questions and offer context-aware responses to simplify your experience.

You can upload a file as an attachment to an open ticket or incident to support a request action. For example, if you lose your identity card you may request a replacement using the request status AI agent. You may be asked to upload an email or document that has your manager's approval to get the replacement ID card. In the conversation, you just type, I need to attach a document to this incident or ticket. The AI agent then provides the **Click here to upload a file** option within the AI agent chat for you to upload an attachment to the ticket. You upload the manager approval and the service agent can then approve your request for a new ID.

The tools and triggers that are associated with the request status AI agent are provided by ServiceNow Otto applications. You can activate the AI agent by making triggers active and setting the display settings to include Virtual Agent. If you want to change this AI agent's instructions, you must duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version of the AI agent instead.

Prerequisites and setup

To use this AI agent, you must have the Requester Agents - Foundation plugin installed on your instance, which is installed with any other ServiceNow Otto application, such as ServiceNow Otto for IT Service Management (ITSM).

To configure which actions are available, a user with the admin or sp_admin role can configure the Standard Ticket configuration for a table. In the Standard Ticket actions related list, you can add, change, or remove actions. All actions available from the Standard Ticket configuration can be used by the request status AI agent. See Configure actions for standard ticket page for more information.

To make the AI agent available for users, you must navigate to the **Toggle display** step of the guided setup in AI Agent Studio. Toggle Virtual Agent to `true` and select an assistant.

To make the AI agent available in Microsoft Teams, you must configure an assistant for ServiceNow Otto for Virtual Agent to use a Teams channel. See Display your assistant on a portal or channel for steps to enable Teams for your assistant. Then, in the request status AI agent guided setup in AI Agent Studio, select the assistant you configured for Microsoft Teams in the **Toggle display** step.

Testing the request status AI agent

You can test the request status AI agent on the Testing page of AI Agent Studio if you have the sn.aia_admin role. Select the AI agent and use prompts in the **Task** field.

Sample prompts

After the agent has been activated in AI Agent Studio, enter phrases such as the following or similar queries to run the AI agent in Virtual Agent, the ServiceNow Otto panel, or Microsoft Teams.

- Can you list all open tickets I've created?
- What's the current status of my incident INC001?
- Add comment to INC001 "I need your help in fixing this request ASAP. Please prioritize this."
- Can you check the latest progress on my most recent request?
- When did I submit this ticket?
- Who is working on it?
- I want to add a comment to my ticket.
- I also want to add an attachment to my ticket.

Search Q&A AI agent

This agent searches available resources to answer user queries, serving as the fallback agent when other agents cannot handle a request.

Workflow

1. Classify the user's query and search across available resources (internal knowledge base, FAQs, external sources).
2. Display the results to the user. If results are ambiguous or insufficient, prompt for clarification and refine the search.
3. If no satisfactory answer is found, suggest alternative resources or escalate.

Used in agentic workflows	Not applicable.

ServiceNow record navigator AI agent

This AI agent surfaces ServiceNow records as clickable navigation views. It handles retrieval-style queries ("show me open P1 incidents") and navigation-style commands ("take me to changes assigned to David").

Workflow

The agent turns a request to find or navigate to records into a clickable navigation view.

1. Rephrase the user's request as a retrieval query by stripping navigation language and reframing it as a request for matching record IDs.
2. Resolve the rephrased query against the knowledge graph to identify the matching records.
3. If the resolution fails, display the returned message to the user and stop.
4. If the resolution succeeds, pass the result directly to the navigation card so the user can click through to the records, without adding any additional text.

Smart documents AI agent

This Document Management AI agent help users interact with document content by providing summaries, FAQs, and answers to their specific questions. It only works within the ServiceNow Document Viewer.

Workflow

1. Greet the user and display options:
   - Summarize the document
   - Generate frequently asked questions
   - Answer questions about the document
2. Execute the task.
3. Display the results and ask the user if they want to continue.
4. End the conversation when instructed.

Survey analysis AI agent

This AI agent extracts and validates date ranges from user input, including natural language expressions. It analyzes survey data (such as questions, responses, and triggered records) to extract key metrics, identify trends, and deliver actionable insights for informed decision-making.

Workflow

1. Scan the entire user utterance for record type keywords.
2. Extract all record types that are mentioned.
3. Extract dates from the user input.
4. Call the Survey Analysis tool to handle the analysis.
5. Show the results to the user and end the conversation.

Troubleshooting AI agent

This AI agent triages an Automated Test Framework (ATF) test failure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent analyzes how and why a test has failed and provided a detailed root cause analysis.

1. Fetch the test description and the traced metadata, client logs, and server logs.
2. Starting with probable metadata identify potential causes for the failure, such as errors, exceptions, or unexpected behavior.
3. Examine the test itself for any potential mistakes made while authoring it.
4. Provide a detailed root cause analysis.
5. Determine fixes the user can make.
6. Use the Format RCA tool to format and return the response to the user.

Update work plan AI agent

This AI agent receives structured plan data from the orchestrator, constructs a valid JSON payload, and updates the finalized work plan in the database.

Workflow

The agent helps users complete tasks related to update work plan.

1. Receive the structured plan data from the orchestrator (tasks with all fields, including next_step).
2. Construct a JSON payload matching the exact database schema.
3. Validate the JSON syntax and schema compliance.
4. If validation fails, identify and repair issues.
5. Persist the plan to the database.
6. Retry up to 3 times on failure.
7. Return success or error status to orchestrator.

Web automation AI agent

This AI agent executes automated actions across any web page, enabling form filling, clicking, data extraction, and navigation tasks.

Workflow

1. Understand the user's goal. If critical details are missing (such as website or data values), ask the user to provide them.
2. Revise the plan until the user approves it.
3. Use the Web Automation tool to execute the plan.
4. If more information is needed, ask the user.
5. Show results to the user.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.
Tools	**Desktop action** Web Automation Tool
Allowed user roles The specific user roles that can access this AI agent.	snc_internal
Data access roles The specific user identity roles that determine which data the AI agent can access and what actions it can take.	sn_aaa.web_agent_runtime

Channels	Configure an assistant for Virtual Agent or ServiceNow Otto panel using Assistant Designer.
Used in agentic workflows	Web Automation

Web research and recommendation AI agent

This AI agent resolves issues by analyzing the problem and generating resolution steps using web search tools.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent is intended for users who require assistance in troubleshooting and resolving technical or nontechnical issues.

1. Get record details for the given task, such as the description and short description.
2. Check whether search is enabled. If enabled, proceed to the next step; otherwise, end the workflow.
3. Analyze the description and use the Web search tool to find resolution steps.
4. Format and present the results to the user in HTML.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Triggers	Optional. None defined by default. An admin can specify triggers if desired. For more information, see Add a trigger to an AI agent.
Channels	Configure an assistant for Virtual Agent or ServiceNow Otto panel using Assistant Designer.
Used in agentic workflows	Not applicable.

Work allocator AI agent

This AI agent automatically fetches backlog tickets, evaluates agent workloads and performance metrics, and assigns tickets to agents in a way that optimizes distribution and operational efficiency.

Workflow

The agent is designed for support team managers and operations leads.

1. Assign tickets to agents optimally for the assignment group indicated by the user's input.
2. Update the records with the ticket assignment.
3. Display the ticket assignments to the user in a readable format.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. Content Understanding AI agents

The following AI agents are available for Content Understanding.

Content insights AI agent

This AI agent processes and analyzes content in the Content Understanding application.

Workflow

The agent has three main capabilities.

1. Analyze the user's request and select the appropriate task:
   - Extract specific fields from documents using predefined configurations.
   - Analyze document content to answer specific user questions.
   - Provide concise summaries of document content.
2. Obtain the document either via user upload or a record number or sys_id.
3. Execute the task.
4. Return results to the user.

MID Server AI agents

The following AI agents are available for MID Server.

MID common AI agent

This AI agent helps users and support personnel to identify, analyze, and resolve MID Server issues.

Workflow

The agent retrieves data from error logs, collects necessary details from users, and provides actionable troubleshooting guidance sourced from official ServiceNow documentation.

1. Search support.servicenow.com and the ServiceNow documentation site.
2. Combine and summarize the results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Present the combined results in a clear format to user.
4. Fetch MID Server errors and warnings if the user requests it.
5. End workflow.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.
Tools	**Scripts** Fetch MID Server Details Fetch the top errors/warnings/exception Trigger log analysis tool **Web searches** Gather support information on site support.servicenow.com Gather product documentation info from site www.servicenow.com/docs/ **Subflow** Wait for log analysis to be executed

Used in agentic workflows	MID Guardian

Learn more about MID Server management in MID Server.

MID keystore AI agent

This AI agent helps IT administrators diagnose and resolve MID Server keystore problems and manage MID Server health.

Workflow

The agent fetches MID Server and issue details, executes rekey and validation operations, provides step-by-step recovery instructions, and ensures the MID Server returns to a validated state.

1. Identify the keystore issue from the user prompt or from the issue table.
2. If the MID Server is up, walk the user through the rekeying process.
3. If the MID Server is down, walk the user through troubleshooting steps.
4. Validate the resolution.
5. If the user verifies that the issue is resolved, end execution. Otherwise, restart the process.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Learn more about MID Server management in MID Server.

MID network AI agent

This AI agent helps administrators and support personnel diagnose and resolve MID Server connectivity issues in a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

The agent scope is strictly limited to MID Server and instance connectivity. It does not troubleshoot MID connections to other devices or systems.

1. Inform the user that the MID Server must be able to connect to the ServiceNow instance URL for it to function properly.
2. Retrieve the current ServiceNow instance URL, if it is not already known, and prompt the user to select the operating system of the MID host.
3. Work with the user to determine whether there is any issue with connectivity to the instance, one command at a time.
4. When Test Network Reachability has passed, validate the user credentials and test connectivity.
5. If Test Network Reachability fails, check firewall settings.
6. Guide the user to validate OCSP connectivity and whether OCSP checks work for the URL.

Configuration

Field	Description

Learn more about MID Server management in MID Server.

MID upgrade AI agent

This AI agent helps admins diagnose and resolve 'Upgrade Failed' issues on MID Servers by automating the identification, script deployment, error collection, and resolution workflow.

Workflow

The agent is designed for users managing MID Server health and upgrades in Windows and Linux environments.

1. Check if MID Server details are provided as input. Otherwise, use the Get MID Server Details tool to retrieve them.
2. If the user requests diagnostics, retrieve the script named 'Get-MIDUpgradeErrors' for the selected OS using the MID Script Retriever tool.
3. Execute the script.
4. Ask the user to provide the error output the diagnostic script generates.
5. Send the output to the Resolution Codes Tool for analysis.
6. Display the results to the user.
7. Confirm resolution or repeat analysis.

Email generator AI agent

This AI agent composes and sends emails (including new messages or replies) based on the provided context.

Workflow

The agent can either send the email or save it as a draft.

1. Based on the context provided, analyze the context and determine the intended action (either send email or save a draft).
2. Analyze the context to determine the type of the email: either New or Reply.
3. Verify that all required parameters corresponding to the determined action and type are explicitly present in the provided input or current conversation context. For example, recipient information and email sys_id.
4. Determine the primary goal and business-appropriate purpose for the email.
5. Construct the email.
6. Execute the final action with all inputs.

Configuration

Learn more about Notifications in Notifications.

Intent executor AI agent

This AI agent executes admin-defined actions, such as workflows or creating reply responses based on matched intent.

Workflow

The agent cannot analyze or compare the intent, nor can it generate an email or email draft itself.

1. Find intent matches.
2. Extract values from input and create JSON.
3. Validate the execution payload JSON.
4. After successfully executing all subflow actions, fetch the email actions that match the intent or fetch the default email actions if there is no intent match.
5. Generate email.

Intent identification AI agent

This AI agent analyzes and identifies the input email body intent. A list of admin-configured intents are compared with the input email body for a potential match.

Workflow

The agent fetches the email body using a given email sys_id.

1. Fetch the email body and execution context for the intent analysis and continue with the next step.
2. Check for malicious attempts, such as prompt injections.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Analyze the input to determine the overall thread context and the latest sender's goal, which can represent either an actionable request, expression, statement, or interest. The email body can include a conversation or email thread involving multiple participants.
4. Perform intent analysis to evaluate whether a given input utterance semantically matches an intent from an admin-configured list.

Learn more about Notifications in Notifications.

Notification AI agent

This AI agent creates or edits notification records through natural-language interaction.

Workflow

The agent determines whether the user intends to create or update a notification, extracts and validates the required inputs based on the rules defined in this specification, guides them through iterative refinement of the notification details when the user provides new information, presents the prepared configuration for confirmation, and creates/updates the notification record only after explicit user approval.

1. Acknowledge and restate the user requirement.
2. Parse the user prompt and extract all notification field values.
3. Validate and select the table the notification applies to.
4. Verify the recipients.
5. Use the Category and Template Resolver tool to fetch the resolved category and template.
6. Derive field values.
7. Display notification details.
8. Validate trigger criteria.
9. Process user response and regenerate notification summary.
10. Request user confirmation.
11. Create notification.

Learn more about Notifications in Notifications.

Notification content AI agent

This AI agent prepares email notification templates and layouts. It begins by analyzing user input to understand the notification's content requirements and design expectations. Before generating any content, the agent searches for similar existing templates and presents the results to the user.

Workflow

The agent is strictly scoped to email notification template and layout creation only.

1. Perform content preparation and request analysis to build a clear understanding of the notification content to be created.
2. Find a default template.
3. Extract template and layout requirements
4. Select the email sections that are required for the user's request.
5. Select interaction elements that are required for the user's request.
6. Determine whether the email should be div-based, table-based, or a hybrid.
7. Select a design style.
8. Determine content and tone.
9. Determine layout requirements.
10. Identify all dynamic fields required for the template which are explicitly mentioned in content requirements or the user's request.
11. Summarize results and confirm with the user.
12. Generate the template and layout.

Setup Hub AI agents

The following AI agents are available for Setup Hub.

Group and roles assignment AI agent

This ServiceNow Otto for Setup AI agent provisions access by creating groups, adding users to a group, assigning roles to a group, and adding users to a role.

Workflow

The agent never creates or edits users or roles, and it never deletes or modifies any existing content.

1. Run the Fetch context tool and present choices to the user.
2. Execute assignments according to the prescribed guardrails.

Configuration

Field	Description

Implementation plan manager AI agent

The implementation plan manager agent orchestrates an implementation by coordinating the plan generator and plan executor agents. It helps to ensure that your technical intent is converted into a clear plan and executed safely and correctly.

Workflow

1. Call the agent context retriever tool to get the questionnaire sysId, additional parameters, and conversation ID.
2. Invoke the Implementation plan generator AI agent and wait for it to return a plan sysId. If the user exits or the plan fails to generate, end the conversation without proceeding.
3. Invoke the Implementation plan executor AI agent, passing it the plan sysId and conversation ID, and wait for it to complete all steps.
4. Clear the same context/state variables again so nothing carries over into the next run.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Initialize IA orchestrator AI agent

This ServiceNow Otto for Setup agent automatically triggers the appropriate Virtual Agent topic to streamline setup and onboarding for users on your ServiceNow instance.

Workflow

1. Use the trigger virtual agent tool, to trigger the virtual agent.
2. If the tool returns an error or fails unexpectedly, inform the user.
3. Never request, wait for, or infer inputs from the user.

Configuration

SLA management AI Agent

This ServiceNow Otto for Setup agent enables administrators to create and edit SLA definitions through a conversational interface. The agent guides you through SLA configuration, including setting target type (Resolution/Response), duration, table, schedule, start/pause/stop conditions, and flow associations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Determine whether the admin wants to create an SLA or edit an existing one (asking if unclear).
2. Collect the target type (Resolution/Response), applicable table, classification (priority, type, model, or service), duration, and name, using existing SLAs and smart defaults to recommend values where possible.
3. Confirm which schedule applies and associate a notification/escalation flow.
4. Recommend and confirm start, pause, and stop conditions based on the SLA type.
5. Present a full summary of the configured SLA and get admin confirmation.
6. Save the SLA definition, handling any duplicate-configuration conflicts along the way.
7. Display a confirmation summarizing what was created or changed.

Configuration

SSO configuration AI agent

This ServiceNow Otto for Setup AI agent guides administrators through secure Single Sign-On (SSO) setup for ServiceNow using SAML or OpenID Connect (OIDC). The agent collects and validates identity provider details, creates authentication configurations, and guides users through review, testing, and activation.

Workflow

1. Check whether the SSO plugin is installed and whether an active SSO configuration already exists. If the plugin isn't installed, offer to install it and monitor progress before continuing.
2. Identify whether the user wants SAML, OIDC, or generic SSO help; if unclear, ask them to choose. If an active configuration already exists, offer to deactivate it instead.
3. For SAML: request the metadata URL. For OIDC: collect the configuration name, client ID, and well-known configuration URL (client secret is handled separately, outside the conversation).
4. Create the SAML or OIDC Identity Provider record based on the provided information. Confirm success or display any errors for correction.
5. Present a link to the newly created record and ask the user to review and correct any fields before continuing.
6. Guide the user through testing the connection and confirm the test passed.
7. Ask whether this should be the default login method and apply that setting if so.
8. Explain ACR as a safety fallback and confirm whether it's been set up before proceeding.
9. Ask for confirmation, then activate the configuration.
10. Depending on earlier default/active selections, mark the configuration as primary automatically or ask for confirmation.
11. Ask the user to test login redirection in a private browser.

Update set AI agent

This ServiceNow Otto for Setup AI agent helps administrators and developers upload, review, and commit XML update sets efficiently.

Workflow

1. Outline the steps that will run (upload, validate, retrieve, preview, conflict handling, commit) and wait for the user to confirm before starting.
2. Accept the XML file upload and retrieve its attachment details.
3. Check the uploaded file is a valid update set XML.
4. Pull the validated update set into the instance.
5. Run a preview to detect conflicts with existing configuration.
6. If conflicts exist, let the user review errors, then accept all, reject all, or resolve manually before rechecking.
7. Commit the update set and confirm success, or report a failure with retry/stop options.

ServiceNow Otto for Creator

ServiceNow Otto for Creator AI agents

The following AI agents are available for ServiceNow Otto for Creator.

Build Agent

This AI agent enables developers to create, edit, and deploy full-stack ServiceNow® applications to update sets that encompass both user interface and back-end components.

Important: Build Agent uses a different framework than other ServiceNow® AI agents. Review the following workflow and configuration settings for Build Agent. For more information, see Build Agent.

Workflow

You describe what to build or change in natural language, and Build Agent proposes, applies, tests, and builds the changes for your review. The workflow is the same in ServiceNow Studio and the ServiceNow IDE.

1. Based on the user's request, parse the requirements.
2. Propose the application and files to create or modify.
3. Display the proposed edits, diffs, and summaries, and pause for user approval.
4. Once approved, edit the code or metadata, or scaffold a new application.
5. Repeat until the requested metadata changes are complete.
6. When prompted, or after asking the user depending on the configuration, create and run Automated Test Framework (ATF) tests.
7. If tests fail, triage the failures and produce a regression test suite for monitoring app health.
8. Build the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration

Build Agent configuration

Configuration area	Description
Plugins	Plugins are required for Build Agent and vary by version. • For Build Agent (Trial/Free): `sn_glider` and `sn_build_agent` plugins. • For Build Agent (Premium): the `sn_now_creator` plugin, which contains the `sn_build_agent_pro` plugin.
Access	Build Agent is accessible in both ServiceNow Studio and the ServiceNow IDE.
Model context protocol (MCP) servers	Build Agent enables access to external tools and resources through standardized communication (MCP servers). For more information, see MCP connections and Build Agent and Connect Build Agent to a supported MCP server.
Tests	Test settings determine whether Build Agent and Autonomous Engineer generate and run Automated Test Framework (ATF) tests in conversations. • **Sync ATF tests with app**: Generates ATF tests when the agent creates an app, and keeps the tests synced when the app is edited. • **Run UI ATF tests**: Runs client-side and server-side UI ATF tests. This setting requires **Sync ATF tests with app** and is off by default because UI test runs are slower. For more information, see Configure auto test prompting and UI tests.
Custom instructions	Custom instructions control how Build Agent behaves during a session. • Rules are preloaded into every session automatically. Rules enforce consistent behavior, such as naming conventions or organizational standards. • Skills are available on demand when a user or the agent invokes them by name. Skills provide task-specific guidance, such as internal guidelines for a particular workflow pattern. The **Applies To** setting determines which sessions use an instruction: all sessions

Build Agent configuration (continued)

Configuration area	Description
	on the instance, sessions within a specific application scope, or only the sessions of the user who created it. For more information, see Configure custom skills and rules.

Access roles

Build Agent uses the following existing roles for access control and feature masking.

sn_glider.admin

Users with this role have the following

- Access control lists (ACLs) on all Build Agent tables
- Read and write access on operational system properties
- Role masking for the Build Agent and Build Agent Preprocessor ServiceNow Otto skills

admin

Users with this role have read access on protected system properties, such as prompt limits and tier overrides.

Catalog AI agent

This ServiceNow Otto for Creator agent gathers, validates, and tracks all required inputs for a given Service Catalog item.

Workflow

The agent prompts the user for each variable, records and recalls previously provided information, identifies missing or inconsistent details, and then seeks user confirmation and submits a complete request.

1. Based on the user's request, find the catalog item.
2. Display auto-filled values and pause for user approval before collecting additional data.
3. Collect remaining variables one at a time.
4. Prepare the request for submission.
5. Display the request to the user and ask for confirmation.
6. Once approved, submit the request.

Module creator AI agent

This ServiceNow Otto for Creator agent Converts natural language requests into structured JSON definitions for ServiceNow application navigator modules.

Workflow

1. Parse the user's request to identify one or more modules to create, including module type, table, view, role, filter criteria, and other properties.
2. Determine whether each module is a modern (Next Experience) or legacy (Core UI) type based on keywords in the request.
3. Look up tables, views, roles, assessments, reports, map pages, or timeline pages as needed, but only when the user explicitly references a specific record by name. If not specified, output minimal JSON.
4. Convert any filter conditions to encoded query format using the Encoded Query Generator tool.
5. Generate a context-aware title for each module based on the table, filter, or user-specified name.
6. Output the final JSON array and call the Process Output tool.

Configuration

Field	Description

Playbook activity context AI agent

This ServiceNow Otto for Creator agent helps users complete ServiceNow forms by fetching form fields, automatically matching pre-filled field values, and prompting for any missing required information. The agent saves the summary of what it has done.

Workflow

1. Pull the form's field definitions (formFields), including each field's type, label, constraints, and reference/choice details.
2. Extract the most relevant available data for each field, matching field type. Leave fields empty when no relevant data exists rather than guessing.
3. Compress or truncate any value that exceeds its field's character limit before assigning it.
4. Package all filled fields into the required schema, along with a summary of the activity and separate success/failure variants of that summary.
5. Execute the slot-filling script with the completed fields and summary.
6. If the JSON output is malformed (not if data is simply missing or wrong), regenerate it one time; otherwise accept the result as final.

Playbook data gathering and processing AI agent

This ServiceNow Otto for Creator agent is a assistant that consolidates data gathering, processing, and slot-filling capabilities. It handles end-to-end playbook execution using a broad

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

toolkit of retrieval, reasoning, and action-oriented functions. The agent also helps with tasks related to processing of files attached to instance records.

Workflow

1. Break the input into separate sub-objectives when it contains multiple distinct tasks; leave it as one task if it's already a single request.
2. Run the appropriate retrieval method for each sub-objective (search across records, structured knowledge lookups, knowledge article search, or web search), including chaining steps together when a task requires first finding related records, then pulling specific details from them.
3. For document/attachment requests, retrieve the attachment, generate a summary, and display it once complete.
4. Apply operations like validation, summarization, classification, translation, or extraction when the task calls for transforming already-retrieved data.
5. Merge all outputs into one response, or display "No results found" if the outcome is empty.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

UI builder AI agent

This agent helps users edit pages and answer questions within the ServiceNow UI Builder editor.

Workflow

1. Get the user's request (or pick it up from the initial mission context).
2. If the user wants to make changes to their page, take control of the editor, perform the requested operations, return editor control, and summarize what changed.
3. If the user is asking a question, search product documentation and the component library, then present an answer.
4. Ask if the user has additional requests and repeat.

ServiceNow Vault AI agents

ServiceNow Vault AI agents

The following AI agents are available for ServiceNow Vault.

Access Observer configuration manager AI agent

This ServiceNow Vault agent helps users to manage Access Observer configurations for specific fields

Workflow

1. Check the user has the security_admin role.
2. Identify which operation the user wants to perform, or present the five supported options:

Create

Collect a table and column. Validate that both exist and aren't blocked, collect start/end dates, then run through a series of checks before creating the Access Observer configuration. On success, direct the user to the **Summarize Access Observer logs** skill.

Delete

Collect table and column and show matching configurations. Prompt the user select one, and delete it.

Deactivate

Show all active configurations and have the user pick one from the list, then deactivate it.

Get/Fetch

Collect table and column. Retrieve and display all configurations for that specific combination.

List all

Retrieve and display all Access Observer configurations.

Create Data Privacy advanced configuration AI agent

This ServiceNow Vault agent helps users fetch, create, activate, and link data privacy policy configurations across data channels.

Workflow

1. Execute one of six operations based on the task received from the workflow:
   - **Fetch active configuration**

     Look up the active data privacy policy configuration for a given data channel.
   - **Fetch data channels**

     Retrieve the list of all available data channels with their IDs.
   - **Create default Data Extraction configuration**

     Create a policy configuration for the data extraction channel using defaults.
   - **Create policy configuration**

     Create an advanced policy configuration with a user-provided name and data channel.
   - **Activate policy configuration**

     Activate an existing policy configuration (fully non-interactive, no user prompts).
   - **Generate configuration URL**

     Produce a link to view a specific policy configuration.
2. After any operation completes, hand the result back to the calling workflow.

Custom app recommendations AI agent

This ServiceNow Vault agent lists the custom apps on the instance, and shows recommendations along with the available protections for the selected apps.

Workflow

1. Verify the classification recommendations skill is active on the instance.
2. Retrieve all installed custom apps and present them for selection.
3. Analyze the selected app's data to identify columns that contain sensitive data needing classification, along with available protection options.
4. Present the recommendations to the user and get explicit confirmation before applying anything.
5. Process and apply the recommended data classifications, then display a summary of what was classified.
6. Provide a link to Vault so the user can set up data protections for the newly classified data.

Configuration

Field	Description

Data Discovery policy and job manager AI agent

This ServiceNow Vault agent checks whether a given list of tables supports data discovery scanning. The agent then creates data discovery job policies using these tables, and creates discovery job policies and schedules and data discovery jobs using the created policy.

Workflow

1. Take a list of table names, validate each one for discovery scan support using the validation tool, and separate them into supported and unsupported groups.
2. Show the results and let the user add, remove, or replace tables. Re-validate after each edit until the user confirms the final list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Generate a policy name and create the policy using the supported tables and selected data patterns.
4. Gather the required inputs for a discovery job: scan type, trigger frequency, and the corresponding date/time parameters for the chosen frequency.
5. Confirm the collected details with the user, submit to the job scheduler tool, and display the created job's name and ID.

Configuration

Field	Description

Data Discovery recommendation AI agent

This ServiceNow Vault agent provides job info, findings, attributes, and related details for a list of tables provided. The agent also returns scan recommendations you can use to create policy and schedule the discovery job by another agent.

Workflow

The agent helps users complete tasks related to data discovery recommendation agent.

1. Take a list of instance table names from the user.
2. Check whether previous discovery jobs have run against those tables (standard or attachment scans).
3. Determine which data patterns have already been scanned and which remain unscanned across the provided tables.
4. Suggest an appropriate scan (Sample, Full, Incremental, or Attachment) based on whether previous jobs exist, data volume, and how frequently data changes.
5. Suggest daily, weekly, or monthly based on the previous job's run type.
6. Rate each table's risk based on the presence of PII patterns.
7. Display a single structured recommendation covering all provided tables: status, scanned/unscanned patterns, suggested scan type and frequency, sensitivity risk, and recommended next action.

Data Discovery util AI agent

This ServiceNow Vault agent assists data stewards in scheduling and managing data discovery jobs by verifying required roles, entitlements, and subscriptions. The agent categorizes discovered data patterns into compliance groups to support regulatory and security requirements. It also help user to add tags to data patterns on demand.

Workflow

1. Check the user's permissions. Stop if role or entitlement is missing, and note the subscription status either way.
2. Verify no active discovery job conflicts with the requested one. Stop if conflicts exist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fetch all available data patterns and check which ones already have tags assigned, displaying them grouped by tag.
4. For patterns without tags, use the discovery grouping skill to recommend classifications across sensitive data categories.
5. Show tagged patterns first, then untagged patterns with their recommended categories.
6. Prompt the user to add patterns to existing categories, create custom categories, and assign patterns across multiple categories.
7. Offer to tag patterns so they're easier to find and assign in future discovery policies. Create tags as needed and associate patterns to them one by one.

Data Discovery workflow lookup AI agent

This ServiceNow Vault agent receives provide recommendation for different tables associated with workflows, and identifies what kind of sensitive data can present in those tables such as PII,PFI,PCI,PHI,FCI.

Workflow

1. Determine whether the user provided specific workflow names, specific table names, or wants to process all workflows.
2. If workflow names were given, retrieve all active workflows from the instance and confirm the user's entries are valid. Ask one clarification question and values are invalid.
3. Either fetch tables associated with the validated workflows, or use the directly provided table names, pulling in associated tables as well.
4. Determine which sensitive data group classifications (PII, PHI, PFI, PCI, FCI) apply to each table.
5. Present the findings in a structured card format showing each table with its sensitive data classifications, grouped by workflow if workflows were the input.

Edit Data Privacy advanced configuration mapping AI agent

This ServiceNow Vault agent helps users complete tasks related to edit data privacy advanced configuration mapping agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Execute one of three operations based on the task received from the calling workflow or agent:
   - Change mapping: Update the existing pattern-technique mapping for the given policy.
   - Add mapping: Look up available patterns for the policy, let the user select one or more, and add them.
   - Remove mapping: Deactivate the pattern-technique mappings for the given policy.
2. After any operation completes (or if no policy ID was provided), hand control back to the caller.

Configuration

Edit privacy advanced configuration AI agent

This ServiceNow Vault agent helps users complete tasks related to edit privacy advanced configuration agent.

Workflow

1. Check that a policy ID was provided.
2. Execute one of three operations based on the task received from the parent workflow:
   - Rename policy: Collect a new name from the user and update the policy.
   - Activate or deactivate policy: Look up the current active/inactive status, ask the user to confirm the toggle, and apply the change.
   - Check user domain: Verify whether the user is in the same domain as the policy and return the result to the workflow.
3. After any operation completes, hand control back to the parent "Edit Privacy Advanced Configuration Flow."

Summarize Access Observer logs AI agent

This ServiceNow Vault agent summarizes access observer logs and provides detailed breakdowns by caller type, users, and roles for specific table and column combinations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Check the user has the security_admin role (required.)
2. Retrieve available table/column combinations that have Access Observer logs, display them with log counts, and let the user pick one.
3. Confirm logs exist for the selected table-column pair.
4. For each of the seven supported caller types (UI action, UI page, script include, scripted REST API, scheduled jobs, business rule, and unidentified sources). Retrieve the access logs and display a summary showing total accesses, users, roles, and caller sources.
5. Point the user to the **Field Encryption with Vault module** skill for encrypting the field and creating module access policies.

Vault crypto module manager AI agent

This ServiceNow Vault agent manages the Vault crypto module configuration and access policies. The agent handles encrypted field configurations for fields, and manages module access policies for roles.

Workflow

1. Check that the required roles (KMF admin/cryptographic manager and security_admin) are available (required) and whether Field Encryption Enterprise is installed (recommended).
2. Present the four supported operations and let the user choose one:

   Encrypt a field

   Collect the table and field name, validate both exist, check whether the field is already encrypted, and if not, encrypt it with the vault crypto module.

   Grant role access

   Collect a role name, check if it already has access, and if not, create a module access policy for that role.

   Check encryption status

   Collect a table and field name, validate both exist, and report whether the field is currently encrypted.

   List roles with access

3. Display the outcome (success, failure, or current status) and end execution.

Configuration

Anonymization Policy Creation AI agent

The agent guides Data Privacy administrators through creating an anonymization policy. It captures the data channel, policy name, and data class, creates a draft policy, recommends anonymization techniques by data type, and then tries to publish the policy, explaining anything that must be fixed first.

Workflow

The agent helps the user create and publish a new anonymization policy.

1. Ask the user whether the policy anonymizes data tables or columns, or user-specific data.
2. Ask the user for a policy name and to select a data class from those available on the instance.
3. For data tables or columns, ask whether the policy should be active during cloning and, if so, the order in which it should run.
4. Summarize the captured details, let the user update any of them, and create the policy as an inactive draft after the user confirms.
5. Present the recommended anonymization techniques grouped by data type, walk the user through each data type, and save the assignments.
6. For user-specific data, ask the user to select a user reference column for each table that requires one.
7. Publish the policy, or explain what needs to be fixed and leave the policy as a draft.

Configuration

Field	Description

Real Time Anonymization(RTA) Policy Configuration AI agent

The agent creates Real-Time Anonymization (RTA) policies that mask or anonymize sensitive column values as they're accessed. It guides the user through naming the policy, selecting the target columns to anonymize, and choosing any child tables that should inherit the same protection.

Workflow

The agent helps the user create a Real-Time Anonymization policy.

1. Ask the user for a policy name.
2. Fetch the available target columns and display them for the user to select, or inform the user if none are available.
3. Confirm the selected columns with the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Fetch the child tables for the selected columns and ask the user which child tables should inherit the protection.
5. Create the RTA policy and display the result.

Configuration

Field	Description

Field Access Auditor AI agent

The agent retrieves the non-elevated user roles that have access to a table field, lets the user add or remove roles, and returns the finalized list of roles.

Workflow

The agent helps the user review and finalize the roles that have access to a field.

1. Confirm that the table name and field name were provided, and ask the user for any that are missing.
2. Retrieve the roles that currently have access to the field.
3. Display the roles and note that elevated roles aren't evaluated and must be granted access separately.
4. Ask whether the user wants to add or remove any roles, and update the list until the user confirms it.
5. Return the finalized list of roles to the calling agent or workflow.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Anonymization Job Scheduler AI agent

The agent helps Data Privacy administrators schedule anonymization jobs against existing records by using a published anonymization policy. It checks for conflicting jobs, configures the job frequency, targets, and conditions, offers an optional dry run, and asks for explicit confirmation because starting a job is irreversible.

Workflow

The agent helps the user schedule an anonymization job that uses an existing anonymization policy.

1. Find the anonymization policies that are eligible to be scheduled, and ask the user to select one.
2. Load the fields that the selected policy can anonymize, and surface any warnings or child table requirements.
3. Check the policy for conflicts with other running jobs and inform the user of any conflicts.
4. Ask whether the user wants to run a dry run first, and if so, whether they want a sample or a detailed preview.
5. For a regular job, ask how often it should run and, optionally, the time window.
6. If the policy doesn't cover the whole data class, ask the user which users or groups the job should target.
7. Build the job record, confirm the saved details with the user, and share a direct link so that the user can open the job and start it.

Real Time Anonymization(RTA) Validation AI agent

The agent confirms that Real-Time Anonymization (RTA) policy creation is supported for the user, and helps the user configure the tables and active data patterns that an RTA policy requires. The agent can add tables and add or remove active data patterns.

Workflow

The agent helps the user prepare the tables and data patterns needed to create a Real-Time Anonymization policy.

1. Confirm that the RTA feature is supported for the user.
2. Display the configured tables, or explain that at least one table is required.
3. Ask whether the user wants to add tables, validate that the requested tables are supported, and add them.
4. Display the active data patterns, or explain that at least one active data pattern is required.
5. Check the shared services usage entitlement, which is required for AI model-based data patterns.
6. Display the available data patterns grouped by type, and let the user add or remove multiple patterns at once.
7. Confirm that the tables and data patterns were added successfully.

Configuration

Software Asset Management

Software Asset Management AI agents

The following AI agents are available for Software Asset Management.

Microsoft license assignment AI agent

This Software Asset Management agent assigns a Microsoft license to a user for a given request item, handling integration profile selection, reservation order creation, and Entra ID group assignment.

Workflow

1. Run the Microsoft License Assignment tool with the request item number. If it returns an error, stop immediately.
2. If there are multiple integration profiles for Microsoft 365 available, prompt the user to select one and re-run the tool with the selection. If there is only one, the system automatically proceeds with that.
3. If licenses aren't currently available but entitlement details exist, offer to create a reservation order. Show the draft order for review and allow date adjustments (validated against the entitlement date range). Create the order in the ServiceNow instance, and inform the customer they must complete the order creation on the Microsoft portal.
4. Review existing Entra ID groups that carry the same license. If multiple groups are found, prompt the user to select one. If only one exists, use it automatically.
5. Assign the license to the user, including the selected group if applicable.
6. If there are no existing Entra ID groups, ServiceNow adds a license to the user at the user level. This applies if the customer is using user-level licensing rather than managing through Entra ID groups.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Software entitlement allocation AI agent

This Software Asset Management agent allocates software licenses for a request item, handling device selection when required.

Workflow

1. Run the license allocation tool with the request item number. If it returns an error, stop immediately.
2. If the allocation requires a device but multiple devices are found, prompt the user to select a device and re-run the allocation with the selected device. If no device is available, the flow ends.
3. If the request item is assigned to a user who doesn't have the required roles (ITIL, procurement_user), the flow ends.
4. If the request item is not approved, the flow ends.
5. If there are no available rights in the entitlement for license metrics Per User, Per Device, or User Subscription, the purchase order flow gets initiated.

Software reclamation rule creation AI agent

This Software Asset Management agent analyzes software utilization and spend, then creates a reclamation rule based on user-approved criteria.

Workflow

1. Identify the target product. If no product ID is available in the agent's context, present available products for the user to select.
2. Fetch reclamation reclamation rule suggestions for the product. If a rule already exists, show the user a link to it and end the conversation.
3. Analyze utilization and spend data, then present the analysis alongside a draft reclamation rule for user review.
4. Collect feedback. The user can approve the draft, request changes (including reclamation type, thresholds, and other rule details), or cancel. Iterate until approved or cancelled.
5. Create the reclamation rule using the approved details.
6. If other existing reclamation rules lack a VIP exclusion condition, offer to update them. Only update if the user approves.
7. If software usage data collection is not set up, notify the user with a documentation link.

Software removal candidate evaluation AI agent

This Software Asset Management agent identifies unused or underused software licenses and initiates reclamation after user confirmation.

Workflow

1. Identify the target product. If a Product ID is provided, use it directly. Otherwise, present available products for the user to select, optionally filtered by Publisher ID.
2. Fetch removal candidate analysis data for the selected product. If no data is found, inform the user and end.
3. Validate that the data supports reclamation. The checks differ based on software type (installed vs. subscription) but follow the same pattern: confirm recent usage or activity data exists, and confirm the ratio of removal candidates to total installations or subscriptions is within an acceptable range. If any check fails, inform the user with a specific reason and end.
4. Present the number of eligible removal candidates and ask the user to confirm reclamation. Only non-VIP users with notifications enabled are included.
5. Run the reclamation workflow and report the result. If successful and there are candidates stuck in "Awaiting Revocation" status for 60 days, flag them for review.

Sourcing and Procurement Operations

Sourcing and Procurement Operations AI agents

The following AI agents are available for Sourcing and Procurement Operations.

Procurement inquiry analysis AI agent

This Sourcing and Procurement Operations agent is an educational assistant for procurement and sourcing terminology questions. The agent scans policy manuals and help articles to deliver plain-language explanations of purchase orders, requisitions, sourcing requests, and procurement cases. It can connect users to a live agent if knowledge articles don't have sufficient information.

Workflow

1. When the user asks about policies, requisitions, sourcing processes, or supplier eligibility, search for relevant knowledge articles and present the information with a link to the source article.
2. If no knowledge article answers the question, try connecting to a live agent. If no live agent is available, redirect to the Employee Center as a last resort.
3. Ask if the user has additional questions and continue or exit accordingly.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.
Manage long-term memory	When enabled, all previous user interactions are used as context for the LLM. This value is off (false) by default. This setting is defined by the *sn_aia.ltm.enable_long_term_memory* system property. For more information, see ServiceNow Otto AI agents reference.

Procurement product recommendation AI agent

This Sourcing and Procurement Operations agent can browse the catalog and create orders. The agent matches user requirements against available items, then routes to submission forms based on vendor status and dollar thresholds. Accepts and processes uploaded quote documents or SOW (Statement of Work) files to extract line items and pricing.

Workflow

1. Create a purchase request from the quote or statement of work was uploaded by the user.
2. Run recommendations for all requested products, then present them one product at a time as selectable options. Collect a selection or skip for each product before moving on.
3. Assemble the selected products with any available details and run the channel decision tool, which determines whether the request routes to purchasing or sourcing. Render an HTML plan for the user.
4. If the plan flags missing fields, ask the user to provide them, re-run the plan tool, and repeat until nothing is missing.
5. Present the plan and ask the user to submit or edit. Edits are applied by re-running the plan tool with the updates, then re-presenting the plan.
6. Ask about attachments, then submit via either the purchasing or sourcing tool based on whether the selected products have product IDs.

Procurement request tracking AI agent

This Sourcing and Procurement Operations agent provides a summary of a procurement request. It can provide current status and next steps for the request.

Workflow

1. Parse the user's message to determine what they're looking for and whether they've provided a specific record number.
2. If no record number is provided, construct a query based on the user's intent and search for matching records. If nothing is found, rephrase the query and retry once before asking the user for more details.
3. Present the search results and ask the user to select one.
4. Run the summary tool against the selected record and the original question, display the result.

Spend categorization AI agent

This Sourcing and Procurement Operations agent predicts and populates product and spend categories in purchase requisition lines, reducing manual effort and improving data accuracy.

Workflow

1. Run category prediction and document extraction based on user provided ID
2. Identify whether the user wants to update product categories or spend categories.
3. Extract purchase header record numbers from the user's request, and optionally collect a reason for the update and a suggested category.
4. Run the validation tool to generate AI-suggested categories and present both AI and user suggestions as selectable options.
5. Let the user choose a category for each line item or skip individual lines.
6. Submit the selected categories to update the records.

Contract Optimization Opportunity Finder agent

This Sourcing and Procurement Operations agent analyzes supplier contracts to identify and create savings opportunities by analyzing price escalations, renewal caps, and payment terms. It can also answer follow-up questions about spend data, contracts, savings opportunities, pipeline projects, and savings calculations.

Workflow

1. When run as a scheduled job, use the ContractSpendAnalyzer tool to scan supplier contracts and create savings opportunities based on price escalations, renewal caps, and payment terms.
2. When a user creates a pipeline project from a savings opportunity, show pre-filled details, collect changes and priority, then run the Create Pipeline Project tool after confirmation.
3. Offer to generate a chat summary of the session and, if the user agrees, post it to the pipeline project's work notes.
4. For any other question about spend data, contracts, savings opportunities, pipeline projects, or savings calculations, run the SpendIntelligenceTool to answer.

Configuration

Strategic Portfolio Management

Strategic Portfolio Management AI agents

The following AI agents are available for Strategic Portfolio Management.

Project eligibility analysis AI agent

This Strategic Portfolio Management agent performs checks for project and project task related requests. The agent analyzes requests to check impact on a project due to project task. It checks if the project summary email skill is enabled for the instance and whether the skill was enabled for a given project.

Workflow

1. Verify that the project summary email skill is enabled on the instance.
2. Retrieve the parent project information using the input task number.
3. Verify that the project manager has scheduled a project summary email for this project.
4. If both checks pass, hand off to the next agent to analyze the task's impact on the project. If either check fails, terminate the workflow.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting

Project summarization AI agent

This Strategic Portfolio Management agent assists project managers to get a summary of the project. The agent helps in keeping their projects on track, by providing actionable and proactive updates on critical changes to projects. It also generates the project summaries.

Workflow

1. Produce project insights and update the status to the project manager.
2. Close without further interaction.

Validate the work item and generate stories AI agent

This Strategic Portfolio Management agent transforms Enterprise Agile Planning work items (epics and features) into a set of well-formed, actionable user stories. It evaluates work items to verify that it contains sufficient information, and guides users through a structured validation process.

Workflow

1. Collect the work item number, description, and any additional context as needed (based on flags from the system), confirming with the user before saving each piece of information.
2. Produce user stories based on the validated work item and collected context.
3. Display the generated stories and offer refinement options: discard stories, combine or split them, adjust personas or metrics, or add new ones.
4. If the user chooses to refine, apply their changes, re-display the updated stories, and offer the same refine-or-save choice again. This loop continues until the user chooses to save.
5. Save the finalized stories to the system and give the user a navigation link to view them.

Configuration

Field	Description

Supplier Lifecycle Operations

Supplier Lifecycle Operations AI agents

The following AI agents are available for Supplier Lifecycle Operations.

Supplier data steward AI agent

This Supplier Lifecycle Operations agent manages supplier onboarding by verifying details, detecting duplicates, presenting scorecards for review, creating records, and updating case status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Based on the case state, prompt the user for a case number (if details are needed), proceed directly to record creation, or handle duplicates.
2. Generate the supplier scorecard from web search results, highlighting key strengths, positive indicators, and potential risk signals. Wait for the user to select either **Reject onboarding** or **Continue onboarding**. The agent can't proceed until the user chooses.
3. If Craft is configured, use the Craft integration to generate a supplier scorecard that provides a comprehensive, normalized evaluation of the supplier's overall profile and associated risk factors. Wait for the user to select either **Reject onboarding** or **Continue onboarding**.
4. Present the duplicate records to the user and ask whether to continue. If yes, offer the option to correct the supplier's legal name, email, or both before proceeding. If the correction resolves the duplicate, continue to onboarding. If the correction triggers a rejection, stop. If the user declines to continue, proceed with rejection.
5. Run the verification and record creation tool using the supplier details.
6. Display one of six results: successful registration, halted by user decision, rejected due to validation failure, rejected for other reasons, rejected at the web search review, or rejected at the Craft review.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Supplier data validator AI agent

This Supplier Lifecycle Operations agent takes a supplier case number and initiates the supplier banking task validation process. The validation process compares the bank account proof against the banking details provided by the supplier contact.

Workflow

1. Run the validation tool with the provided case number. The tool retrieves the supplier banking task details and initiates the validation process.
2. Display a message confirming that the validation process has started.

Learn more about Supplier Lifecycle Operations at Supplier Lifecycle Operations.

Supplier document strategy generator agent

This Supplier Lifecycle Operations agent assists with supplier onboarding by retrieving the supplier's region and industry, then identifying customized onboarding tasks that meet compliance and regulatory requirements.

Workflow

1. Check whether the supplier's region and industry are already known. Ask for either or both if they are missing.
2. When both values are available, search all published knowledge base articles and extract the conformance and regulatory tasks from the articles relevant to the supplier's region and industry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supplier approval AI agent

This Supplier Lifecycle Operations agent performs the supplier activation or supplier rejection tasks during supplier approval process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow

1. Identify whether the request is for supplier activation or rejection.
2. Confirm with the user that they want to proceed. If the user declines, switch to the rejection path.
3. For an activation, set the supplier case status to Closed complete, and set **Onboarded** to Yes and **Active** to true on the supplier record.
4. For a rejection, ask the user for a rejection reason and set the supplier case status to Closed rejected.

Configuration

Field	Description

Telecom, Media and Tech AI agents

Telecommunications, Media and Technology AI agents

The following AI agents are available for Telecommunications, Media and Technology.

Billing account information collector AI agent

This Telecommunications, Media, and Technology (TMT) agent retrieves billing case and account details and communicates them to the user in a structured format.

Workflow

1. Fetch the billing inquiry case information using the case number already provided by the user.
2. Pull the case account number and account name from the case details, then present them to the user.
3. Fetch the billing account details using the case account information. If the billing account can't be found, ask the user to correct the case account number and retry.
4. Show the billing account details to the user.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Billing invoice data collector AI agent

This Telecommunications, Media, and Technology (TMT) agent provides detailed information about invoices, validates amounts, and identifies high-amount line items for billing inquiries. The agent retrieves invoice history, communicates invoice and line item details to the user, and flags potential causes of high charges.

Workflow

1. Fetch the invoice history using the billing account number and extract the latest and previous invoices.
2. Show the user the key details for each invoice: number, amount, usage billed through, and credited amount.
3. If the latest invoice has a pending amount greater than zero, notify the user of the outstanding balance and due date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Fetch detailed line items for the latest invoice and present them to the user. If the line items can't be retrieved, inform the user and stop.
5. If the latest invoice amount is higher than the previous invoice, identify the line item responsible for the increase. Inform the user which item likely caused the higher bill. If the latest invoice is not higher, return control to the orchestrator.

Configuration

Field	Description

Billing plan recommender AI agent

This Telecommunications, Media, and Technology (TMT) agent generates recommended service plans and updates the billing inquiry case work notes with the results. The agent helps to ensure a seamless recommendation process without requiring additional user input beyond initial confirmation.

Workflow

1. Retrieve plan recommendations based on the high usage line item code (not the case sold product code).
2. If no recommended plans are available, inform the user and stop.
3. Write the recommended plan and summary to the billing inquiry case record as a numbered, line-by-line work note entry.

Configuration

Field	Description

Unified Security Exposure Management AI agents

Unified Security Exposure Management AI agents

The following AI agents are available for Unified Security Exposure Management.

VR data retrieval agent AI agent

This Unified Security Exposure Management agent answers questions about vulnerability response data by constructing and executing table queries.

Workflow

1. Introduce the agent's capabilities with example queries and ask how to help.
2. Prompt for a request, ask for clarification if anything is ambiguous or incomplete, and redirect if the request falls outside Vulnerability Response scope.
3. Call the search tool and return its response exactly as received.
4. Ask if the user wants to refine the query or run another search.
5. Continue the loop until the user says they're finished.

break down these numbers by attributes such as severity, assignment group, or configuration class item class.

Workflow

1. Extract the target year, month (defaults to previous month), and grouping attribute (defaults to assignment group) for the user query.
2. Retrieve compliance statistics for the specified time period and grouping.
3. After presenting results, offer three additional options:

   Break down by CI class

   Re-run the statistics grouped by CI class instead of assignment group.

   Compare against another month

   Generate a side-by-side comparison of statistics between two months.

   Identify highs/lows

   Retrieve the full summary and extract which specific assignment groups or CI classes have the highest or lowest missed SLAs for a given severity.
4. Continue the follow-up loop until the user is finished or asks something outside this agent's scope (in which case, route to another agent).

Vulnerability exposure analysis AI agent

This Unified Security Exposure Management agent assesses vulnerability on business services or configuration items.

Workflow

1. Determine whether the user is asking about CISA Known Exploitable Vulnerabilities, specific CVE/vulnerability IDs, configuration item names, or business service names.
2. Call the matching tool based on the input type to retrieve vulnerability data, impact assessments, or CISA KEV information.
3. Display the findings, then offer to help with additional tasks:
   - Check CISA KEVs
   - Assess CVE impact
   - Evaluate vulnerabilities against a business service or CI
   - Provide more detail on a vulnerability
   - Create watch topics
4. Follow-up until the user indicates they're finished.

Workflow Data Fabric AI agents

Workflow Data Fabric AI agents

The following AI agents are available for Workflow Data Fabric.

Automation finder AI agent

This Workflow Data Fabric agent fetches automation records from tables on your instance. The agent discovers relevant automations for a specified asset, estimates cost and time savings, saves the discovered automations, and presents a value insights summary to the user.

Workflow

1. Pass the input JSON received from the data-collection agent to the automation discovery tool to find relevant automations.
2. For the first few discovered automations, run the saving estimator tool to calculate time and cost savings per run, then append those estimates to each automation's record.
3. Execute the discovered automations tool to persist the results and generate a summary.
4. Display the output under the title **Value Insights**, without listing individual automations or inventing additional content.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.
Allow AI specialists to access this AI agent	When enabled, AI specialists can use this agent. This value is off (false) by default. When set to true, more configuration options for tools become available so that an AI specialist can map inputs and response templates to tool outputs. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the Specialist enabled field.

Learn more about Workflow Data Fabric at Build an automation with AI.

Automation table discovery AI agent

This Workflow Data Fabric agent collects asset, time, and scope inputs from the user and returns a structured JSON payload identifying the target execution tables for automation discovery.

Workflow

1. Prompt the user for an automation asset they want to analyze. Only six asset types are supported:
   - ServiceNow Flows
   - Subflows
   - Actions
   - Catalog Items
   - Playbooks
   - RPA Bots
2. Ask the user what time range to analyze.

Workflow data fabric flow generation AI agent

This Workflow Data Fabric agent transforms a user's natural-language integration intent into a generated Workflow Studio flow.

Workflow

1. Get the target application scope from the user (required).
2. Determine what the user wants the flow to do, checking whether the trigger and actions are both clear enough to proceed.
3. If trigger or action details are too vague, ask 1-2 targeted questions.
4. Build an imperative prompt from the user's intent, derive a name and description, invoke the generation tool once, and return the Workflow Studio link exactly as provided.
5. If generation isn't possible, provide a direct link to Workflow Studio with context about what went wrong.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Workflow data fabric product knowledge AI agent

This Workflow Data Fabric agent retrieves and summarizes knowledge articles. The agent passes the user's query verbatim to the search tool, extracts factual content from matching articles, and produces a consolidated summary with references to source documents.

Workflow

1. Pass the user's query verbatim to the knowledge retrieval tool.
2. If articles are found, summarize key findings as concise bullet points and list sources with links to ServiceNow documentation.
3. If nothing is found, provide a link to the external content connectors page so they can verify the documentation source has been crawled and indexed on their instance.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Learn more about Workflow Data Fabric at Build an automation with AI.

Workflow data fabric product recommendation AI agent

This Workflow Data Fabric agent evaluates integration requirements, data movement needs, communication flows, and automation objectives expressed in the user's prompt and determines the most suitable workflow data fabric product.

Workflow

1. Check whether the user has specified a source/target system and an integration objective or pattern, clarifying with targeted questions if needed.
2. Search the internal knowledge base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Identify a best-fit product plus up to two alternatives, with rationale and trade-offs for each.
4. Always show visible output: either a specific recommendation with alternatives, or (if context was insufficient) a general product list suggesting the user consult documentation or a solutions architect.

Configuration

Field	Description

Learn more about Workflow Data Fabric at Build an automation with AI.

Workflow data fabric spoke asset discovery AI Agent

This Workflow Data Fabric agent finds specific flows, subflows, and actions inside a named spoke that fulfill a user's stated automation goal. This agent is triggered only when a user has identified a spoke and wants to explore what reusable assets it contains for their use case.

Workflow

1. Identify the likely spoke/integration and ask the user to confirm before searching.
2. Check whether both the spoke name and a clear purpose (what the user wants to accomplish) are present, and ask additional questions if not.
3. Search for flows and actions using both the spoke name and the user's stated intent as filters.
4. Present matched flows and actions grouped by type, noting which spoke/package each belongs to.

Configuration

Field	Description
Allow third party to access this AI agent	When enabled, third-party AI agents can use this agent. This value is off (false) by default. This setting is defined in the AI Agent configs [sn_aia_agent_config] table on the External discoverable field.

Workflow data fabric spoke install advisor AI Agent

This Workflow Data Fabric agent helps you search for available IntegrationHub spokes that aren't installed on the instance. This agent takes the your search query, retrieves matching non-installed spokes from the instance catalog, and returns a prioritized list of candidates with installation links.

Workflow

1. Identify a specific spoke or system name from the user's request (for example, Jira or Salesforce).
2. If the request is too vague, ask questions to narrow it down. If still unclear, direct them to their ServiceNow admin or the ServiceNow® Store.
3. Search for non-installed spokes matching the identified term, running the search exactly once.

Configuration

Zero Copy Connector AI agents

Zero Copy Connector for ERP AI agents

The following AI agents are available for Zero Copy Connector for ERP.

ERP action invoker AI agent

This AI agent gathers user inputs for a specific operation in Zero Copy Connector for ERP.

Workflow

The AI agent generates mandatory and optional inputs, and waits for the user to supply values for the mandatory inputs before passing the formatted inputs to a tool to invoke an action script.

1. Ask the user to provide mandatory inputs using the `Retrieve Mandatory and Optional Inputs` tool.
2. Ask a single yes or no question if the user also wants to include optional inputs.
3. Pass the user input, the model ID, and the operation ID to a tool that invokes an action script. Then wait until the response is received from the flow action invocation.

ERP output formatter AI agent

The Zero Copy Connector for ERP AI agent formats and refines the output from the ERP action invoker AI agent.

Workflow

The AI agent uses the Knowledge Graph to present data in a structured, organized format for users who need ERP data.

1. Evaluate the output from the ERP action invoker AI agent.
2. If the output is not empty, send it to the `Response Formatter` tool.
3. Show the results to the user.

Configuration

OData service recommender AI agent

The OData service recommender AI agent identifies relevant OData services and endpoints. The AI agent can create a model for the identified service if a model does not already exist.

Workflow

1. Determine the type of request: read, create, or update only.
2. Verify that the request maps to exactly one SAP OData V2 service.
3. Check the internal SAP OData service catalog and attempt to match the user request against catalog entries using intent keywords and domain.

About AI agents and agentic workflows

AI agents and agentic workflows pursue a goal across multiple steps, planning and acting with limited human intervention to resolve an issue or complete a request. Where a generative AI skill completes one task on demand, an agentic workflow coordinates one or more agents to carry a process from start to finish.

An AI agent works toward a goal rather than performing a single action. Given an objective, an agent can reason about the steps required, use tools to gather information and act on your systems, and adjust its approach as conditions change. An agentic workflow brings one or more agents together to complete an entire process, so work that once required a person to coordinate each step can run with limited human intervention.

Why AI agents and agentic workflows matter

Agents extend generative AI from assisting with tasks to completing outcomes. Instead of returning a draft or a summary for a person to act on, an agentic workflow can interpret a request, retrieve what it needs from your knowledge bases and enterprise systems, perform the required actions, and report the result. This work shifts routine, multi-step effort away from your teams and lets them focus on the cases that need human judgment.

Because agents adapt to changing conditions, they suit processes that vary from one case to the next. An agent can respond to what it finds at each step rather than following a fixed script, which helps it stay focused on the objective even when the details differ.

AI agents compared with generative AI skills

Generative AI skills and AI agents address different kinds of work. A skill completes one bounded task when a user asks for it, then returns control to that user. An AI agent pursues a broader goal across several steps and can decide what to do next, which makes it suited to work that no single task can finish on its own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The two are complementary rather than competing. Skills provide focused capabilities, and agents coordinate capabilities and tools to move a process toward an outcome. Many agentic workflows draw on the same enterprise data and generative AI foundation that skills use, applied to a larger, multi-step goal.

When to use AI agents and agentic workflows

Choose an AI agent and an agentic workflow when an outcome depends on several coordinated steps, when decisions vary with conditions that you can't fully predict, or when the work spans multiple systems and would otherwise require a person to drive each step. Agentic workflows suit processes that you want to complete with limited human intervention while keeping oversight of the actions taken.

When the work is a single task that a person starts and reviews in the moment, such as summarizing or drafting, a generative AI skill is the more direct choice.

AI Agent Studio

Build and deploy autonomous AI agents that automate complex workflows. AI Agent Studio is your command center for creating, configuring, and deploying autonomous AI agents that learn your business processes and act on them. Configure agents that learn your processes and handle routine work at scale—while you stay in control and focus on strategic priorities.

Get started

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Note: We have controls in place to enable/disable the data collection and data processing.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Explore AI Agent Studio

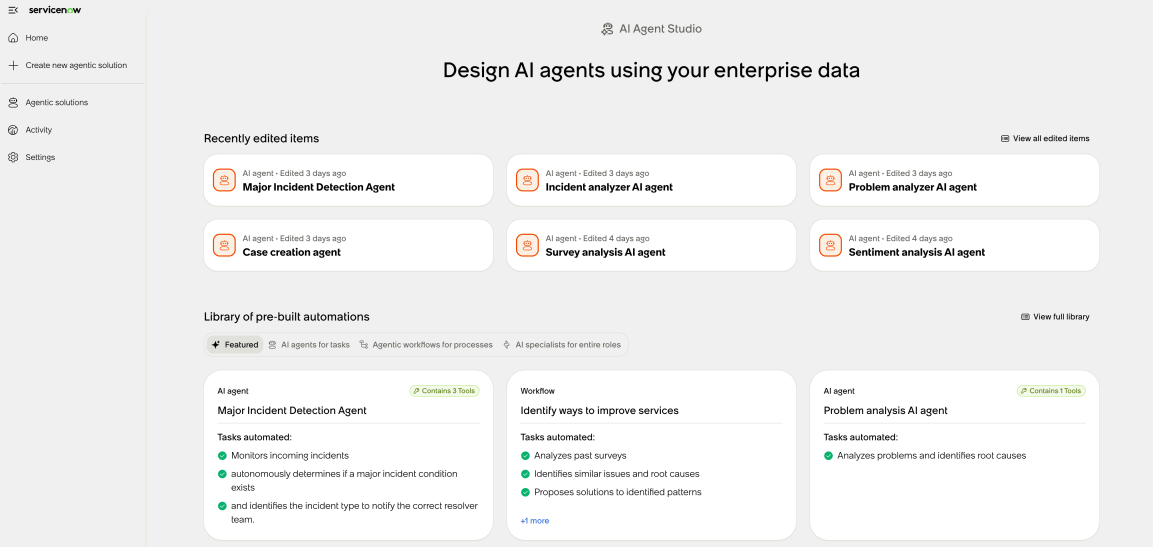
Create, manage, and test AI agents and agentic workflows in one centralized space to build self-executing solutions that help you achieve your business goals.

AI Agent Studio home page

With the AI Agent Studio, you can create, manage, and test AI agents and agentic workflows all in one place. To enable the agentic AI experience, you must first install AI agents. For installation steps, see Install ServiceNow Otto AI Agents.

The AI Agent Studio home page provides an overview of your agentic AI environment with recently edited items and a library of prebuilt automations. From the home page, you can access the library, which includes featured items, AI agents for tasks, and agentic workflows for processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Automation opportunities

The AI Agent Studio home page also lists automation opportunities identified from your instance data, each with an estimated cost saving and time saving. You can use the list to decide which automations to build first.

Cost and time saving estimates are derived from the number of records analyzed for the opportunity, the average handling time for those records, and a standard labor rate. The figure is an annualized projection rather than a measured result, and it is rounded for display. Read the inputs before treating a figure as a business case: a large headline number usually reflects a high record volume rather than a large saving on any single record.

If you select **View all automation opportunities**, you can sort the list by column and filter it by estimated cost saving and estimated time saving.

Selecting an opportunity displays a preview that summarizes the AI agent, including a count of possible tools. This count is the number of tools the opportunity is expected to require, not the number that already exist on your instance. The preview also lists resolution steps for the task being automated. These are evidence that the task can be automated. They are not an implementation plan, and they are not the full AI agent instructions. You can edit the instructions during the build process.

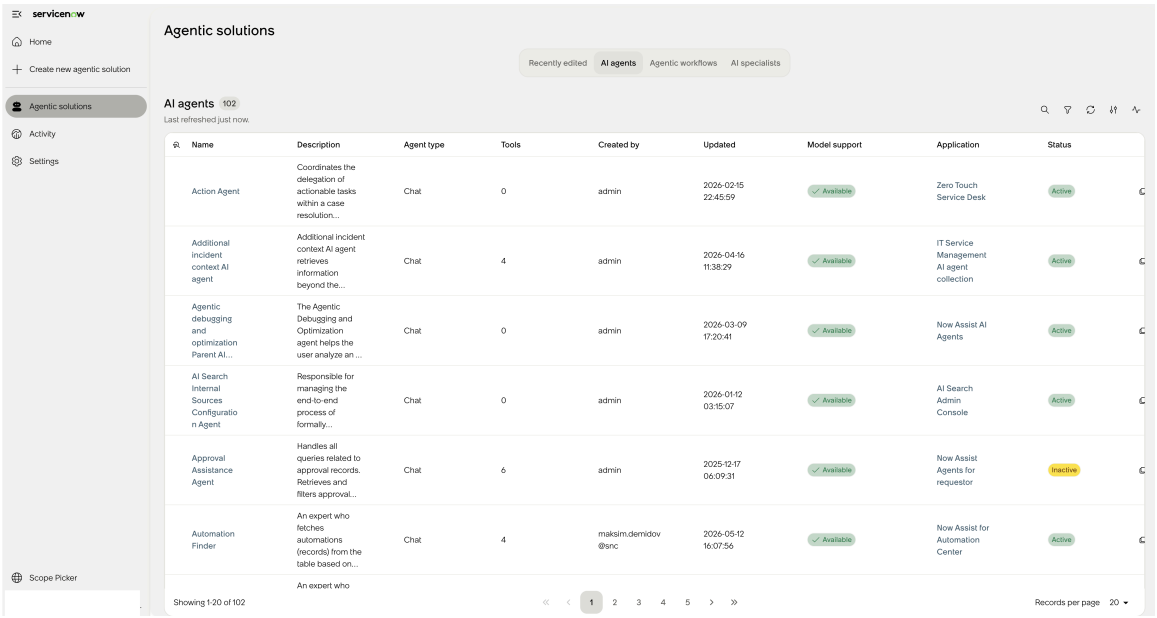
Building from an opportunity opens the guided setup with the opportunity context applied.

Managing agentic workflows and AI agents

From the Agentic solutions section in AI Agent Studio, you can create, duplicate, or manage existing AI agents and agentic workflows. The Agentic solutions page contains tabs for **Recently edited**, **AI agents**, **Agentic workflows**, and **AI specialists**. You can customize the list view columns to display the information that matters most to you. Search and filter options enable you to quickly find the agentic AI assets you're looking for. By selecting the name of an AI agent or agentic workflow, you can open the guided setup to configure or reconfigure it.

The tabs are scoped by type: **AI agents** lists individual agents, **Agentic workflows** lists workflows, **AI specialists** lists role-level solutions, and **Recently edited** lists items you have opened or changed regardless of type.

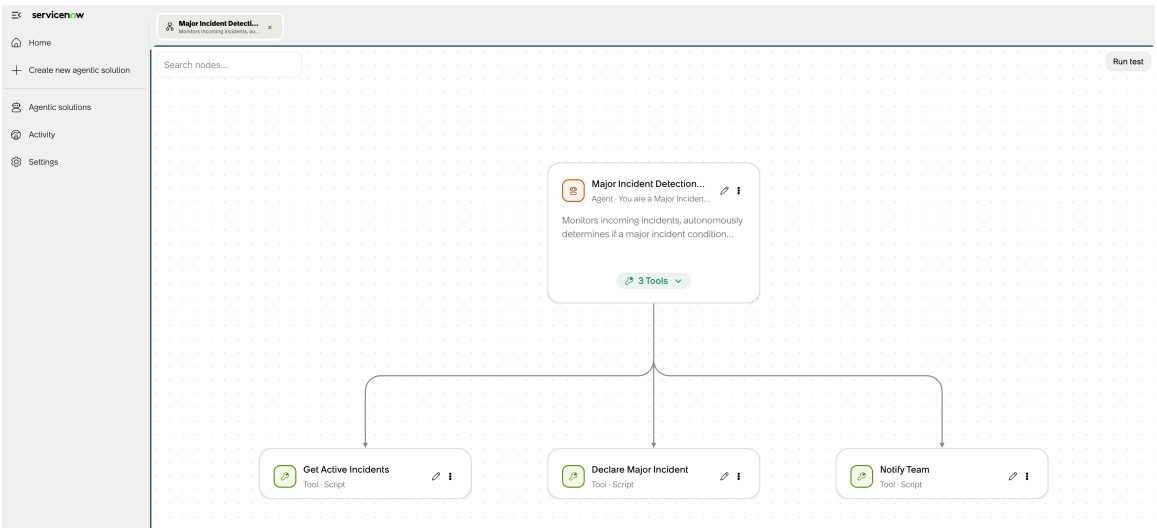
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Node map view

When you select an AI agent or agentic workflow from the Agentic solutions list, the node map view opens. In the node map, you can see the structure of your agentic AI asset. For agentic workflows, the node map displays all the AI agents that make up the workflow. For AI agents, the node map displays all the tools configured for that agent.

From the node map, you can select the edit icon on any node to configure that agentic workflow, AI agent, or tool individually. You can also edit the name and description of your agentic AI asset by selecting the more options icon. You can also use the more options icon to add AI agents to agentic workflows and tools to AI agents to extend their capabilities.



Activity tracking

From the Activity section in AI Agent Studio, you can view execution logs for both AI agents and agentic workflows. On the activity page, you can track trends in how your agentic AI assets perform. You can filter executions and automated evaluations by various fields to analyze performance patterns. For comprehensive insights into AI agent and agentic workflow usage and performance, access the AI Agent Analytics dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Runs that are still in progress, including queued test runs, appear here with their current status. Use this section to check which runs are still in progress.

Testing agentic AI

You can manually test individual AI agents and agentic workflows from their guided setup, or use automated evaluations to assess performance across multiple executions. Manual tests are suited to verifying that an AI agent or agentic workflow behaves as expected on a single test record. Automated evaluations are better at identifying underlying patterns and trends that might not be visible in individual executions.

An automated evaluation runs the asset against test scenarios you select and returns a result for each scenario plus an aggregate view across the run. Decide what you are measuring, and what score you would accept, before configuring one.

AI Agent Studio settings

From the Settings section in AI Agent Studio, you can configure AI Guardian and manage AI agent capabilities. The following settings are available:

- Offensiveness detection and Prompt injection protection
- Long-term memory for AI agents
- User facts and preferences for knowledge retention
- External AI agent settings for discoverability and communication
- Model provider configuration for large language model (LLM) selection

Configure AI Agent Studio

Configure AI agents, agentic workflows, and tools so that AI agents can plan and execute tasks using your record data and knowledge base content.

AI agents follow your instructions and act toward a specific goal by using the tools you configure for them. Using the context of your records and searchable content, AI agents plan and analyze tasks by combining business logic with instructions sent to large language models (LLMs), which suggest the next best action to take.

Note: Keep your record data and knowledge base up to date for best results.

Prerequisites

Before configuring AI agents, establish a clear plan to improve agent performance and result quality. A solid foundation minimizes redundant agents and maximizes the efficiency of existing ones.

- Identify the different kinds of tasks your agentic workflow must handle.
- Understand the general flow for your agentic workflow and agents.
- Prepare agentic tools with well-written descriptions.

Configurable elements

Use the following elements to instruct agentic workflows and AI agents within the framework.

Base plan

Instructions to the AI Agent Orchestrator for the initial planning procedure. Configured at the agentic workflow level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role

A clear identity for the AI agent, comprising two elements:

Agent reasoning

When a role is added to each reasoning prompt, it gives the LLM a sense of identity for the content it generates.

Agent proficiency

An auto-generated, LLM-produced description of what an agent is capable of, derived from the role, instructions, and the descriptions of its assigned tools.

Instructions

Clear directives for the AI agent. Write instructions as a step-by-step algorithm that describes the operational flow the agent should follow.

Tool elements for agentic workflows

Each tool in an agentic workflow is defined by three elements: its functionality, its description, and its error messages.

Functionality

Functionality defines what an AI agent contributes to the agentic workflow. Configure each tool with a single, clearly scoped purpose. Multipurpose tools degrade agent performance for two reasons:

- They are harder for the AI Agent Orchestrator to reason through. When a tool can serve more than one purpose, the orchestrator must determine which purpose applies, which increases runtime.
- The tool description must account for every usage scenario, making it harder to write accurately and completely.

Note: Configure each tool as the solution to a single problem. Avoid tools that can operate in different modes.

Tool description

Tool descriptions are natural language statements that explain the utility a tool provides. Clear scope and limits help verify tools are selected for appropriate scenarios. A strong tool description includes all of the following:

- What the tool does.
- The specific agentic workflows and tasks where the tool applies.
- Scenarios where the tool is explicitly not useful, especially cases where an AI agent might incorrectly select it.
- Definitions of any terms used. For example, if a tool assigns a role to a user, explain what "role" means in the context of that instance.

Error messages

AI agents learn through trial and error. Error messages give an agent feedback on incorrect tool executions, helping it reach more valid conclusions in subsequent steps. Understanding where a tool can fail helps keep execution on track.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoke Conversations with the AI Agent Background Channel

The AI Agent Background Channel lets you invoke AI agent or agentic workflow execution from the Workspace. Use it with the AI Agent Background Provider, which is based on the Custom Adapter Framework from Virtual Agent. For more information, see Configure a provider for your custom chat integration.

To add conversational capabilities to your own provider application and obtain a new inbound ID, create a channel identifier in the Provider Channel Identities table [sys_cs_provider_application]. For more information, see Create a channel identifier for your custom chat integration.

To start a conversation, trigger the flow using the `sn_aia.AiAgentRunttimeUtil().startAiAgentConversation(request)` API in the Script Include (sys_script_include) of the AIAgentBackgroundProvider, then select **Run Script**. When the script execution status shows **Success**, the conversation begins in the order of utterances defined in the script.

Conversations invoked for AI agent execution are logged in the Execution Plans [sn_aia_execution_plan] table. Open the conversation record to confirm the device type as **AI Agent Background**. Open the execution record to review the **Execution Tasks**, **Messages**, and **Tool Executions**.

You can also review the complete execution steps on the AI Agent Studio Testing page. Copy the execution plan record's sys_id and test it there. On the **Chat responses** tab, the AI agent decision logs show agent details and the tools used to resolve the issue.

Interactive and non-interactive execution modes

AI agents operate in one of the two execution modes, which determine how the agent handles fallback scenarios during execution.

Interactive

The AI agent reaches out to the user for information when a fallback occurs, then re-triggers the flow after receiving a response.

Non-interactive

The AI agent does not contact the user at any fallback stage. Instead, it uses a dynamic prompt approach through the ReAct layer, where the prompt adapts based on the execution mode. Fallback options don't collect user input. The output of the AI agent or agentic workflow is still presented to the user, and any execution failure displays a message in the Now Assist panel or Virtual Agent.

The execution mode is set in the **Execution Mode** field in the Execution Plans [sn_aia_execution_plan] table and is determined at runtime.AI agents and agentic workflows can run concurrently in the AI Agent Background Channel and in non-interactive mode. Background execution allows AI agents to operate alongside any chat panel, such as the Now Assist panel or Virtual Agent.

Multilingual support

AI agents support multiple languages to improve translation quality. You can:

- Tune system prompts for native-language translations.
- Implement dynamic translation strategies when native support is unavailable.
- Validate translation quality through automated and manual evaluations.

AI Agent Studio skills migration

You can automatically migrate all AI Agent Studio skills from the on-glide execution path to the off-glide execution path by enabling the **Off-Glide Enabled** setting. This migrates skills to Mosaic.

1. Navigate to the OneExtend Capabilities [sys_one_extend_capability.list] table.
2. Find the Now Assist AI Agents application.
3. Set **Off-Glide Enabled** to **true**.
4. Select **Save**.

Install AI Agent Studio

Install Now Assist AI agents on your ServiceNow instance to enable the agentic AI experience.

Before you begin

To get started with AI agents, you must have:

- **License requirements**: A ServiceNow Pro Plus or Enterprise Plus license.

  Note: A Now Assist License is required. Now Assist AI Agents is available to all users who have Now Assist.

- **Instance requirements**: An instance on Australia Patch 1 or later.
- **Application requirements**: The following store applications and all the dependency applications must be installed and updated:
  - Now Assist for IT or HRSD (or other workflows).

    Note: AI agents aren't standalone applications that you can install directly. To enable AI agents on your instance, you must install and activate other Now Assist applications that include AI agents, such as ServiceNow Otto for IT Service Management (ITSM) or ServiceNow Otto for Customer Service Management (CSM).

  - Now Assist AI Agents store application
- AI Search enabled on your instance.
- The Now Assist panel must be turned on.

  Note: You can access AI agents in the Now Assist panel. To enable the Now Assist panel, see Turn on the Now Assist panel.

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for and select a Now Assist application, such as ServiceNow Otto for IT Service Management (ITSM) or Now Assist for Platform.
3. Select **Install**.

Result

AI agents associated with the Now Assist application are installed on your instance.

What to do next

Assign the admin role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add the role `sn_aia.admin` to the user who will administer the AI Agent Studio, and then navigate to **All > AI Agent Studio > Overview**.

Access the AI Agent Studio

Navigate to **All > AI Agent Studio > Overview** in the AI Agent Studio application navigator where you can create and manage AI agents and agentic workflows.

Group Action Framework (GAF) is an optional way for AI agents to identify and access records using AI-generated indexes and clusters. GAF can be faster and more reliable than AI Search, the default, in some cases. If you want to set up GAF, which can be used instead of AI Search results for gathering related records, see Set up Group Action Framework.

Set up AI Agent Studio

The default (base system) AI agents provide preconfigured agentic workflows that address common business challenges across ServiceNow applications. Before activating the default AI agents, you must verify that your instance meets the prerequisites and complete the required configuration steps.

Before you begin

Role required: sn_aia_admin

About this task

Prerequisites

Platform version:

- Minimum: Yokohama Patch 1+ or Xanadu Patch 7+
- Recommended: Yokohama Patch 11 or Zurich Patch 5

Required plugins and store Apps

- Now Assist AI agents store app (version 6.0.17 or later as of December 2025)
- At least one Now Assist workflow plugin:
  - ServiceNow Otto for ITSM
  - ServiceNow Otto for HRSD
  - ServiceNow Otto for CSM
  - Now Assist for Security Operations
- Generative AI Controller plugin (minimum version 11.0.0)

Note: Select **Load demo data** during installation to access preconfigured examples.

Licensing Requirements

Now Assist Pro Plus or Enterprise entitlement

Required User Roles

- sn_aia.admin - Provides access to AI Agent Studio
- sn_nowassist_admin.nsa_admin - Enables Now Assist administration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enable AI Search.
   a. Navigate to **AI Search** > **AI Search Status**.
   b. Verify that AI Search is enabled.
2. Enable Now Assist panel.
   a. Navigate to **Now Assist admin** > **Experiences**.
   b. Turn on the **Panel** option.
3. Access the AI Agent Studio.
   a. Navigate to **All** > **AI Agent Studio** > **Overview**.
   b. Review the available default (base system) agentic workflows.
4. Activate the default agentic workflows.
   a. Select the agentic workflow that you want to use from the available default workflows.
   b. Activate the workflow. The default workflows are set to read only and must be activated before use.

   The default (OOTB) agentic workflows include:

   - Generate resolution plans
   - Analyze incident trends
   - Classify tasks
   - Investigate IT problems
   - Process emails for tasks
5. Configure chat assistants.
   a. Navigate to **Conversational Interfaces** > **Assistants**.
   b. Determine which chat assistants can access your AI agents.
   c. Complete the configuration wizards for Now Assist panel (NAP) or Now Assist Virtual Agent (NAVA).
6. Configure LLM Connections (optional).

   If using external LLM providers instead of the default OpenAI GPT-4.1:

   a. Navigate to **Now Assist admin Console** > **Settings** > **Manage Integration**.
   b. Configure API credentials for your chosen LLM provider.

   Note: The default Orchestration layer uses OpenAI GPT-4.1 5.4 on ServiceNow-managed Azure servers.

7. Test the default AI agents.
   a. Navigate to **AI Agent Studio** > **Testing** > **Test AI reasoning**.
   b. Verify that the orchestrator canvas displays agent execution properly.
   c. Review AI agent decision logs to confirm interactions and thought processes are recorded.

Configure AI Agent Studio settings

Configure general settings for AI Agent Studio and agentic AI assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_aia.admin

About this task
AI Agent Studio has multiple settings for your agentic AI assets and how they function within the ServiceNow AI ecosystem.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Enable AI Guardian.

   AI Guardian enables you to help protect against offensive content and prompt injection. You can choose whether to check for offensive content, or you can configure prompt injection detection in AI Admin Hub.
3. Set up long-term memory for agentic AI.

   Long-term memory allows agentic AI assets to remember user preferences or facts from previous interactions and use these memories for more focused conversations.
4. Configure external AI agent discoverability and contextual data.

   You can use third-party integrations to connect ServiceNow to other agentic AI systems. From the **Settings** page, you can choose whether you want to discover external agents or have your ServiceNow AI agents discoverable by others. You can also configure memory and data access for external AI agents.
5. Manage Model Contextual Protocol (MCP) servers.

   MCP servers can connect ServiceNow AI agents with external tools to perform additional tasks.
6. Select your large language model (LLM) provider.

   Choose which LLM model provider to use for all agentic AI assets on your instance.

   Note: Options for available LLM providers are configured with AI Control Tower.
7. **Optional:** Select **View legacy AI Agent Studio** to access the previous iteration of the AI Agent Studio UI.

Enable Now Assist Guardian in AI Agent Studio

Identify and block offensive messages that are sent by human agents automatically by enabling AI Guardian in AI agents. With this capability, you can help reduce your agentic workflow or test from being exposed to harmful content.

Before you begin
Role required: admin

About this task
The AI Guardian, which is a ServiceNow AI Platform capability in the Now Assist panel, is a set of guardrails that are designed to intercept and mitigate offensive, sensitive, or security-related issues that may arise during interactions with the Now Assist application.

For example, let's say that AI Guardian detects an offensive message in the execution plan of an agentic workflow. When you try to trigger the plan or test it, AI Guardian can step in to terminate the plan or test because it detected harmful content at the first step of the execution plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about the different guardrails, see Now Assist Guardian.

Procedure

1. Configure Offensiveness for AI agents.
   a. Navigate to **AI Agent Studio** > **SettingsSettings**.
   b. In the AI Guardian section, turn on the **Offensiveness detection** toggle to monitor and block offensive content in AI responses.
2. Configure Prompt Injection for AI agents.
   a. Navigate to **AI Agent Studio** > **SettingsSettings**.
   b. Select **Configure** against **Prompt Injection protection**.
   You're directed to the AI Admin Hub on your instance to configure the Prompt Injection.

   Note: For more information about configuring the Prompt Injection, see .

   When you configure the Prompt Injection for an agentic workflow by using the required instructions, the system is designed to detect the harmful content and block the conversation.

Set up long-term memory

Make AI agents remember your preference or facts from previous interactions and use memories for more focused conversations.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings** > **Long-term memory**.

   Note: Expand the Long-term memory section to see the user facts and preferences.

2. Configure the User facts and preferences.

Preferences	Value
Allow all AI agents to retain user information	The default value is **Allow**. **Note:** Selecting **Do not allow** disables the rest of the preferences for the Long-term memory configuration.
Allow all AI agents to apply their knowledge in conversations	The default value is **Allow**. You can select **Do not allow**, if you don't want to allow the AI agents to apply their knowledge in conversations.
Allow an LLM to identify categories of memories	The default value is **Allow**. You can select **Do not allow** if you don't want to allow an LLM to identify the memory categories.

3. To view the existing AI Agent memory categories, select **View**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about creating long-term memory categories, see Create long-term memory category.

4. To view the AI agent category mappings select **View**.
   For more information about creating a category mapping, see . For more information about mapping a category to an AI agent, see Map Long-term memory category.
5. Configure Past executions outcomes by turning on the **Allow all AI agents to learn from last executions** using the toggle button.

Long-term memory categories

Long-term memory (LTM) categories define the types of semantic information that a Now Assist AI agent can learn and retain about users over time. You can add new categories and map them to specific agents to personalize agent responses based on accumulated user context.

Semantic memory in the AI agent Memories table (`sn_aia_memory_list`) is organized by LTM categories. Each category represents a distinct type of user-specific information, such as software preferences, workplace context, or communication style. By mapping categories to an agent, you control what the agent learns and retains across interactions.

How LTM categories work

When an agent executes, the platform evaluates the interaction for user-specific facts that match the agent's configured LTM categories. Matched facts are stored as semantic memory records in the AI Agent Memories [sn_aia_memory] table, scoped to the user and category. On subsequent interactions, the agent retrieves relevant semantic memories and uses them to personalize its responses without requiring the user to repeat context.

LTM categories are defined globally and can be mapped to one or more agents. An agent only learns and retrieves memories for the categories explicitly mapped to it.

Default LTM categories

The platform includes the following default LTM categories:

Software and tools

Captures information about applications, tools, and software configurations relevant to the user, such as operating system version or approved applications.

Work context

Captures facts about the user's role, department, location, and workplace preferences, such as remote work setup or team structure.

User preferences

Captures communication preferences and interaction style, such as preferred language, response format, or notification settings.

You can extend this list by creating custom categories suited to your organization's use cases.

How categories affect memory extraction

During memory extraction, the platform runs an LLM prompt that evaluates the agent interaction against the descriptions of each mapped LTM category. If the interaction contains information that matches a category, a semantic memory record is created or updated in the AI Agent Memories table with the following fields:

Category

The LTM category that the memory is associated with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User

The user whose interaction generated the memory.

Memory

The extracted user-specific fact, stored as a JSON object.

Type

Set to **Semantic** for category-based memories.

Semantic memories are retrieved at runtime using retrieval-augmented generation (RAG) and injected into the agent prompt to personalize the response for the current user.

Considerations

- Category descriptions directly influence LLM extraction quality. Use specific, unambiguous language to reduce false positives or missed extractions.
- Mapping too many categories to a single agent can increase extraction processing time. Map only the categories relevant to the agent's use case.
- To verify that semantic memories are being extracted, open the AI Agent Memories table and filter by **Type** = **Semantic** and the relevant agent or user.

Create long-term memory category

Add a long-term memory category to add it an AI agent while setting up long term memory

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **AI Agent Studio** > **Settings** > **Long-term memory**.
2. Select **View All** against View the existing categories of memories.
   You're directed to the AI Agent Memory Categories page.
3. Select **New**.
4. On the form, fill in the fields.

Field	Description
Name	A descriptive label for the category, such as `Hardware preferences` or `Accessibility needs`.
Description	A brief explanation of what type of user information this category captures. The description is used by the LLM extraction prompt to identify relevant facts during agent execution, so precise language improves extraction accuracy.

5. Select **Save**.
   After saving the record, the category is activated by default and is available to map to one or more AI agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map Long-term memory category

Map the created long-term memory category to the agents that should use it. Categories must be mapped individually to each agent; they are not applied globally by default.

Before you begin
Role required: sn_aia.admin

About this task
The mapping of LTM categories is done directly while creating an AI agent at the Define the specialty page.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. Navigate to the Define the specialty page of an AI agent form.

   Note: You can add map the categories for a new or existing AI agent.

3. In the manage long-term memory section, select categories that you want to map to your AI agent.
   You will see the list of categories that were created in the AI Agent Memory Categories page.
   For more information, see .
4. Select **Save and continue**.

Result
The selected categories are mapped to your AI agent.

Select the LLM for AI agents and agentic workflows

Choose the large language model (LLM) service provider for Now Assist AI agents in AI Agent Studio.

Before you begin
Role required: sn_aia.admin

About this task
LLMs are part of the foundation of agentic AI. Different LLMs can provide slightly different performance and responses. You can select which LLM to use at a global level for agentic AI from the AI Agent Studio to help adjust the response quality to best fit your agentic workflows.

Note: If you already have agents built and you change the global LLM, then you must test the agents after making the change. You can test the models in the skill kit without changing the LLM provider for all AI skills. Outside of the Skill kit, skills use whichever provider is set as default for the AI AGent SKills group.

Depending on your region, you may have to consent to using a different service provider.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings** > **Model provider**.
2. Select **Configure** to be redirected to AI Admin Hub.
   You're directed to the AI Admin Hub Edit model provider page.

   For more information about managing a editing and customizing a model provider, see Manage model providers.
3. In the *Choose a default model provider* field, select from the following choices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Now LLM Service
- AWS Claude
- Azure OpenAI
- Google Gemini

Note:

The new generative AI Config property records *sys_generative_ai_config* and *sys_generative_ai_prompt_config* have been introduced for the Azure OpenAI: gpt 5.4 model provider. Both the properties share a **definition** field that references the same *sys_one_extend_capability_definition* record, which identifies the LLM provider. The new prompt config records are set to **true** by default.

4. To use a different model provider:
   a. Navigate to the *sys_generative_ai_prompt* table.
   b. Filter and group by the relevant skill definition.
   c. Locate the record for the appropriate skill and provider.
   d. Set the preferred record as default.
5. Review the impacted AI agents.

   Certain AI agents may require specific model providers. Select the AI agents tab in the **Impact overview** section to see which AI agents are affected by any changes to the model provider.
6. Select **Save**.

Result
Your chosen LLM is used globally for all AI agents and agentic workflows.

Multiple conversations in Now Assist AI agents

Multiple active conversations enable live agents to maintain separate conversations for different records. You can preserve the context of multiple conversations and enable multiple AI agents to interact at the same time through the Now Assist panel.

Multiple conversations between live agents and AI agents overview

Once configured, live agents can interact with multiple AI agent conversations through the Now Assist panel.

Note: By default, the ServiceNow Otto panel currently supports only a single conversation and it is required for you to enable the multiple conversation support if you intend to use it

Enabling multiple conversations

You can enable multiple conversations on a ServiceNow instance in the Messaging Channels [sys_cs_channel.list] table by setting the value of the **Supports Multiple Conversations** field on the ServiceNow Otto panel record to **true**. If you don’t see this field, make sure you're in the Global scope and are using the **Default view**. If you still don't see the filed, you may have to add the filed to the table. By saving the record and refreshing the instance, you can see the multiple active conversations features in the ServiceNow Otto panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title for the conversation

With the multiple conversations feature enabled in the ServiceNow Otto panel, the first utterance from the live agent is set as the title for that conversation. For example, if the first utterance is `Explain change risk`, then Explain change risk is set as the title for that conversation in the ServiceNow Otto panel.

Starting a conversation

Start a new conversation by selecting the plus icon and choosing a topic. See the conversation list by selecting the All chats icon, to see the Active chats and Closed chats.

Unread chats on the conversation list

See the batch count of the unread chats on the conversation list icon. For example, if number 6 appears on the All chats icon, that means there's six unread conversations on the ServiceNow Otto panel.

Citations in Now Assist AI agents

Citations appear on the ServiceNow Otto panel when AI agents and agentic workflows provide summaries for similar incidents and knowledge articles.

You can enable citations for **Get relevant knowledge articles** and **Get similar incidents** on your ServiceNow instance.

Generating citations:

- Citations are generated by the LLM (Large Language Model), which use the information available to it.
- URLs can’t be generated by LLM if relevant information isn’t provided.
- LLMs need provide proper URLs for better results.
- Citation URLs return directly from the tool’s outputs.
- The LLM is instructed not to generate or assume citations if they aren’t present.

Note: Invalid or malformed URLs won’t be displayed to the user.

Citations with similar incidents and relevant knowledge articles appear in the Sources section of the AI Agent Studio Chat and on the Now Assist panel. Clickable links direct you to the incident or knowledge article.

You can hide citations for specific agentic workflows or AI agents where it’s necessary or confidential. For more information, see Disable citations in AI Agent Studio.

Disable citations in AI Agent Studio

Disable citations for specific agentic workflows or AI agents in AI Agent Studio where citations aren’t required or involve confidential information.

Before you begin
Role required: sn_aia_admin

About this task
By default, the citations are enabled for all agentic workflows and AI agents. The Agent Properties [sn_aia_property] table enables disabling citations at the agentic workflow or AI agent level. Create a record only when you want to disable citations for specific agentic workflows or AI agents when the **Output transformation strategy** field in the Agent tool record is set either to **Summary for Search Results** or **Verbose**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: All citations are generated by the LLM (Large Language Model), which uses the information available to it.

Procedure

1. Navigate to **All** > **System Definitions** > **Tables** and open the Agent Properties [sn_aia_property] table.
2. Select **New**.
3. On the form, fill in the fields.

Agent Property form

Field	Description
Name	Name for the agent property record used to hide citations for the agentic workflow or AI agent.
Value	Provide **false** as the value to hide the citations.
Target table	The table where the target agentic workflow or AI agent resides.
Target record	The record of the target agentic workflow or AI agent.
Application	The application scope for the agent property record: Now Assist AI agents.

4. Select **Submit**.

Result
Execute an AI agent or an agentic workflow for which you have disabled citations. You'll see the output without citations. See the following example for reference.

Follow-up conversations

AI agents continue with follow-up conversations after the AI agent execution is complete.

Before you begin
Role required: sn_aia_admin

About this task
When the [sn_aia.enable_follow_up] system property is set to **true** and if there is no record for the agentic workflow created in the Agent properties [sn_aia_property] table, then the AI agents continue with the `How else can I help you?` follow-up message after the agentic workflow execution.

The AI agent conversation doesn't get closed after the execution is complete by default. If you would like to override the follow-up behavior for your AI agents for a specific agentic workflow, you must create a record in the Agent Properties [sn_aia_property] table.

Procedure

1. Navigate to **All** > **System Definitions** > **Tables** and open the Agent Properties [sn_aia_property] table.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Agent Property form

Field	Description
Name	Name for the agent property record for the agentic workflow.For example, `follow_up_behaviour`
Value	Provide the following values as per the requirement: ○ **no_followup_close_conversation**: Closes the conversation after the use case is complete. ○ **no_followup_open_conversation**: Keeps the conversation open after the use case is complete.
Target table	The table where the target agentic workflow resides: Agentic workflows [sn_aia_use case] table.
Target record	The record of the target agentic workflow or AI agent.
Application	The application scope for the agent property record: Now Assist AI agents.

4. Select **Submit**.

Add recipients to usage spike, execution failure, and latency error email notifications

Add or change recipients to email notifications triggered by unexpected or undesired behavior in AI agent and agentic workflow executions.

Before you begin

Set your application scope to Now Assist AI Agents.

Role required: admin

About this task

There are different email notifications that can be configured: one for Assist usage spikes, one for failed AI agent executions, and two for latency errors.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. In the *Name* field, search for `AI Agent`, and select the notification you want to edit.

   There are different Notifications records for the different sources of alert. If you want to change the recipients for all types of alerts, you must edit each of the Notification records individually.
3. Open the **Who will receive** tab.
4. Select the unlock icon for the type of recipient you want to add or change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To quickly add yourself to the list of recipients, select the Add me icon next to the *Users* field.

5. Select the users and groups you want to receive email alerts.

   If you select **Send to event creator**, the owner of the AI agent or agentic workflow that triggered the alert receives a notification.

   You can select **Exclude delegates** if you don't want delegated users to receive the notification. By default, delegates will receive notifications.

6. Update or save the record.

Result

The specified users or groups can now receive notifications for a specific triggered condition of AI agent or agentic workflow executions.

What to do next

Repeat for any other AI agent alert notifications you want to configure.

Implement access control in AI Agent Studio

Implement security in AI Agent Studio through access control lists (ACLs), user identities, and role filtering with the access control-based security measures in the agentic system.

Security for AI agents

Access controls for agentic AI on the ServiceNow AI Platform comprises the major aspects: determining which users can access agentic AI resources and what access each of those resources has once invoked. These aspects are controlled through three main components: access control lists (ACLs), user identities and role filtering. The interaction between these components at the agentic workflow, AI agent, and tool levels within AI Agent Studio influences their overall security and functionality.

Access Control Lists (ACLs)

The access control lists (ACLs) in AI agents determine which role(s) a user must have to be allowed to invoke an agentic workflow or an AI agent. ACLs must be configured individually for each agentic workflow, AI agent, external AI agent, and certain AI agent tools such as generative AI Skills, Flows, and Flow Actions.

ACLs configured in the AI Agent Studio for are role-based and of the Allow If type:

- **Allow-If**: Grants access to data or resources when any of the specified conditions in the ACL are met. Allow If ACLs don't prevent other ACLs from granting access to the same resource even if it that specific ACL itself doesn't grant access.
- **Deny-Unless**: Grants access only when the invoking user identity meets all the specified conditions. No other ACLs can override or grant access to that resource once a Deny Unless ACL is in place. This is available when configuring ACLS in the ACL [sys_security_acl] table and not in the AI Agent Studio.

There are three possible options for ACLs created in AI Agent Studio:

- *Any authenticated user*: Grants access to any user who is authenticated on the instance, regardless of the role.
- *Users with specified roles*: The default ACL option that requires you to select the specific roles required to invoke an AI agent or an agentic workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: As the ACLs are Allow If ACLs, any user with at least one of the roles will be able to invoke the AI agent or agentic workflow.

- *Public*: Grants access to all users, including guests who aren't signed in.

Note: Understand that this configuration should be used sparingly and only when needed.

Note:

- ACLs configured in AI Agent Studio only determine the roles required for users to invoke an agentic workflow or an AI agent. They don't determine the access that the agentic workflow or an AI agent has once it's invoked.
- For an agentic workflow or AI agent to successfully execute, the invoking user (or relevant AI user) must meet the criteria of all of the ACLs of any downstream components which have their own ACLs and are assigned to the agentic workflow or AI agent (even if the specific execution might not need to invoke all of those AI agents or tools). Therefore:
  - If there are conflicting security requirements between agentic workflows, AI agents, and AI agent tools, your agentic AI fails to execute.
  - The same occurs if the invoking user meets the criteria for some ACLs but not others. This includes components assigned to the agentic AI that might not be required for the specific execution.
- When configuring these security settings, consider all aspects of the agentic system-including the agentic workflow, AI agents, and tools.

User identities

After configuring the access control lists (ACLs), you must configure the User identity (also called as *Run as*) which the AI agent or agentic workflow will run as during execution.

After configuring the access control lists (ACLs), you must also configure the user identity (also called as Run as) which the AI agent or agentic workflow will run as during execution.

The user identity determines which user the AI agent or an agentic workflow operates as during execution, and therefore the data it can access and the actions it can take, depending on the roles assigned to the user identity.

Note: Each agentic workflow and AI agent has its own user identity configuration.

There are two possible user configurations to select from:

- **Dynamic user**: The user identity of the person or resource (automated trigger/agentic workflow/parent agent) which invokes the execution of an AI agent or an agentic workflow. The roles assigned to the agentic workflow or AI agent will change dynamically depending on the identity of the invoking user.

  Note: Dynamic user is the default user identity, and you can use the dynamic user unless there's a specific need that justifies an AI user.

- **AI user**: A dedicated user identity that the AI agent or an agentic workflow runs as during execution, which has assigned roles that remain consistent regardless of who or how the execution is invoked. For example, an AI agent or an agentic workflow may need to be run with elevated privileges that the dynamic user might not have. If configured as a dynamic user, the execution would fail. However, if the AI agent or agentic workflow is configured to run as an AI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

user that has the elevated roles assigned to it, the execution will succeed even when invoked by a user with lower privileges.

Note: If you don't have a suitable AI user but want to use the *AI user* identity, you must create a record on the User [sys_user] table. See Create a user and select *AI user* as the identity type.

Role filtering

Role filtering restricts the roles that AI agents can inherit from the invoking user to a subset of approved roles. This limits the capabilities of the agent, ensuring it can only use the roles that the builder of the AI agent has specifically permitted, even if the user possesses additional roles.

Role filtering only applies when the agent runs as a dynamic user — because the identity (and resulting roles) of the invoking user can't be known in advance. There could be situations in which high-privileged users invoke AI agents that should not run with high privileges. By applying role filtering, the builders of AI agents can make sure that their agents adhere to the Least Privilege Principle. Role filtering is not required when an AI agent runs as an AI user. Since the roles of the AI user are preconfigured and can (and should) be set to meet the needs of the specific AI agent – no additional filtering is required to conform to the Least Privilege Principle, which can be controlled entirely by the AI user configurations.

Deny by Default

The ServiceNow AI Platform enforces a deny-by-default ACL (Access Control Lists) configuration certain types of agentic components on newly activated instances. In earlier releases, these record types defaulted to allow access unless an ACL was configured for a specific record. In Australia release, newly activated instances start from a deny-by-default posture instead, so access has to be configured explicitly by creating an ACL for the specific record, rather than inherited through permissive defaults. This applies to any AI agents and agentic workflows that don't have an individual ACL configured, reducing unauthorized access risks.

The deny-by-default enforcement works as follows: The **Security Attribute** field value for AI Agent and agentic workflow on the Access Controls table [sys_security_acl] is set to **Never**, enforcing the deny behavior and leaving the **Decision Type** field value as is, that is, **Allow If**. This configuration verifies that if an AI component already has a primary ACL in place, access continues to be governed by that ACL. The backup (wild card) ACLs deny access only when no primary ACL is present. The old wildcard ACLs allow users with agents that predate the availability of access controls in agentic products to continue to run their agents, but that general guidelines is to implement deny by default in all instances. The replacement means that the AI agents and agentic workflows must have explicit ACL entries to operate. Without explicit ACLs, access is denied by default.

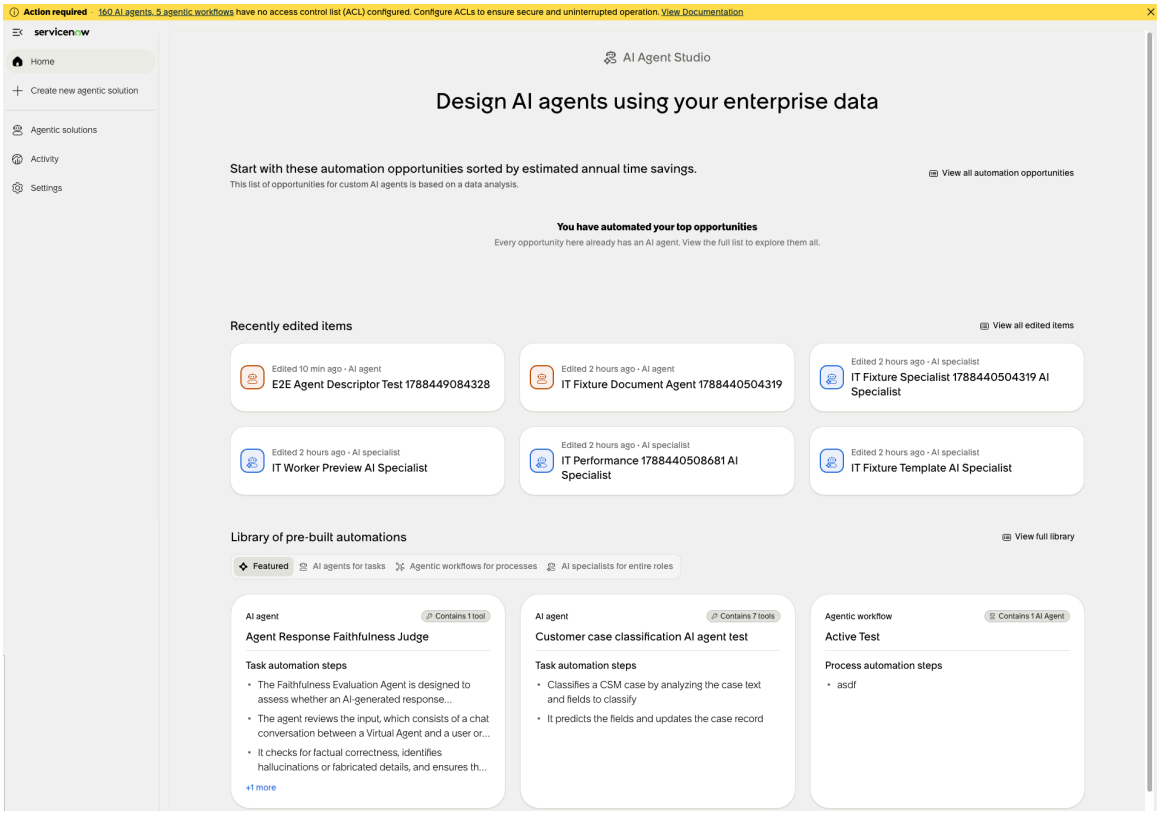
Note: The enforcement applies only to the newly activated instances. Any instances that are upgraded to Australia release from previous releases aren't automatically affected by this configuration change and the adoption of the deny-by-default ACL configuration will require admins to proactively opt in.

Security check on AI Agent Studio

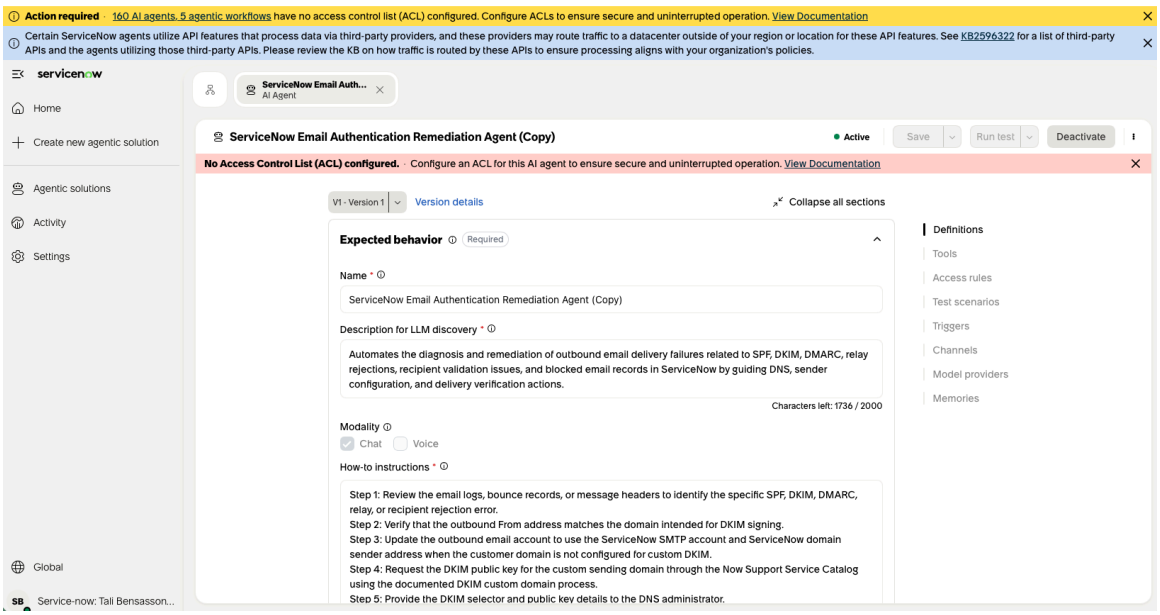
To inform users about security checks on the agentic system, the platform provides the following notifications in the AI Agent Studio interface:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI Agent Studio Home page: The AI Agent Studio Home page displays a warning when AI agents or agentic workflows don't have explicit ACLs configured on the instance.

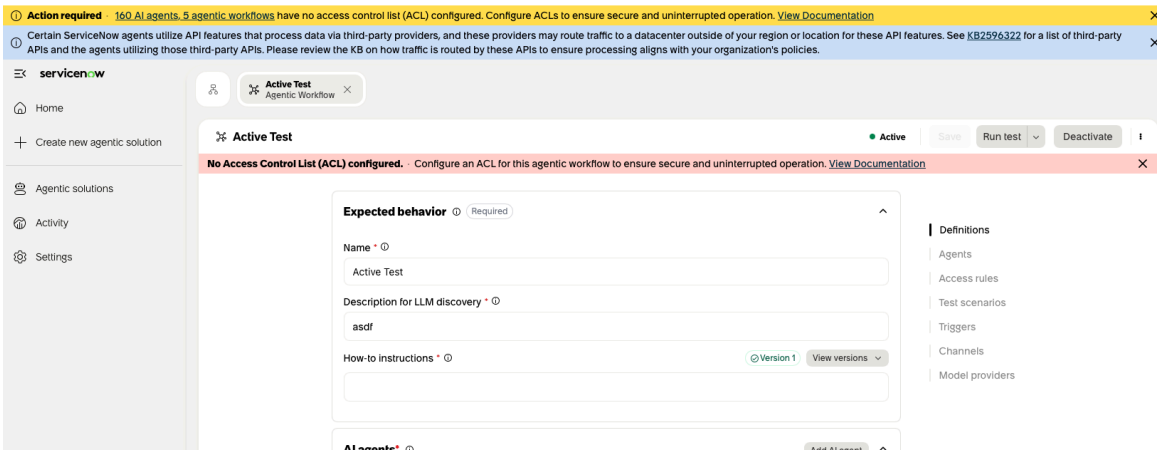


- AI Agent guided setup: The AI agent guided setup page displays a warning banner when that agent doesn't have the required ACLs configured.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Agentic workflow guided setup: The agentic workflow agent guided setup page displays a warning banner when that agentic workflow doesn't have the required ACLs configured.



Security mechanisms

Using ACLs, user identities, and role filtering together provides layered security for AI agents.

- ACLs prevent unauthorized users from reaching and invoking the agent.
- User identities verify the agent operates under the correct privilege scope at runtime, preventing escalation beyond what the assigned dynamic user permits.
- Role filtering verifies that agents can't take actions that exceed defined boundaries even when invoking use has that access.

A common source of confusion is assuming that ACLs define agent actions. They don't! ACLs determine who can invoke the agent. The scope of permissible agent actions are determined by the user identity and role filtering. Use the following summary to distinguish the mechanisms:

Distinguishing ACLS, user identities, and role filtering

Feature	ACLs	User identities	Role filtering
Controls	Who can access the agent	Which identity the agent acts as	What the agent can do
Applied to	Users, groups, and roles that invoke the agent	The user identity with which the agent executes at runtime	The agent's runtime execution context
Security purpose	Restricts agent discoverability and invocation	Determines privilege scope during execution	Restricts agent actions and data access

Distinguishing AI user and Dynamic user

Feature	AI user	Dynamic user
Definition	A predefined identity the agent runs as	The identity of the agent at runtime which is inherited from the invoking user.
Role filtering applies	No	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Distinguishing AI user and Dynamic user (continued)

Feature	AI user	Dynamic user
Roles used	Fixed to the AI user's assigned roles	Scoped down by role filtering
Identity source	Configured statically	Determined dynamically at runtime

Note: Configuring only one of these mechanisms leaves a gap in the agent's security posture. Therefore, it is necessary to configure the security mechanisms across the AI Agent Studio and other AI components such as generative AI Sills, Flows, and Flow Actions.

For more information, see Configure access controls across AI Agent Studio.

Configure access controls across AI Agent Studio

Configure access rules in AI Agent Studio for AI agents, agentic workflows, Model Context Protocol Servers, and external AI agents.

Before you begin

Role required: sn_aia.admin

About this task

Procedure

1. Configure security controls for an AI Agent.
   To configure access rules for an AI agent in AI Agent Studio, see Define access rules for an AI agent.
2. Configure security controls for an agentic workflow.
   To configure access rules controls for an agentic workflow, see Define access rules for an agentic workflow.
3. Configure security controls in Model Context Protocol Servers.
   To configure security controls in Model Context Protocol Servers, see Define security controls for MCP Servers.
4. Configure security controls in external AI agents.
   To configure access rules in external AI agents, see Create an external AI agent.

What to do next

You can use the Access Analyzer in the Test page chat window of an AI Agent, agentic workflow, and an external AI agent. Use it to troubleshoot tools when agent execution fails due to access denial. For more information, see Test access to an AI asset.

Related topics

Granular admin roles

Configuring user access and data permissions for agentic workflows

Test access to an AI asset

Verify whether a user has access to an agentic AI asset - AI agent and agentic workflow.

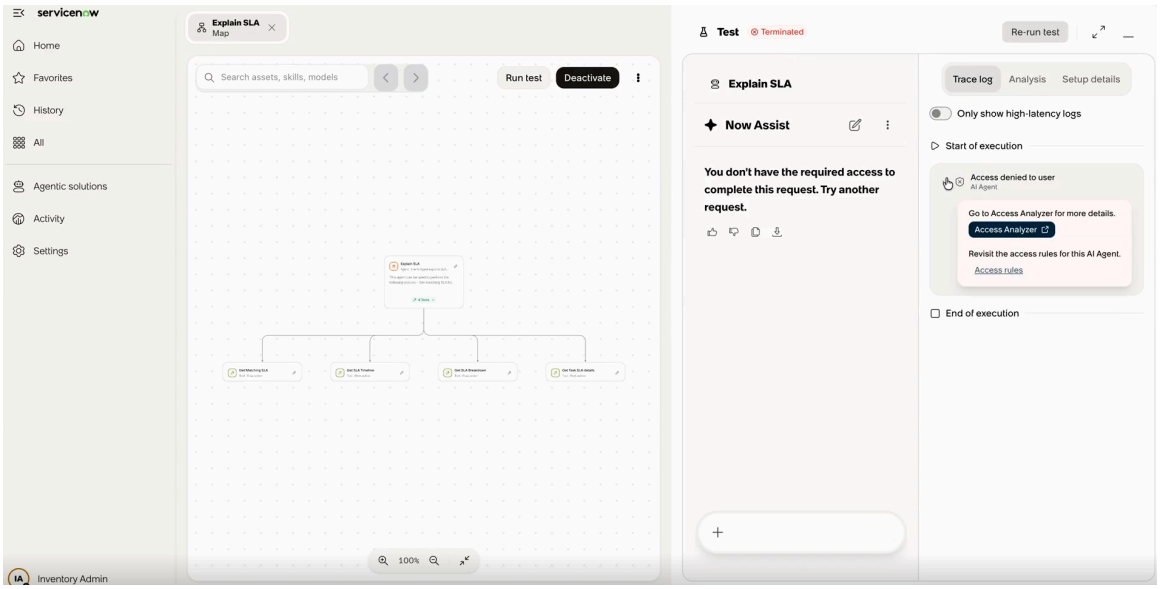
Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic Solutions**.
2. Select an AI asset you want to test access to.
   You can test access to an AI agent and agentic workflow. Select one of them from the Agentic solution page.
3. In the node map view or guided setup, select **Run test**.
4. On the Run a test pop up, select **Single test** as the test type and choose a test objective from the auto-populated objectives.
5. Select **Run Single test**.
6. Review the test results.
   If there is a failed test due to ACL issues, you will see in the node map view, the reason for the failed test in the Chat window. In the Trace Log tab, you will see the test status along with the relevant links to understand more details about the failure:



- Select **Access Analyzer**: You can go to Access Analyzer for more details.

  This opens the Permission for Explain SLA page in Access Management, where you can see the access results for the executed AI asset.

- Select **Access rules**: You can revisit the access rules for the selected AI asset.

Create an AI agent

Create an AI agent in AI Agent Studio to solve problems for your users and coordinate with other AI agents in agentic workflows.

Before you begin

Role required: sn_aia.admin

About this task

In the ServiceNow agentic ecosystem, an AI agent is a set of large language model (LLM) instructions and tools that can perform specific tasks.

An AI agent can collaborate with other agents to achieve better results by using fewer LLM calls. AI agents can also request help or information from the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are three ways to create an AI agent. The following procedure describes the steps for the full guided setup. You complete every section yourself, from the definition through tools, security, triggers, channels, and memory. Use it when you already know what the agent must do and have intended prompts in mind.

You can also create an AI agent conversationally. You describe the agent, and Virtual Agent drafts the definition and displays suggested tools, which you then review and finish in the guided setup. Use it to get to a first draft quickly. You can create only AI agents with this method, not agentic workflows. For those instructions, see Create an AI agent conversationally.

The third way to build an AI agent is through an automation opportunity. When you build from the automation opportunities list, the identified automation context is applied to the AI agent. For those instructions, see Create an AI agent for an automation opportunity.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Home**.
2. Select **Create new agentic solution**, then select **New AI agent for a task**.
3. In the new AI Agent pop-up window, describe your AI agent and select **Next**.
   Alternatively, you can select **Skip** to open a new AI agent form.
4. Select **Create an agent from scratch** and select **Next**.

   To create an external AI agent instead, see Create an external AI agent.

5. Describe the purpose of the AI agent, then select **Check**.

   The LLM uses your description to generate suggested content for the general prompt of the AI agent. Confirm that your description names the goal, what starts the work, the records and tables involved, and the outcome that counts as done. For example, "Categorize incoming ITSM incidents by reading the short description and description, select the best-fit category and subcategory, and update the incident with a short rationale in the work notes."

   The LLM also uses the description to generate tool suggestions that help the AI agent achieve its goal.

   If other agentic solutions accomplish a goal similar to the one you describe, the check identifies them so you can edit a matching solution instead.

   You can skip this step by selecting **Skip**.

6. Review or draft the content in the *Expected behavior* section.

   You can edit any content that the LLM generates.

   The Orchestrator uses the description, role, and instructions when the AI agent is invoked, either alone or as part of an agentic workflow. This content gives the Orchestrator the context it requires to use the AI agent for its intended purpose.

   After making any changes to the AI agent in this guided setup, you can select **Save** to save your progress.

7. Add tools and information your AI agent can use to accomplish its goals.

   The tools give the AI agent the capabilities necessary to accomplish tasks. An AI agent requires tools to perform tasks.

   You can also add information sources, such as knowledge graphs, that the AI agent uses when making decisions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Information can reach an agent at run time in multiple ways. Knowledge graphs supply relationships between entities. Search retrieval tools retrieve content from defined sources. File upload tools give the agent specific documents.

8. Define the AI agent access rules.

   The security controls configure user access and data access to the AI agent. You can also set the discoverability of the AI agent by AI specialists or third parties.

9. Add test scenarios for evaluations.

   Automated evaluations of your AI agent require configured test scenarios to run against. You can add existing table records as scenarios or manually enter different test objectives to cover the full range of conditions your AI agent can encounter.

10. **Optional:** Add a trigger to automatically invoke your AI agent if a specified event occurs.

    (Optional) A trigger isn't required if your AI agent is used only in chats.

11. Determine how and where users can invoke your AI agent.

    To let users invoke the AI agent directly, add it to Virtual Agent chat assistants.

12. Set up long-term memory and active learning controls for your AI agent.

    AI agents can learn from previous interactions, if configured to do so. You can choose the categories of information from previous interactions that the AI agent uses when handling new requests.

13. Select **Save** to save your changes.

Result
Your AI agent has the context that the AI Agent Orchestrator requires and the tools to accomplish its intended tasks.

What to do next
You can test your AI agent on a record manually to see an example execution. You can also create an automated agentic evaluation to test the AI agent over repeated interactions. Automated evaluations can display optimization suggestions when LLM judges detect patterns behind low success rates.

To make your AI agent ready for use, select **Activate**.

Create an AI agent from an automation opportunity

Use automation opportunities identified on your instance to create AI agents in AI Agent Studio.

Before you begin
Role required: sn_aia.admin

About this task
Automation opportunities are determined by data available on your instance. Analysis of common task types with possible agentic AI solutions yields recommendations with estimated time and cost savings based on the records analyzed. Each opportunity shows a list of steps needed to resolve the task, demonstrating possible automation instructions. Each identified opportunity also provides an estimated number of tools necessary for the AI agent to complete those steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Home**.
2. Select **View all automation opportunities**.
3. Check the list of automation opportunities, then select the one you'd like to create an AI agent to solve.

   The list can be filtered and sorted by column. By default, the list is sorted by estimated annual savings time.

   You can choose between the **List** or **Gallery** view to display the opportunities. Sorting is not available in the **Gallery** view.

   You can select **AI Agent Advisor** to be directed to the AI Admin Hub where you can review what tables are being monitored for automation opportunities. You can also add tables

4. Review the automation opportunity preview.

   For more information about the source of the automation opportunity, select **View sample issues**. You can see a list of records, including their number, short description, description, and the analysis of the root cause. You can select a record number to open that record in a new browser tab. When you're done, select **Back** to return to the automation opportunity preview.

   The steps listed in the **Resolution steps** section describe the process that can be automated. The actual prompt for the AI agent will be different than the text shown there.

   The number of tools identified is an estimation. The necessary tools may or may not already exist on your instance.

5. Select a modality for your AI agent, either **Chat** or **Voice**.
6. Select **Build AI Agent** to be redirected to the full setup process with the opportunity context applied.
7. Review the generated content for the AI agent and make modifications to suit your specific needs.

   AI generates the name, description, how-to instructions, and AI agent expertise. It also adds relevant tools if they're available. You may need to create more tools for your AI agent to fulfill all of the steps in the how-to instructions. Steps missing tools are identified in the **Tools** section under the list of currently applied tools.

8. Define the security controls for your AI agent.

   Specify which users can invoke the AI agent with the **Allowed users** dropdown. If you choose **Users with specific roles**, you can choose which roles are required to use the AI agent.

   Determine the data that your AI agent can access. AI agents that act as a **Dynamic user** have the same data access settings as the user who invoked the AI agent. If you set the user identity as an **AI user**, then the AI agent will have the same data access permissions as the chosen user record. AI users must have the type set to *AI*. Once you select an AI user, you can see which roles it has.

9. Review the test scenarios.

   Test scenarios are generated automatically as part of the applied opportunity context. They may take a few minutes to generate, so they won't appear right away. Once they're generated,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

they are added to the AI agent automatically. You can still edit test scenarios after they're generated.

You can add your own scenarios or remove unwanted generated ones.

10. **Optional:** Add a trigger to your AI agent.

    (Optional) If you only want your AI agent to be used in chats, you don't need to add a trigger.

11. Select which channels users can access your AI agent from.

    ServiceNow Otto is recommended.

12. **Optional:** Map long-term memory categories.

    (Optional) For more information about long-term memory, see Set up long-term memory.

13. Select **Save** to save all changes made to the AI agent.

Result

A new AI agent is built based on an identified automation opportunity.

Before activating your new AI agent, manually test your AI agent on sample records to confirm it behaves as expected. Select **Run test** to start. You can also evaluate an AI agent using your test scenarios to identify behavior patterns and possible optimizations. You can't run both a manual test and an evaluation at the same time.

When you're satisfied with the AI agent's performance, you can select **Activate** to make it available to users.

Define the expected behavior of an AI agent

In the guided setup for an AI agent, write a clear description defining your AI agent, its role, and the instructions it should perform to accomplish tasks.

Before you begin

You must either create an AI agent or edit an existing one to get to this step in the guided step. To learn how to get started creating an AI agent, see Create an AI agent. Otherwise, navigate to the AI Agent Studio and select the AI agent you want to define to enter the guided setup.

The name, description, modality, AI agent role, and instructions are all required. If the agent was drafted in a conversation, or created from an opportunity, these fields are pre-filled as a first draft. Treat pre-filled content as generated text to be reviewed, not as confirmed configuration.

Role required: sn_aia.admin

About this task

The first step of the guided setup enables you to define the fundamentals of the AI agent. The description, AI agent role, and instructions fields are used by the AI agent Orchestrator to understand how to use the AI agent, by itself or as part of an agentic workflow. Descriptions, AI agent roles, and instructions should be clear and well-defined. For guidelines for writing these fields, see Writing effectively for agentic AI. For an example AI agent, see Example AI agent.

Procedure

1. Verify the name and description summarize the main intention of the AI agent.

   If the name and description aren't clear or correct, the Orchestrator won't know how to wield the AI agent in context.

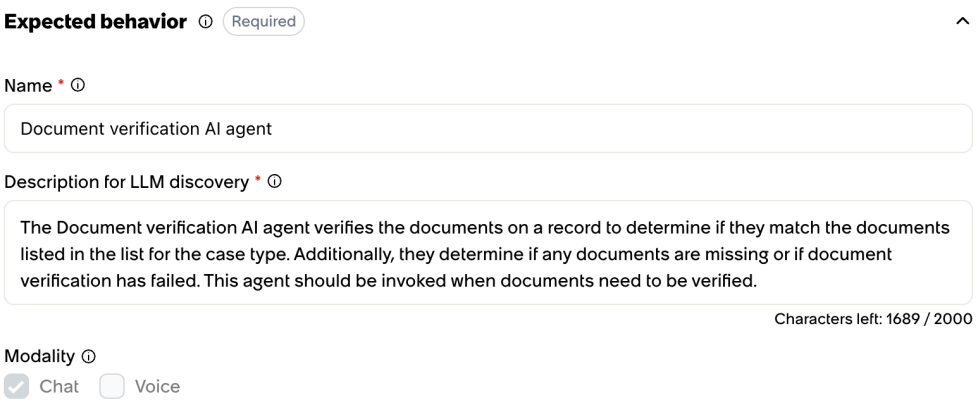
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Check that the modality of the AI agent is correct.

   The *Chat* modality allows users to invoke the AI agent in Virtual Agent or as part of an agentic workflow in the ServiceNow Otto panel.

   An agent has one modality. Chat and Voice cannot both be applied to the same agent. If you need both channels, build one agent per modality. Selecting **Voice** also requires that a voice assistant already exists in Assistant Designer.

   See Create an AI voice agent for more information about creating AI agents with the *Voice* modality.



3. Review and refine instructions.

   The instructions are the most important element of the AI agent. While the name and description guide the AI agent Orchestrator to know when to invoke an AI agent, the instructions tell the Orchestrator what it does and how it will do tasks.

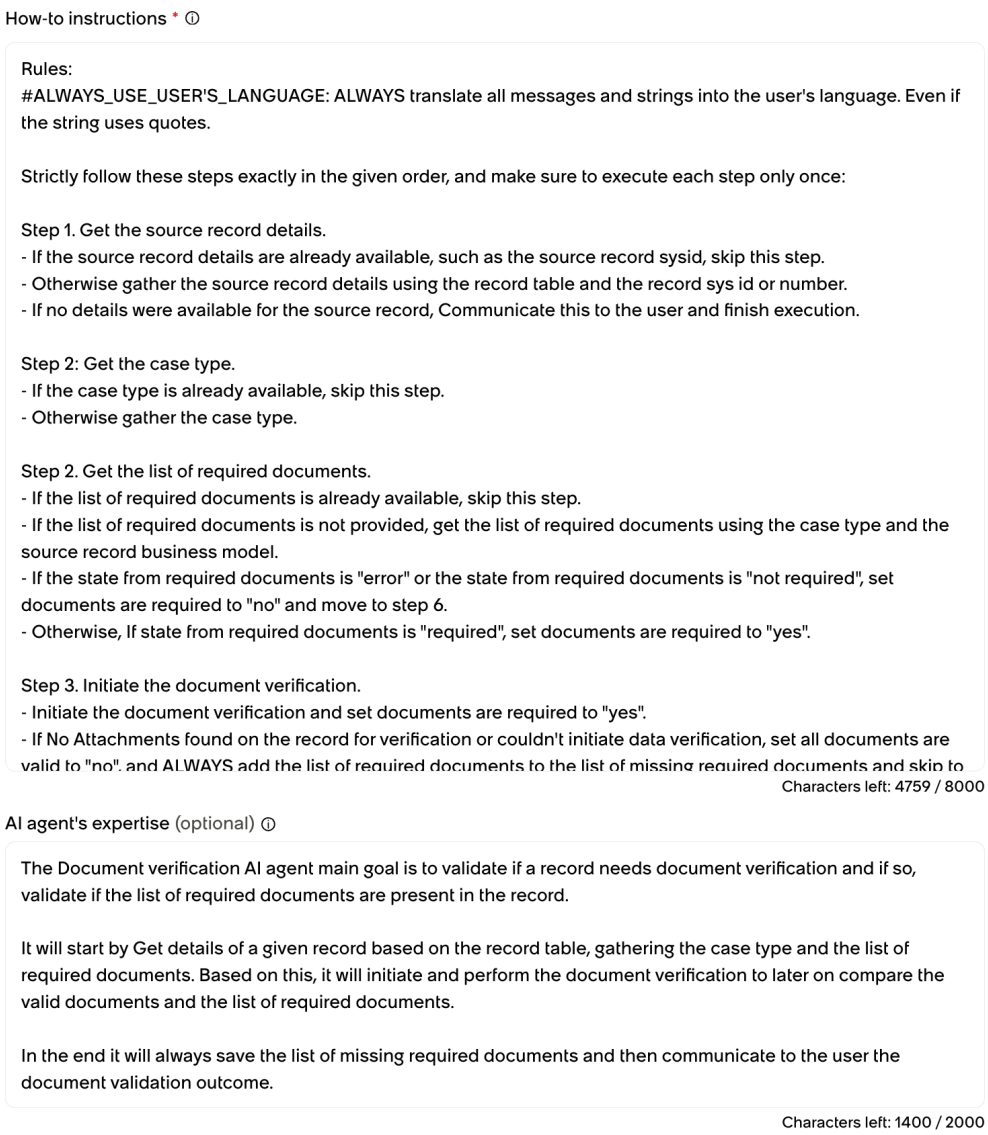
   You can create different versions of the AI agent instructions. After testing an AI agent or evaluating an AI agent, you can adjust the instructions and compare their performance. See Version control for agentic AI to learn more.

4. **Optional:** Confirm the AI agent's expertise.

   (Optional) The difference between the description and the agent role is that the agent role provides more detail about the function that the AI agent serves within a greater context. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

greater context may be as part of an agentic workflow, or it could be the specific function it serves in another type of work process.



Result

The fundamentals of your AI agent are defined so that the AI agent Orchestrator can use it.

What to do next

Scroll down to the next section of the guided setup, *Tools*, to add tools and information your AI agent can use.

Add tools and information to an AI agent

Add a tool to an AI agent to enable different functionalities and help your AI agents achieve their objectives.

Tool overview

Tools give your AI agents the capabilities they need to complete their tasks. When adding tools, think about how the AI agent will use them to achieve its objectives and how those tools will work together. Equipping your AI agents with the right tools helps ensure robust, high-quality performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consider the following guidelines when adding and creating tools:

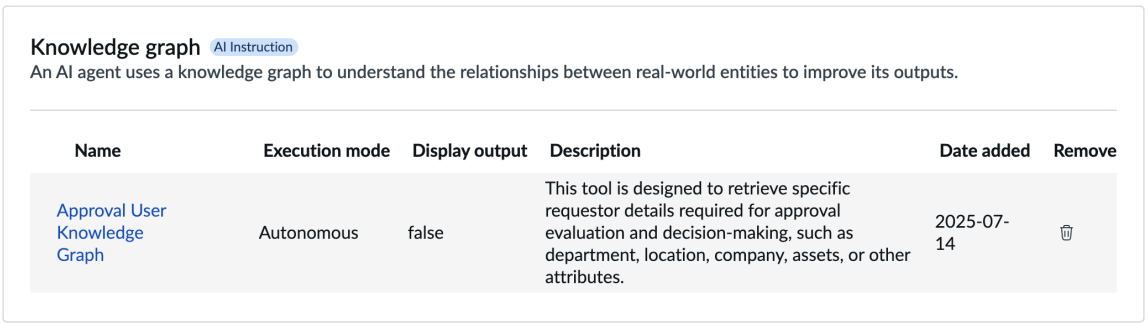
- Design tools to work together. Each AI agent should solve a specific, discrete task, and its tools should provide the capabilities needed to reach that goal.
- Write detailed tool descriptions. The AI agent uses tool descriptions to understand what each tool does. Clear, thorough descriptions give the AI agent the best chance to succeed.
- Plan for tool outputs when creating them. Use the tool description or output transformation strategy fields to explain how to process the tool outputs. For example, if a tool retrieves records from multiple tables, specify how to handle the large volume of results.

Note: If you select Google as your web search tool provider, the web search tool leverages Grounding with Google Search, offered under a Global Standard deployment. Because grounding isn't data resident, Google's global infrastructure routes traffic to a global datacenter for each web search request. This processing may be different than your data processing location chosen for your ServiceNow instance. Consider your organization's data policies before enabling AI agents that use Google web search tools.

After you add the tools to your AI agent, scroll down to the next step in the guided setup.

Knowledge graphs

You can also add Knowledge graphs in this step. Knowledge graphs provide the AI agent with information about relationships between real-world entities, which improves its outputs. For example, you could add a Knowledge Graph to an approval AI agent that maps users to their location, company, and department, helping the AI agent apply the correct approval process.



Supervised vs. autonomous execution mode for AI agents

Autonomous

The tool runs as soon as the agent selects it, with no prompt and no opportunity to intervene. Appropriate for read operations and low-consequence updates.

Supervised

The agent pauses and asks a person to approve the action before the tool runs. Nothing happens until someone responds, so a supervised tool in a background or unattended execution stalls rather than proceeds. Use it for anything that writes, deletes, contacts a customer, or spends budget.

Execution mode is set per tool and can be changed at any time in the guided setup. A mode set during a build conversation can be set after the initial draft. See Modify an AI agent.

You can reduce the risk of an AI agent executing unexpectedly by configuring its tools to run in supervised mode. Supervised mode means that tools use human oversight during execution. Use supervised mode to enhance security for agents that perform sensitive or critical actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can set the supervised execution mode when creating a tool in the AI agent guided setup. For example, select **Supervised** as the *Execution mode* when adding a catalog item tool. For reference, see Add a catalog item to an AI agent.

Add a generative AI skill tool to an AI agent

Add a generative AI skill to an AI agent to expand its capabilities with reusable operations and custom functionality.

Before you begin

If you want to add a custom skill to an AI agent, the skill must be published and activated in the . For more information on deploying custom skills, see Finalize and publish a custom skill and Activate a custom skill.

When an AI agent uses a skill as a tool, the user the AI agent is running as must pass the ACL of the skill. Ensure that the security configurations for the skill are met by the AI agent and agentic workflow. For more information on setting skill-level ACLs, see Configure access control lists for a skill.

Access failures at run time rather than on save. Tool calls fail and the trace log records an access error against the tool, not a configuration warning. When a tool fails for some users and not others, compare the invoking user roles against the ACL of the underlying skill first. If you manually test an agentic AI asset, it will flag access issues by the invoking user if there are any.

Role required: sn_aia.admin

About this task

A generative AI skill is a reusable operation that extends the capabilities of an AI agent. When adding a skill tool, you can configure its execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Skill**.
2. Select an AI skill from the **AI Skill** dropdown.

   The selected skill's name, description, and inputs are displayed automatically.
3. Describe how the AI agent should use the tool.

   Providing a description increases the likelihood that the AI agent calls the correct tool to accomplish its task.
4. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.
5. Toggle **Display output to users** to control whether the tool's output is shown to users.
6. If display output is enabled, select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.
7. Choose whether to display a refined widget message under **Display refined widget message**.
8. Expand the **Advanced settings** section to configure output transformation and processing messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select an output transformation format from the **Output transformation format** dropdown.

   Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

   The available output transformation formats are:

   - *None*: Output data isn't changed into a different format and users will see raw data.
   - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
   - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
   - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
   - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

b. Write processing messages for users under **Write processing messages for users**.

   Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Executing skill" when the tool is in progress and "Skill execution complete" when the tool is done.

Result
You have added a generative AI skill tool to your AI agent with the appropriate execution mode, output settings, and processing messages configured.

Add a catalog item tool to an AI agent

Add a catalog item to an AI agent in AI Agent Studio so that your users can access conversational catalog items.

Before you begin
Role required: sn_aia.admin

About this task
Catalog item tools allow AI agents to interact with service catalog items. When adding a catalog item tool, you can configure its execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure
1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Catalog item**.
2. Select the catalog item from the **Catalog item** dropdown.
3. Enter a name for the tool in the **Name** field.
4. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.

5. Select an execution mode under **Execution mode**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

6. Toggle **Display output to users** to control whether the tool's output is shown to users.
7. Select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

8. Expand the **Advanced settings** section to configure output transformation and processing messages.

   a. Select an output transformation format from the **Output transformation format** dropdown.

      Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

      The available output transformation formats are:

      - *None*: Output data isn't changed into a different format and users will see raw data.
      - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
      - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
      - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
      - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

   b. Write processing messages for users under **Write processing messages for users**.

      Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Requesting a service" when the tool is in progress and "Requested a service" when the tool is done.

Result
You have added a catalog item tool to your AI agent with the appropriate execution mode, output settings, and processing messages configured.

Add a conversational topic tool to an AI agent

Add a Virtual Agent topic to an AI agent in AI Agent Studio so that you can use conversations to get additional information from the user. For example, a conversational topic could be used to let a user select a date range for surveys.

Before you begin
Role required: sn_aia.admin

About this task
Conversational topic tools allow AI agents to utilize conversational topics. When adding a conversational topic tool, you can configure its execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Conversational topic**.
2. Select the conversational topic from the **Conversational topic** dropdown.
3. Enter a name for the tool in the **Name** field.
4. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.
5. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.
6. Toggle **Display output to users** to control whether the tool's output is shown to users.
7. Select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.
8. Expand the **Advanced settings** section to configure output transformation and processing messages.

   a. Select an output transformation format from the **Output transformation format** dropdown.

      Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

      The available output transformation formats are:

      - *None*: Output data isn't changed into a different format and users will see raw data.
      - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
      - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
      - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
      - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

   b. Write processing messages for users under **Write processing messages for users**.

      Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Requesting a service" when the tool is in progress and "Requested a service" when the tool is done.

Result

You have added a conversational topic tool to your AI agent with the appropriate execution mode, output settings, and processing messages configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a deep research tool to an AI agent

Add a deep research tool to an AI agent so it can search multiple sources and provide answers with sources listed.

Before you begin

Role required: sn_aia.admin

About this task

Deep research tools allow AI agents to perform step-by-step investigation across multiple sources to synthesize clear, cited answers. When adding a deep research tool, you can configure its query, depth, knowledge sources, instructions, execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Deep research**.
2. Enter a name for the tool in the **Name** field.
3. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.
4. Enter the deep research query in the **Query** field.
5. Select a depth level from the **Depth** dropdown.

   The depth determines how thoroughly the research investigation is conducted. The available depth levels are:

   - **Basic research**
   - **Standard research**
   - **Advanced research**
6. Add knowledge sources by selecting **+ Add** next to Knowledge sources.

   a. Select a search profile from the **Search profile** dropdown.

   b. Configure search sources under **Search sources**.

   c. Specify fields to be returned under **Fields to be returned**.

   d. Configure semantic indexed fields under **Semantic indexed fields**.

      Semantic indexed fields are fields that have been indexed to understand meaning and context. This allows the search to find results based on semantic similarity, so searches can match related concepts even if exact words don't appear.

   e. Select **Add** to add the knowledge source configuration.
7. Enter instructions in the **Instructions** field.

   Provide instructions for guiding the research process. These instructions help break down the research into smaller questions and guide how the final answer is created.
8. Select an execution mode under **Execution mode**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

9. Toggle **Display output to users** to control whether the tool's output is shown to users.
10. If display output is enabled, select an output widget from the **Widget** dropdown.

    Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

11. Choose whether to display a refined widget message under **Display refined widget message**.
12. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** dropdown.

    Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

    The available output transformation formats are:

    - *None*: Output data isn't changed into a different format and users will see raw data.
    - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
    - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
    - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
    - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

    b. Write processing messages for users under **Write processing messages for users**.

    Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Searching the knowledge base" when the tool is in progress and "Found results" when the tool is done.

Result

You have added a deep research tool to your AI agent with the appropriate query, depth, knowledge sources, execution mode, output settings, and processing messages configured.

Add a desktop action tool to an AI agent

Add a desktop action as a tool to an AI agent so that AI agents can automate tasks in desktop and web-based applications.

Before you begin

Familiarize yourself with desktop actions. For more information, see AI Desktop Actions documentation.

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Desktop actions are tools that AI agents use to interact with web and desktop applications. An AI agent uses a desktop action to automate tasks in desktop-based or web-based applications on the end user's system. You can create a desktop action or add an existing one as a tool to your AI agent.

- Create a defined desktop action in the AI Desktop Actions client application on the Windows machine, then add it as a tool to an AI agent.
- Configure an adaptive desktop action in AI Agent Studio during AI agent tool configuration.

For more information about executing desktop actions, see Examples of executing desktop actions using AI agents.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Desktop action**.
2. Choose one of the following options.

Option	Description
An existing one	Option to add a previously created defined desktop action. Defined desktop actions are categorized into on-screen tasks and background tasks. ○ **On-screen tasks**: These actions help you simulate humans interacting with UI ele ments on your thick client applications, legacy systems, or SaaS applications with out APIs. These actions include clicking but tons, typing into text boxes, selecting from drop-down menus, and more. They encap sulate repeatable UI interactions, such as screens, anchors, and steps. You can cre ate, manage, and test your desktop actions in AI Desktop Actions. When you add an on-screen task desktop action, additional fields require configura tion. For more information, see Parameter mapping for defined desktop actions. ○ **Background tasks**: These actions include prebuilt connectors that enable your AI agents to interact with applications and sys tem components in the background. These connectors streamline automation by offer ing actions for common tasks, reducing the need for complex scripting. Each connec tor focuses on a specific application or sys tem area and provides a collection of relat ed methods. You can't create background tasks actions.
A new desktop action	Option to create a defined or adaptive desk top actions. For more information, see the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. If creating a new desktop action, select how you want to create it.

Option	Description
Let AI determine the steps dynamically	Option to configure adaptive desktop actions that enable the AI agent to plan execution dy namically. Select the environment where these desktop actions run: ○ **Desktop applications**: AI agents run these desktop actions in the AI Desktop Actions client application on the macOS machine. For more information, see Adaptive desk top actions for desktop and web-based tasks. ⚠ **Warning:** This is a beta feature in this release. Functionality, behavior, and execution logic may change in subsequent releases. Test these desk top actions thoroughly in a test en vironment before deploying to pro duction. Report issues or feedback through your support channels. ○ **Web based applications**: AI agents run these desktop actions in the Google Chrome browser through a browser exten sion. For more information, see Adaptive desk top actions for web-based tasks.
Record a fixed sequence of steps	Option to configure defined desktop actions that are a fixed sequence of steps that are recorded in the AI Desktop Actions client ap plication on the Windows machine and then added as a tool to an AI agent.

4. Enter a name for the desktop action in the **Name** field.
5. Enter a detailed description of the desktop action in the **Tool description** field.

   A thorough description helps the AI agent interpret the tool purpose and when to use it. This description is sent to the language model.
6. In the **Navigation actions** field, add a list of precise steps that the AI agent must execute on the web or desktop applications.
7. In the **Time out** field, enter the maximum number of minutes an AI agent must try to execute desktop actions on web or desktop.
   The default value is 30 minutes.
8. Select an execution mode under **Execution mode**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choose **Supervised** to require human input during execution, or **Autonomous** to allow the tool to run without human intervention.

9. Toggle **Display output** to control whether the tool's output is shown to users.
10. If display output is enabled, select an output widget from the **Widget** dropdown.

    Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

11. Choose whether widget transformation is required under **Requires widget transformation**.

    Select **Yes** if the tool's output needs to be transformed before it can be displayed by the widget.

12. Choose whether to display a refined widget message under **Display refined widget message**.
13. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** dropdown.

       Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

       The available output transformation formats are:

       - *None*: Output data isn't changed into a different format and users will see raw data.
       - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
       - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
       - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
       - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

    b. Write processing messages for users under **Write processing messages for users**.

       Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Requesting a service" when the tool is in progress and "Requested a service" when the tool is done.

Result

You have added a desktop action tool to your AI agent with the appropriate configuration, execution mode, output settings, and processing messages.

Parameter mapping for defined desktop actions

The Map parameters section appears when you configure an **On-screen task** desktop action with parameter inputs in AI Agent Studio. Map a parameter record to each step before saving the desktop action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map parameters

Note: These fields appear only when you select an **On-screen task** desktop action configured with parameter inputs.

Field	Description
Step name	Name of the step configured to use a parameter.
Description	Description of the step configured to use a parameter.
Parameter record	The Desktop action parameter record the agent uses to retrieve the value for this step at execution time. Map a parameter record for every step before saving the desktop action. The same parameter record can map to multiple steps. Each step maps to one parameter record only.

Warning: If you update a desktop action after mapping its inputs in AI Agent Studio, the agent continues to use the previous mapping until you reopen the tool configuration and save it again. If you rename an input, the agent registers it as a new input and removes the existing mapping. Remap the renamed input before saving the desktop action.

Add a file upload tool to an AI agent

Upload files for analysis by an AI agent in AI Agent Studio to grant your AI agent access to specialized knowledge.

Before you begin

Role required: sn_aia.admin

About this task

File upload tools allow AI agents to access specialized knowledge from uploaded files. When adding a file upload tool, you can configure which files the AI agent has access to, its execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Attaching a document when building an AI agent conversationally only informs the draft configuration only. See Create an AI agent conversationally. You must add a file upload tool if you want the AI agent to access the file at run time.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **File upload**.
2. Select **Attach file** or drag and drop to upload files.

   You can upload up to 5 files, with a maximum size of 5 MB each, in these formats: PDF, DOCX, TXT.

   Note: By giving AI agents access to these files, you're allowing users interacting with these AI agents to also see information in these files.

3. Enter a name for the tool in the **Name** field.
4. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

6. Toggle **Display output to users** to control whether the tool's output is shown to users.
7. If display output is enabled, select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

8. Choose whether to display a refined widget message under **Display refined widget message**.
9. Expand the **Advanced settings** section to configure output transformation and processing messages.

   a. Select an output transformation format from the **Output transformation format** dropdown.

      Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

      The available output transformation formats are:

      - *None*: Output data isn't changed into a different format and users will see raw data.
      - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
      - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
      - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
      - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

   b. Write processing messages for users under **Write processing messages for users**.

      Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Analyzing files" when the tool is in progress and "Analysis complete" when the tool is done.

Result

You have added a file upload tool to your AI agent with the appropriate files, execution mode, output settings, and processing messages configured.

Add a flow action tool to an AI agent

Add a flow action to an AI agent in AI Agent Studio. Define the flow action to use it as a reusable operation in automating ServiceNow AI Platform features without having to write code.

Before you begin

When an AI agent uses a flow action tool, the user the AI agent is running as must pass the ACL of the flow action. Ensure that the security configurations for the flow action are met by the AI agent and agentic workflow. For more information, see Security for AI agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_aia.admin

About this task

Flow action tools allow AI agents to execute flow actions as reusable operations. When adding a flow action tool, you can configure its execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Flow action**.
2. Select a flow action from the **Select flow action** dropdown.

   The selected flow action description and its inputs are displayed automatically.

   If a flow action's input type is unsupported, the flow action cannot be used by an AI agent. A warning will alert you if this is the case.
3. Enter a name for the tool in the **Name** field.
4. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.
5. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.
6. Toggle **Display output to users** to control whether the tool's output is shown to users.
7. If display output is enabled, select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.
8. Choose whether to display a refined widget message under **Display refined widget message**.
9. Expand the **Advanced settings** section to configure output transformation and processing messages.

   a. Select an output transformation format from the **Output transformation format** dropdown.

      Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

      The available output transformation formats are:

      - *None*: Output data isn't changed into a different format and users will see raw data.
      - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
      - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
      - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
      - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Write processing messages for users under **Write processing messages for users**.

   Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Executing flow" when the tool is in progress and "Flow execution complete" when the tool is done.

Result
You have added a flow action tool to your AI agent with the appropriate execution mode, output settings, and processing messages configured.

Add a knowledge graph tool to an AI agent

Add a Knowledge Graph to an AI agent in AI Agent Studio that uses the structured and unstructured data from different ServiceNow records to enhance the performance of AI agents.

Before you begin
Role required: sn_aia.admin

About this task
A Knowledge Graph is a semantic layer that connects data, relationships, and context across your enterprise. It structures information as a graph of entities and their connections, transforming raw data into actionable knowledge. A Knowledge Graph allows AI agents to understand the relationships between real-world entities and retrieve insights, facts, and relationships directly to automate actions and improve accuracy. When adding a Knowledge Graph tool, you can configure its query instruction, conversation history, execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure
1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Knowledge graph**.
2. Select a Knowledge Graph from the **Select knowledge graph** dropdown.
3. Enter a name for the tool in the **Name** field.
4. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.

5. Enter a query instruction in the **Query instruction** field.

   The query instruction should be a direct translation of the request into a search query without any added interpretations.

6. Toggle **Conversation history** to control whether the tool uses conversation history.
7. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

8. Toggle **Display output to users** to control whether the tool's output is shown to users.
9. If display output is enabled, select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

10. Choose whether to display a refined widget message under **Display refined widget message**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** dropdown.

    Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

    The available output transformation formats are:

    - *None*: Output data isn't changed into a different format and users will see raw data.
    - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
    - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
    - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
    - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

    b. Write processing messages for users under **Write processing messages for users**.

    Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Querying knowledge graph" when the tool is in progress and "Query complete" when the tool is done.

Result
You have added a Knowledge Graph tool to your AI agent with the appropriate query instruction, execution mode, output settings, and processing messages configured.

Add a record operation tool to an AI agent

Add a record operation tool to an AI agent to enable it to perform record operations on tables in your instance.

Before you begin
Role required: sn_aia.admin

About this task
A record operation tool allows AI agents to perform operations on records in your ServiceNow instance. When adding a record operation tool, you can configure its table, operation, inputs, conditions, execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure
1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Record operation**.
2. Choose whether to add a new record operation or an existing one.

   If you want to use an existing one, select the name of the record operation in the **Select a record operation** dropdown.

3. Enter a name for the tool in the **Name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.

5. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

6. Add inputs for the record operation under **Inputs**.

   Select **Add an input** to add each required input. For each input, enter the name and description.

   Input names and the field names they map to need to match exactly. A misspelled name is not caught on save. If a field is misspelled, operation fails at run time and appears in the trace log as a tool failure. Check names against the field labels on the table before testing.

7. Select the table from the **Table** dropdown.
8. Select an operation from the **Operation** dropdown.
9. Define conditions under **Conditions**.

   Defining conditions is required. You can add multiple condition groups using logical operators such as **and** or **or**.

10. Toggle **Display output to users** to control whether the tool's output is shown to users.
11. If display output is enabled, select an output widget from the **Widget** dropdown.

    Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

12. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** dropdown.

       Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

       The available output transformation formats are:

       - *None*: Output data isn't changed into a different format and users will see raw data.
       - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
       - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
       - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
       - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

    b. Write processing messages for users under **Write processing messages for users**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Executing operation" when the tool is in progress and "Operation complete" when the tool is done.

Result
You have added a record operation tool to your AI agent with the appropriate table, operation, conditions, execution mode, output settings, and processing messages configured.

Add a script tool to an AI agent

Add a script tool to an AI agent to enable it to execute custom scripts to perform specialized tasks.

Before you begin
Role required: sn_aia.admin

About this task
A script tool allows AI agents to execute custom scripts to perform specialized tasks. When adding a script tool, you can configure its script inputs, execution mode, output display, and processing messages. You can reference the scripts that come with AI agents associated with AI applications as examples to help you write custom scripts.

Procedure
1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Script**.
2. Choose whether to create a new script or use an existing one.

   Select **A new script** to create a new script, or select **An existing one** to use a previously created script.
3. If you want to use an existing script, select the name of the script from the **Select a script** dropdown.

   The script's inputs and script content are populated automatically.
4. Add script inputs under **Script inputs**.

   Select **Add an input** to add each required input. For each input, enter the input name, description, and mark whether it is mandatory.
5. Write or edit the script in the **Script** field.

   Only string inputs are allowed. The script should return outputs as an object where the keys are understandable by the language model.

   Field names must match exactly. A typo in a variable or column name produces a run-time error that reads as a tool failure.

   Note: For improved security, use GlideRecordSecure instead of GlideRecord and addUserEncodedQuery() instead of addEncodedQuery().
6. Enter a name for the tool in the **Name** field.
7. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.
8. Select an execution mode under **Execution mode**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

9. Toggle **Display output to users** to control whether the tool's output is shown to users.
10. If display output is enabled, select an output widget from the **Widget** dropdown.

    Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

11. Choose whether to display a refined widget message under **Display refined widget message**.
12. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** dropdown.

    Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

    The available output transformation formats are:

    - *None*: Output data isn't changed into a different format and users will see raw data.
    - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
    - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
    - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
    - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

    b. Write processing messages for users under **Write processing messages for users**.

    Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Executing script" when the tool is in progress and "Script execution complete" when the tool is done.

Result
You have added a script tool to your AI agent with the appropriate script inputs, execution mode, output settings, and processing messages configured.

Add a search retrieval tool to an AI agent

Add a search retrieval tool to an AI agent to enable it to retrieve and incorporate relevant information from defined sources.

Before you begin
Role required: sn_aia.admin

About this task
A search retrieval tool (RAG or retrieval-augmented generation) allows AI agents to retrieve and incorporate relevant information from defined sources. When adding a search retrieval tool, you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

can configure its search profile, sources, criteria, execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Search retrieval**.
2. Choose whether to create a new search retrieval or use an existing one.

   Select **A new search retrieval** to create a new search retrieval, or select **An existing one** to use a previously created search retrieval.
3. If you want to use an existing search retrieval, select the name from the dropdown.

   The search retrieval's name, tool description, search profile, search sources, and other settings are populated automatically.
4. Enter a name for the tool in the **Name** field.
5. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.
6. Select a search profile from the **Search profile** dropdown.
7. Configure search sources under **Search sources**.

   Search sources appear after you select a search profile.
8. Enter the number of results to return in the **Results limit** field.
9. Select search criteria under **Search criteria**.

   Choose from **Semantic**, **Keyword**, or **Hybrid** search criteria.
10. Configure semantic indexes under **Semantic indexes** if applicable.
11. Enter a document matching threshold in the **Document matching threshold** field.
12. Select an execution mode under **Execution mode**.

    Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.
13. Toggle **Display output to users** to control whether the tool's output is shown to users.
14. If display output is enabled, select an output widget from the **Widget** dropdown.

    Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.
15. Choose whether to display a refined widget message under **Display refined widget message**.
16. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** dropdown.

       Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

       The available output transformation formats are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *None*: Output data isn't changed into a different format and users will see raw data.
- *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
- *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
- *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
- *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

b. Write processing messages for users under **Write processing messages for users**.

Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Searching sources" when the tool is in progress and "Search complete" when the tool is done.

Result
You have added a search retrieval tool to your AI agent with the appropriate search profile, sources, criteria, execution mode, output settings, and processing messages configured.

Add a subflow tool to an AI agent

Add a subflow tool to an AI agent in AI Agent Studio. Subflows are reusable sequences of processing steps that can be called from within a flow.

Before you begin
When an AI agent uses a subflow tool, the user the AI agent is running as must pass the ACL of the subflow. Ensure that the security configurations for the subflow are met by the AI agent and agentic workflow. For more information, see Security for AI agents.

Role required: sn_aia.admin

About this task
A subflow tool allows AI agents to execute subflows as reusable operations. When adding a subflow tool, you can configure its execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure
1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Subflow**.
2. Select a subflow from the **Select subflow** dropdown.

   The selected subflow's inputs are displayed automatically.
3. Enter a name for the tool in the **Name** field.
4. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.
5. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Toggle **Display output to users** to control whether the tool's output is shown to users.
7. If display output is enabled, select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.
8. Choose whether to display a refined widget message under **Display refined widget message**.
9. Expand the **Advanced settings** section to configure output transformation and processing messages.

   a. Select an output transformation format from the **Output transformation format** dropdown.

      Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

      The available output transformation formats are:

      - *None*: Output data isn't changed into a different format and users will see raw data.
      - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
      - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.
      - *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
      - *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

   b. Write processing messages for users under **Write processing messages for users**.

      Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Executing subflow" when the tool is in progress and "Subflow execution complete" when the tool is done.

Result
You have added a subflow tool to your AI agent with the appropriate execution mode, output settings, and processing messages configured.

Add a web search tool to an AI agent

Add a web search tool to an AI agent to enable it to search the web and retrieve relevant information.

Before you begin
Note: If you select Google as your web search tool provider, the web search tool leverages Grounding with Google Search, offered under a Global Standard deployment. Because grounding is not data resident, Google's global infrastructure routes traffic to a global data center for each web search request. This processing may be different than your data processing location chosen for your ServiceNow instance. Please consider your organization's data policies before adding a web search tool with Google as the provider.

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A web search tool allows AI agents to search the web and retrieve relevant information. When adding a web search tool, you can configure its search parameters, execution mode, output display, and processing messages to ensure the tool works effectively within your AI agent's workflow.

Procedure

1. In the Tools section, select **Add tools**, then **Create new tool**, then select **Web search**.
2. Review the resource and provider information.

   The resource is set to Web Search and the provider is configured elsewhere and cannot be changed.

3. Review the inputs displayed under **Inputs**.

   The inputs are automatically populated based on the web search configuration.

4. Enter a name for the tool in the **Name** field.
5. Enter a detailed description of the tool in the **Description for this AI agent** field.

   A thorough description helps the AI agent understand what the tool does and when to use it.

6. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

7. Toggle **Display output to users** to control whether the tool's output is shown to users.
8. If display output is enabled, select an output widget from the **Widget** dropdown.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

9. Choose whether to display a refined widget message under **Display refined widget message**.
10. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** dropdown.

       Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

       The available output transformation formats are:

       - *None*: Output data isn't changed into a different format and users will see raw data.
       - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
       - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
- *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

b. Write processing messages for users under **Write processing messages for users**.

Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Searching the web" when the tool is in progress and "Search complete" when the tool is done.

Result

You have added a web search tool to your AI agent with the appropriate execution mode, output settings, and processing messages configured.

Define access rules for an AI agent

Define security controls for an AI agent to determine which users can access it and what permissions they have.

Before you begin

Role required: sn_aia_admin

About this task

The Access rules section is divided into two parts: **Which users can access this AI agent (ACLs)** and **Which data this AI agent can access**. The former creates an ACL that determines who can discover or invoke the AI agent. The latter defines the data that the AI agent has access to once it's invoked.

See Security for AI agents for more information about creating ACLs and user identities for security for AI agents.

Procedure

1. Define user access by selecting an option from the **Allowed users** dropdown.

The dropdown menu options are:

- Users with specified roles
- Authenticated users
- Public

If you select *Users with specified roles*, you can select exactly which roles can access the AI agent.

AI agents installed with AI applications each require specific roles. To learn which roles needed for AI agents associated with ServiceNow Otto applications, consult the documentation for the AI agent or the agentic workflow that uses the AI agent.

Selecting *Public* means anyone who can reach the instance can invoke the agent. Use it only for agents that expose no record data. *Public* should be used sparingly.

An access control list (ACL) is generated based on the roles you select. Saving triggers the creation of an ACL for your AI agent. If you want to make changes later, you can return to the guided setup and change the options here. If you have the correct elevated role, you can also make edits directly on the ACL table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select whether third-party AI agents can access the AI agent.

   If selected, only AI agents with the correct user access can invoke the AI agent.

3. Define data access by selecting a user identity type from the **Identity type** dropdown.

   The user identity determines what data the AI agent can read and write while it runs.

   The two options are *Dynamic user* and *AI user*. The dynamic user is the user invoking the AI agent or the dynamic user of the agentic workflow calling on the AI agent. An AI user is a dedicated user that has its own specified roles that allow access, which could be more than the dynamic user. Every invocation reads and writes with the AI user's roles regardless of who started it.

   If you do not have an AI user but want to use the *AI user* identity, you need to create a new record on the User table. See Create a user. Select *AI user* as the identity type.

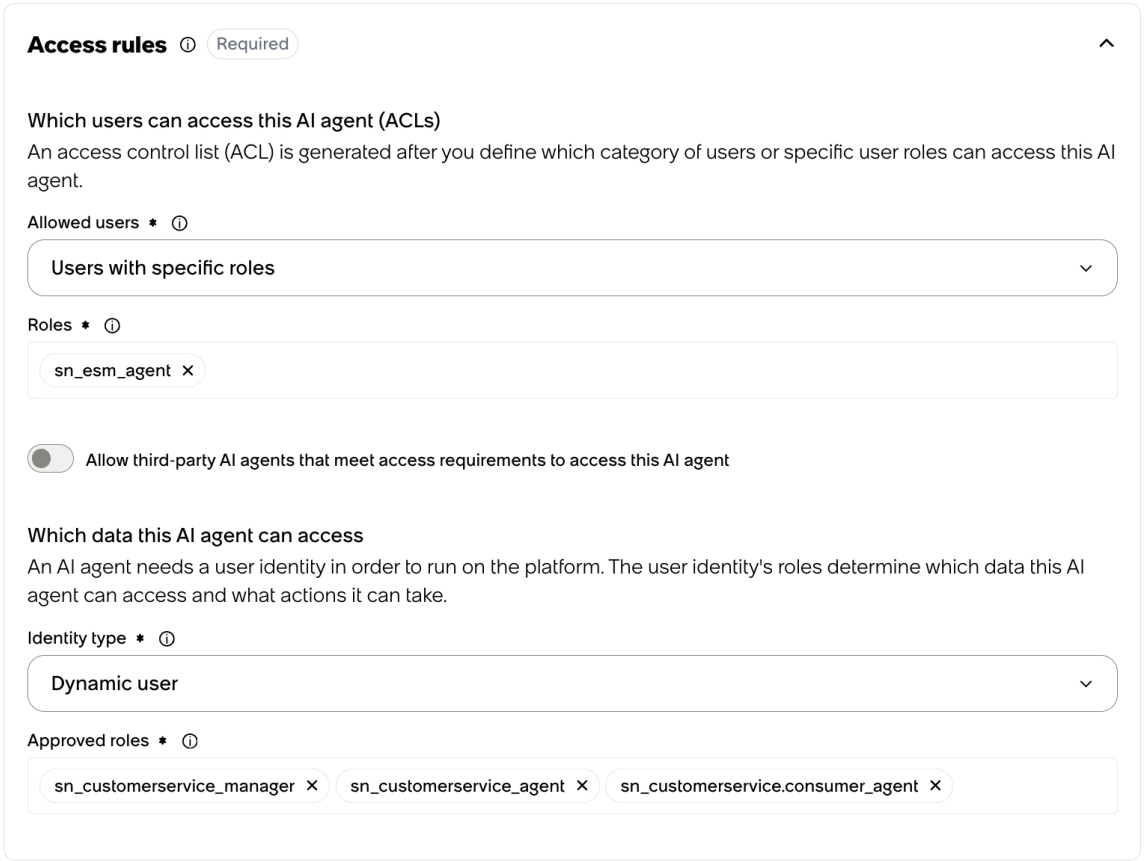
   If you select *Dynamic user*, you can select the *Approved roles* that the AI agent runs with. By default, an AI agent runs as a dynamic user and has the roles of the invoking user. Select the approved roles to limit the data access that an AI agent could have. Role filtering must be applied for all AI agents and agentic workflows to run as dynamic users. If you don't select any roles, the agent inherits whatever roles the invoking user holds.

   To override the role filtering requirement for a specific agentic workflow or AI agent, admins with the correct elevated access can create an approved list of roles for a given agentic workflow or AI agent. Then, they can access that role filtering record in the Agent Access Role Configurations table [sys_agent_access_role_configuration], and select the **allow all roles** check box. Taking these steps deactivates the requirement for a role filtering approved roles list in AI Agent Studio, so the AI admin can return to AI Agent Studio and continue to configure the agentic workflow or AI agent without role filtering applied.

   Note: Role filtering should be applied as security best practice and adherence to the principle of least privilege. Overriding the role filtering requirement isn't recommended.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When testing an AI agent, run the AI agent with different roles to confirm that only the correct data is accessed for the user audience.



Result

You have created an ACL that determines who can discover and access your AI agent, and you have assigned a user identity (and role filtering, if relevant) to the AI agent to determine what data it can access.

What to do next

Scroll down to the next section of the guided setup, *Triggers*, to define specific conditions where the AI agent should run. Adding triggers is optional.

Add a trigger to an AI agent

In the guided setup for an AI agent, add triggers to run the AI agent automatically when certain conditions are met.

Before you begin

Role required: sn_aia.admin

About this task

Adding a trigger is optional. If you want your AI agent to be used only in chats, you don't need to add a trigger. Only add a trigger if you want to invoke the AI agent automatically when some event occurs. Triggers can be added, edited, and removed at any time, and an agent with no trigger can still be used in chat.

A trigger determines how often and how widely the agent runs, so scope the condition before activating it. A condition that matches a large set of records invokes the agent for each of them, and a scheduled trigger processes a capped number of records per run, ten by default. Test the agent manually against a single record that meets the condition first.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't want to add a trigger, skip to the next step, Select channels and messages.

Procedure

1. Select a trigger type from the dropdown.

   The trigger type determines when the AI agent will be invoked.

2. Enter details for the trigger.

   a. Enter a name for the trigger.

   b. Select the table on which the trigger will run.

   c. Define the conditions that must be met for the trigger to activate.

      You must define at least one condition to create a trigger.

   d. Enter the objective for the AI agent in the **Objective for this AI agent** field.

3. Define user identity and data access for the trigger.

   a. Choose how to define the user identity for this trigger.

      You can use an AI user identity, an existing table, or a new custom script. The user identity determines what data the AI agent can access when the trigger runs.

   b. Select the AI user identity.

      Note: This trigger runs as a type of user identity with roles and associated data access rules it can impose on the AI agent. Review the AI agent's access rules to prevent any rule conflicts or gaps.

4. Configure the trigger channel.

   a. Select where the AI agent will launch.

      You can choose to launch the AI agent in the ServiceNow Otto panel or Virtual Agent.

   b. Choose whether to show an alert to users by toggling **Show an alert to users**.

5. Select **Save**.

   If you choose a scheduled trigger, additional options are available, such as the day of the week and time when you want the trigger to run.

   Note: When running a scheduled trigger, not every record is included in the execution. By default, the value is 10. If you want to change this number, you must set the *sn_aia.max_scheduled_trigger_query* system property to a different value.

   If you choose an email trigger, the target emails must exist on the Reply [sys_reply] table. New emails aren't available as triggers.

6. Repeat the preceding steps for additional triggers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You have added triggers to your AI agent to run it automatically under the specified conditions.

What to do next
Scroll down to the next section of the guided setup, *Channel and display*, to configure where the AI agent can be invoked and set processing messages.

Select channels and processing messages for an AI agent

In the guided setup for an AI agent, select whether to use it in the ServiceNow Otto panel or an Otto assistant.

Before you begin
Role required: sn_aia.admin

About this task
In this section of the AI agent guided setup, you configure where the AI agent can be invoked.

Procedure
1. Choose whether to allow users to invoke your AI agent in the ServiceNow Otto panel.
2. Choose whether to engage via Otto assistants by toggling **Otto assistants**.

   If enabled, you must select which chat assistants have access to the AI agent. You can edit assistants using Assistant Designer. If the list is empty, you may need to create a new assistant.

   Assistant Designer is where chat and voice assistants are configured. The list of options is populated from it, so an assistant that does not exist there can't be selected. If the list is empty, or if you are configuring a voice agent and no voice assistant is offered, create the assistant in Assistant Designer first and return to this step.

3. If you selected **Otto assistants** as a channel, set the AI agent's in-progress and completion messages.

   You can set an in-progress message, completion message, or both. If you don't want to use a specific type of message, unselect the toggle next to the message field.

   You can also use ServiceNow Otto to generate the messages for you by selecting **Generate messages**. You can change the messages after they're generated.

   This feature is only available for AI agents with the *Chat* modality.

4. Select **Save**.

Result
You have completed the channels section of the guided setup for creating an AI agent.

What to do next
Move to the next section, Manage memory.

Modify an AI agent

Modify an AI agent in AI Agent Studio to refine its performance, align with business goals, or enable it to perform new tasks.

Before you begin
Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can make tweaks to your AI agent based on previous performance, refine it to better align with evolving business goals, or make major changes to enable it to perform entirely new tasks. This includes updating the definition and instructions, adjusting security controls, adding or removing triggers, modifying tools to provide more or better capabilities, and changing where and how the AI agent is invoked.

This is also where an agent drafted in a conversation can be revised and completed. Nothing set during a conversation is fixed. The definition, tools, execution modes, security controls, triggers, and channels can all be changed here.

The instructions field supports multiple versions within the same AI agent, allowing you to test different instructions and evaluate performance without losing previous versions. For more information, see Version control for AI agents and agentic workflows.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI agent that you want to modify.
3. In the node view, select either the pencil edit icon or the more options icon.

   The first node contains the main configuration settings for the AI agent. The other nodes represent the tools that comprise the underlying architecture.

   The pencil edit icon directs you to the original guided setup for the AI agent. You can add tools in the guided setup, but you can't add child agents.

   If you want to add child agents, select the more options icon and select **Add child agent**. You can add an existing AI agent or create one from scratch. Choosing to add an AI agent from scratch opens a new tab with the guided setup for the AI agent. It will be added as a child agent to the AI agent you're modifying once it's saved.

   Select the more options icon, select **Add tool**, then select the type of tool you want to add to open a new tab with the tool guided setup. See Add a tool to an AI agent.
4. Define the AI agent's specialty.
5. Define access rules for the AI agent.
6. **Optional:** Add a trigger to automatically invoke your AI agent if a specified event occurs.
7. Configure where your AI agent can be invoked and set processing messages.
8. Set up long-term memory and active learning controls for your AI agent.

   AI agents can learn from previous interactions, if configured to do so. You can choose the categories of information that the AI agent should consider from its previous experiences when approaching new problems.
9. Select **Save** or **Run test** to save your changes.

Result

Your AI agent is modified and ready to use.

What to do next

You can test an execution of your AI agent manually or evaluate the AI agent using automated tests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate external AI agents

Integrate external AI agents in AI Agent Studio to connect the ServiceNow AI Platform with third-party agentic AI providers as primary agents.

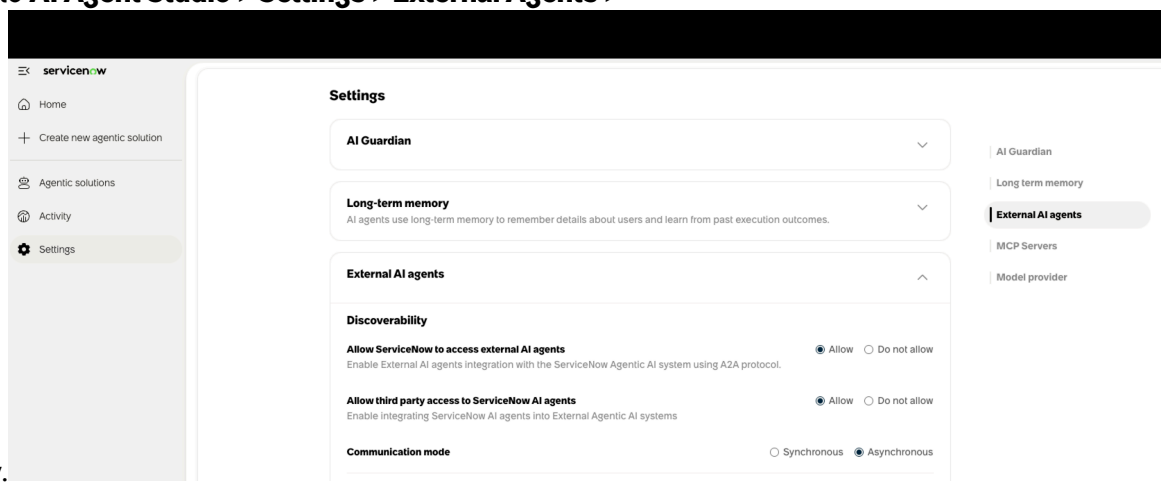
What are External Agents

External agents are the AI agents deployed on other platforms or ServiceNow instances that support A2A protocol. A2A is the only protocol we support for this functionality.

External agents operate independently and aren't managed directly by the ServiceNow AI Platform. Instead, they are invoked by ServiceNow agents through defined API contracts or messaging protocols, allowing two-way communication and task orchestration across system boundaries.

Discover External AI agents

You can enable external AI agents on the AI Agent Studio via the Settings page. Navigate to **AI Agent Studio** > **Settings** > **External Agents** > **Discoverability**.



- **Allow ServiceNow to access external AI agents**: The external AI agents can integrate with the ServiceNow agentic AI system using the A2A protocol, with the **Allow** radio button selected by default.

  To prevent external AI agents from being integrated with the ServiceNow agentic AI system using the A2A protocol, select **don't allow**.

- **Allow third-party access to ServiceNow AI agents**: The ServiceNow AI agents are configured by default for integration into external AI systems, with the **Allow** option selected by default.

  To prevent ServiceNow AI agents from being integrated into the external agentic AI system, select **don't allow**.

  > **Important:** You can integrate ServiceNow AI agents into other agentic AI systems, such as Google Cloud or Azure OpenAI.
  >
  > For information about setting up ServiceNow AI agents as secondary agents (acting as A2A server) for integrating into other agentic AI systems, see ServiceNow AI agents as secondary agents.

- **Communication mode**: Controls how external AI agents interact with the ServiceNow agentic AI system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You have two types of communication modes:

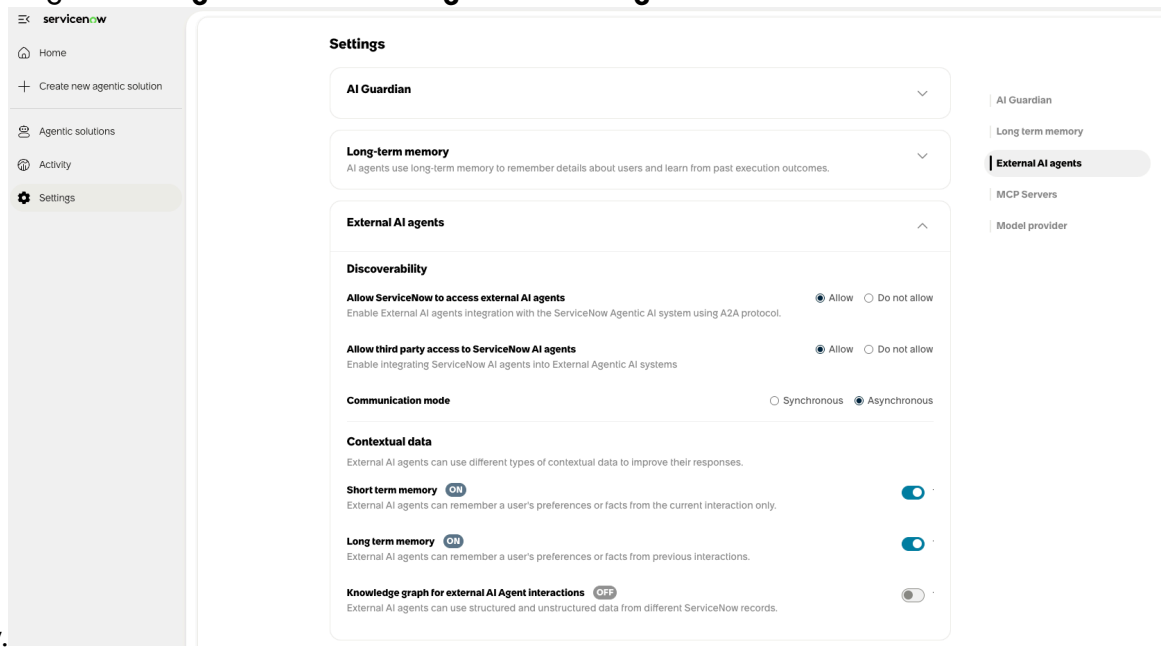
- **Synchronous**: The external AI agent waits for a response before proceeding. The communication is real-time and blocking — the agent pauses until ServiceNow returns a result.
- **Asynchronous**: The external AI agent does not wait for an immediate response. Communication is non-blocking — the agent can continue processing and handle ServiceNow responses when they are available, typically through callbacks or event-driven mechanisms. Asynchronous mode is the default communication mode.

When creating a new external AI agent in AI Agent Studio, you can connect your agent to the ServiceNow agentic AI system using the Agent2Agent (A2A) protocol integration. To do this, you must have a Connection & Credential alias record that connects to your agentic AI provider.

After connecting to the external AI agent, you can add details about its role and instructions to provide context for the AI Agent Orchestrator. Additional context helps differentiate your AI agent from other AI agents so that the AI Agent Orchestrator can decide about which agent to use.

Contextual data access for External AI agents

You can enable contextual data access for external AI agents to improve AI agent response during execution on the AI Agent Studio via the Settings page. Navigate to **AI Agent Studio** > **Settings** > **External Agents** > **Discoverability**.



- **Short-term memory**: Turn on the toggle to enable external AI agents remember your preferences or facts from the current interaction only. The toggle is turned on by default.
- **Long-term memory**: Turn on the toggle to enable external AI agents remember your preferences or facts from previous interaction. The toggle is turned on by default.
- **Knowledge graph for external AI agent interactions**: Turn on the toggle to enable external AI agents to use structured and unstructured data from different records across the ServiceNow AI Platform. The toggle is turned off by default.

Agent2Agent Protocol

Agent2Agent (A2A) is an open standard that enables cross-platform AI agent communication by associating each agent with an Agent Card containing provider information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent2Agent Protocol overview

The standard relies on every AI agent having an Agent Card associated with it. The Agent Card provides basic information for providers like the ServiceNow AI Platform, Microsoft Azure, and Google to use them.

Note: The supported A2A version for on-glide is v0.3 and the supported A2A version when Premium Chat is enabled is v1.

An AI agent's Agent Card uses standardized JSON to help different providers understand its capabilities. The Agent Card is accessed by a specific type of endpoint from a provider's server. Execution plans are communicated through an execution endpoint so that both the provider's server and the ServiceNow AI Platform can track what the external AI agent is doing.

See Create an external AI agent for instructions for using this protocol to create an AI agent.

Configuring A2A authentication

A2A connections require authorization from the source platform to execute on the ServiceNow AI Platform. Authentication is established by creating two Connection & Credential Alias and Connection records, one with an Agent Card endpoint and another with an execution endpoint.

Custom Headers for External Agent Configuration

When configuring external agents, you can pass custom HTTP headers to be included in the API calls to external endpoints. In the External Agent Configuration [sn_aia_external_agent_configuration] table, use the custom headers column to specify headers in JSON format. These headers are applied to all HTTP requests made by that agent during offline execution, regardless of the connection type (OAuth, API Key, or other). The configured headers are sent alongside the agent's authentication credentials and are useful for passing additional metadata or requirements that your external API expects.

Note: Custom headers apply only to the Premium Chat experience.

Configuration Properties

The following properties configure different aspects of how your agents can interact with the ServiceNow AI Platform.

External AI agent properties

Name	Description
sn_aia.external_agents.enabled	Set to `true` to enable external agent features
sn_aia.external_agents.parallel_conversations.enabled	Enables or disables multiple simultaneous conversations per user

Create an external AI agent

Create external AI agents in AI Agent Studio to connect the ServiceNow AI Platform with third-party agentic AI providers.

Before you begin
Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Home** > **Create new agentic solution** and select **New AI agent for a task**.
2. On the New AI Agent pop-up, select **Create an external agent instead**.
3. Discover and select an external AI agent through a provider.

   a. On the New external AI agent form, select an AI agent provider from the **Provider** drop-down or add a provider.
   If you select a **Add new provider**, fill in the fields and select **Add**.

   Add provider form fields

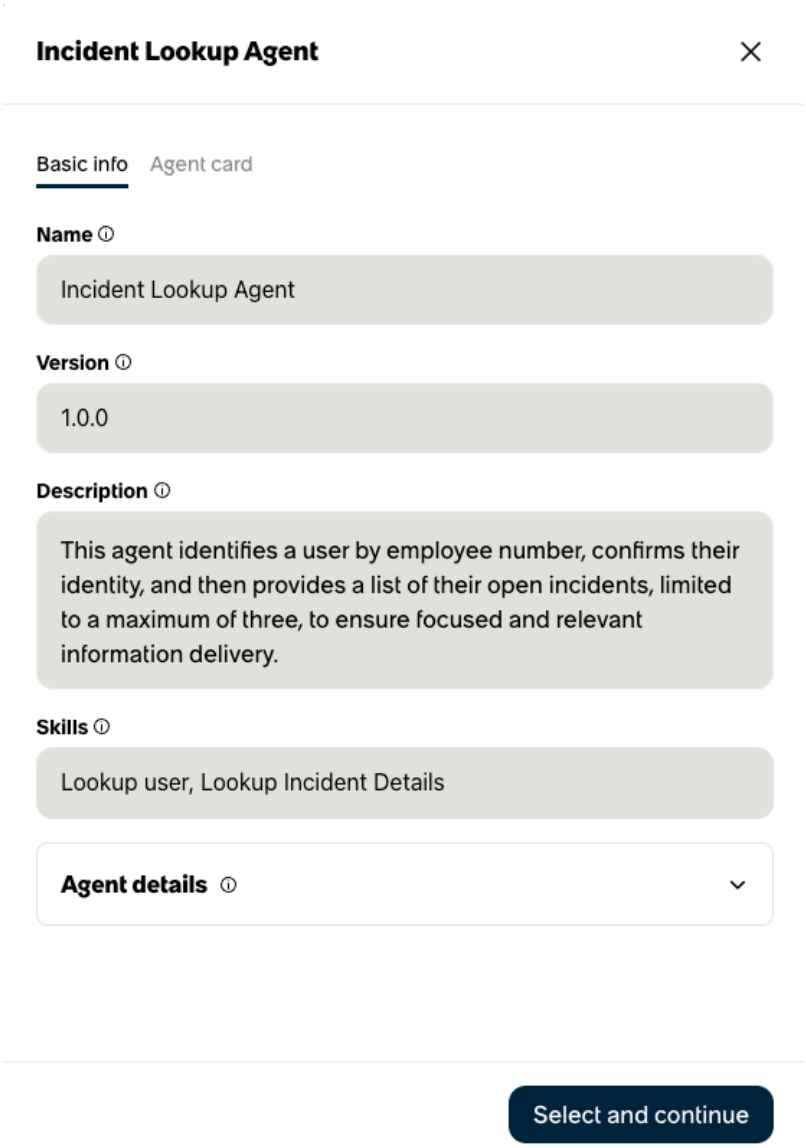
Field	Description
Name	Name of the agentic AI provider.
Discovery type	
Agent card URL	The URL that points to the external AI agent's Agent Card. The URL should include `.well_known/agent_json`.
Advanced settings	
Connection and credential alias	Credentials to access your external AI agent's Agent Card. You can select an existing alias or create one.
Select Subflow	Subflow that establishes Agent2Agent protocol. The default subflow should handle the majority of cases, but you can also create your own.

   Note: Additionally, you can view and edit the provider details by selecting **View provider details**.

   b. Select **Discover external AI agent** to validate the connection to your external agent.
   If discovery is successful, the name of your agent and the version number are added to the page.

   c. Select the name of the agent to verify that the **Basic Info** and **Agent card** details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

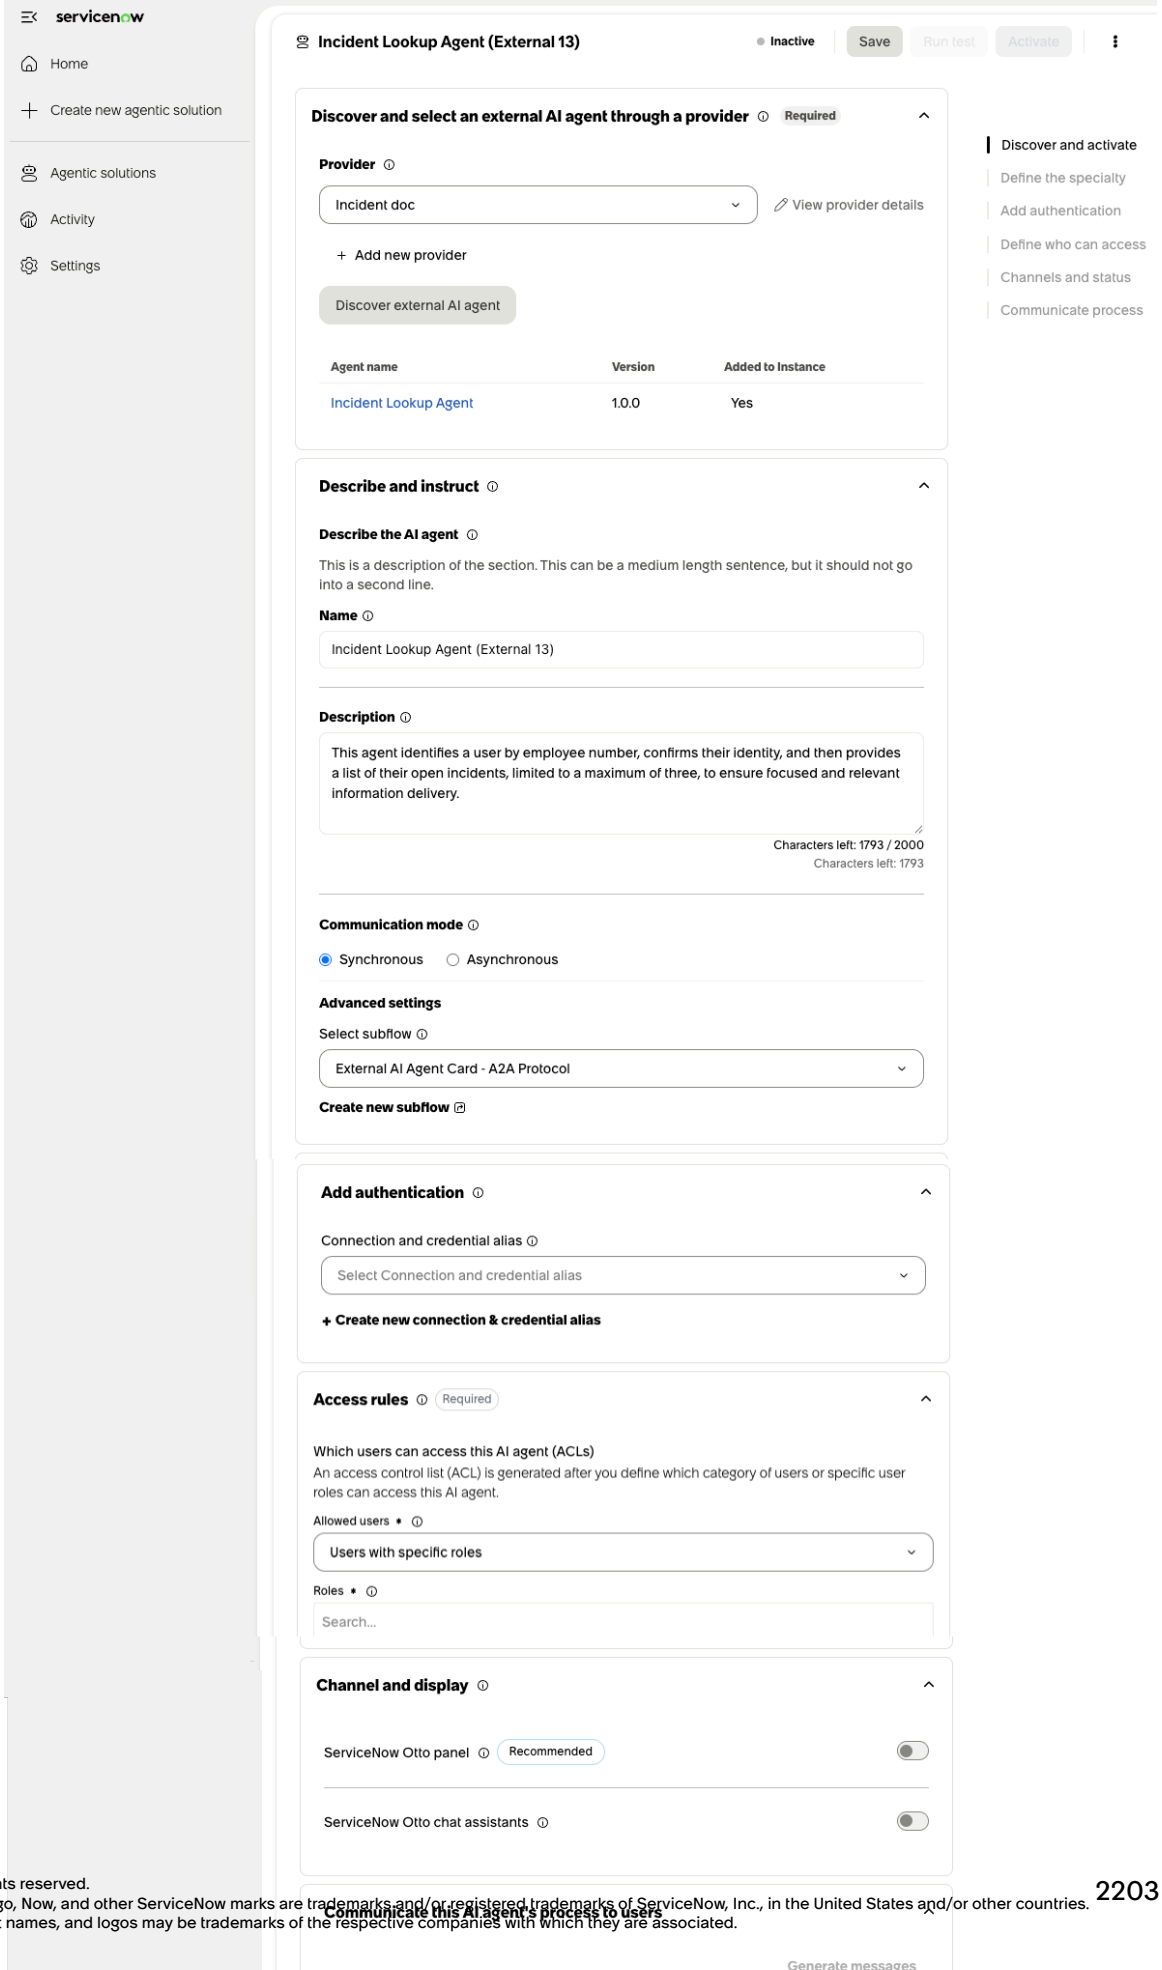


- The **Basic info** tab contains the *`Name`*, *`Version`*, *`Description`*, *`Skills`*, and **Agent details**.
- The **Agent card** tab shows the entire JSON for the agent.

d. Select **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The guided setup for the selected external AI agent is now



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Describe and instruct the external AI agent by adding details for how it fits in the ServiceNow agentic system.

   Describe your external AI agent with a name and description. You must also select the communication mode for the external AI agent along with the subflow. You can leave your external AI agent description as it is, or you can add a longer description to help differentiate the agent from other external AI agents. This helps enable the external AI Agent Orchestrator to use your external AI agent more effectively.

   a. Verify the **Name** and **Description** to summarize the main intention of the external AI agent.

      Note: If the name and description aren't clear or correct, the Orchestrator won't know how to wield the external AI agent in context.

   b. Set your communication mode under **Communication mode** to one of the following:

      - **Synchronous**: ServiceNow Exchanges data with the external AI agent in real-time and waits for an immediate response. The synchronous mode is selected by default.
      - **Asynchronous**: ServiceNow exchanges data with the external AI agent and continues processing without waiting for an immediate response.

        Note: Asynchronous connection involves communication where the sender and receiver don't have to be active simultaneously unlike the synchronous communication mode.

        To establish asynchronous connection, you must obtain a callback URL for push notifications to function. Once you have obtained a callback URL, you must create a record on the External Agent Callback Registries [sn_aia_external_agent_callback_registry] table. Go to the table, select **New**, and enter the callback URL. Save the record.

        After saving the record, a Connection & Credential Alias [sys_alias] record is created for you. To add authentication, you can open the Connection record associated with the sys_alias record and add a credential to the *Credential* field. When the record is created, you can go back to the External Agent Callback Registry record you created and select **Verify URL** to test that the connection works as expected.

      Note: Some agents don’t support asynchronous communication.

   c. Select a subflow under **Advanced settings**.

      You can use either the default subflow; which is **External AI Agent Card - A2A Protocol**, or an existing subflow from the **Select subflow** drop-down, or create a subflow. The default subflow should work for the majority of cases.

5. Add authentication for an external AI agent using the connection and credential alias.

   Choose which credentials access your external AI agent's execution endpoint. You can select an existing alias or create one. If you create one, a modal displays with options for configuring an OAuth or API Key authentication.

   Note: For more information about the API Key credential, see A2A API Key credential behavior.

6. Configure access control lists (ACLs) for the external AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The ACLs determine who has access to discover and execute the AI agent. To learn more about the ACLs you can create in AI Agent Studio and how to add more advanced security configurations, see Implement access control in AI Agent Studio.

Important: This is a required step. If you have previously configured an external AI agent without creating an ACL, you must generate an ACL before you can make other modifications.

Define who can access the external AI agent

Field	Description
User access	The type of users whose access for the AI agent is defined by the following options: ○ **Any authenticated user**: Any user who is logged in can access the external AI agent. ○ **Users with specific roles**: Users that have at least one of the roles assigned to them can access the external AI agent. This option is the default. **Note:** If a user doesn't have access to an external AI agent or if the user doesn't have access to at least one of the external AI agents in the respective agentic workflow execution, then the whole execution aborts before the first external AI agent is initiated. ○ **Public**: Any user can access the external AI agent even without logging in. Use this option only when you want guests to be able to access the external AI agent. **Note:** Understand that this configuration should be used sparingly and only when needed.
Role	Assign one or more specific roles from the drop-down menu. **Note:** Selecting the role is possible only when you chose the **Users with specific roles** user access.

7. Select a display channel where your external AI agent can be discovered.

   ○ **ServiceNow Otto panel**: Users can discover and invoke this external AI agent from the ServiceNow Otto panel.

   ○ **ServiceNow Otto chat assistants**: Users can discover and invoke this external AI agent from the chat assistant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Both the display options are turned off by default. Choose one or both as the channel display for your external AI agent.

8. Communicate the external AI agent's process to users.
   - **Context for the messages**: Describe what you external agent is set to do.
   - **In-progress message**: Choose processing messages to display to the user when the external AI agent is executing.

     For example, `Initiating AI agent` or `Processing record details`, or `An AI agent is looking into the request`.
   - **Completion message**: Provide a completion message to display to the user when an external AI agent is done executing.

     For example: `Identified next steps` or `Processed the record details`.
   - Select **Generate messages**.
9. Select **Activate**.

Result

Your external AI agent is configured with the context necessary for it to be used by the external AI Agent Orchestrator. It has the required information to accomplish its intended tasks.

What to do next

You can test your AI agent on a record manually to see an example execution. You can also create an automated agentic evaluation to test the AI agent over repeated interactions. Automated evaluations can recommend specific optimizations if the LLM judges find underlying patterns for low success rates.

Activate your AI agent and make it ready for use by selecting **Activate**.

Note: The status of the external AI agent is shown as **Inactive** until it is activated.

ServiceNow AI agents as secondary agents

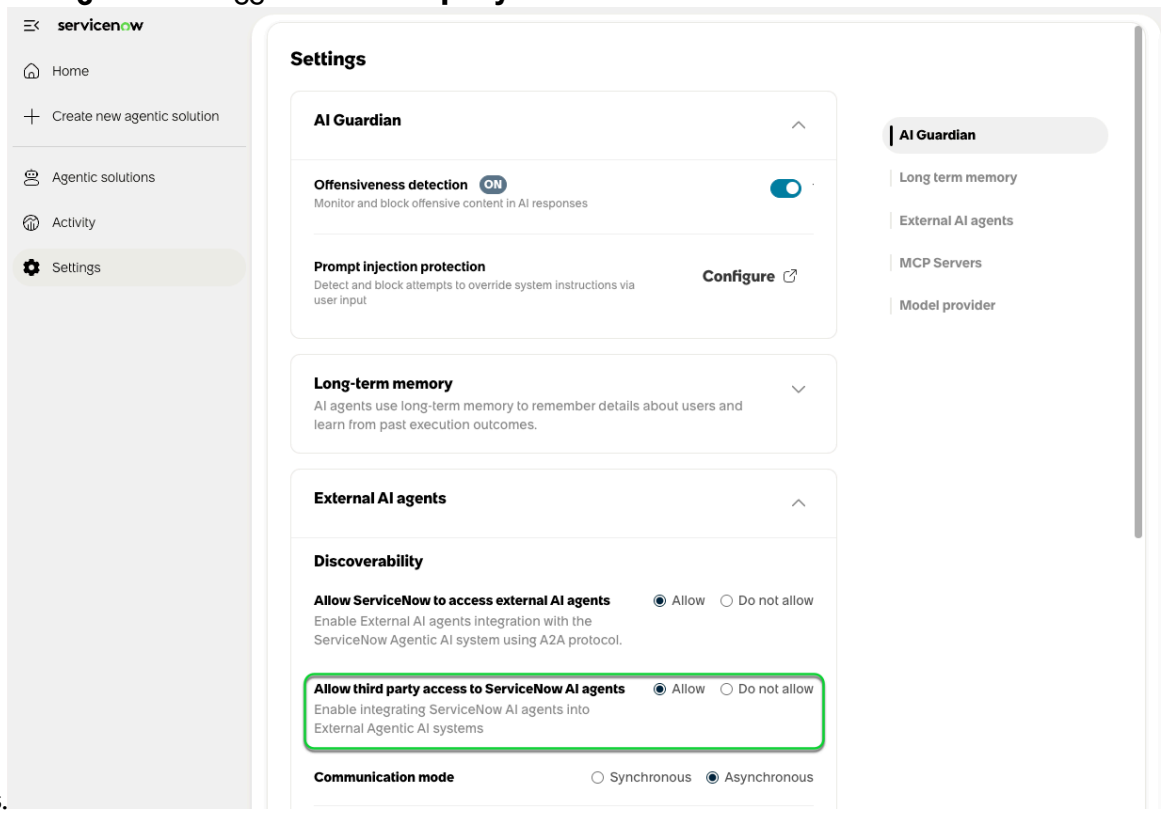
Secondary agents are specialized AI agents that handle specific workflow tasks delegated by a primary agent or user. You can connect your ServiceNow agent to other agentic AI model providers using the Agent2Agent protocol.

Enable ServiceNow AI agents as secondary agents

You can enable ServiceNow AI agents as secondary agents to use on other AI platforms. To do so, navigate to **AI Agent Studio** > **Settings** >

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External AI agents and toggle **Allow third party access to ServiceNow AI agents**.



Secondary agents overview

After creating your AI agent in AI Agent Studio, you can point it to the Agent Card URL that is displayed for secondary agents. Admins can view, copy, and consume the URL for easy access. The endpoint to point the AI agent to Agent Card for the actual execution of the AI agent is in the `{{instance}}.service-now.com/api/sn_aia/a2a/v2/agent/id/{{agent-id}}` format.

You can use the same OAuth or API key for authenticating the agent discovery and the agent execution. For more information, see A2A API Key credential behavior.

To verify that your AI agent is running from the ServiceNow side, during a conversation with the AI agent, you can go to the *`Execution Plan [sn_aia_execution_plan]`* table. From the Execution Plan table, you can identify the execution plan based on the *`Objective`* field that contains the prompt from the conversation on the other platform.

For more information about setting up instructions for your ServiceNow AI agents as secondary agents (acting as A2A server), refer to Authentication for A2A - ServiceNow as Secondary Agent.

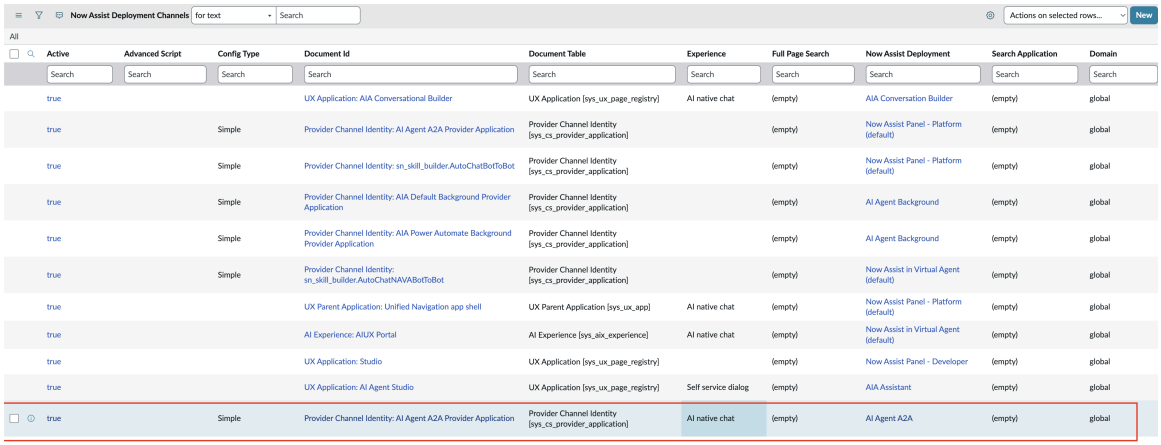
For more information about sample payloads for A2A with ServiceNow AI agent as Secondary agent, see Sample payloads for A2A.

Agent-to-UI (A2UI) protocol support for secondary agents

The A2UI protocol allows interactions that enable agents to drive UI workflows and receive structured responses from user interface surface with more advanced visual responses in external systems when connecting to ServiceNow agents. To enable the A2UI protocol, you must:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Turn on the *sn_aia.external_agents.a2ui.enabled* system property to **true**, whose default value is **false**.
- Route the A2A deployment through off-glide experience. The A2UI responses can only be built on the off-glide path. Verify that the *sn_nowassist_va.show_ai_native_experience* system property to **true** and the A2A deployment record experience to **AI native** in the *sys_now_assist_deployment_channel*, as shown in the following image:



- Check the agent card. When you enable the system properties mentioned earlier, the card adds the extension under *capabilities.extensions*. If the property is enabled but the off-glide experience isn't setup, then the extension is left off the card without any warning. The only sign is an error in the log.
- Have the calling client request A2UI on each call. The client has to:
  - Send the header `X-A2A-Extensions`. For example, `https://a2ui.org/aa-extension/a2ui/v0.9`.

    Note: Only versions **0.9** is supported.

  - Include `application/json+a2ui` or `application/json` if it sets the `configuration.accpetedOutputModes`. Without one of those, the requests is rejected with `InvalidAccpetedOutputModes`.

    To get v1 when ServiceNow acts as primary agent, the premium chat should be enabled in the respective assistant this agent is being executed from. Refer to the Premium Chat experience article on how that can be enabled.

For more information about A2UI, see A2UI documentation.

Setting up A2A authentication for ServiceNow AI agents

Configure ServiceNow AI agents as secondary agents over the Agent2Agent (A2A) protocol by setting up authentication and enabling external agent interoperability.

Before you begin

Before you begin, verify the following requirements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Platform version: Yokohama Patch 11+ (January 2026) or Zurich Patch 4+ (December 2025)
- Now Assist AI Agents 6.0.x or later (December 2025 release or newer)
- Administrator access to configure system settings and API policies

Role required: sn_aia.admin

Procedure

1. Enable external agent settings in AI Agent Studio.

a. Go to **All** > **AI Agent Studio** > **Settings**.

b. Under **External AI agents**, set the following properties to **Allow**:
- **Allow ServiceNow to access external AI agents**
- **Allow third party access to ServiceNow AI agents**

2. Create and configure a service account with appropriate roles.

a. Create a user in the User [Sys_User] table with the following settings:
- **Active**: **true**
- **Password needs reset**: **false**
- **Locked out**: **false**

b. Assign the following roles to the user:
- sn_aia.integration (recommended for basic runtime access)
- sn_aia.admin (for testing only – full write/create access)
- Any necessary application roles such as itil
- Integration roles: rest_service and snc_platform_rest_api_access

3. Select and configure the AI agent for external discovery.

a. Navigate to **All** > **AI Agent Studio** > **Agentic Solutions**.

b. Select the AI agent you want to configure.
Note the Sys_Id of the AI agent from the browser address bar or directly from the AI Agent [sn_aia_agent] table.

c. Enable **Allow third-party to access this AI agent**.
This makes the agent externally discoverable and sets the `External discoverable` property to true in the AI Agent Config record.

d. Select a display channel where your external AI agent can be discovered.
Under the Channel and display section of the external AI agent, select one or both the display options:
- **ServiceNow Otto panel**
- **ServiceNow Otto chat assistants**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure the communication mode.

   a. Decide on your communication mode:

      - **Synchronous:** Use for testing with Postman or when you don't have a functional callback URL.
      - **Asynchronous:** Recommended for production for better user experience and performance. Requires a callback URL configured in the External Agent Callback Registry table.

   b. To set synchronous mode, go to **AI Agent Studio** > **Settings** > **External AI agents** > **Discoverability** and set the **Communication mode** to **Synchronous**.
   Alternatively, navigate to **All** > **Tables** > **Messaging Channels** > **AI Agent A2A Channel** and set **Synchronous** to **true**.

5. Create an OAuth application registry for external clients.

   a. Go to **System OAuth** > **Application Registry**.

   b. Select **New** and choose **Create an OAuth API endpoint for external clients**.

   c. Fill in the following fields:

      - **Name:** Enter a descriptive name (example: A2A OAuth External Agents)
      - **Client ID:** Auto-populated
      - **Client Secret:** Auto-generated upon saving

   d. Under **Auth Scopes**, add the `a2aauthscope` record.

   e. Save the Application Registry record.

6. Configure authentication profiles for OAuth or API key access

   a. Choose your authentication method: **OAuth 2.0** or **API Key**.

      - To configure OAuth 2.0:
        - Navigate to **System Web Services** > **API Access Policies** > **Inbound Authentication Profile** and select **New**.
        - Set **Type** to **OAuth** and select the OAuth entity you created in the previous step.
      - To configure API Key:
        - Navigate to **System Web Services** > **API Access Policies** > **Inbound Authentication Profiles**, select **New**.
        - Select **Create API Key authentication profiles** and set **Auth Parameter** to `x-sn-apikey`.

   b. For API Key authentication, go to **System Web Services** > **API Access Policies** > **REST API Key**, select **New**, and configure:

      - **User:** Select your service account
      - **Auth Scope:** a2authscope

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Add authentication profiles to the API access policy.
   a. Navigate to **System Web Services** > **API Access Policies** > **REST API Access Policies**.
   b. Select **AI Agent A2A API Access Policy**.
   c. Under **Inbound authentication profiles**, add your authentication profile (OAuth or API Key) to the list.
8. Test the A2A API configuration using your chosen authentication method.
   a. **API Key authentication**: Open Postman and create a GET request:
      - **Method:** GET
      - **URL:** `https://<your instance name>.service-now.com/api/sn_aia/a2a/id/<your AI Agent ID>/well_known/agent_json`
      - **Headers:** Add `x-sn-apikey: <your API key>`
   b. **OAuth 2.0 authentication**: In Postman, set **Auth Type** to **OAuth 2.0**, configure grant type and credentials, then select **Get New Access Token**.
   c. Send the request and verify a 200 OK response with the Agent Card payload returned for your AI Agent sys_id.
9. Configure external instance connectivity (for multi-instance setups).
   a. For API Key authentication on client instance, navigate to **IntegrationHub** > **Connections & Credential Aliases**.
   Create two connection aliases: one for Agent Card discovery and one for Agent Execution. For each, set the connection URL to the appropriate A2A endpoint on the server instance and configure a credential with header `x-sn-apikey`.
   b. For OAuth 2.0 authentication on client instance, create an outbound Application Registry in **System OAuth** > **Application Registry** using the same Client ID and Client Secret from the server instance.
   Create the appropriate connection aliases and OAuth 2.0 credentials in IntegrationHub.
   c. In AI Agent Studio on the client instance, navigate to **Create and manage** > **AI agents** and select **Add** > **External**.
   Choose **Agent2Agent (A2A) Protocol** and select your connection alias as the external provider.
10. Debug and validate your A2A implementation.
   a. Enable debug system properties to review logs during troubleshooting:
      - *`com.snc.platform.security.oauth.debug`*: **true**
      - *`glide.auth.debug.enabled`*: **true**
   b. Navigate to **Flow Designer** > **Flow Administration** > **Settings**.
   Set **Reporting** to **Trace** and **Logging** to **Debug** for sub-production environments only.
   c. Review the following tables to validate execution and connectivity:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Execution Plan [sn_aia_execution_plan]
- External Agent Execution History [sn_aia_external_agent_exec_history]

d. Verify that service account credentials are in good standing: Active status, password does not need reset, and account is not locked out.

Result

You have successfully configured ServiceNow AI agents as secondary agents over the A2A protocol. Your AI agents can now accept external requests from other systems using either OAuth 2.0 or API key authentication.

What to do next

After completing this setup, you can:

- Add your configured AI agents as external agents in other ServiceNow instances.
- Integrate your AI agents with third-party systems using the A2A protocol.
- Monitor agent execution and troubleshoot connectivity issues using the execution history tables.

A2A API Key credential behavior

Starting in Now Assist AI Agents 7.1.x, the header included in each A2A request is driven by the API Key credential record and it is not injected automatically by the flow action.

Starting in Now Assist AI Agents 7.1.x, A2A flow actions no longer inject an `Authorization: Bearer` header automatically. The header included in each request is now driven entirely by the API Key credential record bound to the external agent's Connection & Credential Alias.

OAuth-based external agents, and API Key endpoints whose existing credential record already aligns with the endpoint's expectations, are unaffected. You only need to act if your remote A2A endpoint requires a specific header name or a scheme prefix.

Resolve 401 or 403 errors after upgrade

If your A2A endpoint returns a 401 or 403 after upgrading, update the API Key credential record bound to your external agent.

1. Open the `api_key_credentials` record bound to your A2A external agent. Navigate to the record via the **Connection & Credential Alias** on the external-agent provider.
2. If the endpoint requires a specific header name (for example, `x-api-key` instead of `Authorization`), set the **API Key Header** (`api_key_header_name`) field to the header name the endpoint expects.
3. If the endpoint requires a scheme prefix on the value (for example, `Bearer` for Google A2A), include the prefix directly in the **API Key** (`api_key`) field value — for example, change `AIza...` to `Bearer AIza...`.

   Note: The **API Key Prefix** field is not currently applied by the A2A flow action; embed the scheme in the **API Key** value instead.

4. Save the record and re-test the external agent end-to-end.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Wizard-created credential records

The wizard creates a working API Key credential record for most A2A endpoints. Only edit the credential record manually if your remote endpoint has specific requirements that the default credential does not satisfy.

- Custom header name (for example, `x-api-key`): Set the **API Key Header** (`api_key_header_name`) field to the header name the endpoint expects.
- Scheme prefix on the value (for example, `Bearer` for Google A2A): Include the prefix directly in the **API Key** field value — for example, `Bearer <your-key>`. Don't use the **API Key Prefix** field; it is not applied by the A2A flow action.

Modify an external AI agent

Modify an external AI agent in AI Agent Studio to refine its performance, align with business goals, or enable it to perform new tasks.

Before you begin

Role required: sn_aia.admin

About this task

You can make tweaks to your external AI agent based on previous performance. You can refine it to better align with evolving business goals or make major changes to enable it to perform entirely new tasks. This includes updating the definition and instructions, adjusting security controls, and adding or removing triggers. You can also modify tools to provide more or better capabilities and change where and how the external AI agent is invoked.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the external AI agent that you want to modify.
3. In the node view, select either the pencil edit icon or the more options icon.

   The first node contains the main configuration settings for the external AI agent. The other nodes represent the tools that comprise the underlying architecture.

   The pencil edit icon directs you to the original guided setup, where you can edit sections and add tools.
4. Select **Save** or **Run test** to save your changes.

Result

Your external AI agent is modified and ready to use.

What to do next

You can test your external AI agent on a record manually to see an example execution.

Create an agentic workflow

Create an agentic workflow in AI Agent Studio to coordinate multiple AI agents and solve complex problems that require collaboration across specialized agents.

Before you begin

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In the ServiceNow agentic ecosystem, an agentic workflow is a coordinated set of AI agents that work together to solve complex problems. While individual AI agents solve discrete tasks, an agentic workflow orchestrates multiple specialized agents to tackle larger, more complex objectives.

An agentic workflow uses the AI Agent Orchestrator to coordinate agents, delegate subtasks, and manage communication between agents to resolve the overall problem.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Home**.
2. Select **Create new agentic solution**, then select **New agentic workflow for a process**.
3. In the New Agentic Workflow pop-up window, describe your agentic workflow and select **Next**. Alternatively, you can select **Skip** to open a new agentic workflow form.
4. Select **Create a workflow from scratch** and select **Next**.
5. Describe the purpose of the agentic workflow, then select **Check**.

   A large language model (LLM) uses your description to generate suggested content for the general prompt of the agentic workflow. The LLM also uses the description to generate AI agent suggestions that help the agentic workflow achieve its goal.

   If other agentic solutions accomplish a goal similar to the one you describe, the check identifies them so you can edit a matching solution instead.

   You can skip this step by selecting **Skip**.
6. Review or draft the content in the *Expected behavior* section.

   You can edit any content that the LLM generates.

   The Orchestrator uses the description and instructions when the agentic workflow is invoked. This content gives the Orchestrator the context it requires to coordinate agents for the workflow's purpose.

   After making any changes to the agentic workflow in this guided setup, you can select **Save** to save your progress.
7. Add AI agents that work together within the agentic workflow.

   AI agents provide the specialized capabilities that the agentic workflow coordinates. The agentic workflow orchestrates these agents to solve complex problems collaboratively.
8. Define the agentic workflow access rules.

   The security controls configure user access and data access to the agentic workflow.
9. Add test scenarios for evaluations.

   Automated evaluations of your agentic workflow require configured test scenarios to run against. You can add existing table records as scenarios or manually enter different test objectives to cover the full range of conditions your agentic workflow can encounter.
10. **Optional:** Add a trigger to automatically invoke your agentic workflow if a specified event occurs.

    (Optional) A trigger isn't required if your agentic workflow is used only in chats.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Determine how and where users can engage with your agentic workflow and set the processing messages.

    Agentic workflows can be invoked through Virtual Agent assistants, UI actions, or both. You can configure how the workflow communicates its progress to users.

12. Select **Save** to save your changes.

Result
Your agentic workflow has the AI agents and context that it requires to coordinate work across multiple specialized agents.

What to do next
To make your agentic workflow ready for use, select **Activate**.

You can test your agentic workflow manually to see an example execution. You can also create an automated agentic evaluation to test the agentic workflow over repeated interactions. Automated evaluations can display optimization suggestions when LLM judges detect patterns behind low success rates.

Define the expected behavior an agentic workflow

In the guided setup for an agentic workflow, write a clear description defining your agentic workflow and the instructions it should perform to orchestrate AI agents and accomplish complex tasks.

Before you begin
You must either create an agentic workflow or edit an existing one to get to this step in the guided setup. To learn how to get started creating an agentic workflow, see Create an agentic workflow. Otherwise, navigate to the AI Agent Studio and select the agentic workflow you want to define to enter the guided setup.

These fields may be blank or be filled in for you as a first draft as part of the new AI Agent Studio setup process.

Role required: sn_aia.admin

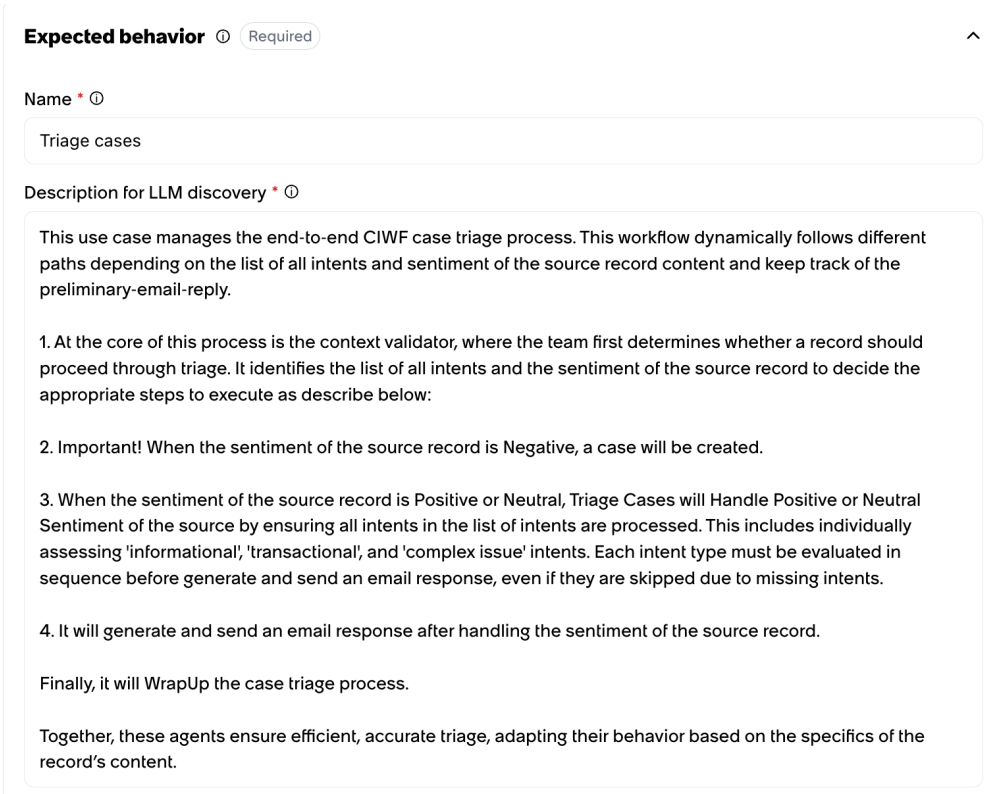
About this task
The first step of the guided setup enables you to define the fundamentals of the agentic workflow. The description and instructions fields are used by the AI agent Orchestrator to understand how to use the agentic workflow and coordinate its AI agents. Descriptions and instructions should be clear and well-defined. For guidelines for writing these fields, see Writing effectively for agentic AI. For an example agentic workflow, see Example agentic workflow.

Procedure

1. Verify or create the name and description of the agentic workflow for the LLM that summarize the main intention of the agentic workflow.

   If the name and description aren't clear or correct, the Orchestrator won't know how to use the agentic workflow in context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

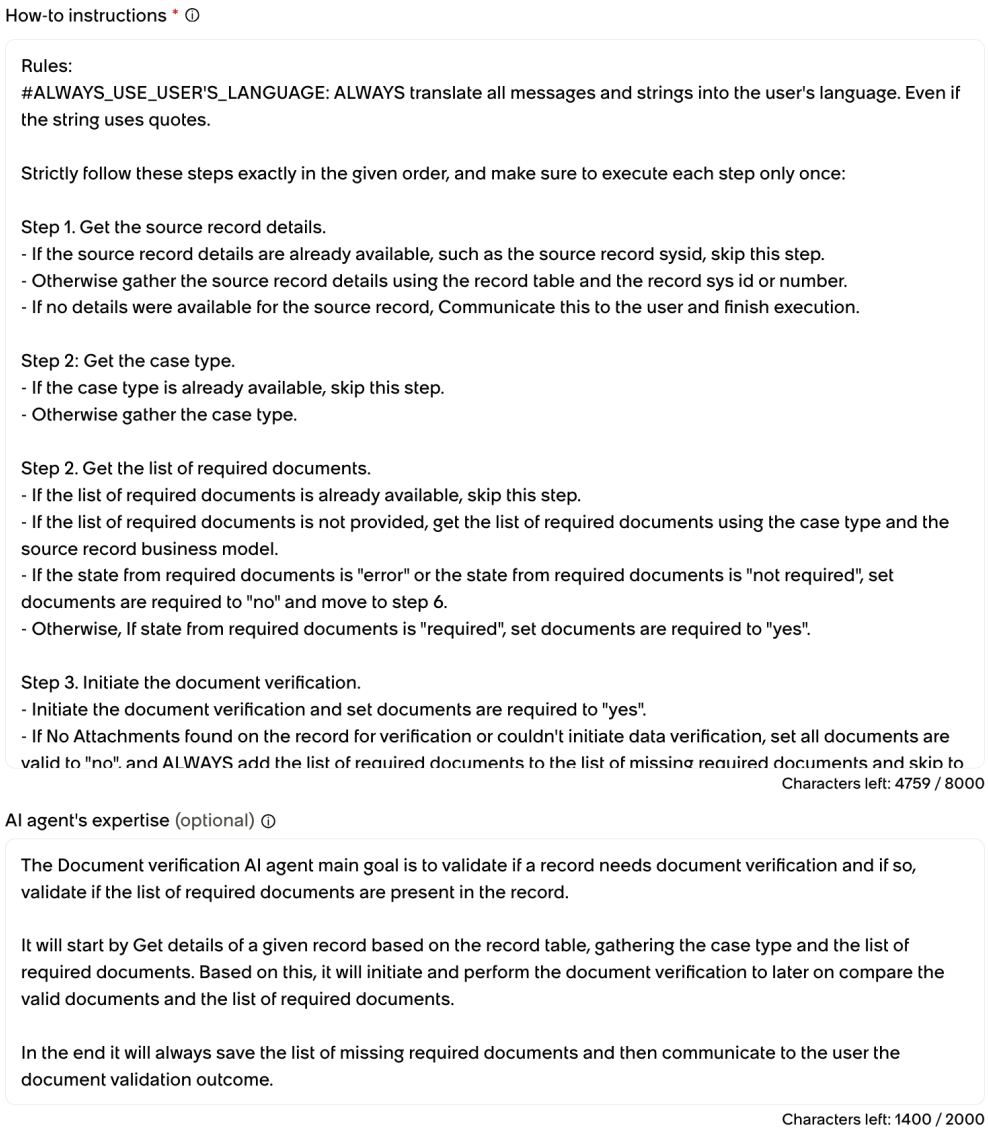


2. Review and refine the *How-to instructions*.

   The instructions are the most important element of the agentic workflow. They tell the Orchestrator what the workflow accomplishes and how it will coordinate AI agents to perform complex tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create different versions of the agentic workflow instructions. After testing an agentic workflow or evaluating an agentic workflow, you can adjust the instructions and compare their performance. See Version control for agentic AI to learn more.



Result

The fundamentals of your agentic workflow are defined so that the AI agent Orchestrator can use it.

What to do next

Scroll down to the next section of the guided setup, *AI Agents*, to add AI agents to your agentic workflow.

Add AI agents to an agentic workflow

Add AI agents to an agentic workflow so they can work together to accomplish complex tasks.

Before you begin

Role required: sn_aia.admin

About this task

AI agents are the core components of an agentic workflow. Each AI agent performs specialized tasks, and the agentic workflow coordinates them to solve complex problems collaboratively. You

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

can create AI agents, add existing AI agents to your workflow, or allow the system to recommend AI agents based on your workflow's description and instructions.

Procedure

1. In the **Agents** section, select **Add Agents**.
2. Choose how you want to add AI agents:

   - Select **Create new agent** to create an AI agent. The AI agent guided setup opens in a new tab of AI Agent Studio. You can configure the new AI agent and return to the agentic workflow once you have saved it.

   - Select **Add existing agent** to add an AI agent that already exists. A modal opens where you can search for an AI agent by name or browse the list of available AI agents. Select the AI agent you want to add to the agentic workflow.

   - Select **Recommend agents** to let the system suggest AI agents. Based on your agentic workflow's description and instructions, the system automatically populates relevant and useful AI agents that would benefit your workflow.

   Once an AI agent is selected, it appears in the Agents section and can be removed by selecting the remove icon.

Result
You have added AI agents to your agentic workflow. The workflow now has the specialized agents it needs to accomplish complex tasks collaboratively.

What to do next
Scroll down to the next section of the guided setup to define security controls for your agentic workflow.

Define access rules for an agentic workflow

Define security controls for an agentic workflow to determine which users can access it and what permissions they have.

Before you begin
Role required: sn_aia_admin

About this task
The Access rules section is divided into two parts: **Which users can access this agentic workflow (ACLs)** and **Which data this agentic workflow can access**. The former creates an ACL that determines who can discover or invoke the agentic workflow. The latter defines the data that the agentic workflow has access to once it's invoked.

See Security for AI agents for more information about creating ACLs and user identities for security for AI agents.

Procedure

1. Define user access by selecting an option from the **Allowed users** dropdown.

   The dropdown menu options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Users with specified roles
- Authenticated users
- Public

If you select *Users with specified roles*, you can select exactly which roles can access the agentic workflow.

Agentic workflows installed with AI applications each require specific roles. To learn which roles needed for agentic workflows associated with ServiceNow Otto applications, consult the documentation for the agentic workflow.

Selecting *Public* means anyone who can reach the instance can invoke the agent. Use it only for agents that expose no record data. *Public* should be used sparingly.

An access control list (ACL) is generated based on the roles you select. Saving triggers the creation of an ACL for your agentic workflow. If you want to make changes later, you can return to the guided setup and change the options here. If you have the correct elevated role, you can also make edits directly on the ACL table.

2. Define data access by selecting a user identity type from the **Identity type** dropdown.

   The user identity determines what data the agentic workflow can read and write while it runs.

   The two options are *Dynamic user* and *AI user*. The dynamic user is the user invoking the agentic workflow or the dynamic user of the agentic workflow calling on the agentic workflow. An AI user is a dedicated user that has its own specified roles that allow access, which could be more than the dynamic user. Every invocation reads and writes with the AI user's roles regardless of who started it.

   If you do not have an AI user but want to use the *AI user* identity, you need to create a new record on the User table. See Create a user. Select *AI user* as the identity type.

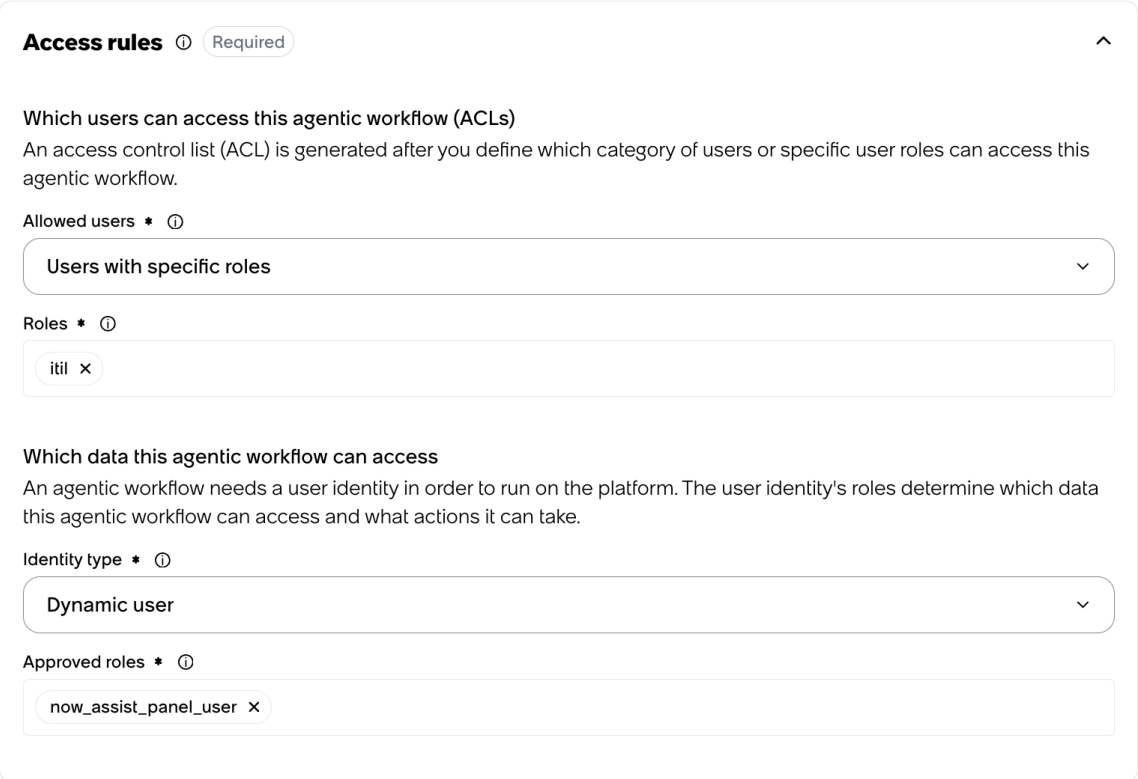
   If you select *Dynamic user*, you can select the *Roles* that the agentic workflow runs with. By default, an agentic workflow runs as a dynamic user and has the roles of the invoking user. Select the approved roles to limit the data access that an agentic workflow could have. Role filtering must be applied for all agentic workflows and agentic workflows to run as dynamic users. If you don't select any roles, the agent inherits whatever roles the invoking user holds.

   To override the role filtering requirement for a specific agentic workflow or AI agent, admins with the correct elevated access can create an approved list of roles for a given agentic workflow. Then, they can access that role filtering record in the Agent Access Role Configurations table [sys_agent_access_role_configuration], and select the **allow all roles** check box. Taking these steps deactivates the requirement for a role filtering approved roles list in AI Agent Studio, so the AI admin can return to AI Agent Studio and continue to configure the agentic workflow or AI agent without role filtering applied.

   Note: Role filtering should be applied as security best practice and adherence to the principle of least privilege. Overriding the role filtering requirement isn't recommended.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When testing an agentic workflow, run the agentic workflow with different roles to confirm that only the correct data is accessed for the user audience.



Result

You have created an ACL that determines who can discover and access your agentic workflow, and you have assigned a user identity (and role filtering, if relevant) to the agentic workflow to determine what data it can access.

What to do next

Scroll down to the next section of the guided setup, *Triggers*, to define specific conditions where the agentic workflow should run. Adding triggers is optional.

Add a trigger to an agentic workflow

In the guided setup for an agentic workflow, add triggers to run the agentic workflow automatically when certain conditions are met.

Before you begin

Role required: sn_aia.admin

About this task

Adding a trigger is optional. If you want your agentic workflow to be used only in chats, you don't need to add a trigger. Only add a trigger if you want to invoke the agentic workflow automatically when some event occurs.

If you don't want to add a trigger, skip to the next step, Configure where your agentic workflow can be invoked and set processing messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select a trigger type from the dropdown.

   The trigger type determines when the agentic workflow will be invoked.

2. Enter details for the trigger.

   a. Enter a name for the trigger.

   b. Select the table on which the trigger will run.

   c. Define the conditions that must be met for the trigger to activate.

      You must define at least one condition to create a trigger.

   d. Enter the objective for the agentic workflow in the **Objective for this agentic workflow** field.

3. Define user identity and data access for the trigger.

   a. Choose how to define the user identity for this trigger.

      You can use an AI user identity, an existing table, or a new custom script. The user identity determines what data the agentic workflow can access when the trigger runs.

   b. Select the AI user identity.

      Note: This trigger runs as a type of user identity with roles and associated data access rules it can impose on the agentic workflow. Review the agentic workflow's access rules to prevent any rule conflicts or gaps.

4. Configure the trigger channel.

   a. Select where the agentic workflow will launch.

      You can choose to launch the agentic workflow in the ServiceNow Otto panel or Virtual Agent.

   b. Choose whether to show an alert to users by toggling **Show an alert to users**.

5. Select **Save**.

   If you choose a scheduled trigger, additional options are available, such as the day of the week and time when you want the trigger to run.

   Note: When running a scheduled trigger, not every record is included in the execution. By default, the value is 10. If you want to change this number, you must set the *sn_aia.max_scheduled_trigger_query* system property to a different value.

   If you choose an email trigger, the target emails must exist on the Reply [sys_reply] table. New emails aren't available as triggers.

6. Repeat the preceding steps for additional triggers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You have added triggers to your agentic workflow to run it automatically under the specified conditions.

What to do next
Scroll down to the next section of the guided setup, *Channel and display*, to configure where the agentic workflow can be invoked and set processing messages.

Select channels for an agentic workflow

In the guided setup for an agentic workflow, configure where users can engage with the agentic workflow.

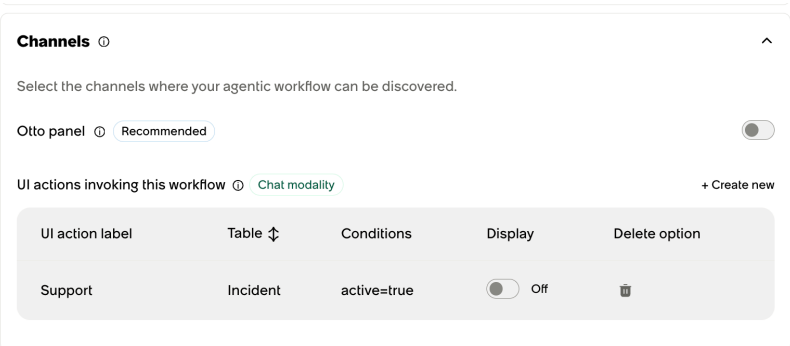
Before you begin
Role required: sn_aia.admin

About this task
In this section of the agentic workflow guided setup, you configure where the agentic workflow can be invoked.

Procedure
1. Choose whether to engage via Otto panel by toggling **Otto panel**.
2. To add UI actions, select **Create new** under **UI actions invoking this workflow**.

   A modal opens where you can configure the UI action.
3. Configure the UI action in the modal.
   a. Toggle **Active** to determine if the UI action is active.
   b. Enter a label for the UI action in the **UI action label** field.
   c. Select the table from the **Table** dropdown where the UI action will appear.
   d. Add conditions to filter under **Add conditions to filter**.

      You can build a filter by adding conditions that contain a field, operator, and value(s).
4. Select **Save**.



Result
You have completed the channels section of the guided setup for creating an agentic workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
You can save the agentic workflow by selecting **Save**, and you can test your agentic workflow by selecting **Run test**.

Modify an agentic workflow

Modify an agentic workflow in AI Agent Studio to refine its performance, align with business goals, or enable it to perform new tasks.

Before you begin
Role required: sn_aia.admin

About this task
You can make tweaks to your agentic workflow based on previous performance, refine it to better align with evolving business goals, or make major changes to enable it to perform entirely new tasks. This includes updating the workflow definition and instructions, adjusting security controls, adding or removing triggers, modifying AI agents to provide more or better capabilities, and changing where and how the agentic workflow is invoked.

The instructions field supports multiple versions within the same agentic workflow, allowing you to test different instructions and evaluate performance without losing previous versions. For more information, see Version control for AI agents and agentic workflows.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the agentic workflow that you want to modify.
3. In the node view, select the first node of the agentic workflow.

   The first node contains the main configuration settings for the agentic workflow. The other nodes represent the individual agents that comprise the underlying architecture.
4. Review or create content in the *`Expected behavior`* section.
5. Add or modify AI agents that work together within the agentic workflow.
6. Define the agentic workflow access rules.
7. **Optional:** Add a trigger to automatically invoke your agentic workflow if a specified event occurs.
8. Determine how and where users can engage with your agentic workflow.
9. Select **Save** or **Run test** to save your changes.

Result
Your agentic workflow is modified and ready to use.

What to do next
You can test your agentic workflow manually or evaluate the agentic workflow using automated tests.

Manually test an agentic AI asset

Manually test an AI agent or agentic workflow to verify it functions as defined and achieves the desired objectives.

Before you begin
If you don't have the roles necessary to pass the ACLs of the agentic AI asset and all of its tools, you will be notified that you don't have the necessary access and the test won't execute. The trace log can redirect you to the **Access Analyzer** for additional details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Decide which records you will test against before you start. Identifiers like record numbers are not offered in the test dialog, and a test that refers to a record needs one that resolves on the instance. If your instance has no suitable records, you can load demo data.

Role required: sn_aia.admin and either admin or at least one role required by the ACL of the agentic AI asset being tested and each of the ACLs of its downstream components.

About this task

After you create an AI agent or agentic workflow, test it to verify the agentic AI asset functions as defined. A test shows what the agentic AI asset did, including which tools it called, in what order, and what it returned. There is no additional guidance on individual tests whether the agentic AI asset's behavior is intended and correct. You can run a manual test to evaluate the behavior of your agentic AI asset on a single test record, or you can run an automated evaluation to reveal patterns across multiple executions. See Evaluate an agentic AI asset for more details about running an automated evaluation.

You can access the test interface from the node map view or from the guided setup. During a test, you can view a chat session, examine node and card expansions that show different agents or tools within an agentic AI asset, review the trace log containing execution information, and analyze test details.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the agentic AI asset you want to test.
3. In the node map view or guided setup, select **Run test**.
4. Select a test type: **Single test** or **Evaluation**.

   Single test provides a snapshot of agentic behavior on a single test record. **Evaluation** reveals patterns of behavior across multiple executions in an automated way. For more information about running an evaluation, see Evaluate an agentic AI asset.

   Note: You can't test and evaluate the same agentic AI asset at the same time.

5. Select the AI agent or agentic workflow you want to test from the dropdown.
6. In the **Version** dropdown, select the version you want to test.

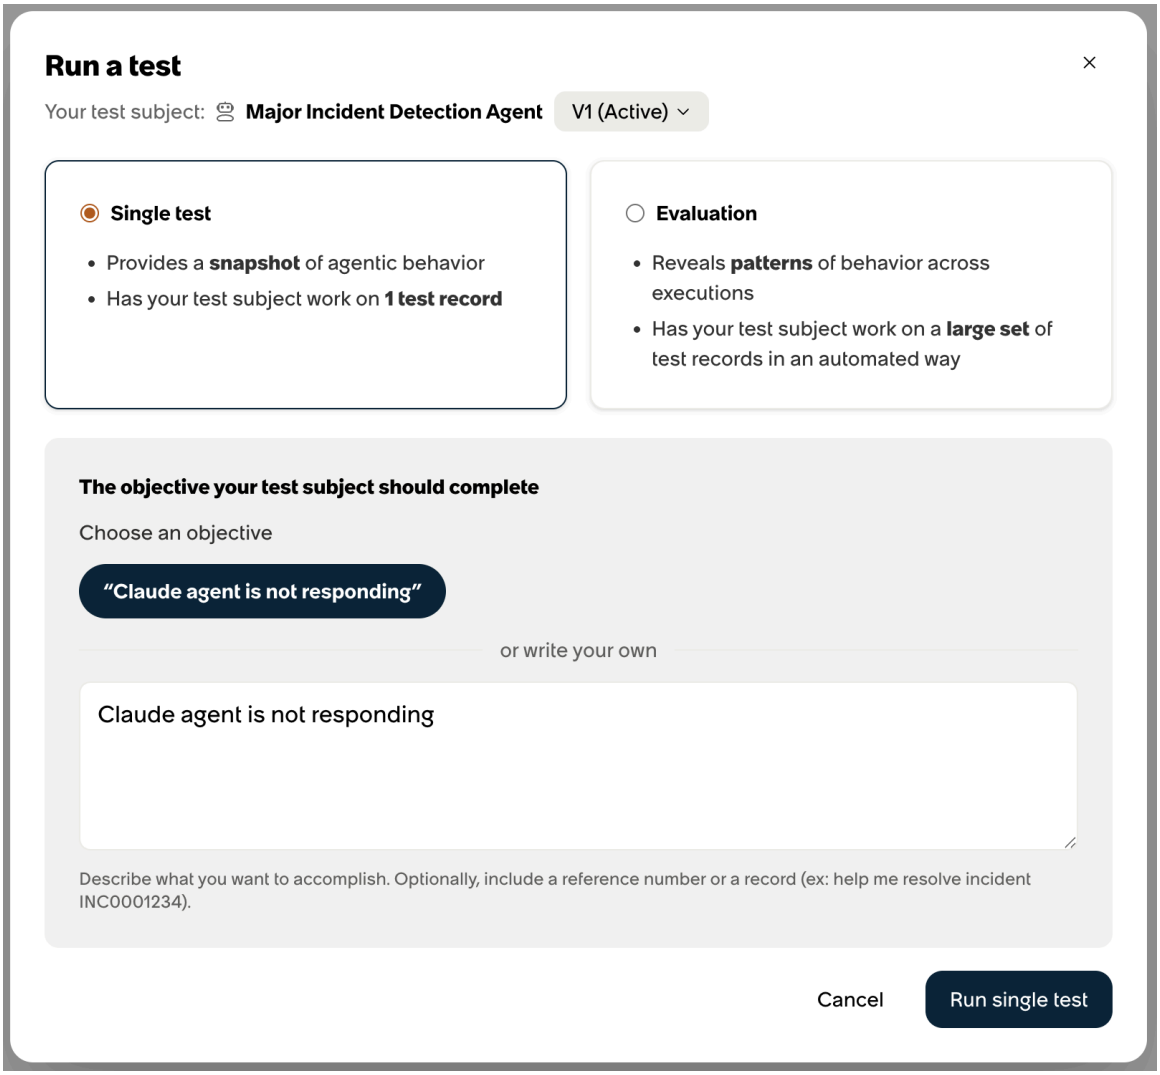
   See Version control for AI agents and agentic workflows for more information about creating and managing versions.

7. Under **Objective for your test subject**, choose an objective or write your own.

   Describe what you want your agentic AI asset to accomplish. If the objective refers to a record, the identifier, such as name or number, has to be present on the instance. For example, "help me resolve incident INC0001234." If you invent a record that doesn't exist with that identifier, the run fails when the lookup returns nothing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Run single test**.



Result
Your agentic AI asset begins to execute the test autonomously to achieve the objective you specified.

Note: There is a pause between starting the test and the first output while the chat session initializes. On a busy instance, this can take a noticeable amount of time, during which the panel shows the session opening but no agent activity. Wait for the first message rather than restarting.

During the test, you can view and analyze the following information:

- A simulated chat session between the invoking user and the agentic AI asset.
- The node map showing the agents and tools involved in solving the objective. Nodes and cards expand to display different agents within an agentic AI asset or different tools within an agentic AI asset.
- The **Trace log** containing execution information about how the agentic AI asset processed the objective.

  The trace log lists each execution task, the messages exchanged, and every tool execution with its inputs and outputs. If there's a failure, read it backwards: find the first tool execution whose inputs or outputs are not what you expected. If you need the full record of an execution,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

open the run in the Execution Plans [sn_aia_execution_plan] table using the sys_id shown in **Test details**.

- The **Analysis** tab with insights into the execution.

  The Analysis tab summarizes the issues found in the run, tagged by severity, and offers fixes you can apply in context. Check it before working through the trace log by hand. Low-level problems such as a misspelled field or variable name are reported here.

- The **Test details** tab with specific information about the test run.

A run that reaches the end without an error means the agent executed and its tools returned. It does not necessarily mean that the agentic AI asset functioned as you intended. A run can also end having worked around tool errors, which still reads as a completed run. Judge the outcome from the detail rather than the status.

You can restart the testing process at any time by selecting **Run test**.

A test run stays open until you end it. While a test is running, any other tests or evaluations are blocked. Close the test panel and start a new run to clear the state, and check the **Activity** section if you're unsure whether an earlier run is still open.

Create test scenarios for an agentic AI asset

Create different scenarios to evaluate your agentic AI asset's performance across multiple executions.

Before you begin

If you're going to use existing table records for your test scenarios, the table should have at least 10 records.

Role required: sn_aia.admin

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the agentic AI asset you want to create test scenarios for.

   After selecting an agentic AI asset, you're directed to the node map view that shows the components, such as AI agents or tools.

3. Select the pencil icon to open the guided setup for the agentic AI asset.
4. Scroll to the **Test scenarios** section, then select **Add scenarios**.
5. Select an input method.

Input method	Description
Table records	Select records from an existing table to test against. You can use table fields as variables when you craft your test objective. Continue to the next step.
Manual entry	Write your own test objectives without using table records. You won't be able to include variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input method	Description
	Note: If you select **Manual entry**, skip the next three steps and go straight to **Craft a test objective**.

6. Select the table that contains the records you want to use.
7. Select records to test your agentic AI asset against.

   For the most thorough and effective testing, you should choose many records that cover a wide range of scenarios your agentic AI asset can encounter.

   You can search for specific records by selecting the magnifying glass icon or select **Filter** to narrow down the types of records on the table to those that fulfill certain criteria.
8. Select the maximum number of records to include.

   The default is 100. If more records match your criteria than the maximum you set, the extras are excluded from the test scenarios.
9. Craft a test objective.

   The test objective is a starting phrase or user utterance for triggering the agentic AI asset.

   If you're using table records, you can select **Insert related columns** to include table fields as variables. You can use variables to use the same test objective on multiple records.

   If you're creating scenarios manually, each scenario will need its own test objective.
10. **Optional:** Add tags for the scenarios.

    (Optional) You can assign multiple types of scenarios to the same agentic AI asset. Use tags to make it easier to choose which test scenarios work best for your automated evaluation.

Result
Your agentic AI asset has test scenarios that can be used for automated evaluations.

What to do next
Add new scenarios to your agentic AI asset, such as ones on different tables, select **Run test** then **Evaluation** to use the scenarios in an automated evaluation. See Launch an automated evaluation for the full process details.

Launch an automated evaluation of an agentic AI asset

Evaluate your agentic AI asset's performance against defined scenarios to identify issues and opportunities for improvement.

Before you begin
Role required: sn_aia.admin

About this task
Evaluations use test scenarios, or saved objectives that you can reuse for a single test or select for an evaluation. Scenarios carry the objective text, but they don't carry live record identifiers, like a record name or number. Scenarios that refer to a record need one that is actually on the instance at run time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenarios have to exist before an evaluation can be configured against them, and they can also be created from the test scenario selection in a single test. Where the evaluation configuration screen offers no way to create one, create it in the library first and then return.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the agentic AI asset you want to evaluate.

   After selecting an agentic AI asset, you're directed to the node map view that shows the components, such as AI agents or tools.
3. Select **Run test**, then select **Evaluation**.
4. Select your test scenarios.

   If you must create test scenarios for the agentic AI asset, select **test scenarios** to be redirected to the guided setup for the agentic AI asset. The **Test scenarios** section displays all of the possible scenarios generated for that specific agentic AI asset. For more information about creating test scenarios, see Create test scenarios for an agentic AI asset.

   You can select test scenarios by tags. If you want to organize your test scenarios by tag, you can add or remove tags from the **Test scenarios** section in the agentic AI asset guided setup.

   If you have more test scenarios than your specified *`Maximum number of records`*, the additional ones won't be included in the test.

   The **Example of objectives** lists the test objectives of the scenarios you have chosen. If you don't see certain fields you want to include, update the test scenarios with the desired variables in the agentic AI asset guided setup.
5. Select your metrics to calculate.

   `Overall task completion evaluation` is selected by default. Calculating multiple metrics at once can give you a better picture of overall performance.

   Custom metrics aren't supported in evaluations started in AI Agent Studio.
6. Select whether you want to automatically generate insights and optimization suggestions.

   Evaluation run results includes detailed information about the performance of the agentic AI asset across all selected metrics. Selecting this option gives you additional analysis of identified issues and offers suggested prompt changes to address them. Insight generation and optimization suggestions add to the time required for an evaluation to complete.

   You can also trigger this process from the evaluation run's results page later.
7. Select **Run evaluation**.

Result

Your agentic AI asset is evaluated against your chosen metrics on the test scenarios you have configured.

What to do next

You can track the evaluation's progress through the test scenarios. When the evaluation is complete, you can view the results page for performance breakdowns overall and by specific test scenarios.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Duplicate an agentic AI asset

Duplicate an agentic AI asset to create an identical copy that you can fine-tune with distinct instructions and tools.

Before you begin
Role required: sn_aia.admin

About this task
Duplicate agentic AI assets to create an identical copy of an existing agent or agentic workflow. Duplicating allows you to reuse asset configurations without affecting the original asset. The duplicated asset cannot have the same name as an existing agentic AI asset.

Note: For AI agents, the duplicated AI agent uses the same tools as the original agent. Modifying the agent tools in the duplicated AI agent affects the agent tools in the original AI agent. To use the tools in a duplicated AI agent, you can either use the duplicated agent tools without making changes or add a new tool.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the **AI agents** or **Agentic workflows** tab.
3. Scroll horizontally to view the duplicate icon on the far right of the agentic AI asset row.
4. Select the duplicate icon for the agentic AI asset you want to duplicate.
5. In the confirmation modal, select **Duplicate**.

Result
You have duplicated the agentic AI asset. The duplicated asset appears in the list and you can now fine-tune it with distinct instructions and tools by following the agentic AI asset configuration guided setup.

Deactivate an agentic AI asset

Deactivate an AI agent or agentic workflow to stop it from running.

Before you begin
Role required: sn_aia.admin

About this task
Deactivate an agentic AI asset when you want to stop it from running. Once deactivated, the agentic AI asset will no longer execute or be available for use.

You can reactivate the agentic AI asset at any time.

Instead of deactivating an entire agentic AI asset, you can create a new version of the instructions and use that instead. You can change versions at any time should you want to. For more information, see Version control for AI agents and agentic workflows.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the **AI agents** or **Agentic workflows** tab.
3. Select the agentic AI asset you want to deactivate.
4. In the node view, select the first node of the AI specialist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and aren't required to view the AI specialist's performance.

5. Select the **Deactivate** button.
6. In the confirmation modal, select **Deactivate** again to confirm.

Result
Your agentic AI asset is deactivated and will no longer run or be available for use.

ServiceNow Otto AI agents reference

Find more information about user roles, tables, and the different properties that are installed in ServiceNow Otto AI agents.

AI agents roles

The following roles are installed with ServiceNow Otto AI agents with a compatible ServiceNow Otto application.

Roles required to configure or monitor AI agents

Role	Description
AI Agent admin [sn_aia.admin]	Administrator of the application. A user with the sn_aia_admin role can create, read, update, and delete records.
AI Agent Viewer [sn_aia.viewer]	Read-only access to the application. A user with the sn_aia_viewer role has read and report access on all tables. **Note:** The sn_aia.admin and the sn_aia.viewer roles should not be given to the same user. If a user has both roles, then AI Agent Studio will only be accessible in read-only mode for that user.
agent_role_config_admin	With this role, user can access and modify Agent role configurations with AI Agent admin [sn_aia_admin] being the parent role.
agent_role_config_viewer	Can view the Agent role configurations with AI Agent Viewer [sn_aia_viewer] being the parent role.
itil_admin or itil	Access to ITSM tables and workflows. Agents working with incident, Request, Change, Problem, CMDB records.
knowledge_admin	Access to Knowledge Management tables and tools - Knowledge agents; KB article retrieval tools.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required to configure or monitor AI agents (continued)

Role	Description
Custom role (e.g., custom_table.admin)	Access to custom tables and fields. Agents accessing tables outside ITSM, Knowledge, or other standard modules.
snc_internal	Overly permissive system role, use only if agent requires true system-level privileges (rare). **Note:** Don't use as fallback.

Note: The roles can be assigned manually through the user record directly. For the assigned roles to take effect, logout and login back to the application.

AI agents system properties

The following are system properties that define default values and behavior.

System properties to use for configuring AI agents

Property	Description
glide.ai_record_activity.validation.feature.enabled	Enables UI validation for agentic AI and skills at the instance level. If this feature is enabled, then any UI validation, such as required fields, must be met before the AI process is completed. The following properties are context-specific gates that determine where validation is done when the feature is enabled: • glide.ai_record_activity.ai_detection.nap.enabled: ServiceNow Otto panel executions • glide.ai_record_activity.ai_detection.skill.enabled: generative AI skill execution with UI actions or in Virtual Agent • glide.ai_record_activity.ai_agent.validation.enabled: agentic AI-initiated record updates with UI actions or in Virtual Agent If you want to enable these gates of the UI validation feature, you must create the system property and set the value to *true*. You don't need to enable this feature for individual skills or agentic AI assets.
sn_aia.agent_llm_provider	Defines the (large language model) LLM service provider for AI agents. Default value: **azure_openai**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties to use for configuring AI agents (continued)

Property	Description
sn_aia.agent_tool_supported_data_types	Defines a comma-separated list of supported data types for tools that are used by agents for IntegrationHub spoke. Each value corresponds to the name field of records in the Field classes table [sys_glide_object].
sn_aia.analytics_dashboard_sysid	Provides the sys_id for the AI Agents Analytics dashboard. read_roles: sn_aia.admin and sn_aia.viewer
sn_aia.continuous_communicator_output_limit	Defines the maximum number of continuous outputs that the AI Agent Orchestrator can trigger to show to users. Default value: **3**
sn_aia.continuous_tool_execution_limit	Defines the maximum consecutive number of uses for the same tool. Default value: **7**
sn_aia.enable_usecase_tool_execution_mode_override	Executes running agentic workflows fully autonomously, overriding any non-automated tools in the agentic workflow. Default value: **false**
sn_aia.ltm.category.auto_create	Enables AI-generated categories if no matching categories exist. Default value: **false**
sn_aia.ltm.enable_long_term_memory	Enables long-term memory for AI agents. All previous user interactions are used as context for the LLM. Default value: **false**
sn_aia.maximum_agent_tools	Defines the maximum number of tools that can be assigned to an AI agent. Default value: **20**
sn_aia.max_scheduled_trigger_query	Defines how many records are processed when a scheduled trigger is detected. Default value: **10** Write_role: admin
sn_aia.mid_skill_switch_enabled	Enables mid-skill switching. Default value: **false**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties to use for configuring AI agents (continued)

Property	Description
sn_aia.react_failure_retry_max_limit	Defines the maximum number of retries in case of an execution failure. Default value: **3**
sn_nowassist_va.router_redirect_va_agentic	Determines AI agent discovery in Virtual Agent. If set to *NEVER*, Virtual Agent continues Q&A without any agentic AI. Default: *ROUTER_DECISION*
com.glide.cs.dynamic.capability.timeout	Defines the Timeout for AIA Proficiency Descriptor. Default value: **180**. Write_role: admin.
sn_aia.enable_follow_up	Enables users to continue the conversation with follow-ups after the agentic workflow execution is complete. Default value: **true**.
sn_aia.follow_up_message	Defines a follow-up message sent after execution is completed. Default Value: **How otherwise can I help you?**
sn_aia.allow_context_sharing	Enables the sharing of short-term memory, allowing context to persist across execution within the same conversation. Default Value: **true**
sn_aia.agent_strategy_choice_enabled	Enables to show the LLM reasoning strategy in the agent setup screen. Default Value: **false**
sn_aia.context_sharing_strategy	This property defines the strategy to use for storing short-term memory for an execution. Default Value: **summarise**
sn_aia.enable_agent_tool_input_value_overrides	Enables you to override the agent tool description. Default Value: **true**.
sn_aia.follow_up_qna_failure_limit	Defines the limit to exit execution if the number of consecutive questions and answers aren't available in the follow-up.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties to use for configuring AI agents (continued)

Property	Description
	Default value: **1**.
sn_aia.ltm.use_memory_for_ai_agent	Enables long-term memory for AI agent interactions. When enabled, stored user memories are utilized in AI agent interactions. Default value: **true.**
sn_aia.quick_mode_failure_retry_max_limit	Defines maximum limit for retries in case of a failure in Quick Mode execution. Default value: **3**.
sn_aia.user_context_data	Defines a comma-separated list of user context data to be used with AI Agents. The list is used to pick the data available from knowledge graph API: getUserContext. List of available user information: • profile • manager • reportees • assets The user information can also be customized by overriding the method `getUserContext` via `UserContextUtil`. If customized, the property must define the comma separated list of keys generated by the customized `getUserContext` method. Default value: **profile**.
sn_aia.external_agents.enabled	Set to `true` to enable external agent features
sn_aia.external_agents.parallel_conversations.enabled	Enables or disables multiple simultaneous conversations per user
sn_mcp_client.cursor.max_iterations	Specifies the maximum number of cursor-based pagination iterations to perform when fetching MCP tools. Helps prevent excessive looping or API calls during data retrieval. **Note:** Set this value to 0 to disable pagination iteration limits.
com.glide.agentic_processes_view.enabled	Enables the in-product experience for agentic workflows in the AI Workflows panel. Verify

System properties to use for configuring AI agents (continued)

Property	Description
	that this is set to `true` if you plan on using UI actions to run agentic workflows.
sys_generative_ai_prompt_config	References a config record via the generative AI Config field.

Global properties used for episodic memory or agent learning

System property	Description
sn_aia.enable_episodic_memory	Enables episodic memory. When enabled, episodic memories from past interactions are collected and stored in sn_aia_memory and utilized in future interactions to enhance the overall experience Default value: **true**. .
sn_aia.enable_memory_limit	Maximum number of episodic memories to inject into prompt when an agent is invoked. **Note:** The maximum number of values allowed is less than or equal to 5.
sn_aia.use_episodic_memory_for_ai_agent	Enables episodic memory injection for AI agent interactions. When enabled, stored user memories are utilized in AI agent interactions. Default value: **true**.

Properties on the Agent Properties table

The following properties are on the Agent Properties [sn_aia_property] table. These properties affect different AI agent behaviors.

General properties on the Agent Properties table

Name	Description	Default value
alert.assist_spike_hours_to_check	Time interval, in hours, between running the scheduled job that checks for spikes in assist usage	3
alert.assist_spike_usage_percentage_threshold	Percentage increase required from	0.5 (50%)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General properties on the Agent Properties table (continued)

Name	Description	Default value
	previous job results to trigger the spike in assist usage notification	
alert.assist_spike_usage_threshold	Minimum number of assists to trigger the spike in assist usage notification	5000
alert.consecutive_error_count	Consecutive number of latency errors to trigger the latency notification	3
alert.llm_latency_threshold	Time taken, in seconds, for the LLM to respond before sending a latency error	10
alert.tool_latency_threshold	Time taken, in seconds, for a tool to finish executing before sending a latency error	300
enable_agent_tool_input_value_overrides	Determines whether tool input values can be overriden by the AI agent or other tools for use by another tool	false

execution_task.latency_thresholds	Determines thresholds on LLM and tool execution times and response	<pre>{
		"llm": {
		"timeBoundaries": [
		5000,
		10000</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General properties on the Agent Properties table (continued)

Name	Description	Default value

	tokens/ character counts for tool calling	<pre>],
		    "tokenLimit":
		500
		  },
		  "tool": {
		
		"timeBoundaries": [
		      200000,
		      300000
		    ],
		
		"outputCharLimit":
		10000
		  }
		}</pre>

follow_up_behaviour	Actions to take by the agentic workflow after it has finished executing. Each record applies to only one agentic workflow.	no_followup_close_conversation
show_citations	Determines whether agentic AI-generated responses in ServiceNow Otto panel or in Virtual Agent add citations for their output.	false
mcp_guardian_check	Determines whether AI Guardian runs on MCP tool executions.	You can enable guardian check for MCP Client when the value is set to **true**. The default value is **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General properties on the Agent Properties table (continued)

Name	Description	Default value
	Note: To enable guardian check for MCP Client, ensure that you enable AI Guardian on **AI Agent Studio** > **Settings** page.	
kill_switch.mode	Controls how the feature responds to a detected breach.	warn_only Other values include: • off • enforce
kill_switch.consecutive_windows_duration	The total look back span.	4320
kill_switch.max_fires_per_window	Fires per record that mark it as breaching.	5
kill_switch.min_distinct_records	Breaching records needed for the window to count as runaway.	25
kill_switch.window_size	Length of one observation window.	1440

The following properties are used to detect and avoid infinite recursion or execution loops. If you reach the max executions that match the query within the time window, any new executions matching the query will abort. You can adjust these values if you want to lower the threshold for detecting recursion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recursive check properties on the Agent Properties table

recursive_check.create_max_executions	Maximum number of matching executions creating records	50
recursive_check.create_time_window	Time window, in minutes, for checking for matching executions creating records	15
recursive_check.query_for_create_record	Query for the fields of execution plans to create records to check if executions are repeating	objective={objective}^agent={agent}^ORusecase={usec
recursive_check.query_for_update_record	Query for the fields of execution plans to update records to check if executions are repeating	related_task_record={related_task_record}^objective={o
recursive_check.update_max_executions	Maximum number of matching executions updating a record	5
recursive_check.update_time_window	Time window, in minutes, for checking	15

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recursive check properties on the Agent Properties table

(continued)

	for matching execution updates

AI agents tables installed

The following tables are installed so AI agents work as expected:

Tables used for configuring AI agents

Table	Description
Agentic workflows [sn_aia_usecase]	List of configured agentic workflows.
AI Agents [sn_aia_agent]	List of configured AI agents.
Tools [sn_aia_tool]	List of tools used by an AI agent.
Strategies [sn_aia_strategy]	List of strategies used by an AI agent.
Teams [sn_aia_team]	Team that is a group of listed agents.
Team members [sn_aia_team_member]	List of teams mapped to an agent.
Agent Tools [sn_aia_agent_tool_m2m]	List of tools mapped to an AI agent.
AIA Trigger Configurations [sn_aia_trigger_configuration]	List of triggers created for an agentic workflow.
Execution Tasks [sn_aia_execution_task]	List of tasks by execution plan ID.
Messages [/sn_aia_message]	List of messages recorded in AI agent conversations to and from the human users.
Tools Executions [sn_aia_tools_execution]	List of tools executed by the plan ID. **Note:** The records in the Tools Executions table expire and is set to unavailable after a period of 13 months.
Execution Plans [sn_aia_execution_plan]	List of plan executions by conversation ID.
Agent Tools [sn_aia_agent_tool_m2m]	List of tools and maximum automatic executions.
AI Agent configs [sn_aia_agent_config]	List of active AI agents configured for the proficiency that they'll be used in.
Agent properties [sn_aia_property]	Various properties that affect AI agent behavior.
Gen AI Metadata M2M [sn_aia_gen_ai_m2m]	List of Gen AI metadata and the maximum automatic executions.Maintains the mapping between sn_aia_execution_task and Gen AI log metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables used for configuring AI agents (continued)

Table	Description
	If two large language model (LLM) calls are made to the sn_aia_execution_task, then the sn_aia_gen_ai_m2m table has two records.
Report metrics [sn_aia_report_metric]	List of the report metrics.
Agent Access Role Configurations [sys_agent_access_role_configuration]	List of agent access roles. You can also create agent access roles from this table.
generative AI Configurations [sys_generative_ai_config]	Record that points to the actual model.
Invocation Sources [sn_aia_invocation_source]	Functions as a registry of entry points and helps track and define the different contexts or surfaces from which an AI agent can be invoked or triggered.
generative AI Log [sys_generative_ai_log]	Used for logging and auditing generative AI activity.

Tables used for Group Action Framework

See **Group Action Framework** *for more information.*

Table	Description
GAF record group [sn_gaf_record_group]	Stores the output of the grouping skill. Each record represents a cluster of related records. You can open each record group record to discover which records were included within the cluster.
GAF record group detail [sn_gaf_record_group_detail]	Contains the individual records that belong to each group GAF record group. You can also find if a record is marked to act as a representative of the cluster on these records.
GAF action strategy result [sn_gaf_action_strategy_result]	Holds the results of the Action Strategy skill, which selects representative records from each group for downstream processing.
GAF action mapper results [sn_gaf_action_mapper_result]	Stores the output of the Mapper skill, which maps new records to existing clusters.
GAF action reducer results [sn_gaf_action_reducer_result]	Stores the result of the Action Reducer skill. The results include insights for entire clusters. For example, how to resolve incidents similar to those gathered in a cluster.

Domain Separation AI agent

The Domain Visibility AI agent enables Domain Admins to manage user domain visibility using guided, conversational workflows in the ServiceNow Otto® panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain Separation AI agent overview

The agent performs validated operations on domain visibility data without requiring direct access to domain visibility tables.

Once enabled, the Domain Visibility agent exposes the following options to the admin:

- List all domain visibility for a user
- Add domain visibility for a user
- Remove domain visibility from a user

Note: The agent interacts directly with the `sys_user_visibility` table. All domain visibility operations (add, remove, list, query) are executed through this table. Admins do not need to open or configure the table manually.

Prerequisites and setup

Ensure the following requirements are met before using the AI agent:

- The Domain Separation plugin is installed on your instance and active. For more information, refer to Domain separation plugin.
- AI capabilities are enabled on the instance.
- You are signed in with a Domain Admin role.

Role masking

Required role: Domain Admin.

AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

In the data access settings, you must also add the necessary roles to enable reading of the tables for the records you want to evaluate for readiness. For example, you can add the itil role to the AI agent's list of approved roles so that it can access Incident records.

Accessing the Issue Readiness AI agent

To access the AI agent:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Go to the **AI Agents** tab.
3. Select **Domain Visibility**.

Access the AI agent

1. Open the ServiceNow Otto panel.
2. Start a new interaction.
3. Enter the prompt, "domain visibility help."

The agent displays the available domain visibility operations and guides you through the selected task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List all domain visibility for a user

Use this operation to view all domains a user can access.

1. Select **List domain visibility** from the agent's options.
2. Provide the name of the user whose domain visibility you want to view.

The agent retrieves all domain visibility entries associated with the user.

Add domain visibility for a user

Use this operation to grant a user visibility to a specific domain.

1. Select **Add domain visibility** from the agent's available options.
2. Provide the requested inputs:
   - **User name**
   - **Domain name**
3. The agent validates that the specified user and domain exist.
4. Confirm the user name and domain name and that you want to add the visibility for the user.

The agent adds visibility for the specified domain to the specified user.

Note: You can verify this by checking the `sys_user_visibility` table.

Remove domain visibility from a user

Use this operation to revoke a user's visibility to a specific domain.

1. Select **Remove domain visibility** from the agent's available options.
2. Provide the requested inputs:
   - **User name**
   - **Domain name**
3. The agent validates that the specified user and domain exist and that the user currently has visibility to the specified domain.

   If no matching visibility exists, the agent reports that there is nothing to remove.
4. If visibility does exist, confirm the user name and domain name and that you want to remove the visibility for the user.

The agent removes visibility for the specified domain from the specified user.

Note: You can verify this by checking the `sys_user_visibility` table.

Troubleshooting agentic AI manual testing failures

When testing an agentic AI asset in AI Agent Studio, there are a few common errors that can be addressed before you test again.

Most failures in a first manual test of an agentic AI asset can be traced to issues with configuration. The run may complete, a tool reports an error in the trace, and nothing in the testing panel names the cause. Check for the following errors before attempting to adjust prompts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Misspelled inputs, fields, or variable names

Names are matched exactly and are not validated when you save an agentic AI asset, so the failure appears only at run time as a tool error. Check the name against the field label on the table.

Records or other identifiers in the objective that don't exist

Record identifiers that don't exist on the instance fail the lookup and end the objective early. Confirm the record exists before looking for a fault in the agentic AI asset.

Inconsistent access to subcomponents

Check whether all of the components of the agentic AI asset have the same ACL requirements. A tool whose ACL the running identity cannot pass may fail for some users and not others. Compare the invoking user roles against what the tool requires. Run tests as different users to verify the security constraints you've added.

Incorrect tool calling

Multipurpose or loosely described tools can lead the Orchestrator to select the wrong tool. Give each tool a single purpose. Tool descriptions should also include when it does not apply.

Troubleshoot AI agents

Use this troubleshooting guide to resolve issues with AI agents' roles, testing procedures, silent failure diagnosis and reference resources.

Required roles assignments

Role assignments control access to AI Agent Studio and determine what tables and tools an agent or an agentic workflow can access.

Each agent comes with predefined user and data roles by default that can be modified by the customer. It is important to understand the difference between these roles, as an AI agent may not function correctly if it lacks the appropriate user or data role assigned. For more information about the default AI agent roles, see the ServiceNow AI agents library.

Note: If the customer alters the default user or data roles, it may lead to issues with the agent's functionality and execution.

Some of the individual ServiceNow AI Platform AI agent roles include:

ServiceNow AI Platform AI agent roles

AI agent	Role or Condition
Issue readiness	sn_uxc_gen_ai.platform_ai_issue_readiness
Request status	LoggedIn=true^ORAllowUnauthRolelessAcl=true
Domain separation	domain_admin
Access analyzer agent	access_analyzer_admin OR user_admin

To identify the roles currently assigned to:

- AI agents: Navigate to **All** > **AI Agent Studio** > **Agentic Solutions**.
- Select an AI agent, and navigate to the **Access rules** section.

For more information, see Define access rules for an AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Agentic workflows: Navigate to **All** > **AI Agent Studio** > **Agentic solutions** > **.**
- Select an agentic workflow, and navigate to the **Access rules** section.

For more information, see Define access rules for an agentic workflow.

Diagnose AI agents' failures

Test agents and workflows

Test your all your AI agents and agentic workflows to make sure they have the correct access. When an AI agent role does not have required resource access, verify that the agent is assigned the correct role. Verify the role has resource access records for all required tables and confirm that role filtering does not override the resource access.

Supporting tables for diagnosing AI agent's failures:

- generative AI Log [sys_generative_ai_log] table: The primary resource for diagnosing AI agent failures is the generative AI Log [sys_generative_ai_log] table. The table logs agentic execution details, errors, and state transitions that help diagnose role-related failures, permission and workflow issues.
- generative AI Configurations [sys_generative_ai_config] table: Contains configuration records for AI agents; useful for validating that agent setups are correct before testing failures.
- AI Agent memory [sn_aia_memory] table: Contains the agent memory state and helps test memory-related failures or edge cases.
- AI Agent [sn_aia_agent] table: Verify agent definitions during failure scenarios.

Important: Silent failures that return no values may indicate an underlying access error. You might have access to the agentic workflow, but the AI agent within the workflow may lack necessary permissions. Always test all underlying AI agents individually, not just the workflow, to catch permission gaps that your own access level might mask.

To manually test an agentic AI asset, see Manually test an agentic AI asset.

Review logs

Use these columns in the generative AI Log [sys_generative_ai_log] table to identify root causes of AI agent and agentic workflow failures. The table records all generative AI activity within your ServiceNow instance, including AI agent invocations, model responses, performance metrics, and errors.

Common issues include:

- Permission and ACL failures
- Model endpoint unavailability
- Token limit exhaustion
- Skill or action failures
- Performance degradation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Columns from generative AI Log [sys_generative_ai_log] table used for troubleshooting AI agents

Column name	Troubleshooting use
user_role	Shows what role the agent has; compare to what's required
error_message	Direct indication of permission versus natural-language mismatch
permission_denied	Boolean flag to quickly filter permission failures
table_name	Target table the agent was accessing when it failed
operation_type	Type of operation attempted: `read`, `write`, `execute`, `query`
action	Shows exactly which step failed (e.g. "update_incident", "create_change", "query_table")
execution_log	Full context; shows agent's reasoning before failure
acl_rule	References the specific ACL that denied access

Additional resources

Use the following documentation resources for more information:

- Granular admin roles: Configuring user access and data permissions for agentic workflows
- Access control: Implement access control in AI Agent Studio.
- Access Analyzer: Test access to an AI asset.
- Manually testing user access to an agentic AI asset: Manually test an agentic AI asset.
- Agent library: ServiceNow AI agents library.
- Knowledge base: AI agent advanced scenarios and runtime issues playbook.
- AI Agents FAQ and Troubleshooting.
- Access control Security enhancements for AI agents and Skill Kit.
- Common solutions for ServiceNow AI Agent, MCP Server, and AI Agent Fabric.
- Accessing AI Agent Studio after upgrading the ServiceNow Otto AI Agents plugin.

Troubleshoot external AI agents

Use this troubleshooting guide to resolve issues with External AI agents' roles, testing procedures, failure diagnosis and reference resources.

Prerequisites for External AI agents

The following plugins, versions, and roles are apply for external AI agents:

- Application version: ServiceNow Otto AI Agents v6.0.x+.
- Platform version: Zurich Patch 4+ or Yokohama Patch 11+.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable external agent interoperability (AI Agent Studio → Settings):
  - Set the *sn_aia.external_agents.enabled* to **true** (ServiceNow can call external agents).
  - Set the *sn_aia.internal_agents.enabled_external* system property to **true** (External agents can call ServiceNow AI Agents).
- Service account & roles for inbound A2A calls: sn_aia.integration (runtime) or sn_aia_admin (testing), plus rest_service and snc_platform_rest_api_access.
- AI Agent activation & discoverability: Ensure the agent is active and enable the AI agent for discovery (sets External discoverable on sn_aia_agent_config).

Autonomous mode

You must enable the autonomous mode for executing External AI agents. Using the Supervised execution mode runs with human interaction or intervention as opposed to an agent interaction and needs the autonomous mode to be set up. For more information, see Add tools and information to an AI agent.

The asynchronous mode is not supported for external AI agents in AI Agent Studio. Change the communication mode to the Synchronous mode while onboarding the external agents and enable push notifications.

Review logs for external agents

You can retrieve tool logs using the sn_aia_external_agent_exec_history table and to access the full conversation history via the task/get method, enable the **Display output** in tool settings.

Additional resources

Use the following documentation resources for more information:

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: We have controls in place to enable/disable the data collection and data processing.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Model Context Protocol Client

The Model Context Protocol (MCP) is a standardized client-server protocol that enables AI applications to discover and interact seamlessly with external tools, data sources, and services. MCP facilitates communication between an AI host application (like AI Agent Studio), an MCP Client embedded in the host, and one or more MCP Servers that expose specific capabilities such as tools.

Model Context Protocol Client terminology

- **MCP Host**: The AI application environment where the tasks are initiated.
- **MCP Client**: Manages communication between the host and the MCP Servers, handling the requests and responses.

  The MCP Client architecture enables AI agents to extend their capabilities by invoking external systems dynamically, enabling tasks like accessing APIs, databases, or file systems in a standardized way.
- **MCP Server**: Provides external functionalities by exposing tools for AI agents to use.
- **MCP Tools**: The external tools exposed by the MCP Servers to be used by AI agents.

Why use MCP Tools

MCP tools enable seamless integration to:

- Connect your AI agent with a wide variety of external tools with minimal setup.
- Add multiple MCP tools to an AI agent to perform a broader range of tasks.
- Review and edit tool input parameters as needed before saving.

Configuring Model Context Protocol Client

Configure the MCP Client to execute agentic workflows with AI agents and mapped tools.

Configuring MCP Client enables you to:

- Incorporate external tools in AI agents built on ServiceNow.
- Access tools offered on external MCP Servers.
- Integrate MCP Client with the AI Agent Studio.

By setting up MCP Servers, AI agents in your environment can leverage external tools efficiently, enhancing their ability to perform complex tasks with up-to-date information.

Install Model Context Protocol Client

Install the MCP Client application on your ServiceNow instance to enable using the tools from the MCP Server Console in AI agents.

Before you begin

Verify that you:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Install the AI Agent Studio plugin [com.snc.sn_aia] and the Generative AI Controller plugin [com.sn.generative.ai] to use Model Context Protocol Client.
- Enable the MCP tool experience in your instance by setting the *sn_aia.enable_mcp_tool* system property to **true**.

Note: ServiceNow supports Protocol version 2025-03-26 of the MCP Server Console for MCP Client.

Role required: sn_mcp_client.admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for Model Context Protocol Client plugin [sn_mcp_client].
3. Select **Install**.

Adding an MCP Server Console in AI Agent Studio

An MCP Server Console hosts the APIs and tools required by an AI application. It receives and processes calls from MCP Clients to govern ingress traffic and promote secure access to tools. Adding an MCP Server Console in the AI Agent Studio helps you to leverage the Model Context Protocol as a tool in the ServiceNow agentic AI system.

Connecting an MCP Server Console with the AI Agent Studio simplifies the integration process, making it easier to discover and invoke services. This connection enhances security and governance, providing a streamlined setup experience for administrators.

Adding an MCP Server Console requires you to add an MCP Server Console in the AI Agent Studio. You can add an MCP Server Console with one of the following authentication options:

1. **OAuth 2.1**: Helps add an MCP Server Console with an authentication code. For more information, see Add an MCP Server with OAuth 2.1.
2. **API Key**: Helps add an MCP Server Console with an API Key. For more information, see Add an MCP Server with API Key.
3. **Others**: Helps add an MCP Server Console in a manual way by selecting a Connection and Credential Alias record. For more information, see Add an MCP Server with Connection and Credential Alias.

Note: You must authenticate the users with the MCP Server Console to add the MCP tool to an AI agent and without prior authentication, you can't add the MCP Server Console.

Add an MCP server with OAuth 2.1

Add an MCP server with OAuth 2.1 in the AI Agent Studio.

Before you begin

Role required: sn_mcp_client.admin

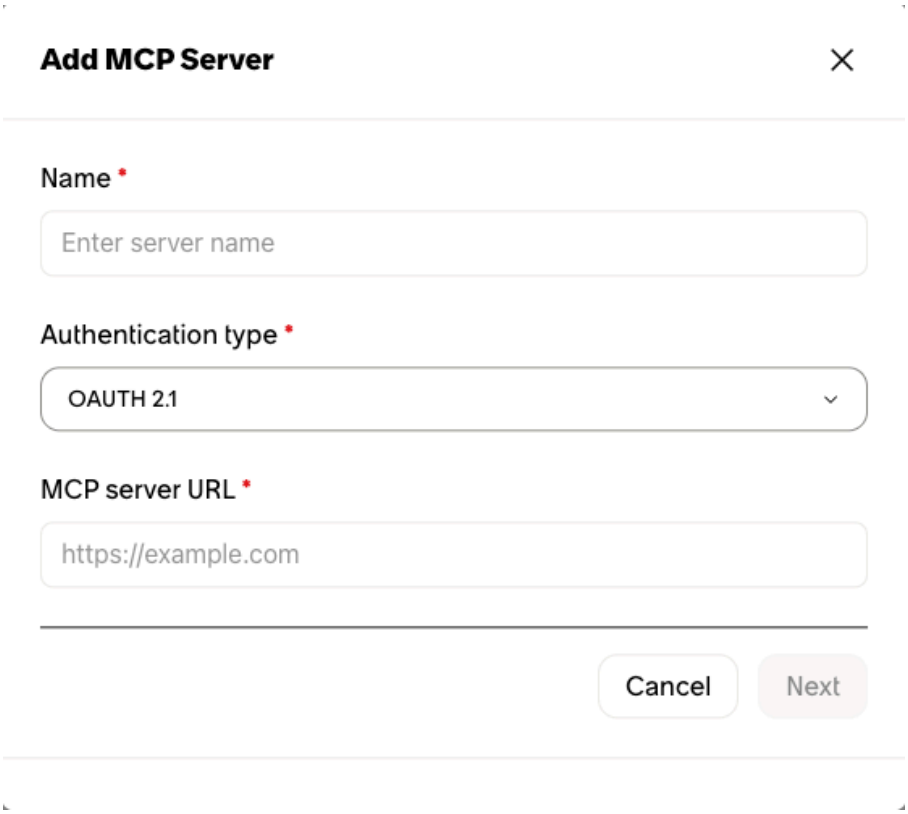
About this task

OAuth is the standard method to authenticate MCP servers. If your MCP server supports it, choose OAuth 2.1 as the authentication method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings** > **Manage Model Contextual Protocol (MCP) Servers**.
2. Select **View** against **MCP Servers**.
3. On the Model Context Protocol Server page, select **New**.
4. On the Add MCP Server Console form, enter a name and the web address for your MCP server.
5. In the **Authentication Type** field, select **OAUTH 2.1**.



6. Select **Next**.
   The form extends with the registration details.
7. On the form, fill in the fields.

Note:

- If your MCP server doesn't support dynamic client registration, register the OAuth client for AI agents manually. Update the client details in AI Agent Studio.
- The manual registration doesn't auto-populate the field data and must be manually provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manual Registration form

Field	Description
Grant Type	How you want to obtain an access token when accessing protected resources. The following options are available: ○ **Authorization Code**: A system-generated code used for granting access to an application or resource. ○ **Client Credentials**: An access token provided by the administrator to access the application directly.
Token Authentication Method	Method using which the client credentials are sent when requesting tokens from the Authorization server. You can one of the two options: ○ **Client Secret Basic** ○ **Client Secret Post**
Client ID	Unique ID for authentication and authorization purposes.
Client Secret	Unique credentials used for authentication.
Auth Scopes	Specific permissions for an application. **Note:** The Auth scopes must be comma-separated values.
Authorization URL	Web address of your server to direct authorization.
Token URL	Web address containing the token.
Token Revocation URL	Web address to revoke the previously provided token.

8. Select **Add**.
   You're redirected to the Model Context Protocol Server Console record to authenticate the MCP server for adding an MCP tool to an AI agent.

   Note: On the Model Context Protocol Server Console record, you will see a warning that server requires authentication.

9. Select **Save** and continue to complete filling the Server details, Access rules, and Tools.
10. Verify the Server details.
    The Server name, Connection Alias, and Application fields are auto-populated with the information from previous steps. Additionally, you can provide a description for the server.
11. Define Security controls for the MCP Servers.
    For more information, see Define security controls for MCP Servers.
12. Define the Tools for the Model Context Protocol Sever.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure the MCP tools in the Assistant Designer. For more information see .

13. Select **Authenticate** to request a new token.
14. In the third-party authorization page, select **Authorize**.

> **Note:** When OAuth access or refresh tokens aren't available, you must authenticate the OAuth configuration on the MCP server record to add it as an AI agent tool.

Add an MCP Server with API Key

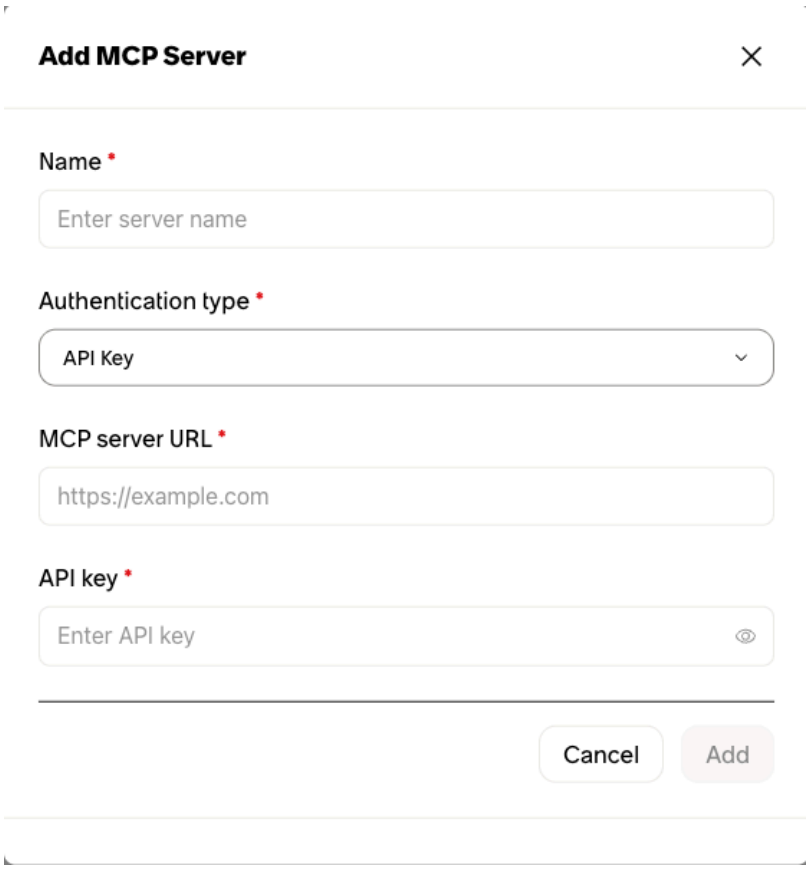
Add an MCP Server with an API Key in the AI Agent Studio.

Before you begin

Role required: sn_mcp_client.admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings** > **Manage Model Contextual Protocol (MCP) Servers**.
2. Select **View** against **MCP Servers**.
3. On the Model Context Protocol Server page, select **New**.
4. On the form, fill in the fields.



Add API Key MCP Server

Field	Description
Name	Name for your MCP Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authentication Type	The authentication type with which you want to add your MCP Server. Select **API Key**.
MCP Server URL	The web address of your MCP Server.
API Key	A unique code or password to identify and authenticate the user or application when accessing the API. **Note:** The API Key adds a Connection alias dynamically at runtime and maps with the MCP Server.

5. Select **Add**.
   You're redirected to the Model Context Protocol Server Console record to complete the Server details, Access rules, and Tools information.
6. Verify the Server details.
   The Server name, Connection Alias, and Application fields are auto-populated with the information from previous steps. Additionally, you can provide a description for the server.
7. Define Security controls for the MCP Servers.
   For more information, see Define security controls for MCP Servers.
8. Define the Tools for the Model Context Protocol Sever.
   You can configure the MCP tools in the Assistant Designer. For more information see .
9. Select **Save**.

Result

An MCP Server Console with API Key authentication gets created with the name you provided and appears in the list of MCP Servers.

Add an MCP Server with Connection and Credential Alias

Add an MCP Server by selecting a Connection and Credential Alias record.

Before you begin

- Role required: sn_mcp_client.admin
- Verify that you have a Connection and Credential alias record created before adding an MCP Server with Others as the option.

  For more information, see Create a Connection & Credential alias.

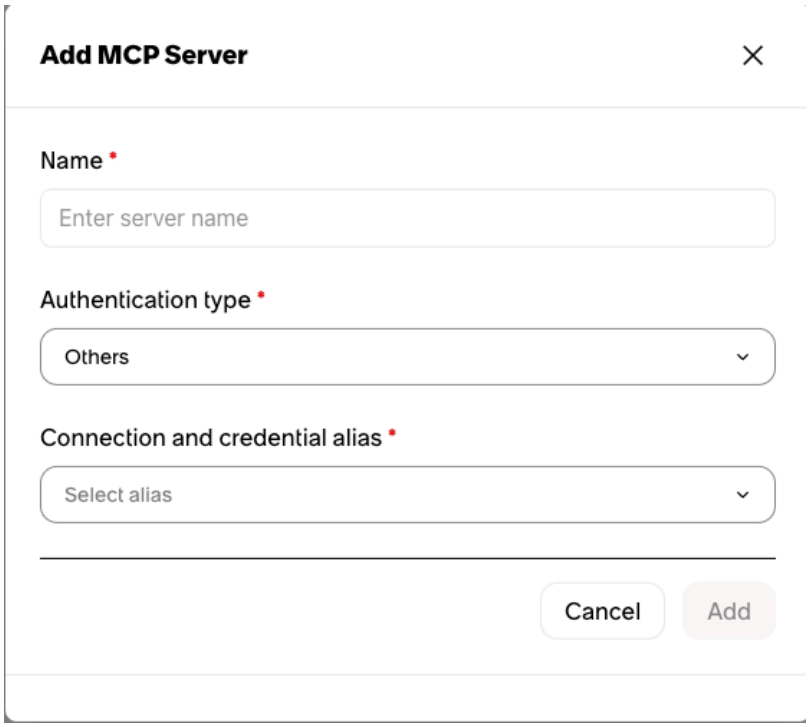
About this task

To use authentication methods not supported in MCP Server, use the Connection and Credential Alias method. Create the alias manually and then update it in the MCP Server. For OAuth-based authentication, first create the OAuth entity profile. Then create the Connection and Credential Alias. For other authentication methods like API Key, Basic Auth, AWS Credentials, or SSH Credentials, create the connection and credential alias directly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings** > **Manage Model Contextual Protocol (MCP) Servers**.
2. Select **View** against **MCP Servers**.
3. On the Model Context Protocol Server page, select **New**.
4. On the form, fill in the fields.



Add MCP Server

Field	Description
Name	Name for your MCP Server.
Authentication Type	The authentication type with which you want to add your MCP Server. Select **Others**.
Connection and credential alias	Select a Connection and credential alias record to map with your MCP Server.

5. Select **Add**.
   You're redirected to the Model Context Protocol Server Console record to authenticate the MCP server for adding an MCP tool to an AI agent.
6. Select **Save** and continue to complete filling the Server details, Access rules, and Tools.
7. Verify the Server details.
   The Server name, Connection Alias, and Application fields are auto-populated with the information from previous steps. Additionally, you can provide a description for the server.
8. Define Security controls for the MCP Servers.
   For more information, see Define security controls for MCP Servers.
9. Define the Tools for the Model Context Protocol Sever.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure the MCP tools in the Assistant Designer. For more information see .

10. Select **Save**.

> **Note:** On the Model Context Protocol Server Console record, you will see a warning that server requires authentication. Authenticate the MCP Server if you see the message requiring it.

Result
An MCP Server with the name you provided appears in the list of MCP Servers.

Define security controls for MCP Servers

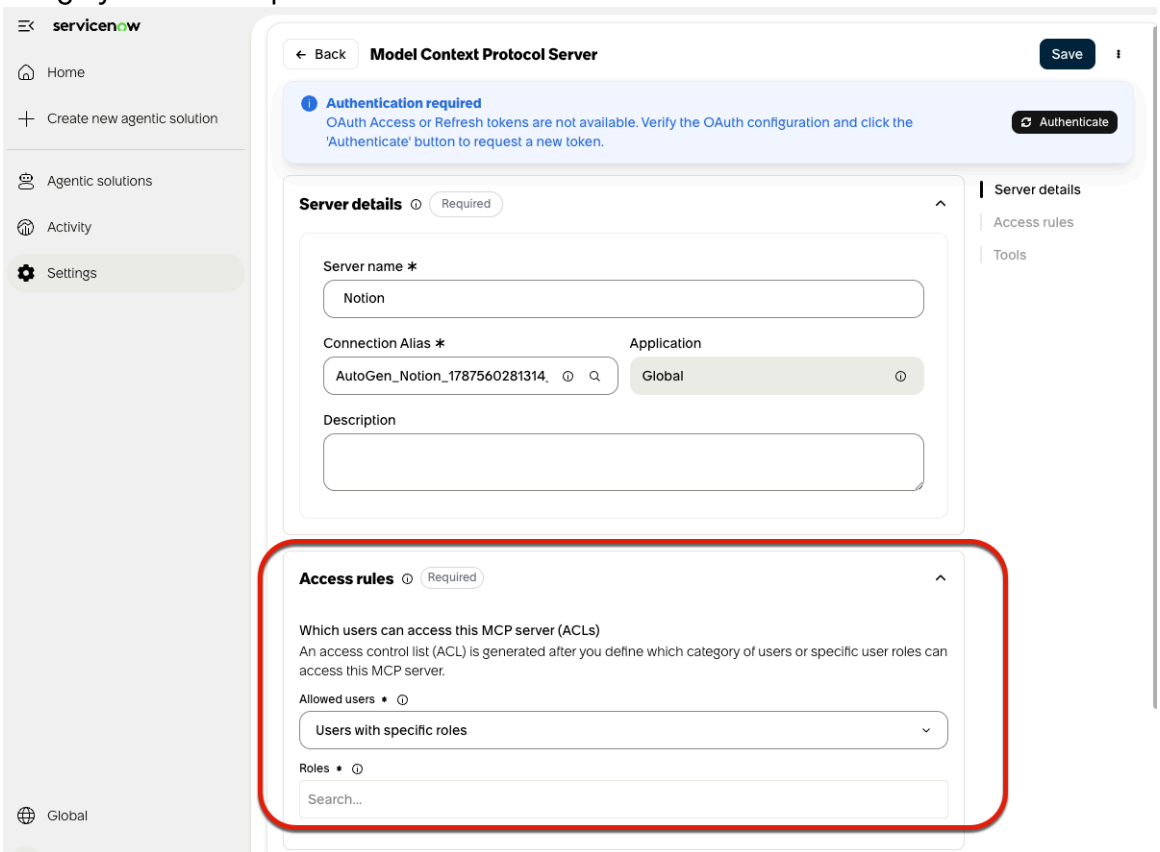
Define security controls for an MCP Servers to determine which users can access it and what permissions they have.

Before you begin
Role required: sn_mcp_client.admin

About this task
The security control applies only when MCP server is added to an Assistant and when a user tries to invoke the respective MCP server from that Assistant. For adding to AI Agent, this ACL won't be applied and automatically agent ACLs are applied for the agent normally.

Procedure
1. Open a Model Context Protocol Server and navigate to Access rules.

   You can select which users can access this MCP server via ACLs. The access control list (ACL) is generated after you define which category of users or specific user roles can access this MCP server.



2. Select the users from the **Allowed users** drop down.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are three possible options for ACLs created in AI Agent Studio:

- *Any authenticated user*: Grants access to any user who is authenticated on the instance, regardless of the role.
- *Users with specified roles*: The default ACL option that requires you to select the specific roles required to invoke an AI agent or an agentic workflow. If you select this option, you will be able to add roles in the **Roles** field.

  Note: As the ACLs are Allow If ACLs, any user with at least one of the roles will be able to define specific roles that the users must have to discover and interact with this AI agent.

- *Public*: Grants access to all users, including guests who aren't signed in.

  Note: Understand that this configuration should be used sparingly and only when needed.

3. Select **Save**.

View tools on the MCP server

You can view the list of tools a connected MCP server exposes on the server's details view in the AI Agent Studio.

Before you begin
Role required: admin

About this task

- The MCP server detail view shows the tools the server exposes, each with tool name and description.
- A tool count for the server is displayed.
- The view is read-only - no add, edit, or remove capabilities are available.
- The view is reachable from the server record without opening an agent or an Assistant (ServiceNow Otto panel or ServiceNow Otto for Virtual Agent).
- View the long tool descriptions.

Procedure

1. Open a Model Context Protocol Server and navigate to the Tools section of the record. You will see the list of all the tools that the MCP server supports.
2. Select the refresh icon to refresh the list if the MCP server updates their tools.
3. Use the **Search** field to search for a particular tool associated with the MCP server or to just see what's available.

   Note: The tools shown in the list are the ones that can be configured in the Assistant to allow, block, or run in supervised mode.

Add an MCP server tool to an AI agent

Add an MCP tool to an AI agent in the AI Agent Studio so that your users can access the MCP server.

Before you begin
Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Agentic Solutions**.
2. On the Agentic solutions page, open the **AI agents** tab and select an AI agent.
3. In the Tools section, select **+Add tool**, select **Create new tool**, and then select **MCP Server tool**.
4. In the Add a Model Context Protocol tool page, select an MCP server from the **Select Model Context Provider server** drop down.
5. Select a tool for the MCP server from the **Select tool** drop down.
6. Define the tool settings which are used only by the selected AI agent.
   - **Name**: The name is auto-populated from the Select tool field. You can also change the name if you would like to.
   - **Description for this AI agent**: Provide a description that covers the tool's purpose, exact input rules, what the tool returns, and how this AI agent should use outputs.

     Note: This description is critical because the AI agent uses it to invoke the tool. Testing shows details of actual tool usage.

7. Select an execution mode under **Execution mode**.

   Choose **Supervised** to require human oversight when the tool executes, or **Autonomous** to allow the tool to run without human intervention.

8. Toggle **Display output** to control whether the tool's output is shown to users.
9. Select an output widget from the **Widget** drop down.

   Widgets can only be used by assistants built in Premium Chat experiences. Select the widget type that best formats the tool's output for users.

10. Display the refined widget message.
    Select **Yes** if you would like a refined widget message.
11. Expand the **Advanced settings** section to configure output transformation and processing messages.

    a. Select an output transformation format from the **Output transformation format** drop down.

    Raw output data usually needs to be transformed into a format that is user-friendly and readable. You can also transform data into smaller formats to reduce the amount of data the AI agent needs to analyze. Transforming data involves tradeoffs between data completeness and latency.

    The available output transformation formats are:

    - *None*: Output data isn't changed into a different format and users will see raw data.
    - *Concise*: Output data is changed into the most minimal format for users, with less data for the AI agent to analyze.
    - *Verbose*: Output data is changed into a summary-like format for users, with slightly less data for the AI agent to analyze.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Paraphrase*: Output data is changed into a format featuring direct statements for users, with no reduction in data.
- *Custom*: Output data is changed into a format you specify (consider data loss and performance issues).

12. Generate or write processing message for users under **Tool processing messages for users**.

    Describe the action that happens while the tool is running in the **In-progress message** field and the final action when the tool completes in the **Completion message** field. For example, users can see "Requesting a service" when the tool is in progress and "Requested a service" when the tool is done.

13. Select **Save**.

What to do next

You can test your AI agent on a record manually to see an example execution. You can also create an automated agentic evaluation to test the AI agent over repeated interactions. Automated evaluations can recommend specific optimizations if the LLM judges find underlying patterns for low success rates.

Activate your AI agent and make it ready for use by selecting **Activate**.

Note: The status of the external AI agent is shown as **Inactive** until it is activated.

Model Context Protocol Client reference

Find more information about user roles, tables, and the different properties that are installed with the Model Context Protocol Client application.

MCP Client Roles

The following roles are installed with the Model Context Protocol Client plugin [sn_mcp_client].

Roles used in MCP Client

Role	Description
MCP Client Admin [sn_mcp_client.admin]	Administrator of the application. A user with the sn_mcp-client.admin role can create, read, update, and delete records. **Note:** The sn_aia.admin role contains the sn_mcp_client.admin role, a role inheritance on plugin activation.
MCP Client Viewer [sn_mcp_client.viewer]	Read-only access to the application. A user with the sn_mcp_client.viewer role has read and report access on all tables. **Note:** The sn_aia.viewer role contains the sn_mcp_client.viewer role, a role inheritance on plugin activation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MCP Client system properties

The following system properties are installed with the Model Context Protocol Client plugin [sn_mcp_client].

System properties used for configuring MCP Client

System property	Description
sn_aia.enable_mcp_tool	Enables access to the MCP Client tool on your ServiceNow instance. Default value: **true**

MCP Client tables

The following tables are installed by default with the installation of the Model Context Protocol Client plugin [sn_mcp_client].

Tables used for configuring MCP Client

Table	Description
MCP Execution Logs [sn_mcp_execution_logs]	Lists the request and response, the method (tool call or tool list) that was carried out along with the mapped session. The execution logs table also helps to debug and shows if there are any errors.
MCP Client Server Session Mappings[sn_mcp_client_server_session_mapping]	Lists the sessions mapped to the server based on the capabilities support.
Model Context Protocol Severs [sn_mcp_server]	Lists the MCP Servers.

AI Agent Studio (legacy)

The ServiceNow® AI agents are entities that mimic human-like intelligence by using large language models (LLMs). AI agents can perform tasks that range from simple automated responses to complex problem solving. By using AI agents, you can reduce the workloads of your live agents and help increase their productivity.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal .

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

For more information, see the Now Assist documentation.

Explore AI agents

Learn how the AI agents enhance live agent productivity by mimicking human-like intelligence to manage tasks ranging from automated responses to complex problem solving.

AI agents overview

AI agents are virtual agents within the ServiceNow AI Platform ecosystem. They can perform specific tasks and functions, often using natural language instead of traditional code.

AI agents can perform the following tasks:

- Analyze data.
- Retrieve information from knowledge bases and enterprise systems.
- Execute automated actions.
- Collaborate with other agents to resolve issues or accomplish requests.

Example:#Imagine you need to reset your password. Multiple AI agents might be involved:

1. One agent understands the request.
2. Another verifies your account details.
3. A third agent conducts a security check.
4. A fourth agent resets the password and notifies you.

agentic AI framework

AI Agent Studio overview

The AI Agent Studio enables you to create, manage, and test AI agents and agentic workflows in a unified environment.

agentic system

The ServiceNow AI Platform's agentic system uses AI agents, orchestrated by an Orchestrator, to execute Agentic workflows.

AI agents

On the ServiceNow AI Platform agentic system, an AI agent contains a set of large language model (LLM) instructions with the tools to accomplish tasks.

agentic workflow

Agentic workflows are smart, context-aware, automated processes designed and executed by AI agents. They represent dynamic, human-like processes where specialized AI agents collaborate to accomplish complex goals. Here are a few key characteristics of Agentic workflows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Autonomous**: Operate independently without constant human intervention.
- **Adaptive**: Adjust to changing situations and business needs.
- **Collaborative**: Work together to complete complex tasks.
- **Intelligent**: Use large language models and business data to make informed decisions.

orchestrator

The AI agent Orchestrator is a central management system that coordinates AI agents to verify they collaborate effectively to complete complex workflows.

For more information, see Understand AI agents.

Guided Setup

The guided setup process in the helps you configure your AI Agent triggers, data sources, and display locations based on your specific business needs.

ServiceNow Otto panel

The ServiceNow Otto panel is a user-facing interface, commonly accessed through the context menu or chat interfaces. It provides quick access to agents' capabilities and enhances productivity by summarizing records, creating content, and analyzing alerts.

Tools

Tools equip your AI agents with the necessary capabilities to complete their tasks. Adding a tool to an AI agent enables various functionalities and helps the AI agents achieve their objectives.

How to put AI agents to work

AI agents can use a variety of tools, such as web searches, record operations, and flows, to work on agentic workflows that you define.

Navigate to **All** > **AI Agent Studio** > **Overview** > **Get an overview of what to expect** and select **View steps** to see how you can successfully put your AI agents to work.

1. Create an agentic workflow: agentic workflows define the problem and situation that you want your AI agents to work on. Without an agentic workflow, your agents don’t know when or what to work on.
2. Create AI agents: AI agents use tools to execute tasks. Consider the tasks needed to solve the agentic workflow you created. Create one or more agents to execute those tasks.
3. Test the agentic workflow: See how your AI agents perform. Make adjustments to either the agentic workflow or AI agents. Test until everything’s working the way you want.
4. Deploy: Put your AI agents to work across your organization.

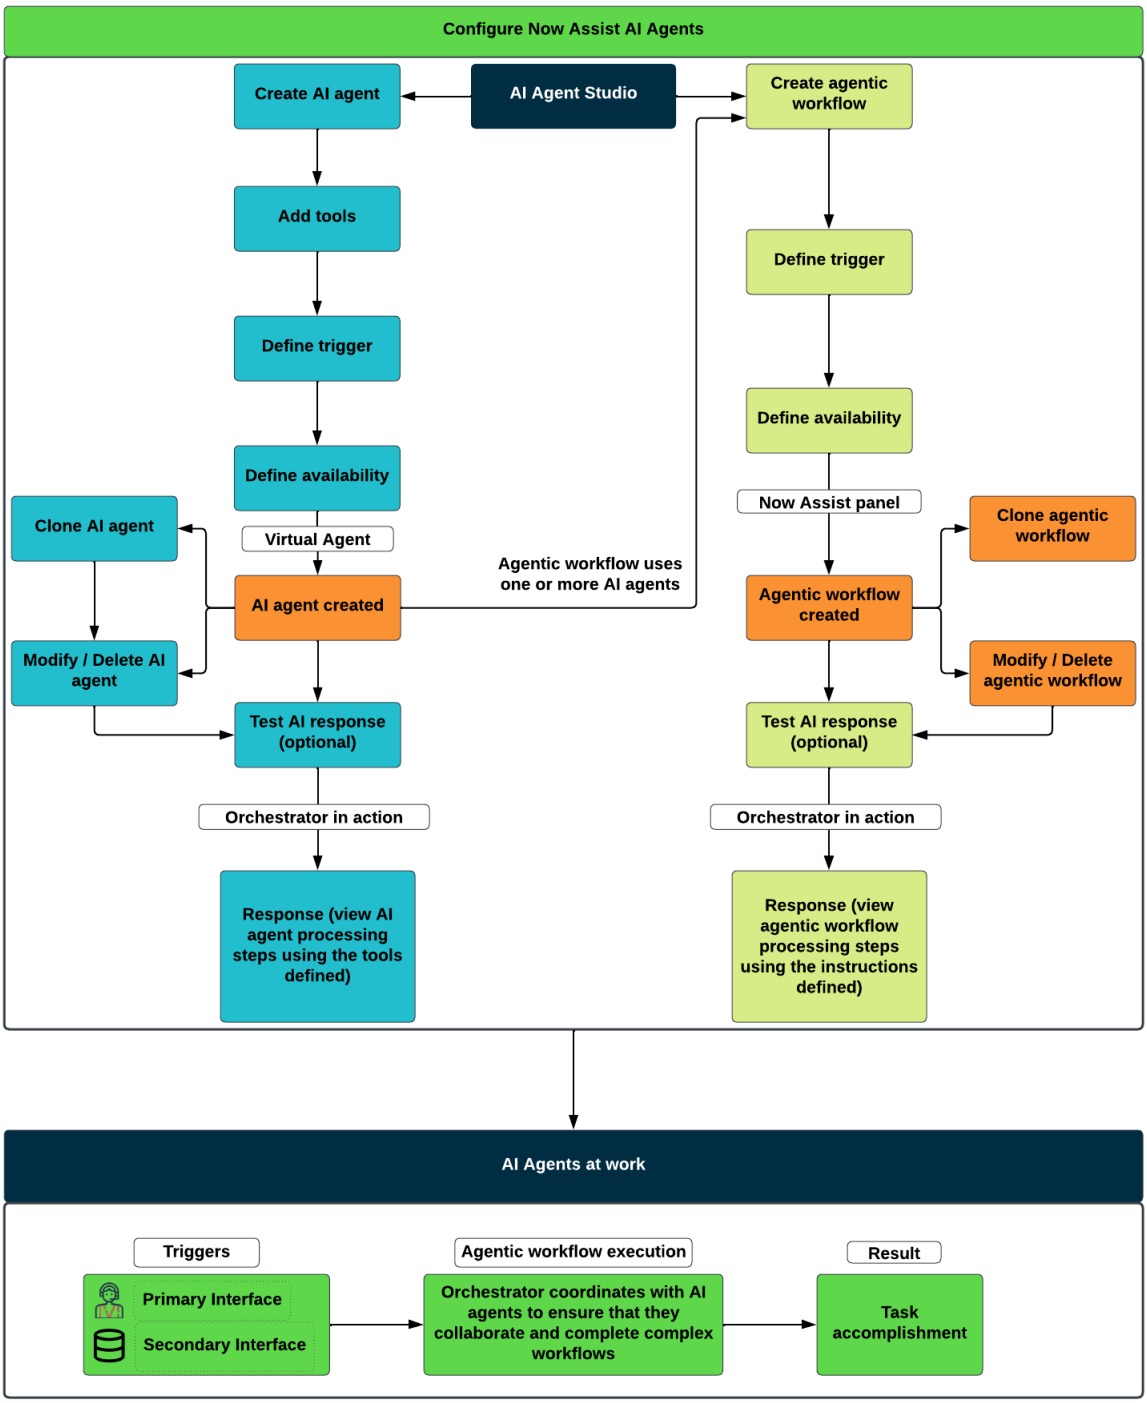
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents configuration and execution



agentic AI has two components: AI agents and agentic workflows. By using the guided setup in AI Agent Studio, you create AI agents and workflows, add tools or define triggers, and define the availability or display location. After they're created, you can duplicate, modify, and test them in AI Agent Studio.

In run time, triggers in the primary and secondary interfaces cause agentic workflow execution, where one or more AI agents execute the plan with the help of the AI agent Orchestrator to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

accomplish the task. After agentic workflow execution, the output appears in the ServiceNow Otto panel. To learn more about an AI agent Orchestrator is, see the Understand AI agents.

AI Agent Studio overview

Create, manage, or test AI agents and agentic workflows so that you can create self-executing workflows to help you achieve your business goals.

https://player.vimeo.com/video/1096896405?h=81ff7b3861&badge=0&autopause=0&player_id=0&app_id=58479

AI Agent Studio homepage

With the AI Agent Studio application, you can create, manage, or test AI agents and agentic workflows all in one place. To enable the agentic AI experience, you must first install AI agents. For more information, see Install ServiceNow Otto AI Agents.

The Overview page has three sections where you can find the information that you must understand, begin, and continue developing AI agents and agentic workflows. When you first go to the AI Agent Studio, tour points are available to guide you through the experience.

In the Ready-made agentic workflows and AI agents section, you can find the templates and ready-made AI agents and agentic workflows that you can incorporate as-is or in custom workflows that you create. You can even explore more templates to find the ones that best fit your needs.

In the Recent agentic workflows and AI agents activity section, you can find the agentic workflows or AI agents that have been created or configured most recently. On both List views, you can create, duplicate, or delete agentic workflows or AI agents. The tab also includes a link to the AI Agents Dashboard where you can review the details about AI agent usage and performance.

The third section is a card to open a modal with a journey checklist that describes the steps to incorporate the AI agents into your workflows successfully and a video that provides an overview of the AI agents and workflows to get you started. Select **View steps** to open this section.

The following example shows the Overview page of AI Agent Studio.

© 2026 ServiceNow, Inc. All rights reserved.

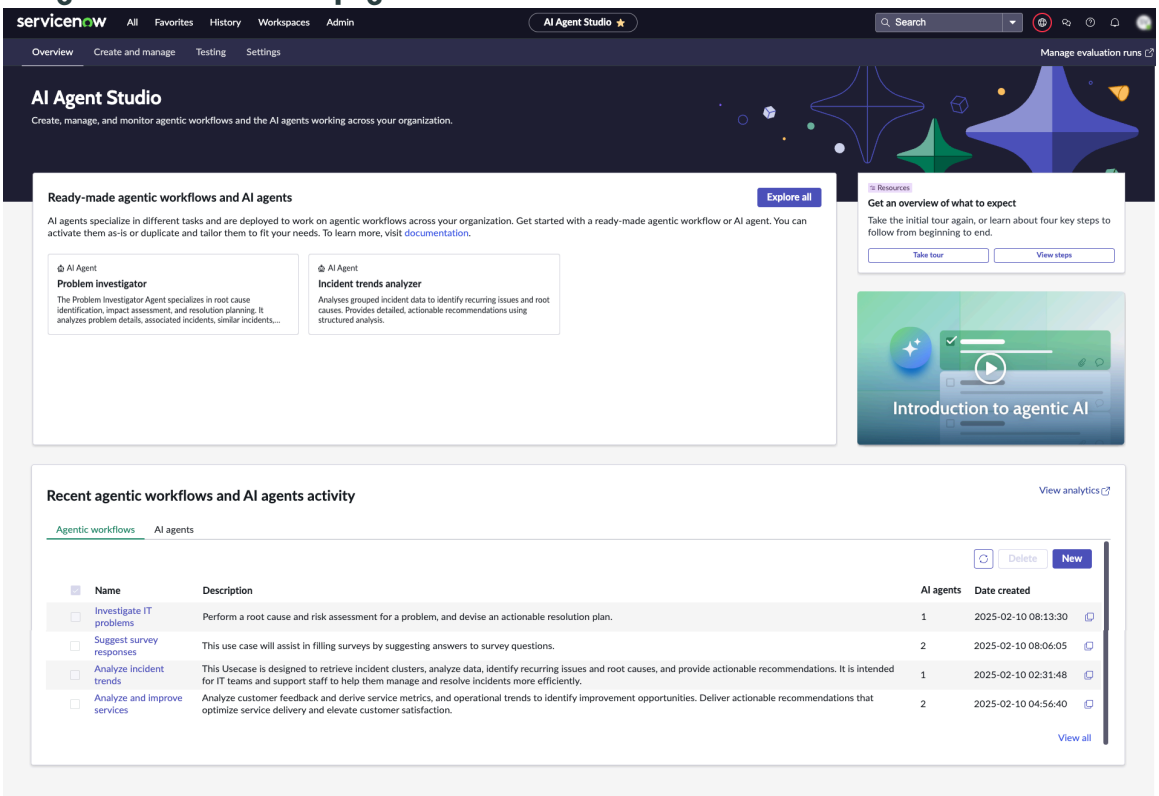
AI Agent Studio overview page

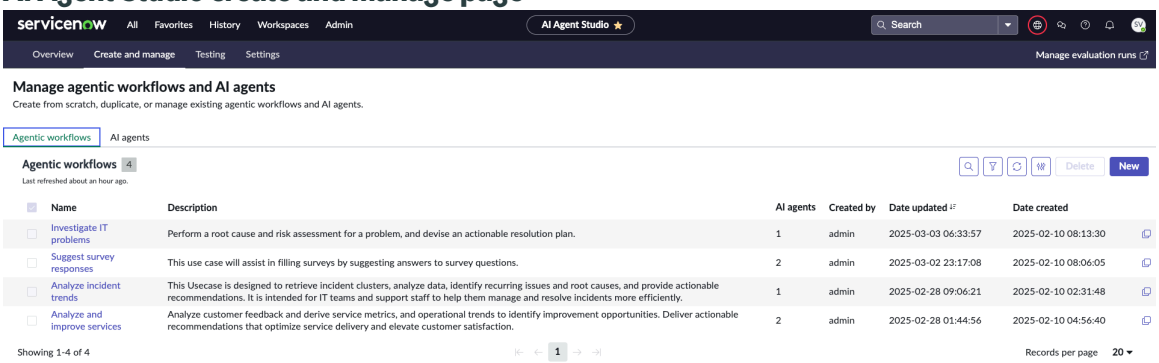


Managing agentic workflows and AI agents

From the AI Agent Studio Create and manage page, you can create, duplicate, or manage the existing agentic workflows and AI agents. This page has two tabs, one for agentic workflows and one for AI agents. You can edit the columns of the List view to change what information is displayed. You can also search or filter the Lists to find the agentic workflows and AI agents that you're looking for quickly. By selecting the name of the agentic workflow or AI agent, you can open Guided Setup to configure or reconfigure the agentic workflow or AI agent.

The following example shows the AI Agent Studio create and manage page after several applications are installed.

AI Agent Studio create and manage page



agentic AI activity

The activity page contains execution logs for both agentic workflows and AI agents. The list allows you to filter based on various fields, including the version. For more information on creating multiple versions of the *`List of steps`* field, see Version control for AI agents and agentic workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows several execution logs in AI Agent Studio.

AI Agent Studio activity page

Testing agentic AI

From the AI Agent Studio testing page, you can review the different tests your AI agents and agentic workflows, both manual and automated. You can test the performance of your agentic AI by simulating a single execution manually, or you can use automated agentic evaluations for testing multiple executions. Single tests are best for evaluating whether the AI agent or agentic workflow does what you expect it to. Agentic evaluations are better at finding underlying patterns and trends that may not be noticeable one execution at a time.

Note: The testing feature does not support the ServiceNow Otto panel assistance for live agent interactions. To connect to a live agent, use Virtual Agent instead. Otherwise, during live agent chat sessions, requester and agent users may be logged out unexpectedly due to sessions expiring prematurely.

There are two types of manual tests you can do: *AI agent or agentic workflow* to test execution or *Test access* to test security controls. You can view your executed tests in the two tabs of the testing page. For manual execution tests, you can select the reply button to repeat the test. You can open the full details page of an automated test by selecting the test's name in the list in the *Automated* tab.

The following example shows the inputs for a Generate Resolution Plan agentic workflow testing setup of AI Agent Studio.

© 2026 ServiceNow, Inc. All rights reserved.

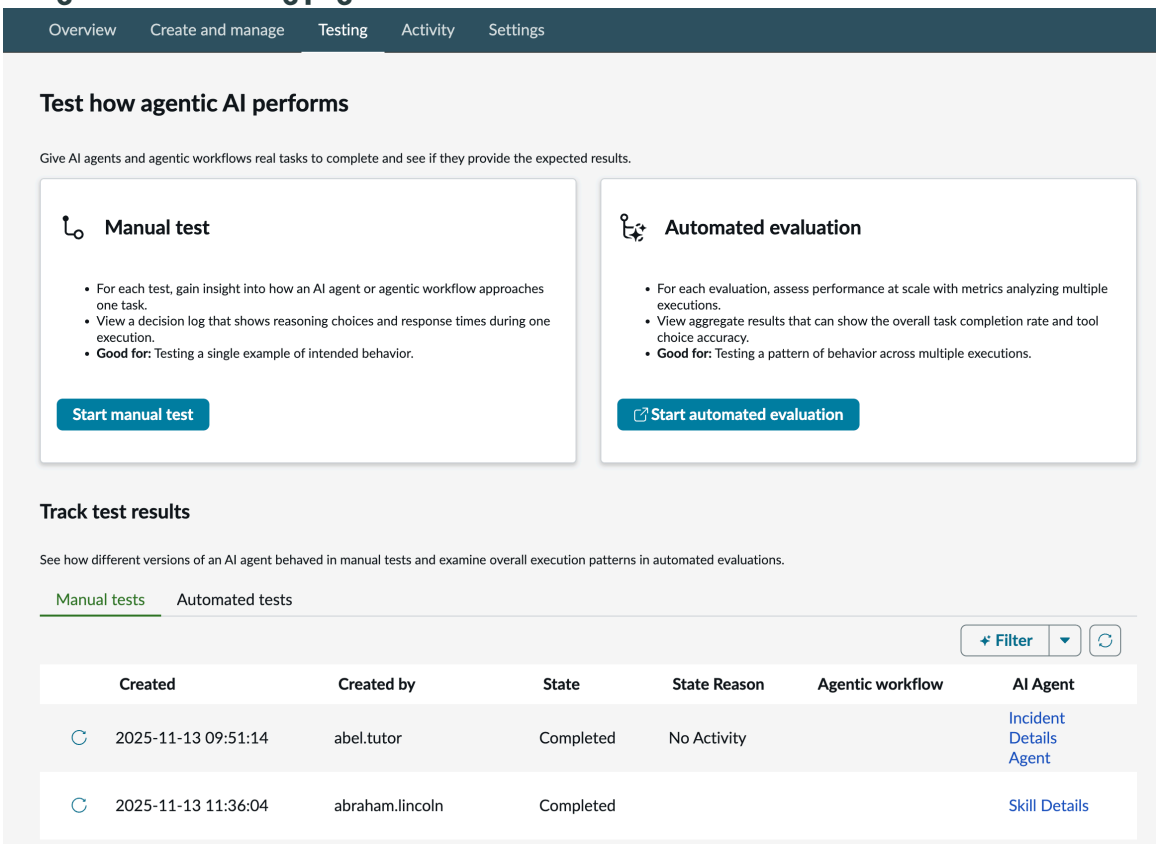
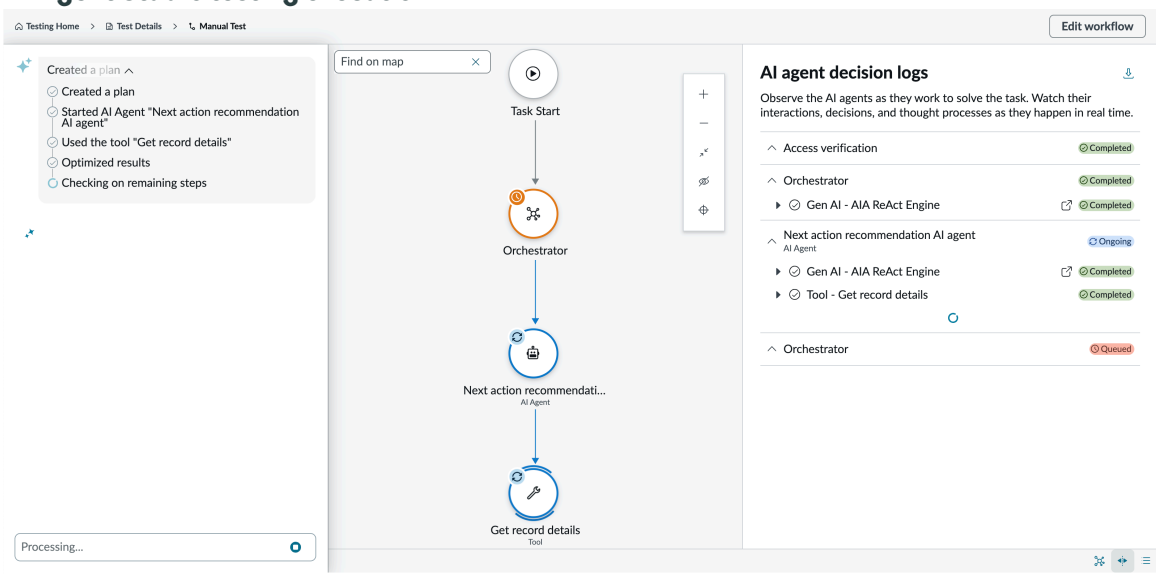
AI Agent Studio testing page



AI Agent Studio testing execution



AI Agent Studio settings

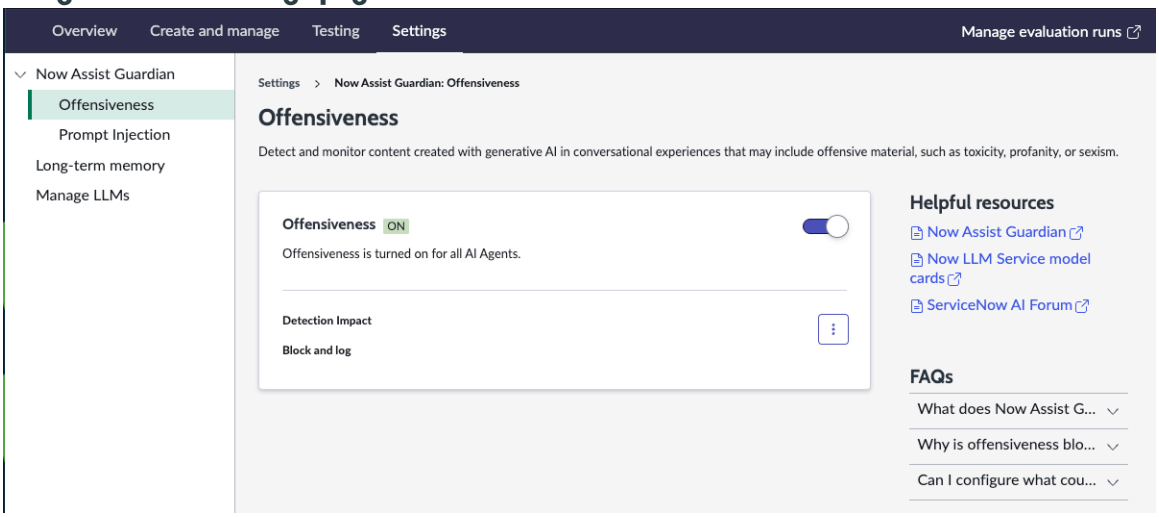
From the AI Agent Studio Settings page, you can enable AI GuardianGuardian for your AI agents. By using AI Guardian, you can configure:

- Offensiveness detection
- Prompt injection attempt decision
- Long-term memory for AI agents

The following image shows the AI Agent Studio settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent Studio settings page

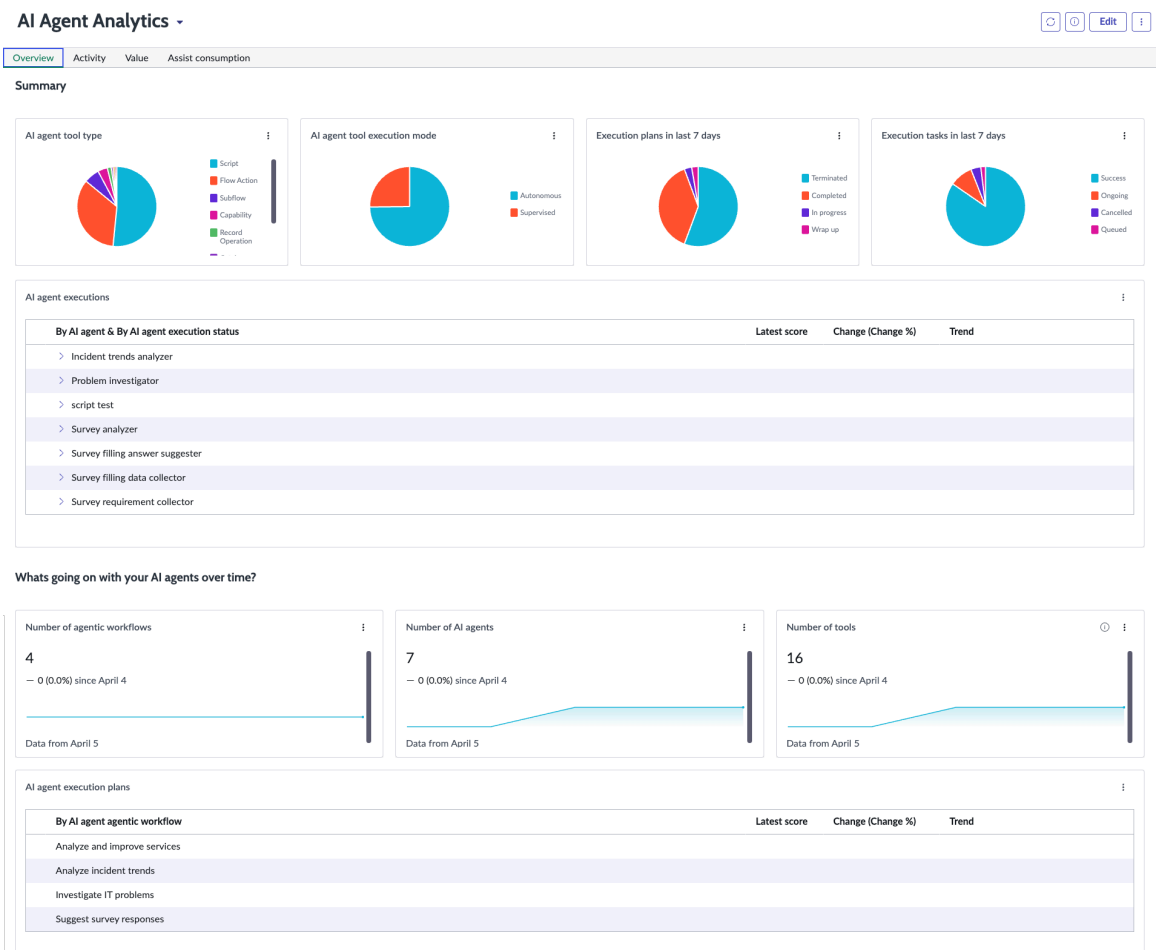


AI Agent Analytics dashboard

From the AI Agent Analytics dashboard, you can review the vital statistics about your AI agents and agentic workflows. You can see the data about the number of agents and agentic workflows used, time-to-resolution efficiency gain, and the number of executions.

The following example shows the overview page for the AI Agent Analytics dashboard.

AI Agent Analytics dashboard overview page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understand AI agents

The AI Agent Studio is designed to securely use your data, workflows, and integrations directly within the ServiceNow AI Platform. AI agents can dynamically adjust their actions based on the progress and changing conditions of incidents or cases to help verify that they stay focused on achieving their objectives.

AI agents Orchestrator

The AI Agent Studio guides users in using AI agents effectively, while AI Orchestrator verifies seamless collaboration among them. The AI agent Orchestrator is a central management system that coordinates AI agents to verify that they collaborate effectively to complete complex workflows. It can also retrieve missing context from users when needed. AI agents operate iteratively, seeking assistance from the Orchestrator if they encounter difficulties. The Orchestrator enhances inter-agent communication and centralizes coordination. The Orchestrator allows AI agents to share information effectively and transition tasks seamlessly, regardless of where the process originates. As a result, the Orchestrator is essential for managing intricate workflows, facilitating real-time adaptability, and efficient task delegation among agents.

The role of Orchestrator in AI Agent Studio:

1. Task Coordination & Execution: manages the interaction between multiple **AI agents**, ensuring that tasks are executed in the correct sequence.
2. Dynamic Decision-Making: Can invoke AI models dynamically based on the scenario.
3. Seamless Integration with Enterprise Systems: Works with ServiceNow workflows, CMDB, and third-party APIs to enable end-to-end automation.
4. Handling Multi-Step Workflows: Enables chained execution of AI-driven tasks among multiple AI Agents.
5. Policy & Governance Enforcement: Enforces governance rules to verify that AI agents adhere to conformance and security standards.

The Orchestrator works with ReAct prompt, where the previous reflection prompt has been merged with the planning prompt for a streamlined execution experience improving the efficiency and visibility of planner actions. With the ReAct prompt, a scheduling mode called Route has been introduced that enables asynchronous, parallel tool execution within agents to reduce latency and improve performance when an agent needs assistance from another agent during the execution process.

Dynamic Orchestrator for agentic workflows

The dynamic orchestrator helps map the right agents to the user's agentic workflow to provide better performance and accuracy. When there are more than the ideal 8 to 10 AI agents available for an agentic workflow, then the dynamic orchestrator helps identify the agents that need to be considered for executing that agentic workflow in the planning phase.

User impersonation in AI agents

The agentic workflow executes tools as the logged-in user in the ServiceNow Otto panel. Any operations that are performed within the tool in this flow are also executed as the logged-in user. After impersonation is enabled, testing an AI agent uses the instance-level impersonation.

Administrators can see logs with individual AI agent names as a record of who approved the agentic action in an agentic workflow. The logs help when determining a point of contact if there’s an issue with the approved agentic action by the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With impersonation, the fulfiller in the ServiceNow Otto panel and the requester in Virtual Agent can see the transactions recorded in the name of the AI agent that performed the agentic workflow execution.

Note: Virtual Agent can be turned on only for AI agents at the Define availability section in the AI agent guided setup. For more information, see Create an AI agent.

Best practices for AI agents configuration

AI agents can dynamically adjust the actions that are based on the progress and changing conditions of incidents or cases to help ensure that they stay focused on achieving their objectives.

AI agents can dynamically adjust the actions that are based on the progress and changing conditions of incidents or cases to help ensure that they stay focused on achieving their objectives.

- You can create, duplicate, and modify AI agents and agentic workflows. The default AI agents and agentic workflows are available in read only mode and to utilize them, you are required to duplicate these resources.
  - For more information about duplicating an AI agent, see Duplicate an AI agent.
  - For more information about duplicating an agentic workflow, see Duplicate an agentic workflow.
- You can also modify the duplicated AI agent and agentic workflow to meet your requirements.
  - For more information about modifying an AI agent, see Modify an AI agent.
  - For more information about modifying an agentic workflow, see Modify an agentic workflow.

Note: The agentic workflows available by default in the system are inactive and you must activate them to utilize. For more information about activating an agentic workflow, see agentic workflow template.

AI agents capabilities

Lists the features supported by AI agents, including configuration options and functional capabilities.

Invoke conversations with AI Agent Background Channel

The AI Agent Background Channel helps you to invoke AI Agent or agentic workflow execution from the Workspace. Use the AI Agent Background Channel associated with the AI Agent Background Provider to invoke conversations. The AI Agent Background Provider is based on the Custom Adapter Framework from Virtual Agent. For more information, see Configure a provider for your custom chat integration.

Create a channel identifier in the Provider Channel Identities table [sys_cs_provider_application] to add any additional conversational capabilities to your own provider application and get a new inbound ID that allows for customization. For more information, see Create a channel identifier for your custom chat integration.

To start a conversation, trigger the flow using the `sn_aia.AiAgentRunttimeUtil().startAiAgentConversation(request)` API in the Script Include (sys_script_include) of the AIAgentBackgroundProvider and select **Run Script**. When the Script execution status indicates Success, the conversation begins in the order of utterances defined in the Script.

Conversations that are invoked for executing an AI agent are logged in the Execution Plans [sn_aia_execution_plan] table. Open the conversation record to confirm the device type as **AI**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Background. Open the execution record to see the **Execution Tasks**, **Messages**, and the **Tools Executions** used to execute the AI agent.

You can also see the entire execution steps on the AI Agent Studio Testing page by copying the execution plan record's [sys_Id] and testing it. On the **Chat responses** tab, in the AI agent decision logs, you can see the AI agent details and the tools it used to resolve the issue.

Interactive and Non-interactive AI agents

The Interactive AI agents reach out to users for information when there is a fallback in the execution process, and the AI agent re-triggers the flow.

The Non-interactive AI agents do not reach out to the user at any fallback stage in the execution process. When the AI agent needs user information, it takes the dynamic prompt approach using the ReAct layer, where the prompt of the ReAct will change based on the execution mode of the AI agent or agentic workflow. Therefore, in the Non-interactive execution, the reach fallback options do not have to collect input from a user as a fallback option. However, the output of the AI agent or agentic workflow will still need to be presented to the user, and in any execution failure scenario, a message in the ServiceNow Otto panel or Virtual Agent is shown.

To implement the Non-interactive execution, the **Execution Mode** field is added in the Execution Plans [sn_aia_execution_plan] table, where the execution mode can be **Interactive** or **Non Interactive** based on the given runtime parameter.

You can run the AI agents and agentic workflows concurrently in the AI Agent Background Channel and in Non-interactive mode where the background execution allows AI agents to operate with any chat panel like ServiceNow Otto panel or Virtual Agent.

Multilingual support

You can leverage multilingual support for AI agents across languages for better translation quality to:

- Tune system prompts for native translations.
- Implement dynamic translation strategies when native support is unavailable.
- Provide extensive testing via automated and manual evaluations.

General guidelines for writing prompts for agentic AI

By following some general guidelines for creating AI agents and agentic workflows, you can create clear and effective instructions that help maximize their efficiency and effectiveness.

https://player.vimeo.com/video/1098393879?h=d37199a090&badge=0&autopause=0&player_id=0&app_id=58479

Creating AI agents and agentic workflows overview

AI agents and agentic workflows rely on large language models (LLMs), so the language that you use for their instructions is important. There are many steps that you can take to help improve the quality and consistency of your agentic AI solutions.

Follow these guidelines when writing AI instructions for an AI agent or agentic workflow.

Clarity

- Use instructions that are concise, clear, and precise. Simple language can help remove ambiguous situations that could stall or disrupt an agent's progress. Example: "You're an assistant tasked with helping the caller or requester by

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

suggesting answers to survey questions." instead of "You help callers with questions."

- Use specific action verbs. Example: "Analyze" instead of "look at."
- Add explicit conditions when a certain step must be completed. Example: "If priority = High, then escalate immediately" instead of "escalate urgent issues."
- Clarify boundaries and limitations. Example: "NEVER modify incident status without supervisor approval."
- Limit technical jargon. Technical jargon can limit applicability because it may not be accessible or universal.

Context

- Embed requirements within context. Specify when certain requirements should be used within the task. Example: "When generating answers to present to the user, apply standard quality controls."
- Only include the context that affects decision making. Avoid extraneous information to help prevent the AI agent or agentic workflow from incorporating unwanted details.
- Define what good outcomes look like. Include examples. Missing or vague descriptions of results could cause AI agents or agentic workflows to exit before the end state is reached. Example: "Present the user with a report that includes a minimum of 3 relevant graphs pertaining to the list of records."

Constraints

- Denote hard requirements. Use strong language to insist on the importance of the requirements. While output may not always follow these requirements, being specific about standards can help reduce deviations.
- Describe preferences that can be adjusted based on context.
- Add conditional restraints. Example: "If more than one record is returned, present the results to the user in order of creation date. If more than five records are returned, present the results to the user in order of relevance."

Coherence

- Create steps that flow logically. Each step should build on the results of the previous step. Example: "Step 1 gathers a list of incident records. Step 2 performs record operations on those list of records."
- Use consistent terminology throughout.
- Design instructions that serve the overall objective. All of your tools and AI agents work together to solve problems.
- Break complex goals into individual pieces. Example: "Step 1: Analyze customer data systematically. Step 2: Check priority and validation permissions. Step 3: Generate and format comprehensive report."

Structure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use consistent formatting. Similar instructions should use similar language patterns.
- Group related steps together.
- Create a smooth flow from instruction to instruction. Along with grouped instructions and logical step progression, this provides a systematic and structured process for the AI agent or agentic workflow to follow.

Guidelines for creating AI agents

The description, AI agent role, and list of steps give the LLM the context and instructions to perform a task. Together, they form the blueprint that's necessary for the LLM to complete its role in a complex workflow. Follow these guidelines to improve the accuracy, adaptability, and optimization of the AI agent:

AI agent description

- Specify the key areas or tasks that you want the agent to handle. Example: "Specializes in handling inquiries and resolving customer issues."
- Use clear, focused language and avoid vague terminology.
- Define the agent's inputs, outputs, and context.
- Differentiate the agent's unique role from other agents. Provide distinct and detailed descriptions of what that specific agent should do that is different than other agents.

AI agent role

- Clearly state the primary function of the AI agent in one or two sentences. Example: "The AI agent acts as a customer service assistant."
- State the specific business challenge that you want the AI agent to address. Example: "Reducing customer wait times by 50%."
- Provide a brief scenario of how the AI agent is to be used. Example: "Automating responses to common queries and escalating complex issues to human agents."

AI agent list of steps

- Create a logical progression from step to step.
- Use action-oriented language. Use verbs like the following:
  - Fetch
  - Retrieve
  - Filter
  - Analyze
  - Extract
  - Parse
  - Update
  - Send
  - Notify
  - Generate
  - Validate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Include outputs for each step to measure the task completion. Example: "Return the total incident count to other agents or processes that need it."
- Add contingencies to account for unexpected scenarios. Example: "If you encounter an error while looking up records, try again. If you still get an error, report that an error occurred."
- Define success and completion. Provide end states so that the AI Agent Orchestrator can determine whether an AI agent has finished its objective.
- If you have created a tool for your AI agent, refer to the tool by name. However, verify that the instructions change if the tool is ever renamed. If you don't, then the AI agent might not complete its task.

Tools

- Write detailed tool descriptions to help the AI agent understand what the tool is and how to use it.
- Create tools that work together. Build your tools around achieving the list of steps for the AI agent itself.
- Use the output transformation strategy field to define what the output of a tool should look like. Specifying how a tool should present its output can help the AI agent use that output when employing other tools or when sharing information between other agents.

Guidelines for creating agentic workflows

Follow these agentic workflow guidelines to provide the detailed information and the steps needed to accomplish a task:

Agentic workflow list of steps

- Write each step sequentially and number each step so that there's a logical and actionable flow.
- Account for as many possibilities as you can to avoid gaps. Provide enough detail that the agentic workflow can adapt if it encounters an edge case.
- Define the starting conditions, actions, decision points, and end states.
- Refer to end users as "the user."
- Use verbs like "show," "display," or "inform" to describe steps where the user needs to be shown something but they do not need to provide input.

Additional tips

Associate a maximum of 10 agents per agentic workflow. Adding more agents might not provide better or faster results. Instead, use small, well-defined scopes.

Note: You can assign up to 100 agents to an agentic workflow. However, not all 100 agents may be involved in resolving the agentic workflow. The AI Agent Orchestrator decides which agents should execute the plan. For example, an incident resolution gets impacted by the size of the agentic workflow and the number of agents that are assigned to it.

When creating agentic workflows with more than one assigned agent, make sure that you clearly define the agents with non-overlapping responsibilities. Include explicit limitations in the agents' roles. For example, one agent could handle user record details while another agent handles the incident record details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common issues

Problem: Agent consistently uses the wrong tool

Potential solutions:

- Create clear, specific instructions with action keywords.
- Write detailed tool descriptions that specify when and why to use each tool.
- Include explicit input and output guidance in tool descriptions.
- Evaluate tool selection logic by testing against various scenarios.

Problem: Inconsistent output quality

Potential solutions:

- Embed standards as actionable requirements.
- Use phrases such as "implementing professional standards."
- Add quality verification steps.

Problem: Quality checks or other steps skipped

Potential solutions:

- Convert checklists to actionable steps.
- Use phrases such as "analyze completion against criteria."
- Add conditional progression logic.

Additional resources

For more prompting recommendations, see the Community AI Agents prompting guide.

Example AI agent

Use the example AI agent with clear name, description, AI agent role, and list of steps fields to use as a guide when creating your own AI agents.

Name

Categorize ITSM incident AI agent

Description

Categorize ITSM incident AI agent assigns the appropriate category, subcategory, and configuration item (CI) to an incident.

AI agent role

You're an expert in analyzing incidents and are tasked with assigning an appropriate category, subcategory, and configuration item (CI).

List of steps

Objective: Incidents represent disruptions, unavailability of a service, or issues faced by a user. The agent's task is to understand the issue and assign the appropriate:

- Category
- Subcategory
- Configuration Item (CI)

Step 1: Retrieve Incident Details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Fetch the details of the given incident.
- DO NOT PROCEED if incident details are missing.
- If no details are found, verify the correctness of the incident number.
- Only proceed when incident details are successfully retrieved.

Step 2: Assign Category, Subcategory, and CI.

Step 2.1: Determine the Category.

- Fetch the available categories.
- Recommend a category only if the incident details contain clear, specific, and meaningful information that directly corresponds to one of the available categories.
- If the details are too vague, generic, lack context, or do not clearly indicate a relevant category, then set the category and subcategory to "Not determined" (field_value = null). Do not edit the subcategory later.
- Do not infer or guess a category based on common or placeholder terms (for example, "test", "check", "issue") unless they are accompanied by enough context to confidently justify a match.
- You must be 100% certain that the incident clearly belongs to a category before assigning it.

Step 2.2: Determine the Subcategory.

- Fetch the list of available subcategories for the chosen category.
- Choose the most appropriate subcategory based on the incident details.
- If no suitable subcategory can be determined or if the category is not determined, set subcategory to: "Not determined" (field_value = null).

Step 2.3: Determine the Configuration Item (CI).

- Fetch the list of CIs assigned to the caller of the incident.
- Pick the most relevant CI based on
  - Name
  - Manufacturer
  - Asset Name
- If no relevant CI is found or the list is empty, set CI to: "Not determined" (field_value = null).
- If multiple options exist, select the most relevant one.

Step 3: Present the Recommendation.

- PRESENT the recommended values to the user in the following bullet-point format:

  Recommended incident ({incident number}) categorization details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Category: {recommended category}, (Reason: {reason for recommendation})
- Subcategory: {recommended subcategory}, (Reason: {reason for recommendation})
- Caller's CI: {recommended CI}, (Reason: {reason for recommendation})

- Ensure this information is explicitly displayed before proceeding to the next step.

Step 4: Update the Incident. Update the incident record with the selected Category, Subcategory, and CI values.

Key Considerations:

- NEVER ask the user for input.
- Never proceed without retrieving incident details.
- If NO appropriate value is found, assign "Not determined" (field_value = null).
- Do NOT ask the user to manually determine category, subcategory, or CI.
- Always present recommendations before updating the incident.
- Ensure that the recommendations are logical and relevant to the incident details.

Example agentic workflow

Use the example agentic workflow with clear name, description, and list of steps fields to use as a guide when creating your own agentic workflows.

Name

Investigate incident

Description

This workflow streamlines incident management by analyzing incidents, linking them to existing problems, and identifying relevant catalog items. It leverages three specialized AI agents: the ITSM Incident Resolution Investigation AI Agent retrieves incident details, identifies similar incidents, and fetches relevant knowledge articles; the Link Incident to Problem AI Agent searches for and links incidents to existing problems based on contextual similarity; and the Find Catalog Item AI Agent locates relevant catalog items and integrates their details into incident records or provides direct links. This structured orchestration ensures efficient incident resolution, reduces redundancy, and enhances decision-making by leveraging historical data, organizational knowledge, and catalog resources, ultimately improving enterprise incident management effectiveness.

List of steps

Step 1: Incident Analysis:

Analyze incident details and retrieve relevant historical data and knowledge articles.

Step 1.1: Retrieve Incident Context:

- Use the ITSM Incident Resolution Investigation AI Agent to fetch incident details (short description, description, caller, state).
- If retrieval fails, inform the user: "Unable to retrieve incident details. Please verify the incident number." and terminate workflow.

Step 1.2: Identify Similar Incidents and Knowledge Articles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the ITSM Incident Resolution Investigation AI Agent to find similar incidents and relevant knowledge articles.
- Confirm with the user before adding resolutions to incident comments.

Step 1.3: Prepare Incident Documentation:

Update incident additional comments with approved resolutions and knowledge article references, preparing clear documentation for next phase.

Step 2: Problem Linking:

Link the incident to an existing relevant problem, if applicable.

Step 2.1: Receive Incident Documentation:

Use Link Incident to Problem AI Agent to validate incident details and confirm no existing problem linkage.

Step 2.2: Identify Relevant Problems:

- Execute search for relevant problems using incident short description.
- If no relevant problems found, inform the user: "No relevant problems found to link." and proceed to Catalog Item Identification.

Step 2.3: Link Incident to Problem:

- Present most similar problem details to the user for approval.
- Upon user approval, link incident to problem using "Set problem to incident" tool; confirm successful linkage to the user.

Step 3: Catalog Item Identification:

Identify and integrate relevant catalog items into the incident record.

Step 3.1: Receive Incident and Problem Context:

Use Find Catalog Item AI Agent to validate incident context and prepare for catalog item search.

Step 3.2: Execute Catalog Item Search:

- Perform targeted search for relevant catalog items based on incident description.
- If no catalog items found, inform the user: "No relevant catalog items identified." and proceed to final delivery.

Step 3.3: Integrate Catalog Item Details:

- Present catalog item choices to the user; upon selection, either add catalog item details to incident additional comments or provide direct catalog item link.
- Confirm successful integration or delivery to the user and complete workflow.

Group Action Framework

Group Action Framework (GAF) is an intelligence feature on the ServiceNow AI Platform that groups related records and applies actions to them using LLMs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GAF overview

GAF is composed of two processes. The grouping process identifies clusters of similar records (incident, cases, KB articles, and the actioning process maps) new records to clusters and selects the representative record. Topic-labeling occurs during the setup process and labels the different clusters, which form the *Description* field of records on the GAF record groups [sn_gaf_record_group] table. GAF processes together benefit your AI agents and generative AI features in multiple ways.

- Improves consistency and quality of agentic and generative AI features by using the best examples from groups of records.
- Reduces the cost of LLM calls by only executing on the representative records.
- Scales to accommodate large amounts of data because selected records can represent any size cluster.

Skills used in GAF

Multiple skills are involved in GAF setup and execution. They are modular, so not all executions will use all skills, but they can be used together in tandem. These skills are used exclusively for GAF and currently cannot be included on their own in custom agentic workflows.

Grouping skill

Clusters related records using machine learning techniques.

Topic-labeling skill

Adds human-readable names to the clusters using an LLM to make the clusters easier to identify.

Action strategy skill

Selects representative records from each cluster for the mapper and reducer skills to use.

Action mapper skill

Runs LLM inference calls for the selected representative records, producing a record summary for the selected records.

Action reducer skill

Uses the generated summaries created by the mapper skill to produce a single summary for the entire cluster.

GAF and ServiceNow® Otto for AI Search

GAF uses AI Search to improve its effectiveness and can use it as a fallback option in case GAF does not return any results. GAF can work without ServiceNow Otto for AI Search, but if it is enabled then GAF has optimized prediction. The optimized prediction feature increases clustering capacity up to 500,000 records and improves recall speed.

See Install ServiceNow Otto for AI Search and Set up AI Search for Group Action Framework for more information on configuring AI Search for GAF.

Grouping inputs

When you configure GAF, the Grouping inputs record in the Now Assist Skill Config Var Set defines what records are clustered and how clustering behaves. The default values work for most configurations, but the following parameters are available if you need to adjust them.

Table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The source table whose records are clustered. For example, the Incident [incident] table for ServiceNow Otto for ITSM.

Fields

The field or fields used as the basis for clustering. GAF compares the content of these fields across records to identify similar ones.

Filter

Conditions that determine which records from the source table are included in the grouping. You should have at least 2,000 records after filters are applied for clustering to complete successfully.

Use taxonomy

When enabled, applies a taxonomy to improve the categorization of clusters.

HTML Preprocessing

When enabled, strips HTML markup from field content before clustering. Enable this if your source records contain HTML-formatted text.

Dimensionality reduction parameters (UMAP)

Controls how GAF compares records to each other before clustering. The *n_neighbors* parameter [2–100] sets how many similar records GAF considers when deciding which cluster a record belongs to. The *n_components* parameter [5–100] sets how many characteristics of each record GAF tracks during that comparison.

Clustering parameters (HDBScan)

Controls how clusters are formed from the compared records. The *min_samples* parameter [2–10] sets how many similar records must exist before GAF treats a pattern as a real cluster rather than noise. The *min_cluster_size* parameter [2–100] sets the minimum number of records required to form a cluster. The *cluster_selection_epsilon* parameter [0.01–0.99] controls how similar two clusters need to be before GAF merges them into one.

Note: The default values for UMAP and HDBScan parameters work for most configurations. Larger, denser clusters represent more common issue patterns and are surfaced more frequently. GAF's retrieval logic also handles smaller clusters, so less common patterns are still accessible.

Diagnosing and troubleshooting GAF

To find logs where GAF is used on your instance, go to the Generative AI Log [sys_generative_ai_log] table and filter based on the skill that used GAF. You can also filter the Log [syslog] table for the scope containing `sn-gaf`. Actions performed by skills, AI agents, and agentic workflows that use GAF all generate logs.

For more information about common errors and possible resolution steps, see Troubleshooting GAF.

Additional information

GAF does not support domain separation at this time.

Version control for AI agents and agentic workflows

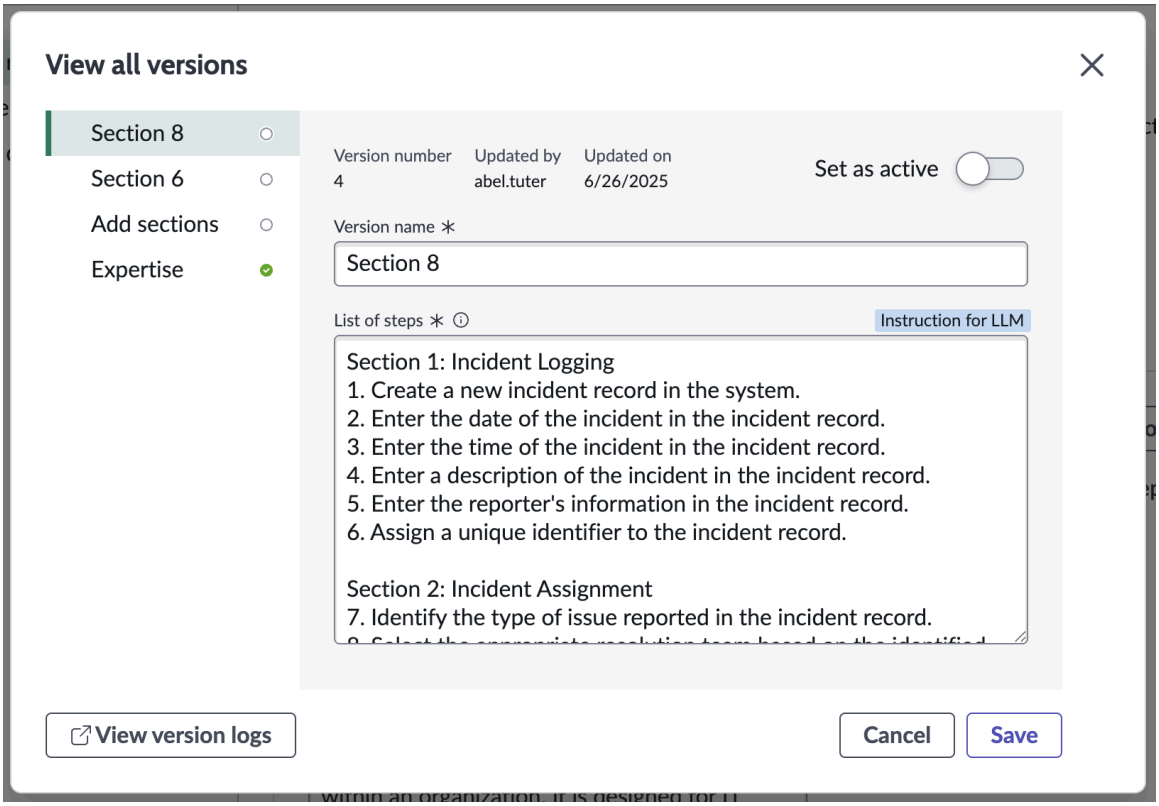
Version control enables you to track changes made to instructions sent to the LLM for AI agents and agentic workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Version control overview

When creating an AI agent or agentic workflow, the *List of steps* field is important because it provides the context necessary for the large language model (LLM) to accomplish tasks. You can use version control to create multiple versions of the *List of steps* field in the guided setup. Tracking your changes with version control helps enable you to experiment and test new instructions. You can create versions, edit and refine versions, and revert to previous versions as needed.

Version control modal



Creating versions

You can create a version by selecting **View versions** > **New version** in the guided setup of an AI agent or agentic workflow. Doing so brings up the *Create a new version* modal where you can name the version and make changes. Naming your version enables you to identify what changes were made to make it easier to track.

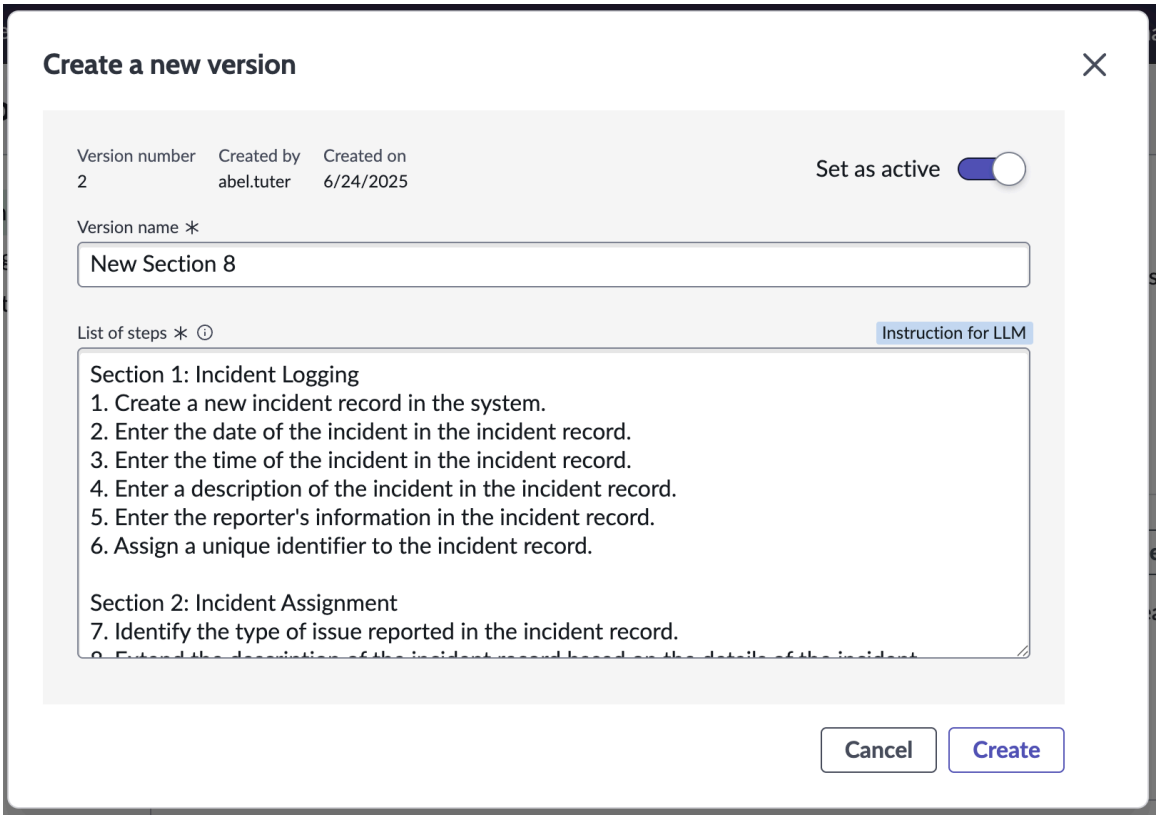
You can choose to make the new version active immediately by selecting the **Set as active** toggle.

For more information about writing effective descriptions and instructions, see General guidelines for creating AI agents and agentic workflows.

When creating a new version, you also have the option to use ServiceNow Otto to refine your current *List of steps*. You must already have an active version for this option to be available. Selecting **View versions** > **Refine version** brings up the modal where ServiceNow Otto generates and displays a new *List of steps* for you to review. You can change any of the generated text, or you can use it as it was generated. Select **Create** to use the new, refined version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a version modal



Changing between versions

When you have multiple versions of the same *`List of steps`* field, you can switch which one is active at any time. Choosing to make a new version active enables you to test it and evaluate its effectiveness.

If you're updating an agentic workflow, you can execute an agentic evaluation run to measure performance.

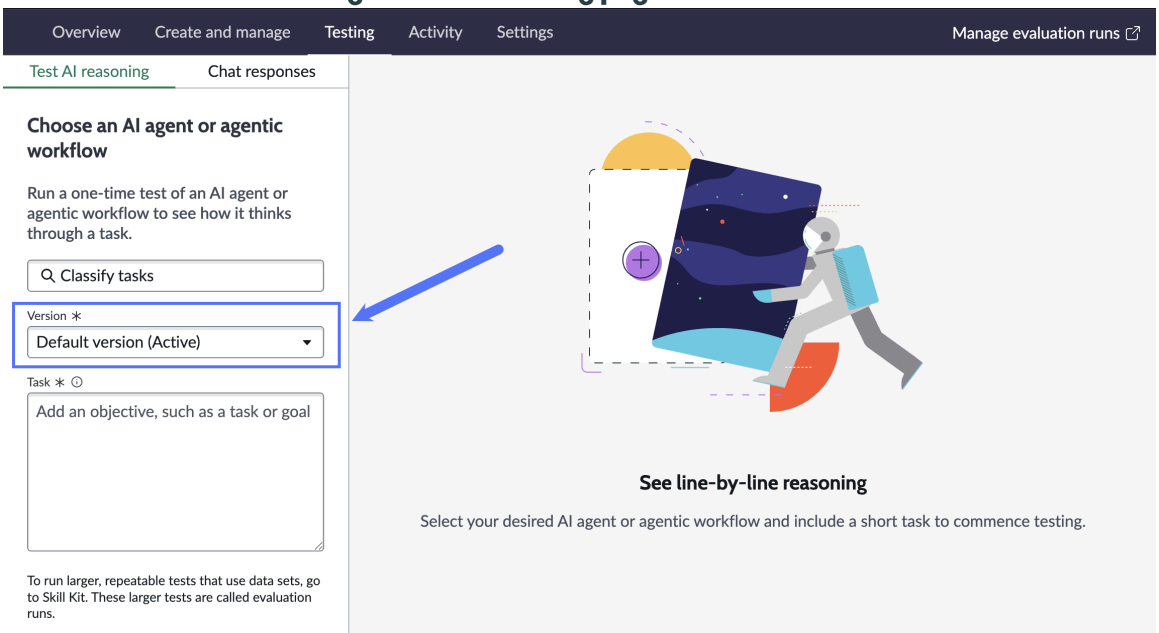
You can decide which version is active by selecting **View versions** in the guided setup. Toggle the **Set as active** field and save your changes to make the new version active.

Testing different versions

You can test different versions of an agentic workflow or AI agent from the AI Agent Studio **Testing** page. The **Version** selector dropdown displays both active and inactive versions with the currently active version marked as *`(Active)`*. You can also start evaluation runs for specific versions by selecting **Set up evaluation run**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Version selector in the AI Agent Studio Testing page



Version logs

The AI Agent Studio **Activity** page enables you to track AI agent and agentic workflow executions by version. When in the guided setup, you can select **View version logs** in the *`View all versions`* modal. Choosing to view the version logs opens the **Activity** tab in a new window with the list filtered for the version you selected.

When viewing the **Activity** tab at any time, you can choose to filter by version. The more specific your version names, the easier it is to identify those changes in the list.

Example execution logs

Implement access control in AI agents

Implement security in AI Agent Studio through access control lists (ACLs), user identities, and role filtering with the access control-based security measures in the agentic system.

Security for AI agents

Access controls for agentic AI on the ServiceNow AI Platform comprises the major aspects: determining which users can access agentic AI resources and what access each of those resources has once invoked. These aspects are controlled through three main components:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

access control lists (ACLs), user identities and role filtering. The interaction between these components at the agentic workflow, AI agent, and tool levels within AI Agent Studio influences their overall security and functionality.

Access Control Lists (ACLs)

The access control lists (ACLs) in AI agents determine which role(s) a user must have to be allowed to invoke an agentic workflow or an AI agent. ACLs must be configured individually for each agentic workflow, AI agent, external AI agent, and certain AI agent tools such as generative AI Skills, Flows, and Flow Actions.

ACLs configured in the AI Agent Studio for are role-based and of the Allow If type:

- **Allow-If**: Grants access to data or resources when any of the specified conditions in the ACL are met. Allow If ACLs don't prevent other ACLs from granting access to the same resource even if it that specific ACL itself doesn't grant access.
- **Deny-Unless**: Grants access only when the invoking user identity meets all the specified conditions. No other ACLs can override or grant access to that resource once a Deny Unless ACL is in place. This is available when configuring ACLS in the ACL [sys_security_acl] table and not in the AI Agent Studio.

There are three possible options for ACLs created in AI Agent Studio:

- *`Any authenticated user`*: Grants access to any user who is authenticated on the instance, regardless of the role.
- *`Users with specified roles`*: The default ACL option that requires you to select the specific roles required to invoke an AI agent or an agentic workflow.

  Note: As the ACLs are Allow If ACLs, any user with at least one of the roles will be able to invoke the AI agent or agentic workflow.

- *`Public`*: Grants access to all users, including guests who aren't signed in.

  Note: Understand that this configuration should be used sparingly and only when needed.

Note:

- ACLs configured in AI Agent Studio only determine the roles required for users to invoke an agentic workflow or an AI agent. They don't determine the access that the agentic workflow or an AI agent has once it's invoked.
- For an agentic workflow or AI agent to successfully execute, the invoking user (or relevant AI user) must meet the criteria of all of the ACLs of any downstream components which have their own ACLs and are assigned to the agentic workflow or AI agent (even if the specific execution might not need to invoke all of those AI agents or tools). Therefore:
  - If there are conflicting security requirements between agentic workflows, AI agents, and AI agent tools, your agentic AI fails to execute.
  - The same occurs if the invoking user meets the criteria for some ACLs but not others. This includes components assigned to the agentic AI that might not be required for the specific execution.
- When configuring these security settings, consider all aspects of the agentic system- including the agentic workflow, AI agents, and tools.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User identities

After configuring the access control lists (ACLs), you must configure the User identity (also called as *Run as*) which the AI agent or agentic workflow will run as during execution.

After configuring the access control lists (ACLs), you must also configure the user identity (also called as Run as) which the AI agent or agentic workflow will run as during execution.

The user identity determines which user the AI agent or an agentic workflow operates as during execution, and therefore the data it can access and the actions it can take, depending on the roles assigned to the user identity.

Note: Each agentic workflow and AI agent has its own user identity configuration.

There are two possible user configurations to select from:

- **Dynamic user**: The user identity of the person or resource (automated trigger/agentic workflow/parent agent) which invokes the execution of an AI agent or an agentic workflow. The roles assigned to the agentic workflow or AI agent will change dynamically depending on the identity of the invoking user.

  Note: Dynamic user is the default user identity, and you can use the dynamic user unless there's a specific need that justifies an AI user.

- **AI user**: A dedicated user identity that the AI agent or an agentic workflow runs as during execution, which has assigned roles that remain consistent regardless of who or how the execution is invoked. For example, an AI agent or an agentic workflow may need to be run with elevated privileges that the dynamic user might not have. If configured as a dynamic user, the execution would fail. However, if the AI agent or agentic workflow is configured to run as an AI user that has the elevated roles assigned to it, the execution will succeed even when invoked by a user with lower privileges.

  Note: If you don't have a suitable AI user but want to use the *AI user* identity, you must create a record on the User [sys_user] table. See Create a user and select *AI user* as the identity type.

Role filtering

Role filtering restricts the roles that AI agents can inherit from the invoking user to a subset of approved roles. This limits the capabilities of the agent, ensuring it can only use the roles that the builder of the AI agent has specifically permitted, even if the user possesses additional roles.

Role filtering only applies when the agent runs as a dynamic user — because the identity (and resulting roles) of the invoking user can't be known in advance. There could be situations in which high-privileged users invoke AI agents that should not run with high privileges. By applying role filtering, the builders of AI agents can make sure that their agents adhere to the Least Privilege Principle. Role filtering is not required when an AI agent runs as an AI user. Since the roles of the AI user are preconfigured and can (and should) be set to meet the needs of the specific AI agent – no additional filtering is required to conform to the Least Privilege Principle, which can be controlled entirely by the AI user configurations.

Deny by Default

The ServiceNow AI Platform enforces a deny-by-default ACL (Access Control Lists) configuration certain types of agentic components on newly activated instances. In earlier releases, these record types defaulted to allow access unless an ACL was configured for a specific record. In Australia release, newly activated instances start from a deny-by-default posture instead, so access has to be configured explicitly by creating an ACL for the specific record, rather than

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

inherited through permissive defaults. This applies to any AI agents and agentic workflows that don't have an individual ACL configured, reducing unauthorized access risks.

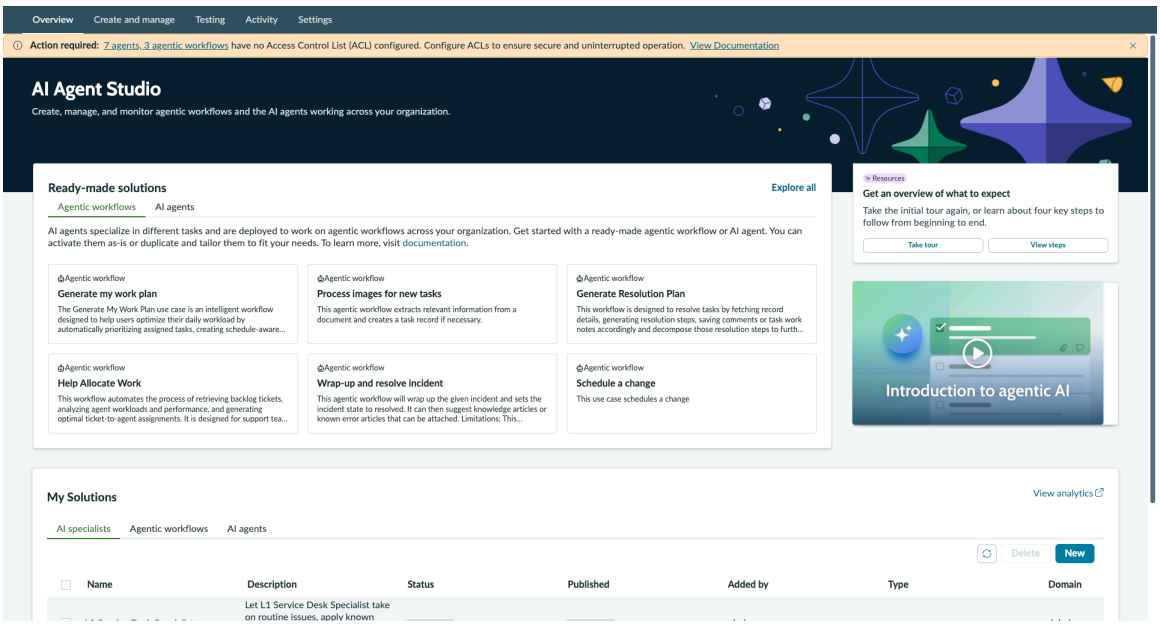
The deny-by-default enforcement works as follows: The **Security Attribute** field value for AI Agent and agentic workflow on the Access Controls table [sys_security_acl] is set to **Never**, enforcing the deny behavior and leaving the **Decision Type** field value as is, that is, **Allow If**. This configuration verifies that if an AI component already has a primary ACL in place, access continues to be governed by that ACL. The backup (wild card) ACLs deny access only when no primary ACL is present. The old wildcard ACLs allow users with agents that predate the availability of access controls in agentic products to continue to run their agents, but that general guidelines is to implement deny by default in all instances. The replacement means that the AI agents and agentic workflows must have explicit ACL entries to operate. Without explicit ACLs, access is denied by default.

Note: The enforcement applies only to the newly activated instances. Any instances that are upgraded to Australia release from previous releases aren't automatically affected by this configuration change and the adoption of the deny-by-default ACL configuration will require admins to proactively opt in.

Security check on AI Agent Studio

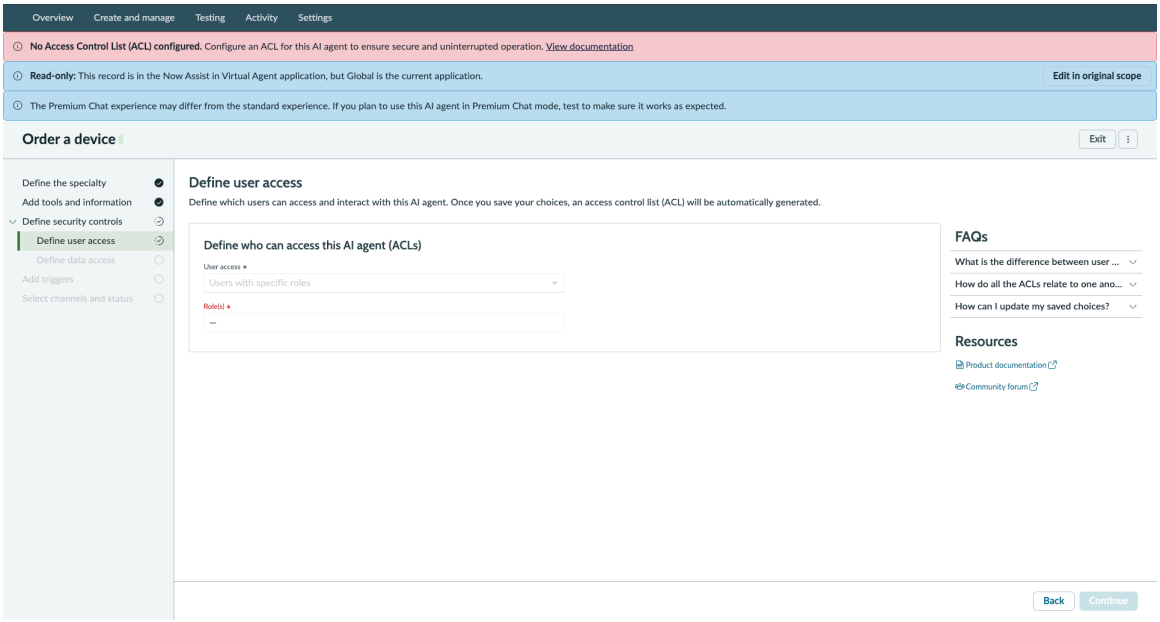
To inform users about security checks on the agentic system, the platform provides the following notifications in the AI Agent Studio interface:

- AI Agent Studio Home page: The AI Agent Studio Home page displays a warning when AI agents or agentic workflows don't have explicit ACLs configured on the instance.



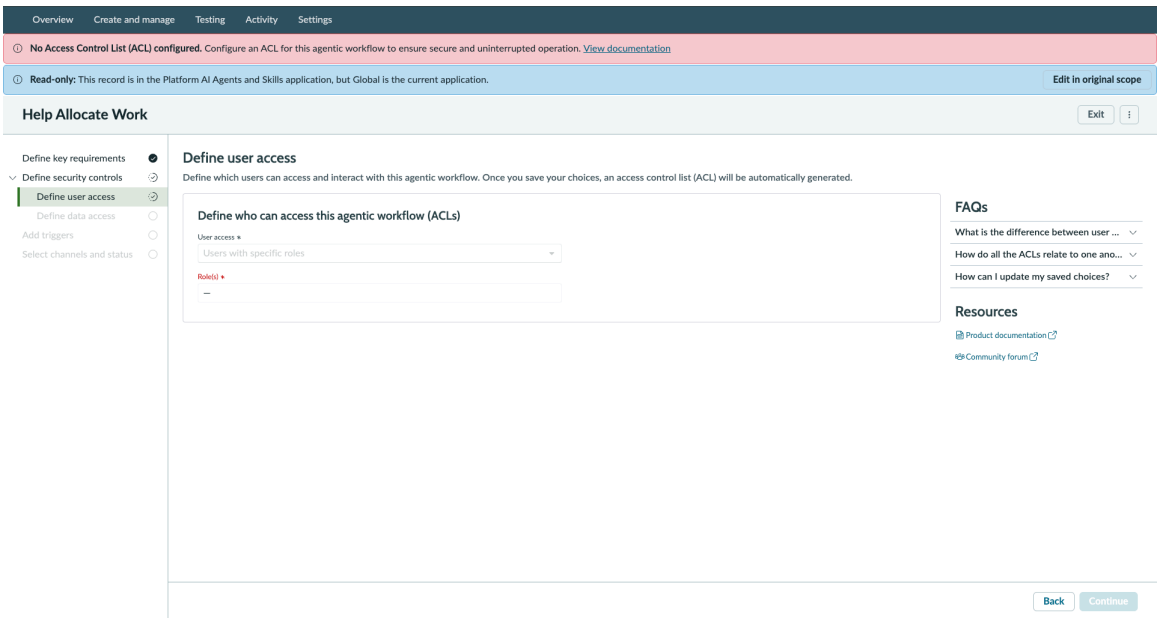
- AI Agent guided setup: The AI agent guided setup page displays a warning banner when that agent doesn't have the required ACLs configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: To configure access control lists for an AI agent, see Define security controls for an AI agent.

- Agentic workflow guided setup: The agentic workflow agent guided setup page displays a warning banner when that agentic workflow doesn't have the required ACLs configured.



Note: To configure access control lists for an agentic workflow, see Define security controls for an agentic workflow.

Security mechanisms

Using ACLs, user identities, and role filtering together provides layered security for AI agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ACLs prevent unauthorized users from reaching and invoking the agent.
- User identities verify the agent operates under the correct privilege scope at runtime, preventing escalation beyond what the assigned dynamic user permits.
- Role filtering verifies that agents can't take actions that exceed defined boundaries even when invoking use has that access.

A common source of confusion is assuming that ACLs define agent actions. They don't! ACLs determine who can invoke the agent. The scope of permissible agent actions are determined by the user identity and role filtering. Use the following summary to distinguish the mechanisms:

Distinguishing ACLS, user identities, and role filtering

Feature	ACLs	User identities	Role filtering
Controls	Who can access the agent	Which identity the agent acts as	What the agent can do
Applied to	Users, groups, and roles that invoke the agent	The user identity with which the agent executes at runtime	The agent's runtime execution context
Security purpose	Restricts agent discoverability and invocation	Determines privilege scope during execution	Restricts agent actions and data access

Distinguishing AI user and Dynamic user

Feature	AI user	Dynamic user
Definition	A predefined identity the agent runs as	The identity of the agent at runtime which is inherited from the invoking user.
Role filtering applies	No	Yes
Roles used	Fixed to the AI user's assigned roles	Scoped down by role filtering
Identity source	Configured statically	Determined dynamically at runtime

Note: Configuring only one of these mechanisms leaves a gap in the agent's security posture. Therefore, it is necessary to configure the security mechanisms across the AI Agent Studio and other AI components such as generative AI Sills, Flows, and Flow Actions.

For more information, see Define security controls for an AI agent and Define security controls for an agentic workflow.

AI agent learning

Enhance AI agent learning through episodic memory, enabling agents to improve by learning from past successful interactions.

Episodic memory overview

The represents historical experiences and their associated learnings in the form of feedback. It's the ability to reflect on and learn from them by applying memory of similar episodes to new

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

experiences. This capability enables agents to extract meaningful patterns and insights from experiences and use them effectively in the future.

Understanding episodic memory in AI agents

When an agent learning is enabled, the AI agent:

- Focuses on learning from execution outcomes, building episodic memory of what went wrong and how it was fixed.
- Acts as a feedback refinement loop, converting agent failures into structured learning for future tasks.
- Memory is heavily based on experience correction rather than just context extension.
- Memory entries carry relevance weights (like attention scores) → aligns with adaptive retention seen in human-like learning.

To configure agent learning at the AI agent level, see Define the specialty of an AI agent.

To configure agent learning at the AI Agent Studio level, see Set up long-term memory.

Configure AI agents

Configure AI agents to execute agentic workflows with AI agents and mapped tools.

AI agents follow your instructions and act toward a specific goal and outcome by using the tools that you configure for those agents. By using the context of your record and your searchable content, AI agents can plan and analyze the task with a business logic that is combined with the instructions that are sent to large language models (LLMs) that suggest the next best action to be taken.

Note: Make sure that your record data and knowledge base have the latest accurate information for the best results.

Preparing for AI agents configuration

Prerequisites

By making a plan, you can improve your AI agent performance and result quality. When you have a solid foundation of what you want to build, you can minimize creating redundant agents and maximizing the efficiency of your existing ones. Before you send instructions to your AI agents, make sure that you follow these prerequisites:

- Have a good idea of the different kinds of tasks that your agentic workflow should be able to handle.
- Understand the general flow for your agentic workflow and agents.
- Use agentic tools with well-written descriptions.

Configurable elements

Instruct the agentic workflows and AI agents through the following elements within the framework:

- **Base plan**: Instructions to the AI Agent Orchestrator for the initial planning procedure that is configured at the agentic workflow level.
- **Role**: Clear identity of the AI agent that includes these elements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Agent reasoning**: When a role is added to each reasoning prompt, it provides a sense of identity to the content that is generated by the LLM.
- **Agent proficiency**: An LLM-generated description of what an agent is capable of, including the content from the role, instructions, and the descriptions from the tools that are assigned to the AI agent.

  Note: The agent proficiency is auto-generated.

- **Instructions**: Clear directives for the AI agent. Write instructions as a step-by-step algorithm that describes the operational flow for the AI agent.

Understanding the tools for agentic workflows configuration

Define the procedure to build functional tools for your agentic workflow with the following three elements:

Functionality

What an AI agent contributes to the agentic workflow. Configure the tools with a single purpose. Multipurpose tools can cause a problem for the agents for the following reasons:

- Multipurpose tools are harder for the AI agent to reason through and determine when to use the tool. If a tool can be used for more than one purpose, the AI Agent Orchestrator has to determine which purpose is most applicable, which can decrease your AI agent's performance by increasing the runtime.
- The tool description must be comprehensive enough to account for all the scenarios for the usage of the tool that is being defined.

Note: Don't use tools that can operate in different modes. Instead, configure your tools as the solution to a singular problem for a scenario.

Tool description

Natural language descriptions that describe the utility provided by the tool. Make sure that you define the scope and limits of the tools clearly to help verify that the tools are picked for the appropriate scenarios in the following ways:

- Provide a description of what the tool is supposed to do.
- Describe the scenarios where the tool can be called. Include the specific agentic workflows and tasks where the tool and its functionality can be used.
- Explore the scenarios where the tool is explicitly not useful but an AI agent can confuse the tool as being useful.
- Explain the terms that are being used in the preceding cases. For example, if you have a tool for assigning a role to a user, you must explain what the role is in the agentic system of the given instance.

Error messages

An AI agent operates through trial and error. For example, an error message about an execution that accidentally ran incorrect tools can help the AI agent reach more valid conclusions in the future. Error messages offer an AI agent a chance to reflect and explore other options.

Understanding the scenarios where the tool can go wrong can help the AI agent with keeping the execution on track.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoke Conversations with AI Agent Background Channel

The AI Agent Background Channel helps you to invoke AI Agent or agentic workflow execution from the Workspace. Use the AI Agent Background Channel associated with the AI Agent Background Provider to invoke conversations. The AI Agent Background Provider is based on the Custom Adapter Framework from Virtual Agent. For more information, see Configure a provider for your custom chat integration.

Create a channel identifier in the Provider Channel Identities table [sys_cs_provider_application] to add any additional conversational capabilities to your own provider application and get a new inbound ID that allows for customization. For more information, see Create a channel identifier for your custom chat integration.

To start a conversation, trigger the flow using the `sn_aia.AiAgentRunttimeUtil().startAiAgentConversation(request)` API in the Script Include (sys_script_include) of the AIAgentBackgroundProvider and select **Run Script**. When the Script execution status indicates Success, the conversation begins in the order of utterances defined in the Script.

Conversations that are invoked for executing an AI agent are logged in the Execution Plans [sn_aia_execution_plan] table. Open the conversation record to confirm the device type as **AI Agent Background**. Open the execution record to see the **Execution Tasks**, **Messages**, and the **Tools Executions** used to execute the AI agent.

You can also see the entire execution steps on the AI Agent Studio Testing page by copying the execution plan record's [sys_Id] and testing it. On the **Chat responses** tab, in the AI agent decision logs, you can see the AI agent details and the tools it used to resolve the issue.

Interactive and Non-interactive AI agents

The Interactive AI agents reach out to users for information when there is a fallback in the execution process, and the AI agent re-triggers the flow.

The Non-interactive AI agents don't reach out to the user at any fallback stage in the execution process. When the AI agent needs user information, it takes the dynamic prompt approach using the ReAct layer, where the prompt of the ReAct will change based on the execution mode of the AI agent or agentic workflow. Therefore, in the Non-interactive execution, the reach fallback options don't have to collect input from a user as a fallback option. However, the output of the AI agent or agentic workflow will still need to be presented to the user, and in any execution failure scenario, a message in the ServiceNow Otto panel or Virtual Agent is shown.

To implement the Non-interactive execution, the **Execution Mode** field is added in the Execution Plans [sn_aia_execution_plan] table, where the execution mode can be **Interactive** or **Non Interactive** based on the given runtime parameter.

You can run the AI agents and agentic workflows concurrently in the AI Agent Background Channel and in Non-interactive mode where the background execution allows AI agents to operate with any chat panel like ServiceNow Otto panel or Virtual Agent.

Multilingual support

You can leverage multilingual support for AI agents across languages for better translation quality to:

- Tune system prompts for native translations.
- Implement dynamic translation strategies when native support is unavailable.
- Provide extensive testing via automated and manual evaluations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Agent Studio Skills migration

You can auto-migrate all the AI Agent Studio skills from on-glide execution path to the off-glide execution path by setting the **Off-Glide Enabled** to **true**, to enable the skill migration to Mosaic. To do this:

- Navigate to the OneExtend Capabilities [sys_one_extend_capability.list] table.
- Find the ServiceNow Otto AI Agents application.
- Set the **Off-Glide Enabled** to **true**
- Select **Save.**

Install ServiceNow Otto AI Agents

Install ServiceNow Otto AI Agents on your ServiceNow instance to enable the agentic AI experience.

Before you begin

To get started with AI agents, you must have:

- **License requirements**: A ServiceNow Otto Pro Plus or Enterprise Plus license.

  Note: A ServiceNow Otto License is required. ServiceNow Otto AI Agents is available to all instances that have who have ServiceNow Otto.

- **Instance requirements**: An instance on Australia Patch 1 or later.
- **Application requirements**: The following store applications and all the dependency applications must be installed and updated:
  - ServiceNow Otto for IT or HRSD (or other workflows).

    Note: ServiceNow Otto AI Agents aren't standalone applications that you can install directly. To enable AI agents on your instance, you must install and activate other ServiceNow Otto applications that include AI agents, such as ServiceNow Otto for IT Service Management (ITSM) or ServiceNow Otto for Customer Service Management (CSM).

  - ServiceNow Otto AI Agents store application
- AI Search enabled on your instance.
- The ServiceNow Otto panel must be turned on.

  Note: You can access AI agents in the ServiceNow Otto panel. To enable the ServiceNow Otto panel, see Turn on the ServiceNow Otto panel.

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for and select a ServiceNow Otto application, such as ServiceNow Otto for IT Service Management (ITSM) or Now Assist for Platform.
3. Select **Install**.

Result

AI agents associated with the ServiceNow Otto application are installed on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Assign the admin role

Add the role `sn_aia.admin` to the user who will administer the AI Agent Studio, and then navigate to **All** > **AI Agent Studio** > **Overview**.

Access the AI Agent Studio

Navigate to **All** > **AI Agent Studio** > **Overview** in the AI Agent Studio application navigator where you can create and manage AI agents and agentic workflows.

Set up AI agents

The default (base system) AI agents provide preconfigured agentic workflows that address common business challenges across ServiceNow applications. Before activating the default AI agents, you must verify that your instance meets the prerequisites and complete the required configuration steps.

Before you begin

Role required: sn_aia_admin

About this task

Prerequisites

Platform version:

- Minimum: Yokohama Patch 1+ or Xanadu Patch 7+
- Recommended: Yokohama Patch 8 or Zurich Patch 4
- Latest: Zurich Patch 12 or Australia Patch 5

Required plugins and store Apps

- ServiceNow Otto AI agents store app (version 8.2 as of Australia Patch 5.)
- At least one ServiceNow Otto workflow plugin:
  - ServiceNow Otto for ITSM
  - ServiceNow Otto for HRSD
  - ServiceNow Otto for CSM
  - ServiceNow Otto for Security Incident Response (SIR)
- Generative AI Controller plugin (minimum version 11.0.0)

Note: Select **Load demo data** during installation to access preconfigured examples.

Licensing Requirements

ServiceNow Otto Pro Plus or Enterprise entitlement

Required User Roles

- sn_aia.admin - Provides access to AI Agent Studio
- sn_nowassist_admin.nsa_admin - Enables ServiceNow Otto administration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enable AI Search.
   a. Navigate to **AI Search** > **AI Search Status**.
   b. Verify that AI Search is enabled.
2. Enable ServiceNow Otto panel.
   a. Navigate to **Now Assist admin** > **Experiences**.
   b. Turn on the **Panel** option.
3. Access the AI Agent Studio.
   a. Navigate to **All** > **AI Agent Studio** > **Overview**.
   b. Review the available default (base system) agentic workflows.
4. Activate the default agentic workflows.
   a. Select the agentic workflow that you want to use from the available default workflows.
   b. Activate the workflow. The default workflows are set to read only and must be activated before use.

   The default (OOTB) agentic workflows include:

   - Generate resolution plans
   - Analyze incident trends
   - Classify tasks
   - Investigate IT problems
   - Process emails for tasks
5. Configure chat assistants.
   a. Navigate to **Conversational Interfaces** > **Assistants**.
   b. Determine which chat assistants can access your AI agents.
   c. Complete the configuration wizards for ServiceNow Otto panel or ServiceNow Otto ServiceNow Otto for Virtual Agent.
6. Configure LLM Connections (optional).

   If using external LLM providers instead of the default OpenAI GPT-4.1:

   a. Navigate to **AI Admin Hub** > **Settings** > **Manage Integration**.
   b. Configure API credentials for your chosen LLM provider.

   Note: The default Orchestration layer uses OpenAI GPT-4.1 5.4 on ServiceNow-managed Azure servers.

7. Test the default AI agents.
   a. Navigate to **AI Agent Studio** > **Testing** > **Test AI reasoning**.
   b. Verify that the orchestrator canvas displays agent execution properly.
   c. Review AI agent decision logs to confirm interactions and thought processes are recorded.

© 2026 ServiceNow, Inc. All rights reserved.

Enable AI Guardian for AI agents

Identify and block offensive messages that are sent by human agents automatically by enabling AI Guardian in AI agents. With this capability, you can help reduce your agentic workflow or test from being exposed to harmful content.

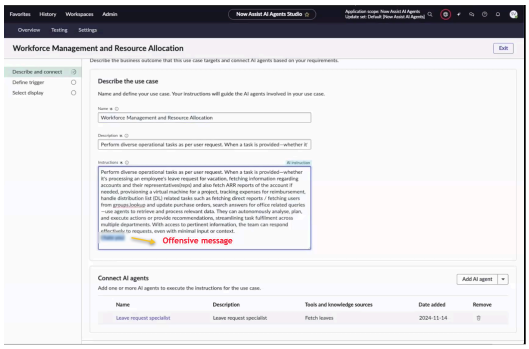
Before you begin

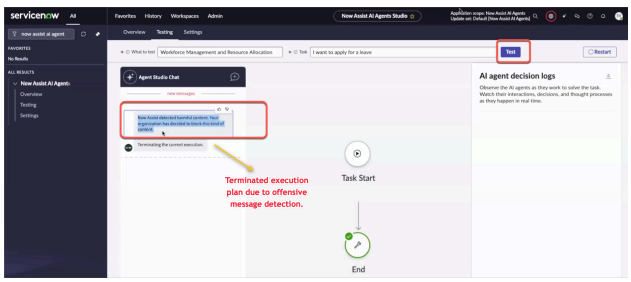
Role required: admin

About this task

The AI Guardian, which is a ServiceNow AI Platform capability in the ServiceNow Otto panel, is a set of guardrails that are designed to intercept and mitigate offensive, sensitive, or security-related issues that may arise during interactions with the ServiceNow Otto application.

For example, let's say that AI Guardian detects an offensive message in the execution plan of an agentic workflow. When you try to trigger the plan or test it, AI Guardian can step in to terminate the plan or test because it detected harmful content at the first step of the execution plan.





For more information about the different guardrails, see AI Guardian.

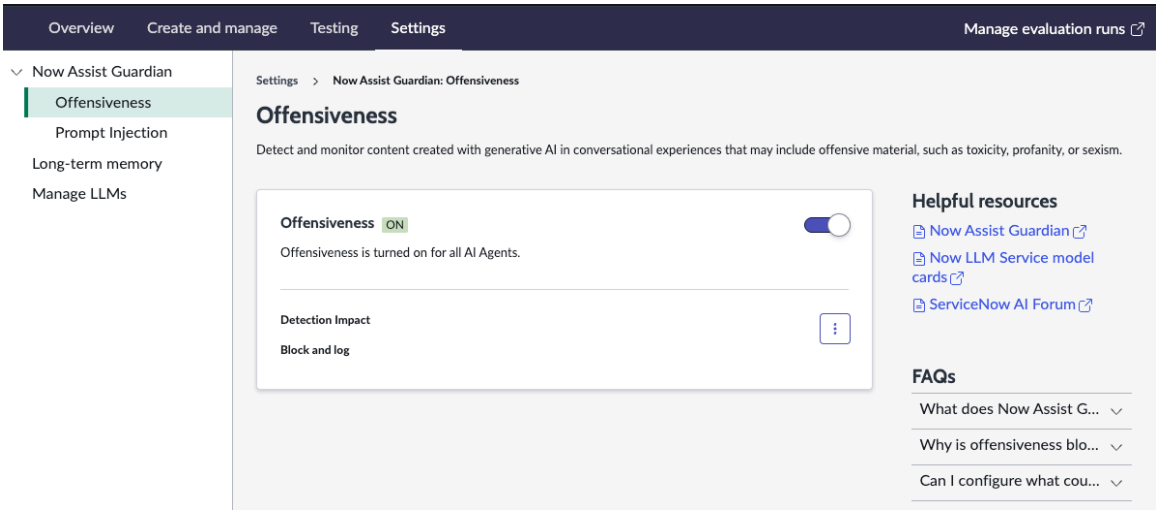
Procedure

1. Configure Offensiveness for AI agents.

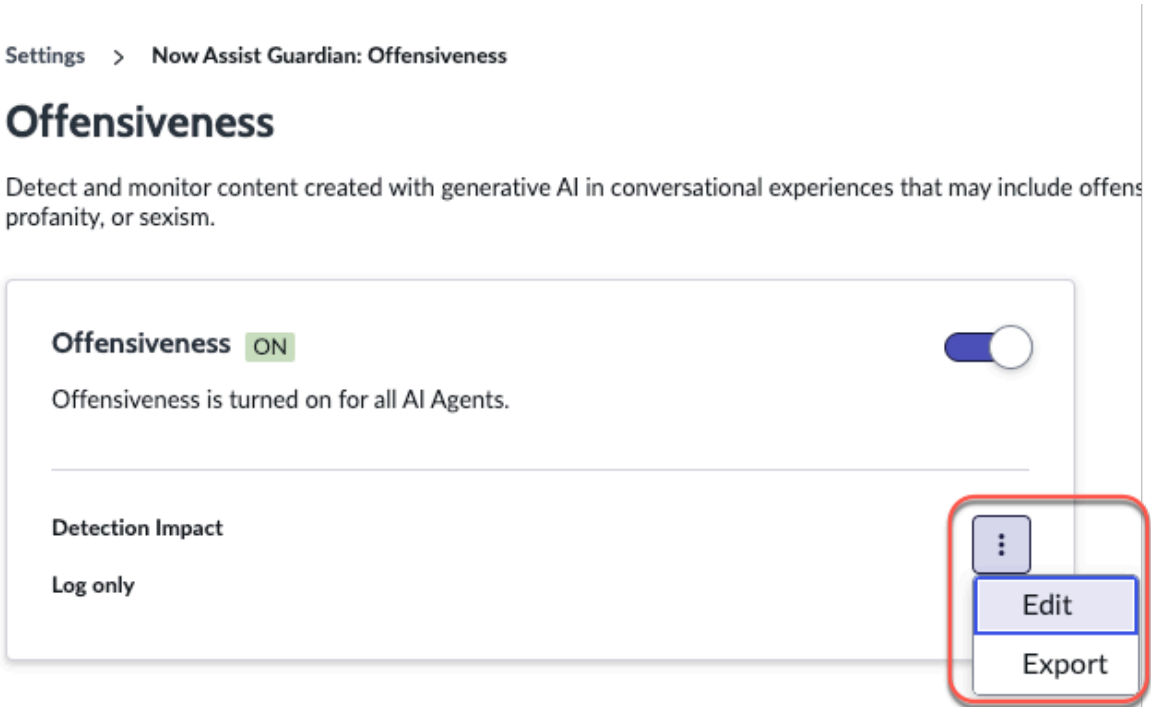
   a. In AI Agent Studio, navigate to the **Settings** tab.
   You're directed to the Offensiveness page.

   b. Turn on the Offensiveness setting for AI agents by using the toggle button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Configure the detection impact by selecting the options icon (⋮) to enable the detection impact to use the following options:



- **Edit**: Choose the detection impact between logging or both blocking and logging.

  Enable the detection impact:

  i. Select the **Edit** option.

  ii. On the Detection impact page, select either the **Log** or **Block and log** button based on your requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

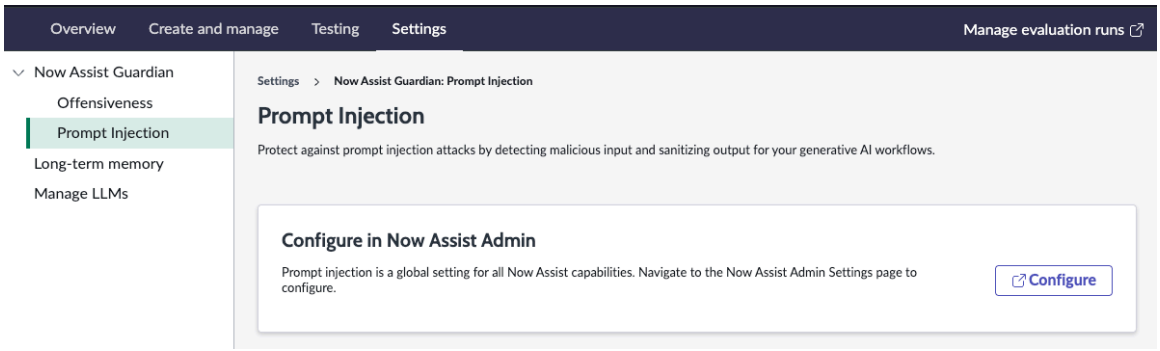
Note: You can switch the detection impact from **Log** to **Block and log** or from **Block and Log** to **Log** at any time.

iii. Select **Save**.

- **Export**: Exports the offensiveness-based logs as a . CSV file. Logs can be analyzed for the types of content that are being identified so you can take other preventive measures, such as changing conversational questions.

2. Configure Prompt Injection for AI agents.

a. In the AI Agent Studio, navigate to **Settings** > **Prompt Injection** and select **Configure**. You're directed to the AI Admin Hub page to configure the Prompt Injection.



Note: For more information about configuring the Prompt Injection, see .

When you configure the Prompt Injection for an agentic workflow by using the required instructions, the system is designed to detect harmful content and block the conversation.

Select the LLM for AI agents and agentic workflows

Choose the large language model (LLM) service provider for AI agents in AI Agent Studio.

Before you begin

Role required: sn_aia.admin

About this task

LLMs are part of the foundation of agentic AI. Different LLMs can provide slightly different performance and responses. You can select which LLM to use at a global level for agentic AI from the AI Agent Studio to help adjust the response quality to best fit your agentic workflows.

Note: If you already have agents built and you change the global LLM, then you must test the agents after making the change. You can test the models in the skill kit without changing the LLM provider for all generative AI skills. Outside of the Skill kit, skills use whichever provider is set as default for the AI Agent Skills group.

Depending on your region, you may have to consent to using a different service provider.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings**.

2. Navigate to the **Model provider** tab.

3. Select **Configure** to be redirected to AI Admin Hub.

4. In the *`Choose a default model provider`* field, select from the following choices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Now LLM Service
- AWS Claude
- Azure OpenAI
- Google Gemini

The new generative AI Config property records *sys_generative_ai_config* and *sys_generative_ai_prompt_config* have been introduced for the Azure OpenAI: gpt 5.4 model provider. Both the properties share a **definition** field that references the same *sys_one_extend_capability_definition* record, which identifies the LLM provider.

Note: The new prompt config records are set to **true** by default.

5. To use a different model provider:
   a. Navigate to the *sys_generative_ai_prompt* table.
   b. Filter and group by the relevant skill definition.
   c. Locate the record for the appropriate skill and provider.
   d. Set the preferred record as default.
6. Review the impacted AI agents.

   Certain AI agents may require specific model providers. Select the AI agents tab in the **Impact overview** section to see which AI agents are affected by any changes to the model provider.
7. Select **Save**.

Result
Your chosen LLM is used globally for all AI agents and agentic workflows.

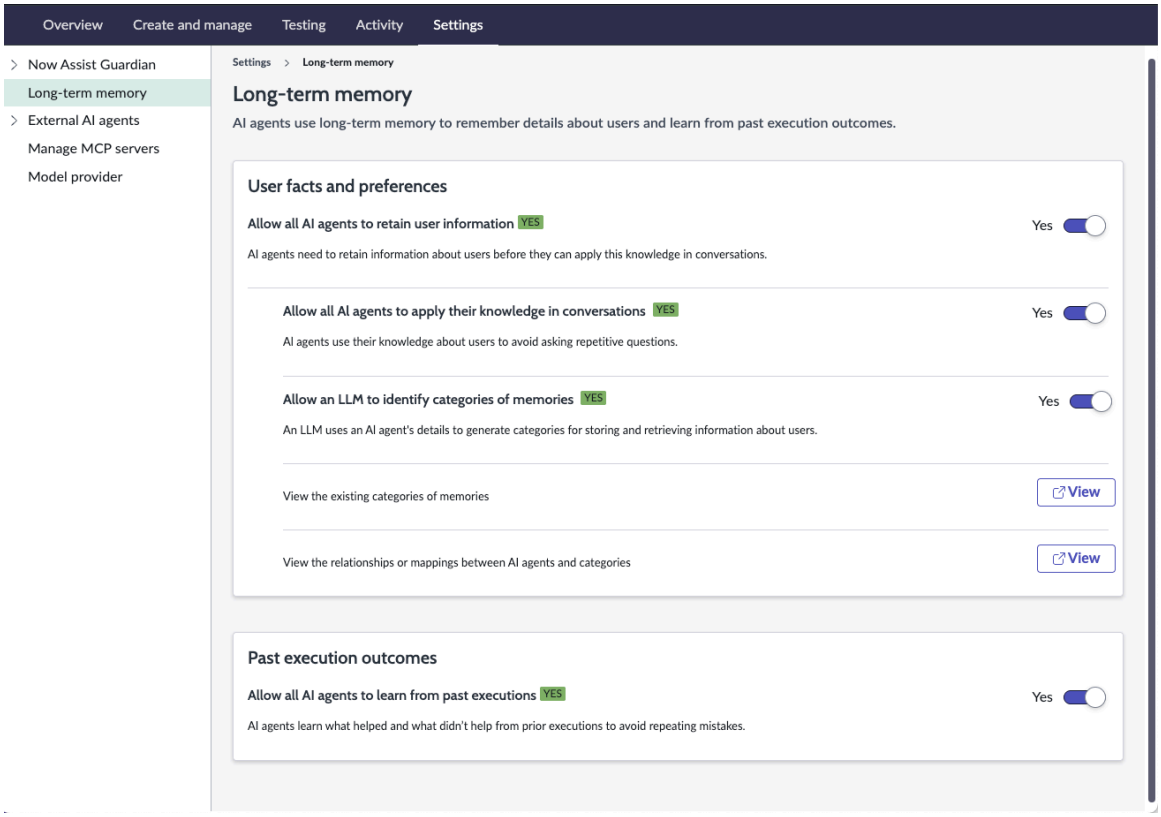
Set up long-term memory

Make AI agents remember your preference or facts from previous interactions and use memories for more focused conversations.

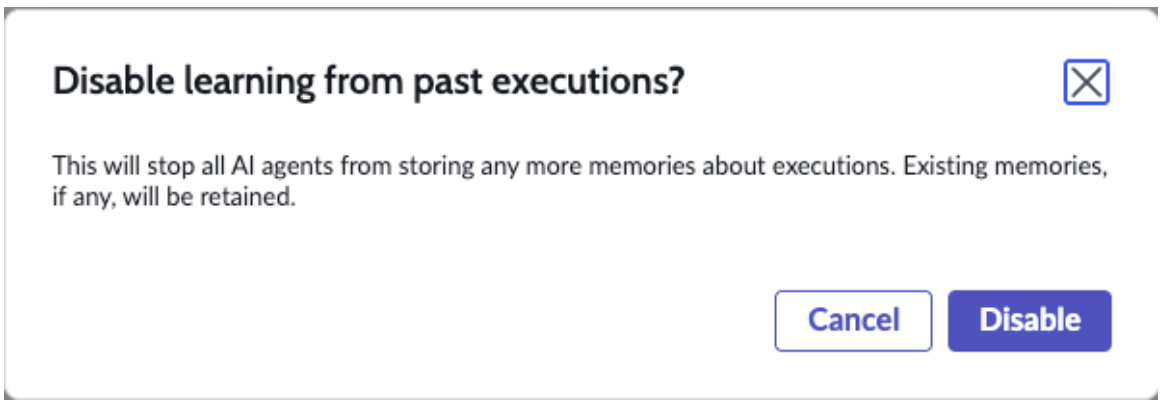
Before you begin
Role required: sn_aia.admin

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Select **Long-term memory**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Configure the User facts and preferences.
   a. Turn on the Allow all AI agents to retain user information using the toggle button.
   b. Turn on the Allow all AI agents to apply their knowledge in conversations using the toggle button.
   c. Turn on the Allow an LLM to identify categories of memories using the toggle button.
   d. To view the existing categories of memories, select **View**.
   e. To view the relationships or mappings between AI agents and categories, select **View**.
4. Configure Past executions outcomes by turning on the Allow all AI agents to learn from past executions using the toggle button.
   When you want to turn off agent learning from past executions, you will see a confirmation pop up. Selecting **Disable** will disable agent learning.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Group Action Framework

Set up Group Action Framework (GAF) to improve the response quality, recall speed, and consistency of AI agents.

Before you begin

There must be a ml_platform read ACL for GAF to be configured. If there is no read ACL present, you must create it and grant the appropriate role access, such as admin, ml_admin, or sn_aia.admin. This is required for GAF to access Machine Learning tables and services. If your ACL is not configured correctly, you may see the error "Failed to initialize pipeline: Failed to load message_content dataset. No columns to parse from file."

Verify that your configured LLM provider (such as OpenAI or Anthropic) has valid credentials and available token quota.

Verify that the prerequisite scheduled job for your workflow exists and is properly configured. For example, if you're configuring GAF for HR Service Delivery, navigate to **All** > **System Definition** > **Scheduled Jobs** and search for "HR service GAF grouping job". Verify that the **Active** field is set to true and that the **Class** field is populated. If either field is empty, the job will not execute.

To access GAF's optimized prediction feature, you can enable AI Search. For more information, see Setup AI Search for Group Action Framework.

Role required: sn_aia.admin

About this task

You can activate GAF to have AI agents use indexed clusters that perform LLM executions on representative records rather than all records. GAF is used by some AI agents and agentic workflows to work optimally. For more information about GAF and how it works, see Group Action Framework.

You can have different GAF configurations for different agentic workflows and applications. You must configure each agentic workflow or application separately.

Important: Setting up GAF can take some time, between 10 minutes up to an hour, depending on the number of records in the grouping. The script runs in the background.

Procedure

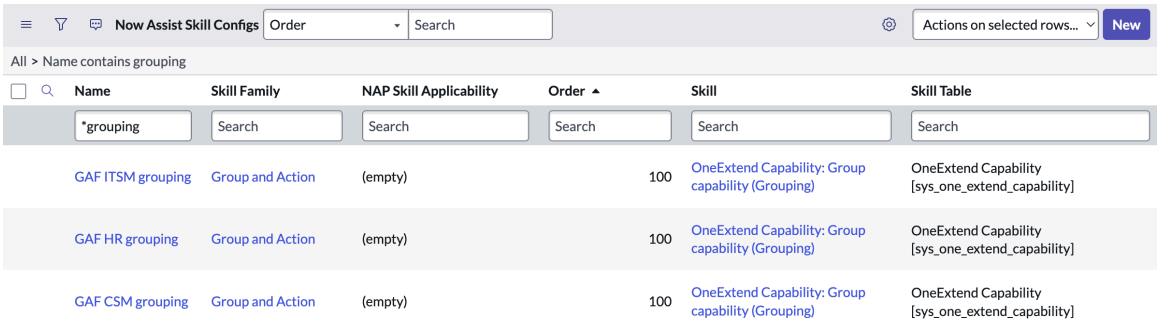
1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Paste the following code into the text area.

   Do not run the script until the groupSkillID and the actionSkillID variables have values. The values are acquired in the following steps.

   ```
   var groupSkillId = "";
   var actionSkillId = "";
   var topicSkillId = "43bce9e477e012103f075cea5b5a998f";
   new sn_gaf.GAFUtils().activate(groupSkillId, topicSkillId,
    actionSkillId, "run_once");
   ```

   The topicSkillId is the same for all GAF setups.
3. In a new browser tab, navigate to the Now Assist Skill Config [sn_nowassist_skill_config] table by entering `sn_nowassist_skill_config.list` in the filter navigator.
4. In the **Name** field, enter `*grouping` and search to see the grouping records that are associated with your agentic workflows and applications.

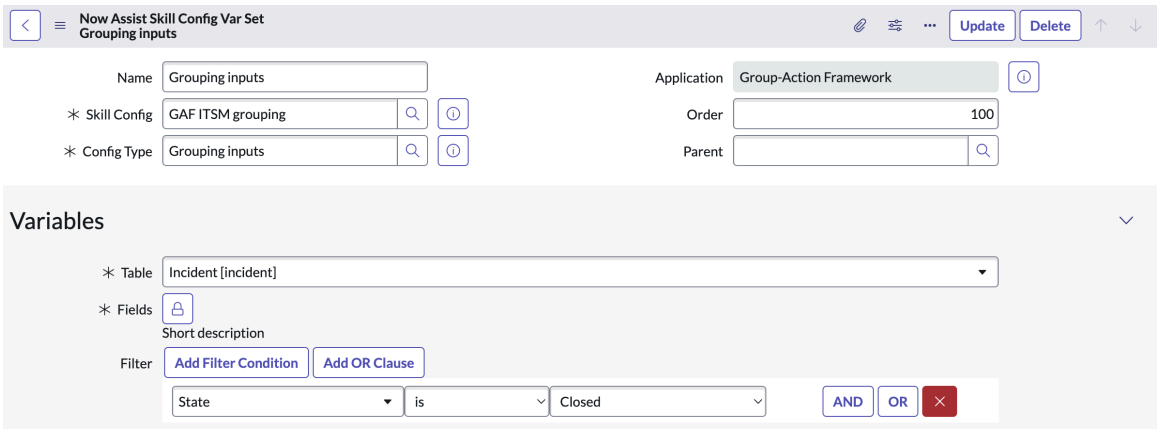
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Open the grouping record for the agentic workflow or application that you want to configure.
6. In the Now Assist Config Var Set related list, open the Grouping inputs record.
7. Confirm that the filters for the grouping include all the records you want to index.

   If you want to add filters to change what records are included in the GAF setup, do so here. The more records that you include means that you have a longer setup time, but they can help increase the quality of your results. You should have at least 2000 records for successful clustering.

   Note: Your current scope should be Group-Action Framework to make changes.



8. Return to the Now Assist Skill Config Grouping record and copy the sys_id.
   You use this sys_id and two other sys_ids in the background script function call.
9. In the browser tab with the background script, paste the sys_id in the script between the quotation marks for the groupSkillId variable.

   Your `groupSkillId` variable should be in the same format as the `topicSkillId` variable.
10. In the tab with the Now Assist Skill Config record, return to the Now Assist Skill Config table and search for `*action strategy` to find the action strategy skill config for the application. Make sure that the record is for the same application. If you pasted the sys_id of the GAF ITSM grouping, you must open the GAF ITSM action strategy.
11. Open the action strategy record for the application that you're configuring.

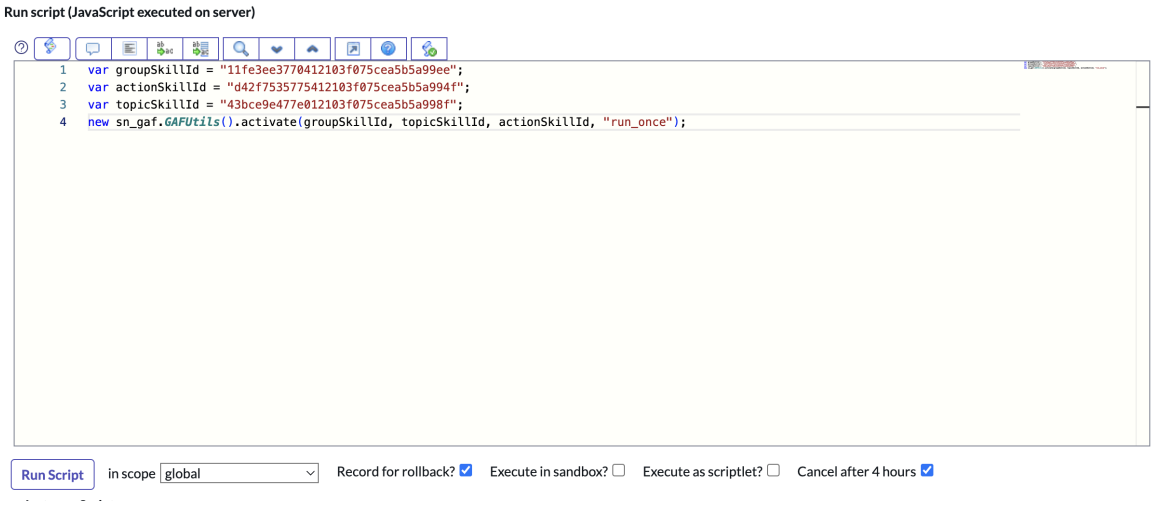
    Note: The Group table field should be left empty. The Group table refers to the table where the grouped records are, not the source table, so the field is populated automatically by the GAF setup job. If this field is populated before you run the script, the GAF job will fail.

12. Copy the sys_id of the action strategy record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. In the browser tab with the background script, paste the sys_id in the script between the quotation marks for the actionSkillId variable.

    Your `actionSkillId` variable should be in the same format as the `groupSkillId` and `topickillId` variables.



14. Run the background script by selecting **Run script**.

    Running this background script creates a scheduled job called GAF - Run Offline Flow. You can view the scheduled job on the Scheduled Script Executions [sysauto_script] table.

Result

GAF is configured on your instance for an application and can be used by AI agents to find related records.

What to do next

To verify that grouping and action outputs have been generated, go to the ML Solution [ml_solution] table to check if the clustering solution is running or completed. If it is complete, check the following tables to see records for groups, clustered records, and down-sampled records per group are present.

- GAF record group [sn_gaf_record_group]
- GAF record group detail [sn_gaf_record_group_detail]
- GAF action strategy result [sn_gaf_action_strategy_result]

You can repeat this procedure for additional agentic workflows and applications.

You may see the error "Failed to initialize pipeline: Failed to load message_content dataset. No columns to parse from file." when trying to configure GAF. This could be because your instance lacks data on the table or filters you configured excluded records from the table. You can reach out to Now Support for additional assistance if you cannot resolve this error.

Set up AI Search for GAF

Configure AI Search to enable Group Action Framework (GAF) to improve quality and consistency of agentic AI and generative AI on the ServiceNow AI Platform.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

GAF is a feature on the ServiceNow AI Platform that clusters and indexes related records and executes actions on them in agentic AI and generative AI. See Group Action Framework for more information about GAF's role in intelligent experiences and how it works.

AI Search is the foundation for GAF's optimized prediction feature. AI Search is the backup search for certain workflows, and if it is not enabled and ready, GAF will not return any results.

You must index every table for each workflow or application you'd like to configure GAF for. For example, if you're configuring GAF for ServiceNow Otto for IT Service Management, you must index the Incident and related tables.

Procedure

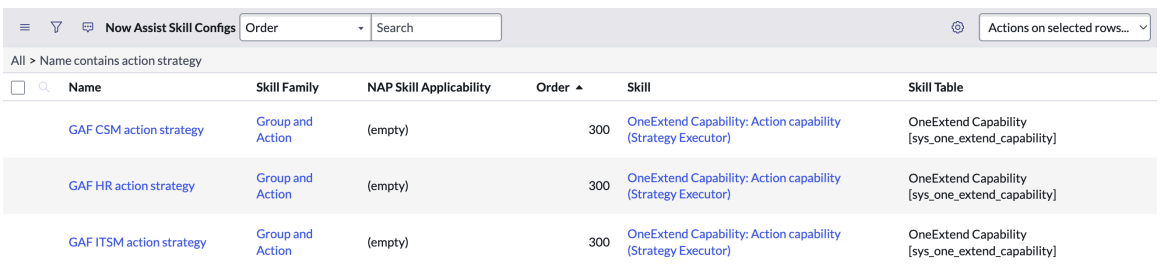
1. Navigate to **All** > **AI Search** > **AI Search Status**.
   If you see "AI Search is ready," proceed. If not, request AI Search installation, which can take 2–24 hours.
2. Install ServiceNow Otto for AI Search by installing an application with generative or agentic AI features.
   For more information, see Install ServiceNow Otto for AI Search.
3. Verify that your LLM provider is configured and accessible.

   GAF's action strategy skill requires a working LLM provider (such as OpenAI or Anthropic) to generate topics and summaries. Before proceeding with AI Search indexing, verify the following:

   - *`LLM provider credentials:`* Navigate to the LLM provider configuration and verify that API keys and credentials are current and valid.
   - *`Token quota:`* Verify that your LLM provider account has sufficient token quota remaining. If quota is exhausted, the action strategy job will fail with "Action strategy job trigger failed. The topic is not generated for any group."
   - *`Model availability:`* Verify that the selected model (e.g., GPT-4, Claude) is available and accessible.

   If any of these checks fail, contact your LLM provider to resolve the issue before proceeding.
4. Navigate to the Now Assist Skill Config [sn_nowassist_skill_config] table by entering `sn_nowassist_skill_config.list` in the filter navigator.
5. Search the Now Assist Skill Config table for action strategy skills by searching *Name* is `*action strategy`, and select the action strategy skill for the application you want to configure.

   For example, if you're configuring GAF for ITSM, select the GAF ITSM action strategy record.

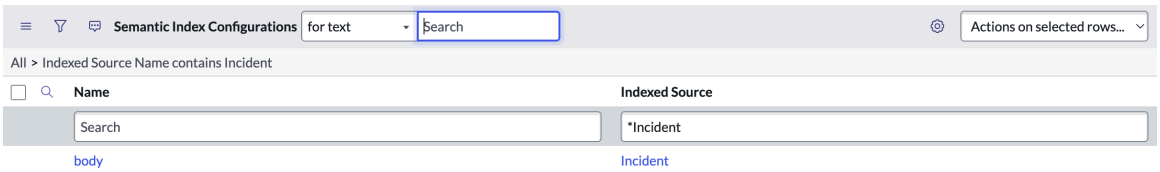


6. In the related list, select the Now Assist Skill Config Var Set record.
7. Set *`Semantic Index Name`* to the appropriate field for your table.

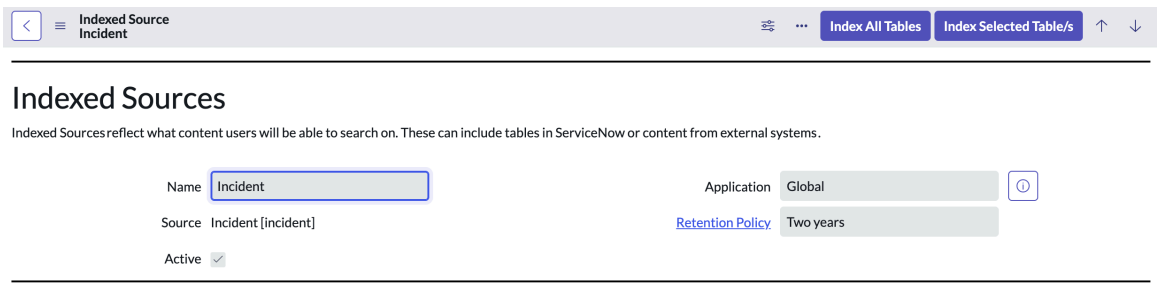
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To find the field for your table, go to the Semantic Index Configuration [ais_semantic_index_configuration] table by entering `ais_semantic_index_configuration.list` in the filter navigator, filter the *`Indexed Source`* for the table you want to index, and use the value in the *Name* field. For example, the value is *`body`* for the Incident table.

8. Navigate to the Semantic Index Configuration [ais_semantic_index_configuration] table by entering `ais_semantic_index_configuration.list` in the filter navigator, filter the *`Indexed Source`* for the table you want to index and the *`Semantic Index Name`* you configured in the previous step, and set *`Active`* to `true` to activate the embedding model.



9. Navigate to **All** > **AI Search** > **AI Search Index** > **Indexed Source**, filter the list so that the *Name* is the name of the table you're configuring, and select the record.
10. Select **Index All Tables**.



Result

The tables for ServiceNow Otto for AI Search for your Now Assist application is indexed based on the appropriate field.

What to do next

To confirm that indexing has occurred successfully, check the Indexed Source History related list and ensure that both the *`Keyword Ingestion State`* and *`Semantic Ingestion State`* are both set to *`Indexed`*.

Once your tables have been indexed, you can continue to Configure Group Action Framework to set up GAF for each application.

Multiple conversations in AI agents

Multiple active conversations enable live agents to maintain separate conversations for different records. You can preserve the context of multiple conversations and enable multiple AI agents to interact at the same time through the ServiceNow Otto panel.

Multiple conversations between live agents and AI agents overview

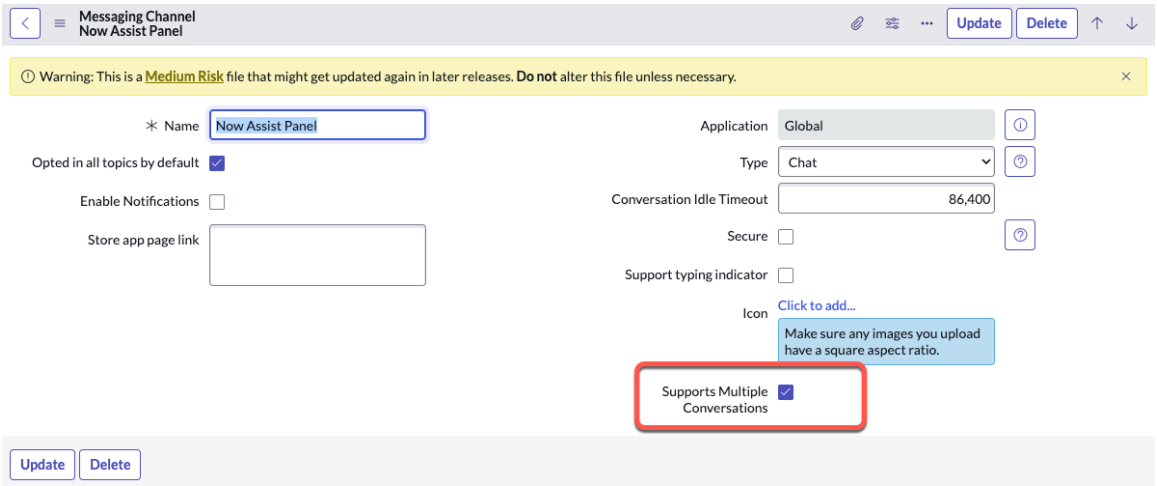
Once configured, live agents can interact with multiple AI agent conversations through the ServiceNow Otto panel.

Note: By default, the ServiceNow Otto panel currently supports only a single conversation and it is required for you to enable the multiple conversation support if you intend to use it

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enabling multiple conversations

Enable multiple conversations on a ServiceNow instance in the Messaging Channels [sys_cs_channel.list] table by setting the value of the **Supports Multiple Conversations** field on the ServiceNow Otto panel record to **true**. If you don't see this field, make sure you are in the Global scope and are using the Default view. By saving the record and refreshing the instance, you can see the multiple active conversations features in the ServiceNow Otto panel.



Title for the conversation

With the multiple conversations feature enabled in the ServiceNow Otto panel, the first utterance from the live agent is set as the title for that conversation. For example, if the first utterance is `Explain change risk`, then Explain change risk is set as the title for that conversation in the ServiceNow Otto panel.

Starting a conversation

Start a new conversation by selecting the plus icon ( ) and choosing a topic. See the conversation list by selecting the All chats icon ( ), to see the Active chats and Closed chats.

Unread chats on the conversation list

See the batch count of the unread chats on the conversation list icon ( ). For example, if number 6 appears on the All chats icon ( ), that means there's six unread conversations on the ServiceNow Otto panel.

Citations in AI agents

You can see citations on the ServiceNow Otto panel when you execute AI agents and agentic workflows in AI agents that provide summaries to get similar incidents and relevant knowledge articles.

Generating citations:

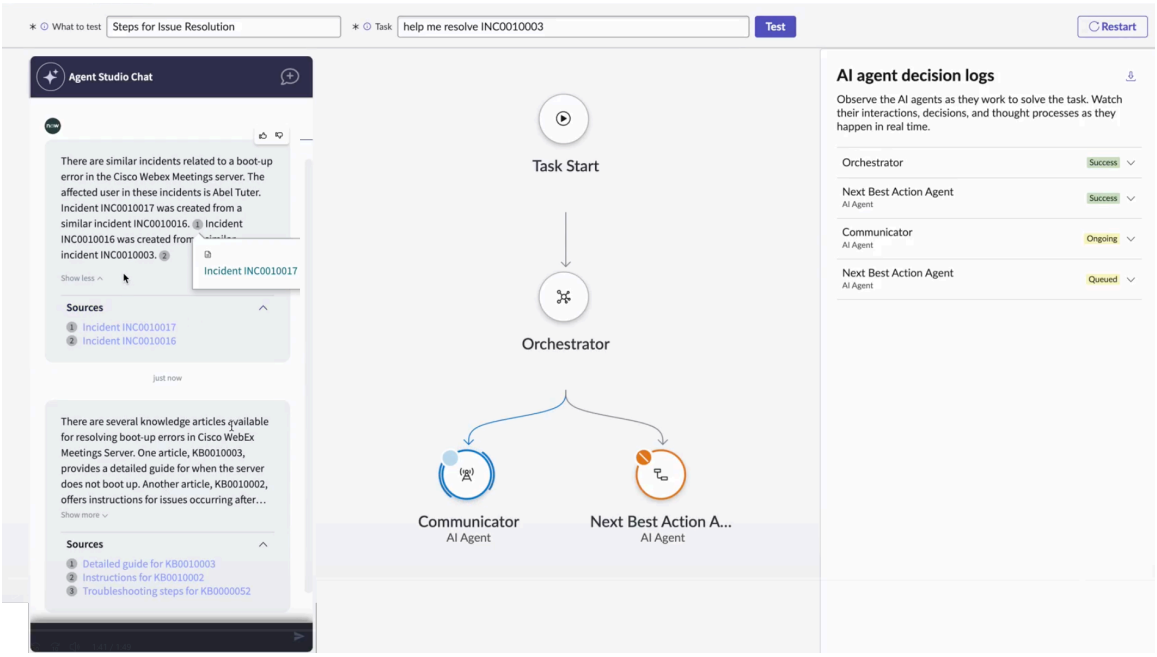
- Citations are generated by the LLM (Large Language Model), which use the information available to it.
- URLs can't be generated by LLM if relevant information isn't provided.
- LLMs need provide proper URLs for better results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

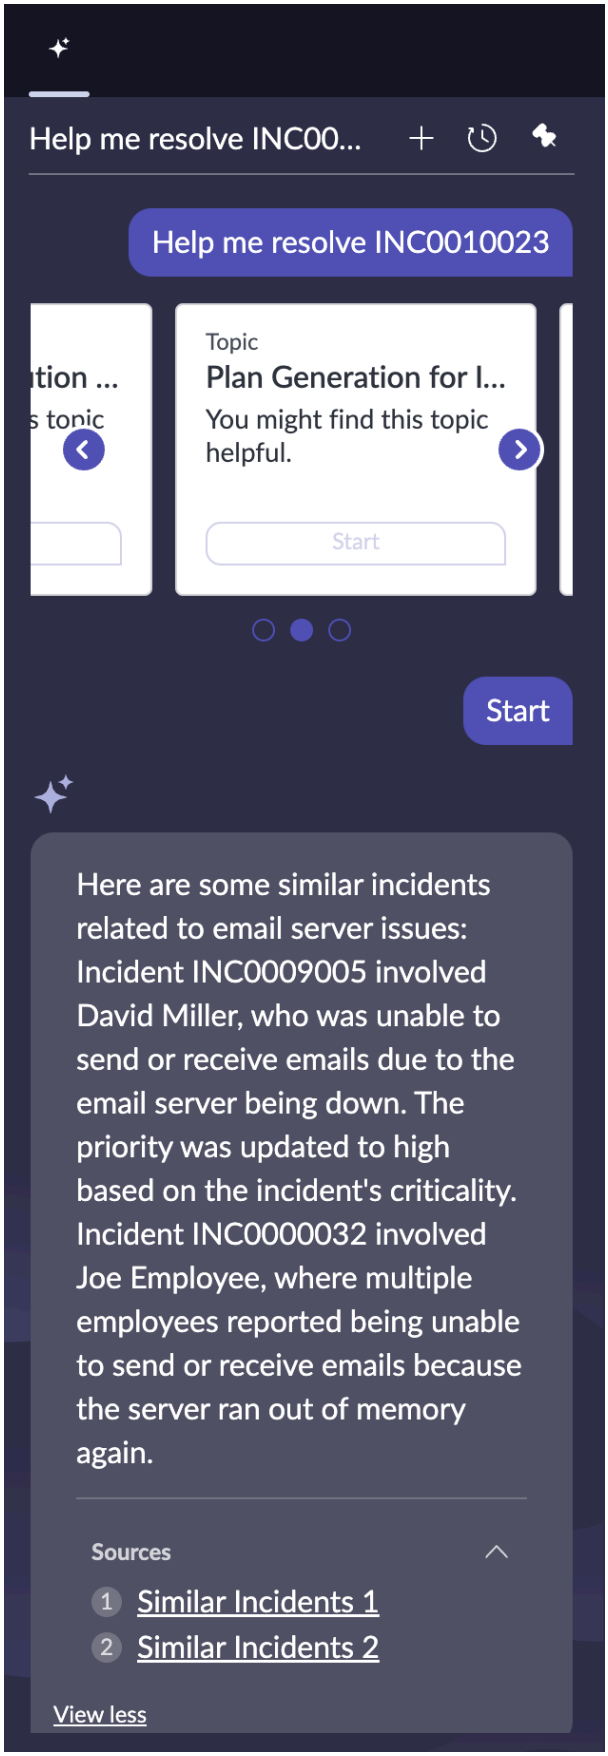
- Citation URLs return directly from the tool's outputs.
- The LLM is instructed not to generate or assume citations if they aren't present.

Note: Invalid or malformed URLs won't be displayed to the user.

Citations with similar incidents and relevant knowledge articles appear in the Sources section of the AI Agent Studio Chat and on the ServiceNow Otto panel and in with click-able links that direct you to the incident or knowledge article.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can hide citations for specific agentic workflows or AI agents where it's necessary or confidential. For more information, see Disable citations in AI Agent Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disable citations in AI Agent Studio

Disable citations for specific agentic workflows or AI agents in AI Agent Studio where citations aren't required or involve confidential information.

Before you begin

Role required: sn_aia_admin

About this task

By default, the citations are enabled for all agentic workflows and AI agents. The Agent Properties [sn_aia_property] table enables disabling citations at the agentic workflow or AI agent level. Create a record only when you want to disable citations for specific agentic workflows or AI agents when the **Output transformation strategy** field in the Agent tool record is set either to **Summary for Search Results** or **Verbose**.

- All citations are generated by the LLM (Large Language Model), which uses the information available to it.
-

Procedure

1. Navigate to **All** > **System Definitions** > **Tables** and open the Agent Properties [sn_aia_property] table.
2. Select **New**.
3. On the form, fill in the fields.

Agent Property form

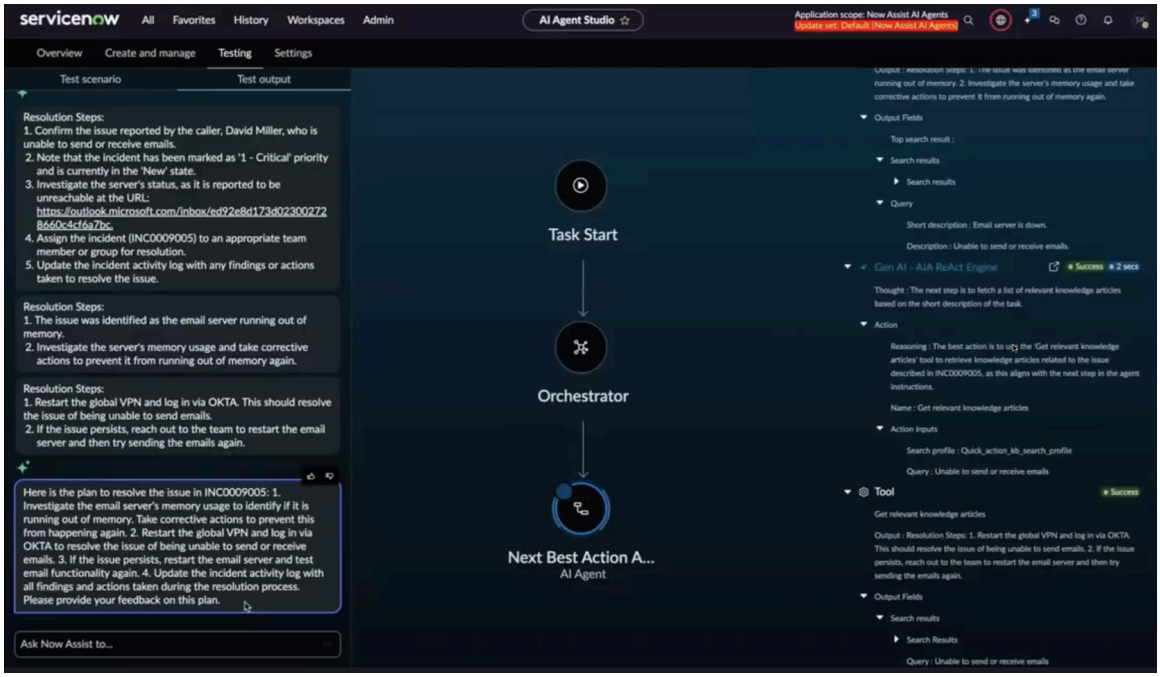
Field	Description
Name	Name for the agent property record used to hide citations for the agentic workflow or AI agent.
Value	Provide **false** as the value to hide the citations.
Target table	The table where the target agentic workflow or AI agent resides.
Target record	The record of the target agentic workflow or AI agent.
Application	The application scope for the agent property record: ServiceNow Otto AI agents.

4. Select **Submit**.

Result

Execute an AI agent or an agentic workflow for which you have disabled citations. You'll see the output without citations. See the following example for reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Follow-up conversations

AI agents continue with follow-up conversations after the AI agent execution is complete.

Before you begin

Role required: sn_aia_admin

About this task

When the [sn_aia.enable_follow_up] system property is set to **true** and if there is no record for the agentic workflow created in the Agent properties [sn_aia_property] table, then the AI agents continue with the `How else can I help you?` follow-up message after the agentic workflow execution.

The AI agent conversation doesn't get closed after the execution is complete by default. If you would like to override the follow-up behavior for your AI agents for a specific agentic workflow, you must create a record in the Agent Properties [sn_aia_property] table.

Procedure

1. Navigate to **All** > **System Definitions** > **Tables** and open the Agent Properties [sn_aia_property] table.
2. Select **New**.
3. On the form, fill in the fields.

Agent Property form

Field	Description
Name	Name for the agent property record for the agentic workflow.For example, `follow_up_behaviour`
Value	Provide the following values as per the requirement:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **no_followup_close_conversation**: Closes the conversation after the use case is complete. ○ **no_followup_open_conversation**: Keeps the conversation open after the use case is complete.
Target table	The table where the target agentic workflow resides: Agentic workflows [sn_aia_use case] table.
Target record	The record of the target agentic workflow or AI agent.
Application	The application scope for the agent property record: ServiceNow Otto AI agents.

4. Select **Submit**.

Add recipients to usage spike, execution failure, and latency error email notifications

Add or change recipients to email notifications triggered by unexpected or undesired behavior in AI agent and agentic workflow executions.

Before you begin

Set your application scope to ServiceNow Otto AI Agents.

Role required: admin

About this task

There are different email notifications that can be configured: one for Assist usage spikes, one for failed AI agent executions, and two for latency errors. The properties for configuring the thresholds for sending these notifications can be found in the Now Assist AI Agents Reference.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. In the *Name* field, search for `AI Agent`, and select the notification you want to edit.

   There are different Notifications records for the different sources of alert. If you want to change the recipients for all types of alerts, you must edit each of the Notification records individually.
3. Open the **Who will receive** tab.
4. Select the unlock icon for the type of recipient you want to add or change.

   To quickly add yourself to the list of recipients, select the Add me icon next to the *Users* field.
5. Select the users and groups you want to receive email alerts.

   If you select **Send to event creator**, the owner of the AI agent or agentic workflow that triggered the alert receives a notification.

   You can select **Exclude delegates** if you don't want delegated users to receive the notification. By default, delegates will receive notifications.
6. Update or save the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The specified users or groups can now receive notifications for a specific triggered condition of AI agent or agentic workflow executions.

What to do next
Repeat for any other AI agent alert notifications you want to configure.

Role masking in AI agents

Role masking for AI agents and agentic workflows helps users enhance security by enabling them to limit their roles during tool execution and verify that AI agents run with least-access privileges.

Role masking overview

Role masking lets AI admins in the AI Agent Studio to limit permissions of agentic workflows or AI agents set to run as dynamic users by defining an allow-list of roles they can inherit from invoking users, enforcing least-privilege access.

Use role masking to:

- Empower users to follow least-access principles when an agentic workflow or AI agent executes on behalf of a dynamic user.
- Limit roles that agentic workflows, AI agents, and skills inherit from users and can be applied when a user invokes them.

  For more information about configuring skills, see AI Skill Kit.
- Reduce the risk of AI solutions accessing the resources that they shouldn't, therefore helping prevent agentic overreach into sensitive data or capabilities beyond what the user is allowed.
- Expand the security configurations to increase functionality of agentic products while reducing security risks by enforcing governance for elevated or scoped roles.

Prerequisites

To configure role masking on your ServiceNow instance, you must have:

- ServiceNow Otto for Platform version 10.0.2-SS.
- The sn_aia.admin privileges.

Role masking behavior

Role masking behavior in agentic workflows, AI agents, and tools controls which of the invoking user's roles are available to AI agents and tools during workflow execution. The roles are applied sequentially across layers in the agentic workflow, AI agent, and Tool sequence to verify that tools execute with minimum required privileges.

Role masking rules

1. Role masking limits the roles with which an agentic workflow, AI agent or Skill can execute to the intersection between the roles assigned to the invoking user and the roles included in the role masking approved roles list.
2. AI user vs Role mask:

   The AI admin can choose for the component to run as either an AI user or a dynamic user. If set to run as a dynamic user, the AI admin can configure role masking for the component. Role masking cannot be configured for agentic workflows or AI agents set to run as AI users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If an AI user is selected, all roles assigned to the AI user are available to the agentic workflow or AI agent. This can be used to provide elevated access to the agentic workflow AI agent.

  Note: Tools always run as dynamic users.

- If Role masking is applied to an agentic workflow, AI agent, or tool running as a dynamic user, the component runs with roles with roles limited to the intersection of the current invoking user's roles and the roles included in the role masking approved roles list.

3. Multiple role masks can be configured and applied in the agentic workflow - AI agent - tool sequence, but each mask still follows the intersection rule.
4. Role masking only restricts roles that components can execute with, but never grants components roles which exceed those of the invoking user. Thus, if the invoking user has a role that is not included in the approved roles list, the component will not be allowed to execute with that role. And, if the approved roles list includes a role that is not assigned to the invoking user, the component will not be able to execute with that role again.
5. When a workflow running as an AI user invokes an AI agent running as a dynamic user with role masking configured, then the roles available to the AI agent will be the intersection of the role masking configuration of the AI agent and the roles assigned to the AI user of the agentic workflow. The same holds true for an AI agent running as an AI user that then invokes a skill with role masking configured.

Configuration

- To configure role masking for an AI agent, see Define security controls for an AI agent.
- To configure role masking for an AI agent, see Define security controls for an agentic workflow.

Create an AI agent

Create an AI agent in AI Agent Studio to solve problems for your users and coordinate with other AI agents while executing the agentic workflows.

Before you begin

Role required: sn_aia.admin

About this task

In the ServiceNow agentic ecosystem, an AI agent is a set of large language model (LLM) instructions and tools that can perform specific tasks.

An AI agent can collaborate with other agents to achieve better results by using fewer LLM calls. AI agents can also reach out to the user if they need any help or information.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. From the **Add** drop-down menu, select one of the following agent creation options:**Chat** or **External**.

   a. **Chat**: Select the Chat option to create AI agents in the AI Agent Studio to connect with internal AI agents within the ServiceNow AI Platform to execute agentic workflows.

   The following instructions are for Chat AI agents. See the following links for guides to create other types of AI agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. **Voice**: Select the Voice option to create an AI voice agent.

   See Deploy AI agents for voice for more information on setting up and creating AI voice agents.

c. **External**: Select the External option to create external AI agents in the AI Agent Studio to connect the ServiceNow AI Platform with the third-party agentic AI providers.

   For more information about creating external AI agents in the AI Agent Studio, see Create an external AI agent.

3. Define the AI agent's specialty.
4. Define the AI agent security controls.
5. **Optional:** Add a trigger to automatically invoke your AI agent if a specified event occurs.

   (Optional) If you want your AI agent to be used only in chats, you don't need to add a trigger.

6. Determine the chat assistants to access your AI agent, set the processing messages, and activate your AI agent..
7. Select **Save and test** to complete the configuration steps or review a previous step by selecting **Back**.

   Selecting Save and test leads you to the AI agent testing page, where you can test the AI agent that you created. For more information, see Manually test the execution of an AI agent.

   To test the AI agent, you must have the sn_aia.admin role and any roles the ACLs configured for the AI agent and its tools require, if applicable.

Result

You can see the AI agent that you created in the **Manage agentic workflows and AI agents** page.

If you selected **Users with specific roles** for your ACL, you can change roles at any point. Return to the guided setup and double-click the pills to make changes. All other security changes must be done on the ACL [sys_security_acl] table by a user with elevated permissions.

Find AI agents

Find available AI agents in AI Agent Studio to explore your options when creating agentic workflows.

Before you begin

Role required: sn_aia_viewer.

About this task

AI agents are autonomous systems that interact with their environment to gather data, make decisions, and complete tasks that would otherwise need to be done by a human.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. View the available AI agents in AI Agent Studio.

Current location	Navigation option
AI Agent Studio Overview page	Select the **Explore all** button in the Ready-made agentic workflow and AI agents section, and then select the **AI agents** tab.
AI Agent Studio Overview page	View the Recent agentic workflows and AI agents activity section on the **AI agents** tab to see the most recently added or changed agents. **Note:** You see a list of the AI agents on ly when there's recent activity of the AI agents on your instance.
Anywhere else	Navigate to **All** > **AI Agent Studio** > **Create and manage**, and then select the **AI agents** tab.

2. View all AI agents, including those AI agents that were installed with Now Assist applications by navigating to the **AI agents** tab.

Result
Navigating through any of the preceding options directs you to the AI agents that are available on your AI Agent Studio instance.

Define the specialty of an AI agent

In the guided setup for an AI agent, write a clear description defining your agent and its role. You can also configure supported LLMs, enable third-party access, and manage long-term memory.

Before you begin
Role required: sn_aia.admin

About this task
The first step of the guided setup enables you to define the fundamentals of the AI agent. The description, AI agent role, and list of steps fields are used by the LLM to understand how to use the AI agent, by itself or as part of an agentic workflow. Descriptions, AI agent roles, and list of steps should be clear and well-defined. For guidelines for writing these fields, see Writing effectively for agentic AI. For an example AI agent, see Example AI agent.

Note: If you have the Off Glide Conversation Server plugin (com.glide.cs.offglide) installed on your ServiceNow instance, then the Premium Chat experience may differ from the standard experience. If you plan to use an AI agent in the Premium Chat mode, make sure to test so it works as expected.

Procedure

1. Enter a name for the AI agent.
2. Craft an AI agent description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The description should clarify the purpose of the AI agent, including its inputs, outputs, and context.

3. Craft the AI agent role.

   The difference between the description and the agent role is that the agent role provides more detail about the function that the AI agent serves within a greater context. The greater context may be as part of an agentic workflow, or it could be the specific function it serves in another type of work process.

4. Craft a list of steps.
   You can also use an old version of a list of steps. Select **View versions** for a full list of previous versions of the field. See Version control for more information.
5. Determine unsupported model providers.

   You may find that some models use your AI agent better than others. If you want to avoid users from having a less optimal experience with a certain model, you can mark a model as unsupported. If an administrator changes the instance-level settings to an unsupported model, your AI agent won't be available to users.

6. Determine if the AI agent can be accessed by third parties.

   Make your AI agent discoverable by turning on the **Allow third-party to access this AI agent** toggle button that enables you to use your ServiceNow AI agent on other platforms. You can still use it on your ServiceNow instances as well.

   See ServiceNow agents as secondary agents for more information about configuring agents to use on other AI platforms.

7. Configure long-term memory options.

   Long-term memory for AI agents enables agents to access data outside of the specific conversation or trigger that executes it. For example, you can select the *`Device and Software`* category to give the AI agent access to user information about the kinds of hardware devices and software that are available to the invoking user. The AI agent can remember this information in later conversations.

   - For more information about creating LTM categories, see .
   - For more information about selecting the categories to map them to you AI agent, see .

8. Configure AI agent learning.

   You can enable the AI agent to learn from past interactions with the user. For example, if the user encounters a similar issue, enabling this feature could help the AI agent understand what didn't work previously, so it can recommend other options.

   Note: When the agent learning capability is inactive at the AI Agent Studio level, the option to enable at the AI agent level is also inactive. To enable agent learning at the AI Agent Studio level, see Set up long-term memory.

Result
You have defined the basics of your AI agent.

What to do next
Select **Save and continue** to move to the next step, Add tools and information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add tools and information to an AI agent

Add a tool to an AI agent to enable different functionalities and help your AI agents achieve their objectives.

Tool overview

Tools provide your AI agents with the capabilities necessary to complete their tasks. When adding tools, consider how the AI agent uses them to achieve its objectives and how those tools interact with each other. Providing your AI agents with the appropriate tools help promote the robustness and quality of their performance.

Some additional guidelines for adding and creating tools are the following:

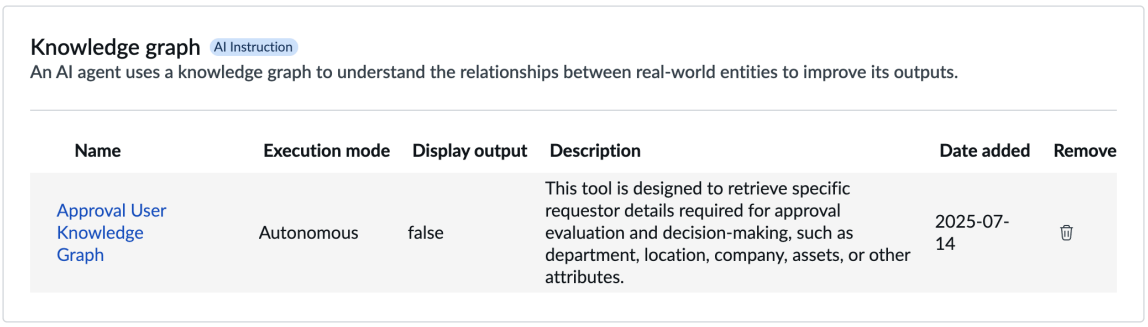
- Design tools to work together. Your AI agent should solve a specific, discrete task, and the tools should give the AI agent the capabilities necessary to achieve its goal.
- Write detailed tool descriptions. Tool descriptions are used by the AI agent to determine a tool's function. Thorough descriptions about what the tools are and how they work give the AI agent the best chance to succeed.
- Consider the outputs of tools when creating them. Use the tool description or output transformation strategy fields to describe how to process the tool outputs. For example, if you have a tool that gathers records from many tables, provide the tool with plans for how to handle the large number of records.

Note: If you select Google as your web search tool provider, the web search tool leverages Grounding with Google Search, offered under a Global Standard deployment. Because grounding isn't data resident, Google's global infrastructure routes traffic to a global datacenter for each web search request. This processing may be different than your data processing location chosen for your ServiceNow instance. Consider your organization's data policies before enabling AI agents that use Google web search tools.

Once you have added the tools to your AI agent, you can select **Save and continue** to move to the next step in the guided setup.

Knowledge graphs

In this step, you can also add Knowledge graphs. Knowledge graphs give the AI agent information to understand the relationships between real-world entities to improve its outputs. For example, you could add a Knowledge Graph to an approval AI agent that maps users to their location, company, and department to help the AI agent understand the specific approval process to apply.



Supervised execution mode for AI agents

You can minimize the potential negative impact of an AI agent not executing as expected by configuring AI agents' tools to run in supervised mode. Running in supervised mode means that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the tools use human oversight when executing actions. You can use the Supervised mode to enhance security for agents with the capability to perform sensitive or critical actions.

You can set the supervised execution mode when creating a tool in the AI agent guided setup. For example, choose Supervised as the Execution mode when adding a catalog item tool. For reference, see Add a catalog item to an AI agent.

Add a catalog item to an AI agent

Add a Service Catalog to an AI agent in AI Agent Studio so that your users can access conversational catalog items.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a catalog item to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Catalog item**.
4. On the form, fill in the fields.

Add a catalog item form

Fields	Description
Name	Name that you want to specify for your catalog item.
Description	Description of the catalog item and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Select catalog item	Catalog item that you want to add. If there is a tool used by an AI agent for the same catalog item, the rest of the form will populate the fields based on the other tool. You can make any changes specific to the current AI agent to suit your needs, and it will not affect the tool of the existing AI agent.
Execution mode	Mode of execution for your selected catalog item: ○ **Supervised**: Inputs from your human agent are required during the execution of this catalog item while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this catalog item while the AI agent runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
zz	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A catalog item is added in the Catalog items list on the Add tools and information page.

Add a conversational topic to an AI agent

Add a Virtual Agent topic to an AI agent in AI Agent Studio so that you can use conversations to get additional information from the user. For example, a conversational topic could be used to let a user select a date range for surveys.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a conversational topic to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Conversational topic**.
4. On the form, fill in the fields.

Add a conversational topic form

Fields	Description
Name	Name that you want to specify for your conversational topic.
Description	Description of the conversational topic and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Select topic	The Virtual Agent topic that you want to add. After it's selected, the description of the topic displays underneath the drop-down list. If there is a tool used by an AI agent for the same conversational topic, the rest of the form will populate the fields based on the other tool. You can make any changes specific to the current AI agent to suit your

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A conversational topic is added in the Conversational topics list on the Add tools and information page.

Add a defined desktop action tool to an AI agent for desktop and web-based task

Add a desktop action as a tool to an AI agent in AI Agent Studio so that AI agents can execute defined path desktop actions for repetitive tasks in desktop and web environment.

Before you begin

Familiarize yourself with defined path desktop actions. For more information, see Defined desktop actions for desktop and web-based tasks and Defined desktop actions in AI Desktop Actions.

Role required: sn_aia.admin

About this task

Desktop actions are tools that AI agents use to interact with web and desktop applications. When you configure an AI agent and select desktop action as a tool, you define whether the AI agent follows a defined path (fixed steps designed in AI Desktop Actions) or an adaptive path (high-level goal described in the tool configuration). Unlike adaptive path desktop actions that dynamically plan execution, defined path desktop actions enable AI agents to execute preconfigured workflows through a fixed sequence of steps.

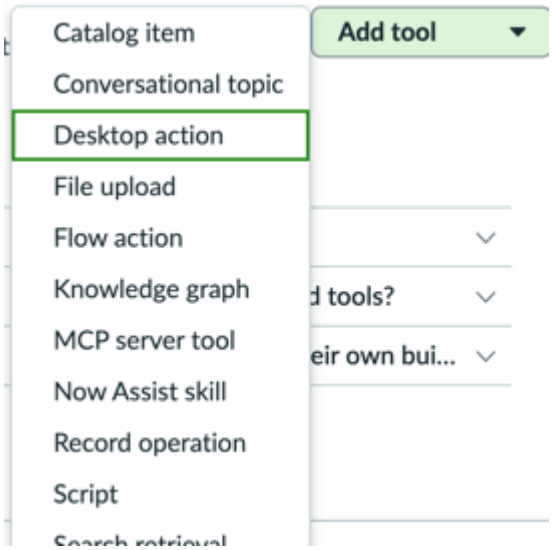
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defined desktop actions are further categorized into on-screen tasks and background tasks.

- **On-screen tasks**: These actions help you simulate humans interacting with UI elements on your thick client applications, legacy systems, or SaaS applications without APIs. These actions include clicking buttons, typing into text boxes, selecting from drop-down menus, and more. They encapsulate repeatable UI interactions, such as screens, anchors, and steps. You can create, manage, and test your desktop actions in AI Desktop Actions.
- **Background tasks**: These actions include prebuilt connectors that enable your AI agents to interact with various applications and system components in the background. These connectors streamline automation by offering actions for common tasks, reducing the need for complex scripting. Each connector focuses on a specific application or system area, providing a collection of related methods. You can't create background tasks actions.

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a desktop action to.
   For creating an AI agent, see Create an AI agent.
3. Navigate to the Add tools and information step.
4. In the **Add tool** drop-down list, select **Desktop action**.



5. Select or create a desktop action.

Existing desktop action	New desktop action
a. Select an existing desktop action of type on-screen task or background task from the **Select a desktop action** drop-down list. The background task desktop actions are supported for the following applications: ▪ Microsoft Excel ▪ Microsoft Outlook ▪ Microsoft Word ▪ PDF ▪ PowerShell Connector	**a.** On the Add a desktop action modal, select the **Click here to create a desktop action** link. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Existing desktop action	New desktop action
▪ SQL ▪ SSH ▪ SystemAction **b.** Select **Continue**.	**b.** Select the option **Record a fixed sequence of steps for desktop and web-based tasks**. **c.** Select **Open AI Desktop Actions app**. Record or manually capture the desktop action in AI Desktop Actions Windows application, activate it, and then come back here to add it as a tool. For more information, see Defined desktop actions in AI Desktop Actions. The creation process of defined desktop actions ends here.

6. On the form, fill in the fields.

Add a desktop action form

Fields	Description
Desktop action description	Read-only. Description of the desktop action or application that you selected.
Applications	Read-only. Applications that this desktop action interacts with. **Note:** This field appears only when **On-screen task** desktop action is selected.
Created by	Read-only. User who created the desktop action. **Note:** This field appears only when **On-screen task** desktop action is selected.
Last updated	Read-only. Date when this desktop action was last updated. **Note:** This field appears only when **On-screen task** desktop action is selected.
Inputs	Read-only. Input parameters associated with this desktop action. **Note:** This field appears when a desktop action or application is selected from the list.
Outputs	Read-only. Output parameters associated with this desktop action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: This field appears when a desktop action or application is selected from the list.
Name	Name that you want to specify for your selected desktop action.
Tool description	Description of the desktop action tool and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Map parameters **Important:** If you update a desktop action after mapping its inputs in AI Agent Studio, the agent continues to use the previous mapping until you reopen the tool configuration and save it again. If you rename an input in the desktop action, the agent treats it as a new input and the existing mapping for that input is removed. You must remap the renamed input before the desktop action can be saved.	
Step name	Read-only. The name of the step that is configured to use a parameter. **Note:** This field appears only when an **On-screen task** desktop action with inputs configured for parameters is selected.
Description	Read-only. The description entered for the step that is configured to use a parameter. **Note:** This field appears only when an **On-screen task** desktop action with inputs configured for parameters is selected.
Parameter record	Select the Desktop action parameter record that the AI agent must use to retrieve the value for this step at execution time. Mapping a parameter record is required for all steps before the desktop action can be saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: This field appears only when an **On-screen task** desktop action with inputs configured for parameters is selected. The same parameter record can be mapped to multiple steps. Each step can only be mapped to one parameter record.
Execution mode	Mode of execution for your selected desktop action: ○ **Supervised**: Inputs from your live agent are required during the execution of this desktop action while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this desktop action while the AI agent runs.
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

7. Select **Add desktop action**.
   The desktop action is added in the Desktop actions list on the Add tools and information page.

What to do next

For more information about executing desktop actions, see Examples of executing desktop actions using AI agents.

Add a file upload to an AI agent

Upload files for analysis by an AI agent in AI Agent Studio to grant your AI agent access to specialized knowledge.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a file upload to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **File upload**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add file upload form

Fields	Description
Name	Name that you want to specify for your file upload.
Description	Description of the file upload and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Execution mode	Mode of execution for your selected file upload: ○ **Supervised**: Inputs from your human agent are required during the execution of this uploaded file while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this uploaded file while the AI agent runs.
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Attachments	For analysis by an AI agent, attach up to 5 files with a maximum size of 5 MB each in these file formats: PDF, DOCX, or TXT formats. **Note:** A user who interacts with the AI agent with the file upload tool can see the information contained within the files.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A file upload is added to the AI agent.

Add a flow action to an AI agent

Add a flow action to an AI agent in AI Agent Studio. Define the flow action to use it as a reusable operation in automating the ServiceNow AI Platform features without having to write code.

Before you begin

When an AI agent uses a flow action tool, the user the AI agent is running as must pass the ACL of the flow action. Ensure that the security configurations for the flow action are met by the AI agent and agentic workflow. For more information, see Security for AI agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a flow action to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Flow action**.
4. On the form, fill in the fields.

Add a flow action form

Fields	Description
Name	Name that you want to specify for your selected flow action.
Description	Description of the flow action and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Select flow action	Existing automated process to be selected from the list. If there is a tool used by an AI agent for the same flow action, the rest of the form will populate the fields based on the other tool. You can make any changes specific to the current AI agent to suit your needs, and it will not affect the tool of the existing AI agent.
Inputs	Flow action inputs. The values are filled in by the LLM at runtime unless you specify a value override. **Note:** If the agent uses multiple tools, you can choose to use another tool's output as an input value override. Select the data picker icon ( ) to review the available options.
Execution mode	Mode of execution for your selected flow action: ○ **Supervised**: Inputs from your human agent are required during the execution of this flow action while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this flow action while the AI agent runs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A flow action is added in the Flow actions list on the Add tools and information page.

Add a Knowledge Graph to an AI agent

Add a Knowledge Graph to an AI agent in AI Agent Studio that uses the structured and unstructured data from different ServiceNow records to enhance the performance of AI agents.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Select **New** or open the AI agent that you want to add a Knowledge Graph to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Knowledge graph**.
   You may have to scroll down.
4. On the form, fill in the fields.

Add a Knowledge Graph form

Fields	Description
Name	Name that you want to specify for your selected Knowledge Graph.
Description	Description of the Knowledge Graph and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Select Knowledge Graph	Existing Knowledge Graph to be added to the AI agent. If there is a tool used by an AI agent for the same Knowledge Graph, the rest of the form will populate the fields based on the other tool. You can make any changes specific to the current AI agent to suit your needs, and it will not affect the tool of the existing AI agent.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	You can utilize Enterprise Graph and Enterprise Graph (Small) as Knowledge Graph resources while creating the Knowledge Graph tool.
Query instruction	The search query. Translate your request into a search query, including a verb. The query instruction is passed on to the LLM to generate a structured query for the Graph from the inputs selected in the tool form.
Conversation history	When enabled, the last 5 conversation turns are passed to the Knowledge Graph tool, allowing users to ask follow-up questions on the previously returned results. Turn off the toggle if each query should be treated as a standalone lookup. **Note:** The knowledge graph tools added previously to your AI agents will have the Conversation history turned off by default.
Execution mode	Mode of execution for your selected Knowledge Graph: ○ **Supervised**: Inputs from your human agent are required during the execution of this Knowledge Graph while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this Knowledge Graph while the AI agent runs.
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform

Fields	Description
	the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   The Knowledge Graph tool is added to the AI agent.

Add a generative AI skill to an AI agent

Add a generative AI skill to an AI agent in AI Agent Studio. You can customize the skills to meet the needs of your users in different workflows.

Before you begin

If you want to add a custom skill to an AI agent, the skill must be published and activated on the . For more information on deploying custom skills, see Finalize and publish a custom skill and Activate a custom skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When an AI agent uses a skill as a tool, the user the AI agent is running as must pass the ACL of the skill. Ensure that the security configurations for the skill are met by the AI agent and agentic workflow. For more information on setting skill-level ACLs, see Configure access control lists for a skill.

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a skill to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Generative AI skill**.
4. On the form, fill in the fields.

Add a generative AI skill form

Fields	Description
Name	Name that you want to specify for your skill.
Description	Description of the skill and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Select skill	Existing skill to be selected from the list. If there is a tool used by an AI agent for the same skill, the rest of the form will populate the fields based on the other tool. You can make any changes specific to the current AI agent to suit your needs, and it will not affect the tool of the existing AI agent.
Inputs	Skill inputs. The values are filled in by the LLM at runtime unless you specify a value override. **Note:** If the agent uses multiple tools, you can choose to use another tool's output as an input value override. Select the data picker icon ( ) to review the available options.
Execution mode	Mode of execution for your skill: ○ **Supervised**: Inputs from your human agent are required during the execution of this tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this tool while the AI agent runs.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Display output	Permission to display the output of the tool execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A generative AI skill tool is added in the Skills section on the Add tools and information page.

Add a record operation to an AI agent

Add a record operation to an AI agent in AI Agent Studio to create, update, look up, or delete records.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a record operation to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Record operation**.
4. On the form, fill in the fields.

Add a record operation form

Fields	Description
Select a type of record operation to add	If you select **An existing one**, you can select a record operation tool used by the current AI agent or any other AI agent. You can make changes to the settings of that tool to fit the needs of your specific AI agent.
Name	Name that you want to specify for your record operation.
Description	Description of the record operation and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Inputs	○ **Input name**: Name of the input for the LLM to use. ○ **Description**: Description of the input to give the LLM context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ **Value override**: Value for the input. If you leave it blank, generative AI fills in the value for you. **Note:** If the agent uses multiple tools, you can choose to use another tool's output as an input value override. Select the data picker icon ( ) to review the available options.
Table	Table that you want to perform the record operation on.
Select operation	Inputs should be referred to as {{inputname}}. Camelcase is not supported. ○ **Create record**: Requires values for fields in the new record. ○ **Delete records**: Requires the conditions to determine which records to delete. ○ **Look up records**: Requires the conditions to determine which records to look up, number of results specified, which fields to return, the result order, and the result sort type. ○ **Update records**: Requires the values for fields in the updated record and conditions to determine which records to update.
Execution mode	Mode of execution for your selected record operation: ○ **Supervised**: Inputs from your human agent are required during the execution of this tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this tool while the AI agent runs.
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A record operation is added in the Record operations list on the Add tools and information page.

© 2026 ServiceNow, Inc. All rights reserved.

Add a script to an AI agent

Create a script to add it to an AI agent in AI Agent Studio. With scripts, you can use the scriptable APIs and back-end integration to support the AI agent.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a script to and navigate to the Add tools and information section.
3. In the **Add tool** drop-down list, select **Script**.
4. On the form, fill in the fields.

Add a script form

Fields	Description
Select a type of record operation to add	If you select **An existing one**, you can select a record operation tool used by the current AI agent or any other AI agent. You can make changes to the settings of that tool to fit the needs of your specific AI agent.
Name	Name that you want to specify for your script.
Description	Description of the script and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Script inputs	Input name and description to use in the script. The LLM uses the name and description to determine what value should be used at runtime. Example: Input name is *task_record_sys_id* and description is *sys_id of the Task Record, this is mandatory*.
Script	JavaScript code that includes an object class or a function for your script. **Note:** For improved security, use GlideRecordSecure instead of GlideRecord and addUserEncodedQuery() instead of addEncodedQuery().
Execution mode	Mode of execution for your script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ **Supervised**: Inputs from your human agent are required during the execution of this tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this tool while the AI agent runs.
Display output	Permission to display the output of the tool execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A script tool is added in the Scripts section on the Add tools and information page.

Add a search retrieval to an AI agent

Add a search retrieval to an AI agent in AI Agent Studio. Leveraging the Retrieval-Augmented Generation (RAG) enables an AI agent to retrieve and incorporate relevant information from an external source.

Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a search retrieval to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Search retrieval**.
4. On the form, fill in the fields.

Add search retrieval form

Fields	Description
Select a type of record operation to add	If you select **An existing one**, you can select a record operation tool used by the current AI agent or any other AI agent. You can make changes to the settings of that tool to fit the needs of your specific AI agent.
Name	Name that you want to specify for your search retrieval tool.
Description	Description of the search retrieval tool and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Search profile	Name of the search profile that you want to add to your RAG-based tool from the list. To learn more about a search profile, see Search profiles in AI Search.
Search sources	One or multiple sources that you want to add to your search profile. To learn more about the search sources, see Search profiles in AI Search.
Fields returned	One or multiple fields that you want your search profile to return from the search sources.
Results limit	Number of records to be retrieved from the defined search source. The default value is 10.
Search criteria	Type of search that needs to be used: ○ **Semantic**: This search is carried out with the logical meaning of the search query. ○ **Keyword**: This search is carried out with the defined keywords. ○ **Hybrid**: This search is a combination of both keyword and semantic searches.
Semantic indexes	Fields on the source table that are indexed for a semantic search. **Note:** Semantic indexed fields are required if the search criteria are semantic or hybrid.
Document matching threshold	Cosine similarity score between 0 and 1 (exclusive). Default value is 0. The higher the number, the more variation in search results.
Execution mode	Mode of execution for your search retrieval tool: ○ **Supervised**: Inputs from your human agent are required during the execution of this tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this tool while the AI agent runs.
Display output	Permission to display the output of the tool execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A search retrieval tool is added in the Search retrievals section on the Add tools and information page.

Add a subflow to an AI agent

Add a subflow tool to an AI agent in AI Agent Studio. Subflows are reusable sequences of processing steps that can be called from within a flow.

Before you begin

When an AI agent uses a subflow tool, the user the AI agent is running as must pass the ACL of the subflow. Ensure that the security configurations for the subflow are met by the AI agent and agentic workflow. For more information, see Security for AI agents.

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > *AI Agent Studio* > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a subflow to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Subflow**.
4. On the form, fill in the fields.

Add a subflow form

Fields	Description
Name	Name that you want to specify for your selected subflow.
Description	Description of the subflow and what it's going to do to assist your AI agent. **Note:** This description is sent to the large language model (LLM).
Select subflow	Existing process automation capability you want to add. If there is a tool used by an AI agent for the same subflow, the rest of the form will populate the fields based on the other tool. You can make any changes specific to the current AI agent to suit your needs, and it will not affect the tool of the existing AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Inputs	Subflow inputs. The values are filled in by the LLM at runtime unless you specify a value override. **Note:** If the agent uses multiple tools, you can choose to use another tool's output as an input value override. Select the data picker icon ( ) to review the available options.
Execution mode	Mode of execution for your selected subflow: ○ **Supervised**: Inputs from your human agent are required during the execution of this tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this tool while the AI agent runs.
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats: ○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A subflow tool is added in the Subflows section on the Add tools and information page.

Add a web search to an AI agent

Add a web search to an AI agent in AI Agent Studio using a third-party search API such as Microsoft Bing or Google.

Before you begin

Note: If you select Google as your web search tool provider, the web search tool leverages Grounding with Google Search, offered under a Global Standard deployment. Because grounding is not data resident, Google's global infrastructure routes traffic to a global data center for each web search request. This processing may be different than your data processing location chosen for your ServiceNow instance. Please consider your organization's data policies before adding a web search tool with Google as the provider.

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a web search to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **Web search**.
4. On the form, fill in the fields.

Add a web search

Fields	Description
Name	Name that you want to specify for your web search.
Resource	Resource for the web search.
Provider	Third-party search API provider. **Note:** You can configure the default provider for the Web Search API capability on the OneExtend Definition Config table [sys_one_extend_definition_config].
Inputs	Information for the search API to include in the web search. You can select value overrides or leave them blank for generative AI to fill in the details for you. ○ **Country**: Country where results come from. ○ **Max tokens**: Maximum number of tokens to include in the response. ○ **Number of results**: Total number of results acquired. ○ **Search query**: Value to search for ○ **Sites or domains**: Websites where you want to search. **Note:** If the agent uses multiple tools, you can choose to use another tool's output as an input value override. Select the data picker icon ( ) to review the available options.
Execution mode	Mode of execution for your selected web search:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ **Supervised**: Inputs from your human agent are required during the execution of this tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this tool while the AI agent runs.
Display output	Permission to display the output of the execution in the ServiceNow Otto panel or in Virtual Agent: ○ **Yes** ○ **No** If you want the AI agent to work in Off Glide architecture with Premium Chat experience, you must turn-on the **Display output** toggle. When the toggle is turned-on, you can add widgets that can be used in assistants built with Premium Chat experiences. The widget configuration includes: ○ **Widget**: Defines the display output to render the content in a better user experience. You can select the widget from the drop-down. ○ **Require widget transformation**: An additional LLM call is required to transform the raw tool. If you choose to skip this transformation step, the tool output will be directly mapped to the widget. ▪ **Yes** ▪ **No** ○ **Display refined widget message**: Refines the widget message when configured. ▪ **Yes** ▪ **No** **Note:** The display output as a toggle is exclusively available for the Premium Chat experience when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard display output options.
Advanced settings	
Select an output transformation format	Style for the LLM to present the results as it passes information between tools and to other agents. Out transformation formats:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ None ○ Concise ○ Paragraph ○ Summary ○ Custom
Write processing messages for users	Message to display to users during tool execution. ○ In-progress message: Write an in-progress message to be displayed to end-users while the tool is running. ○ Completion message: Write a completion message to be displayed to end-users once the tool finishes running.

5. Select **Add**.
   A web search is added in the Web search list on the Add tools and information page.

Define security controls for an AI agent

In the guided setup for an AI agent, define security controls for who can access the AI agent and what data the AI agent has access to.

Before you begin

Role required: sn_aia.admin

About this task

The **Define security controls** step is divided into two parts: **Define user access** and **Define data access**. The former creates an ACL that determines who can discover or invoke the AI agent. The latter defines the data that the AI agent has access to once it's invoked.

See Security for AI agents for more information about creating ACLs and user identities for security for AI agent.

Procedure

1. Select which users can access the AI agent.

   The drop-down menu options are:

   ○ Users with specified roles
   ○ Authenticated users
   ○ Public

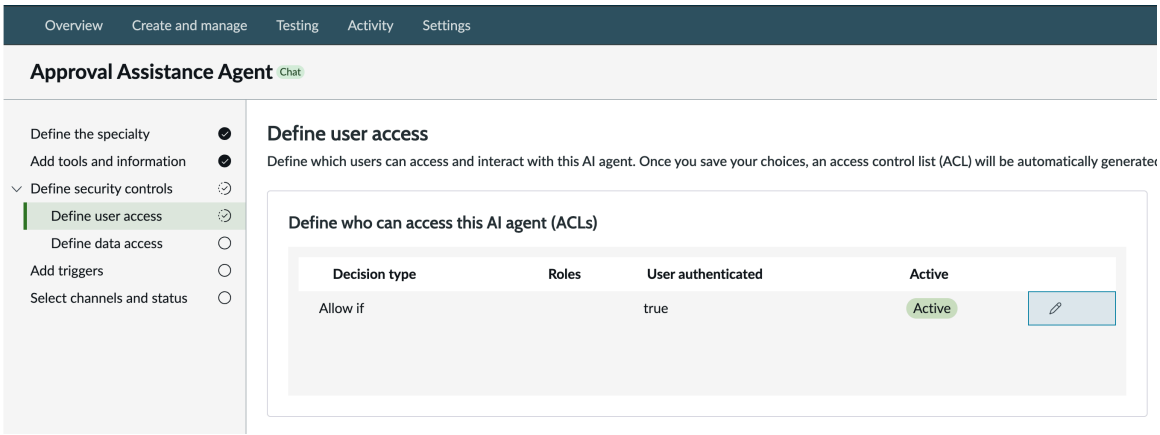
   If you select *`Users with specified roles`*, you can select exactly which roles can access the AI agent.

   AI agents installed with applications each require specific roles. To learn which roles they need, consult the documentation for the AI agent or the agentic workflow that uses the AI agent.

2. Select **Save and continue** to move to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Saving and moving onto the next step triggers the creation of an ACL for your AI agent. If you want to make changes later, you can return to the guided setup and change the options here. If you have the correct elevated role, you can also make edits directly on the ACL table.



3. Define the user identity of the AI agent to determine what data it has access to.

   The two options are *`Dynamic user`* and *`AI user`*. The dynamic user is the user invoking the AI agent or the dynamic user of the agentic workflow calling on the AI agent. An AI user is a dedicated user that has its own specified roles that allow access, which could be more than the dynamic user.

   If you do not have an AI user but want to use the *`AI user`* identity, you need to create a record on the User table. See Create a user. Select *`AI user`* as the identity type.

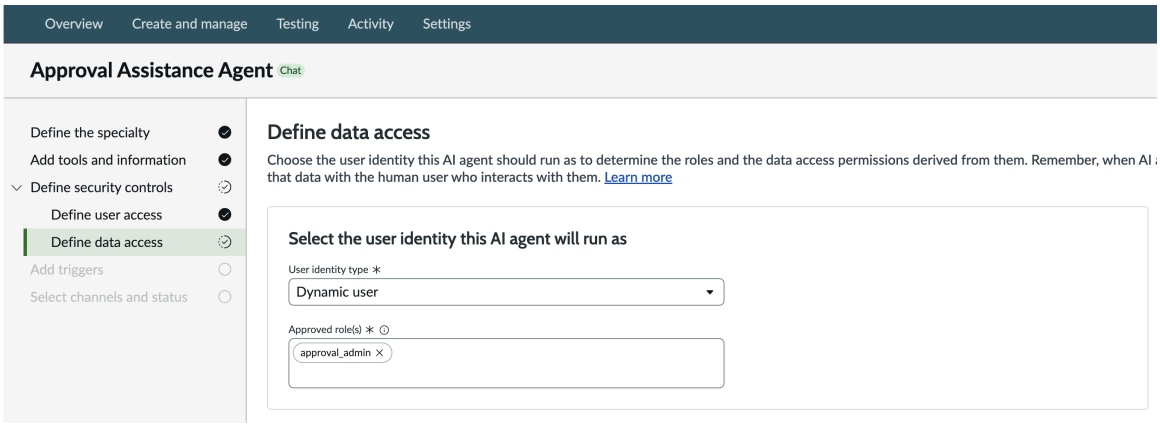
   If you select *`Dynamic user`*, you can select the *`Approved roles`* that the AI agent runs with. By default, an AI agent runs as a dynamic user and has the roles of the invoking user. Select the approved roles to limit the data access that an AI agent could have. Role masking must be applied for all AI agents and agentic workflows to run as dynamic users.

   To override the role masking requirement for a specific agentic workflow or AI agent, admins with the correct elevated access can create an approved list of roles for a given agentic workflow or AI agent. Then, they can access that role masking record in the Agent Access Role Configurations table [sys_agent_access_role_configuration], and select the “allow all roles” check box. Taking these steps deactivates the requirement for a role masking approved roles list in AI Agent Studio, so the AI admin can return to AI Agent Studio and continue to configure the agentic workflow or AI agent without role masking applied.

   Note: Role masking should be applied as security best practice and adherence to the principle of least privilege. Overriding the role masking requirement isn’t recommended.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you select *AI user*, the list of roles that the AI user has is displayed.



Result

You have created an ACL that determines who can discover and access your AI agent, and you have assigned a user identity (and role masking, if relevant) to the AI agent to determine what data it can access.

What to do next

Select **Save and continue** to move to the next step, Adding a trigger. Adding a trigger is optional. You can also skip to the final step, Select channels and access.

Add a trigger to an AI agent

In the guided setup for an AI agent, add triggers to run the AI agent automatically when certain conditions are met.

Before you begin

Role required: sn_aia.admin

About this task

Adding a trigger is optional. If you want your AI agent to be used only in chats, you don't need to add a trigger. Only add a trigger if you want to invoke the AI agent automatically when some event occurs.

Note: Triggers contain instance-specific information. If you're moving AI agents or agentic workflows between instances using Update Sets, you must set the triggers to inactive before adding them to the update sets and then activate them on the new instance.

If you don't want to add a trigger, skip to the final step, Select channels and access.

Procedure

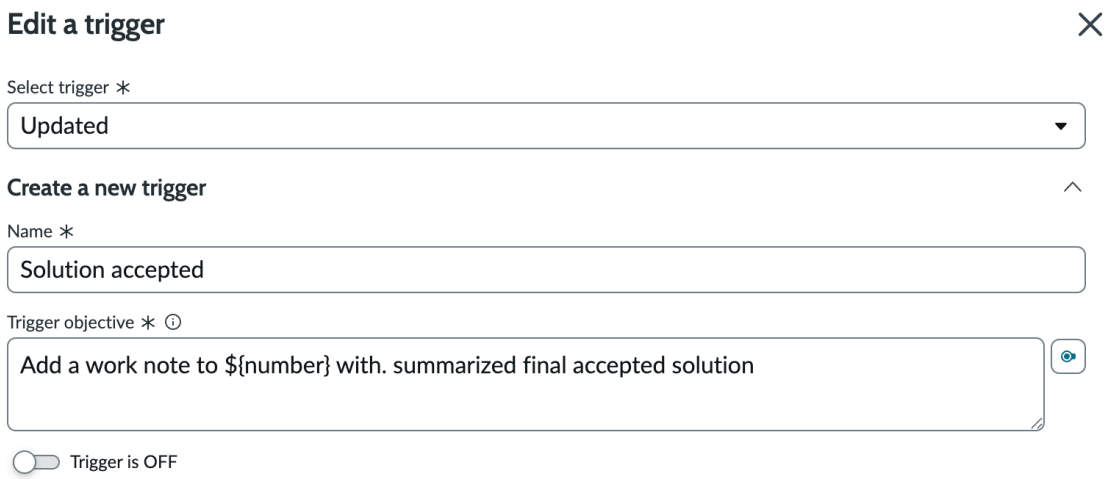
1. Select **Add trigger**.
2. On the form, fill in the fields.

Create a new trigger

Fields	Description
Select trigger	List of triggers that are available in the instance.
Name	Name of the trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

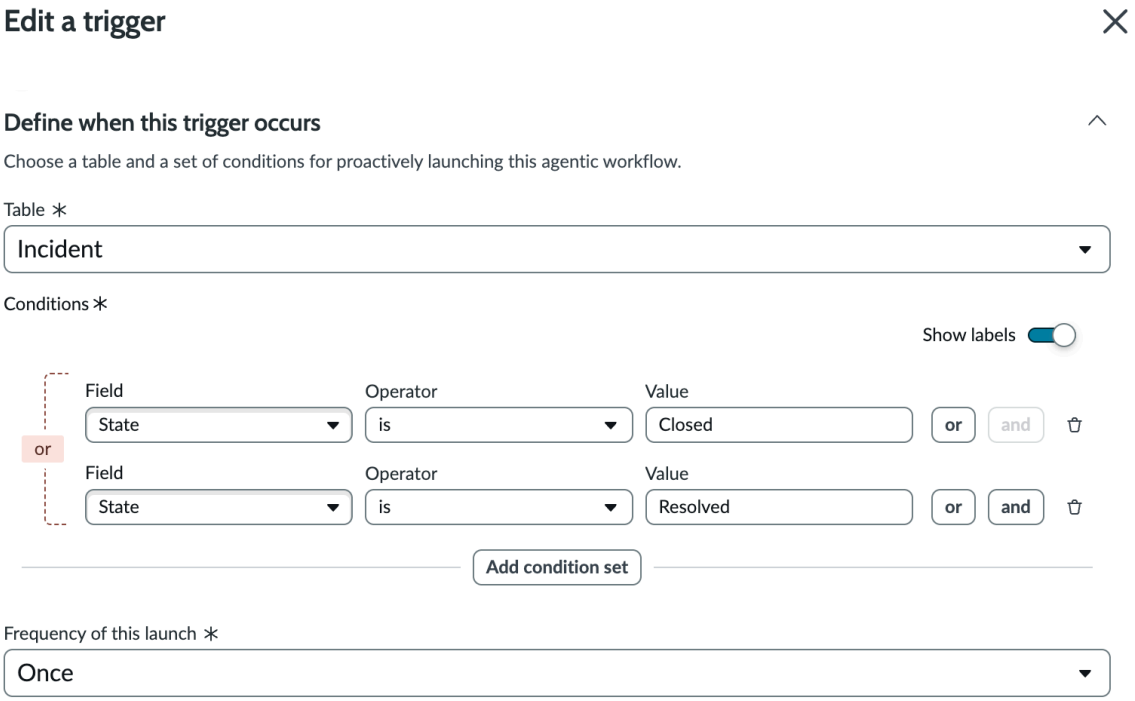
Fields	Description
Trigger objective	Additional user statements or sample utterances that help guide when to trigger this AI agent.



Define when this trigger occurs

Fields	Description
Table	Name of the applicable table for your AI agent.
Conditions	Conditions that you can add to control the trigger configuration. You must have at least one condition. Select **+ Add condition set** to add conditions to your AI agent trigger.
Active trigger toggle	Only enable the trigger once you're confident in the execution of your AI agent. Try testing the AI agent execution and user access. To review overall trends over many executions, try an automated evaluation.

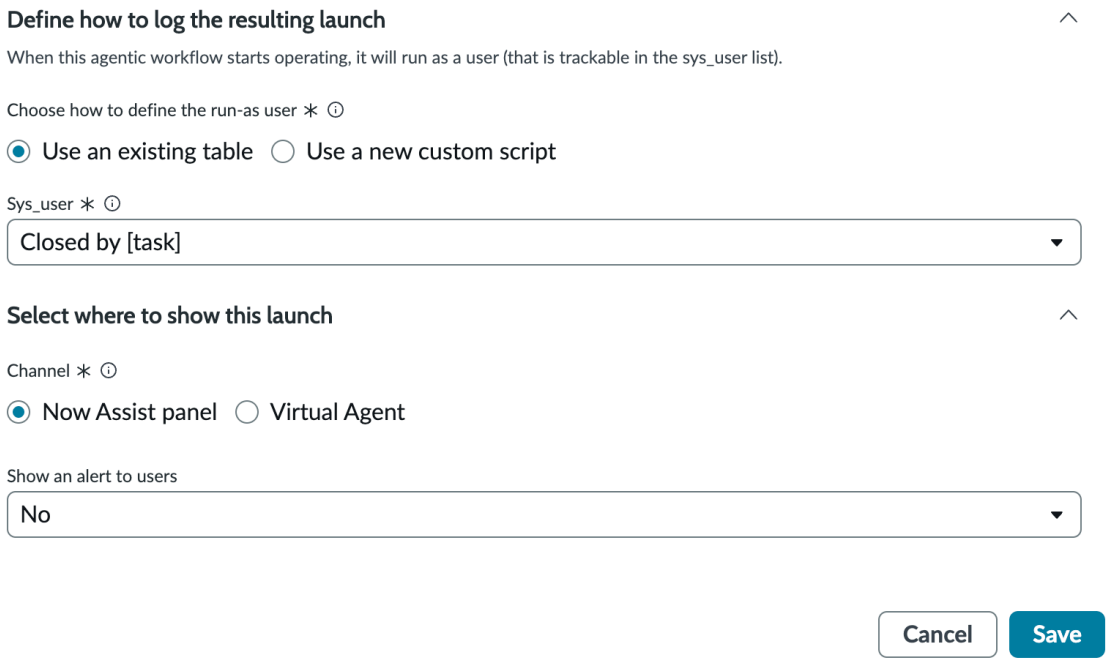
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select where to show this launch

Fields	Description
Channel	Medium for the AI agent output: ServiceNow Otto panel or Virtual Agent. **Note:** To view the output from a triggered AI agent in the ServiceNow Otto panel, you need the now_assist_panel_user role.
Show an alert to users	Alerts appear in the selected channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you choose a scheduled trigger, additional options are available, such as the day of the week and time when you want the trigger to run.

Note: When running a scheduled trigger, not every record is included in the execution. By default, the value is 10. If you want to change this number, you must set the *sn_aia.max_scheduled_trigger_query* system property to a different value.

If you choose an email trigger, the target emails must exist on the Reply [sys_email] table. New emails aren't available as triggers.

3. Select **Add**.
4. Repeat the preceding steps for additional triggers.

Result
You have added triggers to your AI agent to run it automatically under the specified conditions.

What to do next
Select **Save and continue** to move to the final step, Select channels and access.

Select channels and status for an AI agent

In the guided setup for an AI agent, activate the AI agent to use in an assistant in ServiceNow Otto for Virtual Agent, and set the processing messages.

Before you begin
Role required: sn_aia.admin

About this task
The final step of the AI agent guided setup includes options for where you can invoke the agentic workflow as well as set the processing message. You must select which assistants for ServiceNow Otto in Virtual Agent you want to be able to invoke the AI agent. Your processing messages appear when the AI agent is running and when the AI agent's task is completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select whether you want users to use ServiceNow Otto in Virtual Agent to invoke the AI agent.

   If enabled, you must select which chat assistants have access to the AI agent. You can edit assistants using Assistant Designer.

2. **Optional:** Set the processing and completion messages for your AI agent.

   (Optional) You can set a processing message, completion message, or both. If you don't want to use a specific type of message, unselect the toggle next to the message field.

   You can also use ServiceNow Otto to generate the messages for you by selecting **Generate messages**. You can change the messages after they're generated.

3. Activate the AI agent.

   Select the **This AI agent is active** toggle to activate the AI agent only when you want users to be able to use it. If you want to test your AI agent first, wait until after you have tested it before activating it. You can return to the guided setup later.

   If you don't see this option, you may need to scroll.

   Note: If you have installed the Off Glide Conversation Server plugin (com.glide.cs.offglide) on your ServiceNow AI Agent Studio instance, then agent learning and voice agents won't work if the assistant is in Premium Chat mode.

4. Select **Save and test**.

Result

You have completed the guided setup for creating an AI agent. Your new AI agent can be edited at any time using AI Agent Studio.

What to do next

Move to the **Testing** page to test an AI agent execution using example utterances or to test user access.

Duplicate an AI agent

Duplicate an existing AI agent in AI Agent Studio so that you can save time by not having to manually configure or create AI agents.

Before you begin

Role required: sn_aia.admin

About this task

Duplicate the AI agents to do the following tasks:

- Duplicate the record.
- Disallow any AI agents with existing names.

Custom columns, such as the Tools and Knowledge sources, Status, and a column with the Duplicate icon ( ) are available for the AI agents list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

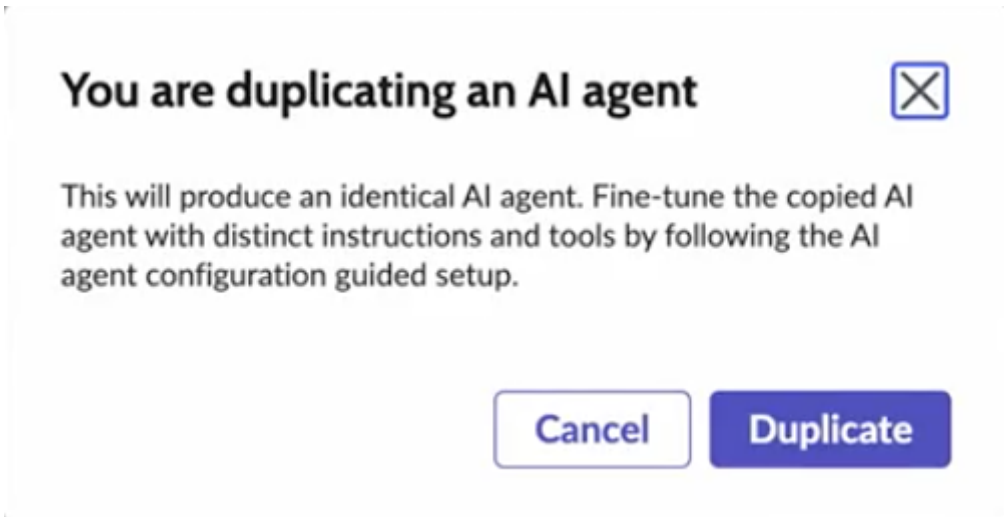
Note: The duplicated AI Agents use the same tools as the original agent and modifying the agent tools in the duplicated AI agent affects the agent tools in the original AI agent. To use the tools in a duplicated AI agent, you can either use the duplicated agent tools without making changes to them or add a new tool."

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents** and open the AI agents list in AI Agent Studio.
2. Duplicate the AI agent from either the Manage agentic workflows and AI agents page or the AI agent form.

Current location	Navigation option
Manage agentic workflows and AI agents page	On the AI agents list, select the duplicate icon ( ) for the AI agent that you would like to duplicate.
AI agent form	Open the AI agent that you want to duplicate, select the menu icon ( ) next to **Exit** on the Describe and instruct form, and select **Duplicate**.

You see a confirmation message in a pop-up window.



3. Create a copy of the AI agent with the same information from the original AI agent's record by selecting **Duplicate**.

   Note: The name of the duplicated AI agent is appended with the suffix `(Copy)` so that you can clearly identify the duplicated AI agent from the original AI agent. For example, `Knowledge Article Agent (Copy)`. You can rename the duplicated AI agent and also edit the other information that is duplicated from the original AI agent.

4. After editing the details in the Describe and instruct section, select **Save and continue**.
5. In the Add tools and information section, edit the details that are from the original AI agent or add new tools for your requirements and select **Save and continue**.
6. In the Toggle display section, turn on the Status for the duplicated AI agent and select **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You're redirected to the AI Agent Studio home page. In the Manage and configure AI Agents to solve agentic workflow section on the **AI Agents** tab, you see the duplicated AI agent.

Modify an AI agent

Modify an AI agent in AI Agent Studio to suit your changing business needs.

Before you begin
Role required: sn_aia.admin

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**
2. Select the AI agent that you want to modify.
3. Modify the fields of the different sections of the Guided Setup, making changes to the fields for your requirements.

   The guided setup is the same as the one for creating an AI agent:

   - Define the AI agent's specialty.
   - Define the AI agent security controls.
   - (Optional) Add a trigger to automatically invoke your AI agent if a specified event occurs..
   - Determine whether you want to use the ServiceNow Otto in Virtual Agent chat assistants and/or as UI action, set the processing messages, and activate your AI agent..

   Note: Some fields aren't editable if the agent is associated with an application. If you want to make more modifications, duplicate the agentic workflow and make changes to the duplicate.

   - For the *`List of steps`* field in the **Define specialty** step, you can create multiple versions of the same AI agent without losing previous versions. Creating versions enables you to test different instructions to evaluate performance. See Version control for AI agents and agentic workflows for more information.
   - For more guidance on creating effective instructions, see the general guidelines for creating AI agents and agentic workflows.
   - For the access control lists (ACLs), you can edit the security fields and define who can access the AI agent and edit the entity to run the AI agent as a dynamic user or an AI user. For more information, see Implement access control in AI agents.

   You can navigate through the steps of the Guided Setup with the **Continue** and **Back** buttons.
4. Navigate to the last step and select **Test** to save your changes and begin testing your modified agent.

Result
Your agent is modified and ready to test.

What to do next
You can test an execution of your AI agent manually or test the user access. Once you've determined that the AI agent has the basic functionality you expect, you can evaluate the AI agent using automated tests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manually test the execution of an AI agent

Analyze the execution of an AI agent so you can see that it functions the way that you defined it.

Before you begin

Role required: sn_aia_admin and either admin or at least one role required by the ACL of the AI agent being testing and each of the ACLs of its downstream components

About this task

After you create an AI agent, test it to see that it functions the way that you defined it. You can choose to run a manual test with a single instruction to test its basic functioning, or you can evaluate the AI agent's performance across multiple executions.

If you want to test multiple executions using execution logs, you can run an automated test. If you select **Start automated evaluation**, the agentic evaluation guided setup opens in a new browser tab. See Evaluate an AI agent for more details about running a new automated evaluation.

When manually testing performance, you can see how the AI agent interacts with the AI Agent Orchestrator and the Communicator AI agent. The Orchestration is an agent that directs different AI agents, and the Communicator AI agent facilitates the communication between the user and other AI agents.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Testing**.
2. Select **Start manual test**.

   If you want to start an automated test, see Evaluate an AI agent for more details on that process.
3. In the *Choose a test type* drop-down menu, select *AI agent or workflow*.

   If you want to test user access security controls, see Test AI agent user access.
4. Under *Choose a testing mode*, select the testing mode either as **Premium Chat** or **Standard**.

   Note: The Premium Chat testing mode is exclusively accessible when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard testing playground.
5. Select an agentic workflow or AI agent that you want to test by searching the name of a workflow or choosing from the drop-down menu.
6. In the Version drop-down list, select the version of the AI agent you want to test.

   See Version control for AI agents and agentic workflows for more information about creating and changing versions.
7. In the **Task** field, provide a concise summary of the task to be achieved.

   Note: In the task summary, include a reference number or specific record for better results during your testing.
8. Select **Continue to Test Chat Response**.

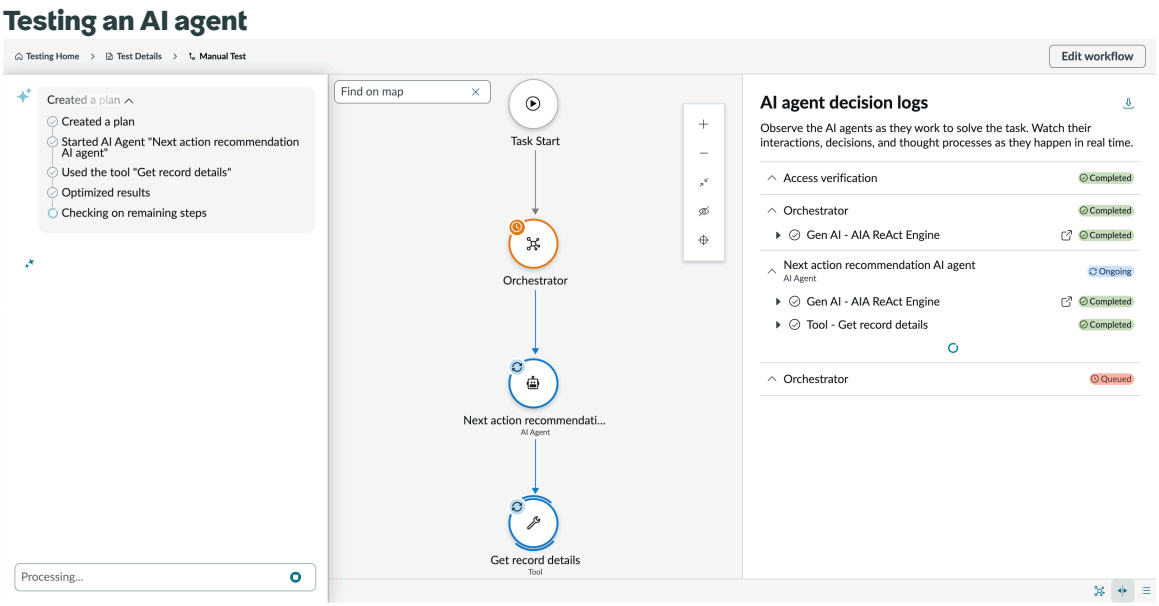
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

When testing an AI agent, you can see the AI agent Orchestrator and Communicator working together to organize and manage the AI agents like a team. The AI agent Orchestrator assigns the individual, specialized agents to complete the subtasks. The AI agent Communicator lets the AI agent Orchestrator know the status of each agent.

Note: If you don't have the roles necessary to pass the ACLs of the AI agent and all of its tools, you'll be notified that you don't have the necessary access and the test won't execute.

Your AI agent starts to execute the test autonomously to resolve the task.



- A simulated chat experience begins on the ServiceNow Otto panel between your invoking user and AI agent.
- At the top of the canvas, you can see information about the AI agent you're testing, including its name, version, and description.
- A diagram shows the tasks and communication of the AI agents that are working together to solve the case.
- A decision log records the thought process of each AI agent that is involved in solving the agentic workflow.

Note: You can view the entire decision log by selecting **Download logs**.

You can restart the entire testing process at any time by selecting **Restart**.

Test user access to an AI agent

Run a manual test to verify that only the users you want to access the AI agent can do so.

Before you begin

Role required: sn_aia.admin and either admin or at least one role required by the ACL of the AI agent being testing and each of the ACLs of its downstream components

About this task

You can establish the security settings for an AI agent in the guided setup to establish which users can access it. See Define security controls for instructions on how to change the user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

access settings. When you select **Save and continue** on that step of the guided setup, an ACL is created that establishes limitations on which users can access the AI agent.

Once you have created these ACLs, you can verify that they work as intended by using the *Test access* test type of a manual test of an AI agent.

To see instructions for performing manual tests to evaluate performance, see Test performance manually. For more information about automated tests, see Evaluate an AI agent.

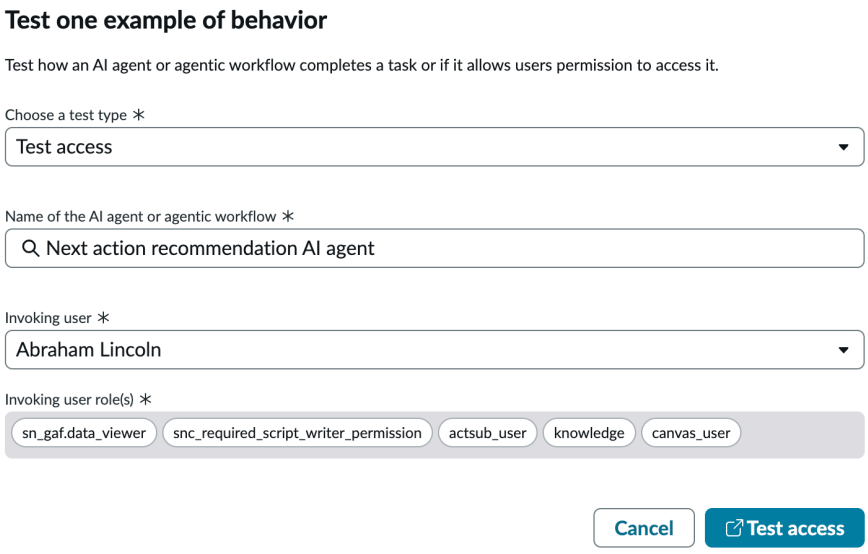
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Testing**.
2. Select **Start manual test**.
3. In the *Choose a test type* drop-down menu, select *Test access*.

   If you want to test the basics of how an AI agent works, select *AI agent or workflow*. The full instructions for that test type can be found in Test performance manually.
4. Search for or select the name of the AI agent you want to test.
5. Select an invoking user.

   The invoking user can be the user that triggers the AI agent or it can be the invoking user of an upstream component, such as an agentic workflow. For more information about how the invoking user works, see Security for AI agents.

   When you select an invoking user, the user roles are populated in the *Invoking user roles* field. The field is read-only. If you want to change a user's roles, you must change the user's User record. See Assign a role to a user.
6. Select **Test access**.



Result

The results of the access test are opened in the Access Analyzer in a new browser tab.

Access Analyzer identifies all the ACL calls made in the execution of the AI agent, including its tools, if any are present. You can see the results of each ACL to verify that each one has the correct user access defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
If the results are different than what you expect or want, you can redefine the security controls of the AI agent.

You can also test an AI agent's performance with either a manual test or automated evaluations. See Test performance manually or Evaluate an AI agent.

Delete an AI agent

Delete an AI agent from AI Agent Studio if you no longer need it.

Before you begin
Role required: sn_aia_admin

About this task
You must assign appropriate permissions by using the access control lists (ACLs) to delete AI agents on AI Agent Studio.

Note: You can't delete the AI agents that come installed with applications.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. Select the check box of the AI agent that you want to delete and select **Delete**.

   You can also delete multiple AI agents by selecting multiple AI agent records at a time.

   Note: Some AI agents installed with ServiceNow applications can't be deleted.

3. In the confirmation pop-up window, select **Delete**.

Result
The selected AI agents are deleted from the AI agents list in AI Agent Studio.

Create an external AI agent

Create external AI agents in AI Agent Studio to connect the ServiceNow AI Platform with third-party agentic AI providers as primary agents.

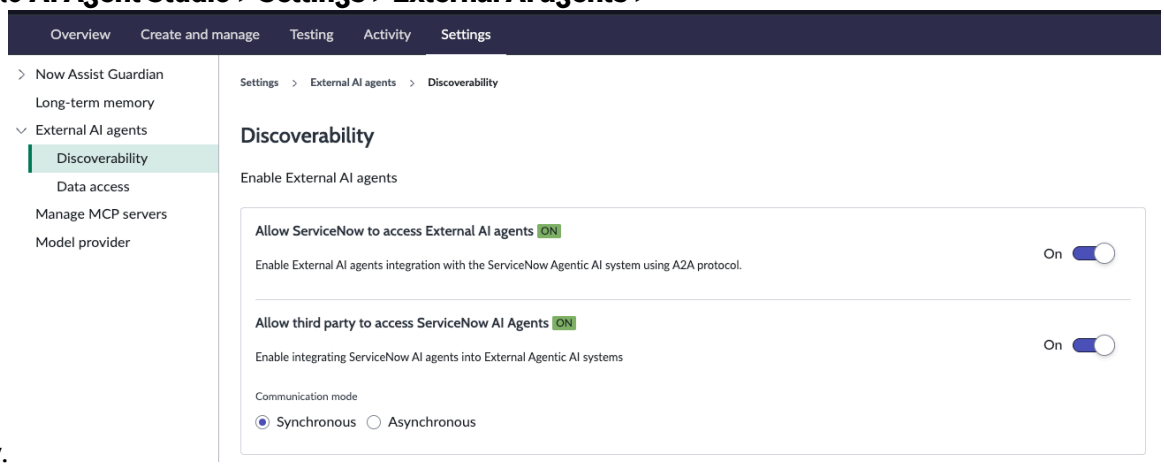
Integrating external AI agents

Integrate and configure external agents with the ServiceNow agentic AI system using Agent2Agent (A2A) protocol integration to use in agentic workflows created in the AI Agent Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External agent discovery on the ServiceNow AI Platform

You can enable external AI agents on the AI Agent Studio via the Settings page. Navigate to **AI Agent Studio** > **Settings** > **External AI agents** > **Discoverability**.



- **Allow ServiceNow to access External AI agents**: Turn on the toggle to enable external AI agents integration with the ServiceNow agentic AI system using the A2A protocol.
- **Allow third party to access ServiceNow AI agents**: Turn on the toggle to enables integrating ServiceNow AI agents into external agentic AI systems.

When creating a new external AI agent in AI Agent Studio, you can connect your agent to the ServiceNow agentic AI system using the Agent2Agent (A2A) protocol integration. To do this, you must have a Connection & Credential alias record that connects to your agentic AI provider.

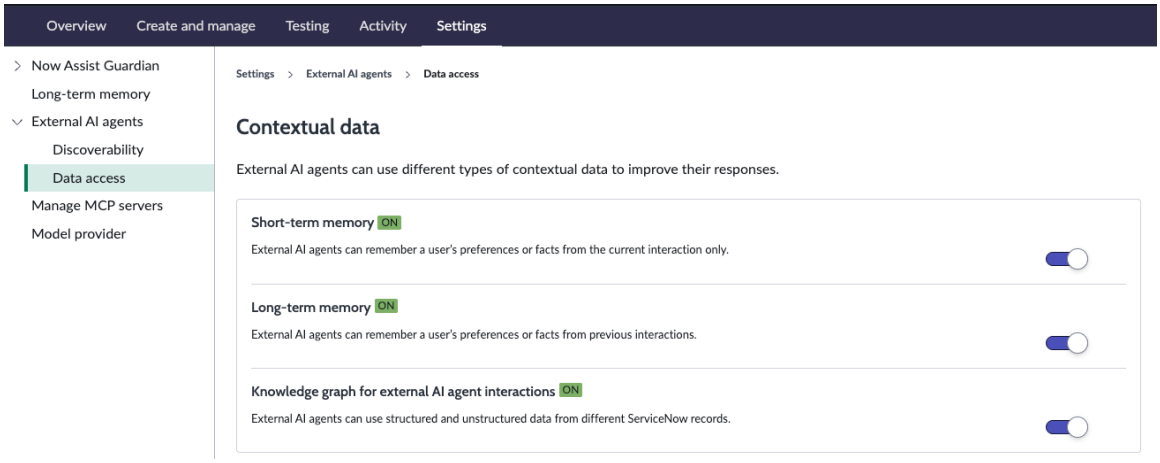
After connecting to the external AI agent, you can add details about its role and instructions to provide context for the AI Agent Orchestrator. Additional context helps differentiate your AI agent from other AI agents so that the AI Agent Orchestrator can decide about which agent to use.

Contextual data access for external agents on the ServiceNow AI Platform

Enable contextual data access for external agents to improve AI agent response during execution.

- **Short-term memory**: Turn on the toggle to enable external AI agents remember your preferences or facts from the current interaction only.
- **Long-term memory**: Turn on the toggle to enable external AI agents remember your preferences or facts from previous interaction.
- **Knowledge graph for external AI agent interactions**: Turn on the toggle to enable external AI agents to use structured and unstructured data from different records across the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Agent2Agent protocol overview

Agent2Agent (A2A) is an open standard that enables AI agents across different platforms to communicate with each other. The standard relies on every AI agent having an Agent Card associated with it that provides basic information for providers like the ServiceNow AI Platform, Azure, and Google to use them.

Version 0.3 of A2A is supported.

An AI agent's Agent Card uses standardized JSON to help different providers understand its capabilities. The Agent Card is accessed by a specific type of endpoint from a provider's server. Execution plans are communicated through an execution endpoint so that both the provider's server and the ServiceNow AI Platform can track what the external AI agent is doing.

See Create an external AI agent with the Agent2Agent protocol for instructions for using this protocol to create an AI agent.

Configuring A2A authentication

A2A connections require authorization from the source platform to execute on the ServiceNow AI Platform. Authentication is established by creating two Connection & Credential Alias and Connection records, one with an Agent Card endpoint and another with an execution endpoint.

Custom Headers for External Agent Configuration

When configuring external agents, you can pass custom HTTP headers to be included in the API calls to external endpoints. In the External Agent Configuration [sn_aia_external_agent_configuration] table, use the custom headers column to specify headers in JSON format. These headers are applied to all HTTP requests made by that agent during offline execution, regardless of the connection type (OAuth, API Key, or other). The configured headers are sent alongside the agent's authentication credentials and are useful for passing additional metadata or requirements that your external API expects.

Note: Custom headers apply only to the Premium Chat experience.

Configuration Properties

The following properties configure different aspects of how your agents can interact with the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External AI agent properties

Name	Description
sn_aia.external_agents.enabled	Set to `true` to enable external agent features
sn_aia.external_agents.parallel_conversations.enabled	Enables or disables multiple simultaneous conversations per user

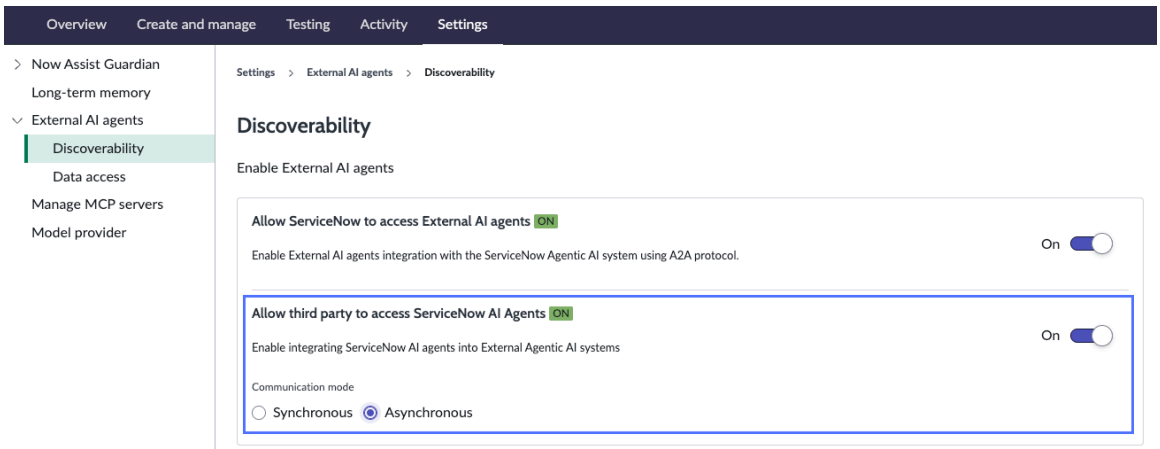
ServiceNow AI agents as secondary agents

Integrate ServiceNow AI agents into other agentic AI systems, such as Google Cloud or Azure OpenAI.

Enabling discovery of ServiceNow mobile agents

In AI Agent Studio, on the **Settings** page, under **External AI Agents** > **Discoverability**, you can enable the discovery of ServiceNow AI agents to use on other AI platforms. To do so, toggle **Allow third party to access ServiceNow AI Agents**.

You can also choose between **Synchronous** and **Asynchronous** communication between your external AI agent and the agentic AI provider.



ServiceNow AI agents as secondary agents overview

You can connect your ServiceNow agent to other agentic AI model providers using the Agent2Agent protocol.

After creating your AI agent in AI Agent Studio, you can point to the Agent Card URL that is displayed for secondary agents for easy access so the admins can view, copy, and consume the URL.

The endpoint to point to for the actual execution of the AI agent is in the format `{{instance}}.service-now.com/api/sn_aia/a2a/v2/agent/id/{{agent-id}}`.

You can use the same OAuth or API key for authenticating the agent discovery and the agent execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To verify that your AI agent is running from the ServiceNow side, during a conversation with the AI agent, you can go to the *Execution Plan [sn_aia_execution_plan]* table. From the Execution Plan table, you can identify the execution plan based on the *Objective* field that contains the prompt from the conversation on the other platform.

For more information about sample payloads for Google A2A with ServiceNow AI agent as Secondary agent, see Sample payloads for Google A2A.

For more information about setting up instructions for your ServiceNow AI agents as secondary agents (acting as A2A server), refer to Authentication for Google A2A - ServiceNow as Secondary Agent.

Asynchronous connection

Asynchronous connection involves communication where the sender and receiver don't have to be active simultaneously unlike the synchronous communication mode.

To establish asynchronous connection, you must obtain a callback URL for push notifications to function.

Once you have obtained a callback URL, you must create a record on the External Agent Callback Registries [sn_aia_external_agent_callback_registry] table. Go to the table, select **New**, and enter the callback URL. Save the record.

Once you save the record, a Connection & Credential Alias [sys_alias] record is created for you. To add authentication, you can open the Connection record associated with the sys_alias record and add a credential to the *Credential* field.

When the record is created, you can go back to the External Agent Callback Registry record you created and select **Verify URL** to test the connection works as expected.

Create an external AI agent with the Agent2Agent protocol

Create external AI agents in AI Agent Studio to connect the ServiceNow AI Platform with third-party agentic AI providers.

Before you begin

If you don’t see the option to create an external agent, confirm that your administrator has selected **Allow ServiceNow to access External AI Agents**. This option is available on the **Settings** page in AI Agent Studio, under **External AI Agents** > **Discoverability**.

Your instance must be at least on Zurich patch 4.

Role required: sn_aia.admin

About this task

You can integrate third-party AI providers into the ServiceNow AI Platform by creating an external AI agent in AI Agent Studio.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. Select **New** > **External**.
3. In the **Discover and activate** step, select the AI agent provider for your external agent and discover your agent.
   Select **Save and continue** to navigate to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select an existing provider or add a provider.

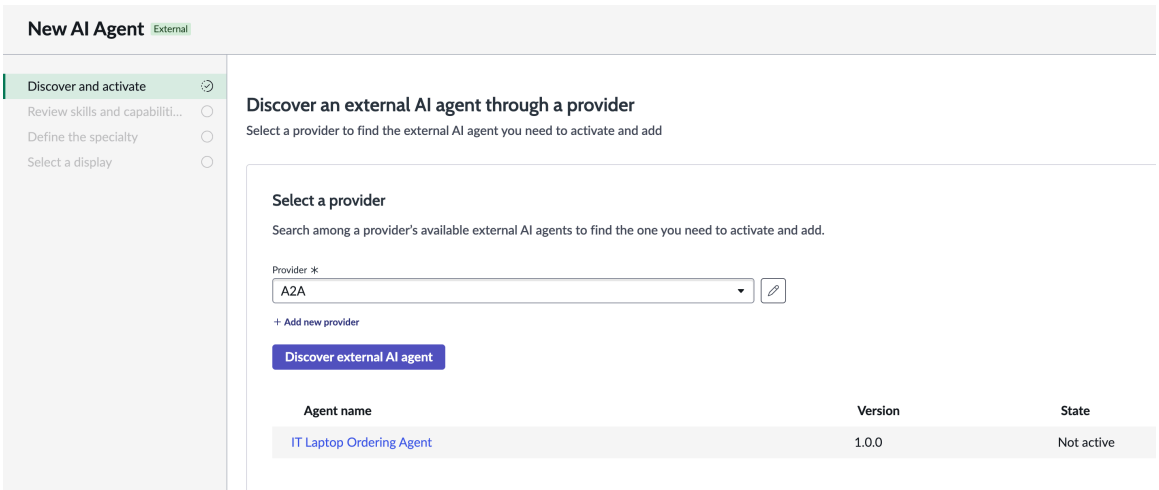
If you select **Add new provider**, you must fill out the fields and then select **Save**.

Add provider form fields

Name	Description
Name	Name of the agentic AI provider.
Agent card URL	The URL that points to the external AI agent's Agent Card. The URL should include `well_known/agent_json`.
Under **Advanced settings**, Connection & Credential alias	Credentials to access your external AI agent's Agent Card. You can select an existing alias or create one.
Under **Advanced settings**, Select subflow	Subflow that establishes Agent2Agent protocol. The default subflow should handle the majority of cases, but you can also create your own.

b. Select **Discover external AI agent** to validate the connection to your external agent.

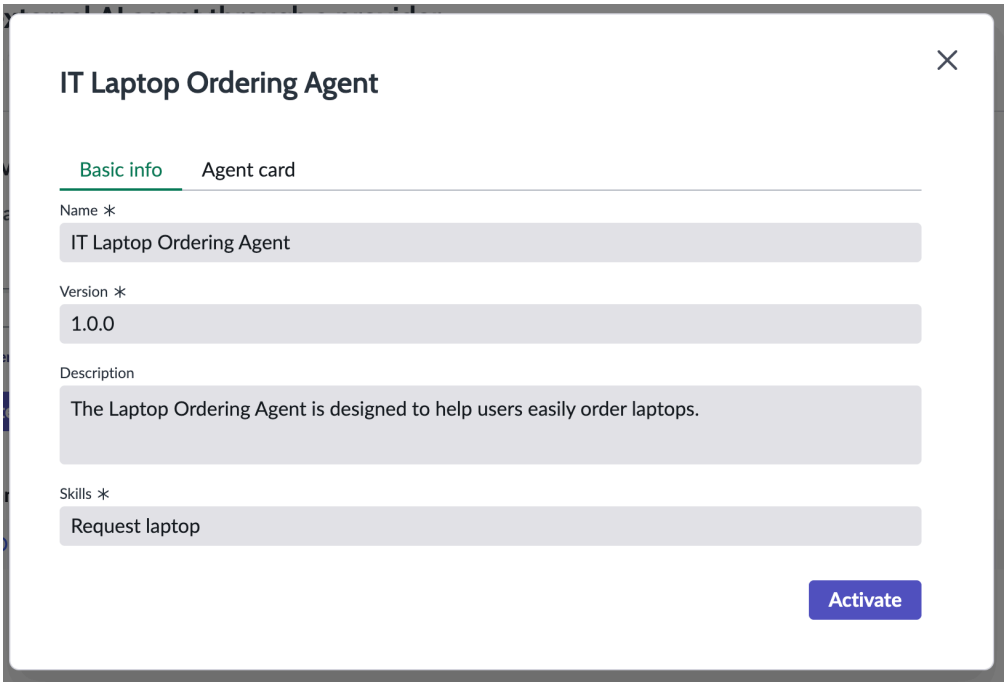
If discovery is successful, the name of your agent and the version number are added to the page previous the Discover external AI agent button.



c. Select the name of the agent to verify that the *`Name`*, *`Version`*, *`Description`*, and *`Skills`* fields are populated correctly, then select **Selected**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Agent card** tab shows the entire JSON for the agent.



4. In the **Review skills and capabilities** step, verify that the skill names are correct.
5. In the **Define the specialty** step, add details for how the external agent fits in the ServiceNow agentic system.

   a. Review your AI agent description.

      You can leave your AI agent description as it is, or you can add a longer description to help differentiate the agent from other AI agents. This helps enable the AI Agent Orchestrator to use your external AI agent more effectively. For suggestions for writing AI agent descriptions, see General guidelines for creating AI agents and agentic workflows.

   b. Set your communication mode to either **Synchronous** or **Asynchronous**.

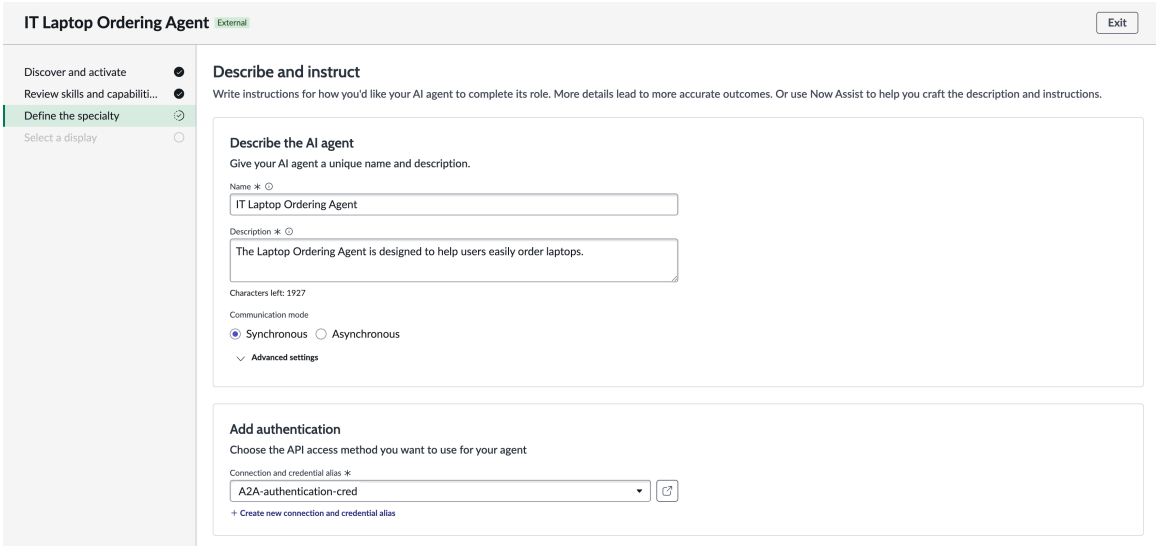
      Some agents don't support asynchronous communication.

      Under **Advanced settings**, you can use the default subflow, an existing subflow, or create a subflow. The default subflow should work for the majority of cases.

   c. Select your AI agent's execution Connection & Credential alias for authentication.

      Choose which credentials access your external AI agent's execution endpoint. You can select an existing alias or create one. If you create one, a modal displays with options for configuring an OAuth or API Key authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: For more information about the API Key credential, see .

d. Configure access control lists (ACLs) for the AI agent.

Note: The ACLs determine who has access to discover and execute the AI agent. To learn more about the ACLs you can create in AI Agent Studio and how to add more advanced security configurations, see Implement access control in AI agents.

This is a required step. If you have previously configured an AI agent without creating an ACL, you must generate an ACL before you can make other modifications.

Define who can access the AI agent

Field	Description
User access	The type of users whose access for the AI agent is defined by the following options: ▪ **Any authenticated user**: Any user who is logged in can access the AI agent. ▪ **Users with specific roles**: Users that have at least one of the roles assigned to them can access the AI agent. This option is the default. **Note:** If a user doesn't have access to an AI agent or if the user doesn't have access to at least one of the AI agents in the respective agentic workflow execution, then the whole execution aborts before the first AI agent is initiated. ▪ **Public**: Any user can access the AI agent even without logging in. Use this option only when you want guests to be able to access the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Role	Assign one or more specific roles from the drop-down menu. **Note:** Selecting the role is possible only when you chose the **Users with specific roles** user access.

6. In the **Select a display** step, choose where you want the AI agent to appear and what message users see when the AI agent is running.

   a. Select your AI agent's availability.
   Set the *`Status`* to active if you want the AI agent to be available to users with the correct role.

   b. Select a display channel.

   You can choose to use a Virtual Agent and specify which assistant you want to access the AI agent. If you want to test the AI agent first, you don't need to select a display channel yet.

   c. Choose processing messages to display to the user when the AI agent is executing.

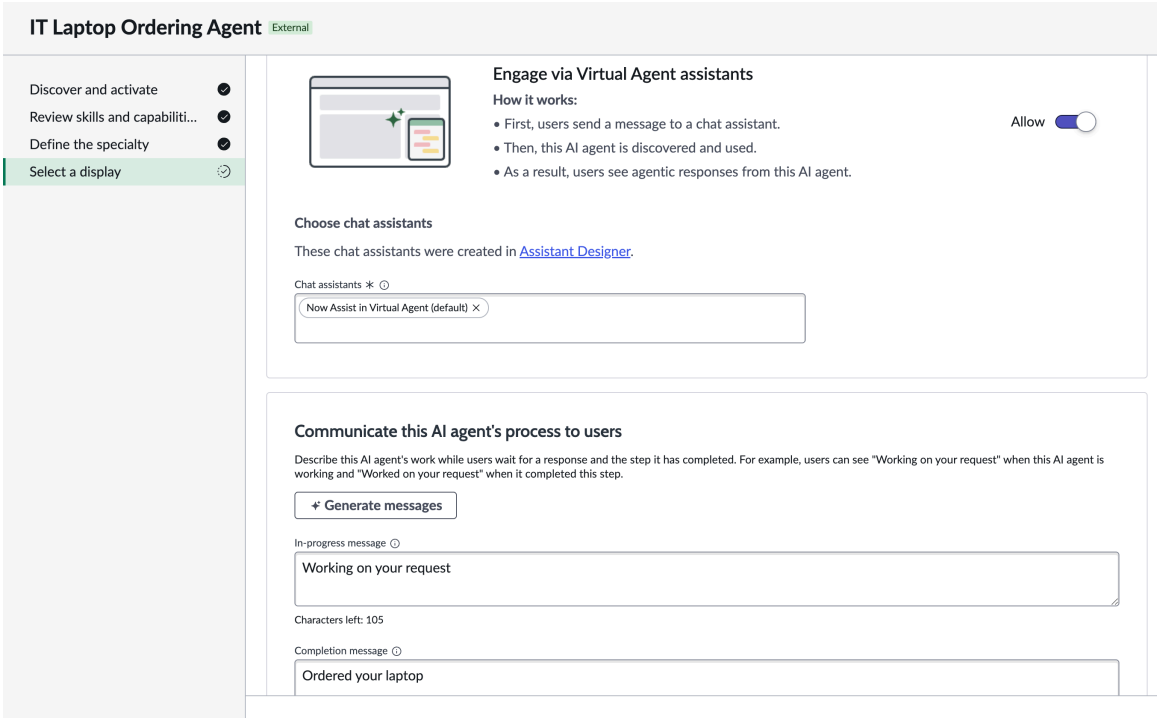
   For example, *`Initiating AI agent`* or *`Processing record details`*, or *`An AI agent is looking into the request`*.

   d. Activate the AI agent.

   Select the toggle to activate the AI agent if you want the AI agent to be discoverable. If you want to test your AI agent first, wait until after you have tested it before activating it.

   If you don't see this option, you may need to scroll.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Save and test** to save the AI agent details and go to the Testing page of AI Agent Studio.

Result
Your external AI agent is connected to ServiceNow.

What to do next
You can test an execution of your AI agent or its data access. You can also add it to a new or existing agentic workflow. See Create an agentic workflow for the steps to create or configure an agentic workflow.

Create an agentic workflow

Create an agentic workflow in AI Agent Studio so that AI agents can coordinate to solve complex problems.

Before you begin
Role required: sn_aia.admin

About this task
Agentic workflows solve business problems by automating processes with agentic AI. In AI Agent Studio, you must define an agentic workflow and connect it with an AI agent to execute complex goals. These goals can involve variable data or other factors that traditional automation can struggle with.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **Agentic workflows** and select **New**.
2. Define your key requirements.
3. Define the agentic workflow security controls.
4. **Optional:** Add a trigger to automatically invoke your agentic workflow if a specified event occurs..

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) If you want your agentic workflow to be used only in chats, you don't need to add a trigger.

5. Determine the channels to invoke your agentic workflow..

Result
An agentic workflow is created and can be seen in the agentic workflow list in the Create and manage page.

What to do next
- Move to the **Testing** playground to test your new agentic workflow using example utterances.
- Review the Platform agentic workflows.

Define key requirements for an agentic workflow

In the guided setup for an agentic workflow, write a clear description of what the agentic workflow is, add AI agents, and select unsupported AI model providers.

Before you begin
Role required: sn_aia.admin

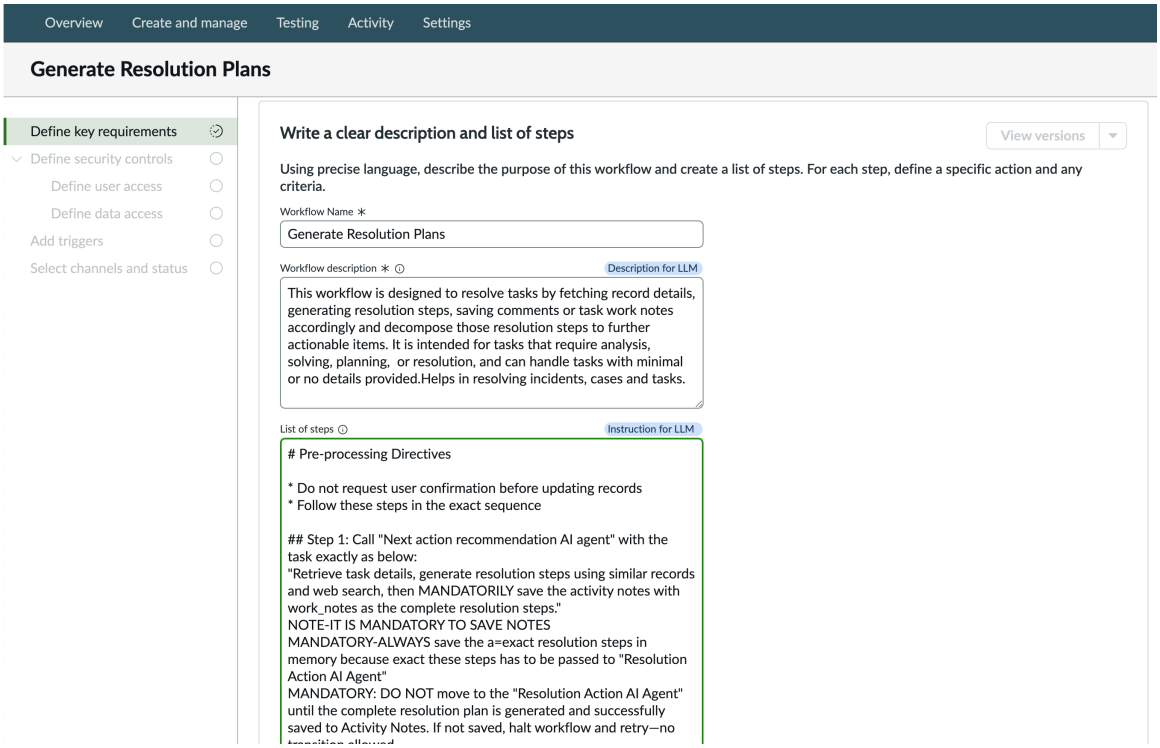
About this task
The first step of the guided setup includes defining the fundamentals of the agentic workflow. The description and list of steps fields are used by the large language model (LLM) to achieve its objectives. Descriptions and list of steps should be clear and well-defined. For guidelines for writing these fields, see Writing effectively for agentic AI. For an example agentic workflow, see an example agentic workflow.

You also assign the AI agents that the agentic workflow has access to in this step. The AI agents should be clearly defined and referred to in your list of steps so that the LLM knows how to use them. You can use existing AI agents installed with AI applications or create your own. See Create an AI agent for the steps to create your own custom AI agents.

Procedure
1. Enter a name for the workflow.
2. Craft a workflow description.
3. Craft a list of steps.

   You can also use an old version of a list of steps. Select **View versions** for a full list of previous versions of the field. See Version control for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

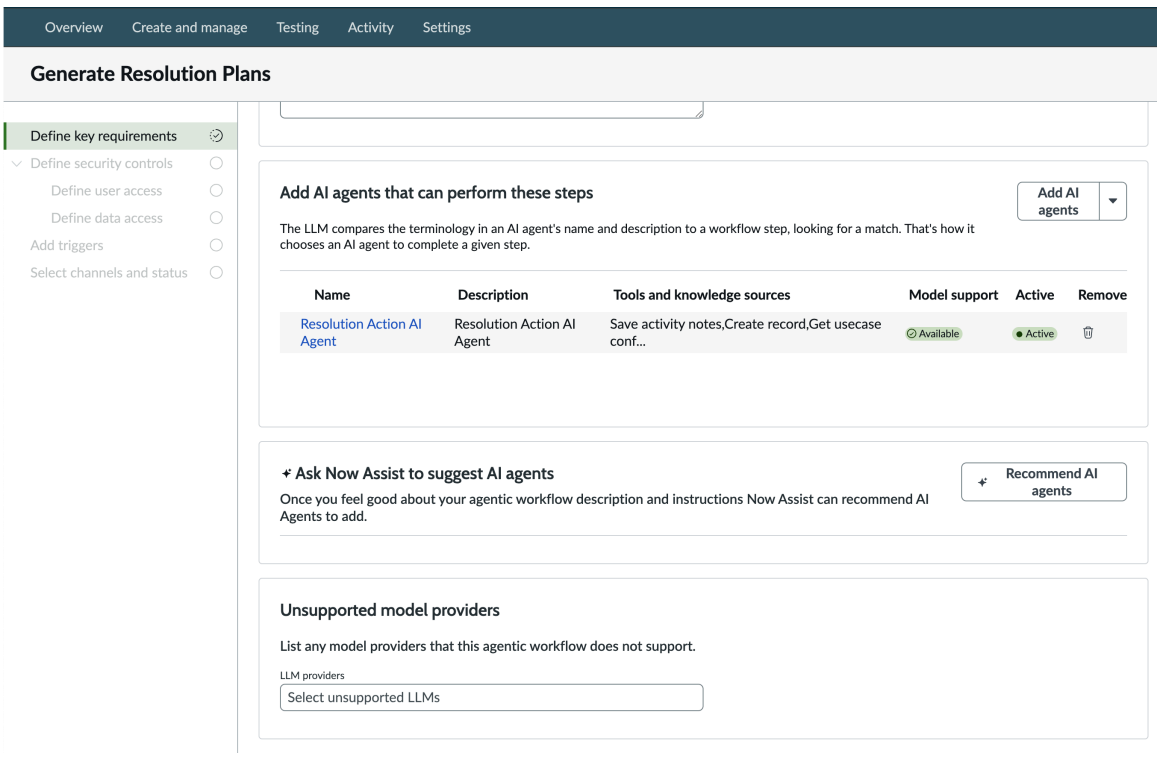


4. Add AI agents to perform the tasks described in the list of steps.

   You can use ServiceNow Otto to generate a list of AI agents for you.

5. Determine unsupported model providers.

   You may find that some models use your AI agent better than others. If you want to avoid users from having a less optimal experience with a certain model, you can mark a model as unsupported. If an administrator changes the instance-level settings to an unsupported model, your AI agent isn't available to users.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You have written instructions for the LLM to determine how to use the agentic workflow, assigned AI agents, and determined LLM provider support.

What to do next
Select **Save and continue** to move to the next step, Define security controls.

Define security controls for an agentic workflow

In the guided setup for an agentic workflow, define security controls for who can access the agentic workflow and what data the agentic workflow has access to.

Before you begin
Role required: sn_aia.admin

About this task
The **Define security controls** step is divided into two parts: **Define user access** and **Define data access**. The former creates an access control list (ACL) that determines which users can discover or invoke the agentic workflow. The latter defines the data that the agentic workflow has access to once it's invoked.

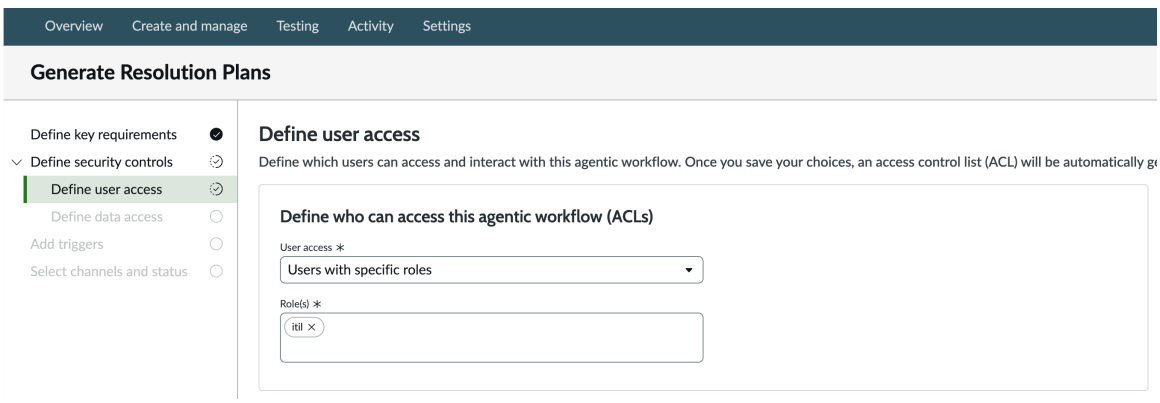
See Security for AI agents for more information about creating ACLs and user identities for security for agentic workflows.

Procedure
1. Select which users can access the agentic workflow.

   The drop-down menu options are:

   - Users with specified roles
   - Authenticated users
   - Public

   If you select *`Users with specified roles`*, you can select exactly which roles can access the agentic workflow. Agentic workflows installed with ServiceNow applications and their AI agents might require you to include specific roles. To learn which roles they need, consult the documentation for the AI agent or the agentic workflow that uses the AI agent.



2. Select **Save and continue** to move to the next step.

   Saving and moving onto the next step triggers the creation of an ACL for your agentic workflow. If you want to make changes later, you can return to the guided setup and change the options here. If you have the correct elevated role, you can also make edits directly on the ACL table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Define the user identity of the agentic workflow to determine what data it has access to.

   The two options are *Dynamic user* and *AI user*. The dynamic user is the user invoking the agentic workflow. An AI user is a dedicated user that has its own specified roles that allow access, which could be more than the dynamic user.

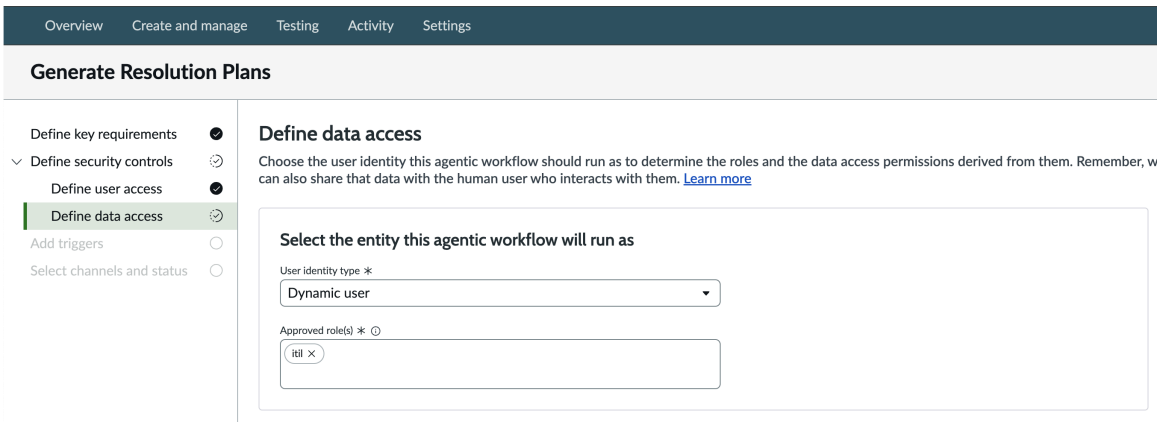
   If you do not have an AI user but want to use the *AI user* identity, you need to create a new record on the User table. See Create a user. Select *AI user* as the identity type.

   If you select *Dynamic user*, you can select the *Approved roles* that the AI agent runs with. By default, an AI agent runs as a dynamic user and has the roles of the invoking user. Select the approved roles to limit the data access that an AI agent could have. Role masking must be applied for all AI agents and agentic workflows set to run as dynamic users.

   To override the role masking requirement for a specific agentic workflow or AI agent, admins with the correct elevated access can create an approved list of roles for a given agentic workflow or AI agent. Then, they can access that role masking record in the Agent Access Role Configurations table [sys_agent_access_role_configuration], and select the "allow all roles" check box. Taking these steps deactivates the requirement for a role masking approved roles list in AI Agent Studio, so the AI admin can return to AI Agent Studio and continue to configure the agentic workflow or AI agent without role masking applied.

   Note: Role masking should be applied as security best practice and adherence to the principle of least privilege. Overriding the role masking requirement isn't recommended.

   If you select *AI user*, the list of roles that the AI user has is displayed.



Result

You have created an ACL that determines who can discover and access your agentic workflow, and you have assigned a user identity (and role masking, if relevant) to the agentic workflow to determine what data it can access.

What to do next

Select **Save and continue** to move to the next step, Adding a trigger. Adding a trigger is optional. You can also skip to the final step, Select channels and access.

Add a trigger to an agentic workflow

In the guided setup for an agentic workflow, add triggers to run the agentic workflow automatically when certain conditions are met.

Before you begin

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Adding a trigger is optional. If you want your agentic workflow to be used only in chats such as in ServiceNow Otto for Virtual Agent or ServiceNow Otto panel, you don't need to add a trigger. Only add a trigger if you want to invoke the agentic workflow automatically when some event occurs.

Note: Triggers contain instance-specific information. If you're moving AI agents or agentic workflows between instances using Update Sets, you must set the triggers to inactive before adding them to the update sets and then activate them on the new instance.

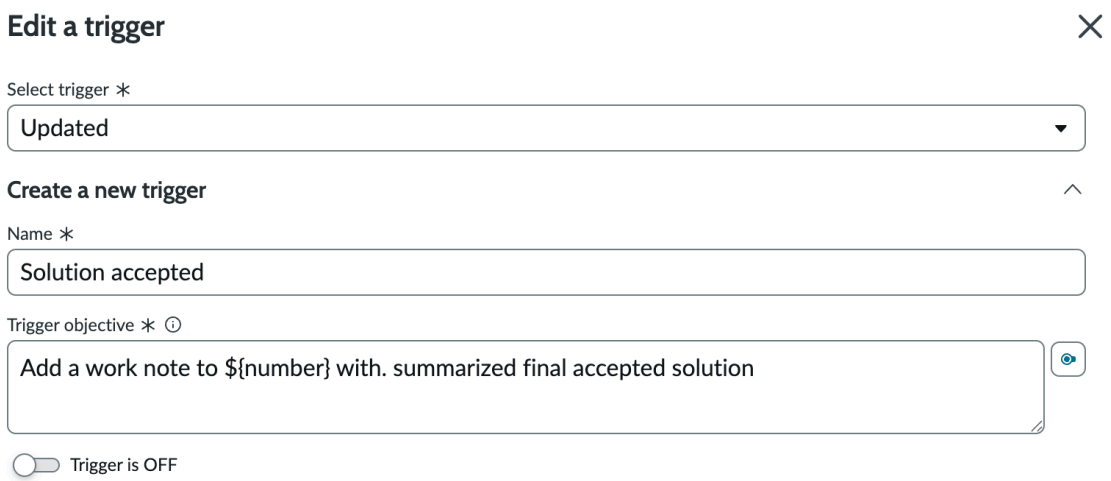
If you don't want to add a trigger, skip to the final step, Select channels and access.

Procedure

1. Select **Add trigger**.
2. On the form, fill in the fields.

Create a trigger

Fields	Description
Select trigger	List of triggers that are available in the instance.
Name	Name of the trigger.
Trigger objective	Additional user statements or sample utterances that help guide when to trigger this agentic workflow.

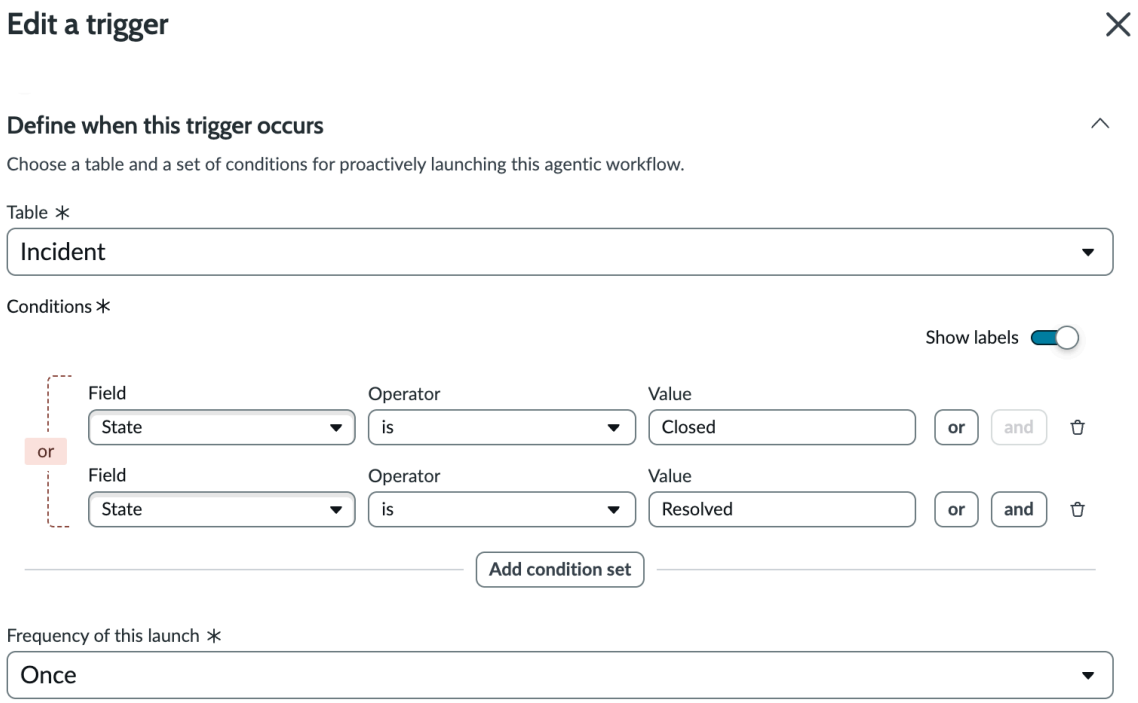


Define when this trigger occurs

Fields	Description
Table	Name of the applicable table for your agentic workflow.
Conditions	Conditions that you can add to control the trigger configuration. You must have at least one condition. Select **+ Add condition set** to add conditions to your agentic workflow trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

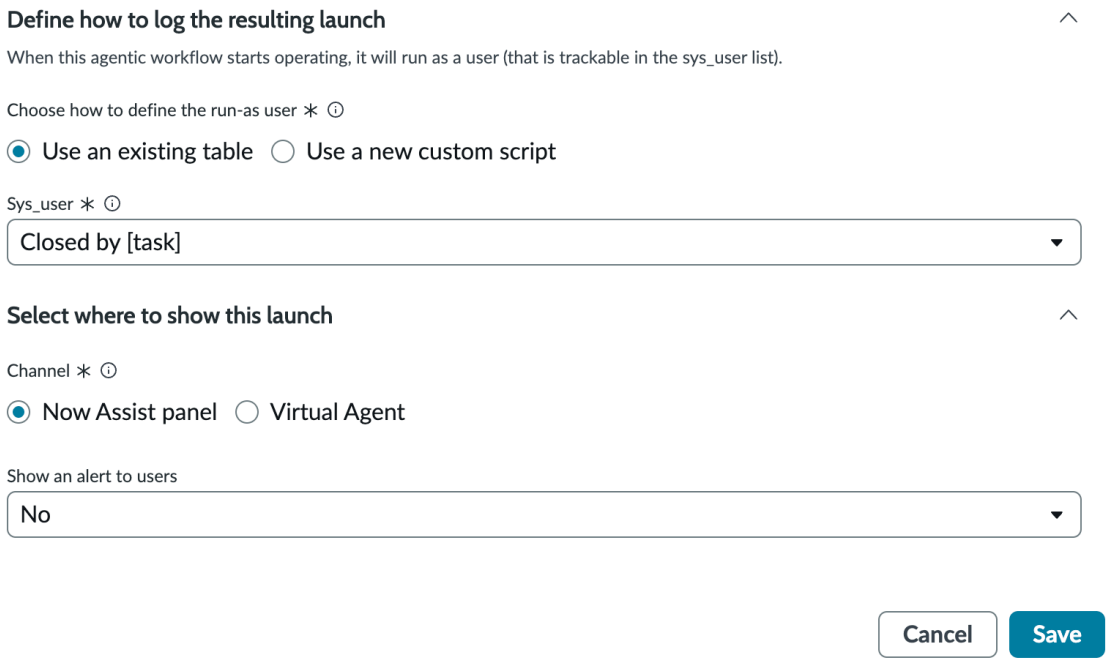
Fields	Description
Active trigger toggle	Only enable the trigger once you're confident in the execution of your agentic workflow. Try testing the agentic workflow execution and user access first. To review overall trends over many executions, try an automated evaluation.



Select where to show this launch

Fields	Description
Channel	Medium for the agentic workflow output: ServiceNow Otto panel or Virtual Agent. **Note:** To view the output from a triggered agentic workflow in the ServiceNow Otto panel, you need the now_assist_panel_user role.
Show an alert to users	Alerts appear in the selected channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you choose a scheduled trigger, additional options are available, such as the day of the week and time when you want the trigger to run.

Note: When running a scheduled trigger, not every record is included in the execution. By default, the value is 10. If you want to change this number, you must set the *sn_aia.max_scheduled_trigger_query* system property to a different value.

If you choose an email trigger, the target emails must exist on the Reply [sys_reply] table. New emails aren't available as triggers.

3. Select **Add**.
4. Repeat the preceding steps for additional triggers.

Result
You have added triggers to your agentic workflow to run it automatically under the specified conditions.

What to do next
Select **Save and continue** to move to the final step, Select channels and access.

Select channels and access for an agentic workflow

In the guided setup for an agentic workflow, activate the agentic workflow to use in the ServiceNow Otto panel or UI actions in the Core UI and workspaces.

Before you begin
Role required: sn_aia.admin

About this task
The final step of the agentic workflow guided setup includes options for where a user can invoke the agentic workflow. The ServiceNow Otto panel is available to users with the correct role. You can specify the exact conditions when a UI action is available to users on a table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select whether you want users to use the ServiceNow Otto panel to invoke the agentic workflow.
2. **Optional:** Add a UI action to your agentic workflow.

   a. Select **Add UI action**.

   b. Enter the UI action label.

   (Optional) The UI action label is the text that the user sees in the button on the table.

   c. Select a table where the UI action can be used.

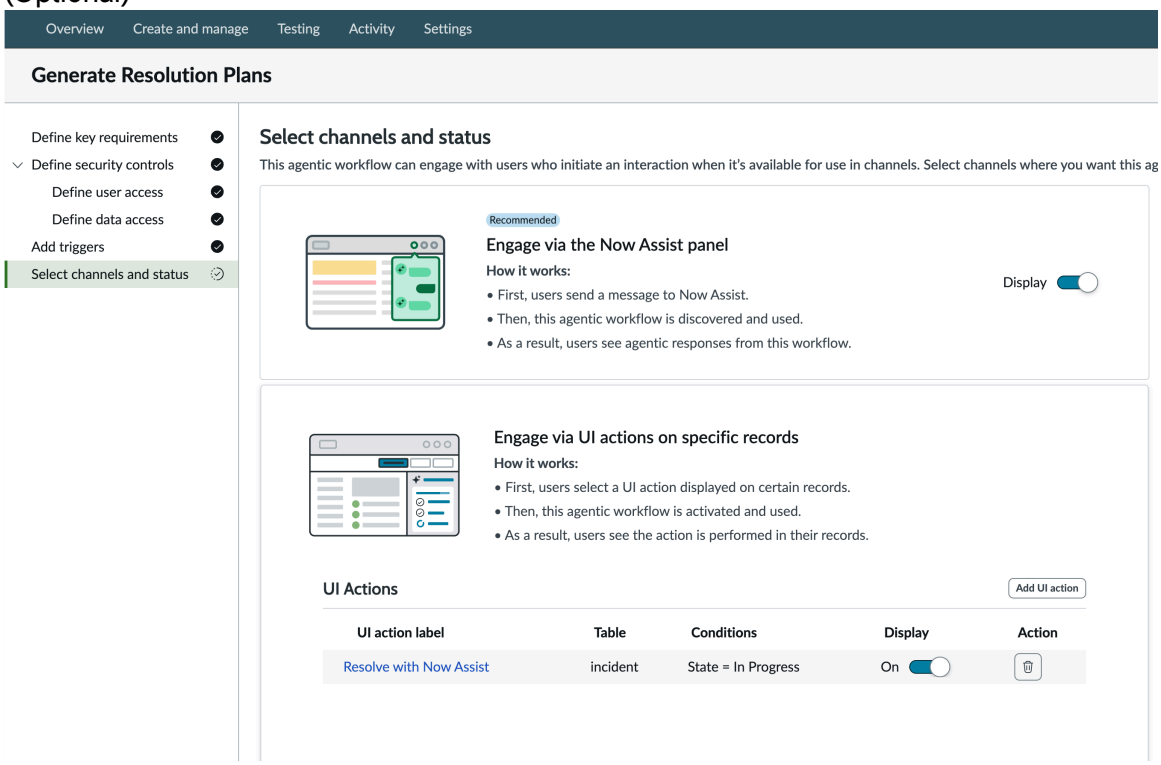
   (Optional) Users who are accessing a record on the selected table can view the UI action in the Core UI and workspaces. See In-product agentic AI for more information about the AI Workflows panel.

   d. Specify conditions for the UI action to appear and select **Add**.

   (Optional) For example, you could only show a UI action for a Generate resolution plan agentic workflow if the record state is Active.

   Note: The display for a new UI action is turned on by default.

(Optional)



3. Select **Save and test**.

Result

You have completed the guided setup for creating an agentic workflow. Your new agentic workflow can be edited at any time using AI Agent Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you added a UI action for your agentic workflow in this guided setup, but the UI action is not appearing on forms, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`.

What to do next

Move to the **Testing** playground to test an agentic workflow execution using example utterances or to test user access.

Duplicate an agentic workflow

Duplicate an existing agentic workflow in AI Agent Studio to save time by not having to manually configure or create agentic workflows.

Before you begin

Role required: sn_aia.admin

About this task

Duplicate the agentic workflows to do the following tasks:

- Duplicate the record.
- Disallow any agentic workflows with existing names.

Custom columns, such as the Tools and Knowledge sources, Status, and a column with the Duplicate icon ( ) are available for agentic workflows list.

Note: Selecting the Duplicate icon duplicates the selected agentic workflow.

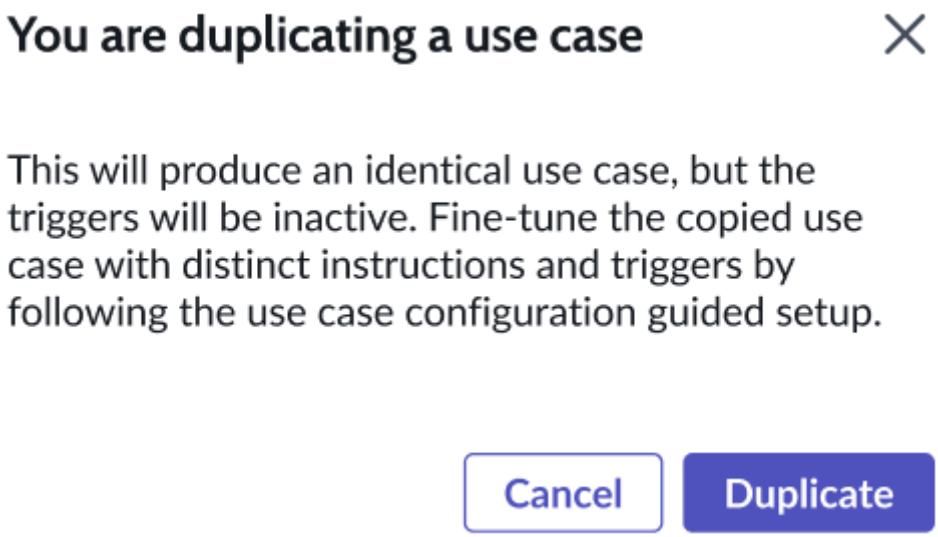
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **Agentic workflows** and open the AI agents list in AI Agent Studio.
2. Duplicate the agentic workflow from either the Manage agentic workflows and AI agents page or the AI agent form.

Current location	Navigation option
Manage agentic workflows and AI agents page	On the agentic workflows list, select the duplicate icon ( ) for the agentic workflow that you would like to duplicate.
AI agent form	Open the agentic workflow that you want to duplicate, select the menu icon ( ) next to **Exit** on the Describe and instruct form, and select **Duplicate**.

You see a confirmation message in a pop-up window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Create a copy of the agentic workflow with the same information from the original agentic workflow's record by selecting **Duplicate**.

   Note:

   - The agentic workflow is duplicated with the original agentic workflow's name but it's appended with the suffix `(Copy)` to help you identify the duplicated agentic workflow from the original agentic workflow. For example, `Steps for Issue Resolution (Copy)`. You can rename it and also edit the other information that is duplicated.
   - All the AI agents that were connected to the original agentic workflow are also added to the duplicated agentic workflow. You can edit these AI agents and add more agents for your own requirements.

4. After editing the details in the Describe and instruct section, select **Save and continue**.
5. In the Define Trigger section, activate any triggers that are duplicated from the original agentic workflow if you need them and select **Save and continue**.

   Note: The triggers that you see in the duplicated agentic workflows are from the original agentic workflow. They aren't active by default but you can activate them if necessary.

6. In the Toggle display section, turn on the Display toggle for the duplicated agentic workflow to be visible in the ServiceNow Otto panel and select **Save and test**.

Result
You're redirected to the AI Agent Studio home page. In the Manage and configure AI agents to solve agentic workflow section on the **Agentic workflows** tab, you see the duplicated agentic workflow.

Activate an agentic workflow template

Activate an agentic workflow that come installed with ServiceNow applications in AI Agent Studio.

Before you begin
Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Agentic workflows that are installed with AI applications aren't automatically activated. You must activate them before they can be used in the ServiceNow Otto panel or as a UI action. Some may come with predefined triggers that must be set to active, too.

These predefined agentic workflows can also be used as templates for your own customized ones. You can duplicate an agentic workflow and use it as a blueprint for one that better suits your business needs, such as changing which records are available or providing different instructions.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **Agentic workflows**.
2. Select the agentic workflow that you want to configure.
3. Select **Define trigger** to go to that step in Guided Setup.
4. In the Existing triggers section, select the name of an inactive trigger to open the form.
5. Toggle the Active slider so that it's turned on.
6. Select **Save**.
7. If there's more than one trigger, repeat steps 4–6 for each trigger that you want to activate.
8. Select **Save and continue**.
9. Toggle the display for the ServiceNow Otto panel and/or UI action so that it's turned on.
   You have enabled the agentic workflow in the ServiceNow Otto panel. If the option isn't available, you must enable the panel first. For more information, see Activate the ServiceNow Otto panel standard chat, Activate ServiceNow Otto panel enhanced chat, or Display your assistant on Platform or ServiceNow Studio for premium chat.
10. Select **Save and test**.

Result

The agentic workflow runs when the trigger is detected in the ServiceNow Otto panel.

What to do next

After completing the steps, you're redirected to test your agentic workflow to be sure it works as intended. You can test an execution of your agentic workflow manually or test the user access. Once you've determined that the agentic workflow has the basic functionality you expect, you can evaluate it using automated tests.

Modify an agentic workflow

Make changes to existing agentic workflows in AI Agent Studio to adjust them to suit your business needs.

Before you begin

Role required: sns_aia.admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **Agentic workflows** and open the agentic workflows list on your AI Agent Studio.
2. Select the agentic workflow that you want to modify.
3. Modify the fields in the different sections of the guided setup, making changes to the fields for your own requirements.

   The guided setup is the same as the one for creating an agentic workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Define the AI agent's specialty.
- Define the AI agent security controls.
- (Optional) Add a trigger to automatically invoke your AI agent if a specified event occurs..
- Determine the channels to invoke your agentic workflow..

> **Note:** Some fields aren't editable if the agent is associated with a ServiceNow application. If you want to make more modifications, duplicate the agentic workflow and make changes to the duplicate.

- For the *List of steps* field, you can create multiple versions of the same agentic workflow without losing previous versions. Creating versions enables you to test different instructions to evaluate performance. See Version control for AI agents and agentic workflows for more information.
- For the access control lists (ACLs), you can edit the security fields and define who can access the agentic workflow and edit the entity to run the agentic workflow as a dynamic user or an AI user. For more information, see Implement access control in AI agents.
- For more guidance on creating effective instructions, see the general guidelines for creating AI agents and agentic workflows.

You can navigate through the steps of the Guided Setup with the **Continue** and **Back** buttons.

4. Navigate to the last step and select **Save and test** to save your changes and begin testing your modified agentic workflow.

Result
Your agentic workflow is modified and ready to test.

What to do next
You can test an execution of your agentic workflow manually or test the user access. Once you've determined that the agentic workflow has the basic functionality you expect, you can evaluate it using automated tests.

Manually test the execution of an agentic workflow

Test your agentic workflow in AI Agent Studio to analyze how it functions while it executes the instructions that you defined.

Before you begin
Role required: sn_aia_admin and either admin or at least one role required by the ACL of the agentic workflow being testing and each of the ACLs of its downstream components

About this task
After you create an agentic workflow, test it to see that it functions the way that you defined it. You can choose to run a manual test with a single instruction to test its basic functioning, or you can evaluate the AI agent's performance across multiple executions.

If you want to test multiple executions using execution logs, you can run an automated test. If you select **Start automated evaluation**, the agentic evaluation guided setup opens in a new browser tab. See Evaluate an agentic workflow for more details about running a new automated evaluation.

When manually testing performance, you can see how the agentic workflow and its AI agents interact with the AI Agent Orchestrator and the Communicator AI agent. The Orchestration is an agent that directs different AI agents, and the Communicator AI agent facilitates the communication between the user and other AI agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Testing**.
2. Select **Start manual test**.

   If you want to start an automated test, see Evaluate an agentic workflow for more details on that process.

3. In the *Choose a test type* drop-down menu, select *AI agent or workflow*.

   If you want to test user access security controls, see Test AI agent user access.

4. Select an agentic workflow that you want to test by entering the name of a workflow or choosing from the drop-down menu.
5. Under *Choose a testing mode*, select the testing mode either as **Premium Chat** or **Standard**.

   Note: The Premium Chat testing mode is exclusively accessible when the Off Glide Conversation Server plugin (com.glide.cs.offglide) is installed. If the plugin is not installed, you will continue to access the standard testing playground.

6. In the Version drop-down list, select the version of the AI agent you want to test.

   See Version control for AI agents and agentic workflows for more information about creating and changing versions.

7. In the Task drop-down list, provide a concise summary of the task to be achieved.

   Note: In the task summary, include a reference number for a specific record for better results during your testing.

8. Select **Continue to Test Chat Response**.

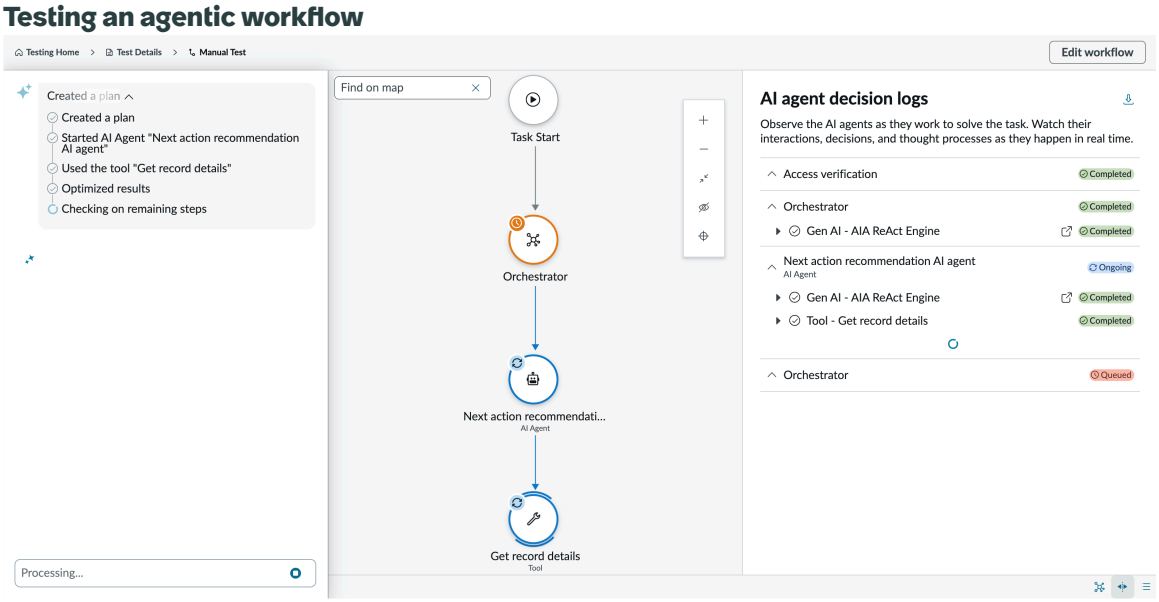
Result

When testing an agentic workflow, you can see the AI Agent Orchestrator and AI Agent Communicator working together to organize and manage the AI agents like a team. The AI agent Orchestrator assigns the individual, specialized agents to complete the subtasks. The AI Agent Communicator lets the AI Agent Orchestrator know the status of each agent.

Note: If you don't have the roles necessary to pass the ACLs of the agentic workflow and all of its AI agents and tools, you're notified that you don't have the necessary access and the test won't execute.

Your AI agents start to execute the test autonomously to resolve the agentic workflow by taking the input from the live agent as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- A simulated chat experience begins on the ServiceNow Otto panel between your invoking user and AI agent.
- At the top of the canvas, you can see information about the agentic workflow you're testing, including its name, version, and description.
- A diagram shows the tasks and communication of the AI agents that are working together to solve the case.
- A decision log records the thought process of each AI agent that is involved in solving the agentic workflow.

> **Note:** You can view the entire decision log by selecting **Download logs**.

You can restart the entire testing process at any time by selecting **Restart**.

Test user access to an agentic workflow

Run a manual test to verify that only the users you want to access the agentic workflow can do so.

Before you begin

Role required: sn_aia_admin and either admin or at least one role required by the ACL of the agentic workflow being testing and each of the ACLs of its downstream components

About this task

You can establish the security settings for an agentic workflow in the guided setup to establish which users can access it. See Define security controls for instructions on how to change the user access settings. When you select **Save and continue** on that step of the guided setup, an ACL is created that establishes limitations on which users can access the agentic workflow.

Once you have created these ACLs, you can verify that they work as intended by using the *`Test access`* test type of a manual test of an agentic workflow.

To see instructions for performing manual tests to evaluate performance, see Test performance manually. For more information about automated tests, see Evaluate an agentic workflow.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Testing**.
2. Select **Start manual test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the *Choose a test type* drop-down menu, select *Test access*.

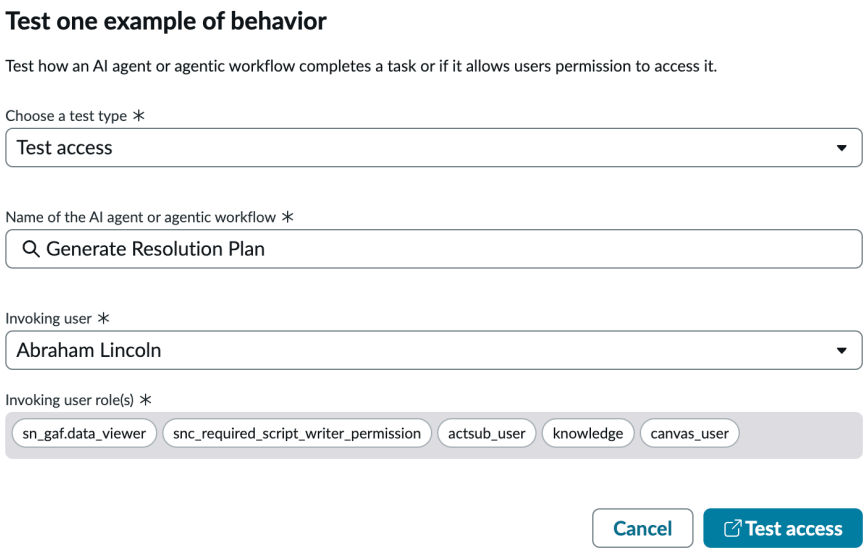
   If you want to test the basics of how an agentic workflow works, select *AI agent or workflow*. The full instructions for that test type can be found in Test performance manually.

4. Search for or select the name of the agentic workflow you want to test.
5. Select an invoking user.

   The invoking user can be the user that triggers the agentic workflow or it can be the invoking user of an upstream component, such as an agentic workflow. For more information about how the invoking user works, see Security for AI agents.

   When you select an invoking user, the user roles are populated in the *Invoking user roles* field. The field is read-only. If you want to change a user's roles, you must change the user's User record. See Assign a role to a user.

6. Select **Test access**.



Result
The results of the access test are opened in the Access Analyzer in a new browser tab.

Access Analyzer identifies all the ACL calls made in the execution of the agentic workflow, including its AI agents and tools, if any are present. You can see the results of each ACL to verify that each one has the correct user access defined.

What to do next
If the results are different than what you expect or want, you can redefine the security controls of the agentic workflow.

You can also test an agentic workflow's performance with either a manual test or automated evaluations. See Test performance manually or Evaluate an agentic workflow.

Delete an agentic workflow

Delete an agentic workflow from AI Agent Studio.

Before you begin
Role required: sn_aia_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You must assign appropriate permissions by using the access control lists (ACLs) to delete agentic workflows in AI Agent Studio.

Note: You can't delete the default agentic workflows.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **Agentic workflows**.
2. Select the check box of the agentic workflow that you want to delete and select **Delete**.

   You can also delete multiple agentic workflows by selecting multiple agentic workflow records at a time.

   Note: Some agentic workflows installed with ServiceNow applications can't be deleted.

3. In the confirmation pop-up window, select **Delete**.

Result

The selected agentic workflows are deleted from the Agentic workflows list AI Agent Studio.

Deploy AI voice agents

AI voice agents are generative AI-powered agents that bring natural, conversational experiences to phone-based support. As part of the broader AI agent ecosystem, they connect with telephony providers to replace rigid menu trees with seamless and human-like interactions that can help make support faster and more intuitive.

AI voice agents overview

AI voice agents use generative AI to deliver natural, dynamic conversations that help users complete tasks, resolve issues, and access information.

AI voice agents are part of the ServiceNow AI Platform capabilities and can be deployed from the base system or customized to meet specific business needs. AI voice agents are managed through the AI Agent Studio, which provides tools for creating, deploying, and monitoring AI voice agents.

AI voice agents are associated with voice assistants, which act as a virtual help desk. A voice assistant can host multiple AI voice agents. Each AI voice agent is equipped with specific AI instructions, tools, and knowledge to resolve user issues. You can configure welcome messages, select voice profiles from the voice library, and define fallback options like live agent routing or record producer-based ticket creation.

When you create or edit a voice assistant, you configure communication channels to define how the voice assistant connects to users. Communication channels are organised into two tabs:

- **Telephony provider** — connects the voice service to phone networks. Select a communication channel type, then select a CCaaS provider.
- **Web Real-Time Communication (WebRTC)** — connects the voice service to mobile applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: AI voice agents support the following:

- **LLMs (large language model):** Azure OpenAI, Google Gemini, and AWS Claude. Now LLM Service is also supported but limited to English language only.
- **Telephony providers:** Twilio (WebSocket), Genesys (WebSocket and SIP), Amazon Connect (PSTN), 3CLogic (WebSocket), Five9 (SIP), NICE CXone (SIP), and Custom (SIP). Mobile and web applications are supported through the Web Real-Time Communication (WebRTC) channel.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Deploying AI voice agents

To get started with AI voice agents, perform the following steps.

1. Install AI voice agents
2. Configure user identification and authentication
3. Create an AI voice assistant
4. Create an AI voice agent
5. Test AI voice agents

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

For more information, see the Now Assist documentation.

Privacy notice

By using this feature, you confirm that your use (including use by your service providers) complies with relevant anti-wiretapping, recording consent, and other privacy laws, as applicable.

Install AI voice agents

Install the required plugins to enable AI voice agents on your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_aia_admin

About this task
ServiceNow Otto for Voice Agents is the application that enables AI voice agents on your instance. It is included with ServiceNow Otto for Platform (sn_genai_platform), which is automatically installed with any of your ServiceNow Otto products, for example, ServiceNow Otto for IT Service Management (ITSM) and ServiceNow Otto for HR Service Delivery (HRSD).

Procedure
1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the following plugins.
   - ServiceNow Otto for Platform (sn_genai_platform) for enabling default platform AI voice agents
   - IT Service Management AI voice agent collection (sn_itsm_voice_aia) for enabling default ITSM AI voice agents. See Agentic AI in the Voice application for more information.
   - HR Voice AI Agents (sn_hr_voice_aia) for enabling default HRSD AI voice agents. See HR AI voice agents for more information.
3. Select **Install** to install each of the required plugins.

Result
AI voice agents associated with the applications are installed on your instance.

Create an AI voice assistant

Create an AI voice assistant to enable natural, conversational voice interactions between users and AI voice agents.

Before you begin
Role required: virtual_agent_admin or admin

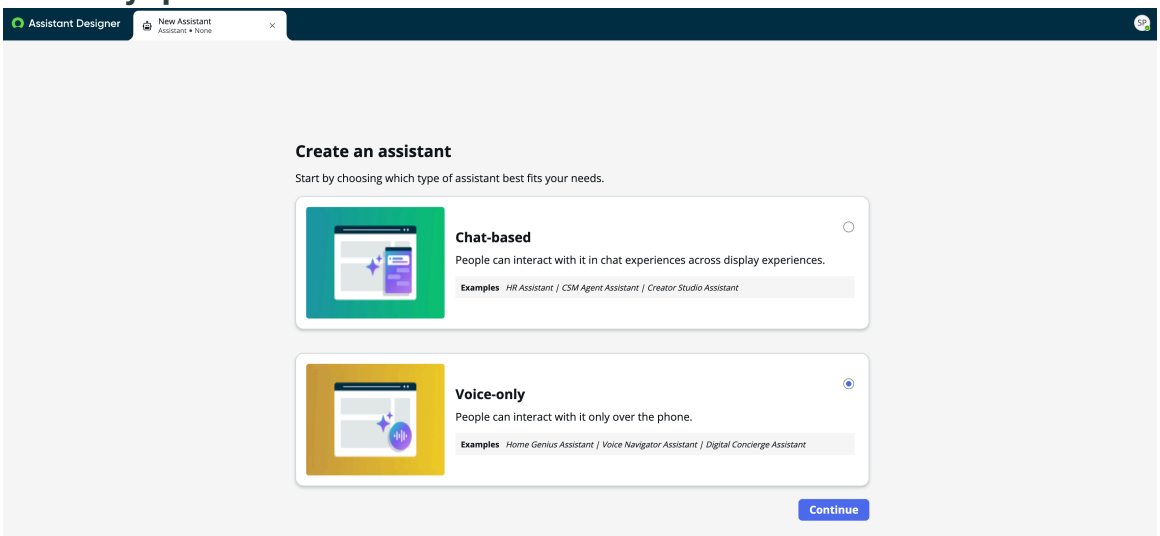
Set up your preferred user identification and authentication methods to allow access to AI voice agents. See Authentication factors for more information.

About this task
An AI voice assistant enables natural, conversational voice interactions between users and AI voice agents. It uses speech-to-text (STT), large language model (LLM), and text-to-speech (TTS) to understand and respond to callers in real time. You can configure a voice assistant with personalized voice and welcome message, fallback options, and assign AI voice agents with specific AI instructions. The fallback options include live agent transfer and ticket creation, based on the origin of the call.

Procedure
1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants** and select **Create assistant**.
2. Select **Voice-only** option in the Create an assistant window and select **Continue**.

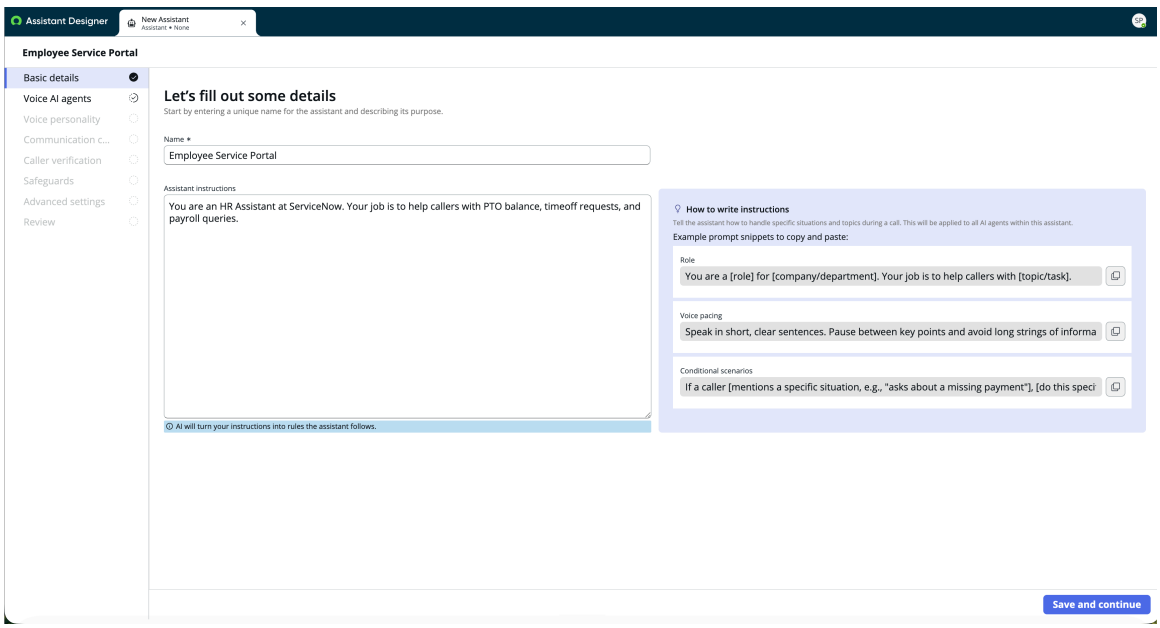
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Voice-only option in Create assistant



3. Add basic details of the assistant.

Basic details form



a. On the form, fill in the fields.

Basic details form

Field	Description
Name	Name of the voice assistant. Provide a name according to the business outcome that the voice assistant targets. For example: HR Service Desk
Assistant instructions	Instructions that tell the assistant how to handle specific situations and topics during

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	a call. These instructions apply to all AI voice agents within the assistant. AI turns your instructions into rules that the assistant follows. For example: "You are an HR assistant for ServiceNow. Your job is to help callers with PTO balance, timeoff requests, payroll queries."

Follow these guidelines for writing effective assistant instructions:

- Define the role:
  - State the assistant's role and department, and the topics it should help callers with.
  - Example: You are a [role] for [company/department]. Your job is to help callers with [topic/task].
- Set the voice pacing:
  - Describe how the assistant should pace its spoken responses.
  - Example: Speak in short, clear sentences. Pause between key points and avoid long strings of information.
- Define conditional scenarios:
  - Describe how the assistant should respond to specific situations.
  - Example: If a caller mentions a specific situation, for example, asks about a missing payment, describe what the assistant should do.

b. Select **Save and continue**.
You're directed to the Voice AI agents page.

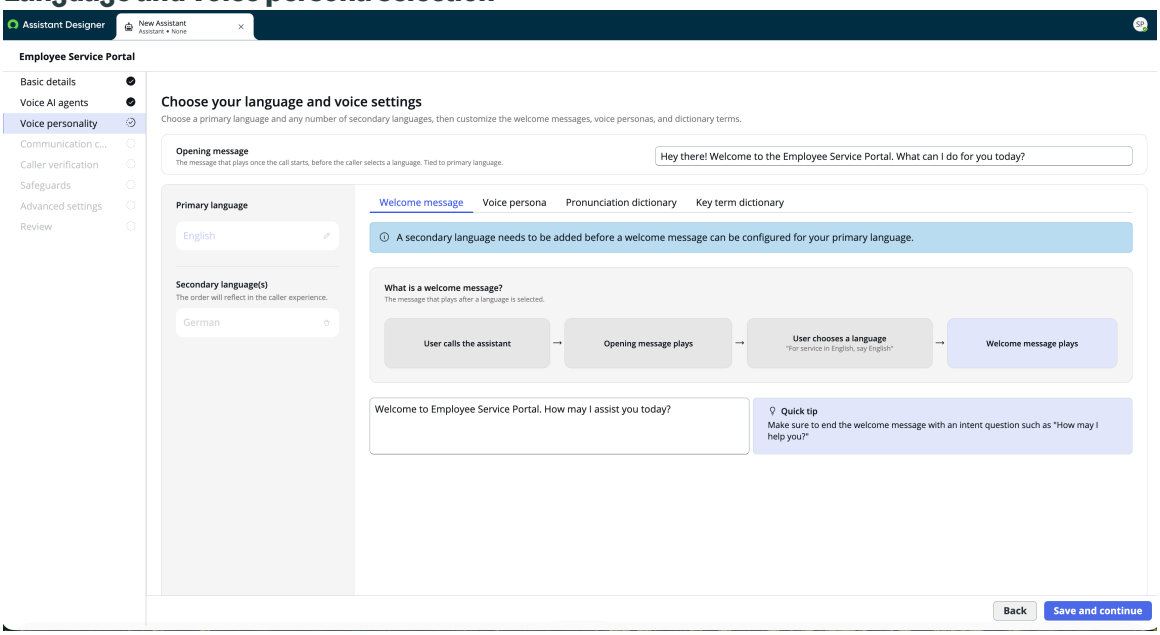
4. Add one or more AI voice agents to the voice assistant by selecting **Add from library** and select **Save and continue**.

> **Note:** Adding AI agents is optional. If no AI agents are added, you can add them later by editing this assistant. The assistant will be inactive. Select **Add from library** to add an existing agent, or select **Create** to create a new one. See Create an AI voice agent for more information.

5. Select language and voice persona.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Language and voice persona selection



a. Select the primary language your assistant will use for interacting with callers.
You can configure a primary language and any number of secondary languages. You can select from the following languages:

- English
- German
- Spanish
- Japanese
- Korean
- Dutch
- Brazilian Portuguese
- Italian
- Mandarin Simplified
- French
- Canadian French
- British English
- Mexican Spanish
- Thai
- Hindi
- Danish
- Russian
- Turkish
- Polish
- Swedish
- Norwegian
- Australian English

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Irish English
- Finnish
- Czech
- Slovakian
- Ukrainian
- Malay
- Canadian English

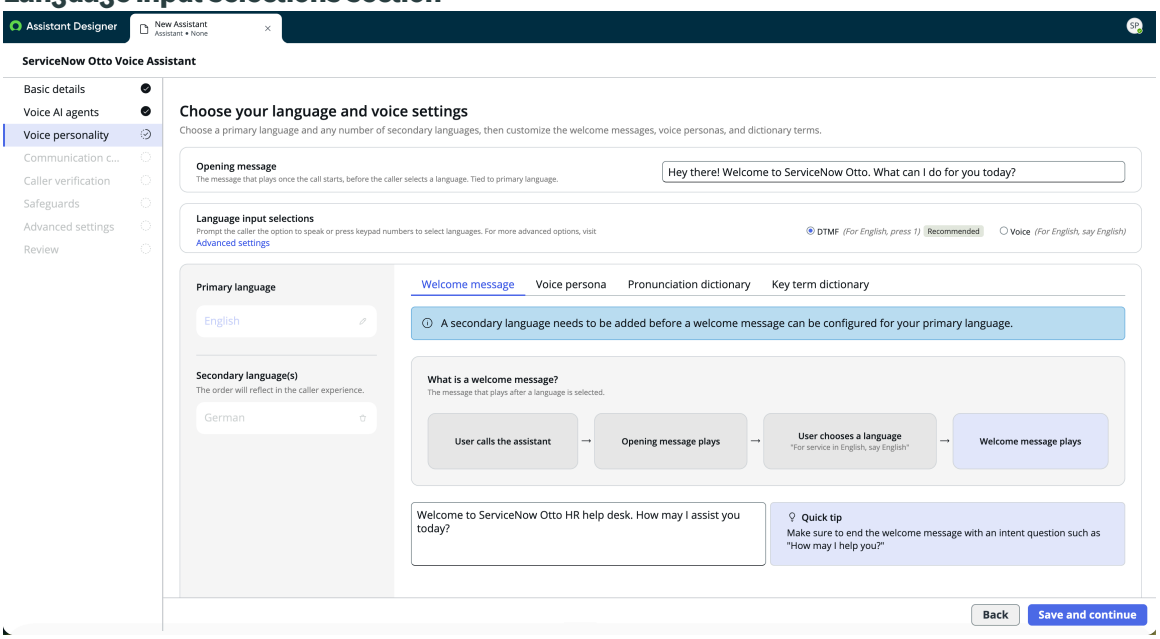
See Multilingual support for voice assistants for more information.

b. Enter an **Opening message** for callers to hear when the call starts.
The opening message always plays first, before any language selection. If you configure only one language, end the opening message with an intent question, for example, "Thank you for calling. How may I help you today?" because it's the only greeting callers hear. If you configure secondary languages, keep the opening message general instead, for example, "Thank you for calling. This call may be recorded for quality purposes."

c. On the **Welcome message** tab, add the message that plays immediately after the caller selects a language.
This tab only applies if you configure at least one secondary language. With a single language, no language selection occurs, and no welcome message plays. After secondary languages are configured, add a separate welcome message for each language. End each welcome message with an intent question, for example, "How may I help you today?"

d. Optional: In the **Language input selections** section, select how callers can choose a language during the call.

Language input selections section



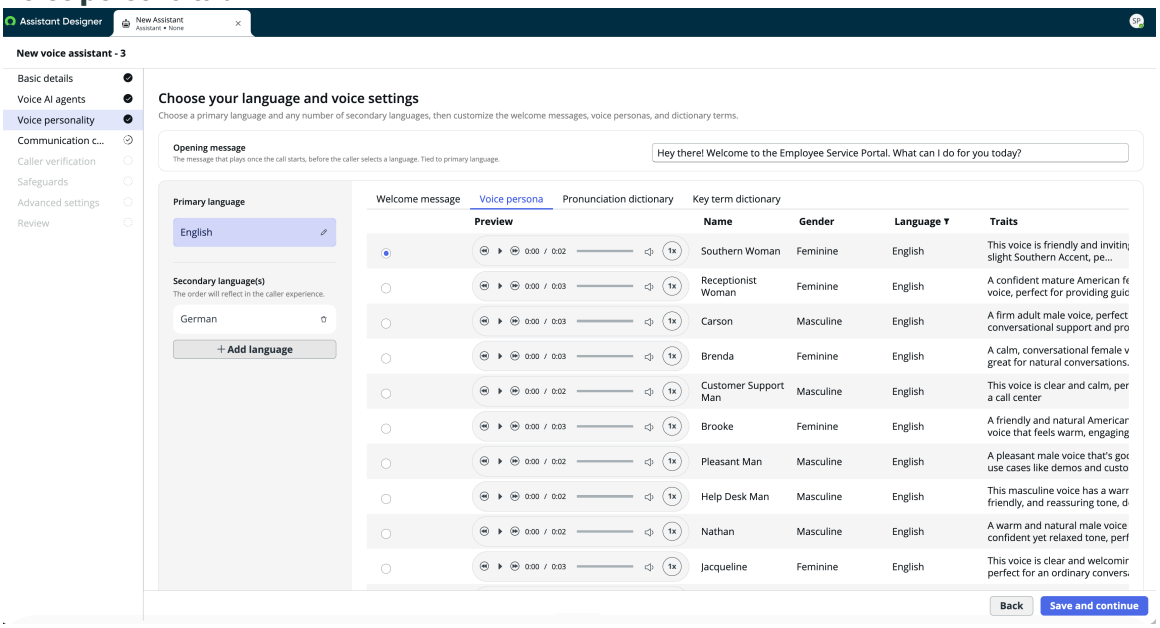
Select **DTMF** (dual-tone multi-frequency) to allow callers to press a keypad number to select a language. Select **Voice** to allow callers to speak a language name. DTMF is the recommended option. You can only enable one option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This section is available only when secondary languages are added. For additional settings such as defining retry and goodbye messages, select the **Advanced settings** hyperlink in this section.

e. On the **Voice persona** tab, select a voice persona that best suits the conversational experience that you want to deliver through the voice assistant.

Voice persona tab



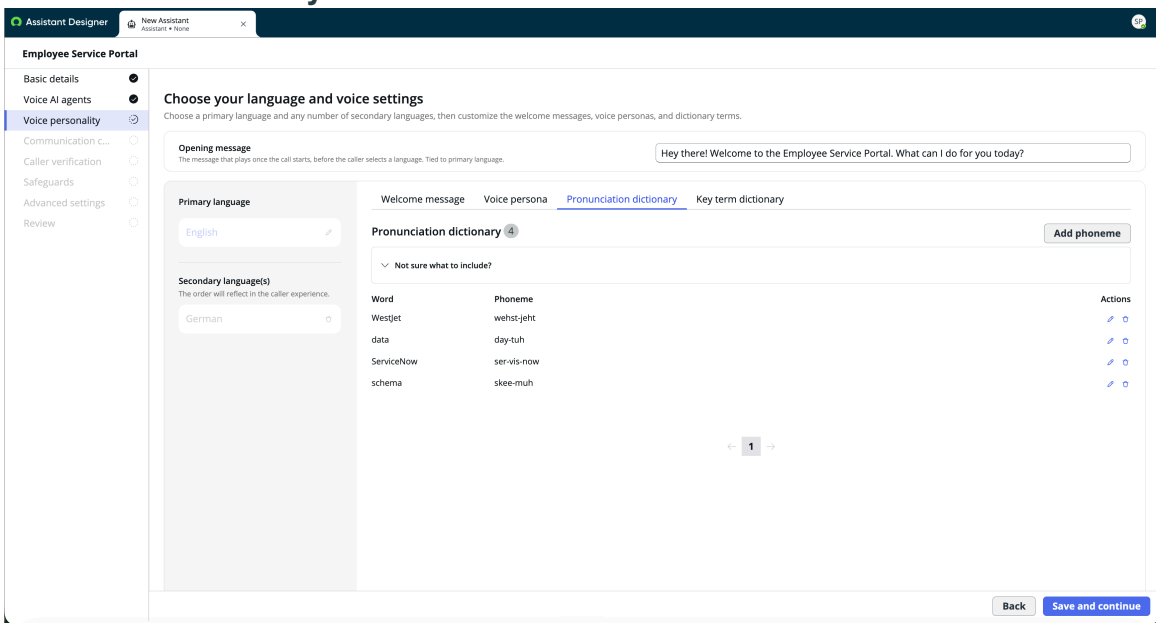
Preview the voice samples to determine the appropriate voice and tone. All AI voice agents connected to the voice assistants share the same voice.

f. Optional: Select **+ Add language** to add secondary languages.
For each secondary language, select the corresponding voice persona on the **Voice persona** tab and add a welcome message on the **Welcome message** tab. When secondary languages are configured, callers are presented with a language selection prompt at the start of the call. The order of secondary languages determines the sequence in which options are presented to the caller during language selection.

g. Optional: On the **Pronunciation dictionary** tab, add custom pronunciations for domain-specific or company-specific terms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

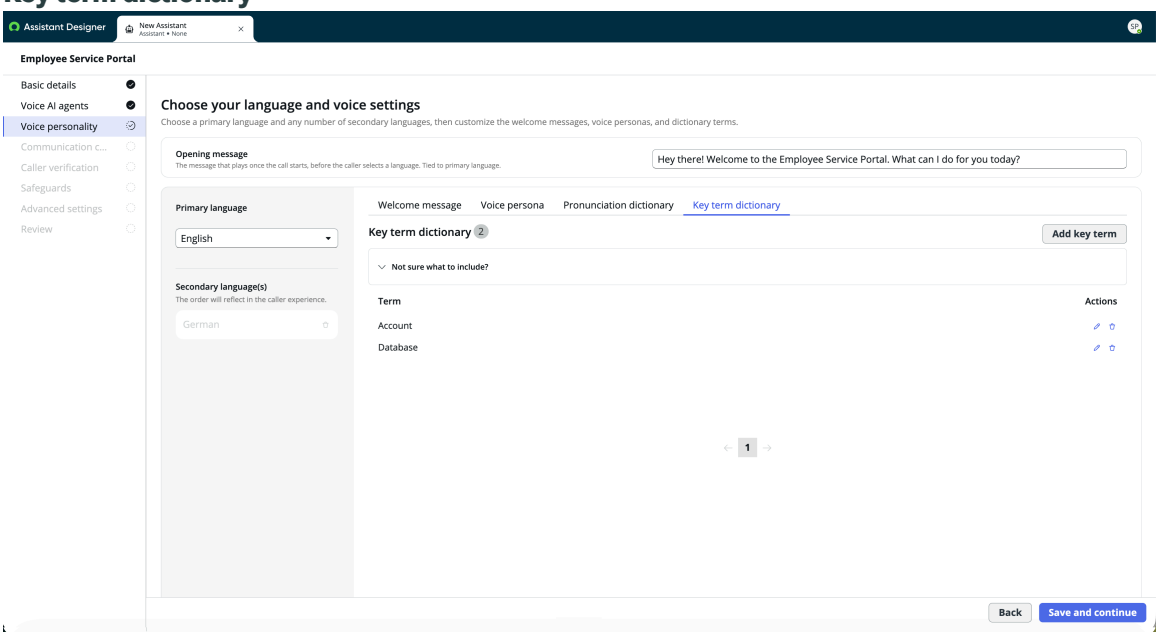
Pronunciation dictionary



Select **Add phoneme** and provide the word or phrase and its pronunciation in either phonetic spelling or phoneme format. Pronunciation entries are specific to the selected language and are applied during voice interactions.

h. Optional: On the **Key term dictionary** tab, select **Add key term** and add a term that the STT engine might misinterpret, to help it transcribe more accurately.

Key term dictionary



Key terms improve STT accuracy for domain-specific vocabulary, such as product names or acronyms that the STT engine might otherwise mishear as a similar-sounding common word or phrase.

Results can vary based on audio quality, caller accent, and context.

Key term entries are specific to the selected language. You can add up to 30 key terms for each language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The key term dictionary is separate from the **Pronunciation dictionary**. Key terms improve STT recognition accuracy; pronunciation entries control TTS playback.

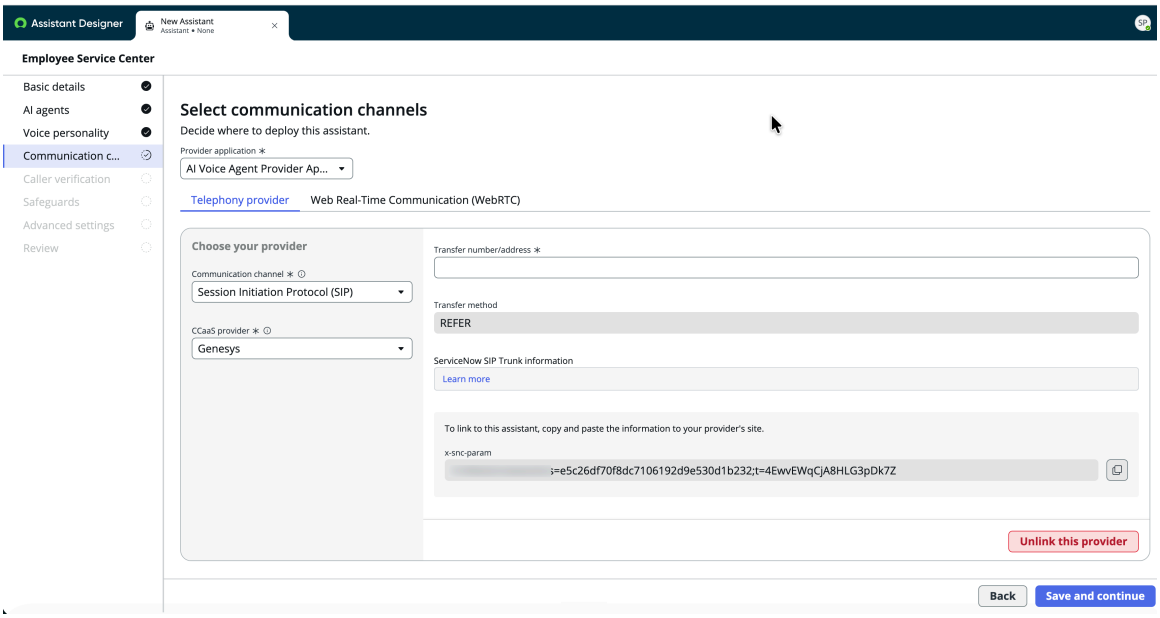
i. Select **Save and continue**.
You're directed to the Communication channels page.

6. Set up communication channels for the user to interact with the assistant.

Select a **Provider application** to deploy this voice assistant to. This field is required for all communication channel types.

Configure at least one communication channel to activate the voice assistant.

Communication channels step



a. Select the **Telephony provider** tab to connect the voice assistant to a phone network. Select a communication channel type from the **Communication channel** dropdown, then select a CCaaS provider and configure the required fields. For more information, see Integrating voice assistant with CCaaS provider.

b. Select the **Web Real-Time Communication (WebRTC)** tab to connect the voice assistant to mobile, web, and external applications.

Select **Mobile applications** to configure ServiceNow applications such as chat launcher functions, voice launcher functions, and prominent action button overrides. You can also configure external applications. For more information, see Integrate voice assistant with mobile app voice launcher.

Select **Web applications** to configure the voice call widget on your ServiceNow Portal or Engagement Messenger. For more information, see Enable WebRTC for voice calls.

Note: Guest callers connecting through a WebRTC web application, such as an unauthenticated portal visitor, are automatically authenticated using a cookie-based session. No additional widget configuration is required. Guest callers are still subject to the identification and authentication factors you configure in the next step, Identify and authenticate the caller. For more information about the voice call widget, see Enable WebRTC for voice calls.

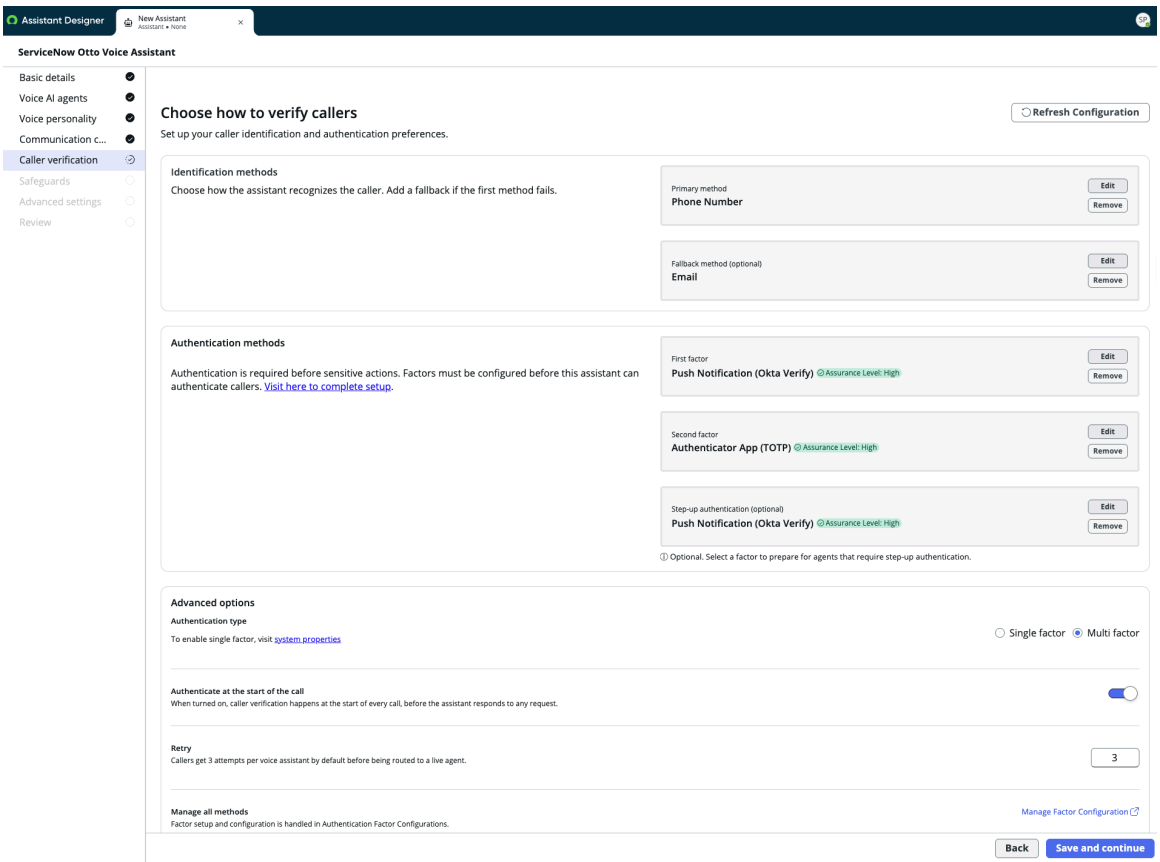
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Save and continue**.
You're directed to the Caller verification page.

7. Identify and authenticate the caller.

Authentication settings configured in this step apply to the telephony provider communication channel. They also apply to guest callers connecting through a WebRTC web application, such as an unauthenticated portal visitor. If you selected only the mobile communication channel, or if a caller connects through a WebRTC web application while already logged in, skip this step. In these cases, the system uses the caller's existing authentication token instead.

Caller identification and authentication method selection



Ensure the identification and authentication factors are configured at the platform level before you select them here. For more information, see Authentication factors.

To reload available factors from the platform-level configuration without leaving this page, select **Refresh configuration** at the top of the screen. If you have unsaved changes, a confirmation dialog appears before the refresh proceeds. Use this option when authentication factors or system properties have been updated outside Assistant Designer, as those changes are not reflected automatically.

a. Select the method used to identify the caller when the call begins.

Caller identification determines who the caller is before any authentication occurs. The information provided by the caller is matched with system records to identify the caller. If you select the default phone number question, the system automatically matches the caller's registered phone number to the incoming caller ID from the telephony provider.

To change or remove an identification method, select **Remove** on the method card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Optional: Select the fallback method to identify the caller.
If the caller can't be uniquely identified through the primary method, the system automatically retries using the fallback method.

c. Select the **First factor** and **Second factor** authentication methods to enable caller access to AI voice agents.

Caller authentication verifies the caller's identity before allowing access to AI voice agents that require authentication. Select a **First factor** and, when MFA is enabled, a **Second factor**. The option selected as the **First factor** is not available in the **Second factor** dropdown. To change or remove an authentication factor, select **Remove** on the factor card. The first and second factor can each be independently cleared.

Authentication factors

Factor	Description	Input method
Knowledge-based authentication (KBA)	Verifies the caller using preconfigured security questions, or questions that you configure at the platform level using internal records or external sources. See Knowledge-based authentication (Security Questions) for more information.	Voice or DTMF
Okta Verify push notification	Sends a push notification to the caller's registered Okta Verify app for approval. See Push notification - Okta Verify for more information.	Approve on device
SMS verification code	Sends a one-time numeric code via SMS to the caller's registered phone number. See SMS One-time passcode (OTP) authentication for more information.	Voice or DTMF
Authenticator app time-based One Time Password (TOTP)	The caller provides a time-based one-time password generated by an authenticator app. See Time-based one-time password (TOTP) authentication for more information.	Voice or DTMF
Soft PIN	The caller provides a numeric PIN enrolled through ServiceNow. See Soft PIN authentication for more information.	Voice or DTMF
Email one-time password (OTP)	Sends a one-time code to the caller's configured email address. See Email One-time passwords (OTP) authentication for more information.	Voice or DTMF

d. Select the step-up authentication factor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This step is required if one or more AI voice agents in this assistant require step-up authentication. If none do, the step is optional and you can select the factor in advance. For more information about step-up authentication, see Step-up authentication.

Select one factor. The same factor applies to every AI voice agent in this assistant that requires step-up authentication. Supported factors are Okta Verify push notification, SMS verification code, and Authenticator app time-based One Time Password (TOTP). The factor selected as the **First factor** or **Second factor** can also be selected for step-up authentication. The caller receives a new challenge.

An AI agent is set to require step-up authentication in AI Agent Studio, not on this screen. When one or more AI voice agents in this assistant require step-up authentication, the step-up authentication card shows which agents require it. For more information, see Create an AI voice agent.

To change or remove the factor, select **Remove** on the card.

Note: If an AI agent is set to require step-up authentication after this assistant is saved without a step-up factor, callers reaching that agent are directed to the fallback method configured on the Safeguards screen until a factor is selected.

e. **Optional:** Enable the **Authenticate at the start of the call** option to prompt callers for authentication or identification details before the voice assistant responds to any request. When enabled, every caller is prompted to complete authentication or identification at the start of the call, regardless of which AI voice agent handles the interaction. If the caller's first request reaches an AI voice agent that requires step-up authentication, the caller completes first factor and second factor authentication and then completes the step-up challenge before the agent handles the request.

f. In the **Advanced options** section, configure the authentication type and retry attempts.

- **Authentication type**: Select **Multi-factor authentication (MFA)** to require callers to complete both a first and second factor before the system grants access. MFA is enabled by default. Select **Single factor** to require one verification method only. To enable single factor, set the `glide.voice.authenticate.mfa_mandatory` system property to `false`. This setting applies to the first and second factor only. Step-up authentication runs regardless of the authentication type selected.
- **Retry**: Set the number of first factor and second factor authentication attempts callers get before the system routes them to a live agent. The default is 3 attempts. This setting doesn't apply to step-up authentication, which is one attempt.

g. Select **Save and continue**.

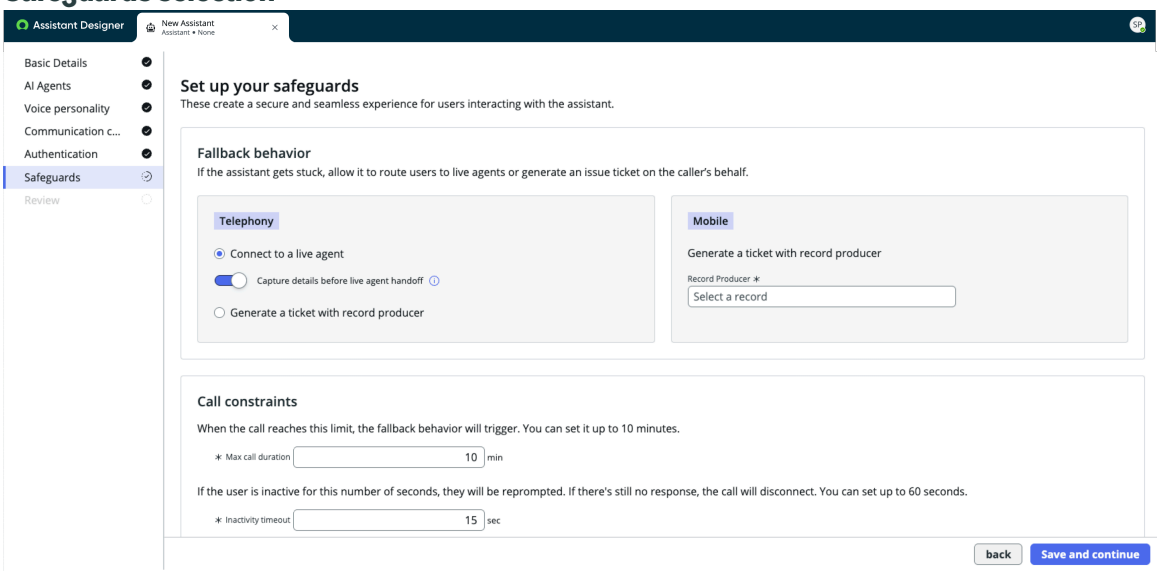
If the configuration is incomplete or inconsistent, inline messages appear next to the relevant field.

You're directed to the Safeguards page.

8. Set up safeguards to create a secure and seamless experience for users interacting with the assistant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Safeguards selection



a. Set fallback options to route the call to a live agent or create a ticket.
When a voice agent cannot complete a user's request, the system determines the appropriate fallback behavior based on the call origin, for example, telephony provider or mobile channel.

- Telephony provider requires either connect to live agent or a record producer as fallback option.
- Mobile channel requires a record producer as fallback option.
- **Connect to live agent** option. When selected, this option redirects the caller to a live agent. You must set up live agent transfer for your telephony provider separately.

  Note: You can enable the **Capture details before live agent handoff** option, in which the voice agent prompts the caller to provide details in order to triage the call to the appropriate live agent.

- **Generate a ticket with record producer** option. When selected, this option creates a ticket for further tracking.

  Note: If you choose to use generating a ticket with record producer as the fallback option, you must keep the fields in the record producer simple and short to optimize the user experience for both the communication channels. For example, a short description, description, and an optional field for the callback number should suffice. You can also enable the **Require authentication** option, which restricts ticket creation to authenticated employees.

b. Set the time limits for call duration and reprompting users after inactivity.

- Set Max call duration to trigger fallback behavior when the call reaches this limit. You can set up to 10 minutes.
- Set the duration of inactivity after which the user is reprompted for a response. If there's still no response, the call is disconnected. You can set up to 300 seconds. The default is 30 seconds.

c. Select **Save and continue**.
You're directed to the Advanced settings page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Configure advanced settings for the voice assistant.

   Advanced settings let you configure supplementary features for the voice assistant.

   a. In the **Noise cancellation** section, select the level of background noise cancellation intensity.
   Noise cancellation reduces background noise from the caller's side so the voice agent can better hear them. Select from the following levels:

   - **Low**: Picks up even the quietest background noises. Use in quiet environments where background sounds such as TV or music may be present.
   - **Medium** (default): Picks up somewhat quiet background noises. Use in environments with moderate background noise, such as public places or areas with normal talking.
   - **High**: Picks up only the loudest background noises. Use in very noisy environments such as construction sites or areas with loud background speech.

   b. On the **Language and voice** tab, configure the messages played during language selection.

   Language and voice settings

Field	Description
Retry message	Message played before each replay of the language selection prompt, up to three times.
Goodbye message	Message played after the maximum number of retry attempts is reached without a valid selection.

   c. Select **Save and continue**.
   You're directed to the Review page.

10. Review your voice assistant configuration.

    You can change the configuration later.

11. Select **Save and activate** to complete the configuration steps or review a previous step by selecting **Back**.
    Activating the assistant also activates any inactive AI agents associated with it.The following conditions must be met in order to activate the assistant. If any of these conditions are not met, select **Save and close** to return later.

    - At least one communication channel is selected (telephony provider or mobile channel)
    - At least one AI agent is associated with the assistant
    - If a telephony provider is enabled, authentication is set up and fallback is configured to either connect to a live agent or create a record producer.
    - If a mobile channel is enabled, fallback is configured to create a record producer.

What to do next

Test the execution of your AI voice agent by manually calling in the telephony number to see if the AI voice agent functions the way you defined it. Review the transcript and logs for troubleshooting and improving the conversational experience of users. See AI voice agent transcript and logs tables for information on the tables containing transcript and logs.

Configure custom assistant

Configure a custom telephony provider to use instead of the out-of-the-box voice assistant.

Before you begin

Role required: admin

Procedure

1. Configure the token by doing one of the following, depending on the token type:
   - Static token:
     a. Navigate to **All**, and then enter `token_verification.list` in the navigation filter.
     b. Select **New**.
     c. On the form, fill in the fields.

Token Verifications form

Field	Description
Name	Name of the authentication token, such as `AI voice token`.
Description	Description of the authentication token, such as `Voice Agent Auth Token`.
Token	Authentication token that is used to authenticate the provider application. Enter the authentication token that you generated using any general programming or scripting language, or select the **Generate Secure Token** related link.

     d. Select **Submit**.
   - Hash token:
     a. Navigate to **All**, and then enter `hash_message_verification.list` in the navigation filter.
     b. Select **New**.
     c. On the form, fill in the fields.

Hash Message Verification form

Fields	Description
Name	Name of the authentication token, such as `AI voice token`.
Description	Description of the authentication token, such as `Voice Agent Auth Token`.
Secret	Authentication token (random string).

     d. Select **Submit**.
2. Set up Provider Authentication for token-based authentication.
   a. Navigate to **All**, and then enter `message_auth.list` in the navigation filter.
   b. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the form, fill in the fields.

Message Auth form

Field	Description
Name	Name of the message authentication, such as `AI voice token`.
Provider	Name of the provider, for example, AI Voice provider.
Group name	Not required.
Service Portal	Not required.
Inbound message verification	Select the Static token or Hash message token that you created.
Outbound message creation	Select the Static token or Hash message token that you created.
Outbound service token	This field is not supported.

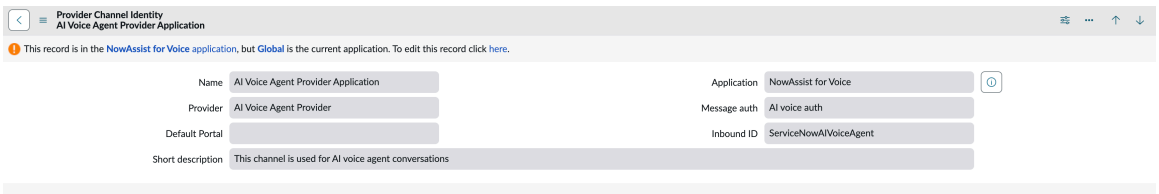
d. Select **Submit**.

3. Set the channel identity.

a. Navigate to **All**, and then enter `sys_cs_provider_application.list` in the navigation filter.

b. Select the **AI Voice Agent Provider Application** record to open it.
If you want to use an existing application or create a new provider application, be sure to update the existing configuration according to the values mentioned in Configuration for custom AI voice agent provider before proceeding further.

c. In the Provider Channel Identity form, locate the **Message auth** field and select the message auth that you set up previously.



d. Select **Update**.

Create an AI voice agent

Create an AI voice agent in the AI Agent Studio to resolve cases, incidents, or tasks through the phone channel.

Before you begin

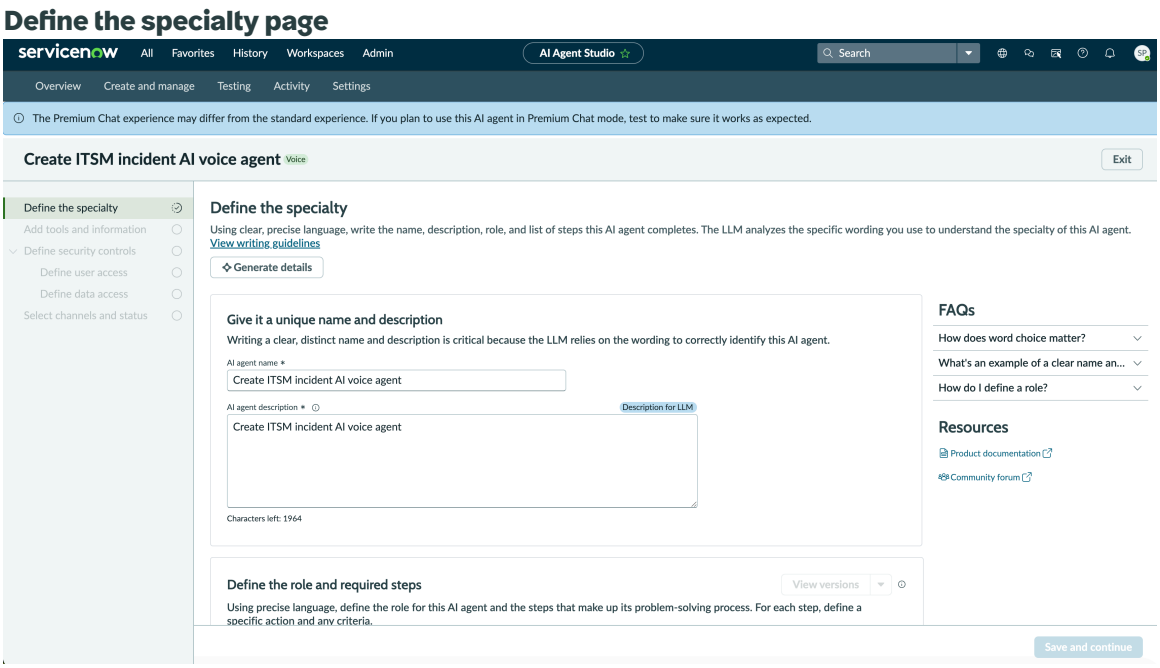
Role required: sn_voice_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the New AI Agent page in the Assistant Designer or AI Agent Studio.

To	Do this
Navigate in Assistant Designer	**a.** Go to the **Asset Library** and select **Create asset**. The Create asset window appears. **b.** Select **AI Agent**. You are redirected to the New AI Agent workflow in the AI Agent Studio.
Navigate in AI Agent Studio	**a.** Go to **All** > **AI Agent Studio** > **Create and manage** and select the **AI agents** tab. **b.** In the Add drop-down list, select **Voice** to create an AI voice agent. 
2. On the Define the specialty page, describe your AI agent and provide instructions on how you want your AI agent to perform its tasks.



Select **Generate details** to generate a description and instructions with AI. If you provide the description of what you want the agent to do, you can select **Generate** to write the name, description, AI agent role, and instructions fields for you. You can change those fields after the text has been generated or try again with new instructions.

Note: The more details that you provide, the more accurately your AI agent can perform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the form, fill in the fields.

Give a unique name and description form

Field	Description
AI agent name	Name of the AI agent. Provide a name according to the outcome that you want your AI agent to achieve. For example: Incident manager.
AI agent description	Brief summary of what your AI agent can do autonomously. Outline all the activities that you want your AI agent to perform. Example for the Incident manager: The Incident manager AI agent assists users with existing incidents by gathering information over the phone, matching it to records in the system, and sharing relevant incident details. It can also make limited updates to the incident using preconfigured tools.

b. On the form, fill in the fields.

Note: The AI agent uses this information as guidance to tailor its responses and actions.

Define the role and required steps form

Field	Description
AI Agent role	Capabilities and responsibilities for your AI agent. Roles enable your AI agent to perform its required actions. Example for the Incident manager: You're an AI agent that communicates incident details and makes changes to incidents for callers. You can retrieve incident fields and comments, and escalate urgency. Only gather information and run tools if the caller matches the user listed on the incident.
List of steps	Necessary steps to be followed by the AI agent while carrying out its role. **Note:** The instructions are sent to the large language model (LLM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Example for the Incident manager: Incidents are records for tracking issues and their resolution updates through a set of journal entries. Your objective is to act as an incident manager. If the user provides an incident number, verify the caller identity before sharing permitted details. If no number is given, match incidents using the short description and confirm with the user. Allow updates only if the user matches the caller. Offer live agent transfer if the user is unsatisfied. To resolve an incident: **i.** Verify the caller number. **ii.** Search for incident records associated with the user. **iii.** Consider the context and relationship between different data points. **iv.** If the user provides an incident number, verify their identity against the caller field before sharing permitted details. Proceed with updates or modifications only after the caller's identity is verified. **v.** If no incident number is given, search using the short description, list matching incidents with brief summaries, and confirm which one the users wants to explore further. **vi.** Only share allowed fields (for example, incident number, caller, dates, urgency, state, short description, comments). Summarize comments if there are more than five, and notify the user if a field is empty or restricted. **vii.** If the user is unsatisfied, offer to transfer to a live agent. End the conversation politely if they’re satisfied or after a transfer.

Follow these guidelines for writing effective Instructions:

- Define the AI agent's role:
  - Clearly state the primary function of the AI agent in one or two sentences.
  - Example: The AI agent acts as a customer service assistant.
- Outline specialties:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Specify the key areas or tasks that the AI agent handles.
- Example: Specializes in handling inquiries and resolving customer issues.

- Identify the business problem:
  - Articulate the specific business challenge for the AI agent to address.
  - Example: Reducing customer wait times by 50%.

- Describe the workflow:
  - Provide a brief scenario of how the AI agent is to be used.
  - Example: Automating responses to common queries and escalating complex issues to human agents.

- Be concise and clear:
  - Use simple and direct language.
  - Avoid jargon and technical terms.
  - Example: The AI agent helps customers find answers quickly.

- Provide actionable steps:
  - Include specific instructions on how to set up and use the AI agent.
  - Example: Step 1: Define the types of inquiries the AI agent handles. Step 2: Integrate the AI agent with the customer service platform.

- Include examples:
  - Provide real-world examples to illustrate how the AI agent should function.
  - Example: For example, the AI agent can automatically respond to questions about the order status.

- Focus on outcomes:
  - Emphasize the benefits and outcomes of using the AI agent.
  - Example: Using the AI agent leads to faster resolution times and higher customer satisfaction scores.

By following these general guidelines, you can create clear and effective prompt instructions that enable you to use AI agents to their fullest potential. For more information and examples, see General guidelines for creating AI agents.

c. Optional: Determine if the AI agent can be accessed by third parties.
Making your AI agent discoverable allows you to use your ServiceNow AI agent on other platforms. You can still use it on your ServiceNow instances as well.

d. Select **Save and continue** to move to the next step.

3. In the **Add tools and information** tab, configure additional tools and data sources that provide capabilities necessary to your AI agent to accomplish its objectives.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select **Recommend Tools** for AI to suggest the tools that are required for the AI agent to carry out the tasks that it's built for. AI suggests tools based on the AI agent description and instructions given in the previous section.

You can add the tools suggested by AI or manually select the tools from the Add tool drop-down list. You must add at least one tool to continue setting up your AI agent, but you can also add more tools to your AI agent. The data input and output type for tools must be string for optimal voice experience.

The following tools are available for AI voice agents:

- File upload: Different file types such as PDF, DOCX, or TXT formats that you can add to your AI agent.
- Flow action: Custom automated processes in your system that you can add to your AI agent. Example for the Incident manager agent: Fetch details of the incident.
- Knowledge Graph: Various Knowledge Graph items that you can add to you AI agent.
- MCP server tool: An MCP server tool that you can to your AI agent.
- Record operation: Different record operations that you can add to your AI agent.
- Script: Editable scripts and APIs that you can add to your AI agent.
- Search retrieval: Information retrieval processes in your system that you can add to your AI agent.

  Note: Create a dedicated search profile that includes only the KB articles for AI voice agents to reduce the search scope and minimize latency.

- Sub flow: Automated flows in your system that you can add to your AI agent.

4. In the Define security controls tab, define who can access the AI agent and what data the AI agent has access to.

   a. Define the users who can access this AI agent (ACLs).
   Choose from:

   - **Any authenticated user**: A user who is logged in can access the AI agent.
   - **Users with specific roles**: Users that are assigned specific roles can access the AI agent. Selecting this option enables you to select the roles in the Role drop-down list.
   - **Public**: Anyone can access the AI agent, even without logging in.

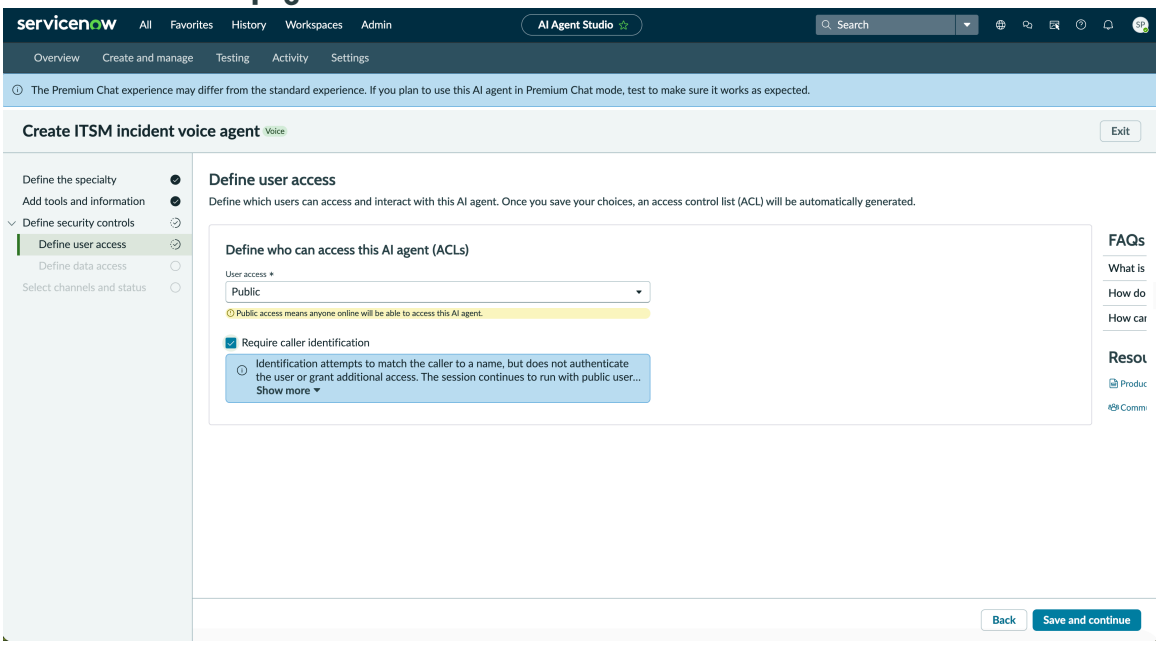
   b. **Optional:** If you selected **Public**, select **Require caller identification** to have the AI voice agent identify the caller before the conversation begins.

   (Optional) When selected, the agent uses the caller identification methods configured in the Caller Identification section of the voice assistant to match the caller to a name. Identification does not authenticate the caller or grant additional access. The session continues with public user permissions.

   Note: This option is available only for voice agents configured with **Public** access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define user access page



c. Optional: Select **Require step-up authentication of users** to require callers to complete a high-assurance authentication factor before the AI agent runs.

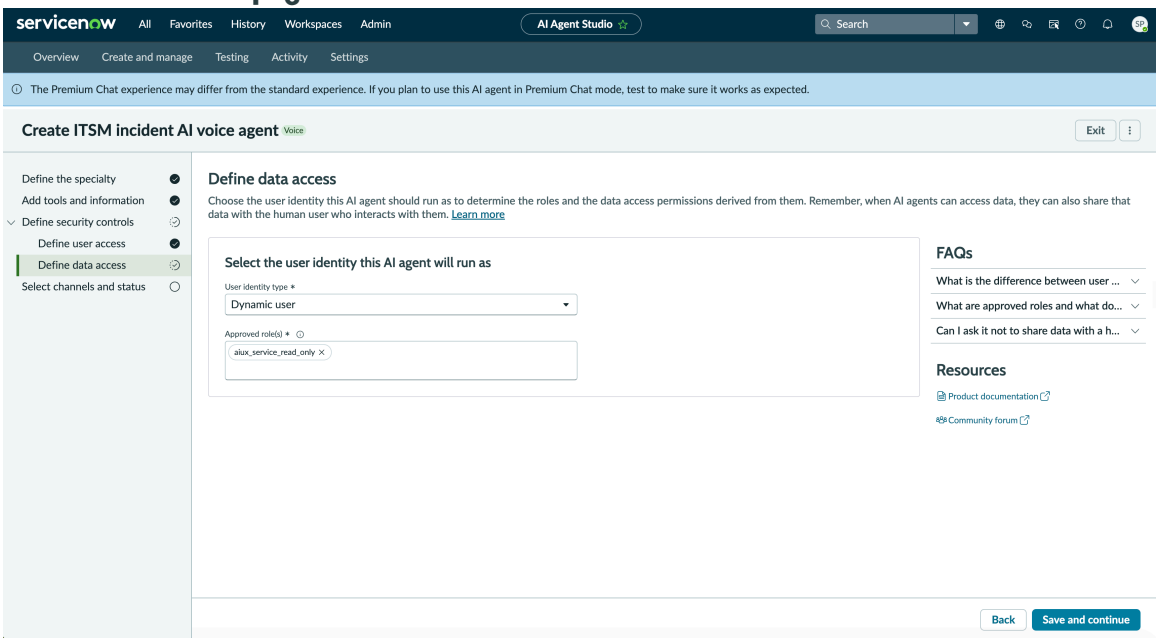
> **Note:**
>
> This option is available only for AI voice agents. For more information about step-up authentication, see Step-up authentication.
>
> A step-up authentication factor must also be selected in **Caller Verification** for each voice assistant that uses this AI agent, from the following supported factors: Okta Verify push notification, SMS verification code, and authenticator app time-based one-time password (TOTP). See Identify and authenticate the caller. Without a selected factor, callers are routed to the fallback method configured on the Safeguards screen.

d. Define the user identity of the AI agents to determine what data it has access to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

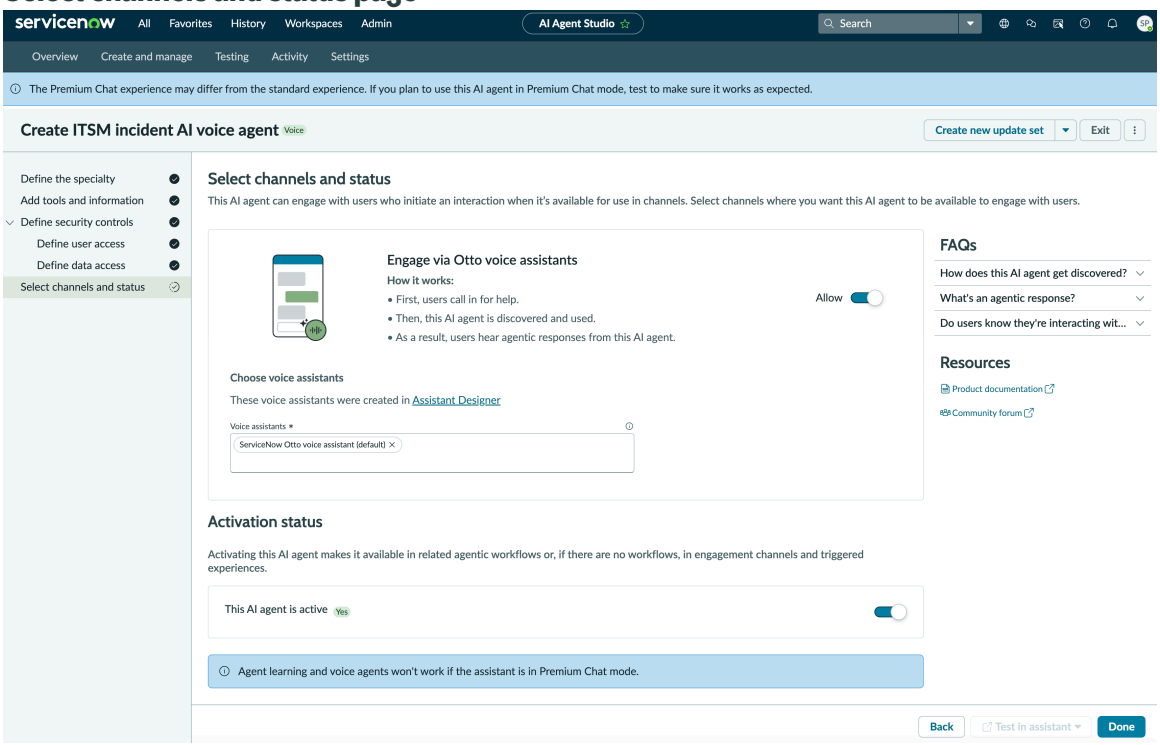
The default selection is **Dynamic user**. The user passes their roles to the AI agent, and the AI agent runs as the user that invokes it. The user's ACLs determine the data accessible to the AI agent.

Define data access page



5. Select channels and activation status for your AI voice agent.

Select channels and status page



a. Select **Allow** to enable users to use phone calls to invoke the AI agent.

b. In the **Choose voice assistants** field, select the default assistant or a custom assistant. Voice assistants are created in Assistant Designer. See Create a voice assistant for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Activate the AI agent by toggling the **Status**.

d. **Optional:** Select **Test in assistant** to test your AI voice agent in the voice testing experience.
   - If one voice assistant is linked, the voice testing panel opens directly.
   - If multiple voice assistants are linked, select the voice assistant you want to use for testing.
   - If no voice assistants are linked, **Test in assistant** is disabled. Link a voice assistant first.

6. Select **Done** to save the configuration.

Integrating voice assistant with CCaaS provider

Enable users to get voice-based support from ServiceNow AI voice agents by integrating ServiceNow voice assistant with supported third-party Contact Center as a Service providers (CCaaS).

When you create or edit a voice assistant, you configure communication channels to define how the assistant connects to users. Select a **Provider application** to deploy the assistant to — this field is required for all communication channel types and appears above the channel tabs.

Communication channels are organized into two tabs:

- **Telephony provider** — connects the voice assistant to a phone network.
- **Web Real-Time Communication (WebRTC)** — connects the voice assistant to mobile applications.

Note: To configure a telephony provider, select a communication channel type from the **Communication channel** drop-down, then select a CCaaS provider. The available CCaaS providers depend on the selected channel type. To remove a linked provider, select **Unlink this provider**.

Telephony providers

The following sections describe the configuration fields for each supported CCaaS provider under the **Telephony provider** tab.

Twilio voice service (WebSocket)

Twilio voice service configuration fields

Field	Description
Authentication Token	Authentication token to authenticate to your Twilio voice service account.
URL	Read-only. Autogenerated URL to connect Twilio voice service to the voice assistant.

Genesys voice service (Audio Connector)

Genesys uses the Audio Connector integration and the WebSocket channel type. After the configuration is saved, copy the generated credentials and paste them into your Genesys Cloud account to complete the integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Genesys Audio Connector configuration fields

Field	Description
Base connection URI	Read-only. Autogenerated WebSocket URL to connect the Genesys Cloud Audio Connector to the voice assistant. Copy this value to your Genesys Cloud account.
Connector ID	Read-only. Autogenerated identifier for the Genesys Cloud Audio Connector. Copy this value to your Genesys Cloud account.
Client secret	Read-only. Base64-encoded client secret for secure access. Copy this value to your Genesys Cloud account.
API key	Read-only. API key to authenticate your Genesys Cloud service to the voice assistant. Copy this value to your Genesys Cloud account.

Genesys voice service (SIP)

Genesys voice service configuration fields

Field	Description
Transfer number/address	SIP URI to transfer the call to the Genesys voice service. Use the format `user@domain`, where the user part is up to 16 characters and the domain part is up to 256 characters. URI parameters are not supported.
Transfer method	Read-only. Set to **REFER** for Genesys voice service.
ServiceNow SIP Trunk information	Read-only. The ServiceNow SIP fully qualified domain name for your region, used to route calls from Genesys voice service to the voice assistant. For configuration details, see KB3023612.
x-snc-param	Read-only. Generated token to send to your Genesys CCaaS account to authenticate requests to the voice assistant.

Amazon Connect (PSTN)

Amazon Connect configuration fields

Field	Description
Transfer method	Read-only. Set to **BYE** for Amazon Connect.
Call context API	Read-only. The URL that Amazon Connect uses to send call context data to the voice assistant.
Client ID	Read-only. Generated client ID for OAuth2 authentication of call context requests from Amazon Connect to the voice assistant.
Client Secret	Read-only. Generated client secret for OAuth2 authentication of call context requests from Amazon Connect to the voice assistant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3CLogic (WebSocket)

3CLogic uses the WebSocket channel type. After the configuration is saved, copy the generated credentials and paste them into your 3CLogic account to complete the integration.

3CLogic configuration fields

Field	Description
URL	Read-only. Autogenerated WebSocket URL to connect the 3CLogic voice service to the voice assistant. Copy this value to your 3CLogic account.
Client secret	Read-only. Generated client secret to authenticate requests from 3CLogic to the voice assistant. Copy this value to your 3CLogic account.
Client id	Read-only. Generated client ID to authenticate requests from 3CLogic to the voice assistant. Copy this value to your 3CLogic account.

Five9 (SIP)

Five9 configuration fields

Field	Description
Transfer method	Read-only. Set to **BYE** for Five9.
ServiceNow SIP Trunk information	Read-only. The ServiceNow SIP fully qualified domain name (FQDN) for your region, used to route calls from Five9 to the voice assistant. For configuration details, see KB3023612.
x-snc-param	Read-only. Generated token to send to your Five9 account to authenticate requests to the voice assistant.

NICE CXone (SIP)

NICE CXone uses the SIP channel type. Enter the NICE API credentials from your CXone account, then use the generated ServiceNow SIP Trunk information to configure the SIP trunk in CXone.

NICE API credentials

Field	Description
API endpoint	The CXone API base URL. Must be a valid NICE domain, such as `https://cxone.niceincontact.com` or `https://cxone-gov.niceincontact.com`.
Token endpoint	The CXone OAuth token URL used to generate authentication tokens. Must be a valid NICE domain.
Username	The access key ID from your CXone account. Work with your Nice account team to obtain this credential.
Password	The access key secret from your CXone account. This value is only displayed once when generated. Copy it before navigating away.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NICE API credentials (continued)

Field	Description
Client ID	The OAuth client ID from your CXone account.
Client Secret	The OAuth client secret from your CXone account.

ServiceNow SIP Trunk information

Field	Description
Transfer number/address	SIP URI or phone number to transfer the call to your CXone service. Use the format `user@domain`.
Transfer method	Read-only. Set to **REFER** for CXone.
ServiceNow SIP FQDN	Read-only. The ServiceNow SIP fully qualified domain name (FQDN) for your region, used to route calls from CXone to the voice assistant. For configuration details, see KB3023612.
x-snc-param	Read-only. Generated token to send to your CXone account to authenticate requests to the voice assistant.

Integrate ServiceNow voice assistant with Twilio voice service

Enable users to get support from AI voice agents by integrating a ServiceNow AI voice assistant with the Twilio voice service.

Before you begin

ServiceNow AI voice assistant uses the authentication token of your Twilio account to connect to the Twilio voice service. To obtain the authentication token, do the following.

1. Sign up or log in to your Twilio admin console.
2. Navigate to **Account Dashboard** > **Account Info**.
3. Copy your Account SID and Auth Token.

Role required: sn_aia.admin

About this task

Connect your Twilio voice service to a ServiceNow voice assistant using the WebSocket communication channel. After the integration is configured, Twilio routes calls to the ServiceNow voice assistant. When the interaction is complete, the integration supports transferring the caller to a live agent.

Procedure

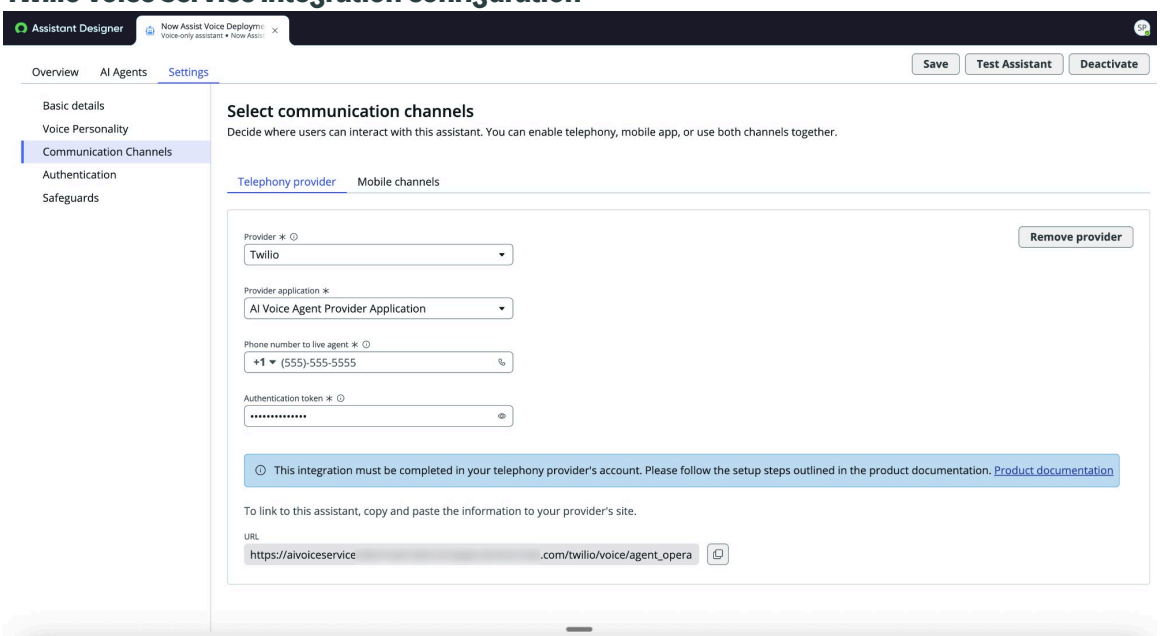
1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant to connect to Twilio and select **Edit**.
3. Select **Communication channels** from the guided setup navigation.
4. In the **Provider application** field, select the provider application to deploy the voice assistant to.
5. Select the **Telephony provider** tab.
6. From the **Communication channel** drop-down list, select **WebSocket**.
7. From the **CCaaS provider** drop-down list, select **Twilio** and fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Twilio voice service configuration fields

Field	Description
Authentication token	Authentication token to connect the ServiceNow® voice assistant to your Twilio voice service. Enter the Auth Token that you collected earlier.
URL	Autogenerated URL to connect Twilio voice service to the ServiceNow® voice assistant. Copy the URL for use in the Twilio console. If you do not see the URL, make sure an endpoint is associated with the `sys_service` record for AIVoiceAgents. This endpoint is used to generate the URL required for your integration. If no endpoint is present in the record, click Refresh Connections to populate it.

Twilio voice service integration configuration

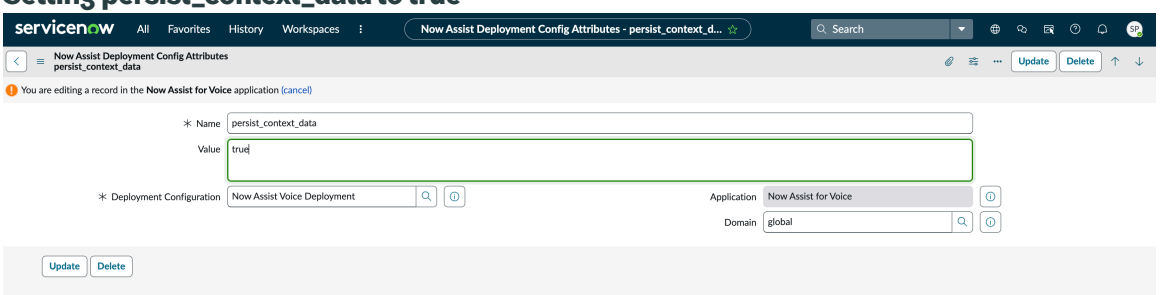


8. Enable context data persistence for the voice service.

   a. Navigate to `sys_now_assist_deployment_config_attributes.list` and check whether a `persist_context_data` attribute exists for your voice service.

   b. If the attribute exists, open it and set **Value** to `true`.

Setting persist_context_data to true



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

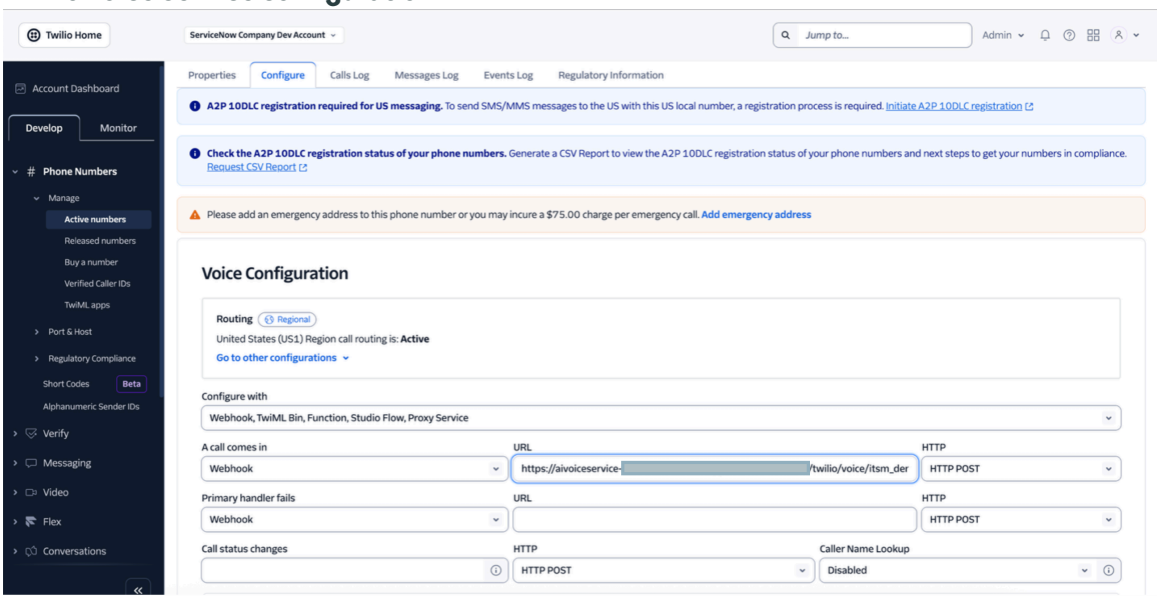
c. If the attribute does not exist, navigate to `sys_now_assist_deployment_config.list`, open your voice assistant's deployment configuration record, and copy its sys_id.
To copy the sys_id, select and hold (or right-click) the record header bar and select **Copy sys_id**.

d. Navigate to `sys_now_assist_deployment_config_attributes.list`, select **New**, set **Deployment Configuration** to the sys_id you copied, **Name** to `persist_context_data`, and **Value** to `true`, then select **Submit**.

When `persist_context_data` is enabled, the voice assistant saves the session context as an `interaction_context` record named `bot_context_data` after each call. For details about the stored fields, see Bot context data.

9. In the Twilio console, go to your purchased number's configuration and set the URL copied earlier as the Webhook URL.

Twilio voice service configuration



Integrate ServiceNow voice assistant with Genesys Cloud service (Audio Connector)

Enable users to get support from AI voice agents by integrating a ServiceNow AI voice assistant with Genesys Cloud service using the Audio Connector integration.

Before you begin

- Be aware of Genesys Audio Connector limits and throttling policies. See Organization rate limits and Platform API rate limits for more information.
- Be sure to host the ServiceNow instance in a region the same as or closer to the region where the Genesys Cloud service is hosted to minimize latency.
- To route live agent transfer via Advanced Work Assignment (AWA), download and install the Unified Experience from Genesys - Core and Unified Experience from Genesys Store apps.

Role required: sn_aia.admin

About this task

Connect your Genesys Cloud contact center to a ServiceNow voice assistant using the Audio Connector integration and the WebSocket communication channel. After the integration is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

configured, Genesys Cloud routes calls to the ServiceNow voice assistant through the Audio Connector. When call handling is complete, the integration supports transferring the caller to a live agent queue.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant to connect to Genesys Cloud service and select **Edit**.
3. Select **Communication channels** from the guided setup navigation.
4. In the **Provider application** field, select the provider application to deploy the voice assistant to.
5. Select the **Telephony provider** tab.
6. From the **Communication channel** drop-down list, select **WebSocket**.
7. From the **CCaaS provider** drop-down list, select **Genesys**.

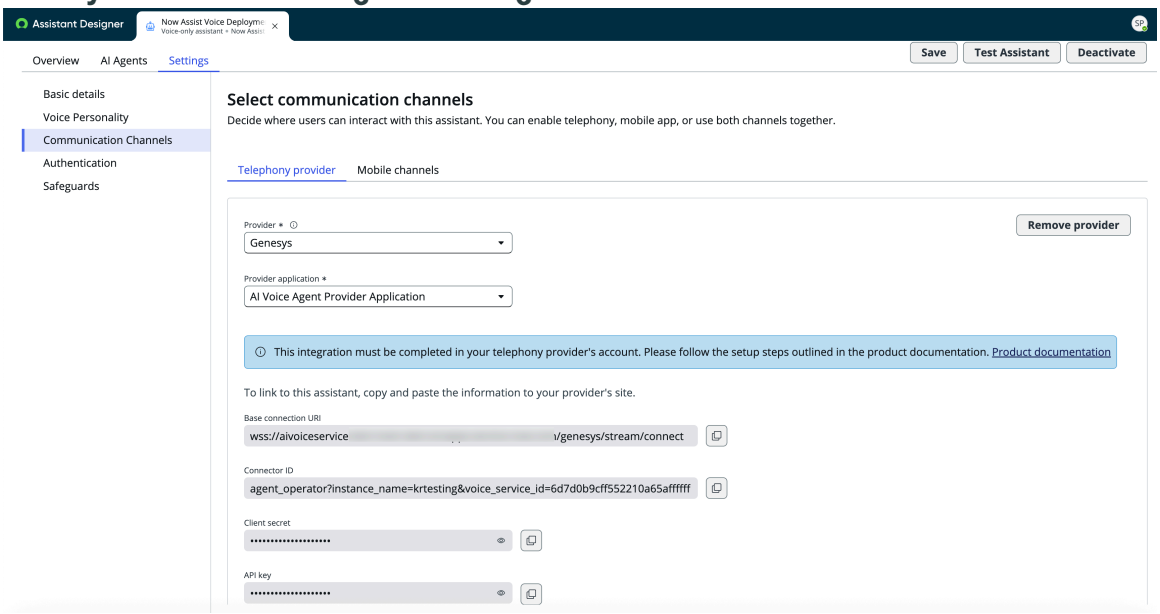
   The following fields are generated. Copy these values to configure the Audio Connector integration in your Genesys Cloud account.

Genesys Audio Connector configuration fields

Field	Description
Base connection URI	Autogenerated WebSocket URL to connect your Genesys Cloud Audio Connector to the ServiceNow voice assistant. Copy the URL for use in the Audio Connector configuration. If you do not see the URL, make sure an endpoint is associated with the `sys_service` record for AIVoiceAgents. This endpoint is used to generate the URL required for your integration. If no endpoint is present in the record, click Refresh Connections to populate it.
Connector ID	Autogenerated identifier for the Genesys Cloud Audio Connector. Copy the value for use in the Audio Connector configuration.
Client secret	Base64-encoded client secret used to provide secure access to the required resources. Copy the value for use in the Audio Connector configuration. For more information on Client secret and API key, see Client Authentication.
API key	API key to authenticate your Genesys Cloud service to the ServiceNow voice assistant. Copy the value for use in the Audio Connector configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Genesys Cloud service integration configuration



8. Enable context data persistence for the voice service.

   a. Navigate to `sys_now_assist_deployment_config_attributes.list` and check whether a `persist_context_data` attribute exists for your voice service.

   b. If the attribute exists, open it and set **Value** to `true`.

Setting persist_context_data to true

   c. If the attribute does not exist, navigate to `sys_now_assist_deployment_config.list`, open your voice assistant's deployment configuration record, and copy its sys_id.
   To copy the sys_id, select and hold (or right-click) the record header bar and select **Copy sys_id**.

   d. Navigate to `sys_now_assist_deployment_config_attributes.list`, select **New**, set **Deployment Configuration** to the sys_id you copied, **Name** to `persist_context_data`, and **Value** to `true`, then select **Submit**.

   When `persist_context_data` is enabled, the voice assistant saves the session context as an `interaction_context` record named `bot_context_data` after each call. For details about the stored fields, see Bot context data.

9. Create Audio Connector integration.

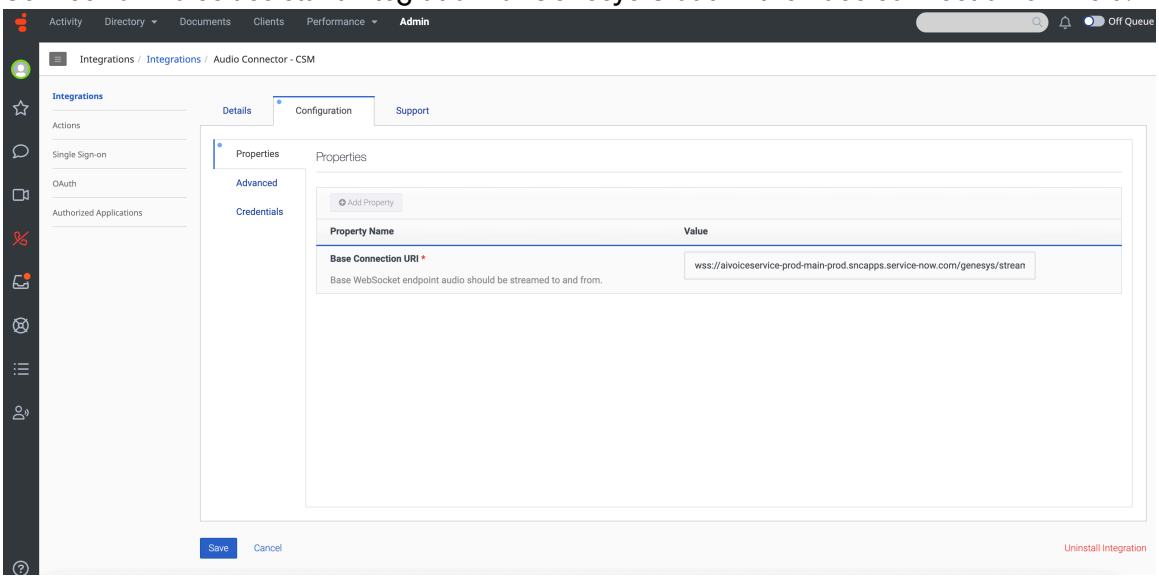
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Menu** > **IT and Integrations** > **Integrations** and select **Add new integration**.

b. Select **Audio Connector** as the integration type and select **Install**.

c. In the Details tab, name the integration, for example, Audio Connector - Voice.

d. In the **Configuration** tab, select **Properties**, and add the Base connection URI from your ServiceNow voice assistant integration for Genesys Cloud in the Base connection URI field.



e. Select **Credentials**, and add the API key and Client secret obtained from ServiceNow voice assistant integration for Genesys Cloud.

f. Select **Save**.

10. Architect the inbound call flow.

a. Use the search bar to navigate to Architect and create the inbound call flow according to your requirements.

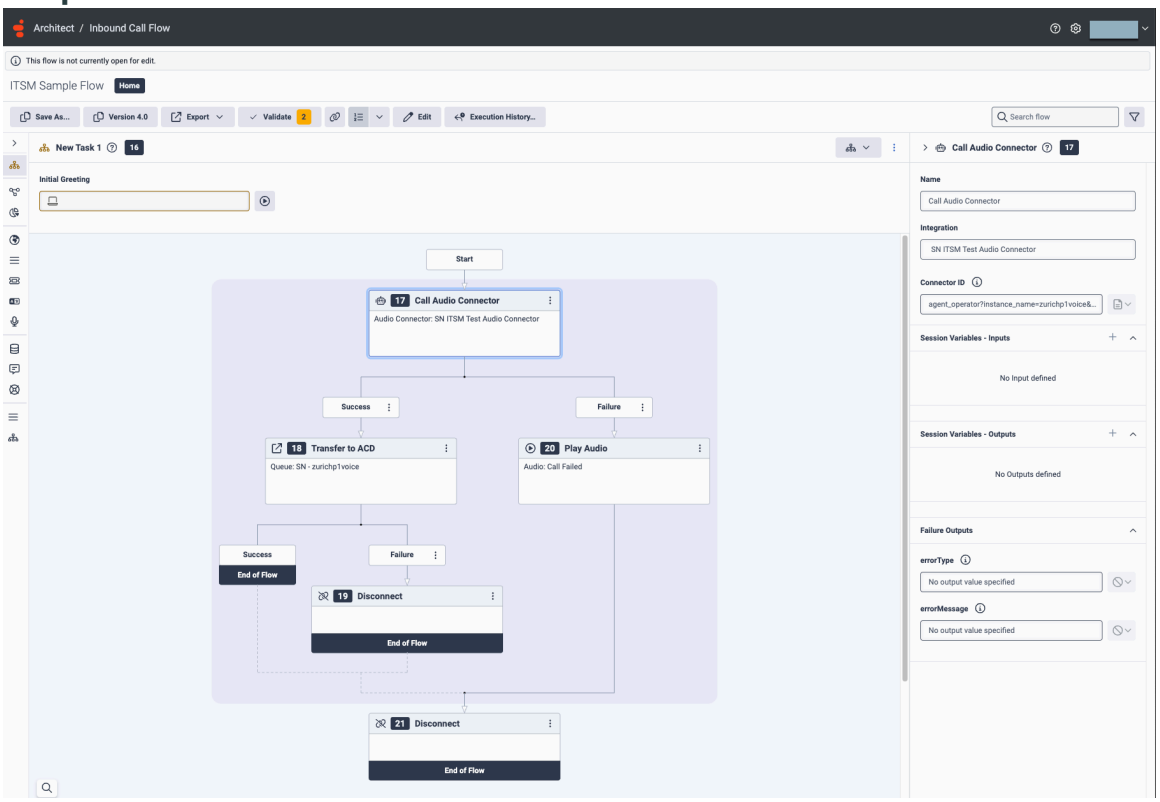
Note:

In the **Connector ID** field, enter the Connector ID obtained from creating ServiceNow voice assistant integration for Genesys Cloud.

If you intend to use live agent transfer as the fallback option, add the transfer logic in the call flow and validate the flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample inbound call flow



b. Select **Save** to save and **Publish** to publish the call flow.

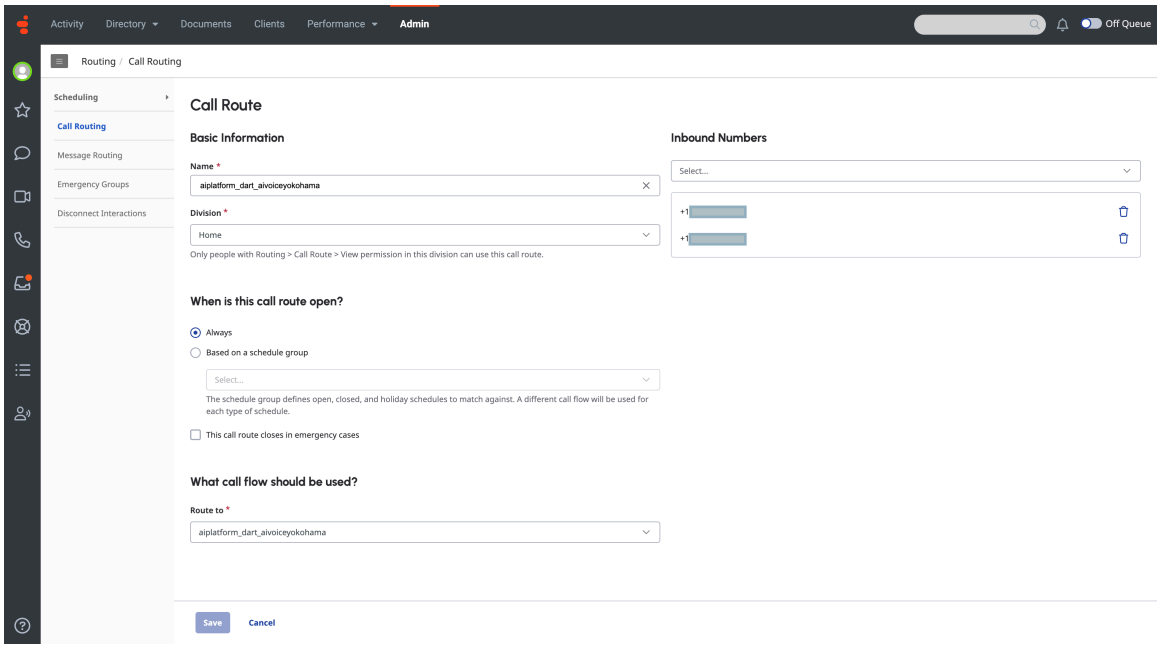
11. Configure call routing.

a. Use the search bar to navigate to Call Routing and create a call route.
For more information on creating a call flow routing, see Add a call route.

b. Assign the inbound call flow that you created earlier to the call route.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Save**.



12. Assign a phone number to the call route.
    a. Use the search bar to navigate to Telephony and select DID numbers.
    b. Select a DID number and assign the number to the call route created earlier.

Integrate ServiceNow voice assistant with Genesys Cloud service (SIP)

Enable users to get support from AI voice agents by integrating a ServiceNow voice assistant with Genesys Cloud service using the Session Initiation Protocol (SIP) communication channel.

Before you begin

- Create a voice assistant. See Create an AI voice assistant for more information.

Role required: sn_aia.admin

About this task

Connect your Genesys Cloud contact center to a ServiceNow voice assistant using the Session Initiation Protocol (SIP) communication channel. After the integration is configured, Genesys Cloud routes calls to the ServiceNow SIP endpoint, where the AI voice agent handles the interaction. When call handling is complete, the integration supports transferring the caller to a live agent queue using the SIP REFER transfer method.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant to connect to Genesys Cloud service and select **Edit**.
3. Select **Communication channels** from the guided setup navigation.
4. In the **Provider application** field, select the provider application to deploy the voice assistant to.
5. Select the **Telephony provider** tab.
6. From the **Select communication channels** drop-down list, select **Session Initiation Protocol (SIP)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

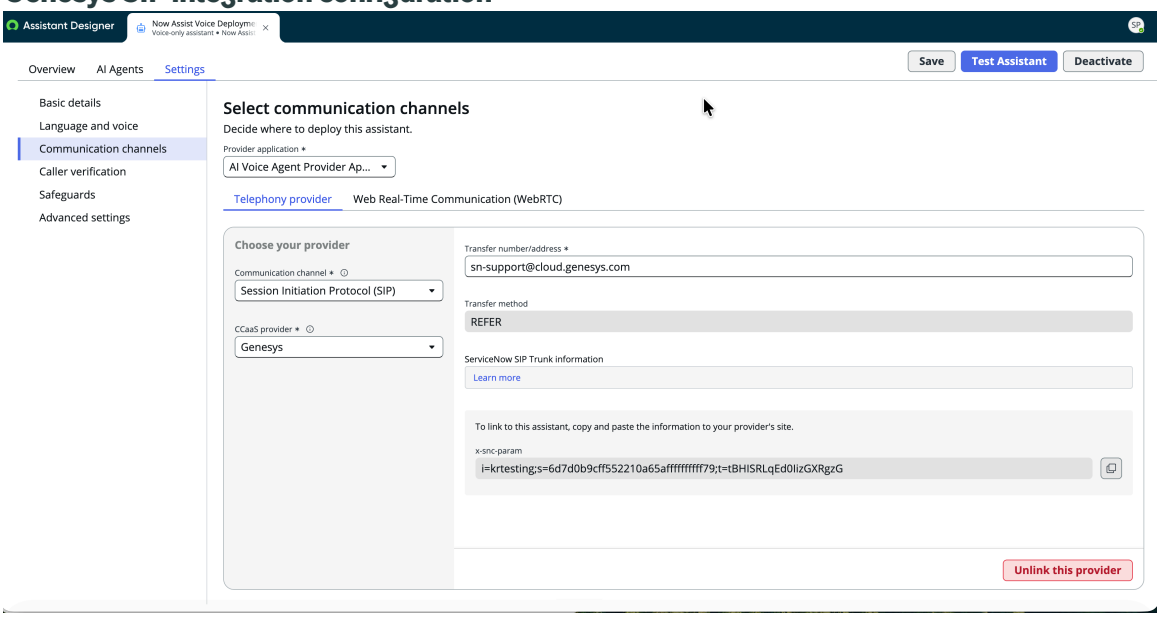
7. From the **CCaaS provider** drop-down list, select **Genesys**.

   Enter the **Transfer number/address** and note the following generated values. You need these to configure the SIP trunk in your Genesys Cloud account.

Genesys SIP configuration fields

Field	Description
Transfer number/ address	SIP URI to transfer the call to your Genesys Cloud service. Use the format `user@domain`, where the user part is up to 16 characters and the domain part is up to 256 characters. URI parameters are not supported.
Transfer method	Value set to **REFER** for Genesys Cloud service.
ServiceNow SIP Trunk information	The ServiceNow SIP fully qualified domain name (FQDN) for your region, used to route calls from Genesys Cloud service to the voice assistant. For SIP trunk configuration details including IP addresses and FQDNs per region, see SIP trunk configuration [KB3023612].
x-snc-param	Generated token to send to your Genesys Cloud account to authenticate requests to the voice assistant.

Genesys SIP integration configuration



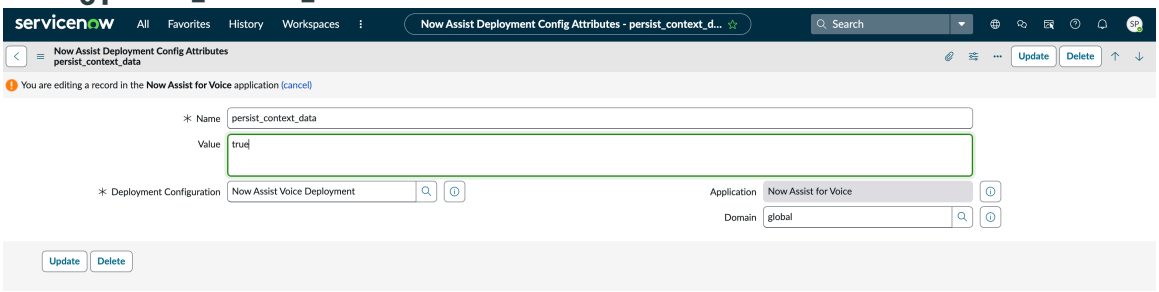
8. Enable context data persistence for the voice service.

   a. Navigate to `sys_now_assist_deployment_config_attributes.list` and check whether a `persist_context_data` attribute exists for your voice service.

   b. If the attribute exists, open it and set **Value** to `true`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting persist_context_data to true



c. If the attribute does not exist, navigate to `sys_now_assist_deployment_config.list`, open your voice assistant's deployment configuration record, and copy its sys_id.
To copy the sys_id, select and hold (or right-click) the record header bar and select **Copy sys_id**.

d. Navigate to `sys_now_assist_deployment_config_attributes.list`, select **New**, set **Deployment Configuration** to the sys_id you copied, **Name** to `persist_context_data`, and **Value** to `true`, then select **Submit**.

When `persist_context_data` is enabled, the voice assistant saves the session context as an `interaction_context` record named `bot_context_data` after each call. For details about the stored fields, see Bot context data.

9. In your Genesys Cloud account, configure the SIP trunk using the ServiceNow SIP FQDN and authentication token.
Use the **ServiceNow SIP Trunk information** and the **x-snc-param** token generated in the previous step. For SIP trunk configuration details, see SIP trunk configuration [KB3023612].

Result
Genesys Cloud service is connected to your ServiceNow voice assistant. Incoming calls routed through Genesys Cloud service are handled by the AI voice agent, which responds with a greeting and processes the caller's requests.

What to do next
For live agent transfer configuration and advanced SIP trunk settings, refer to your Genesys Cloud documentation or contact Genesys support.

Integrate ServiceNow voice assistant with 3CLogic

Enable users to get support from AI voice agents by integrating a ServiceNow AI voice assistant with the 3CLogic voice service.

Before you begin
- Create a voice assistant. See Create an AI voice assistant for more information.

Role required: sn_aia.admin

About this task
Connect your 3CLogic voice service to a ServiceNow voice assistant using the WebSocket communication channel. When the integration is complete, incoming calls routed through 3CLogic are handled by the AI voice agent. When call handling is complete, the integration supports transferring the caller to a live agent queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant that you want to connect to 3CLogic and select **Edit**.
3. Select **Communication channels** from the guided setup navigation.
4. In the **Provider application** field, select the provider application to deploy the voice assistant to.
5. Select the **Telephony provider** tab.
6. From the **Select communication channels** dropdown, select **WebSocket**.
7. From the **CCaaS provider** dropdown, select **3CLogic**.

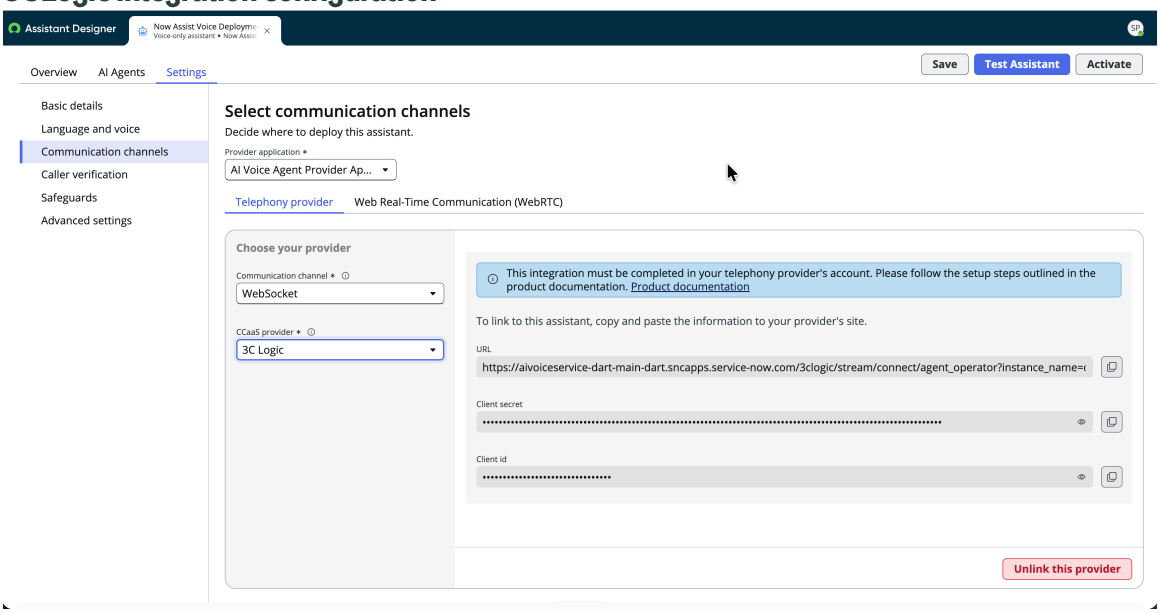
> **Note:** This integration must be completed in your telephony provider's account. Follow the setup steps outlined in the 3CLogic product documentation.

The following read-only fields are generated. Copy these values to your 3CLogic account to complete the integration.

3CLogic configuration fields

Field	Description
URL	Autogenerated WebSocket URL to connect the 3CLogic voice service to the voice assistant.
Client secret	Generated client secret to authenticate requests from 3CLogic to the voice assistant.
Client id	Generated client ID to authenticate requests from 3CLogic to the voice assistant.

3CLogic integration configuration



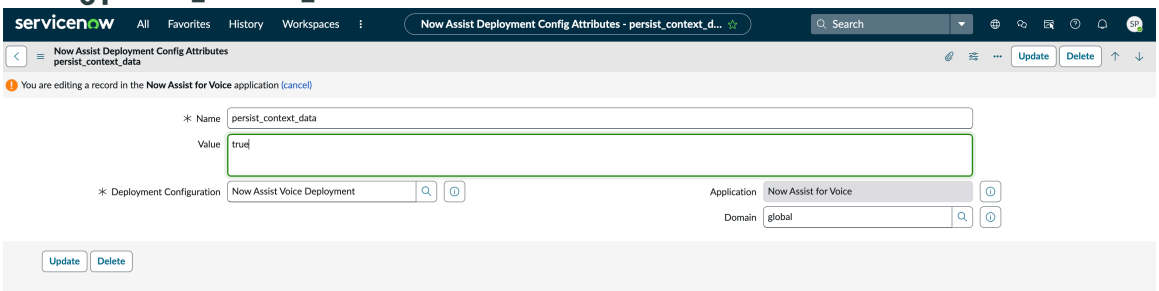
8. Enable context data persistence for the voice service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to `sys_now_assist_deployment_config_attributes.list` and check whether a `persist_context_data` attribute exists for your voice service.

b. If the attribute exists, open it and set **Value** to `true`.

Setting persist_context_data to true



c. If the attribute does not exist, navigate to `sys_now_assist_deployment_config.list`, open your voice assistant's deployment configuration record, and copy its `sys_id`.
To copy the `sys_id`, right-click the record header bar and select **Copy sys_id**.

d. Navigate to `sys_now_assist_deployment_config_attributes.list`, click **New**, set **Deployment Configuration** to the `sys_id` you copied, **Name** to `persist_context_data`, and **Value** to `true`, then click **Submit**.

When `persist_context_data` is enabled, the voice assistant saves the session context as an `interaction_context` record named `bot_context_data` after each call. For details about the stored fields, see Bot context data.

9. In your 3CLogic account, paste the **URL**, **Client secret**, and **Client id** into the corresponding fields.
10. Complete any additional configuration required in your 3CLogic account.
For provider-side configuration steps specific to your 3CLogic deployment, contact 3CLogic customer support.

Result

The 3CLogic voice service is connected to your ServiceNow voice assistant. Incoming calls routed through 3CLogic are handled by the AI voice agent, which responds with a greeting and processes the caller's requests.

Note: Call recording is not available for 3CLogic integrations.

What to do next

For live agent transfer configuration and advanced 3CLogic settings, contact 3CLogic customer support.

Integrate ServiceNow voice assistant with Amazon Connect

Enable users to get support from AI voice agents by integrating a ServiceNow voice assistant with Amazon Connect.

Before you begin

- Create a voice assistant. See Create an AI voice assistant for more information.
- Access to your Amazon Connect instance with permissions to create Lambda functions, configure contact flows, and manage Identity and Access Management (IAM) roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_aia.admin

About this task

Connect your Amazon Connect contact center to a ServiceNow voice assistant using the Public Switched Telephone Network (PSTN) communication channel. When a call arrives, Amazon Connect invokes a Lambda function that retrieves a PSTN number from the ServiceNow Call Context API and transfers the call to the voice assistant. After the voice assistant handles the interaction, the Lambda function retrieves the interaction context and routes the call to a queue or ends the call.

Procedure

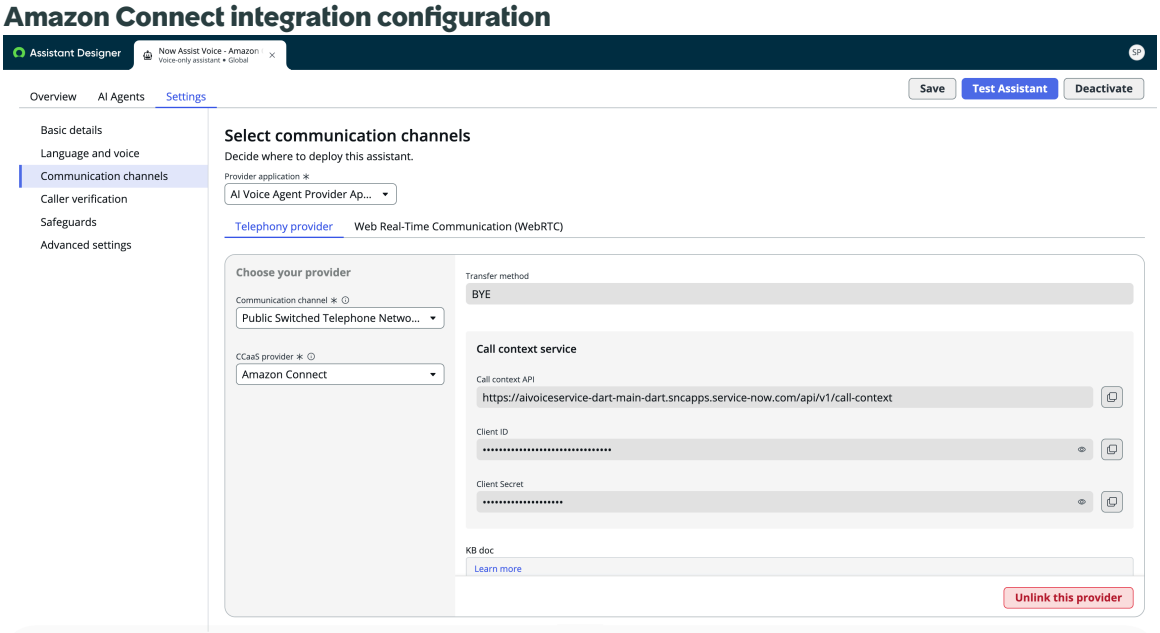
1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant to connect to Amazon Connect and select **Edit**.
3. Select the **Settings** tab.
4. Select **Communication channels** from the guided setup navigation.
5. In the **Provider application** field, select the provider application to deploy the voice assistant to.
6. Select the **Telephony provider** tab.
7. From the **Communication channels** drop-down list, select **Public Switched Telephone Network (PSTN)**.
8. From the **CCaaS provider** drop-down list, select **Amazon Connect**.

   The following read-only fields are generated in the **Call context service** section. Copy and save these values — you need them to configure the integration on the Amazon Connect side.

Amazon Connect configuration fields

Field	Description
Transfer method	Value set to **BYE** for Amazon Connect.
Call context API	The URL that Amazon Connect uses to send call context data to the voice assistant. Copy this value for use as the `call_context_api_path` and `voice_service_host_name` Lambda environment variables.
Client ID	Generated client ID for OAuth2 authentication. Copy this value for use in the AWS Parameter Store setup.
Client Secret	Generated client secret for OAuth2 authentication. Copy this value for use in the AWS Parameter Store setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Also note the voice service sys_id, which you can find in the URL when viewing the voice service record. You need this value in the Amazon Connect configuration steps.

Note: The Call Context API uses client credentials OAuth 2.0. For more details, see Client Credentials.

9. Enable context data persistence for the voice service.

   a. Navigate to `sys_now_assist_deployment_config_attributes.list` and check whether a `persist_context_data` attribute exists for your voice service.

   b. If the attribute exists, open it and set **Value** to `true`.
   This setting allows the Lambda function to retrieve interaction context data from ServiceNow after the voice assistant completes the call.

   c. If the attribute does not exist, navigate to `sys_now_assist_deployment_config.list`, open your voice assistant's deployment configuration record, and copy its sys_id.
   To copy the sys_id, select and hold (or right-click) the record header bar and select **Copy sys_id**.

   d. Navigate to `sys_now_assist_deployment_config_attributes.list`, select **New**, set **Deployment Configuration** to the sys_id you copied, **Name** to `persist_context_data`, and **Value** to `true`, then select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When `persist_context_data` is enabled, the voice assistant saves the session context as an `interaction_context` record named `bot_context_data` after each call. For details about the stored fields, see Bot context data.

10. In your AWS account, create the Lambda function that connects Amazon Connect to the voice assistant.

    a. From the AWS console, create a new Lambda function.
    In the **Runtime** field, select a Node.js version that AWS currently supports. For a list of supported versions, see https://docs.aws.amazon.com/lambda/latest/dg/lambda-nodejs.html.

    b. In the Lambda function code editor, replace the default handler code with the Lambda function code.
    See Amazon Connect Lambda function code.

    c. Set the following environment variables on the Lambda function.

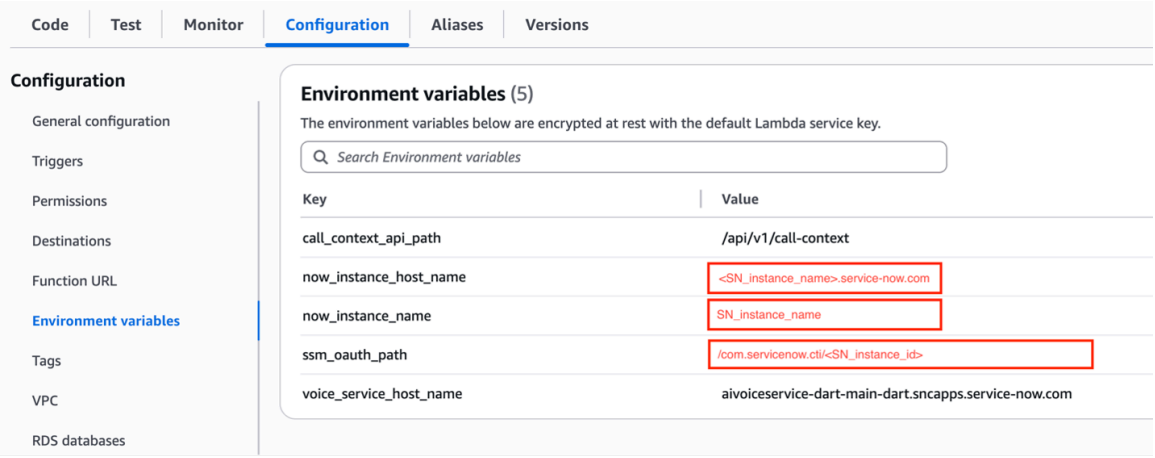
Lambda environment variables

Variable	Value
`call_context_api_path`	The path portion of the ServiceNow call context URL — the part of the URL after `.com`.
`now_instance_host_name`	The ServiceNow instance URL, without the `https://` prefix.
`now_instance_name`	The name portion of your ServiceNow instance URL. For example, `myinstance`, not `myinstance.service-now.com`.
`ssm_oauth_path`	The base path for OAuth credentials in AWS Parameter Store: `/com.servicenow.cti/<sn-instance-id>`. For example: `/com.servicenow.cti/a1b2c3d4a1b2c3d4a1b2c3d4a1b2c3d4`.
`voice_service_host_name`	The hostname from the ServiceNow call context URL.

Note: Both `call_context_api_path` and `voice_service_host_name` are derived from the Call Context API URL in the voice service configuration. `voice_service_host_name` uses the hostname portion of that URL, and `call_context_api_path` uses the path portion after `.com`. For example, for a Call Context API URL of `https://instance.service-now.com/api/v1/call-context`, set `voice_service_host_name` to `instance.service-now.com` and `call_context_api_path` to `/api/v1/call-context`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

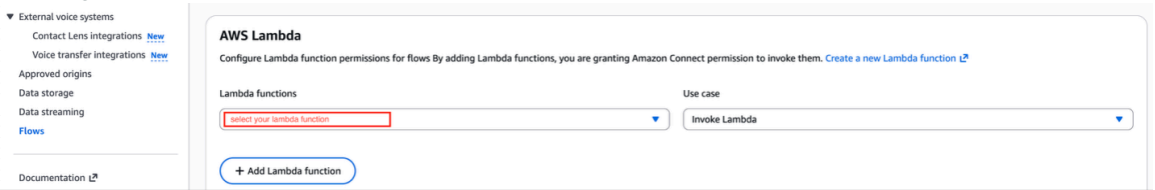
Lambda environment variables



d. Grant your Amazon Connect instance permission to invoke the Lambda function.

In the Amazon Connect console, navigate to your instance, select **Flows**, and under **AWS Lambda**, add the Lambda function with the Invoke Lambda use case. Confirm the policy was added in the Lambda console under **Configuration** > **Permissions**.

Adding a Lambda function in Amazon Connect



e. Replace the Lambda execution role permissions policy with the Identity and Access Management (IAM) policy.

See Amazon Connect Lambda Identity and Access Management (IAM) policy.

In the Lambda console, navigate to **Configuration** > **Permissions** > **Execution Role** and replace the existing permissions policy. Replace `<region>`, `<account-id>`, and `<lambda-function-name>` with your values.

f. Create a CloudWatch log group for the Lambda function.
In the AWS console, navigate to **CloudWatch** > **Log Management**. If no log group exists for your Lambda function, create one named `/aws/lambda/<your_Lambda_name>`.

g. Create the OAuth credentials in AWS Parameter Store.

From the AWS console, navigate to Parameter Store and create the following parameters using **SecureString** as the type.

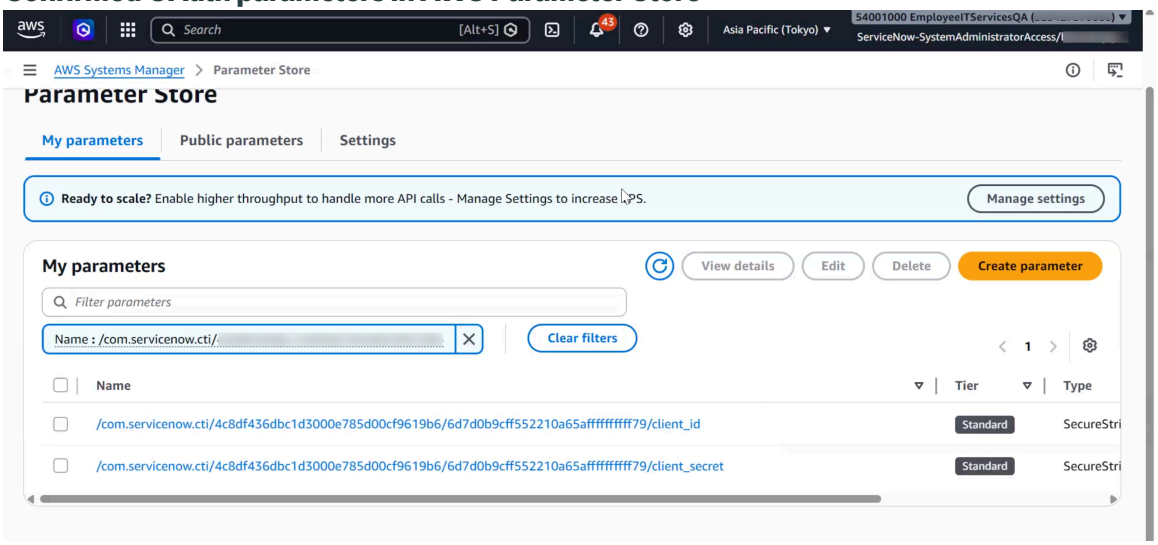
Parameter Store entries

Name	Value
`/com.servicenow.cti/<sn-instance-id>/<voice-service-id>/client_id` Where `sn-instance-id` is the value of the `instance_id` system property (to find this value, navigate to `sys_properties.list`	Client ID from the ServiceNow voice service configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value
and search for `instance_id`), and `voice-service-id` is the voice service sys_id.	
`/com.servicenow.cti/<sn-instance-id>/<voice-service-id>/client_secret` Where `sn-instance-id` is the value of the `instance_id` system property (to find this value, navigate to `sys_properties.list` and search for `instance_id`), and `voice-service-id` is the voice service sys_id.	Client Secret from the ServiceNow voice service configuration.

Confirmed OAuth parameters in AWS Parameter Store



Note: For example, if your `instance_id` property value is `a1b2c3d4a1b2c3d4a1b2c3d4a1b2c3d4` and your voice service sys_id is `b5c6d7e8b5c6d7e8b5c6d7e8b5c6d7e8`, create parameters named `/com.servicenow.cti/a1b2c3d4a1b2c3d4a1b2c3d4a1b2c3d4/b5c6d7e8b5c6d7e8b5c6d7e8b5c6d7e8/client_id` and `/com.servicenow.cti/a1b2c3d4a1b2c3d4a1b2c3d4a1b2c3d4/b5c6d7e8b5c6d7e8b5c6d7e8b5c6d7e8/client_secret`.

h. Add the AWS PowerTools layer to the Lambda function.
In the Lambda console, navigate to the Lambda function and select **Layers**. Add the AWS layer `AWSLambdaPowertoolsTypeScriptV2`, version 2.33.0 or later.

11. Import and configure the Amazon Connect contact flow.

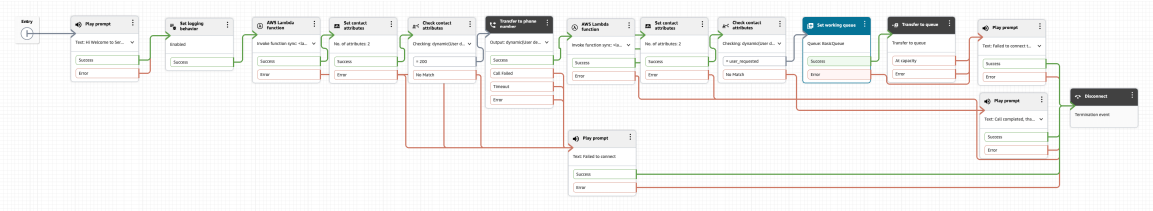
a. In your Amazon Connect instance, create a new contact flow by importing the Voice AI inbound flow JSON.

See Amazon Connect Voice AI inbound flow.

In the Amazon Connect console, navigate to **Routing** > **Flows**, select **Create flow**, then use the import option. Replace all placeholder values with your own before importing.

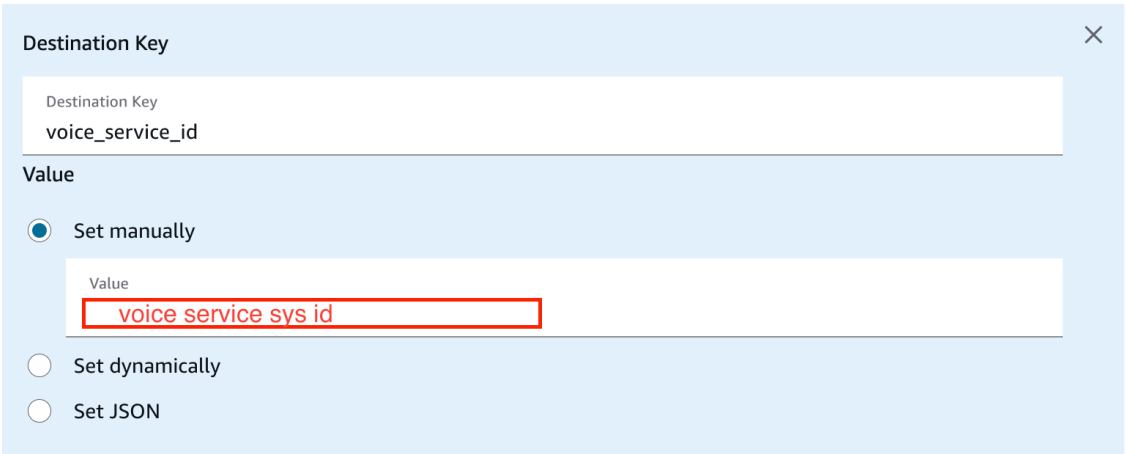
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Imported Voice AI inbound contact flow



b. In both AWS Lambda function blocks, set the function ARN to your Lambda and set the `voice_service_id` parameter to the voice service sys_id.

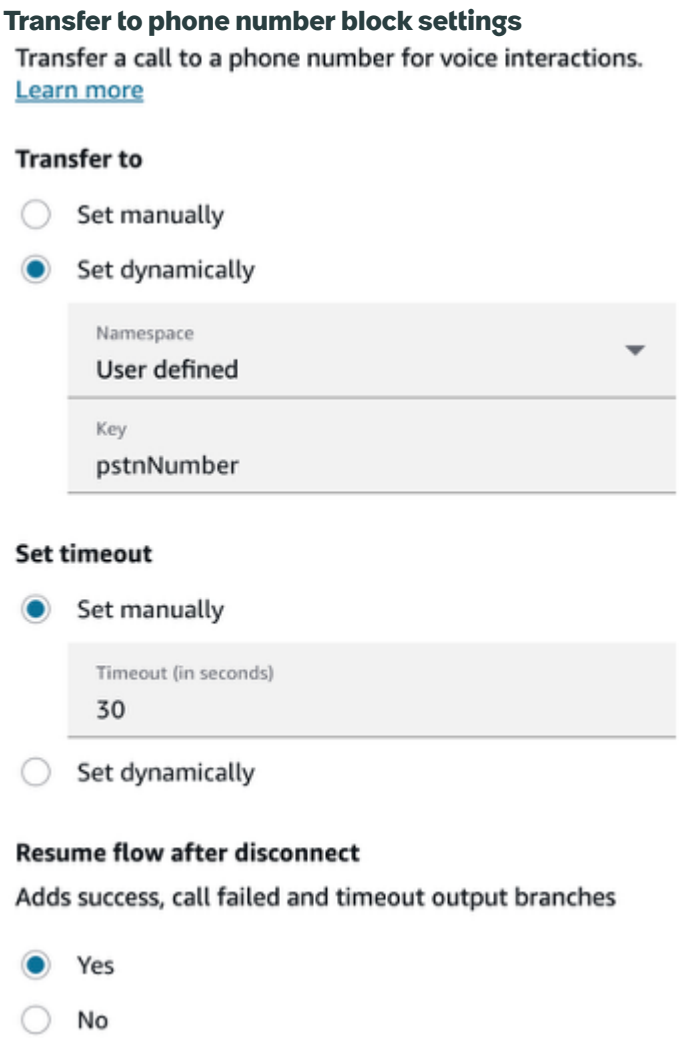
Configuring an AWS Lambda function block



c. Save and publish the contact flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When Amazon Connect transfers the call to ServiceNow, the contact flow must pass the original caller's phone number as the caller ID. Verify that your contact flow is configured to preserve the original caller ID during the transfer, not the Amazon Connect transfer number.



12. Associate a phone number with the contact flow.

    a. In the Amazon Connect service dashboard, navigate to **Channels** > **Phone numbers**.

    b. Claim a new number or select an existing number to associate with the contact flow. Associating a phone number with the contact flow enables incoming calls to be routed through the voice assistant.

Result

Amazon Connect is connected to your ServiceNow voice assistant. Incoming calls routed through Amazon Connect are handled by the AI voice agent, which responds with a greeting and processes the caller's requests. When call handling is complete, the contact flow routes the caller to a queue or ends the call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Test the integration by placing a call through your Amazon Connect phone number and verifying that the voice assistant responds correctly. Review the CloudWatch logs for the Lambda function to troubleshoot any connection issues.

Integrate ServiceNow voice assistant with Five9

Enable users to get support from AI voice agents by integrating a ServiceNow voice assistant with Five9 voice service.

Before you begin

- Create a voice assistant. See Create an AI voice assistant for more information.

Role required: sn_aia.admin

About this task

Connect your Five9 contact center to a ServiceNow voice assistant using the Session Initiation Protocol (SIP) communication channel. After the integration is configured, Five9 routes calls to the ServiceNow SIP endpoint, where the AI voice agent handles the interaction. When call handling is complete, the integration supports transferring the caller to a live agent queue.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant that you want to connect to Five9 and select **Edit**.
3. Select **Communication channels** from the guided setup navigation.
4. In the **Provider application** field, select the provider application to deploy the voice assistant to.
5. Select the **Telephony provider** tab.
6. From the **Select communication channels** dropdown, select **Session Initiation Protocol (SIP)**.
7. From the **CCaaS provider** dropdown, select **Five9**.

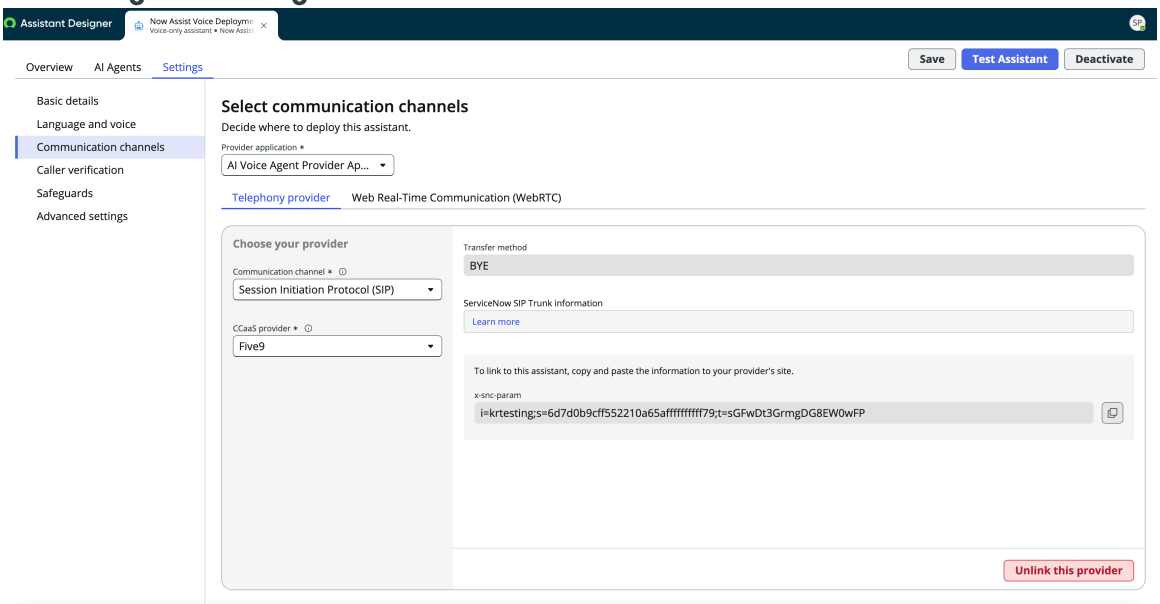
   The following read-only fields are generated. Use these values to configure the SIP trunk in your Five9 account.

Five9 configuration fields

Field	Description
Transfer method	Read-only. Set to **BYE** for Five9.
ServiceNow SIP Trunk information	Read-only. The ServiceNow SIP fully qualified domain name (FQDN) for your region, used to route calls from Five9 to the voice assistant. For SIP trunk configuration details including IP addresses and FQDNs per region, see KB3023612.
x-snc-param	Read-only. Generated token to send to your Five9 account to authenticate requests to the voice assistant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Five9 integration configuration



8. Enable context data persistence for the voice service.

   a. Navigate to `sys_now_assist_deployment_config_attributes.list` and check whether a `persist_context_data` attribute exists for your voice service.

   b. If the attribute exists, open it and set **Value** to `true`.

Setting persist_context_data to true

   c. If the attribute does not exist, navigate to `sys_now_assist_deployment_config.list`, open your voice assistant's deployment configuration record, and copy its `sys_id`.
   To copy the `sys_id`, right-click the record header bar and select **Copy sys_id**.

   d. Navigate to `sys_now_assist_deployment_config_attributes.list`, click **New**, set **Deployment Configuration** to the `sys_id` you copied, **Name** to `persist_context_data`, and **Value** to `true`, then click **Submit**.

   When `persist_context_data` is enabled, the voice assistant saves the session context as an `interaction_context` record named `bot_context_data` after each call. For details about the stored fields, see Bot context data.

9. In your Five9 IVR, add the **x-snc-param** as a SIP custom header using the Set Variable Module. In the Set Variable Module, use the following function to pass the **x-snc-param** value generated in the previous step:

```
PUT(ToIVA, "x-snc-param", "x-snc-param value")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Five9 is connected to your ServiceNow voice assistant. Incoming calls routed through Five9 are handled by the AI voice agent, which responds with a greeting and processes the caller's requests.

What to do next
For live agent transfer configuration and advanced SIP trunk settings, refer to the Five9 BYO SIP Trunk Integration Guide or contact Five9 support.

Integrate ServiceNow voice assistant with Nice CXone

Enable users to get support from AI voice agents by integrating a ServiceNow voice assistant with Nice CXone.

Before you begin
- Create a voice assistant. See Create an AI voice assistant for more information.
- Access to your CXone account with permissions to configure SIP trunks.
- Nice API credentials, including the API endpoint, token endpoint, access key ID, access key secret, client ID, and client secret. Work with your Nice account team to obtain the access key ID and secret. See the CXone developer documentation for more information.

Role required: sn_aia.admin

About this task
Connect your CXone contact center to a ServiceNow voice assistant using the Session Initiation Protocol (SIP) communication channel. After the integration is configured, CXone routes calls to the ServiceNow SIP endpoint, where the AI voice agent handles the interaction. When call handling is complete, the integration supports transferring the caller to a live agent queue using the SIP REFER transfer method.

Procedure
1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant that you want to connect to CXone and select **Edit**.
3. Select the **Settings** tab.
4. Select **Communication channels** from the guided setup navigation.
5. In the **Provider application** field, select the provider application to deploy the voice assistant to.
6. Select the **Telephony provider** tab.
7. From the **Communication channel** dropdown, select **Session Initiation Protocol (SIP)**.
8. From the **CCaaS provider** dropdown, select **Nice**.

   Enter the values in the **Nice API credentials** section.

Nice API credentials

Field	Description
API endpoint	The CXone API base URL. Must be a valid Nice domain, such as `https://cxone.niceincontact.com` or `https://cxone-gov.niceincontact.com`.
Token endpoint	The CXone OAuth token URL used to generate authentication tokens. Must be a valid Nice domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Username	The access key ID from your CXone account. Work with your Nice account team to obtain this credential.
Password	The access key secret from your CXone account. This value is only displayed once when generated. Copy it before navigating away.
Client ID	The OAuth client ID from your CXone account.
Client Secret	The OAuth client secret from your CXone account.

After saving the credentials, copy the generated **x-snc-param** value from the page. This is a token that authenticates requests from CXone to the voice assistant. Paste it in your CXone account when configuring the SIP trunk.

9. Enable context data persistence for the voice service.

   a. Navigate to `sys_now_assist_deployment_config_attributes.list` and check whether a `persist_context_data` attribute exists for your voice service.

   b. If the attribute exists, open it and set **Value** to `true`.

Setting persist_context_data to true

   c. If the attribute does not exist, navigate to `sys_now_assist_deployment_config.list`, open your voice assistant's deployment configuration record, and copy its `sys_id`.
   To copy the `sys_id`, right-click the record header bar and select **Copy sys_id**.

   d. Navigate to `sys_now_assist_deployment_config_attributes.list`, click **New**, set **Deployment Configuration** to the `sys_id` you copied, **Name** to `persist_context_data`, and **Value** to `true`, then click **Submit**.

   When `persist_context_data` is enabled, the voice assistant saves the session context as an `interaction_context` record named `bot_context_data` after each call. For details about the stored fields, see Bot context data.

10. In your CXone account, configure the SIP trunk using the **ServiceNow SIP FQDN** and pass the **x-snc-param** value copied in the previous step as a SIP header on outbound calls to the voice assistant.
    For SIP trunk configuration details including IP addresses and FQDNs per region, see KB3023612. For CXone-side SIP trunk configuration steps, see the CXone developer documentation.

Result

CXone is connected to your ServiceNow voice assistant. Incoming calls routed through CXone are handled by the AI voice agent, which responds with a greeting and processes the caller's

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

requests. When call handling is complete, the voice assistant transfers the caller back to CXone using the REFER method.

What to do next

Configure the **Onsignal** event action flow in your CXone account. When a voice agent call ends or transfers to a live agent, ServiceNow automatically notifies CXone by sending a signal to the `/interactions/{contactId}/signal` API endpoint, which triggers the Onsignal event action flow. For configuration details, see the CXone developer documentation.

Integrate ServiceNow voice assistant with a custom SIP provider

Enable users to get support from AI voice agents by integrating a ServiceNow voice assistant with a custom Session Initiation Protocol (SIP) provider.

Before you begin

- Create a voice assistant. See Create an AI voice assistant for more information.
- Access to your SIP-capable telephony system with permissions to configure SIP trunks.

Role required: sn_aia.admin

About this task

Connect any SIP-capable telephony system to a ServiceNow voice assistant using the Custom provider option. Use this integration when your organization routes calls through its own SIP infrastructure rather than a named CCaaS provider. Inbound calls arrive over the provided SIP trunk and are handled by the AI voice agent. When call handling is complete, the integration supports transferring the caller back to your telephony system or terminating the call.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant that you want to connect to your SIP provider and select **Edit**.
3. Select the **Settings** tab.
4. Select **Communication channels** from the guided setup navigation.
5. In the **Provider application** field, select the provider application to deploy the voice assistant to.
6. Select the **Telephony provider** tab.
7. From the **Communication channel** dropdown, select **Session Initiation Protocol (SIP)**.
8. From the **CCaaS provider** dropdown, select **Custom**.
9. Configure the transfer settings.

Transfer configuration fields

Field	Description
Transfer method	Select **REFER** or **BYE** depending on the transfer protocol supported by your telephony system. Select **REFER** to transfer the caller to a live agent queue using SIP REFER. Select **BYE** to terminate the SIP session when call handling is complete, which allows your telephony system to take over the call independently.
Transfer number/address	The SIP URI to transfer the call to your telephony system. Use the format `user@domain`. This field is visible only when **Transfer method** is set to **REFER**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Select a **Context transport format** to specify how the voice assistant passes conversation context when transferring or terminating a call.

Context transport format options

Option	Description
X-snc-context (default)	Passes conversation context using the ServiceNow proprietary SIP header. Maintains conversation state and session metadata across call transfers, handoffs, and interactions.
User-to-User (UUI)	Passes conversation context using the standard SIP User-to-User header, enabling transfers without losing conversation state. Use this option when your telephony system supports the SIP UUI header.
None	No session or interaction data is shared between systems.

Custom SIP configuration

11. Select **Save and continue**.

    The **ServiceNow SIP Trunk information** section displays a read-only **x-snc-param** value. Copy this token to use it when configuring your SIP trunk to authenticate requests to the voice assistant.

12. Configure your SIP-capable telephony system to route calls to the **ServiceNow SIP FQDN** for your region.
    For SIP trunk configuration details including IP addresses and FQDNs per region, see KB3023612.

13. Pass the **x-snc-param** value as a SIP header on outbound calls to the voice assistant.

Result

Your custom SIP provider is connected to the ServiceNow voice assistant. Incoming calls routed through your SIP trunk are handled by the AI voice agent. When call handling is complete, the voice assistant transfers or terminates the call according to the configured transfer method.

Integrate voice assistant with mobile app launcher

Configure your voice assistant to be accessible through the voice launcher functions in mobile app.

Before you begin

Role required: virtual_agent_admin or admin

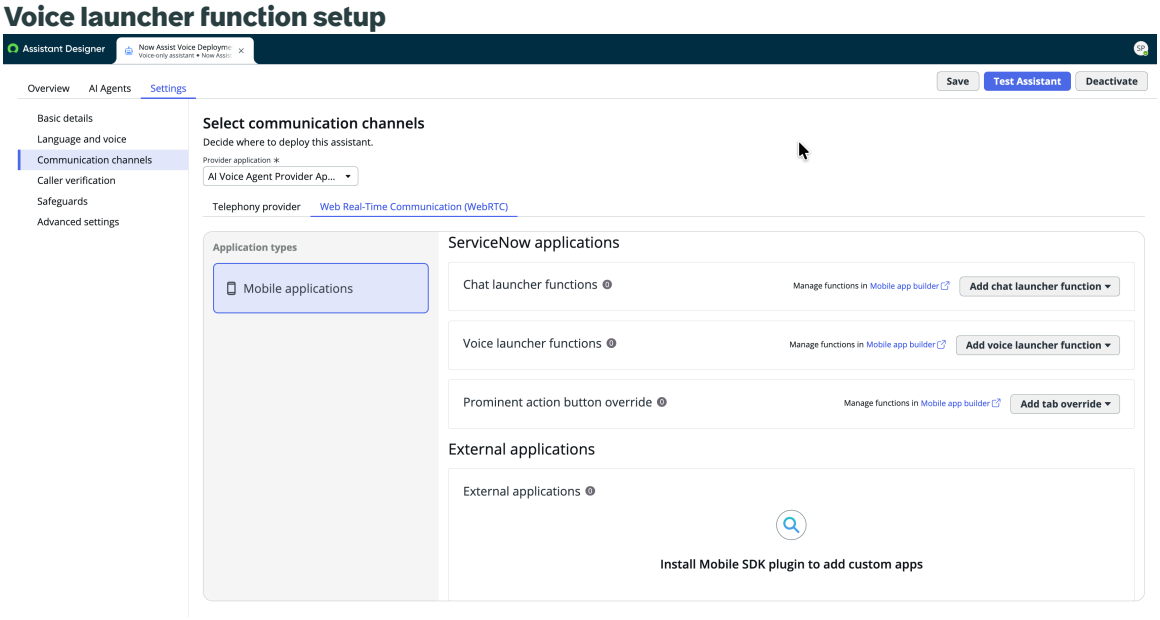
- You must have a voice assistant created in Assistant Designer
- Mobile app voice launcher function must be configured using Now Assist for Mobile before you can assign it to an assistant. See Configure Mobile AI Voice Agent for more information.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Assistant Designer** > **Assistants**.
2. Find the voice assistant that you want to connect to a mobile app voice launcher and select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Communication channels** in the Settings tab and select **Mobile channels** tab.



4. In Voice launcher functions, select from the **Add voice launcher function** drop-down to add a voice launcher function to open the assistant in voice mode.
5. **Optional:** In Chat launcher functions, select from the **Add chat launcher function** drop-down to add a chat launcher function to open the assistant in chat mode.
6. In Prominent action button override, select from the **Add tab override** drop-down to allow a prominent action button to launch the assistant.

   The prominent action button overrides what's been defined in the chat launcher and voice launcher functions. See Configuring a prominent action button for more information on configuring the prominent action button.

7. Select **Save** to save the configuration.

Test AI voice agents

Test your AI voice agents associated with a voice assistant from the Assistant Designer. You can make browser-based voice calls and view turn-by-turn analysis of AI voice agents invoked, tools executed, and latency data during the conversation.

Use the voice testing experience to evaluate how your AI voice agents handle real conversations before deploying them. You can access voice testing from Assistant Designer or from AI Agent Studio.

Test from Assistant Designer

Navigate to the voice assistant in Assistant Designer and select **Test** to open the voice testing interface. See for step-by-step instructions.

Test from AI Agent Studio

Launch the voice testing interface directly from the agent's channel configuration in AI Agent Studio. See for step-by-step instructions.

AI voice agent analytics

The Voice dashboard page in the Analytics tab of Assistant Designer helps you monitor the usage and performance metrics for AI voice agents.

Accessing AI voice agent analytics

To view the dashboard, navigate to **All** > **Assistant Designer** > **Analytics** and select the **Voice** tab. See Voice page in assistant analytics for more information.

AI voice agent reference

Reference information for AI voice agents.

AI voice agent roles

The following table lists the roles installed with the ServiceNow Otto for Voice Agents plugin.

Roles	Description
sn_voice_aia.admin	Provides access to agents configuration flow
sn_voice_aia.guest	Enables employees to use AI voice agents without authentication
sn_voice_aia.integration	Enables access to integrations such as Oracle

AI voice agent attributes

The AI voice agent attributes enable you to configure the authentication functionality for AI voice agents. Navigate to **All** > **System Definition** > **Tables** and search for Now Assist Deployment Config Attributes table to view the attributes.

The following table lists the attributes related to AI voice agent configuration.

Attribute	Description
voice_max_retries	The maximum number of retries allowed for successful authentication before the user account is locked. The default value is 3.
voice_minutes_account_is_locked	The number of minutes the user account is locked for, following maximum retries. The default value is 1440 minutes.
persist_context_data	Controls whether interaction context data is persisted after a call ends. Set to `true` to enable context data storage. The default value is `false`. This attribute is scoped per voice assistant deployment. For details about the stored data, see the Bot context data section.

Bot context data

When the `persist_context_data` attribute is enabled, the voice assistant saves the session context as an `interaction_context` record after each call. The record includes the following fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bot context data interaction_context record fields

Field	Value
name	`bot_context_data`
interaction	sys_id of the related interaction record.
value	JSON string containing the session context. See the following tables for field descriptions.

The `value` field is a JSON string that contains the following base fields.

Bot context data base fields

Field	Type	Description
conversationId	string	Conversation identifier.
interactionId	string	sys_id of the related interaction record.
completed	boolean	Set to `true` when the bot session completed normally.
sessionVariables	object	Key-value pairs describing the session state. See the following table for details.

Bot context data sessionVariables fields

Key	Description
snStatusCode	HTTP status code from the voice session.
snTransferReason	Reason for the conversation end state. Set to `user_requested` when a live agent transfer is required.
snConversationId	sys_id of the conversation record for the call.
snInteractionId	sys_id of the interaction record for the call.
snIsAuthenticated	Indicates whether the caller was successfully authenticated.
snFirstName, snLastName	First and last name of the caller. Present only when the interaction is authenticated and the caller is verified.

Additional keys can appear in `sessionVariables` when custom data is added to the session cache by the voice agent.

The following example shows the JSON stored in the `value` field of a `bot_context_data` record.

```
{
  "conversationId": "e7dc929a3b714bd04eae2a8693e45afe",
  "interactionId": "27dcd29a3b714bd04eae2a8693e45a01",
  "completed": true,
  "sessionVariables": {
    "snStatusCode": "200",
    "snTransferReason": "auto_closed",
    "snConversationId": "e7dc929a3b714bd04eae2a8693e45afe",
    "snInteractionId": "27dcd29a3b714bd04eae2a8693e45a01",
    "snIsAuthenticated": "true",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "snFirstName":  "System",
        "snLastName":  "Administrator"
    }
}
```

AI voice agent system properties

The following table consists of system properties to set up AI voice agents.

Property	Description
sn_aia.enable_voice_agent_setup	The system property to enable AI voice agents. Set the value of the property to true to enable AI voice agents on the instance.
glide.voice.authenticate.mfa_mandatory	Controls whether multi-factor authentication is required for caller verification. Set to `false` to enable single factor authentication. Default value is `true`.

Configuration for custom AI voice agent provider

The following table captures the required configurations on your instance to support AI voice agents. These configurations are required only if you're creating a new messaging channel, provider channel, and provider channel identity for AI voice agents.

Field	Value
Messaging channel	
Type	Phone
Synchronous	True
Provider Channel	
Provider attributes action	sn_va_as_service.virtual_agent__bot_to_bot_provider_attribute
Sender subflow	sn_va_as_service.virtual_agent__bot_to_bot_contextual_action
Contextual action	sn_va_as_service.virtual_agent__bot_to_bot_contextual_action
Allow account linking	True
Account linking type	Verification question
Automatic link action	sn_va_as_service.virtual_agent__bot_to_bot_auto_link_account
Rich control mappings	
Control type	DefaultAction
Outbound transformer action	sn_va_as_service.virtual_agent__bot_to_bot_action_outbound_
Provider Channel Identity	
Message auth	Name of the message authentication that you created as part of
Provider Identity properties	
allow_storing_history_in_ongoing_conversation	True

AI voice agent analytics indicators details

The following table maps the visualizations to the indicator sources and the calculation behind the metrics shown in the dashboard.

AI voice agent analytics indicator details

Visualization	Indicator type	Calculation	Available breakdowns	Frequency	Unit	Precision
Total voice conversations	Automated	Count of all voice calls	None	Daily	#	0
Calls completed without a live agent	Automated	Count of voice calls where Agent chat=false	None	Daily	#	0
Conversations transferred to a live agent	Automated	Count of voice calls where Agent chat=true	None	Daily	#	0
Number of tickets created	Automated	Count of Interaction Related Records where Agent chat = false and Interaction Virtual agent = true and Interaction Type = Phone and Interaction AI Voice = true	None	Daily	#	0
Conversations disconnected	Automated	Count of voice calls where State=Closed Abandoned	None	Daily	#	0
Inferred customer satisfaction (CSAT): average score (out of 5)	sn_na_analytics_insights table	Average of session CSAT	None	Daily	#	1
Average voice	Formula	[[AI Agent-Summed	None	Daily	Minutes	0

AI voice agent analytics indicator details (continued)

Visualization	Indicator type	Calculation	Available breakdowns	Frequency	Unit	Precision
conversation duration		duration of calls]] / [[AI Agents-Total Calls]]				
Number of deflected conversations per AI agent	sn_na_analytics_insights table	Count of voice calls where Resolved is Yes	None	Daily	#	0

AI voice agent transcript and logs tables

The following tables contain details of the voice calls, from initiation and conversation details to agent actions and tool executions.

AI voice agent transcript and log tables

Table	Details
sn_aia_execution_plan	The sn_aia_execution_plan table stores execution plans associated with voice calls. Each record in this table represents a single execution plan and contains detailed information about the interactions and actions that occurred during the call.
sn_aia_tools_execution	The sn_aia_tools_execution table logs information related to tool executions during a voice call. Each record represents a single tool execution and captures details about the agent, the tool used, and the outcome of that execution.
sys_cs_conversation	The sys_cs_conversation table stores the conversation record created at the start of a voice call. Its creation timestamp marks the beginning of the call. This table contains metadata and transcripts associated with the conversation, like state, device type, and transcripts from the call. **Note:** Personally Identifiable Information (PII) data is redacted from transcripts before it is stored.
Interactions	The Interactions table is similar to sys_cs_conversation and is created at the same time as the conversation record. It contains much of the same information related to the voice call.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI voice agent transcript and log tables (continued)

Table	Details
sys_generative_ai_log	The sys_generative_ai_log table stores general-purpose logs for generative AI interactions during a voice call. If an agent uses an LLM (Large Language Model) during the call, this table records the relevant details such as prompt, response, and errors.

Amazon Connect Lambda function code

Use the following Lambda function code when creating the Lambda function for the Amazon Connect and ServiceNow voice assistant integration. Copy this code into the Lambda function code editor. All dynamic values are read from environment variables set on the Lambda function.

```
const https = require('https');
const { getParameter, setParameter } =
 require('@aws-lambda-powertools/parameters/ssm');

// ### Structured logger
############################################################

function log(level, message, context = {}) {
 console[level === 'ERROR' ? 'error' : level === 'WARN' ? 'warn' : 'log'](
  JSON.stringify({ level, message, ...context })
 );
}

// ### HTTP helper
#####################################################################

function sendHttpsRequest(options, postData) {
 return new Promise((resolve, reject) => {
  const req = https.request(options, (res) => {
   let body = '';
   res.on('data', (chunk) => { body += chunk; });
   res.on('end', () => {
    if (res.statusCode >= 200 && res.statusCode < 300) {
     resolve(body);
    } else {
     reject(new Error(`HTTP ${res.statusCode} for
 ${options.method} ${options.hostname}${options.path}`));
    }
   });
  });
  req.on('error', reject);
  if (postData) req.write(postData);
  req.end();
 });
}

// ### SSM

Execute an agentic evaluation run

Evaluate agentic AI assets against datasets to monitor performance and compare benchmarks.

Before you begin

Evaluation runs require execution log data of the agentic AI asset you want to evaluate. You can create execution log data by testing in AI Agent Studio or triggering agentic AI. You can also create execution log data after setting up your evaluation run.

For more information about testing agentic workflows, see Manually test the execution of an agentic workflow.

For more information about getting started with agentic evaluations, see General guidelines for agentic evaluation runs.

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Agentic Evaluations**.

   You can also start from the testing page of the AI Agent Studio. Navigate to **All** > **AI Agent Studio** > **Testing**. Select **Start automated evaluation** to access the guided setup.

2. On the evaluations home page, select **New evaluation run** to begin the guided setup.
3. In the modal, select **Chat agent or workflow**, then select **Proceed**.

   The following steps are for chat agentic AI assets. If you're evaluating an AI voice agentic asset, see Execute a run for an AI voice agentic asset. Many steps are similar, but there are aspects specific to AI voice agentic assets that require special attention.

4. In the **Add general info** step, add a name and select the agentic AI asset that you want to evaluate.

5. Select **Continue** to go to the next step.

   Each time you navigate through a step, the evaluation run is saved automatically as a draft. At any point, you can select **Save as draft**.

   If you want to exit the guided setup, you can select **Exit setup**. You're redirected to the Agentic Evaluations page.

   - If you select **Save and exit**, the evaluation run appears on the Agentic Evaluations page with the status of *Draft*.
   - If you select **Discard and exit**, the evaluation run draft is deleted.

6. Select your evaluation metric.

   Overall task completeness evaluation is selected by default. Running multiple evaluation metrics provides a comprehensive overview of the agentic AI asset's performance.

   To see more information about each plan, you can expand the card for each evaluation plan by selecting the chevron icon .

   Any custom metrics that you have published appear as options. If you don't see your custom metric, verify that it's published. See Create a custom metric for more information.

7. Configure your dataset.

   a. Choose between generating new execution logs by running the agent or workflow or using execution logs from previous runs.

   b. To create a dataset by generating new execution logs, start by selecting a table.

      Instead of making a new dataset from scratch, you can choose to use a past dataset that you used in a different evaluation by selecting **Select from a past dataset**. Once you select a dataset, you can review the details including source table, record count, and the last agentic AI asset that used the dataset.

      Note: If you're evaluating an agentic AI asset created with AI Agent Advisor, the options for your dataset are automatically filled in for you. You can still make edits to the values.

Configure dataset form for new execution logs

Field name	Description
Table	The source table for records that the agentic AI asset uses to perform tasks and create executions.
Added filters	Conditions for narrowing down the list of records for the agentic AI asset to use to generate execution log data.
No. of records to use	The maximum number of records within the dataset for evaluation. If the dataset contains more records than the maximum, additional records are ignored.
Task	Utterance given to the agentic AI asset to execute. Use the pill picker to select dynamic inputs for the task. For example, set the starting instruction to `Help me resolve {{incident.number}}`. Inputs from the record must be written between double curly braces.
Additional details about the agent or workflow	Information given to the large language model (LLM) that supplements table record information. For example, a tuition reimbursement agentic workflow requires the normal reimbursement allowance, which could be provided through a knowledge article.
Run as user	The user associated with the table record to run the agentic AI asset. For example, depending on your use case, you can run the user as the requester or as the fulfiller.
Name	Name for the dataset. This can be useful if you plan on using the same dataset again.
Description	Description of the records contained within the dataset. This can be useful if you plan on using the same dataset again.

Note: If you're creating new execution logs, the user submitting the evaluation must pass the ACLs of the agentic AI asset and its components. Without correct role requirements, execution logs report access denial and the evaluation fails. See Security for agentic AI for more information.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure dataset form for existing execution logs

Field name	Description
Added filters	Conditions for narrowing down the AI execution log records you want to include in the dataset. **Note:** Filter conditions aren't supported for creating datasets of AI voice agent execution logs.
No. of records to use	The maximum number of records within the dataset for evaluation. If the dataset contains more records than the maximum, additional records are ignored.

c. Select **See preview** to see a list of records based on the conditions you specified. You can narrow down the records by selecting specific records in the preview list. Unselected records won't be included in the dataset.

8. Review the agentic evaluation details in the last step of the guided setup.

   If you want to make changes, you can select **Back** to go to a previous step, or you can select the step in the sidebar.

9. Select **Start evaluation**.

Result

Your evaluation run executes. Completion time varies, but after completion you can select the evaluation from the Agentic Evaluations page to view results.

For more information on the metrics on the results page, see Agentic evaluation run results.

Create a custom metric for evaluating agentic workflows

Create a custom metric for evaluating AI agents and agentic workflows to test the outputs against expected responses.

Before you begin

Role required: sn_aia.admin

About this task

Custom metrics enable you to choose you measure your AI agents and agentic workflow for effectiveness. You can create custom metrics that apply to one agentic AI asset or multiple ones. Once created, you can select custom metrics in the guided setup for agentic evaluations. You can select both or either custom metrics and metrics installed with AI applications. Examples of custom metrics include:

- Testing that a certain phrase is in the response
- Measuring the length of a response to test verbosity

When writing the script, you have access to the output of a parser tool. See agentic evaluation parser tool for more details on how it works.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Skill Kit** > **Agentic Evaluations**.
2. Go to the Evaluation metrics tab and select **Create metric**.
3. In the **General information** step, enter a name and short description for your custom metric.

   You can navigate between steps in the guided setup with the **Continue** and **Back** buttons. After entering a name for your custom metric, you can skip directly to writing your script by selecting **Skip to Script Editor**. You can fill out the details later from the Metric settings tab in the Script Editor.

4. **Optional:** In the **Metric details** step, add information about the evaluation metric, how it works, and what the output format of the metric is.

   (Optional) If you select **Use this content**, then the details you provide are displayed along with the option in the guided setup for an agentic evaluation run.

   You do not have to fill in details, but you have the option to provide useful information and context to aid the custom metric development process. You can also add metric details from the **Metric settings** tab of the Script Editor.

5. After reviewing your metric information in the **Summary** step of the guided setup, select **Finish setup** to be redirected to the Script Editor.
6. **Optional:** Add metric inputs.

   (Optional) By default, the execution plan record sys_id is included as a metric input.

   The parser tool lets you access content from the execution plan log without having to parse through the XML or JSON content yourself. You can access the parser tool's outputs with `tool.output`.

   a. In the Metric inputs section, select the plus icon to open the Add metric input modal.

   b. Complete the form.

Field	Description
Input datatype	Drop-down selector to choose what data type and format the input is
Name	Short, user-friendly name for the input
Description	Description of the input. You can view the description of any input by selecting it in the Metric inputs section of the Script Editor.
Test values	Default input values used for testing your script in the Script Editor
Mandatory	Determines whether providing the input is necessary for the evaluation to run

   c. Select **Add**.

7. Write your script-based metric.

   The default code block in the Script Editor contains commented code that can guide you through the script-writing process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

At any time, you can select **Metric output template** to see the code necessary for the output to display correctly when looking at the evaluation run results in Skill Kit. This content is also included in the default code block when you first open the Script Editor. If necessary, you can copy the template and paste it into the script. Be sure to change the values to the results of your custom metric.

You can review the details of the custom metric from the guided setup from the Metric settings tab.

When you have made changes, you can select the **Save** button to save your changes.

Important: Even if you save, the metric won't be available to use in agentic evaluation runs until you publish it.

8. Select **Run test** to open the Run test modal, enter your metric test inputs, and run the test.

   After you have run at least one test, you can review the response and request of both the overall execution and the parser tool.

   After you have run at least one test, you can select the **Run test** drop-down button and select **Run test history** to open a new sidebar with past test results. You can filter test runs by the user who executed the test.

9. Select **Publish metric** to save your script and activate the metric.

   Before publishing, ensure that your output matches the metric output template. If not, your metric may not work as expected or display correctly on the evaluation run results page.

Result
You have a new custom metric that can be used for evaluating agentic AI assets.

What to do next
Execute an evaluation run and select your custom metric in the guided setup. See Evaluate agentic AI for more information on executing an evaluation run.

If you do not see your custom metric in the guided setup for an evaluation run, make sure that you have published it.

Agentic evaluation parser tool

Use the outputs of the agentic evaluation parser tool in your scripts for custom metrics to customize the criteria for effective AI agents and agentic workflows.

Parser tool overview

The agentic evaluation parser tool extracts structured execution data from the execution logs of an agentic workflow or AI agent. You can use the information gathered by the tool to create custom metrics that use scripts to evaluate agentic workflows.

The parser tool returns structured AI agent or agentic workflow execution data within the `output.payload` object, which contains the following:

- `executionInputs`: A JSON object that contains initial workflow setup information, such as the names and instructions of agents and tools and the initial user utterance
- `executionOutputs`: A JSON object with AI agent actions and tool execution results

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *executionMessages*: A JSON object array of user-facing conversation flow and system responses
- *executionPlanDetails*: A JSON object of execution metadata, such as status, sys_ids, and configuration values

```
{
     "output": {
 "payload": {
  "executionInputs": { ... },
  "executionOutputs": { ... },
  "executionMessages": [ ... ],
  "executionPlanDetails": { ... }
 }
}
```

Accessing the parser tool's output

To view the complete parser tool output for testing and development, perform the following steps.

- Navigate to the Script Editor view in your custom metric guided setup.
- Select **Run Test**.
- Wait for the test to complete.
- View the complete JSON output in the Tools section of the test results.

Reviewing the parser tool's output before designing your custom metric enables you to inspect the data structure before implementing any specific logic.

executionInputs data structure

The executionInputs attribute contains a JSON object with the following structure:

```
"executionInputs": {
 "agenticWorkflow": "(name of agentic workflow)",
 "description": "(descriptions for agentic workflow)",
 "instructions": "(list of steps for agentic workflow)",
 "utterance": "(initial user utterance)",
 "agents": [
  {
   "name": "(AI agent name)",
   "instructions": "(list of steps for AI agent)",
   "tools": [
    {
     "name": "(tool name)",
     "description": "(tool description)",
     "executionMode": "(execution mode, either Autonomous or
 Supervised)",
     "inputs": { ... }
    },
    { ... }, ...
   ]
  },
  { ... }, ...
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 ]
}
```

executionOutputs data structure

The executionOutputs attribute contains a JSON object with the following structure:

```
"executionOutputs": {
 "agents": [
  {
   "name": "(AI agent name)",
   "subTask": { ... },
   "tools": [
    {
     "name": "(tool name)",
     "inputs": { ... },
     "output": { ... }
    }
   ]
  },
  { ... }, ...
 ]
}
```

executionMessages data structure

The executionOutputs attribute contains an array of JSON objects with the following structure:

```
"executionMessages": [
 {
  "role": "(Message sender, either 'agent' or 'user')",
   "message": "(Content of message)",
   "order": "(Sequence number indicating order of message in the
 conversation)"
  },
  { ... }, ...
]
```

executionPlanDetails data structure

The executionPlanDetails attribute contains a JSON object with the following structure:

```
"executionPlanDetails": {
    "state": "(Current execution status)",
    "runType": "(Type of execution)",
    "conversationId": "(sys_id of conversation)",
    "relatedTask": "(sys_id of the associated task or record)",
    "relatedTaskTable": "(Table name where the related task is
 stored)",
    "context": { ... } (May be null)
    "builtInTools": [ { ... } ]
    }
```

This section provides execution metadata for tracking workflow performance, debugging issues, and correlating executions with specific tasks or conversations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The possibilities for runType include the following:

- API
- Chat
- Evaluation
- Testing
- Trigger

Using parser tool output in metric scripts

The parser tool data is available in your metric script through the *context* parameter. Access the structured data using the following code:

```
// Access the parser tool output from context
var parserToolOutput =
 context['AgenticExecutionParserTool.output'];
if (typeof parserToolOutput == "string") {
 parserToolOutput = JSON.parse(parserToolOutput);
}
var parserToolPayload = parserToolOutput.payload;
var parserToolStatus = parserToolOutput.status;

// Extract individual sections from payload
var inputs = parserToolPayload.executionInputs;
var outputs = parserToolPayload.executionOutputs;
var messages = parserToolPayload.executionMessages;
var planDetails = parserToolPayload.executionPlanDetails;
```

General guidelines for agentic AI asset evaluation

Learn about agentic evaluation runs and different recommendations for evaluating your agentic AI assets against datasets to check for completion, performance, and tool execution.

Overview of agentic evaluation runs

Agentic evaluations help you verify that your agentic AI assets perform as expected across different scenarios and data sets. Regular evaluation helps maintain quality and identify areas for improvement as you develop your agentic AI assets.

The evaluation process uses automated testing to measure how well your agentic AI assets performs. Metrics for evaluation include complete tasks, execute tools correctly, and maintain performance standards. You can also create your own custom metrics to evaluate agentic AI asset responses and tasks in other ways.

When to run agentic evaluations

Run agentic evaluations at key points in your development and maintenance cycle to verify performance and catch issues early.

Run after you have manually tested basic execution

Before running an automated evaluation, manually test the execution of an AI agent or agentic workflow. Manual testing helps you identify obvious issues and verify that the basic functionality works before investing time in automated evaluation.

Run agentic evaluations when you make significant changes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After making updates to the agentic workflow, execute an agentic evaluation run to track the efficacy of the new version. This includes changes to prompts and tool configurations that might affect performance.

Run evaluations before deploying to production

Evaluate your agentic AI assets in a test environment before deploying them to production. This helps verify that changes work correctly and maintain expected performance levels.

Run periodic evaluations for ongoing monitoring

Schedule regular evaluation runs to monitor the ongoing performance of your agentic AI assets. This helps detect performance degradation over time and ensures consistent quality.

Run evaluations after data source changes

When the underlying data sources or schemas change, run evaluations to verify that your agentic AI assets continue to function correctly with the new data structure.

Choosing an evaluation method

Select evaluation methods based on what aspects of your agentic AI asset performance you want to measure. Different methods provide insights into different aspects of functionality.

Review the evaluation method options

The agentic evaluation guided setup provides information about each evaluation method, including what they're measuring and how they work. You can also review the common questions in the sidebar for answers about the available metrics. Take time to understand each method before selecting which ones to use.

Use multiple evaluation methods at a time

Choosing multiple evaluation methods can provide a better overall picture of the agentic AI asset's performance. Different methods measure different aspects, such as task completion rates, response accuracy, and tool execution success.

Consider task completion metrics for workflow validation

Task completion metrics help you verify that your agentic workflows successfully complete their intended tasks and validate end-to-end workflow functionality.

Apply tool execution metrics for technical validation

Tool execution metrics verify that your agentic AI assets correctly use the tools and APIs they're configured to access. This method helps ensure that integrations work as expected.

Creating a dataset

Create targeted datasets that represent the scenarios and data your agentic AI assets will encounter in production. Well-designed datasets provide more meaningful evaluation results.

Use filters to target the right data

Add filters to the execution logs to control exactly what you're measuring your agentic workflow against. You can select **See preview** to see a list of records. You can also use the check boxes to select individual records to measure against.

Generate new execution data for your evaluation run

When going through the agentic evaluation guided setup, you can create new execution logs on multiple records before the evaluation begins. Use this option to reduce time and ensure you have fresh data for evaluation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Include diverse scenarios in your dataset

Create datasets that include various scenarios your agentic AI assets might encounter, including edge cases and error conditions. Comprehensive datasets help identify potential issues before they affect users.

Maintain dataset quality and relevance

Regularly review and update your evaluation datasets to ensure they remain relevant to current use cases. Remove outdated scenarios and add new ones that reflect changing requirements or data patterns.

Consider data volume for meaningful results

Include sufficient data volume in your datasets to generate statistically meaningful results. Small datasets might not reveal performance patterns or issues that become apparent with larger data sets.

Interpreting evaluation results

Understanding evaluation results helps you make informed decisions about improving your agentic AI assets and identifying areas that need attention.

Analyze trends across multiple evaluation runs

Compare results from multiple evaluation runs to identify trends in performance. Look for patterns that indicate improving or declining performance over time.

Focus on metrics that align with business objectives

Prioritize the evaluation metrics that most closely align with your business objectives and user requirements. Not all metrics carry equal weight for your specific use case.

Investigate unexpected results

When evaluation results differ significantly from expectations, investigate the identified issues and their traces. This might reveal issues with the agentic AI asset configuration, data quality, or evaluation setup.

General guidelines for effective evaluation

Follow these general guidelines to maximize the value of your agentic evaluation efforts and ensure reliable results.

Establish baseline performance metrics

Create baseline measurements when you first deploy your agentic AI assets. These baselines provide reference points for comparing future evaluation results and tracking improvements.

Monitor evaluation performance over time

Track how your evaluation processes themselves perform over time. This includes evaluation run times, resource usage, and the reliability of the evaluation infrastructure.

Validate evaluation methods periodically

Periodically review and validate your evaluation methods to ensure they continue to provide meaningful insights. Update methods as your agentic AI assets evolve and requirements change.

Examples of using AI agents

Review different ways that you can leverage the Now Assist AI agents application in agentic workflows across the platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents Overview

AI agents in the Now Assist application provide automated solutions for a wide range of business processes and operational challenges. These agents can work independently or as part of hierarchical structures to handle complex workflows, reduce manual effort, and improve service delivery efficiency. You can leverage AI agents across multiple departments including IT Service Management, Customer Service Management, and Human Resources.

Incident Management and Resolution

AI agents can automate the entire incident lifecycle from initial triage to resolution. When an incident is created and assigned to a designated service desk user, the agent automatically retrieves incident details, searches for similar historical incidents, and analyzes relevant knowledge base articles. Based on this research, the agent determines an appropriate resolution path.

If the agent has high confidence in the solution, it posts the resolution in the work notes and closes the incident automatically. When confidence is lower, the agent documents its findings and reassigns the incident to a technical support specialist for review. This approach reduces mean time to resolution while ensuring quality control for complex issues.

Case Management Automation

Similar to incident management, AI agents can handle case workflows in customer service scenarios. Agents analyze case details, match them with historical cases, search knowledge articles, and provide recommended solutions or next steps. This automation helps customer service teams handle higher volumes of cases while maintaining consistent quality in responses.

Cross-Functional Process Automation

AI agents can orchestrate workflows that span multiple departments and systems. For instance, an onboarding agent might coordinate tasks across HR, IT, facilities, and finance departments, ensuring new employees receive proper access, equipment, workspace setup, and orientation materials. The agent can track progress, send reminders, escalate delays, and provide status updates to stakeholders throughout the process.

Knowledge Management and Content Discovery

AI agents can assist users in finding relevant information by analyzing queries, searching across multiple knowledge sources, and presenting contextualized results. These agents understand the user's intent, consider their role and permissions, and deliver targeted information that helps them complete tasks or resolve issues independently.

Virtual Agent Enhancement

AI agents can work behind the scenes to enhance Virtual Agent conversations by providing intelligent responses, retrieving relevant information, and executing actions on behalf of users. This integration creates more capable and helpful conversational experiences that can handle complex queries and multi-step processes.

Implementation Considerations

When implementing AI agents, organizations should consider the following factors:

- Start with well-defined, repetitive processes that have clear success criteria
- Ensure adequate training data and knowledge base content for agents to reference

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Define appropriate confidence thresholds for automated actions versus human review
- Establish monitoring and quality assurance processes to track agent performance
- Plan for iterative improvements based on agent interaction data and outcomes
- Configure memory sharing appropriately for different hierarchy structures
- Consider scalability requirements when designing complex agent hierarchies

Resolve an incident

Help your live agents resolve an incident faster with Now Assist AI agents by using the Now Assist panel.

https://player.vimeo.com/video/1098087911?h=d89ede16f9&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: none

Procedure

1. Navigate to **All** > **Incidents** > **Assigned to you** and open an incident that you would like to resolve.
   When you open an incident, the Now Assist application checks if a plan is available by using AI agents and displays the `Now Assist has a plan for solving INCXXXXXXX. Open Now Assist Panel to view the plan.` message in a banner.

   Note: You can select the banner and directly go to the conversation on the Now Assist panel to complete the task.

2. Open the Now Assist panel by using the Now Assist icon.
   Now Assist provides the resolution steps for the incident.
3. On the Now Assist panel, enter `Yes`.
   When the live agent enters `Yes`, they can proceed with the execution plan that is proposed by the Now Assist AI agents. The live agent checks the conversation and adds further inputs, if needed, to resolve the incident.

Review and update tickets with the Ticket Status AI agent

Review the status of your tickets and take standard ticket actions, such as adding comments, using the Ticket Status AI agent in Now Assist in Virtual Agent.

Before you begin

Role required: By default, any authenticated user with access to the portal the Ticket Status AI agent is enabled for can access the AI agent. There may be additional roles required depending on the configuration by your administrator.

Procedure

1. Navigate to your Service Portal and open Virtual Agent to start a new conversation.

   Depending on the configuration, you may also be able to access this AI agent in the Now Assist panel or Microsoft Teams with myBot.

2. Enter one of the following utterances:
   - Can you list all open tickets I've created?
   - What's the current status of my incident INC001?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add comment to INC001 "I need your help in fixing this request ASAP. Please prioritize this."
- Can you check the latest progress on my most recent request?

3. Answer any follow-up questions.

Result
The Ticket Status AI agent used various tools to check and update your tickets.

ServiceNow Otto AI agents reference

Find more information about user roles, tables, and the different properties that are installed in ServiceNow Otto AI agents.

AI agents roles

The following roles are installed with ServiceNow Otto AI agents with a compatible ServiceNow Otto application.

Roles required to configure or monitor AI agents

Role	Description
AI Agent admin [sn_aia.admin]	Administrator of the application. A user with the sn_aia_admin role can create, read, update, and delete records.
AI Agent Viewer [sn_aia.viewer]	Read-only access to the application. A user with the sn_aia_viewer role has read and report access on all tables. **Note:** The sn_aia.admin and the sn_aia.viewer roles should not be given to the same user. If a user has both roles, then AI Agent Studio will only be accessible in read-only mode for that user.
agent_role_config_admin	With this role, user can access and modify Agent role configurations with AI Agent admin [sn_aia_admin] being the parent role.
agent_role_config_viewer	Can view the Agent role configurations with AI Agent Viewer [sn_aia_viewer] being the parent role.
itil_admin or itil	Access to ITSM tables and workflows. Agents working with incident, Request, Change, Problem, CMDB records.
knowledge_admin	Access to Knowledge Management tables and tools - Knowledge agents; KB article retrieval tools.
Custom role (e.g., custom_table.admin)	Access to custom tables and fields. Agents accessing tables outside ITSM, Knowledge, or other standard modules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required to configure or monitor AI agents (continued)

Role	Description
snc_internal	Overly permissive system role, use only if agent requires true system-level privileges (rare). **Note:** Don't use as fallback.

Note: The roles can be assigned manually through the user record directly. For the assigned roles to take effect, logout and login back to the application.

AI agents system properties

The following are system properties that define default values and behavior.

System properties to use for configuring AI agents

Property	Description
glide.ai_record_activity.validation.feature.enabled	Enables UI validation for agentic AI and skills at the instance level. If this feature is enabled, then any UI validation, such as required fields, must be met before the AI process is completed. The following properties are context-specific gates that determine where validation is done when the feature is enabled: • glide.ai_record_activity.ai_detection.nap.enabled: ServiceNow Otto panel executions • glide.ai_record_activity.ai_detection.skill.enabled: generative AI skill execution with UI actions or in Virtual Agent • glide.ai_record_activity.ai_agent.validation.enabled: agentic AI-initiated record updates with UI actions or in Virtual Agent If you want to enable these gates of the UI validation feature, you must create the system property and set the value to *true*. You don't need to enable this feature for individual skills or agentic AI assets.
sn_aia.agent_llm_provider	Defines the (large language model) LLM service provider for AI agents. Default value: **azure_openai**.
sn_aia.agent_tool_supported_data_types	Defines a comma-separated list of supported data types for tools that are used by agents for IntegrationHub spoke. Each value

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties to use for configuring AI agents (continued)

Property	Description
	corresponds to the name field of records in the Field classes table [sys_glide_object].
sn_aia.analytics_dashboard_sysid	Provides the sys_id for the AI Agents Analytics dashboard. read_roles: sn_aia.admin and sn_aia.viewer
sn_aia.continuous_communicator_output_limit	Defines the maximum number of continuous outputs that the AI Agent Orchestrator can trigger to show to users. Default value: **3**
sn_aia.continuous_tool_execution_limit	Defines the maximum consecutive number of uses for the same tool. Default value: **7**
sn_aia.enable_usecase_tool_execution_mode_override	Enables running agentic workflows fully autonomously, overriding any non-automated tools in the agentic workflow. Default value: **false**
sn_aia.ltm.category.auto_create	Enables AI-generated categories if no matching categories exist. Default value: **false**
sn_aia.ltm.enable_long_term_memory	Enables long-term memory for AI agents. All previous user interactions are used as context for the LLM. Default value: **false**
sn_aia.maximum_agent_tools	Defines the maximum number of tools that can be assigned to an AI agent. Default value: **20**
sn_aia.max_scheduled_trigger_query	Defines how many records are processed when a scheduled trigger is detected. Default value: **10** Write_role: admin
sn_aia.mid_skill_switch_enabled	Enables mid-skill switching. Default value: **false**
sn_aia.react_failure_retry_max_limit	Defines the maximum number of retries in case of an execution failure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties to use for configuring AI agents (continued)

Property	Description
	Default value: **3**
sn_nowassist_va.router_redirect_va_agentic	Determines AI agent discovery in Virtual Agent. If set to *NEVER*, Virtual Agent continues Q&A without any agentic AI. Default: *ROUTER_DECISION*
com.glide.cs.dynamic.capability.timeout	Defines the Timeout for AIA Proficiency Descriptor. Default value: **180**. Write_role: admin.
sn_aia.enable_follow_up	Enables users to continue the conversation with follow-ups after the agentic workflow execution is complete. Default value: **true**.
sn_aia.follow_up_message	Defines a follow-up message sent after execution is completed. Default Value: **How otherwise can I help you?**
sn_aia.allow_context_sharing	Enables the sharing of short-term memory, allowing context to persist across execution within the same conversation. Default Value: **true**
sn_aia.agent_strategy_choice_enabled	Enables to show the LLM reasoning strategy in the agent setup screen. Default Value: **false**
sn_aia.context_sharing_strategy	This property defines the strategy to use for storing short-term memory for an execution. Default Value: **summarise**
sn_aia.enable_agent_tool_input_value_overrides	Enables you to override the agent tool description. Default Value: **true**.
sn_aia.follow_up_qna_failure_limit	Defines the limit to exit execution if the number of consecutive questions and answers aren't available in the follow-up. Default value: **1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties to use for configuring AI agents (continued)

Property	Description
sn_aia.ltm.use_memory_for_ai_agent	Enables long-term memory for AI agent interactions. When enabled, stored user memories are utilized in AI agent interactions. Default value: **true.**
sn_aia.quick_mode_failure_retry_max_limit	Defines maximum limit for retries in case of a failure in Quick Mode execution. Default value: **3**.
sn_aia.user_context_data	Defines a comma-separated list of user context data to be used with AI Agents. The list is used to pick the data available from knowledge graph API: getUserContext. List of available user information: • profile • manager • reportees • assets The user information can also be customized by overriding the method `getUserContext` via `UserContextUtil`. If customized, the property must define the comma separated list of keys generated by the customized `getUserContext` method. Default value: **profile**.
sn_aia.external_agents.enabled	Set to `true` to enable external agent features
sn_aia.external_agents.parallel_conversations.enabled	Enables or disables multiple simultaneous conversations per user
sn_mcp_client.cursor.max_iterations	Specifies the maximum number of cursor-based pagination iterations to perform when fetching MCP tools. Helps prevent excessive looping or API calls during data retrieval. **Note:** Set this value to 0 to disable pagination iteration limits.
com.glide.agentic_processes_view.enabled	Enables the in-product experience for agentic workflows in the AI Workflows panel. Verify that this is set to `true` if you plan on using UI actions to run agentic workflows.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties to use for configuring AI agents (continued)

Property	Description
sys_generative_ai_prompt_config	References a config record via the generative AI Config field.

Global properties used for episodic memory or agent learning

System property	Description
sn_aia.enable_episodic_memory	Enables episodic memory. When enabled, episodic memories from past interactions are collected and stored in sn_aia_memory and utilized in future interactions to enhance the overall experience Default value: **true**. .
sn_aia.enable_memory_limit	Maximum number of episodic memories to inject into prompt when an agent is invoked. **Note:** The maximum number of values allowed is less than or equal to 5.
sn_aia.use_episodic_memory_for_ai_agent	Enables episodic memory injection for AI agent interactions. When enabled, stored user memories are utilized in AI agent interactions. Default value: **true**.

Properties on the Agent Properties table

The following properties are on the Agent Properties [sn_aia_property] table. These properties affect different AI agent behaviors.

General properties on the Agent Properties table

Name	Description	Default value
alert.assist_spike_hours_to_check	Time interval, in hours, between running the scheduled job that checks for spikes in assist usage	3
alert.assist_spike_usage_percentage_threshold	Percentage increase required from previous job results	0.5 (50%)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General properties on the Agent Properties table (continued)

Name	Description	Default value
	to trigger the spike in assist usage notification	
alert.assist_spike_usage_threshold	Minimum number of assists to trigger the spike in assist usage notification	5000
alert.consecutive_error_count	Consecutive number of latency errors to trigger the latency notification	3
alert.llm_latency_threshold	Time taken, in seconds, for the LLM to respond before sending a latency error	10
alert.tool_latency_threshold	Time taken, in seconds, for a tool to finish executing before sending a latency error	300
enable_agent_tool_input_value_overrides	Determines whether tool input values can be overriden by the AI agent or other tools for use by another tool	false

execution_task.latency_thresholds	Determines thresholds on LLM and tool execution times and response tokens/ character	<pre>{
		"llm": {
		"timeBoundaries": [
		5000,
		10000
		],</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General properties on the Agent Properties table (continued)

Name	Description	Default value
	counts for tool calling	<pre>"tokenLimit": 500 }, "tool": { "timeBoundaries": [200000, 300000], "outputCharLimit": 10000 } }</pre>
follow_up_behaviour	Actions to take by the agentic workflow after it has finished executing. Each record applies to only one agentic workflow.	no_followup_close_conversation
show_citations	Determines whether agentic AI-generated responses in ServiceNow Otto panel or in Virtual Agent add citations for their output.	false
mcp_guardian_check	Determines whether AI Guardian runs on MCP tool executions.	You can enable guardian check for MCP Client when the value is set to **true**. The default value is **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

General properties on the Agent Properties table (continued)

Name	Description	Default value
	Note: To enable guardian check for MCP Client, ensure that you enable AI Guardian on **AI Agent Studio** > **Settings** page.	
kill_switch.mode	Controls how the feature responds to a detected breach.	warn_only Other values include: • off • enforce
kill_switch.consecutive_windows_duration	The total look back span.	4320
kill_switch.max_fires_per_window	Fires per record that mark it as breaching.	5
kill_switch.min_distinct_records	Breaching records needed for the window to count as runaway.	25
kill_switch.window_size	Length of one observation window.	1440

The following properties are used to detect and avoid infinite recursion or execution loops. If you reach the max executions that match the query within the time window, any new executions matching the query will abort. You can adjust these values if you want to lower the threshold for detecting recursion.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recursive check properties on the Agent Properties table

recursive_check.create_max_executions	Maximum number of matching executions creating records	50
recursive_check.create_time_window	Time window, in minutes, for checking for matching executions creating records	15
recursive_check.query_for_create_record	Query for the fields of execution plans to create records to check if executions are repeating	objective={objective}^agent={agent}^ORusecase={usec
recursive_check.query_for_update_record	Query for the fields of execution plans to update records to check if executions are repeating	related_task_record={related_task_record}^objective={c
recursive_check.update_max_executions	Maximum number of matching executions updating a record	5
recursive_check.update_time_window	Time window, in minutes, for checking	15

Recursive check properties on the Agent Properties table

(continued)

	for matching execution updates

AI agents tables installed

The following tables are installed so AI agents work as expected:

Tables used for configuring AI agents

Table	Description
Agentic workflows [sn_aia_usecase]	List of configured agentic workflows.
AI Agents [sn_aia_agent]	List of configured AI agents.
Tools [sn_aia_tool]	List of tools used by an AI agent.
Strategies [sn_aia_strategy]	List of strategies used by an AI agent.
Teams [sn_aia_team]	Team that is a group of listed agents.
Team members [sn_aia_team_member]	List of teams mapped to an agent.
Agent Tools [sn_aia_agent_tool_m2m]	List of tools mapped to an AI agent.
AIA Trigger Configurations [sn_aia_trigger_configuration]	List of triggers created for an agentic workflow.
Execution Tasks [sn_aia_execution_task]	List of tasks by execution plan ID.
Messages [/sn_aia_message]	List of messages recorded in AI agent conversations to and from the human users.
Tools Executions [sn_aia_tools_execution]	List of tools executed by the plan ID. **Note:** The records in the Tools Executions table expire and is set to unavailable after a period of 13 months.
Execution Plans [sn_aia_execution_plan]	List of plan executions by conversation ID.
Agent Tools [sn_aia_agent_tool_m2m]	List of tools and maximum automatic executions.
AI Agent configs [sn_aia_agent_config]	List of active AI agents configured for the proficiency that they'll be used in.
Agent properties [sn_aia_property]	Various properties that affect AI agent behavior.
Gen AI Metadata M2M [sn_aia_gen_ai_m2m]	List of Gen AI metadata and the maximum automatic executions.Maintains the mapping between sn_aia_execution_task and Gen AI log metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables used for configuring AI agents (continued)

Table	Description
	If two large language model (LLM) calls are made to the sn_aia_execution_task, then the sn_aia_gen_ai_m2m table has two records.
Report metrics [sn_aia_report_metric]	List of the report metrics.
Agent Access Role Configurations [sys_agent_access_role_configuration]	List of agent access roles. You can also create agent access roles from this table.
generative AI Configurations [sys_generative_ai_config]	Record that points to the actual model.
Invocation Sources [sn_aia_invocation_source]	Functions as a registry of entry points and helps track and define the different contexts or surfaces from which an AI agent can be invoked or triggered.
generative AI Log [sys_generative_ai_log]	Used for logging and auditing generative AI activity.

Tables used for Group Action Framework

See **Group Action Framework** *for more information.*

Table	Description
GAF record group [sn_gaf_record_group]	Stores the output of the grouping skill. Each record represents a cluster of related records. You can open each record group record to discover which records were included within the cluster.
GAF record group detail [sn_gaf_record_group_detail]	Contains the individual records that belong to each group GAF record group. You can also find if a record is marked to act as a representative of the cluster on these records.
GAF action strategy result [sn_gaf_action_strategy_result]	Holds the results of the Action Strategy skill, which selects representative records from each group for downstream processing.
GAF action mapper results [sn_gaf_action_mapper_result]	Stores the output of the Mapper skill, which maps new records to existing clusters.
GAF action reducer results [sn_gaf_action_reducer_result]	Stores the result of the Action Reducer skill. The results include insights for entire clusters. For example, how to resolve incidents similar to those gathered in a cluster.

Domain separation in AI Agent Studio

Domain separation is supported for AI agents in the AI Agent Studio. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain Separation Overview

AI agents use basic domain separation capabilities to help protect your users' data. Domain separation support for AI agents is applied at design time and run time.

Design-time support

Refers to creating or updating agentic workflows, agents, tools, trigger configurations, and so on. AI agent configurations can be made domain-specific for individual agents and the actual agentic workflows. Administrators can apply specific domains to those records. Similar to other basic domain separations, records in the AI agents tables are accessible if the user belongs to the same or a higher domain than those records.

Run-time support

Refers to the agentic conversation on the ServiceNow Otto panel, web client, or any conversational channel. In the agentic conversations, the user that the agent impersonates functions as an agent with any AI agents who initiate the conversation on demand. For example, if the conversation is happening via a trigger mentioned on the *Run as* field on the Trigger form of an agentic workflow. If the user that the agent impersonates belongs to the same or a higher domain, that agent can access and use configurations that are associated with that domain.

The domain visibility for an agentic workflow is resolved during run time based on the *Run as* attribute in the agentic workflow trigger condition. For more information, see defining a trigger for an agentic workflow.

When an agentic conversation is triggered on demand, the domain visibility is applied to the particular agent in action. When an agentic conversation is initiated through a trigger, the domain visibility is applied to the user who resolves the caller (in an incident record where the *Run as* attribute is set to *Caller*), when the conversation runs against the incident record.

Note: The **sys_domain** field is added to all AI agent tables to achieve domain separation in AI Agent Studio. The sys_domain_path, which is available for domain separation, is enabled on your instance.

To understand more about the ServiceNow domain separation, see Exploring domain separation.

How domain separation works in AI Agent Studio

Process separation is enabled through the use of the sys_overrides column in domain-aware tables. Any table that contains both the sys_domain and the sys_overrides fields can be configured to have different processes from the parent domain.

AI Agents support only configuration tables to be process separated. Below are the list of tables that are process separated:

- sn_aia_agent_config
- sn_aia_usecase_config_override

Domain separation in AI agents supports:

- Agentic workflow discovery.
- AI agent and its tools can be active in the X domain and inactive in the Y domain.
- Memory category can be active in the X domain and inactive in the Y domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- sn_aia_property can be overridden in a different domain.
- Triggers can be overridden in different domain.

Note: AI agent and agentic workflow details can't be overridden in the different domains.

Domain separation for service providers

AI Agent Analytics dashboard

Track the AI agent use and efficiency gain on your instance through the AI Agent Analytics dashboard. The dashboard can reveal trends in how AI agents are used to improve the time to resolution and the number of tasks closed.

Required ServiceNow AI Platform roles

To use the AI Agent Analytics dashboard, you must have either the sn_aia.viewer or the sn_aia.admin role.

If you want to change the dashboard, you must duplicate it and apply changes to the copy. You can redirect the Analytics page in AI Agent Studio to the new dashboard by replacing the dashboard sys_id in the system property *sn_aia.analytics_dashboard_sysid*.

Accessing the AI Agent Analytics dashboard

To open the dashboard, navigate to **All** > **AI Agent Studio** > **Analytics**.

You can also access the dashboard from the AI Agent Studio overview page. Go to the Recent agentic workflows and AI agents activity section and select the **View analytics** link.

Indicators

Most indicators are updated daily. The latency indicators are updated every 15 minutes.

Once you have installed AI agents, you can collect initial data by running the [Now Assist AI Agents] Historical Data Collection job. The other data collection jobs, [Now Assist AI Agents] Daily Data Collection and [Now Assist AI Agents] Periodic Data Collection, update the indicators.

Automated indicators for AI agents

Name	Description
Agentic workflow latency	Time taken for an agentic workflow to complete.
AI agent execution plan P90 latency	Time taken for 90% of AI agent execution plans in a system to be processed.
AI agent execution plan P95 latency	Time taken for 95% of AI agent executions plans in a system to be processed.

© 2026 ServiceNow, Inc. All rights reserved.

Automated indicators for AI agents

(continued)

Name	Description
AI agent execution plan P99 latency	Time taken for 99% of AI agent execution plans in a system to be processed.
AI agent latency	Time taken for an AI agent in a system to be processed.
All agentic workflows	Total number of agentic workflows created before today.
All AI agents	Total number of AI agents created before today.
All tools	Total number of tools created before today.
LLM P90 latency	Time taken for 90% of LLM requests in a system to be processed.
LLM P95 latency	Time taken for 95% of LLM requests in a system to be processed.
LLM P99 latency	Time taken for 99% of LLM requests in a system to be processed.
Number of closed tasks	Total number of tasks closed.
Number of closed tasks with AI agent assist	Total number of tasks closed today that were closed with agentic workflows or AI agents.
Summed duration of closed tasks	Total time taken to close tasks.
Summed duration of closed tasks with AI agent assist	Total time taken to close tasks today that were closed with agentic workflows or AI agents.
Tool execution P90 latency	Time taken for 90% of tool executions in a system to be processed.
Tool execution P95 latency	Time taken for 95% of tool executions in a system to be processed.
Tool execution P99 latency	Time taken for 99% of tool executions in a system to be processed.

Automated indicators for AI agents (continued)

Name	Description
Tool latency	Time taken for a tool in a system to be processed.
Total number of CS conversations	Total number of conversations in ServiceNow Otto panel or Virtual Agent.
Total number of execution plans	Total number of execution plans created by agentic workflows and AI agents today.
Total number of execution tasks	Total number of tasks executed by agentic workflows and AI agents today.
Total number of tool executions	Total number of tool executions in agentic workflows and AI agents today.
Use case execution plan P90 latency	Time taken for 90% of agentic workflows in a system to be processed.
Use case execution plan P95 latency	Time taken for 95% of agentic workflows in a system to be processed.
Use case execution plan P99 latency	Time taken for 99% of agentic workflows in a system to be processed.

Formula indicators for AI agents

Name	Description
% of conversations with an AI agent or agentic workflow defined	Number of conversations in ServiceNow Otto panel or Virtual Agent with a defined AI agentic or agentic workflow divided by the total number of conversations.
Average time to close a task	Average time taken for a task to go from creation to closure.
Average time to close a task with AI agent assist	Average time taken for a task to go from creation to closure with an agentic workflow or AI agent involved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Formula indicators for AI agents

(continued)

Name	Description
Efficiency gain	Percentage efficiency gain comparing average time taken to close a task with AI agent assist against a task closed without AI agent assist.
Percentage of tasks closed using AI agents	Number of tasks closed using AI agents and agentic workflows divided by the total number of tasks.

Breakdowns

Different breakdowns enable you to divide the data differently to track specific aspects of the AI agent usage. Not all breakdowns are available for all indicators.

- Agentic workflow
- AI agent
- AI agent execution status
- Latency metric
- Tool
- Tool latency metric

Filters

You can filter data to review a subset of trends. The following table lists the available filters on the AI Agent Analytics dashboard.

Filters on the AI Agent Analytics dashboard pages

Page	Available filters
Status	Time created
Insights	• Time created • Agentic workflow • AI agent • AI Agent Type
Assist consumption	• Time created • Agentic workflow • AI agent • AI Agent Type

Performance	• Time created • Agentic workflow • AI agent • AI Agent Type • Tool
Troubleshooting	Time created

Data visualizations

Visualizations are graphic elements that can be used to see data trends, percentages, and scores. The AI Agent Analytics dashboard includes the following visualizations.

Data visualizations on the AI Agent Analytics dashboard overview page

Title	Type	Description
Average inferred CSAT for AI agents in last 7 days	Score card	AI-generated score estimating what a customer would rate the AI response. 1 being the user is extremely dissatisfied and 5 being the user is extremely satisfied with the interaction.
Execution tasks in last 7 days	Pie chart	Execution tasks divided by status (Success, Ongoing, Cancelled, Queued).
AI Agent errors in last 90 days	Line graph	Number of errors seen by AI agents within the last 90 days broken down by week.
AI agent tool type	Pie chart	Tools divided by type. Example: Script, Flow action, Subflow, and so on.
AI agent tool execution mode	Pie chart	Tools divided by either autonomous or supervised execution mode.
Execution plans in last 7 days	Pie chart	Execution plans divided by status (Completed, Terminated, Wrap Up, or In Progress)

Data visualizations on the AI Agent Analytics dashboard insights page (continued)

Title	Type	Description
Task closure efficiency gain using AI agents	Trend line	Percentage efficiency gained with agentic workflows and AI agents. Trend line is shown.
Average close time assisted by AI agents	Trend line	Average time taken for a task to go from creation to closure with the involvement of an AI agent or agentic workflow. Trend line is shown.
Inferred CSAT of AI agents	Score card	Estimated CSAT score calculated using AI based on the subjective quality of the AI agents' responses. 1 being the user is extremely dissatisfied and 5 being the user is extremely satisfied with the interaction.
Inferred Session CSAT	Score card	Estimated CSAT score calculated using AI based on the overall session interactions of a user. 1 being the user is extremely dissatisfied and 5 being the user is extremely satisfied with the interaction.
Top user intents when using agentic solutions	Bar chart	Most common user intents as interpreted by the LLM. Intents are grouped by Group Action Framework.
Average AI agent CSAT by intent	Bar chart	Average CSAT score for each user intent interpreted by the LLM. Intents are grouped by Group Action Framework.
Transfers and escalations using AI agents	Bar chart	An estimated score using AI that indicates whether the user requested an escalation or there was a transfer to another AI agent or human.
User effort required with AI agents	Bar chart	Counts of AI-generated scores that measure the time and energy users had to put in during their interaction with an AI agent. Values are on a 3-point scale of low, medium, and high.
AI agent recommended next steps	Bar chart	Counts of AI-generated scores that indicate whether the AI agent recapped the outcome and provided clear instructions or guidance on what the customer should do next, if applicable. Values are on a 3-point scale of low, medium, and high.
AI agent resolved the users request	Score card	An AI-generated score that indicates whether the AI agent resolved the user's request. Values can be yes, no or unknown.

Agentic evaluation run results

Learn about agentic evaluation runs and the meaning behind different evaluation scores from the agentic evaluation results page.

Agentic evaluations overview

Agentic evaluations measure how well AI agents and agentic workflows are accomplishing their objectives. A Now LLM Service model judges the AI agent or agentic workflow based on the execution logs. The results page of an evaluation run shows multiple metrics and scores measuring task completeness and tool use.

If you run an overall task completion evaluation, the results page shows recommended actions for the AI agent or agentic workflow. Recommended actions give you suggestions for deployment or improvement to help verify that the agentic workflows that you deploy are performing up to your standards.

After you've reviewed your evaluation results, you can archive your evaluation or copy it to run another evaluation with the same parameters and dataset.

You can export the evaluation results as a report. The report is formatted as a .csv file that includes the individual sys_ids of the execution records and the metric scores for each.

For more information on AI agent usage and other analytics, you can review the AI Agent Analytics dashboard in the AI Agent Studio.

Evaluation results overview

For each evaluation method that you execute, the results page displays an overall score for the agentic workflow with a percentage of successful record evaluations and a label of Excellent, Good, Moderate, or Poor. You can change the metric thresholds for each label by selecting **Customize metric thresholds**.

In addition to the overall task completeness results, you can review a summary of the results of the other metrics.

Overall task completeness evaluation run results

Label	Description	Recommended action	Default threshold
Excellent	Tasks were consistently performed at a high standard. The agentic workflow or AI agent is working well.	Proceed with confidence	90%–100%

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overall task completeness evaluation run results (continued)

Label	Description	Recommended action	Default threshold
Good	Most tasks were performed successfully, but some performance inconsistencies suggest areas for improvement.	Deploy with caution	70%–89%
Moderate	A significant number of tasks weren't fully completed. Performance is below the desired level.	Investigate the root causes of poor task completion	50%–69%
Poor	The agentic workflow is consistently failing to complete tasks adequately. Major issues are present.	Do not deploy	0%–49%

Individual record metric scores

Evaluations are run against the log tables of agentic workflow executions. Each record is individually scored for each evaluation plan that you run. Individual record evaluations are scored according to the following metrics.

Overall task completeness record metric scores

The overall task completeness metric assesses whether an AI agent successfully completes its assigned task. It evaluates the execution logs of the agent, ensuring that all required steps were taken and the task was logically and effectively completed.

Number	Score	Description
3	Successful	The main task was fully completed. All subtasks were resolved, and the steps followed a logical sequence with no critical errors.
2	Partially successful	The task was partially completed. Some subtasks remain unresolved or inefficiencies affected the process.
1	Unsuccessful	The task wasn't completed. Critical subtasks were abandoned or unresolved or the execution failed entirely.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool performance record metric scores

The tool performance evaluation metric assesses an AI agent's ability to select the most appropriate tool for each step while completing a task.

Number	Score	Description
1	True	The right tool was chosen for the action in the plan.
0	False	The right tool wasn't chosen.

Tool calling records metric scores

The tool calling evaluation metric assesses whether an AI agent correctly constructs tool calls by validating the accuracy, completeness, and formatting of the inputs it provides.

Number	Score	Description
1	True	Input key completeness, input value correctness, and input format correctness are all successful. • *`Input key completeness`*: 1 - True – All required parameters are present with exact name matches, and no unexpected parameters are included. • *`Input value correctness`*: 1 - True – Tool input values are correctly mapped. • *`Input format correctness`*: 1 - True – Tool inputs are in the correct format.
0	False	One or more of input key completeness, input value completeness, or input format completeness wasn't successful. • *`Input key completeness`*: 0 - False – A mandatory parameter is either missing, its name doesn't match exactly, or an unexpected parameter was found. • *`Input value correctness`*: 0 - False – Tool input values are not correctly mapped. • *`Input format correctness`*: 0 - False – Tool inputs are not in the correct format.

Note: The values of the sub-metrics are aggregated using an AND operator. If any one value is 0, then the entire tool calling records metric score will be 0.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

For more information, see the Now Assist documentation.

Exploring Model Context Protocol Client

The Model Context Protocol (MCP) is a standardized client-server protocol that enables AI applications to discover and interact seamlessly with external tools, data sources, and services. MCP facilitates communication between an AI host application (like AI Agent Studio), an MCP Client embedded in the host, and one or more MCP Servers that expose specific capabilities such as tools.

Model Context Protocol Client terminology

- **MCP Host**: The AI application environment where the tasks are initiated.
- **MCP Client**: Manages communication between the host and the MCP Servers, handling the requests and responses.

  The MCP Client architecture enables AI agents to extend their capabilities by invoking external systems dynamically, enabling tasks like accessing APIs, databases, or file systems in a standardized way.
- **MCP Server**: Provides external functionalities by exposing tools for AI agents to use.
- **MCP Tools**: The external tools exposed by the MCP Servers to be used by AI agents.

Why use MCP Tools

MCP tools enable seamless integration to:

- Connect your AI agent with a wide variety of external tools with minimal setup.
- Add multiple MCP tools to an AI agent to perform a broader range of tasks.
- Review and edit tool input parameters as needed before saving.

Configuring Model Context Protocol Client

Configure the MCP Client to execute agentic workflows with AI agents and mapped tools.

Configuring MCP Client enables you to:

- Incorporate external tools in AI agents built on ServiceNow.
- Access tools offered on external MCP Servers.
- Integrate MCP Client with the AI Agent Studio.

By setting up MCP Servers, AI agents in your environment can leverage external tools efficiently, enhancing their ability to perform complex tasks with up-to-date information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Model Context Protocol Client

Install the MCP Client application on your ServiceNow instance to enable using the tools from the MCP Server in AI agents.

Before you begin

Role required: sn_mcp_client.admin

Verify that you:

- Install the AI Agent Studio plugin [com.snc.sn_aia] and the Generative AI Controller plugin [com.sn.generative.ai] to use the MCP Client.
- Enable the MCP Tool experience in your instance by setting the *sn_aia.enable_mcp_tool* system property to **true**.

Note: ServiceNow supports Protocol version 2025-03-26 of the MCP Servers for MCP Client.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for Model Context Protocol Client plugin [sn_mcp_client].
3. Select **Install**.

Adding an MCP Server in AI Agent Studio

An MCP Server hosts the APIs and tools required by an AI application, enabling it to receive and process calls from MCP Clients to govern ingress traffic and to promote secure and efficient access to tools. Adding an MCP Server in the AI Agent Studio helps you to leverage the Model Context Protocol as a tool in an AI agent.

Connecting an MCP Server with the AI Agent Studio simplifies the integration process, making it easier to discover and invoke services. This connection enhances security and governance, providing a streamlined setup experience for administrators.

Adding an MCP Server requires you to add an MCP Server in the AI Agent Studio. You can add an MCP Server with one of the following authentication options:

1. **OAuth 2.1**: Helps add an MCP Server with an authentication code. For more information, see Add an MCP Server with OAuth 2.1.
2. **API Key**: Helps add an MCP Server with an API Key. For more information, see Add an MCP Server with API Key.
3. **Others**: Helps add an MCP Server in a manual way by selecting a Connection and Credential Alias record. For more information, see Add an MCP Server with Connection and Credential Alias.

Note: You must authenticate the users with the MCP Server to add the MCP tool to an AI agent and without prior authentication, you can't add the MCP Servers.

Add an MCP Server with OAuth 2.1

Add an MCP Server with OAuth 2.1 in the AI Agent Studio.

Before you begin

Role required: sn_mcp_client.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

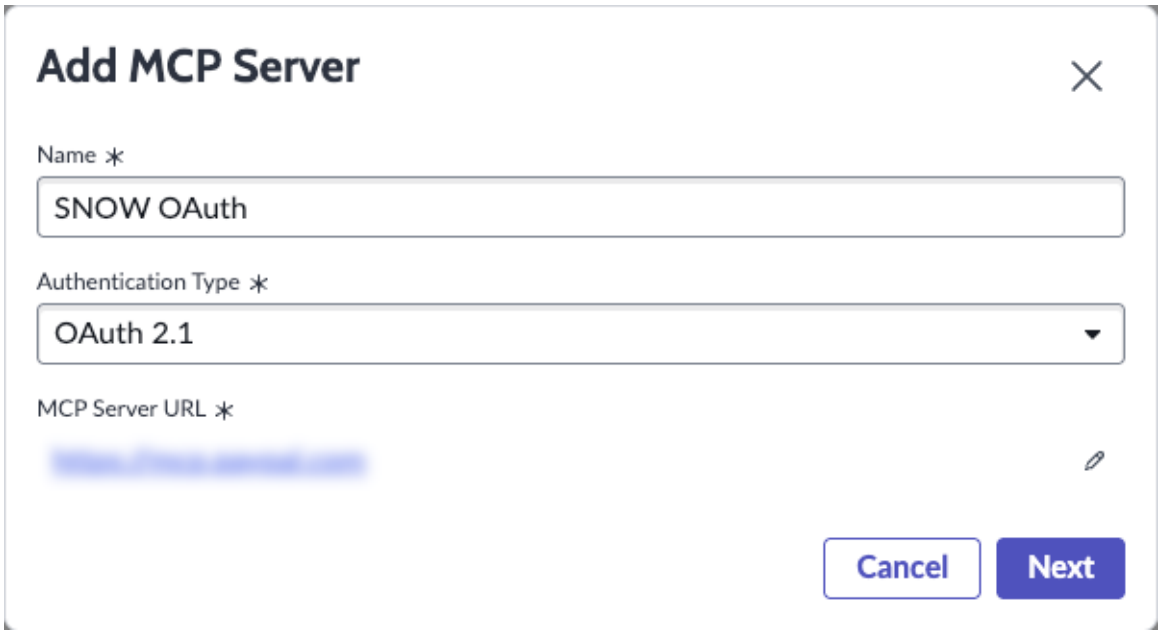
OAuth is the usual method to authenticate the MCP servers. If your MCP server supports it, choose OAuth 2.1 in the Authentication method.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Navigate to **Manage MCP Servers** and select **New**.
3. On the form, fill in the fields.

Add MCP Server

Field	Description
Name	Name for your MCP Server.
Authentication Type	The authentication type with which you want to add your MCP Server. Select **OAuth 2.1**.
MCP Server URL	The web address of your MCP Server.



4. Select **Next**.
   The form extends with the registration details.
5. On the form, fill in the fields:

   The dynamic client registration auto-populates the data in the form fields.

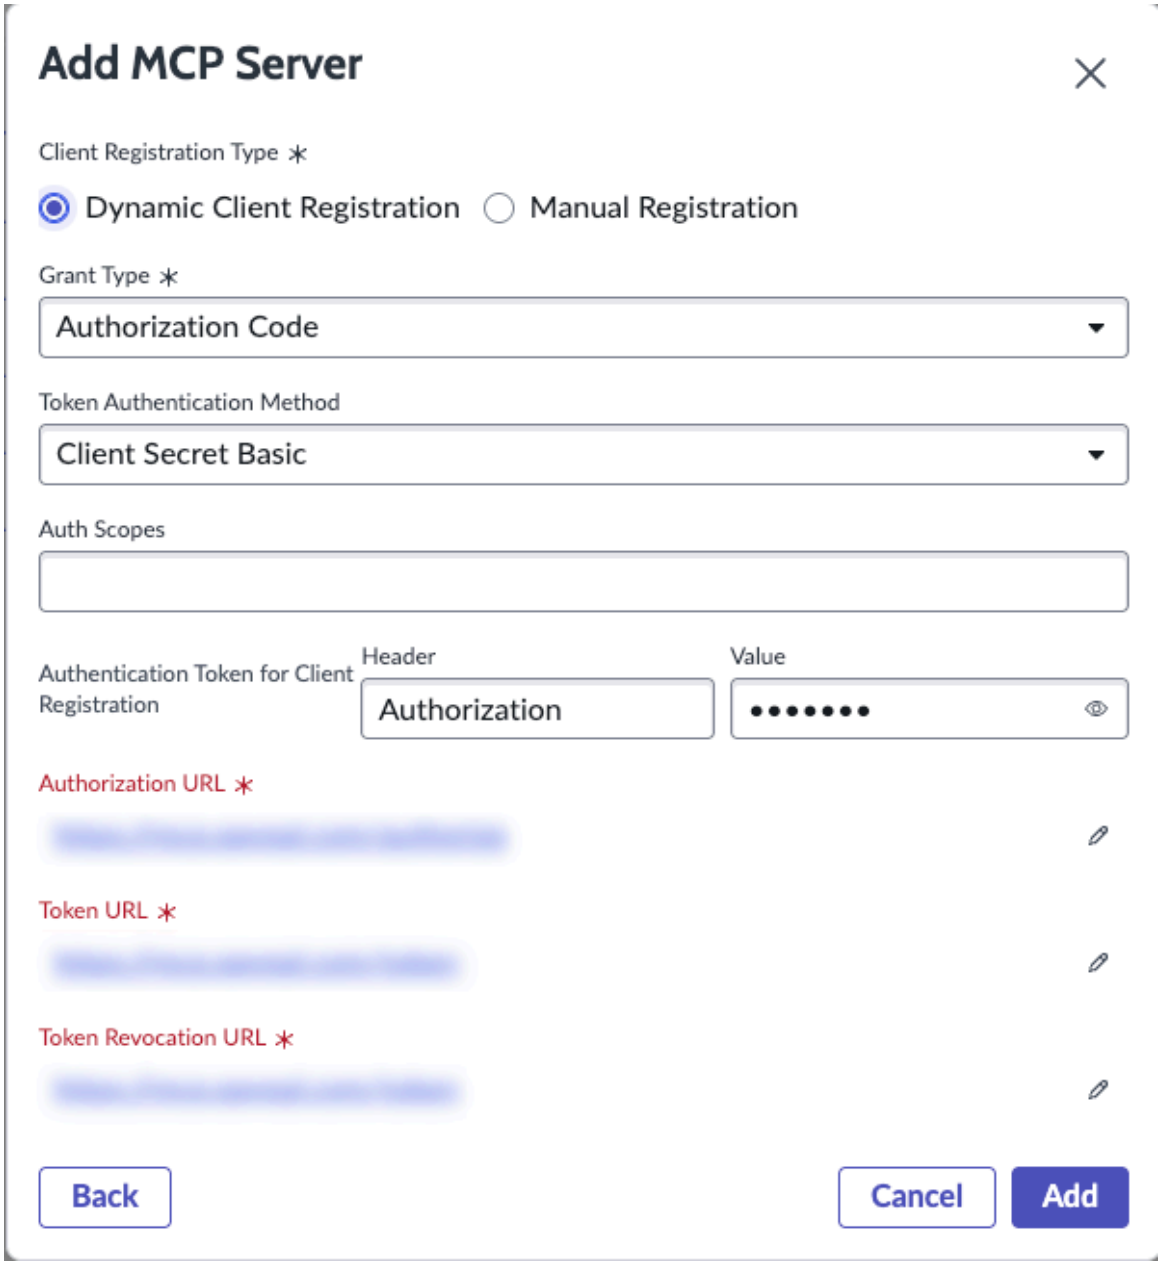
> **Note:** If dynamic registration is supported by the MCP Server, you'll be prompted to confirm the grant type and other inputs. If dynamic registration isn't supported, you can continue with the Manual Registration method in Step 6.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic Client Registration

Field	Description
Grant Type	The way you want to obtain an access token for accessing protected resources. One of the following two options is used here with auto-populated data. ○ **Authorization Code**: A system-generated code that is used for granting access to an application or resource. ○ **Client Credentials**: Access token provided by the administrator to access the application directly.
Token Authentication Method	Unique token granted to access resources. Select the value from the drop-down list.
Auth Scopes	Define the specific permissions for an application. **Note:** The Auth scopes must be comma-separated values.
Authentication Token for Client Registration	Authentication token used to verify client's identity and grant it permission to register with an authorization token. Provide the following values: ○ **Header**: Authorization header. ○ **Value**: Authentication password.
Authorization URL	Web address of your server to direct authorization.
Token URL	Web address containing the token.
Token Revocation URL	Web address to revoke the previously provided token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The MCP Server with dynamic client registration is added as a simple connection and credential alias.

6. On the form, fill in the fields:

Note:

- If your MCP Server doesn't support Dynamic Client Registration, then you can register the OAuth client for AI agents in your MCP Server manually and update those client details in AI Agent Studio.
- The manual client registration doesn't auto-populate the data in the form fields and must be manually provided.

Manual Registration

Field	Description
Grant Type	The way you want to obtain an access token for accessing protected resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You can select one of the two options: ○ **Authorization Code**: A system-generated code that is used for grating access to an application or resource. ○ **Client Credentials**: Access token provided by the administrator to access the application directly.
Token Authentication Method	Unique token granted to access resources. Select the value from the drop-down list.
Client ID	Unique ID for authentication and authorization purposes.
Client Secret	Unique credentials used for authentication.
Auth Scopes	Define the specific permissions for an application. **Note:** The Auth scopes must be comma-separated values.
Authentication Token for Client Registration	Authentication token used to verify client's identity and grant it permission to register with an authorization token. Provide the following values: ○ **Header**: Authorization header. ○ **Value**: Authentication password.
Authorization URL	Web address of your server to direct authorization.
Token URL	Web address containing the token.
Token Revocation URL	Web address to revoke the previously provided token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Add**.
   Selecting Add takes you to the MCP Server record where you must authenticate it for adding an MCP tool to an AI agent.
8. Select **Authenticate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting **Authenticate** takes you to the third-party authorization page where you must select a workspace and select **Authorize**.

Note: When the OAuth access or refresh tokens aren't available, you must authenticate the OAuth configuration on the MCP Server record to add it as a tool to an AI agent.

Add an MCP Server with API Key

Add an MCP Server with an API Key in the AI Agent Studio.

Before you begin

Role required: sn_mcp_client.admin

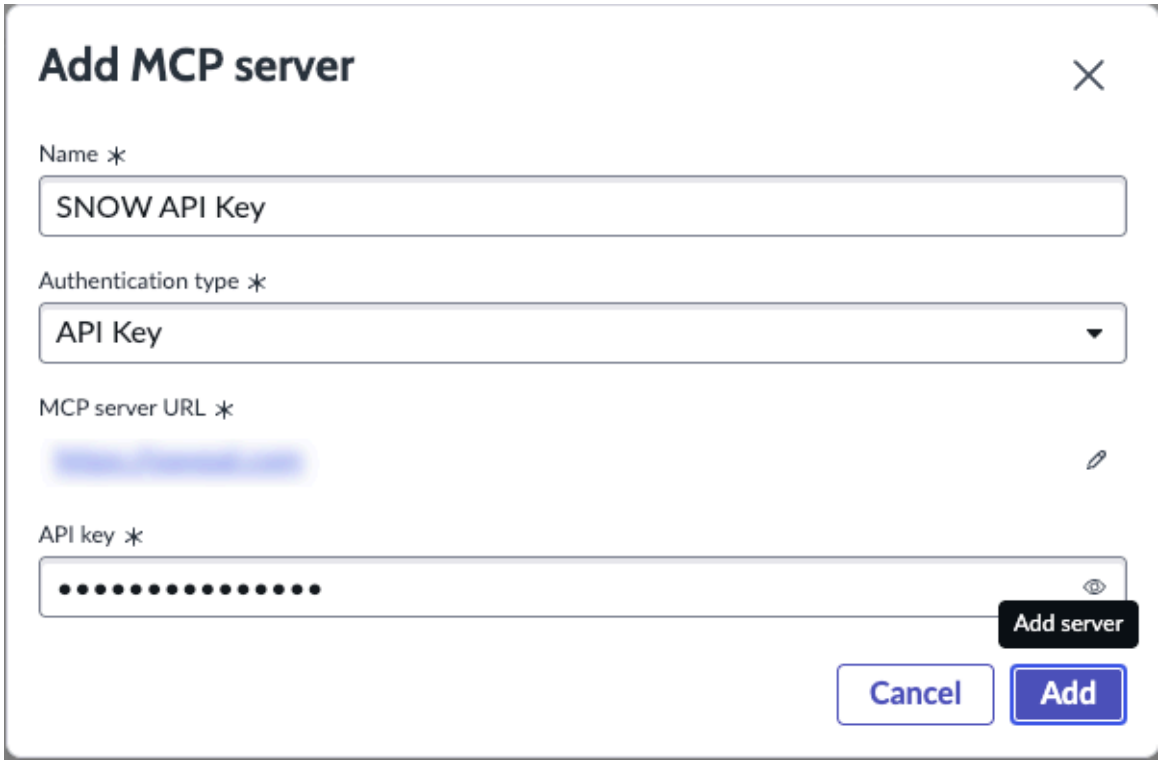
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Navigate to **Manage MCP Servers** and select **New**.
3. On the form, fill in the fields.

Add MCP Server

Field	Description
Name	Name for your MCP Server.
Authentication Type	The authentication type with which you want to add your MCP Server. Select **API Key**.
MCP Server URL	The web address of your MCP Server.
API Key	A unique code or password to identify and authenticate the user or application when accessing the API. **Note:** The API Key adds a Connection alias dynamically at runtime and maps with the MCP Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Add**.

Result
An MCP Server with the name you provided appears in the list of MCP Servers.

Add an MCP Server with Connection and Credential Alias

Add an MCP Server by selecting a Connection and Credential Alias record.

Before you begin

- Role required: sn_mcp_client.admin
- Verify that you have a Connection and Credential alias record created before adding an MCP Server with Others as the option.

  For more information, see Create a Connection & Credential alias.

About this task
For using the Authentication methods not supported in MCP Server, you can use the Connection and Credential Alias method to create the Alias manually and then update it in the MCP Server. For using OAuth based authentication method, first create the OAuth entity profile and then create the Connection and Credential Alias. For other authentication methods like API Key, Basic Auth, AWS Credentials, SSH Credentials, create the connection and credential Alias directly.

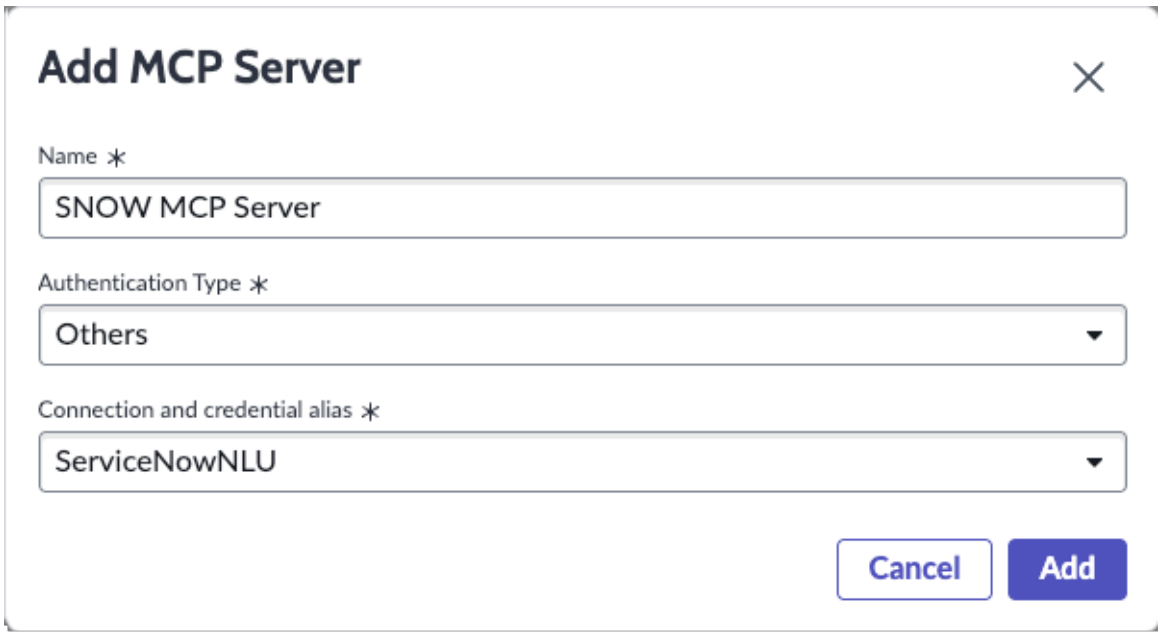
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Settings**.
2. Navigate to **Manage MCP Servers** and select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add MCP Server

Field	Description
Name	Name for your MCP Server.
Authentication Type	The authentication type with which you want to add your MCP Server. Select **Others**.
Connection and credential alias	Select a Connection and credential alias record to map with your MCP Server.



4. Select **Add**.

Note: Authenticate the MCP Server if you see the message requiring it.

Result
An MCP Server with the name you provided appears in the list of MCP Servers.

Add a Model Context Protocol to an AI agent

Add a Model Context Protocol tool to an AI agent in the AI Agent Studio so that your users can access the MCP Server.

Before you begin
Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. Open the AI agent that you want to add a Model Context Protocol tool to and navigate to the Add tools and information section.
3. In the Add tool drop-down list, select **MCP server tool**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a Model Context Protocol Tool

Field	Description
Select Model Context Protocol Server	The Model Context Protocol Server that you want to add to the tool. **Note:** Verify that the MCP Server is authenticated before adding the MCP tool to an AI agent. If the MCP Server isn't authenticated, then you receive an error message - "Authentication is needed to display tools. Open the MCP server record to authenticate."
Select Tool	The tool that you want to add from the Model Context Protocol Server.
Name	Name of the Model Context Protocol tool.
Tool and Description	Description of the Model Context Protocol and what it's going to do to assist your AI agent. **Note:** This description is sent to the LLM (LLM).
Execution Mode	Mode of execution for your selected Model Context Protocol tool: ○ **Supervised**: Inputs from your live agent are required during the execution of this Model Context Protocol tool while the AI agent runs. ○ **Autonomous**: Doesn't require any input from your live agent during the execution of this Model Context Protocol tool while the AI agent runs.
Display output	Permission to display the output of the execution in the Now Assist panel or in Virtual Agent: ○ **Yes** ○ **No**
Processing message	Message to display to users when the tool is running.
Output transformation strategy	Style for the LLM to present the results. ○ None ○ Concise ○ Paragraph ○ Verbose ○ Custom

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Add**.
   A Model Context Protocol tool is added in the Model Context Protocol Tools list on the Add tools and information page.

Test an AI agent

Analyze the performance of an AI agent with a Model Context Protocol tool added to it to verify that it functions the way that you defined it.

Before you begin

Role required: sn_aia.admin

About this task

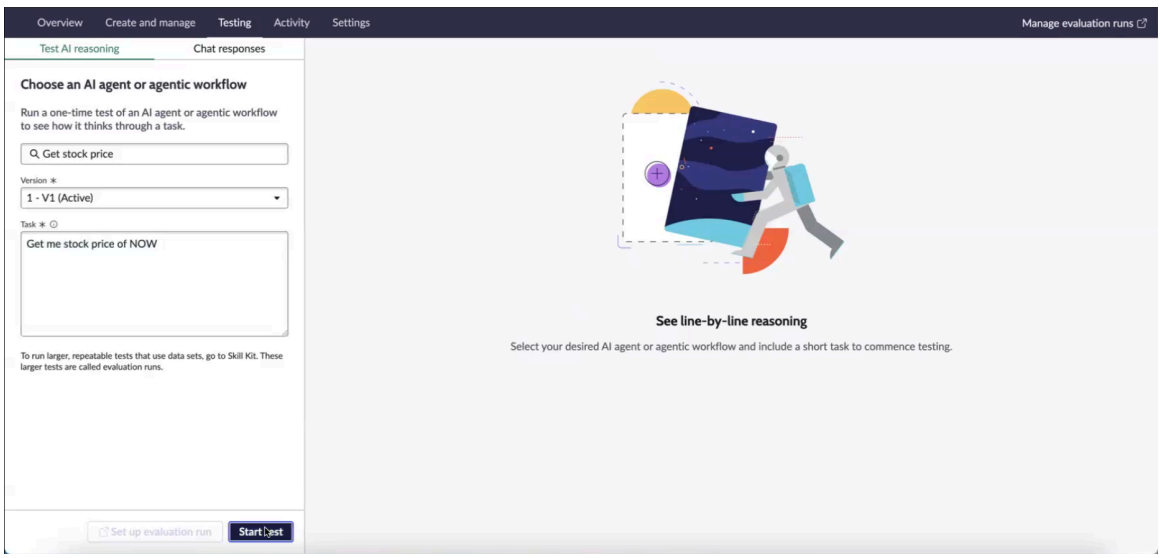
After you create an AI agent and a Model Context Protocol to it as a tool, test it to see that it functions the way that you defined it. Search for the AI agent that you want to test and select the version from the Version drop-down and provide a task with a concise summary and a reference number in the **Task** field to begin testing the AI agent.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Testing**.
2. In the **Test AI reasoning** tab, use the Search bar to search and select the AI agent that you want to test.
3. In the Version drop-down list, select the version of the AI agent.
4. In the **Task** field, provide a concise summary of the task to be achieved.

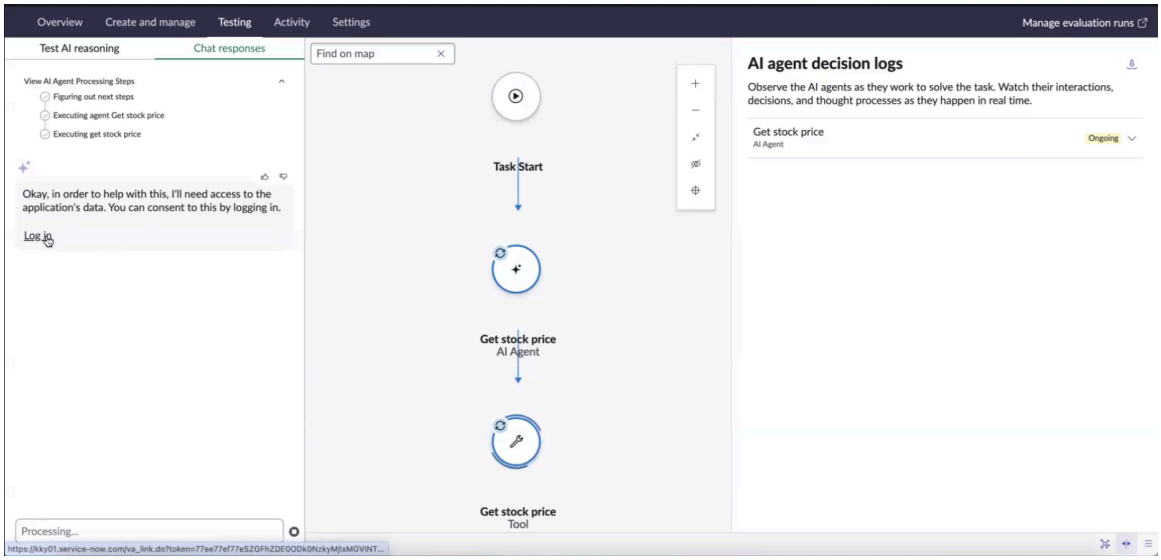
   Note: In the task summary, include a reference number or specific record for better results during your testing.

5. Select **Start test**.



You're directed to the **Chat responses** tab, where you can see Now Assist executing operations to test the AI agent.

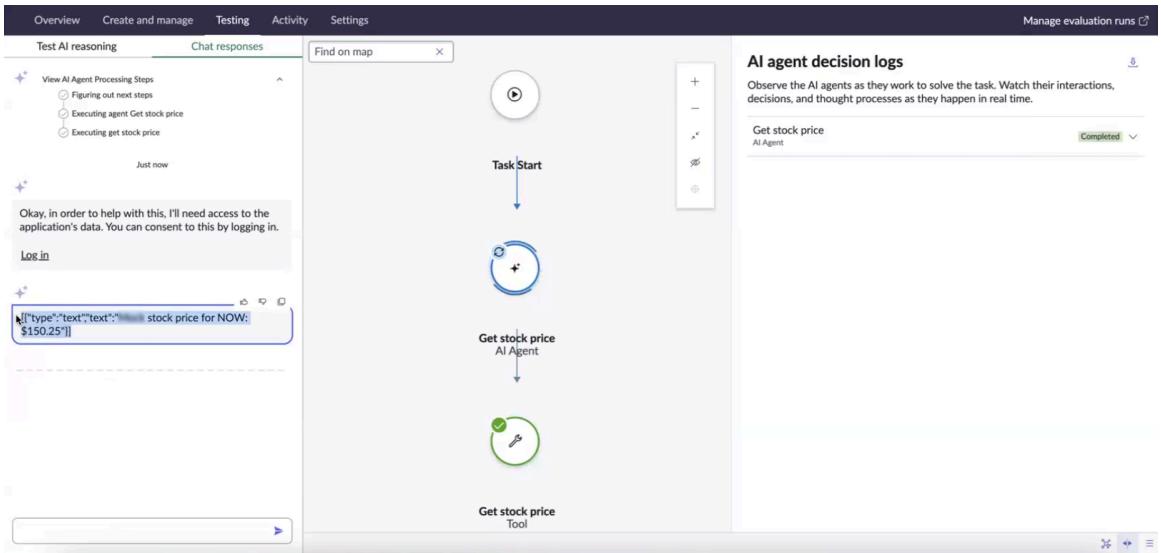
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Log in** and authenticate the MCP server to complete the testing.

Note:

- Log in will be visible only if the server isn't authenticated.
- Enabling access to the MCP Server refreshes the whole Testing page and resumes testing in the Chat responses tab. The OAuth token used for the authentication is saved in the OAuth Credentials table [oauth_credential].



Model Context Protocol Client reference

Find more information about user roles, tables, and the different properties that are installed with the Model Context Protocol Client application.

MCP Client Roles

The following roles are installed with the Model Context Protocol Client plugin [sn_mcp_client].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles used in MCP Client

Role	Description
MCP Client Admin [sn_mcp_client.admin]	Administrator of the application. A user with the sn_mcp-client.admin role can create, read, update, and delete records. **Note:** The sn_aia.admin role contains the sn_mcp_client.admin role, a role inheritance on plugin activation.
MCP Client Viewer [sn_mcp_client.viewer]	Read-only access to the application. A user with the sn_mcp_client.viewer role has read and report access on all tables. **Note:** The sn_aia.viewer role contains the sn_mcp_client.viewer role, a role inheritance on plugin activation.

MCP Client system properties

The following system properties are installed with the Model Context Protocol Client plugin [sn_mcp_client].

System properties used for configuring MCP Client

System property	Description
sn_aia.enable_mcp_tool	Enables access to the MCP Client tool on your ServiceNow instance. Default value: **false**

MCP Client tables

The following tables are installed by default with the installation of the Model Context Protocol Client plugin [sn_mcp_client].

Tables used for configuring MCP Client

Table	Description
MCP Execution Logs [sn_mcp_execution_logs]	Lists the request and response, the method (tool call or tool list) that was carried out along with the mapped session. The execution logs table also helps to debug and shows if there are any errors.
MCP Client Server Session Mappings[sn_mcp_client_server_session_mapping]	Lists the sessions mapped to the server based on the capabilities support.
Model Context Protocol Severs [sn_mcp_server]	Lists the MCP Servers.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Autonomous Workforce

Learn more about Autonomous Workforce and review the benefits AI specialists can provide for different users in your organization.

Autonomous Workforce overview

Your autonomous workforce is made up of AI specialists. Each specialist combines individual AI agents that solve discrete tasks, such as prioritizing an incident or identifying similar records. Working together, these agents tackle bigger goals like task triage or updating requesters with solutions that worked for similar issues. The AI specialist performs tasks and is capable of functioning as a reliable extension of your workforce, taking on work that would bottleneck your team. Spend less time on ticket volume and more time delivering meaningful resolutions.

Assign your AI specialist to specific assignment groups and roles to limit the scope of its work and the data it can access. Once configured, you can test your AI specialist to confirm it behaves as expected before putting it to work. After activation, your AI specialist runs against real records, and you can monitor its performance and activity over time to confirm it continues to meet your needs.

Accessing AI specialists

To access AI specialists, you must have the following plugins installed:

- Zero Touch Service Desk plugin [sn_ztsd] version 2.3.19+
- ServiceNow Otto AI Agents [sn_aia] version 7.1+
- AI Engagement Experience [sn_now_canvas_ai] version 3.1.1+

Your instance must also be at least on Zurich Patch 10 or Australia Patch 3.

Autonomous Workforce users

Different users interact with Autonomous Workforce in various ways depending on their role and responsibilities.

Users

User	Role	Description
AI administrator	sn_aia.admin	The AI administrator can configure and activate AI specialists using AI Agent Studio. After AI specialists are activated, they can monitor their performance and activity to track their effectiveness, efficiency, and customer satisfaction.
Service Desk manager	sn_sow_itsm_common.sn_service_desk_manager	Service Desk managers have the capabilities of a standard Service Desk Agent (sn_service_desk_agent) and team level oversight and task resolution. They can view and manage

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

User	Role	Description
		team performance reports, analytics, and tasks and onboard an AI specialist to the team in Service Operations Workspace.
Service Desk agent	sn_itsm_common.sn_service_desk_agent	Service Desk agents resolve tasks, such as incidents and cases, using their knowledge, research, and experience. They have access to the Service Operations Workspace, where they can view the work of an AI specialist on a record.

Autonomous Workforce workflow

Follow this workflow to implement and manage AI specialists in your organization.

For more information about considerations to make before deployment, see General guidelines for deploying AI specialists.

1. Onboard an AI specialist.

   As an AI administrator, you can use AI Agent Studio to configure your AI specialists.

   After installing the applications and plugins and activating the sn_aia.enable_ai_workers system property, you can activate an AI specialist as-is or configure any of the following:

   - Basic details, including name, profile icon, department, and description
   - Profile, including the roles and assignment groups
   - Tasks, things the AI specialist can do
   - Triggers, for running the AI specialist after specified events occur
2. Manually assign tickets to your AI specialist to see how it works. Once you have built trust, create assignment rules or configure Advanced Work Assignment to route work to your AI specialist automatically.
3. Monitor AI specialist activity. You can review the records that the AI specialist has worked on individually to check how it's doing.
4. Track AI specialist performance. Analytics for AI specialists that track their effectiveness, efficiency, and value can be found in AI Agent Studio and Service Operations Workspace. Use the analytics routinely to confirm that the AI specialist keeps up if things change. If performance isn't where you want it to be, you can configure it again at any time.

Autonomous Workforce benefits

Autonomous Workforce provides specific benefits for different types of users in your organization.

© 2026 ServiceNow, Inc. All rights reserved.

Autonomous Workforce benefits

Benefit	Feature
Automate high-volume, repeatable requests to reduce manual effort and free up agents for complex work	AI specialist capabilities
Classify and triage incoming work to route requests to the right team faster	AI specialist tasks
Investigate related records to surface relevant context and accelerate resolution	AI specialist tasks
Communicate with requesters throughout the lifecycle of a request to keep them informed	AI specialist tasks
Monitor team and AI specialist performance to track efficiency and identify areas for improvement	Performance metrics
Test AI specialist behavior before activation to validate outcomes and reduce risk	AI specialist guided setup in AI Agent Studio
Simplified agentic AI setup reduces configuration complexity and helps accelerate time to value	AI specialist guided setup in AI Agent Studio
Enforce data security for agentic AI by assigning roles to control what each AI specialist can access and act on	AI specialist assigned roles

General guidelines for deploying an autonomous workforce

AI specialists, like other agentic AI, benefit from strategic planning for testing, deploying, and monitoring performance. Learn guiding principles to help your AI specialists achieve their highest chances of success.

Overview of deploying an autonomous workforce

AI specialists use artificial intelligence to perform work, but they don't require extensive knowledge about AI to set up and use. The possible tasks available to an AI specialist come pre-configured. You can choose which ones apply, test to verify that the AI specialist works as you expect, and then activate.

Like all AI, strategic planning for autonomous workforce implementation can be key to getting the most out of your AI specialists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Questions to ask before you begin activating AI specialists might be:

- What problems do I want my AI specialist to solve, and why?
- Would an AI specialist be the best solution for these problems, or would they be better solved with an AI skill, AI agent, or agentic workflow?
- What counts as success in terms of AI specialist effectiveness, efficiency, and customer satisfaction?
- How do I want my team members to interact with an AI specialist?

AI specialists perform best under the following conditions:

- Strong knowledge base: Well-maintained, procedural knowledge articles with clear self-service instructions for end users
- High-volume of similar issues: Incidents with a single dominant root cause and clear resolution paths
- Existing catalog items: Well-defined catalog items for accurate redirection of misclassified incidents
- Clear policy rules: Approve/reject criteria that are explicit and well-documented

AI specialists don't perform well under the following conditions:

- Sparse or outdated knowledge: knowledge articles that are incomplete, out of date, or written for internal audiences
- Complex multi-step troubleshooting: issues that require orchestration across multiple external systems or remote device access
- Undocumented internal knowledge: resolutions that depend on tacit knowledge not captured in formal systems
- Highly sensitive categories: Personally identifying information, security incidents, or areas with severe cost of error should be avoided

Configuring AI specialists in your autonomous workforce

When configuring an AI specialist, there are several important aspects to consider.

Within the AI specialist's profile, the sections each relate to different aspects of the AI specialist's suitability for certain work:

Assignment groups: the work the AI specialist is assigned

The AI specialist can't work on tasks not assigned to those assignment groups. If you don't want the AI specialist to work on certain tasks, confirm that the correct assignment groups are selected.

Roles: what data the AI specialist has access to

See the section Data access security for AI specialists.

The AI specialist's tasks specify the actions that it can take to solve problems within the domains. Each task has different options to configure the actions further. For more information about the different tasks available, see Edit the tasks of an AI specialist.

Operating modes: from supervised to autonomous

Supervised (Copilot) mode

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The AI specialist researches and drafts a proposed solution, but a person reviews and approves it before it reaches the requester. Use this mode when you don't yet have confidence in autonomous resolution for a given category.

Autonomous mode

The AI specialist resolves and communicates independently, escalating to a human when its confidence is low.

Move an AI specialist to autonomous operation as soon as it has proven itself in testing. See the following section for guidance on when to hold a category back.

Confidence, cost of error, and escalation

Before posting a resolution, an AI specialist scores its proposed solution and compares that score against a confidence threshold you configure. If the score meets the threshold, the solution is posted; if it falls short, the work routes to a human fulfiller instead. That score is informed by how well the solution is supported by evidence, how closely it fits the specific task, how likely it is to resolve the issue, and the AI specialist's overall certainty.

Not every category carries the same risk, so weigh cost of error alongside confidence: financial impact if the resolution is wrong, sensitivity if the category involves personally identifying information or security data, and whether the resolution is internal-facing or reaches a customer directly. Categories with a higher cost of error should stay in supervised mode, or stay outside the AI specialist's assignment groups, regardless of how well-suited they otherwise seem.

Data access security for AI specialists

AI specialists only have access to the data that you specify. AI specialists can be assigned roles to limit their data access to certain scopes. Verify that the roles granted to the AI specialist are enough to enable it to complete its tasks, but not enough to access data it shouldn't. The roles function the same as the roles for a human user.

Consider these security principles when configuring AI specialist roles:

- Apply the principle of least privilege by granting only the minimum roles necessary for the AI specialist to perform its assigned tasks.
- Review role assignments regularly to verify they remain appropriate as your AI specialist's responsibilities evolve.
- Test role configurations in a non-production environment before deploying to production.

Important: AI specialists can access and modify data based on their assigned roles. Verify that role assignments align with your organization's data governance and security policies.

Assigning work to the AI specialist

Tasks must be assigned to the AI specialist. You can assign tasks to the AI specialist like any other user. Manual assignment, business rules or other triggers, and Advanced Work Assignment (AWA) all work. AWA allows you to select rules for assigning work so that work can be assigned automatically when the record is created or updated.

The User record associated with the AI specialist can be found on its profile. You can use business rules, triggers, or AWA to assign work to the AI specialist referencing that User record.

When setting up assignment rules, consider these factors:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Volume and complexity of work to confirm the AI specialist can handle the assigned workload
- Priority levels to determine which tasks the AI specialist should handle first
- Escalation paths for cases where the AI specialist can't complete a task

Common failure modes to validate against

Certain conditions are reliable early warnings that a deployment will encounter issues. Validate against each of these before activating an AI specialist.

- Task states that don't change during AI specialist execution, which can suggest extensive customizations that fall outside foundational readiness. Run the AI Readiness Evaluation application to assess foundational readiness before proceeding.
- Task states that don't change during AI specialist execution, which can also suggest a state model that isn't mapped to the AI specialist's processing states. See Edit the tasks of an AI specialist in the legacy AI Agent Studio for steps to configure state mapping.
- Test queries that return no results or surface internal-only content, which points to a knowledge base that isn't ready. Complete a knowledge audit and enforce audience separation before proceeding.
- Poor knowledge base search results despite a ready knowledge base, which points to an AI Search profile misconfiguration. Inspect and adjust the Zero Touch Service Desk (ZTSD) search profile and AI Search configuration to target the right content for the AI specialist to rely on.
- Zero assignments after activation, which points to an assignment rule or routing misconfiguration. Validate routing in a non-production environment and run a test task through the full routing chain across all intake channels.
- A spike in reopened tasks, which points to accuracy issues. Start with thorough testing and gate any move to autonomous operation on whether you consistently meet the expected thresholds.
- Work that sits with the AI specialist for more than 2 hours with no state change, which points to a broken escalation path. Validate escalation and run escalation test cases before activation.

Previewing your AI specialist

Previewing your AI specialist on multiple records can show you what to expect when the AI specialist is activated and running.

Important: Changes made by the AI specialist during previews are actually made to the record.

Follow these testing guidelines to validate your AI specialist's performance:

- Use representative tasks for initial validation. Selecting tasks that mirror the ones the AI specialist will handle enable you to check basic functions. You could also create dummy tasks that simulate active ones.

  Note: The AI specialist won't send any communications to users during tests.

- Test across different incident and case categories. Testing multiple categories allows you to confirm that the AI specialist is working effectively in multiple domains.
- Run at least 5 to 10 tests before activating. Try to create tests that cover all situations assigned to the AI specialist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Test edge cases and unusual scenarios to see how the AI specialist handles unexpected situations.
- Validate that the AI specialist respects data access controls and role-based permissions during testing.

Improving AI specialist performance with feedback

AI specialists can make mistakes. With feedback or changes to the sources they access, you can improve their performance for next time.

Use these methods to monitor and improve AI specialist performance:

- Administrators and Service Desk managers can review the individual steps an AI specialist took to reach its conclusions, in either Service Operations Workspace or the Core UI.
- AI administrators and Service Desk managers can view an AI specialist's activity in AI Agent Studio. You can see the different tasks that your AI specialist has worked on. In the list, there is the option to provide granular feedback of either *Helpful* or *Not helpful*. You can open the record, check the AI specialist's work, and then submit the feedback in the activity list.
- If the AI specialist makes errors based on knowledge articles that contain outdated or faulty information, knowledge administrators can update the articles to improve AI specialist performance.

Establish regular performance review cycles to:

- Analyze AI specialist activity logs and success rates
- Identify patterns in errors or suboptimal performance
- Update knowledge base content based on AI specialist performance
- Adjust AI specialist configuration based on performance data

Ongoing monitoring and optimization

After deploying your AI specialist, continuous monitoring helps maintain optimal performance and identify opportunities for improvement. You can track the performance analytics of an AI specialist by selecting them in AI Agent Studio. See View AI specialist performance metrics.

Key metrics include:

- Task completion rates and mean time to resolution
- User satisfaction scores and feedback
- Escalation rates to human agents
- Durable auto-resolve rate: the percentage of work the AI specialist resolves with no reopen during the post-resolution monitoring window
- AI coverage rate: the percentage of eligible volume the AI specialist is actually eligible to handle, which keeps scaling honest rather than cherry-picking easy work
- Time to value: how quickly enough production data exists to quantify impact after go-live

Regular optimization activities should include:

- Refining assignment rules to improve work distribution
- Updating knowledge base content to address new scenarios
- Adjusting role assignments based on security reviews and changing requirements

Domain separation for service providers

Configuring AI specialists

Configure the name, profile icon, capabilities, assignment groups, tasks, and language proficiencies of AI specialists in AI Agent Studio.

Configuration overview

See General guidelines for AI specialists for more information about setting up your autonomous workforce.

1. Configure AI specialist profile

   Configure the name, icon, roles, and assignment groups of an AI specialist.

2. Configure AI specialist tasks

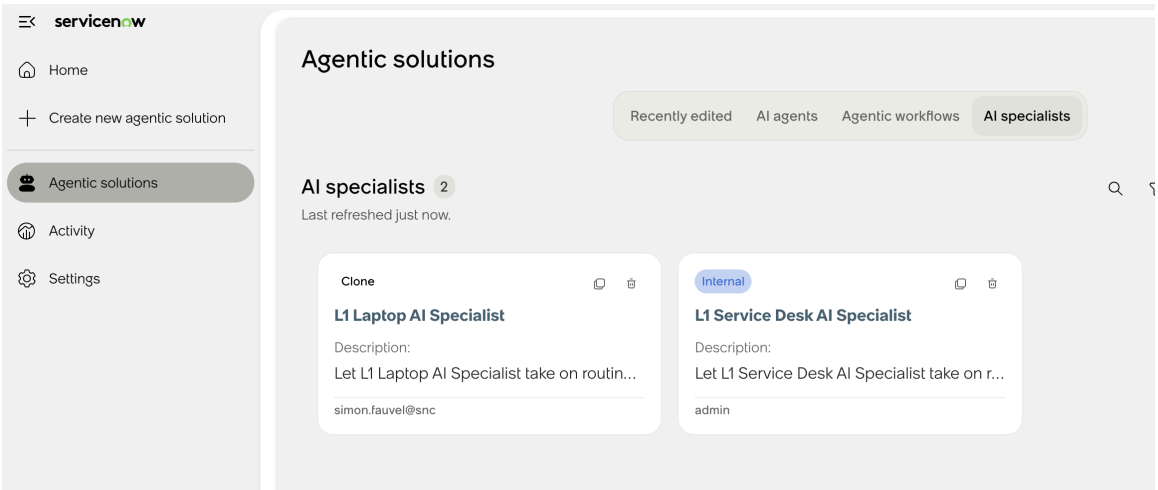
   Configure the tasks that an AI specialist is capable of.

3. Test an AI specialist

   Run the AI specialist on a specific record to check how it functions.

Configure AI specialists in AI Agent Studio

Configure your AI specialists in your autonomous workforce in AI Agent Studio.



The following is the basic workflow for configuring an AI specialist.

1. **Profile**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set basic details like the AI specialist's name, icon, role, and assignment groups. Assignment groups are the most important setting because they determine which groups the AI specialist can act on behalf of.

2. **Tasks**

   Define what the AI specialist can do, such as triaging incoming work, researching context, and responding to requesters.

4. **Preview the AI specialist**

   Test the AI specialist on an actual record, not a simulation, to see how it reasons and what actions it takes.

Edit the profile of an AI specialist in AI Agent Studio

Modify the profile of an AI specialist in AI Agent Studio to set its name, description, roles, and assignment groups.

Before you begin

Role required: sn_aia.admin

About this task

AI specialists profiles determine the unique specialties of the AI specialist. Choosing the right roles helps give your AI specialist the context necessary to accomplish its tasks.

To learn how to modify the tasks that an AI specialist is capable of, see Edit the tasks of an AI specialist.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to modify.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and don't require modification to change the profile of the AI specialist.

4. Update the name, profile icon, title, and description of your AI specialist.

   The user ID must match the ID of an existing record on the User table with the AI user type.

5. Choose your AI specialist's assignment groups.

   The assignment groups determine what work the AI specialist can pick up. Multiple teams can use the same AI specialist, but you can create copies of a AI specialist if you want to fine-tune an AI specialist for different teams. See Create a copy of an AI specialist for more information.

   If you remove your team from the list of assignment groups, the AI specialist won't handle your team's tickets.

6. Select your AI specialist's role(s).

   Roles determine what data access your AI specialist has. For example, if the AI specialist has a role that grants it access to the Incident table, it can work on incidents. If the role(s) don't grant access to a necessary table, the AI specialist can't pick up work on that table, even if it's within the assignment group's domain.

   Review the full list of roles granted to the AI specialist to check your AI specialist has access only to what it needs to accomplish tasks.

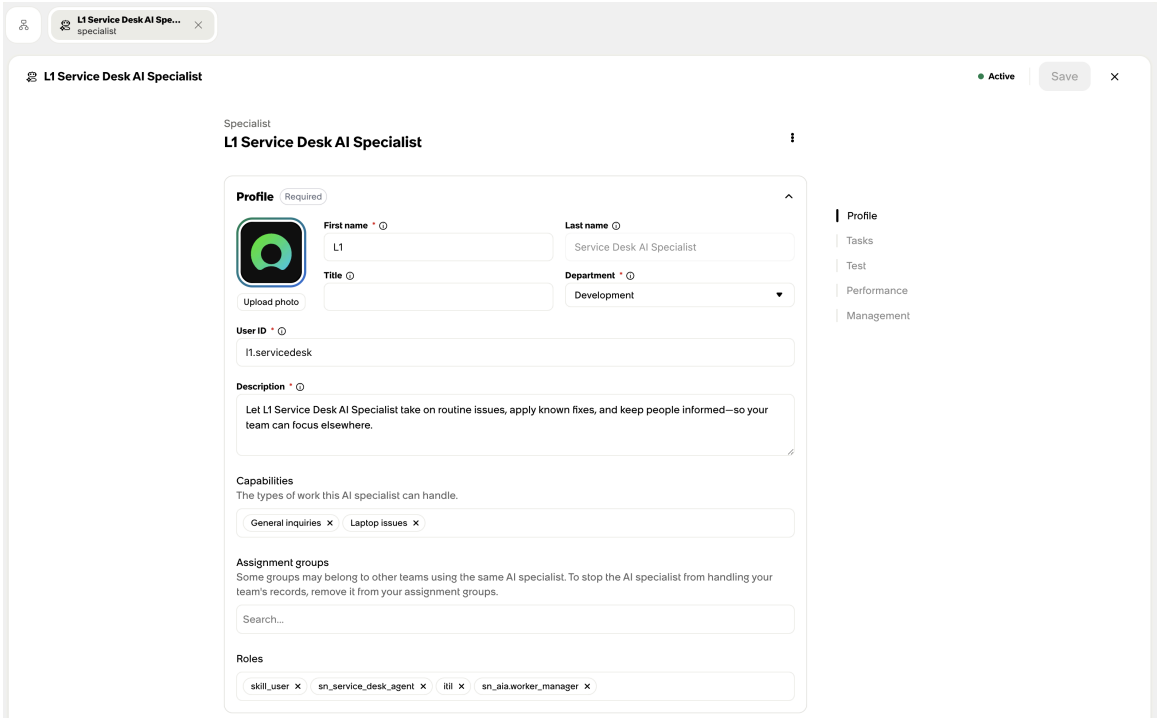
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Save** to save your changes.

   You can make additional changes to your AI specialist before selecting save.

   If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

Edit the tasks of an AI specialist in AI Agent Studio

Select tasks that an AI specialist can perform in the new AI Agent Studio.

Before you begin

Role required: sn_aia.admin

About this task

AI specialist tasks determine what they can do. Choosing the correct tasks provides your AI specialist with the tools required to complete complex goals autonomously.

To learn how to modify the roles and capabilities that an AI specialist has, see Edit the profile of an AI specialist.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to modify.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and don't require modification for task configuration.

4. Scroll down to the **Tasks** section in the AI specialist guided setup to view the full list of tasks that the AI specialist can perform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the card of a task to review, select the pencil icon, and make changes to the specific details of the task configuration.

   The following tasks are available to the L1 IT Service Desk AI Specialist. These are presented as examples. Different AI specialists may have different tasks.

   Classify and assign: Configure how the AI specialist identifies incidents, classifies them, and assigns a specific incident type for follow-up.

   - *Table*: Select the table in which the AI specialist operates and resolution workflows are executed.
   - *Fields to classify on the record*: Enter the fields that the AI specialist should classify if empty.
   - *Routing*: Add and manage the routing criteria that determine which records the AI specialist handles. For more information, see Manage the routing criteria of an AI specialist.

   Triage and diagnose: Configure the details for how the AI specialist analyzes incidents for accurate handling.

   - *Field to use as Task objective*: Select the record fields which the AI specialist uses to analyze and determine the next steps.
   - *Use attachment content*: Enable the option for the AI specialist to review the content of attached files as part of incident triage and diagnosis.
   - *Map AI specialist states to record states*: Map the states of the AI specialist's execution to the states of the incident record. For example, the AI specialist's *Awaiting information* state can be mapped to the incident record *On Hold* state. If you have customized state values for your Incident table, you can map them to the AI specialist's states here.
   - *Default routing decision*: Select the routing decision that the AI specialist falls back to when an incident matches none of the routing criteria. Select either *Attempt resolution* or *Reassign*.
   - *Routing criteria*: Add criteria that determine which records the AI specialist handles. Criteria are grouped into two sections:
     - *Reassign for*: When an incident matches one of these criteria, the incident is reassigned to a human.
     - *Attempt resolution for*: When an incident matches one of these criteria, the AI specialist attempts to resolve it.

     To add a criterion, select **Add reassigned criteria** or **Add attempted criteria**, depending on which decision you want the criterion to trigger. Complete the following required fields and then select **Add routing criteria**.

     - *Name*: Enter a name that identifies the criterion, such as `AD account access blocked`.
     - *Routing instructions for LLM*: Describe which incidents the criterion applies to, including any scope that limits it. The AI specialist uses

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

these instructions to determine whether an incident matches the criterion. Enter up to 4,000 characters.

- *Routing Decision*: Set by the button that you selected, either *Reassign* or *Attempt resolution*.

Each criterion appears as a labeled item in its section, showing only the name. To change a criterion, select its name to reopen the dialog box. To remove a criterion, select the **X** next to its name and then select **Delete** to confirm.

Investigate and resolve: Configure the following details on how the AI specialist investigates to find relevant solutions and resolve the issue.

- *Knowledge sources*: Select search profiles and knowledge base *sys_ids* to define how the AI specialist retrieves knowledge articles. AI search profiles can include sources such as knowledge articles, ServiceNow documentation, or specific tables. You can create AI Search profiles specifically for your AI specialists. To customize what information your AI specialist accesses, add search profiles with the pre-installed ones or remove the pre-installed ones. You must have at least one search profile selected for the AI specialist to complete the *Investigate and resolve* task.

  Note: If you include a table as a search source but don't grant the AI specialist access through its assigned roles, it can't search that table.

- *Automatically create KFT records*: Enable if you want the AI specialist to create a KB Feedback Task record after proposing a solution without an existing knowledge article.
- *Research depth*: Select how extensively the AI specialist must gather and analyze data during investigation.
- *Pre resolution condition*: The conditions that must be true before the AI specialist will resolve the ticket. These are fields that get filled in after a ticket has been submitted.
- *Execution mode*: Determine how autonomously the AI specialist should act. *Autopilot* mode grants the AI specialist the ability to mark a ticket as resolved once resolution steps are sent. *Copilot* mode requires human acceptance of its resolution proposal.
- *Auto-submit catalog requests*: Enable AI specialists to submit catalog items on behalf of the user without an additional confirmation step.

Response formatting: Configure the details on how the AI specialist communicates to keep requesters informed through communication channels.

- *Inbound channels*: Select the inbound channels such as Activity stream through which the AI specialist can receive messages from requesters.
- *Outbound Channels*: Select the outbound channels the AI specialist uses to send responses or notifications. You can select channels such as Activity stream, email, portal, or phone.
- *Internal communication when confidence is low*: Enable the AI specialist to log its solution as a work note rather than proposing it directly.
- *Response templates*: Write the template for what the AI specialist should say to communicate to the user. You can set response templates for three different AI specialist states: Awaiting Info, Solution Proposed, and Reassign to Human. You can format your message using the editor to include things like bold text, specific fonts, tables, highlighting, links, and bullets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reassign: Configure the following details on how the AI specialist directs unresolved incidents to the correct team or agent for timely resolution.

- *Maximum number of interactions before escalation*: Set how many times to contact the requester before sending to a human agent. Enter a number greater than zero.
- *Reassign on follow-up question*: Enable this option to send the ticket to a human agent when the requester asks a follow-up question. Turning off the option lets the AI specialist handle follow-ups.
- *Choose where to reassign records*: Select the assignment group to reassign the ticket after an AI specialist has reviewed it and chosen to reassign it.
- *Cross-group reassignment*: Enable the AI specialist to recommend reassigning an incident to a different assignment group. The AI specialist never reassigns an incident to a different assignment group on its own.
- *Cross-group confidence threshold*: Set the confidence threshold for whether an incident belongs to a specific other assignment group.

6. Select **Save** to save your changes.

   You can make additional changes to your AI specialist before selecting save. Changing tabs in the AI specialist guided setup won't lose your changes.

   If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

Preview an AI specialist in the new AI Agent Studio

Run a preview of your AI specialist in the new AI Agent Studio on a single record to preview how it works and verify it matches your intentions.

Before you begin

Role required: sn_aia.admin

About this task

You can test an execution of the AI specialist on a single record to preview its capabilities.

Note: Previewing an AI specialist, depending on the tasks configured, can actually make changes to the record. Previews aren't simulations.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to preview.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and do not require modification to preview an AI specialist.

4. Scroll down to the **Test** section in the AI specialist guided setup.
5. In the dropdown menu, select a record you want to preview the AI specialist on.

   Once a record is chosen, you can select the open link button to open the record in a new browser tab to check the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Choose records that you can safely make changes to. The work is actually being done on the record during the preview.

6. Select **Run** to begin the preview.

   The test begins on the record. You can watch what fields it updates and any comments or work notes it generates.

   When the test is complete, you can review all the changes made.

7. Verify that the AI specialist's performance meets your expectations.

   See the Testing section in General guidelines for AI specialists for more information about how to test your AI specialist.

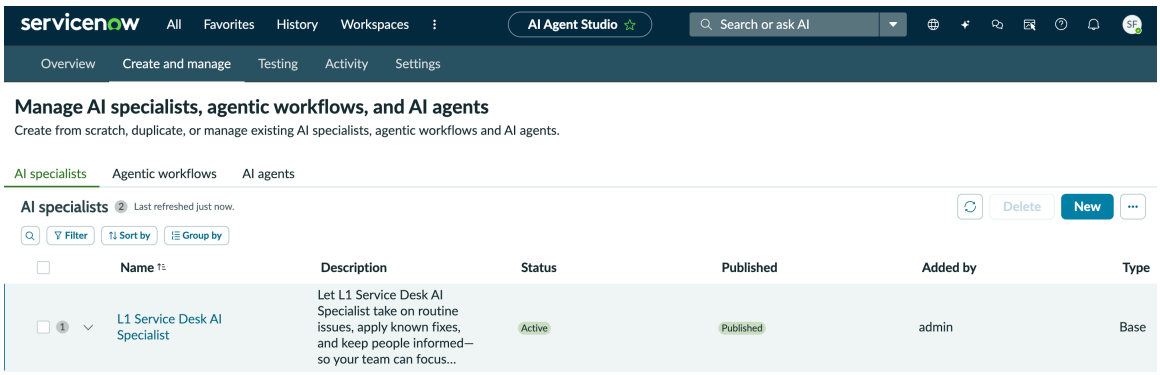
Result
Your AI specialist has worked on a specific record or records of your choice.

What to do next
You can return to the **Profile** or **Tasks** sections by scrolling up in the guided setup to make changes if necessary. Once the changes are made, you can preview the AI specialist again.

If you're satisfied with the AI specialist's performance after making changes, you can select **Save** to save changes or **Activate** to let the AI begin work.

Configure AI specialists in the legacy AI Agent Studio

Configure your AI specialists in your autonomous workforce in the legacy AI Agent Studio.



The following is the basic workflow for configuring an AI specialist.

1. **Basic details**

   Set basic details like the AI specialist's name, icon, and role.

2. **Profile**

   Set basic details like the AI specialist's capabilities and assignment groups. Assignment groups are the most important setting here, since they determine which groups the AI specialist can act on behalf of.

3. **Tasks**

   Define what the AI specialist can do, such as triaging incoming work, researching context, and responding to requesters.

4. **Preview the AI specialist**

   Test the AI specialist on an actual record, not a simulation, to see how it reasons and what actions it takes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit the profile of an AI specialist in the legacy AI Agent Studio

Modify the profile of an AI specialist in the legacy AI Agent Studio to set its name, description, roles, and assignment groups.

Before you begin

Role required: sn_aia.admin

About this task

AI specialists profiles determine the unique specialties of the AI specialist. Choosing the right roles helps give your AI specialist the context necessary to accomplish its tasks.

To learn how to modify the tasks that an AI specialist is capable of, see Edit the tasks of an AI specialist.

Procedure

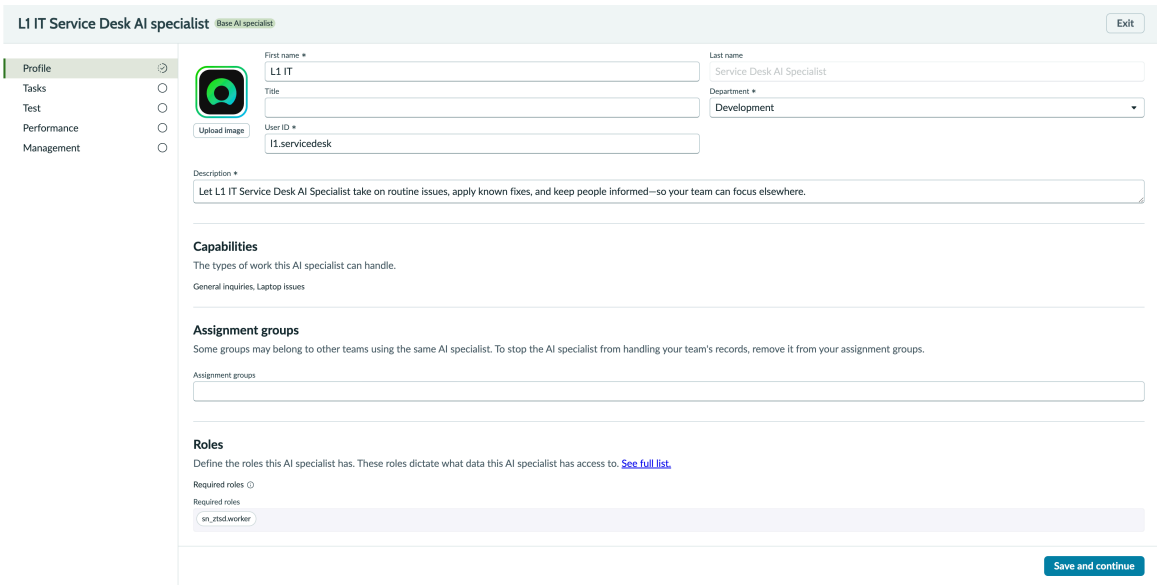
1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to edit.
3. In the **Profile** tab, select the edit icon next to the name of the AI specialist.
4. Choose your AI specialist's assignment groups.

   The assignment groups determine what work the AI specialist can pick up. Multiple teams can use the same AI specialist. If you remove your team from the list of assignment groups, the AI specialist won't handle your team's tickets.

5. Select your AI specialist's role(s).

   Roles determine what data access your AI specialist has. For example, if the AI specialist has a role that grants it access to the Incident table, it can work on incidents. If the role(s) don't grant access to a specific table, the AI specialist can't pick up work on that table, even if it is within the domain of its capabilities and assignment group.

   Review the full list of roles granted to the AI specialist to check your AI specialist has access only to what it needs to accomplish tasks.



6. Select **Save** to save your changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can make additional changes to your AI specialist before selecting save. Changing tabs in the AI specialist guided setup won't lose your changes.

If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

Result

Your AI specialist profile is updated. Your AI specialist has the updated context for understanding its role when accomplishing tasks.

Edit the tasks of an AI specialist in the legacy AI Agent Studio

Select tasks that an AI specialist can perform in the legacy AI Agent Studio.

Before you begin

Role required: sn_aia.admin

About this task

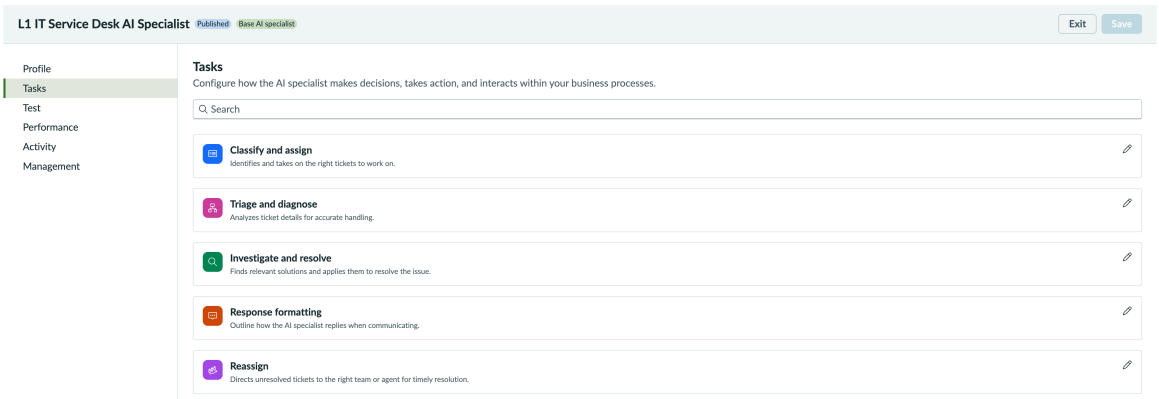
AI specialist tasks determine what they can do. Choosing the correct tasks provides your AI specialist with the tools required to complete complex goals autonomously.

To learn how to modify the roles and capabilities that an AI specialist has, see Edit the profile of an AI specialist.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to edit.
3. Navigate to the **Tasks** tab in the AI specialist guided setup to view the full list of tasks that the AI specialist can perform.
4. Select the card of a task to review and make changes to the specific details of the task configuration.

   The following tasks are available to the L1 IT Service Desk AI Specialist. These are presented as examples. Different AI specialists may have different tasks.



Classify and assign: Configure how the AI specialist identifies incidents, classifies them, and assigns a specific incident type for follow-up.

- *`Table`*: Select the table in which the AI specialist operates and resolution workflows are executed.
- *`Fields to predict`*: Enter the fields that the AI specialist should classify if empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Similar records search profile*: Select the AI Search profile that should be used for gathering records similar to the assigned record.
- *Override existing field values with predictions*: Enable this setting to let the AI specialist use predictions from similar records to replace existing values. Fields that can potentially be overridden are *Service*, *Offering*, and *CI*. Turn off if you only want the AI specialist to fill in empty fields.

Triage and diagnose: Configure the details for how the AI specialist analyzes incidents for accurate handling.

- *Field to use as Task objective*: Select the record fields which the AI specialist uses to analyze and determine the next steps.
- *Use attachment content*: Enable the option for the AI specialist to review the content of attached files as part of incident triage and diagnosis.
- *Map AI specialist states to record states*: Map the states of the AI specialist's execution to the states of the incident record. For example, the AI specialist's *Awaiting information* state can be mapped to the Incident record *On Hold* state. If you have customized state values for your Incident table, you can map them to the AI specialist's states here.
- *Default routing decision*: Determine whether an AI specialist should attempt to resolve a case outside of the assignment group's scope or reassign it to another assignment group. You can also specify in the following routing criteria section different categories of tasks for the AI specialist to attempt or reassign.
- *Default routing decision*: Select the routing decision that the AI specialist falls back to when an incident matches none of the routing criteria. Select one of the following options:
  - *Resolve without root cause analysis*
  - *Perform root cause analysis*
  - *Ask the caller for more information*
  - *Route to the service desk team*
- *Routing criteria*: Add criteria that determine which records the AI specialist handles. Criteria are grouped into two sections:
  - *Attempt resolution for*: When an incident matches one of these criteria, the AI specialist attempts to resolve it.
  - *Reassign for*: When an incident matches one of these criteria, the incident is reassigned to a human.

  To add a criterion, select **Add attempted criteria** or **Add reassigned criteria**, depending on which decision you want the criterion to trigger. In the **New routing criteria** dialog box, enter a name in the *Criteria* field and explain in the *Description* field which incidents belong to the criterion.

  Select **Submit** to add the criterion. The criterion appears as a labeled item in its section.

  To change a criterion, select its name to reopen the dialog box. To remove a criterion, select the **X** next to its name and then select **Delete** to confirm. A removed criterion is no longer used when the AI specialist routes work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Default routing decision*: Select the routing decision that the AI specialist falls back to when an incident matches none of the routing criteria. Select one of the following options:
  - *Resolve without root cause analysis*
  - *Perform root cause analysis*
  - *Ask the caller for more information*
  - *Route to the service desk team*

Investigate and resolve: Configure the following details on how the AI specialist investigates to find relevant solutions and resolve the issue.

- *Knowledge sources*: Select search profiles and/or knowledge base *sys_ids* to define how the AI specialist retrieves knowledge articles. AI search profiles can include sources such as knowledge articles, ServiceNow documentation, or specific tables. You can create AI Search profiles specifically for your AI specialists. To customize what information your AI specialist accesses, add search profiles with the pre-installed ones or remove the pre-installed ones. You must have at least one search profile selected for the AI specialist to complete the *Investigate and resolve* task.

  Note: If you include a table as a search source but don't grant the AI specialist access through its assigned roles, it can't search that table.

- *Automatically create KFT records*: Enable if you want the AI specialist to create a KB Feedback Task record after proposing a solution without an existing knowledge article.
- *Research depth*: Select how extensively the AI specialist must gather and analyze data during investigation.
- *Pre resolution condition*: The conditions that must be true before the AI specialist will resolve the ticket. These are fields that get filled in after a ticket has been submitted.
- *Execution mode*: Determine how autonomously the AI specialist should act. *Autopilot* mode grants the AI specialist the ability to mark a ticket as resolved once resolution steps are sent. *Copilot* mode requires human acceptance of its resolution proposal.
- *Auto-submit catalog requests*: Enable AI specialists to submit catalog items on behalf of the user without an additional confirmation step.

Response formatting: Configure the details on how the AI specialist communicates to keep requesters informed through communication channels.

- *Inbound channels*: Select the inbound channels such as Activity stream through which the AI specialist can receive messages from requesters.
- *Outbound Channels*: Select the outbound channels the AI specialist uses to send responses or notifications. You can select channels such as Activity stream, email, portal, or phone.
- *Internal communication when confidence is low*: Enable to allow the AI specialist to log its solution as a work note rather than proposing it directly.
- *Response templates*: Write the template for what the AI specialist should say to communicate to the user. You can set response templates for three

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

different AI specialist states: Awaiting Info, Solution Proposed, and Reassign to Human. You can format your message using the WYSIWYG editor to include things like bold text, specific fonts, tables, highlighting, links, and bullets.

Reassign: Configure the following details on how the AI specialist directs unresolved incidents to the correct team or agent for timely resolution.

- *Maximum number of interactions before escalation*: Set how many times to contact the requester before sending to a human agent. Enter a number greater than zero.
- *Reassign on follow-up question*: Enable this option to send the ticket to a human agent when the requester asks a follow-up question. Turning off the option lets the AI specialist handle follow-ups.
- *Choose where to reassign records*: Select the assignment group to reassign the ticket after an AI specialist has reviewed it and chosen to reassign it.
- *Cross-group reassignment*: Enable the AI specialist to recommend reassigning an incident to a different assignment group. The AI specialist never reassigns an incident to a different assignment group on its own.
- *Cross-group confidence threshold*: Set the confidence threshold for whether an incident belongs to a specific other assignment group.

5. Select **Save** to save your changes.

   You can make additional changes to your AI specialist before selecting save. Changing tabs in the AI specialist guided setup won't lose your changes.

   If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

Result
Your AI specialist tasks are updated. After being assigned work, your AI specialist performs the actions necessary to complete those tasks on the relevant records.

Preview an AI specialist in the legacy AI Agent Studio

Run a preview of your AI specialist in the legacy AI Agent Studio on a single record to preview how it works and verify it matches your intentions.

Before you begin
Role required: sn_aia.admin

About this task
You can test an execution of the AI specialist on a single record to preview its capabilities.

Note: Previewing an AI specialist, depending on the tasks configured, can actually make changes to the record. Previews are not simulations.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to preview.
3. Navigate to the **Preview** tab in the AI specialist guided setup.
4. Choose a record to run the preview on.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommended records for preview are selected based on their relevance to the capabilities and tasks available to the AI specialist.

Once a record is chosen, you can select the open link button to open the record in a new browser tab to check the details.

Note: Choose records that you can safely make changes to. The work is actually being done on the record during the preview.

5. Select **Run** to begin the preview.

   The test begins on the record. You can watch what fields it updates and any comments or work notes it generates.

   When the test is complete, you can review all the changes made.

6. Verify that the AI specialist's performance meets your expectations.

   See the Testing section in General guidelines for AI specialists for more information about how to test your AI specialist.

Result
Your AI specialist has worked on a specific record or records of your choice.

What to do next
You can return to the **Profile** or **Tasks** tabs in the guided setup to make changes if necessary. Once the changes are made, you can preview the AI specialist again.

If you are satisfied with the AI specialist's performance after making changes, you can select **Save** to save changes or **Activate** to let the AI begin work.

Assigning work to an AI specialist

You can assign work to an AI specialist in one of three ways, depending on your current work assignment procedures.

AI specialists can't assign themselves work, even if they've been put into an assignment group. There are three ways you can assign work to an AI specialist.

1. Manual assignment. You can change the user in the **Assigned to** field to your AI specialist on a record form or list. A service desk manager or team lead can assign work to the AI specialist just as they would assign work to human agents on their team.

2. Assignment rules. Assignment rules automatically assign work on your instance based on predefined conditions. They are applied whenever a task that isn't already assigned is created or updated. If you have multiple assignment rules, the one with the lowest order takes precedence.

3. Advanced Work Assignment (AWA). AWA assigns work based on more context than simple assignment rules, such as an agent's availability, capacity, and skills. Configuring AWA involves creating and managing service channels, work item queues, routing conditions, and assignment criteria.

With manual assignment, you control exactly which records an AI specialist works on. This works best when doing initial testing to see how an AI specialist handles a particular task type or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

subject. After you've established trust, you can allow the AI specialist to work at a larger scale by creating assignment rules or configuring AWA.

To have AWA assign work to an AI specialist, configure AWA first. You can then add the AI specialist to existing work queues, like another member of the team. If you don't already have AWA set up on your instance, assignment rules require less configuration than setting up AWA for AI specialists alone.

Manually assign work to an AI specialist

Manually assign specific records to an AI specialist by changing the Assigned to field when you need to override automatic assignment rules.

Before you begin

Role required: itil_admin

Procedure

1. Navigate to the table containing the record to assign.
   You can assign AI specialists to records in tables such as the Incident [incident] table.
2. Open the record for the AI specialist to work on.
3. In the **Assigned to** field, enter the name of the AI specialist.

   Trouble?
   If the AI specialist does not appear in the **Assigned to** list, verify that the AI specialist is active and has the appropriate capabilities configured for this record type.
4. Save the record.

Result

The record is assigned to the AI specialist. The AI specialist processes the record according to its configured capabilities and workflows.

Create an assignment rule for an AI specialist

Create an assignment rule to route matching tasks to an AI specialist automatically, without setting the Assigned to field on each record.

Before you begin

Role required: assignment_rule_admin or admin

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Assignment**.
2. Select **New**.
3. In the **Name** field, enter a name for your assignment rule, such as `AI L1 Service Desk`.
4. In the **Applies to** tab, select the table and filter conditions that identify the tasks for the AI specialist to handle.
5. In the **Assign to** tab, enter the name of the AI specialist in the **User** field.
6. Select **Submit** to create the assignment rule.

Result

The assignment rule routes matching tasks to the AI specialist automatically.

© 2026 ServiceNow, Inc. All rights reserved.

Configure Advanced Work Assignment for an AI specialist

Add an AI specialist to an existing Advanced Work Assignment (AWA) assignment rule so that it can receive work items alongside your human agents.

Before you begin

This procedure applies when service channels and work item queues are already configured in AWA. For instructions on creating new ones, see Create a service channel and Create a work item queue.

Role required: awa_admin

Procedure

1. Confirm that the AI specialist has the awa_agent role.

   Navigate to **All** > **User Administration** > **Users**, find and open the user record for the AI specialist, and check the roles in the Roles related list.

2. Navigate to **All** > **Advanced Work Assignment** > **Home** > **Assignment rules**.
3. Select **New** to open the new record form or open an existing assignment rule.
4. In the **Auto-assign handling** tab, select **Enable auto-assign work items**.
5. In the **Manage AI agents** tab, select **Include AI agents**.
6. **Optional:** In the **Manage AI agents** tab, select **Prioritize AI agents**.

   (Optional) Choosing to prioritize AI agents routes relevant work to the AI specialist first. The AI specialist then triages the task and determines whether it can propose an acceptable solution. If the AI specialist can't propose a solution, or if the task is outside its configured capabilities, it can reassign the task to a human agent or a different assignment group. For steps on configuring the routing criteria for reassignment, see Configure AI specialist tasks.

   If you don't choose to prioritize AI agents, the AI specialist can still be assigned work from the work item queue.

7. Select **Save**.
8. **Optional:** Set the maximum capacity for the AI specialist.

   (Optional) See Override agent capacity for selected agents.

Result

Your AI specialist is added to the AWA assignment rule as an eligible assignee.

What to do next

You can track an AI specialist's performance and the records it works on in AI Agent Studio. See View performance and View activity.

Using AI specialists

AI specialists are autonomous, hierarchical AI agents designed to serve as team members who can accomplish complex tasks. Onboard AI specialists to your team to use AI for role-based automation.

Use AI specialists in AI Agent Studio

Onboard and view the performance and activity of AI specialists in AI Agent Studio.

Review the performance of an AI specialist in AI Agent Studio

Review the performance analytics of an AI specialist to track their task execution success. You can use the analytics to tune the AI specialist to suit your business needs.

Before you begin

Role required: sn_aia.admin

About this task

Monitoring AI specialist performance helps you identify where your AI specialist succeeds or fails. The analytics help you decide whether to change aspects of the AI specialist's profile or tasks to improve performance. Regular monitoring helps you identify areas of concern.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to preview.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and aren't required to view the AI specialist's performance.
4. Scroll down to the **Performance** section in the AI specialist guided setup.
5. Review the performance analytics of the AI specialist.

   You can filter all metrics by date and assignment group.

Overview AI specialist performance metrics

See how your AI specialist is performing overall.

Section name	Individual metrics
At a glance	○ *`Durable auto-resolve rate (%)`*: Percentage of incidents the AI specialist resolved without reassigning to a human agent, and not reopened. ○ *`Coverage rate (%)`*: Percentage of assigned incidents that the AI specialist attempted to resolve.
Routing journey	○ *`1. Closed incidents in eligible assignment group(s)`*: All incidents in assignment group(s) the AI specialist is part of. ○ *`2. Closed incidents assigned to AI specialist`*: Based on AWA or assignment rules, incidents assigned to the AI Specialist for triage. ○ *`3. Closed incidents attempted by AI specialist`*: Incidents where the AI specialist has the confidence level to propose a solution or take autonomous action.
Incident outcomes	○ *`All incident outcomes`*: Percentage and counts of results of the AI specialist's attempts: resolved, reassigned to a human agent, reopened, generated a new ticket, or in-progress ○ *`Incident outcomes over time`*: Trend of AI specialist result outcomes

Section name	Individual metrics
KB article list	○ *All used articles*: Lists all KB articles the AI specialist has used, showing usage frequency (how often the article was cited after retrieval) and reopen rate (percentage of incidents resolved using the article that were later reopened). ○ *Unused articles*: Lists KB articles with no references during the selected period.

What to do next

If you want to make changes to your AI specialist based on the performance analytics, see Edit the profile of an AI specialist or Edit the tasks of an AI specialist.

View the activity of an AI specialist in AI Agent Studio

View the task execution history of an AI specialist in the new AI Agent Studio to track where and when it plans and attempts executions. You can also give feedback on its performance.

Before you begin

Role required: sn_aia.admin

About this task

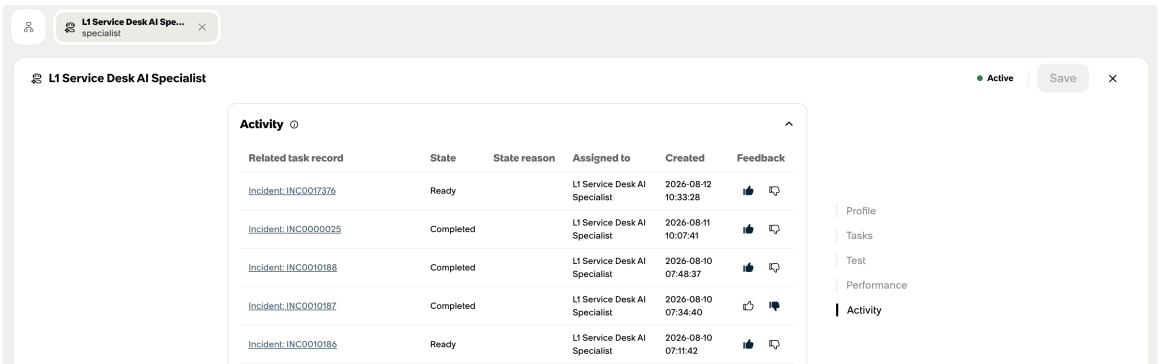
Monitoring AI specialist activity allows you to identify where your AI specialist is being used on which records.

For a given execution, you can rate the work of the AI specialist as either helpful (thumbs up) or not helpful (thumbs down) in the *Feedback* field of the list.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to preview.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and don't require access to view the AI specialist's activity.
4. Scroll down to the **Activity** section in the AI specialist guided setup.



5. Review the activity of the AI specialist.

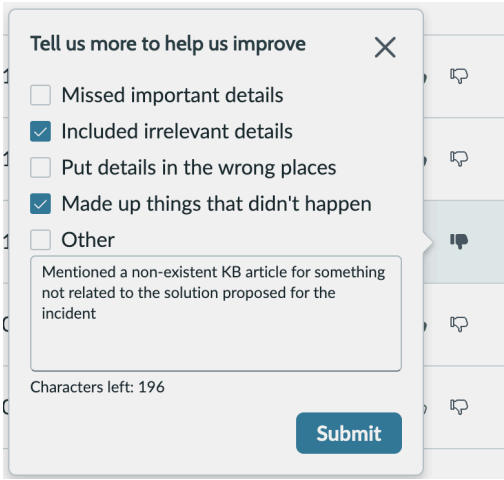
   AI specialist activity is presented as a filtered list that includes all records related to the AI specialist. You can add more filters to narrow down the activity further.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can sort by any of the list columns by selecting the column name.

If the execution state is not *Completed*, a reason is given to explain the state. Possible reasons include "failed execution" or "no activity."

You can give feedback on any given activity item. Select the thumbs up icon for positive feedback or the thumbs down icon to give negative feedback. If you select the thumbs down icon, you can specify exactly why you have given it that rating. After selecting a reason, you can also add a comment to detail the issue further.



Possible reasons for negative feedback include:

- Missed important details
- Included irrelevant details
- Put details in wrong places
- Made up things that didn't happen
- Other

What to do next

If you want to change which records the AI specialist picks up, you can change the capabilities or assignment groups in the AI specialist's profile. See Edit the profile of an AI specialist for more information.

To learn more about changing the specific tasks that the AI specialist performs on a record, see Edit the tasks of an AI specialist.

You can test the AI specialist on a specific record of your choosing by previewing the AI specialist.

Manage access to an AI specialist in AI Agent Studio

Control workspace access, user roles, and publishing settings for your AI specialist and its copies configured for specific teams.

Before you begin

Verify that you have an AI specialist created and configured.

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Configure access settings to control which workspaces and users can interact with your AI specialist. You can also manage different copies of AI specialists configured for specific assignment groups or teams with varying access requirements.

Access management includes workspace permissions, role-based security, publishing status, and copy creation privileges. These settings determine the operational scope and security boundaries for your AI specialist.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to configure from the available list.
3. In the node view, select the first node representing the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and do not require modification for access management.
4. Scroll down to the **Management** section in the AI specialist guided setup.

   The Management section contains all access control and operational settings for the AI specialist.
5. Configure workspace access by defining the workspaces where the AI specialist can operate.

   Workspace access determines where agents can monitor the progress and activity of the AI specialist. Users can only interact with the AI specialist within the specified workspaces.
6. Configure role-based access by selecting which roles have permission to use the AI specialist.

   Users without the specified roles cannot invoke the AI specialist or review its work. Role configuration ensures that only authorized users can interact with the AI specialist.
7. Set the publishing status by selecting whether to publish the AI specialist.

   Publishing controls whether the AI specialist can perform work on records. An unpublished AI specialist remains inactive even if it meets all other access requirements.
8. Configure copy creation permissions by selecting whether users with the defined roles can create copies of the AI specialist.

   Copy creation allows teams to customize AI specialist behavior for specific assignment groups or use cases. Different copies can have varying configurations while maintaining the same core functionality.

   For example, you can configure an AI specialist copy for one assignment group to perform specific tasks that differ from those assigned to another group. For more information, see Create a copy of an AI specialist.
9. Select **Save** to apply your access configuration changes.

   You can modify additional AI specialist settings before saving. All changes are applied when you select **Save**.

   ⚠ **Warning:** If you navigate to a different page or close the browser without selecting **Save**, your changes are lost and must be reconfigured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your AI specialist now has configured workspace access, role-based security, publishing status, and copy creation permissions. Users can interact with the AI specialist according to the access settings you defined.

What to do next
Verify that the access configuration works as expected by testing the AI specialist with users who have the required roles in the specified workspaces. Monitor AI specialist activity to confirm that access restrictions are properly enforced.

Create a copy of an AI specialist in AI Agent Studio

Create a new copy of an AI specialist to configure different settings for different assignment groups

Before you begin
Role required: sn_aia.admin

About this task
The base AI specialist can be configured to cover general or the most likely situations. Creating a copy of an AI specialist allows you to make specific changes for different assignment groups, such as different capabilities. You can also specify exactly which roles have access to the copy.

You can't change the tasks of an AI specialist at the copy level. Tasks must be configured for the base AI specialist.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to copy.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and do not require access or modification to create a copy of an AI specialist.
4. Scroll down to the **Management** section in the AI specialist guided setup to configure the different access settings.
5. In the Copies section, select **Add copy**.
6. Review the basic details and profile of the base AI specialist, then make changes for the specific copy.

   For example, you may want to change the name of the AI specialist or its department or description.
7. Assign the copy of the AI specialist to an assignment group.
8. Select a manager for the AI specialist.

   A manager might be the Service Desk Manager whose team the AI specialist will be a part of.
9. Select the roles to access this copy of the AI specialist.

Result
A new instance of an AI specialist is configured for a new assignment group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
The copy of the AI specialist can be made available to users by publishing and activating the base AI specialist.

Deactivate an AI specialist in AI Agent Studio

Deactivate an AI specialist in AI Agent Studio so that it no longer acts on records.

Before you begin
Role required: sn_aia.admin

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to deactivate.
3. Select the pencil icon to open the AI specialist's setup.
4. By the **Save** button, select the more options icon , then select **Deactivate**.

Result
Your AI specialist is turned off.

What to do next
You can make changes to your AI specialist, such as changing the profile or modifying the tasks, to affect its behavior. Once you have made edits, you can preview the AI specialist and reactivate it later.

Use AI specialists in the legacy AI Agent Studio

Onboard and view the performance and activity of AI specialists in the legacy AI Agent Studio.

Review the performance of an AI specialist in the legacy AI Agent Studio

Review the performance analytics of an AI specialist to track their task execution success. You can use the analytics to tune the AI specialist to suit your business needs.

Before you begin
Role required: sn_aia.admin

About this task
Monitoring AI specialist performance helps you identify where your AI specialist succeeds or fails. The analytics help you decide whether to change aspects of the AI specialist's profile or tasks to improve performance. Regular monitoring helps you identify areas of concern.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to view the performance of.
3. Navigate to the **Performance** tab in the AI specialist guided setup.
4. Review the performance analytics of the AI specialist.

   You can filter all metrics by date and assignment group.

2. Select the AI specialist you want to configure from the available list.
3. Select the **Management** tab in the AI specialist guided setup.

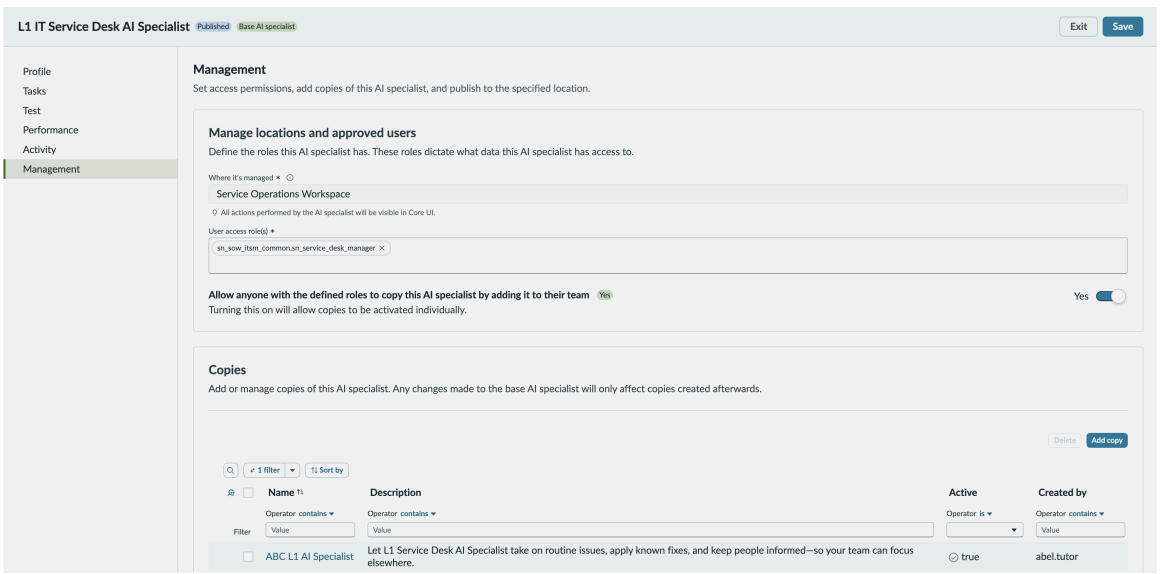
   The Management tab contains all access control and operational settings for the AI specialist.
4. Configure workspace access by defining the workspaces where the AI specialist can operate.

   Workspace access determines where agents can monitor the progress and activity of the AI specialist. Users can only interact with the AI specialist within the specified workspaces.
5. Configure role-based access by selecting which roles have permission to use the AI specialist.

   Users without the specified roles cannot invoke the AI specialist or review its work. Role configuration ensures that only authorized users can interact with the AI specialist.
6. Configure copy creation permissions by selecting whether users with the defined roles can create copies of the AI specialist.

   Copy creation allows teams to customize AI specialist behavior for specific assignment groups or use cases. Different copies can have varying configurations while maintaining the same core functionality.

   For example, you can configure an AI specialist copy for one assignment group to perform specific tasks that differ from those assigned to another group. For more information, see Create a copy of an AI specialist.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

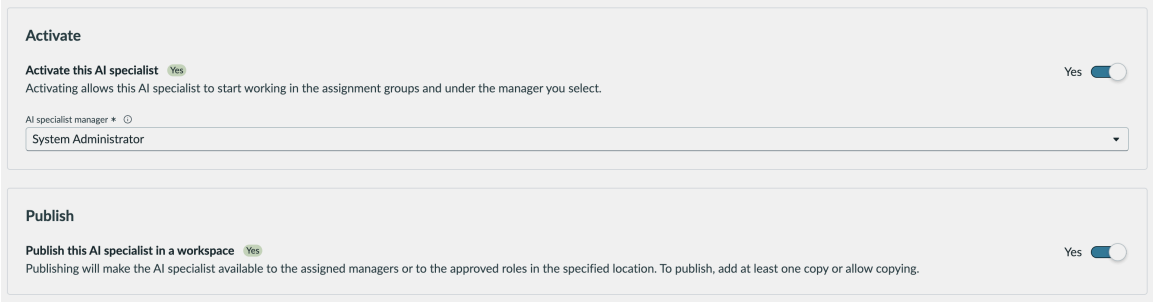
7. Set the active status of the AI specialist.

   Activation controls whether the AI specialist performs work. If an AI specialist is inactive, it won't work on any tasks, even if it is published.

8. Set the publishing status by selecting whether to publish the AI specialist.

   Publishing controls whether the AI specialist can be seen in workspaces and be assigned to a manager. An unpublished AI specialist remains inactive even if it meets all other access requirements.

   If an AI specialist is unpublished, then it will not be visible for Service Desk Managers or other members of the assignment group, even if it is active.



9. Select **Save** to apply your access configuration changes.

   You can modify additional AI specialist settings before saving. All changes are applied when you select **Save**.

> ⚠ **Warning:** If you navigate to a different page or close the browser without selecting **Save**, your changes are lost and must be reconfigured.

Result
Your AI specialist now has configured workspace access, role-based security, publishing status, and copy creation permissions. Users can interact with the AI specialist according to the access settings you defined.

What to do next
Verify that the access configuration works as expected by testing the AI specialist with users who have the required roles in the specified workspaces. Monitor AI specialist activity to confirm that access restrictions are properly enforced.

Create a copy of an AI specialist in the legacy AI Agent Studio

Create a copy of an AI specialist to configure different settings for different assignment groups

Before you begin
Role required: sn_aia.admin

About this task
The base AI specialist can be configured to cover general or the most likely situations. Creating a copy of an AI specialist allows you to make specific changes for different assignment groups. You can also specify exactly which roles have access to the copy.

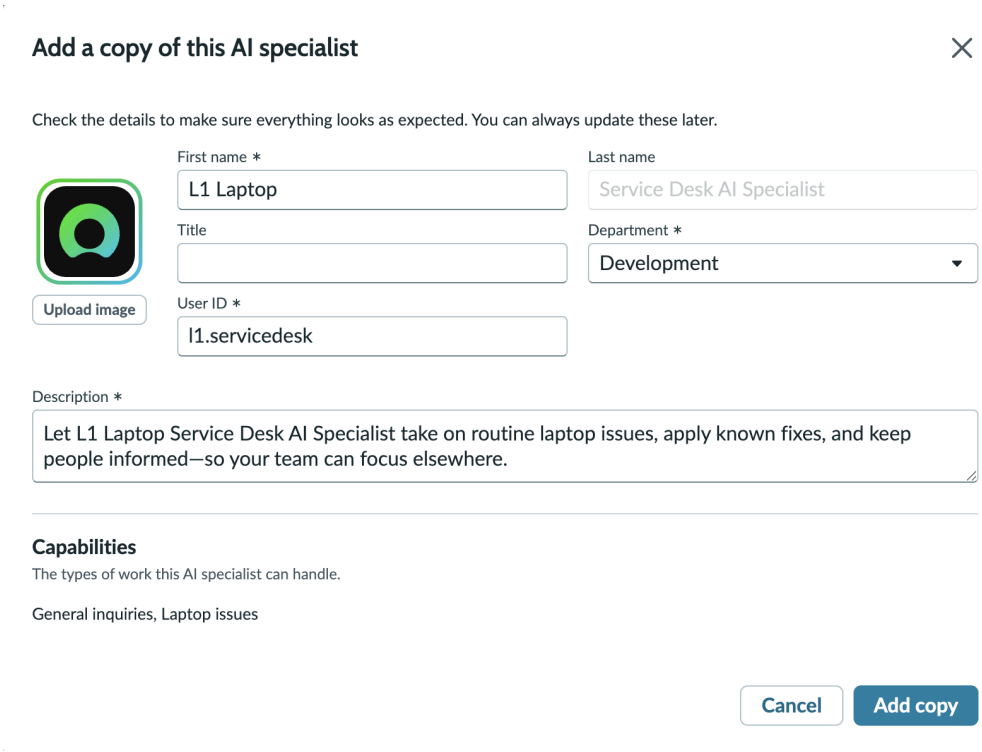
You can't change the kinds of tasks an AI specialist has at the copy level, only their configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select the AI specialist you want to preview.
3. Select the **Management** tab in the AI specialist guided setup to configure the different access settings.
4. In the Copies section, select **Add copy**.
5. Review the basic details and profile of the base AI specialist, then make changes for the specific copy.

   For example, you may want to change the name of the AI specialist or its department or description.



6. Assign the copy of the AI specialist to an assignment group.
7. Select a manager for the AI specialist.

   A manager might be the Service Desk Manager whose team the AI specialist will be a part of.
8. Select the roles to access this copy of the AI specialist.

Result

A new instance of an AI specialist is configured for a new assignment group.

What to do next

The copy of the AI specialist can be made available to users by publishing and activating the base AI specialist.

Deactivate an AI specialist in the legacy AI Agent Studio

Deactivate an AI specialist in the legacy AI Agent Studio so that it no longer acts on records and lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_aia.admin

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to view the activity of.
3. Select the more options button ⋯ to open the drop-down menu.
4. Select **Deactivate**.

Result
Your AI specialist is turned off.

What to do next
You can make changes to your AI specialist, such as changing the profile or modifying the tasks, to affect its behavior. Once you have made edits, you can preview the AI specialist and reactivate it later.

Reference for Autonomous Workforce

Reference for Autonomous Workforce provides additional information about the roles associated with AI specialists.

Reference

Review roles associated with AI specialists.

Autonomous Workforce consists of your AI specialists that augment entire roles, not just individual business processes. As pre-trained, agentic AI, they arrive equipped with the capabilities and tasks enabled to handle jobs without needing to iterate on prompts.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the AI Opt-Out page.

Exploring Autonomous Workforce

Learn more about Autonomous Workforce and review the benefits AI specialists can provide for different users in your organization.

Autonomous Workforce overview

Your autonomous workforce is made up of AI specialists. Each specialist combines individual AI agents that solve discrete tasks, such as prioritizing an incident or identifying similar records. Working together, these agents tackle bigger goals like task triage or updating requesters with solutions that worked for similar issues. The AI specialist performs tasks and is capable of functioning as a reliable extension of your workforce, taking on work that would bottleneck your team. Spend less time on ticket volume and more time delivering meaningful resolutions.

Assign your AI specialist to specific assignment groups and roles to limit the scope of its work and the data it can access. Once configured, you can test your AI specialist to confirm it behaves as expected before putting it to work. After activation, your AI specialist runs against real records, and you can monitor its performance and activity over time to confirm it continues to meet your needs.

Accessing AI specialists

To access AI specialists, you must have the following plugins installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Zero Touch Service Desk plugin [sn_ztsd] version 2.3.19+
- ServiceNow Otto AI Agents [sn_aia] version 7.1+
- AI Engagement Experience [sn_now_canvas_ai] version 3.1.1+

Your instance must also be at least on Zurich Patch 10 or Australia Patch 3.

Autonomous Workforce users

Different users interact with Autonomous Workforce in various ways depending on their role and responsibilities.

Users

User	Role	Description
AI administrator	sn_aia.admin	The AI administrator can configure and activate AI specialists using AI Agent Studio. After AI specialists are activated, they can monitor their performance and activity to track their effectiveness, efficiency, and customer satisfaction.
Service Desk manager	sn_sow_itsm_common.sn_service_desk_manager	Service Desk managers have the capabilities of a standard Service Desk Agent (sn_service_desk_agent) and team level oversight and task resolution. They can view and manage team performance reports, analytics, and tasks and onboard an AI specialist to the team in Service Operations Workspace.
Service Desk agent	sn_itsm_common.sn_service_desk_agent	Service Desk agents resolve tasks, such as incidents and cases, using their knowledge, research, and experience. They have access to the Service Operations Workspace, where they can view the work of an AI specialist on a record.

Autonomous Workforce workflow

Follow this workflow to implement and manage AI specialists in your organization.

For more information about considerations to make before deployment, see General guidelines for deploying AI specialists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Onboard an AI specialist.

   As an AI administrator, you can use AI Agent Studio to configure your AI specialists.

   After installing the applications and plugins and activating the sn_aia.enable_ai_workers system property, you can activate an AI specialist as-is or configure any of the following:

   - Basic details, including name, profile icon, department, and description
   - Profile, including the roles and assignment groups
   - Tasks, things the AI specialist can do
   - Triggers, for running the AI specialist after specified events occur
2. Manually assign tickets to your AI specialist to see how it works. Once you have built trust, create assignment rules or configure Advanced Work Assignment to route work to your AI specialist automatically.
3. Monitor AI specialist activity. You can review the records that the AI specialist has worked on individually to check how it's doing.
4. Track AI specialist performance. Analytics for AI specialists that track their effectiveness, efficiency, and value can be found in AI Agent Studio and Service Operations Workspace. Use the analytics routinely to confirm that the AI specialist keeps up if things change. If performance isn't where you want it to be, you can configure it again at any time.

Autonomous Workforce benefits

Autonomous Workforce provides specific benefits for different types of users in your organization.

Autonomous Workforce benefits

Benefit	Feature
Automate high-volume, repeatable requests to reduce manual effort and free up agents for complex work	AI specialist capabilities
Classify and triage incoming work to route requests to the right team faster	AI specialist tasks
Investigate related records to surface relevant context and accelerate resolution	AI specialist tasks
Communicate with requesters throughout the lifecycle of a request to keep them informed	AI specialist tasks
Monitor team and AI specialist performance to track efficiency and identify areas for improvement	Performance metrics
Test AI specialist behavior before activation to validate outcomes and reduce risk	AI specialist guided setup in AI Agent Studio
Simplified agentic AI setup reduces configuration complexity and helps accelerate time to value	AI specialist guided setup in AI Agent Studio
Enforce data security for agentic AI by assigning roles to control what each AI specialist can access and act on	AI specialist assigned roles

General guidelines for deploying an autonomous workforce

AI specialists, like other agentic AI, benefit from strategic planning for testing, deploying, and monitoring performance. Learn guiding principles to help your AI specialists achieve their highest chances of success.

Overview of deploying an autonomous workforce

AI specialists use artificial intelligence to perform work, but they don't require extensive knowledge about AI to set up and use. The possible tasks available to an AI specialist come pre-configured. You can choose which ones apply, test to verify that the AI specialist works as you expect, and then activate.

Like all AI, strategic planning for autonomous workforce implementation can be key to getting the most out of your AI specialists.

Questions to ask before you begin activating AI specialists might be:

- What problems do I want my AI specialist to solve, and why?
- Would an AI specialist be the best solution for these problems, or would they be better solved with an AI skill, AI agent, or agentic workflow?
- What counts as success in terms of AI specialist effectiveness, efficiency, and customer satisfaction?
- How do I want my team members to interact with an AI specialist?

AI specialists perform best under the following conditions:

- Strong knowledge base: Well-maintained, procedural knowledge articles with clear self-service instructions for end users
- High-volume of similar issues: Incidents with a single dominant root cause and clear resolution paths
- Existing catalog items: Well-defined catalog items for accurate redirection of misclassified incidents
- Clear policy rules: Approve/reject criteria that are explicit and well-documented

AI specialists don't perform well under the following conditions:

- Sparse or outdated knowledge: knowledge articles that are incomplete, out of date, or written for internal audiences
- Complex multi-step troubleshooting: issues that require orchestration across multiple external systems or remote device access

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Undocumented internal knowledge: resolutions that depend on tacit knowledge not captured in formal systems
- Highly sensitive categories: Personally identifying information, security incidents, or areas with severe cost of error should be avoided

Configuring AI specialists in your autonomous workforce

When configuring an AI specialist, there are several important aspects to consider.

Within the AI specialist's profile, the sections each relate to different aspects of the AI specialist's suitability for certain work:

Assignment groups: the work the AI specialist is assigned

The AI specialist can't work on tasks not assigned to those assignment groups. If you don't want the AI specialist to work on certain tasks, confirm that the correct assignment groups are selected.

Roles: what data the AI specialist has access to

See the section Data access security for AI specialists.

The AI specialist's tasks specify the actions that it can take to solve problems within the domains. Each task has different options to configure the actions further. For more information about the different tasks available, see Edit the tasks of an AI specialist.

Operating modes: from supervised to autonomous

Supervised (Copilot) mode

The AI specialist researches and drafts a proposed solution, but a person reviews and approves it before it reaches the requester. Use this mode when you don't yet have confidence in autonomous resolution for a given category.

Autonomous mode

The AI specialist resolves and communicates independently, escalating to a human when its confidence is low.

Move an AI specialist to autonomous operation as soon as it has proven itself in testing. See the following section for guidance on when to hold a category back.

Confidence, cost of error, and escalation

Before posting a resolution, an AI specialist scores its proposed solution and compares that score against a confidence threshold you configure. If the score meets the threshold, the solution is posted; if it falls short, the work routes to a human fulfiller instead. That score is informed by how well the solution is supported by evidence, how closely it fits the specific task, how likely it is to resolve the issue, and the AI specialist's overall certainty.

Not every category carries the same risk, so weigh cost of error alongside confidence: financial impact if the resolution is wrong, sensitivity if the category involves personally identifying information or security data, and whether the resolution is internal-facing or reaches a customer directly. Categories with a higher cost of error should stay in supervised mode, or stay outside the AI specialist's assignment groups, regardless of how well-suited they otherwise seem.

Data access security for AI specialists

AI specialists only have access to the data that you specify. AI specialists can be assigned roles to limit their data access to certain scopes. Verify that the roles granted to the AI specialist are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

enough to enable it to complete its tasks, but not enough to access data it shouldn't. The roles function the same as the roles for a human user.

Consider these security principles when configuring AI specialist roles:

- Apply the principle of least privilege by granting only the minimum roles necessary for the AI specialist to perform its assigned tasks.
- Review role assignments regularly to verify they remain appropriate as your AI specialist's responsibilities evolve.
- Test role configurations in a non-production environment before deploying to production.

Important: AI specialists can access and modify data based on their assigned roles. Verify that role assignments align with your organization's data governance and security policies.

Assigning work to the AI specialist

Tasks must be assigned to the AI specialist. You can assign tasks to the AI specialist like any other user. Manual assignment, business rules or other triggers, and Advanced Work Assignment (AWA) all work. AWA allows you to select rules for assigning work so that work can be assigned automatically when the record is created or updated.

The User record associated with the AI specialist can be found on its profile. You can use business rules, triggers, or AWA to assign work to the AI specialist referencing that User record.

When setting up assignment rules, consider these factors:

- Volume and complexity of work to confirm the AI specialist can handle the assigned workload
- Priority levels to determine which tasks the AI specialist should handle first
- Escalation paths for cases where the AI specialist can't complete a task

Common failure modes to validate against

Certain conditions are reliable early warnings that a deployment will encounter issues. Validate against each of these before activating an AI specialist.

- Task states that don't change during AI specialist execution, which can suggest extensive customizations that fall outside foundational readiness. Run the AI Readiness Evaluation application to assess foundational readiness before proceeding.
- Task states that don't change during AI specialist execution, which can also suggest a state model that isn't mapped to the AI specialist's processing states. See Edit the tasks of an AI specialist in the legacy AI Agent Studio for steps to configure state mapping.
- Test queries that return no results or surface internal-only content, which points to a knowledge base that isn't ready. Complete a knowledge audit and enforce audience separation before proceeding.
- Poor knowledge base search results despite a ready knowledge base, which points to an AI Search profile misconfiguration. Inspect and adjust the Zero Touch Service Desk (ZTSD) search profile and AI Search configuration to target the right content for the AI specialist to rely on.
- Zero assignments after activation, which points to an assignment rule or routing misconfiguration. Validate routing in a non-production environment and run a test task through the full routing chain across all intake channels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A spike in reopened tasks, which points to accuracy issues. Start with thorough testing and gate any move to autonomous operation on whether you consistently meet the expected thresholds.
- Work that sits with the AI specialist for more than 2 hours with no state change, which points to a broken escalation path. Validate escalation and run escalation test cases before activation.

Previewing your AI specialist

Previewing your AI specialist on multiple records can show you what to expect when the AI specialist is activated and running.

Important: Changes made by the AI specialist during previews are actually made to the record.

Follow these testing guidelines to validate your AI specialist's performance:

- Use representative tasks for initial validation. Selecting tasks that mirror the ones the AI specialist will handle enable you to check basic functions. You could also create dummy tasks that simulate active ones.

  Note: The AI specialist won't send any communications to users during tests.

- Test across different incident and case categories. Testing multiple categories allows you to confirm that the AI specialist is working effectively in multiple domains.
- Run at least 5 to 10 tests before activating. Try to create tests that cover all situations assigned to the AI specialist.
- Test edge cases and unusual scenarios to see how the AI specialist handles unexpected situations.
- Validate that the AI specialist respects data access controls and role-based permissions during testing.

Improving AI specialist performance with feedback

AI specialists can make mistakes. With feedback or changes to the sources they access, you can improve their performance for next time.

Use these methods to monitor and improve AI specialist performance:

- Administrators and Service Desk managers can review the individual steps an AI specialist took to reach its conclusions, in either Service Operations Workspace or the Core UI.
- AI administrators and Service Desk managers can view an AI specialist's activity in AI Agent Studio. You can see the different tasks that your AI specialist has worked on. In the list, there is the option to provide granular feedback of either *Helpful* or *Not helpful*. You can open the record, check the AI specialist's work, and then submit the feedback in the activity list.
- If the AI specialist makes errors based on knowledge articles that contain outdated or faulty information, knowledge administrators can update the articles to improve AI specialist performance.

Establish regular performance review cycles to:

- Analyze AI specialist activity logs and success rates
- Identify patterns in errors or suboptimal performance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Update knowledge base content based on AI specialist performance
- Adjust AI specialist configuration based on performance data

Ongoing monitoring and optimization

After deploying your AI specialist, continuous monitoring helps maintain optimal performance and identify opportunities for improvement. You can track the performance analytics of an AI specialist by selecting them in AI Agent Studio. See View AI specialist performance metrics.

Key metrics include:

- Task completion rates and mean time to resolution
- User satisfaction scores and feedback
- Escalation rates to human agents
- Durable auto-resolve rate: the percentage of work the AI specialist resolves with no reopen during the post-resolution monitoring window
- AI coverage rate: the percentage of eligible volume the AI specialist is actually eligible to handle, which keeps scaling honest rather than cherry-picking easy work
- Time to value: how quickly enough production data exists to quantify impact after go-live

Regular optimization activities should include:

- Refining assignment rules to improve work distribution
- Updating knowledge base content to address new scenarios
- Adjusting role assignments based on security reviews and changing requirements

Domain separation in Autonomous Workforce

Domain separation is unsupported for Autonomous Workforce.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Related topics

Domain separation for service providers

Configuring AI specialists

Configure the name, profile icon, capabilities, assignment groups, tasks, and language proficiencies of AI specialists in AI Agent Studio.

Configuration overview

See General guidelines for AI specialists for more information about setting up your autonomous workforce.

1. Configure AI specialist profile

   Configure the name, icon, roles, and assignment groups of an AI specialist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Configure AI specialist tasks

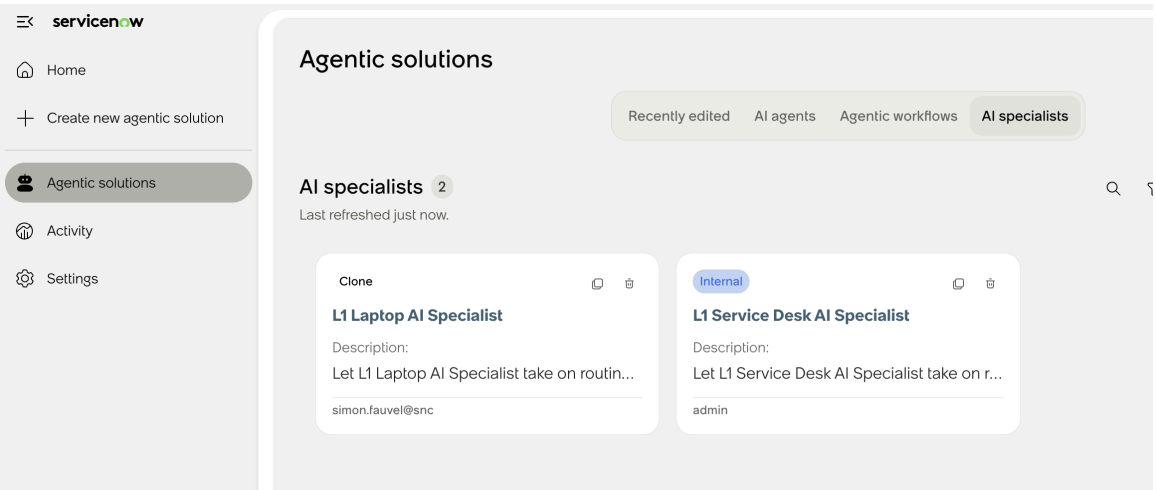
   Configure the tasks that an AI specialist is capable of.

3. Test an AI specialist

   Run the AI specialist on a specific record to check how it functions.

Configure AI specialists in AI Agent Studio

Configure your AI specialists in your autonomous workforce in AI Agent Studio.



The following is the basic workflow for configuring an AI specialist.

1. **Profile**

   Set basic details like the AI specialist's name, icon, role, and assignment groups. Assignment groups are the most important setting because they determine which groups the AI specialist can act on behalf of.

2. **Tasks**

   Define what the AI specialist can do, such as triaging incoming work, researching context, and responding to requesters.

4. **Preview the AI specialist**

   Test the AI specialist on an actual record, not a simulation, to see how it reasons and what actions it takes.

Edit the profile of an AI specialist in AI Agent Studio

Modify the profile of an AI specialist in AI Agent Studio to set its name, description, roles, and assignment groups.

Before you begin

Role required: sn_aia.admin

About this task

AI specialists profiles determine the unique specialties of the AI specialist. Choosing the right roles helps give your AI specialist the context necessary to accomplish its tasks.

To learn how to modify the tasks that an AI specialist is capable of, see Edit the tasks of an AI specialist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to modify.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and don't require modification to change the profile of the AI specialist.

4. Update the name, profile icon, title, and description of your AI specialist.

   The user ID must match the ID of an existing record on the User table with the AI user type.

5. Choose your AI specialist's assignment groups.

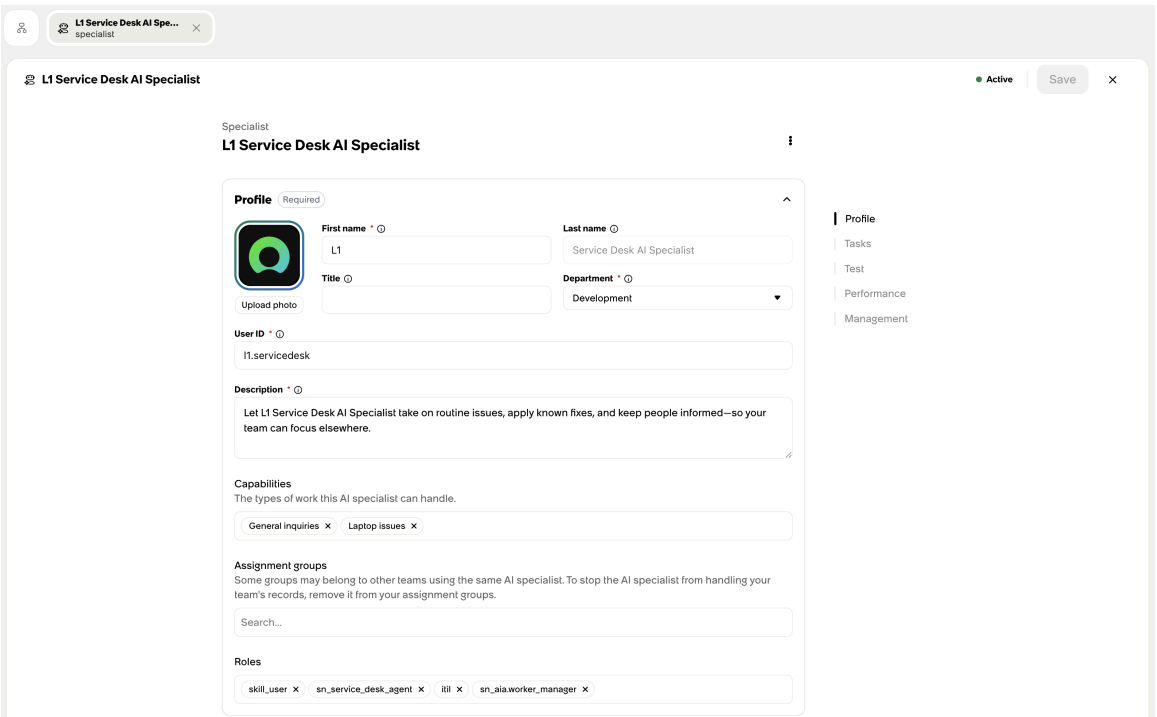
   The assignment groups determine what work the AI specialist can pick up. Multiple teams can use the same AI specialist, but you can create copies of a AI specialist if you want to fine-tune an AI specialist for different teams. See Create a copy of an AI specialist for more information.

   If you remove your team from the list of assignment groups, the AI specialist won't handle your team's tickets.

6. Select your AI specialist's role(s).

   Roles determine what data access your AI specialist has. For example, if the AI specialist has a role that grants it access to the Incident table, it can work on incidents. If the role(s) don't grant access to a necessary table, the AI specialist can't pick up work on that table, even if it's within the assignment group's domain.

   Review the full list of roles granted to the AI specialist to check your AI specialist has access only to what it needs to accomplish tasks.



7. Select **Save** to save your changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can make additional changes to your AI specialist before selecting save.

If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

Edit the tasks of an AI specialist in AI Agent Studio

Select tasks that an AI specialist can perform in the new AI Agent Studio.

Before you begin

Role required: sn_aia.admin

About this task

AI specialist tasks determine what they can do. Choosing the correct tasks provides your AI specialist with the tools required to complete complex goals autonomously.

To learn how to modify the roles and capabilities that an AI specialist has, see Edit the profile of an AI specialist.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to modify.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and don't require modification for task configuration.

4. Scroll down to the **Tasks** section in the AI specialist guided setup to view the full list of tasks that the AI specialist can perform.
5. Select the card of a task to review, select the pencil icon, and make changes to the specific details of the task configuration.

   The following tasks are available to the L1 IT Service Desk AI Specialist. These are presented as examples. Different AI specialists may have different tasks.

   Classify and assign: Configure how the AI specialist identifies incidents, classifies them, and assigns a specific incident type for follow-up.

   - *`Table`*: Select the table in which the AI specialist operates and resolution workflows are executed.
   - *`Fields to classify on the record`*: Enter the fields that the AI specialist should classify if empty.
   - *`Routing`*: Add and manage the routing criteria that determine which records the AI specialist handles. For more information, see Manage the routing criteria of an AI specialist.

   Triage and diagnose: Configure the details for how the AI specialist analyzes incidents for accurate handling.

   - *`Field to use as Task objective`*: Select the record fields which the AI specialist uses to analyze and determine the next steps.
   - *`Use attachment content`*: Enable the option for the AI specialist to review the content of attached files as part of incident triage and diagnosis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Map AI specialist states to record states*: Map the states of the AI specialist's execution to the states of the incident record. For example, the AI specialist's *Awaiting information* state can be mapped to the incident record *On Hold* state. If you have customized state values for your Incident table, you can map them to the AI specialist's states here.
- *Default routing decision*: Select the routing decision that the AI specialist falls back to when an incident matches none of the routing criteria. Select either *Attempt resolution* or *Reassign*.
- *Routing criteria*: Add criteria that determine which records the AI specialist handles. Criteria are grouped into two sections:
  - *Reassign for*: When an incident matches one of these criteria, the incident is reassigned to a human.
  - *Attempt resolution for*: When an incident matches one of these criteria, the AI specialist attempts to resolve it.

  To add a criterion, select **Add reassigned criteria** or **Add attempted criteria**, depending on which decision you want the criterion to trigger. Complete the following required fields and then select **Add routing criteria**.

  - *Name*: Enter a name that identifies the criterion, such as `AD account access blocked`.
  - *Routing instructions for LLM*: Describe which incidents the criterion applies to, including any scope that limits it. The AI specialist uses these instructions to determine whether an incident matches the criterion. Enter up to 4,000 characters.
  - *Routing Decision*: Set by the button that you selected, either *Reassign* or *Attempt resolution*.

  Each criterion appears as a labeled item in its section, showing only the name. To change a criterion, select its name to reopen the dialog box. To remove a criterion, select the **X** next to its name and then select **Delete** to confirm.

Investigate and resolve: Configure the following details on how the AI specialist investigates to find relevant solutions and resolve the issue.

- *Knowledge sources*: Select search profiles and knowledge base *sys_ids* to define how the AI specialist retrieves knowledge articles. AI search profiles can include sources such as knowledge articles, ServiceNow documentation, or specific tables. You can create AI Search profiles specifically for your AI specialists. To customize what information your AI specialist accesses, add search profiles with the pre-installed ones or remove the pre-installed ones. You must have at least one search profile selected for the AI specialist to complete the *Investigate and resolve* task.

  Note: If you include a table as a search source but don't grant the AI specialist access through its assigned roles, it can't search that table.

- *Automatically create KFT records*: Enable if you want the AI specialist to create a KB Feedback Task record after proposing a solution without an existing knowledge article.
- *Research depth*: Select how extensively the AI specialist must gather and analyze data during investigation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Pre resolution condition*: The conditions that must be true before the AI specialist will resolve the ticket. These are fields that get filled in after a ticket has been submitted.
- *Execution mode*: Determine how autonomously the AI specialist should act. *Autopilot* mode grants the AI specialist the ability to mark a ticket as resolved once resolution steps are sent. *Copilot* mode requires human acceptance of its resolution proposal.
- *Auto-submit catalog requests*: Enable AI specialists to submit catalog items on behalf of the user without an additional confirmation step.

Response formatting: Configure the details on how the AI specialist communicates to keep requesters informed through communication channels.

- *Inbound channels*: Select the inbound channels such as Activity stream through which the AI specialist can receive messages from requesters.
- *Outbound Channels*: Select the outbound channels the AI specialist uses to send responses or notifications. You can select channels such as Activity stream, email, portal, or phone.
- *Internal communication when confidence is low*: Enable the AI specialist to log its solution as a work note rather than proposing it directly.
- *Response templates*: Write the template for what the AI specialist should say to communicate to the user. You can set response templates for three different AI specialist states: Awaiting Info, Solution Proposed, and Reassign to Human. You can format your message using the editor to include things like bold text, specific fonts, tables, highlighting, links, and bullets.

Reassign: Configure the following details on how the AI specialist directs unresolved incidents to the correct team or agent for timely resolution.

- *Maximum number of interactions before escalation*: Set how many times to contact the requester before sending to a human agent. Enter a number greater than zero.
- *Reassign on follow-up question*: Enable this option to send the ticket to a human agent when the requester asks a follow-up question. Turning off the option lets the AI specialist handle follow-ups.
- *Choose where to reassign records*: Select the assignment group to reassign the ticket after an AI specialist has reviewed it and chosen to reassign it.
- *Cross-group reassignment*: Enable the AI specialist to recommend reassigning an incident to a different assignment group. The AI specialist never reassigns an incident to a different assignment group on its own.
- *Cross-group confidence threshold*: Set the confidence threshold for whether an incident belongs to a specific other assignment group.

6. Select **Save** to save your changes.

   You can make additional changes to your AI specialist before selecting save. Changing tabs in the AI specialist guided setup won't lose your changes.

   If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

© 2026 ServiceNow, Inc. All rights reserved.

Preview an AI specialist in the new AI Agent Studio

Run a preview of your AI specialist in the new AI Agent Studio on a single record to preview how it works and verify it matches your intentions.

Before you begin
Role required: sn_aia.admin

About this task
You can test an execution of the AI specialist on a single record to preview its capabilities.

Note: Previewing an AI specialist, depending on the tasks configured, can actually make changes to the record. Previews aren't simulations.

Procedure

1. Navigate to the **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to preview.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and do not require modification to preview an AI specialist.
4. Scroll down to the **Test** section in the AI specialist guided setup.
5. In the dropdown menu, select a record you want to preview the AI specialist on.

   Once a record is chosen, you can select the open link button to open the record in a new browser tab to check the details.

   Note: Choose records that you can safely make changes to. The work is actually being done on the record during the preview.
6. Select **Run** to begin the preview.

   The test begins on the record. You can watch what fields it updates and any comments or work notes it generates.

   When the test is complete, you can review all the changes made.
7. Verify that the AI specialist's performance meets your expectations.

   See the Testing section in General guidelines for AI specialists for more information about how to test your AI specialist.

Result
Your AI specialist has worked on a specific record or records of your choice.

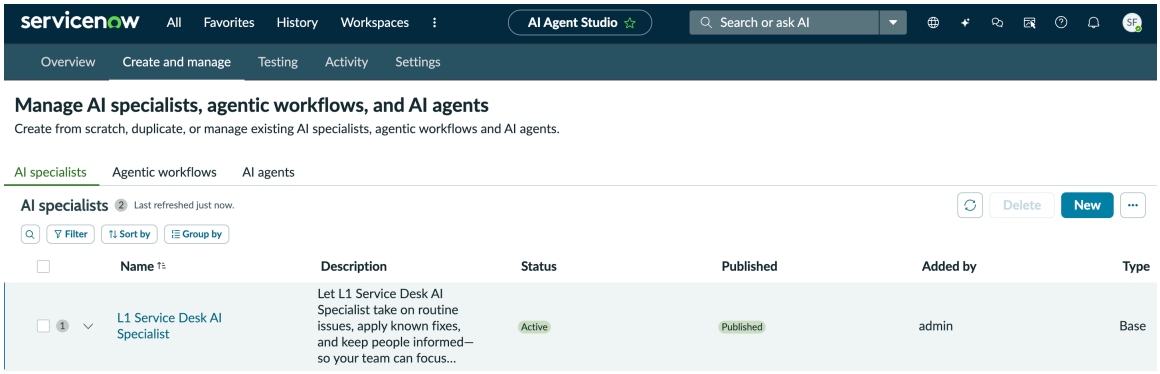
What to do next
You can return to the **Profile** or **Tasks** sections by scrolling up in the guided setup to make changes if necessary. Once the changes are made, you can preview the AI specialist again.

If you're satisfied with the AI specialist's performance after making changes, you can select **Save** to save changes or **Activate** to let the AI begin work.

Configure AI specialists in the legacy AI Agent Studio

Configure your AI specialists in your autonomous workforce in the legacy AI Agent Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The following is the basic workflow for configuring an AI specialist.

1. **Basic details**

   Set basic details like the AI specialist's name, icon, and role.

2. **Profile**

   Set basic details like the AI specialist's capabilities and assignment groups. Assignment groups are the most important setting here, since they determine which groups the AI specialist can act on behalf of.

3. **Tasks**

   Define what the AI specialist can do, such as triaging incoming work, researching context, and responding to requesters.

4. **Preview the AI specialist**

   Test the AI specialist on an actual record, not a simulation, to see how it reasons and what actions it takes.

Edit the profile of an AI specialist in the legacy AI Agent Studio

Modify the profile of an AI specialist in the legacy AI Agent Studio to set its name, description, roles, and assignment groups.

Before you begin

Role required: sn_aia.admin

About this task

AI specialists profiles determine the unique specialties of the AI specialist. Choosing the right roles helps give your AI specialist the context necessary to accomplish its tasks.

To learn how to modify the tasks that an AI specialist is capable of, see Edit the tasks of an AI specialist.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to edit.
3. In the **Profile** tab, select the edit icon next to the name of the AI specialist.
4. Choose your AI specialist's assignment groups.

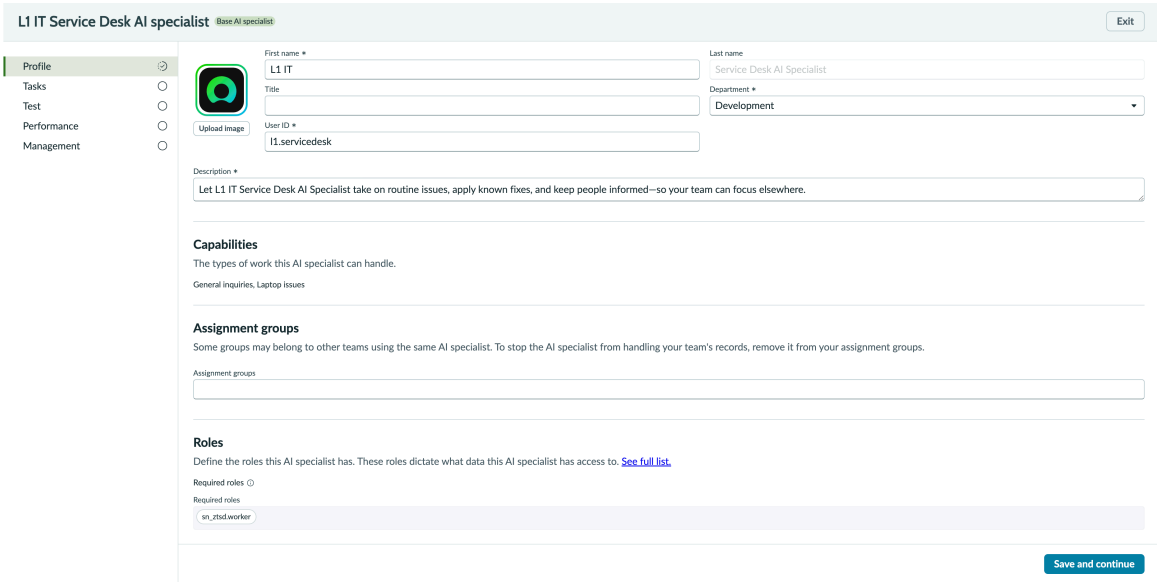
   The assignment groups determine what work the AI specialist can pick up. Multiple teams can use the same AI specialist. If you remove your team from the list of assignment groups, the AI specialist won't handle your team's tickets.

5. Select your AI specialist's role(s).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles determine what data access your AI specialist has. For example, if the AI specialist has a role that grants it access to the Incident table, it can work on incidents. If the role(s) don't grant access to a specific table, the AI specialist can't pick up work on that table, even if it is within the domain of its capabilities and assignment group.

Review the full list of roles granted to the AI specialist to check your AI specialist has access only to what it needs to accomplish tasks.



6. Select **Save** to save your changes.

   You can make additional changes to your AI specialist before selecting save. Changing tabs in the AI specialist guided setup won't lose your changes.

   If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

Result

Your AI specialist profile is updated. Your AI specialist has the updated context for understanding its role when accomplishing tasks.

Edit the tasks of an AI specialist in the legacy AI Agent Studio

Select tasks that an AI specialist can perform in the legacy AI Agent Studio.

Before you begin

Role required: sn_aia.admin

About this task

AI specialist tasks determine what they can do. Choosing the correct tasks provides your AI specialist with the tools required to complete complex goals autonomously.

To learn how to modify the roles and capabilities that an AI specialist has, see Edit the profile of an AI specialist.

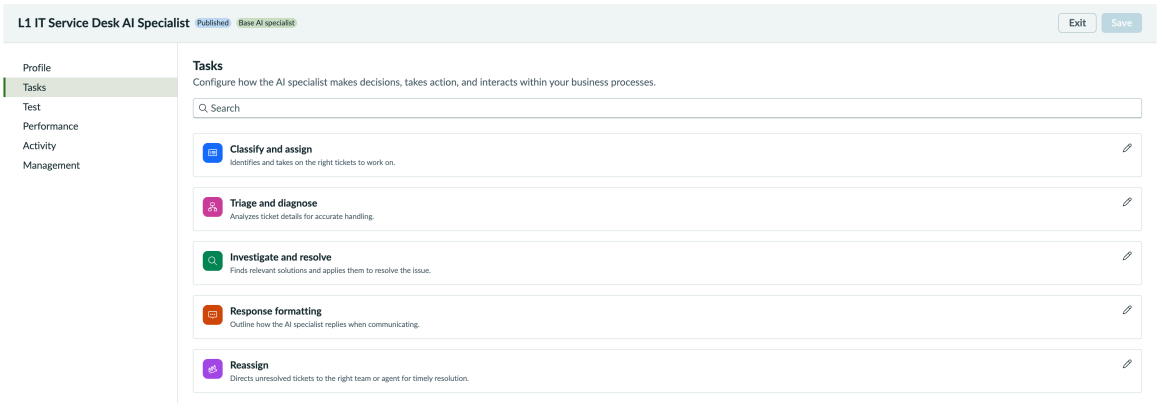
Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to edit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Navigate to the **Tasks** tab in the AI specialist guided setup to view the full list of tasks that the AI specialist can perform.
4. Select the card of a task to review and make changes to the specific details of the task configuration.

   The following tasks are available to the L1 IT Service Desk AI Specialist. These are presented as examples. Different AI specialists may have different tasks.



Classify and assign: Configure how the AI specialist identifies incidents, classifies them, and assigns a specific incident type for follow-up.

- *`Table`*: Select the table in which the AI specialist operates and resolution workflows are executed.
- *`Fields to predict`*: Enter the fields that the AI specialist should classify if empty.
- *`Similar records search profile`*: Select the AI Search profile that should be used for gathering records similar to the assigned record.
- *`Override existing field values with predictions`*: Enable this setting to let the AI specialist use predictions from similar records to replace existing values. Fields that can potentially be overridden are *`Service`*, *`Offering`*, and *`CI`*. Turn off if you only want the AI specialist to fill in empty fields.

Triage and diagnose: Configure the details for how the AI specialist analyzes incidents for accurate handling.

- *`Field to use as Task objective`*: Select the record fields which the AI specialist uses to analyze and determine the next steps.
- *`Use attachment content`*: Enable the option for the AI specialist to review the content of attached files as part of incident triage and diagnosis.
- *`Map AI specialist states to record states`*: Map the states of the AI specialist's execution to the states of the incident record. For example, the AI specialist's *`Awaiting information`* state can be mapped to the Incident record *`On Hold`* state. If you have customized state values for your Incident table, you can map them to the AI specialist's states here.
- *`Default routing decision`*: Determine whether an AI specialist should attempt to resolve a case outside of the assignment group's scope or reassign it to another assignment group. You can also specify in the following routing criteria section different categories of tasks for the AI specialist to attempt or reassign.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Default routing decision*: Select the routing decision that the AI specialist falls back to when an incident matches none of the routing criteria. Select one of the following options:
  - *Resolve without root cause analysis*
  - *Perform root cause analysis*
  - *Ask the caller for more information*
  - *Route to the service desk team*
- *Routing criteria*: Add criteria that determine which records the AI specialist handles. Criteria are grouped into two sections:
  - *Attempt resolution for*: When an incident matches one of these criteria, the AI specialist attempts to resolve it.
  - *Reassign for*: When an incident matches one of these criteria, the incident is reassigned to a human.

  To add a criterion, select **Add attempted criteria** or **Add reassigned criteria**, depending on which decision you want the criterion to trigger. In the **New routing criteria** dialog box, enter a name in the *Criteria* field and explain in the *Description* field which incidents belong to the criterion.

  Select **Submit** to add the criterion. The criterion appears as a labeled item in its section.

  To change a criterion, select its name to reopen the dialog box. To remove a criterion, select the **X** next to its name and then select **Delete** to confirm. A removed criterion is no longer used when the AI specialist routes work.

- *Default routing decision*: Select the routing decision that the AI specialist falls back to when an incident matches none of the routing criteria. Select one of the following options:
  - *Resolve without root cause analysis*
  - *Perform root cause analysis*
  - *Ask the caller for more information*
  - *Route to the service desk team*

Investigate and resolve: Configure the following details on how the AI specialist investigates to find relevant solutions and resolve the issue.

- *Knowledge sources*: Select search profiles and/or knowledge base *sys_ids* to define how the AI specialist retrieves knowledge articles. AI search profiles can include sources such as knowledge articles, ServiceNow documentation, or specific tables. You can create AI Search profiles specifically for your AI specialists. To customize what information your AI specialist accesses, add search profiles with the pre-installed ones or remove the pre-installed ones. You must have at least one search profile selected for the AI specialist to complete the *Investigate and resolve* task.

  Note: If you include a table as a search source but don't grant the AI specialist access through its assigned roles, it can't search that table.

- *Automatically create KFT records*: Enable if you want the AI specialist to create a KB Feedback Task record after proposing a solution without an existing knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Research depth*: Select how extensively the AI specialist must gather and analyze data during investigation.
- *Pre resolution condition*: The conditions that must be true before the AI specialist will resolve the ticket. These are fields that get filled in after a ticket has been submitted.
- *Execution mode*: Determine how autonomously the AI specialist should act. *Autopilot* mode grants the AI specialist the ability to mark a ticket as resolved once resolution steps are sent. *Copilot* mode requires human acceptance of its resolution proposal.
- *Auto-submit catalog requests*: Enable AI specialists to submit catalog items on behalf of the user without an additional confirmation step.

Response formatting: Configure the details on how the AI specialist communicates to keep requesters informed through communication channels.

- *Inbound channels*: Select the inbound channels such as Activity stream through which the AI specialist can receive messages from requesters.
- *Outbound Channels*: Select the outbound channels the AI specialist uses to send responses or notifications. You can select channels such as Activity stream, email, portal, or phone.
- *Internal communication when confidence is low*: Enable to allow the AI specialist to log its solution as a work note rather than proposing it directly.
- *Response templates*: Write the template for what the AI specialist should say to communicate to the user. You can set response templates for three different AI specialist states: Awaiting Info, Solution Proposed, and Reassign to Human. You can format your message using the WYSIWYG editor to include things like bold text, specific fonts, tables, highlighting, links, and bullets.

Reassign: Configure the following details on how the AI specialist directs unresolved incidents to the correct team or agent for timely resolution.

- *Maximum number of interactions before escalation*: Set how many times to contact the requester before sending to a human agent. Enter a number greater than zero.
- *Reassign on follow-up question*: Enable this option to send the ticket to a human agent when the requester asks a follow-up question. Turning off the option lets the AI specialist handle follow-ups.
- *Choose where to reassign records*: Select the assignment group to reassign the ticket after an AI specialist has reviewed it and chosen to reassign it.
- *Cross-group reassignment*: Enable the AI specialist to recommend reassigning an incident to a different assignment group. The AI specialist never reassigns an incident to a different assignment group on its own.
- *Cross-group confidence threshold*: Set the confidence threshold for whether an incident belongs to a specific other assignment group.

5. Select **Save** to save your changes.

   You can make additional changes to your AI specialist before selecting save. Changing tabs in the AI specialist guided setup won't lose your changes.

   If you don't select **Save** before navigating to a new page or closing the browser, your changes are lost.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your AI specialist tasks are updated. After being assigned work, your AI specialist performs the actions necessary to complete those tasks on the relevant records.

Preview an AI specialist in the legacy AI Agent Studio

Run a preview of your AI specialist in the legacy AI Agent Studio on a single record to preview how it works and verify it matches your intentions.

Before you begin
Role required: sn_aia.admin

About this task
You can test an execution of the AI specialist on a single record to preview its capabilities.

Note: Previewing an AI specialist, depending on the tasks configured, can actually make changes to the record. Previews are not simulations.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to preview.
3. Navigate to the **Preview** tab in the AI specialist guided setup.
4. Choose a record to run the preview on.

   Recommended records for preview are selected based on their relevance to the capabilities and tasks available to the AI specialist.

   Once a record is chosen, you can select the open link button to open the record in a new browser tab to check the details.

   Note: Choose records that you can safely make changes to. The work is actually being done on the record during the preview.

5. Select **Run** to begin the preview.

   The test begins on the record. You can watch what fields it updates and any comments or work notes it generates.

   When the test is complete, you can review all the changes made.

6. Verify that the AI specialist's performance meets your expectations.

   See the Testing section in General guidelines for AI specialists for more information about how to test your AI specialist.

Result
Your AI specialist has worked on a specific record or records of your choice.

What to do next
You can return to the **Profile** or **Tasks** tabs in the guided setup to make changes if necessary. Once the changes are made, you can preview the AI specialist again.

If you are satisfied with the AI specialist's performance after making changes, you can select **Save** to save changes or **Activate** to let the AI begin work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assigning work to an AI specialist

You can assign work to an AI specialist in one of three ways, depending on your current work assignment procedures.

AI specialists can't assign themselves work, even if they've been put into an assignment group. There are three ways you can assign work to an AI specialist.

1. Manual assignment. You can change the user in the **Assigned to** field to your AI specialist on a record form or list. A service desk manager or team lead can assign work to the AI specialist just as they would assign work to human agents on their team.

2. Assignment rules. Assignment rules automatically assign work on your instance based on predefined conditions. They are applied whenever a task that isn't already assigned is created or updated. If you have multiple assignment rules, the one with the lowest order takes precedence.

3. Advanced Work Assignment (AWA). AWA assigns work based on more context than simple assignment rules, such as an agent's availability, capacity, and skills. Configuring AWA involves creating and managing service channels, work item queues, routing conditions, and assignment criteria.

With manual assignment, you control exactly which records an AI specialist works on. This works best when doing initial testing to see how an AI specialist handles a particular task type or subject. After you've established trust, you can allow the AI specialist to work at a larger scale by creating assignment rules or configuring AWA.

To have AWA assign work to an AI specialist, configure AWA first. You can then add the AI specialist to existing work queues, like another member of the team. If you don't already have AWA set up on your instance, assignment rules require less configuration than setting up AWA for AI specialists alone.

Manually assign work to an AI specialist

Manually assign specific records to an AI specialist by changing the Assigned to field when you need to override automatic assignment rules.

Before you begin

Role required: itil_admin

Procedure

1. Navigate to the table containing the record to assign.
   You can assign AI specialists to records in tables such as the Incident [incident] table.
2. Open the record for the AI specialist to work on.
3. In the **Assigned to** field, enter the name of the AI specialist.

   Trouble?
   If the AI specialist does not appear in the **Assigned to** list, verify that the AI specialist is active and has the appropriate capabilities configured for this record type.
4. Save the record.

Result

The record is assigned to the AI specialist. The AI specialist processes the record according to its configured capabilities and workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an assignment rule for an AI specialist

Create an assignment rule to route matching tasks to an AI specialist automatically, without setting the Assigned to field on each record.

Before you begin

Role required: assignment_rule_admin or admin

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Assignment**.
2. Select **New**.
3. In the **Name** field, enter a name for your assignment rule, such as `AI L1 Service Desk`.
4. In the **Applies to** tab, select the table and filter conditions that identify the tasks for the AI specialist to handle.
5. In the **Assign to** tab, enter the name of the AI specialist in the **User** field.
6. Select **Submit** to create the assignment rule.

Result

The assignment rule routes matching tasks to the AI specialist automatically.

Configure Advanced Work Assignment for an AI specialist

Add an AI specialist to an existing Advanced Work Assignment (AWA) assignment rule so that it can receive work items alongside your human agents.

Before you begin

This procedure applies when service channels and work item queues are already configured in AWA. For instructions on creating new ones, see Create a service channel and Create a work item queue.

Role required: awa_admin

Procedure

1. Confirm that the AI specialist has the awa_agent role.

   Navigate to **All** > **User Administration** > **Users**, find and open the user record for the AI specialist, and check the roles in the Roles related list.

2. Navigate to **All** > **Advanced Work Assignment** > **Home** > **Assignment rules**.
3. Select **New** to open the new record form or open an existing assignment rule.
4. In the **Auto-assign handling** tab, select **Enable auto-assign work items**.
5. In the **Manage AI agents** tab, select **Include AI agents**.
6. **Optional:** In the **Manage AI agents** tab, select **Prioritize AI agents**.

   (Optional) Choosing to prioritize AI agents routes relevant work to the AI specialist first. The AI specialist then triages the task and determines whether it can propose an acceptable solution. If the AI specialist can't propose a solution, or if the task is outside its configured capabilities, it can reassign the task to a human agent or a different assignment group. For steps on configuring the routing criteria for reassignment, see Configure AI specialist tasks.

   If you don't choose to prioritize AI agents, the AI specialist can still be assigned work from the work item queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.
8. **Optional:** Set the maximum capacity for the AI specialist.

   (Optional) See Override agent capacity for selected agents.

Result
Your AI specialist is added to the AWA assignment rule as an eligible assignee.

What to do next
You can track an AI specialist's performance and the records it works on in AI Agent Studio. See View performance and View activity.

Using AI specialists

AI specialists are autonomous, hierarchical AI agents designed to serve as team members who can accomplish complex tasks. Onboard AI specialists to your team to use AI for role-based automation.

Use AI specialists in AI Agent Studio

Onboard and view the performance and activity of AI specialists in AI Agent Studio.

Review the performance of an AI specialist in AI Agent Studio

Review the performance analytics of an AI specialist to track their task execution success. You can use the analytics to tune the AI specialist to suit your business needs.

Before you begin
Role required: sn_aia.admin

About this task
Monitoring AI specialist performance helps you identify where your AI specialist succeeds or fails. The analytics help you decide whether to change aspects of the AI specialist's profile or tasks to improve performance. Regular monitoring helps you identify areas of concern.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to preview.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and aren't required to view the AI specialist's performance.

4. Scroll down to the **Performance** section in the AI specialist guided setup.
5. Review the performance analytics of the AI specialist.

   You can filter all metrics by date and assignment group.

   #### Overview AI specialist performance metrics

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See how your AI specialist is performing overall.

Section name	Individual metrics
At a glance	○ *Durable auto-resolve rate (%)*: Percentage of incidents the AI specialist resolved without reassigning to a human agent, and not reopened. ○ *Coverage rate (%)*: Percentage of assigned incidents that the AI specialist attempted to resolve.
Routing journey	○ *1. Closed incidents in eligible assignment group(s)*: All incidents in assignment group(s) the AI specialist is part of. ○ *2. Closed incidents assigned to AI specialist*: Based on AWA or assignment rules, incidents assigned to the AI Specialist for triage. ○ *3. Closed incidents attempted by AI specialist*: Incidents where the AI specialist has the confidence level to propose a solution or take autonomous action.
Incident outcomes	○ *All incident outcomes*: Percentage and counts of results of the AI specialist's attempts: resolved, reassigned to a human agent, reopened, generated a new ticket, or in-progress ○ *Incident outcomes over time*: Trend of AI specialist result outcomes
Resolution details	○ *Mean time to resolution*: Average time between the incident being assigned to the AI specialist and the time a response was generated that was later accepted ○ *Mean time to first response*: Average time between the incident being assigned to the AI specialist and the time a response was generated
Reassignment reasons	○ *Reasons for reassignment*: Percentage and total counts of incidents that were reassigned to a human agent broken down by cause ○ *Reasons for reassignment over time*: Trend of AI specialist reassignment broken down by reason
Follow-ups	○ *Follow up rate (%)*: Percentage of attempted incidents where the AI specialist needed a follow-up to ask for further information. ○ *Count of incidents that required a follow up*: Count of incident records that required at least one additional message by the AI specialist

Evaluate adoption trend, customer sentiment, and feedback to identify opportunities to improve the AI specialist experience.

Section name	Individual metrics
Assess impact and user satisfaction	○ *Aggregated sentiment analysis*: Shows the overall tone (from negative to positive) of user messages in incidents handled by the AI specialist. ○ *Adoption coverage*: Shows how many relevant assignment groups have adopted and used the AI specialist to handle incidents. ○ *Direct user feedback*: Graphical representation of the direct user feedback provided by customers in response to the incident resolved by the AI specialist.

KB articles AI specialist performance metrics

See which articles are retrieved, cited in responses, or left unused. Identify which content is driving successful resolutions and where gaps exist.

Section name	Individual metrics
KB article usage summary	○ *KB articles used*: Number of distinct KB articles the AI specialist referenced during the selected period. ○ *Total records*: Total number of records (incidents, problems, interactions, etc) resolved using at least one KB article retrieval. ○ *Shown in citations*: KB articles the AI specialist included in a response to the user. A higher count suggests the AI specialist is actively surfacing relevant content. ○ *Retrieved only*: KB articles the AI specialist retrieved internally but did not include in a response. A high count may indicate retrieval quality issues worth investigating. ○ *Unused articles*: KB articles that were not retrieved or cited during the selected period. Review these to identify outdated or hard-to-discover content.
KB article list	○ *All used articles*: Lists all KB articles the AI specialist has used, showing usage frequency (how often the article was cited after retrieval) and reopen rate (percentage of incidents resolved using the article that were later reopened). ○ *Unused articles*: Lists KB articles with no references during the selected period.

What to do next

If you want to make changes to your AI specialist based on the performance analytics, see Edit the profile of an AI specialist or Edit the tasks of an AI specialist.

View the activity of an AI specialist in AI Agent Studio

View the task execution history of an AI specialist in the new AI Agent Studio to track where and when it plans and attempts executions. You can also give feedback on its performance.

Before you begin

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Monitoring AI specialist activity allows you to identify where your AI specialist is being used on which records.

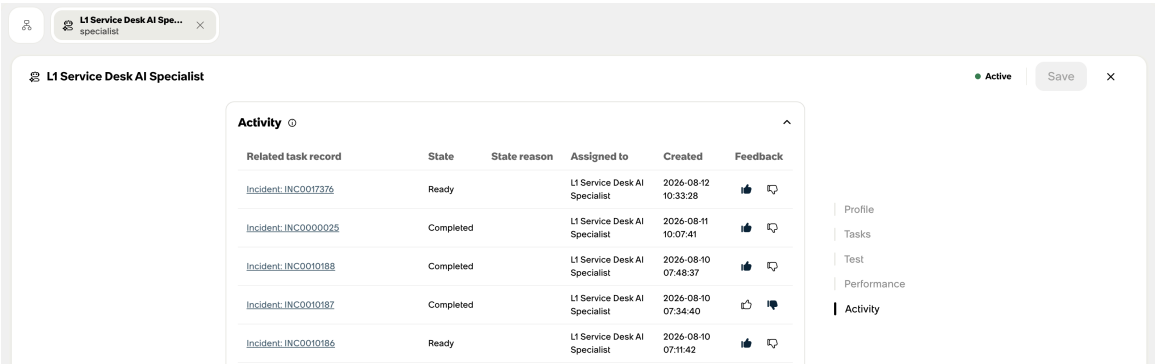
For a given execution, you can rate the work of the AI specialist as either helpful (thumbs up) or not helpful (thumbs down) in the *Feedback* field of the list.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to preview.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and don't require access to view the AI specialist's activity.

4. Scroll down to the **Activity** section in the AI specialist guided setup.



5. Review the activity of the AI specialist.

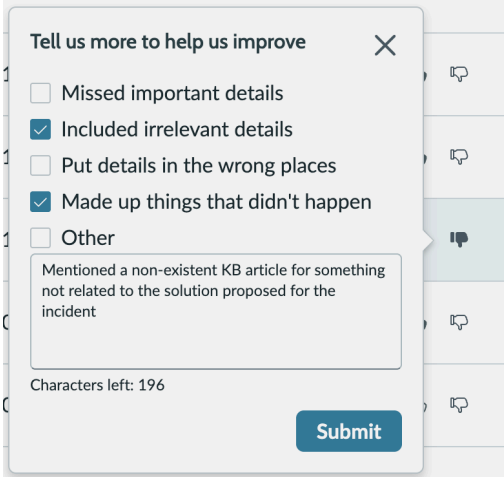
   AI specialist activity is presented as a filtered list that includes all records related to the AI specialist. You can add more filters to narrow down the activity further.

   You can sort by any of the list columns by selecting the column name.

   If the execution state is not *Completed*, a reason is given to explain the state. Possible reasons include "failed execution" or "no activity."

   You can give feedback on any given activity item. Select the thumbs up icon for positive feedback or the thumbs down icon to give negative feedback. If you select the thumbs down icon, you can specify exactly why you have given it that rating. After selecting a reason, you can also add a comment to detail the issue further.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Possible reasons for negative feedback include:

- Missed important details
- Included irrelevant details
- Put details in wrong places
- Made up things that didn't happen
- Other

What to do next

If you want to change which records the AI specialist picks up, you can change the capabilities or assignment groups in the AI specialist's profile. See Edit the profile of an AI specialist for more information.

To learn more about changing the specific tasks that the AI specialist performs on a record, see Edit the tasks of an AI specialist.

You can test the AI specialist on a specific record of your choosing by previewing the AI specialist.

Manage access to an AI specialist in AI Agent Studio

Control workspace access, user roles, and publishing settings for your AI specialist and its copies configured for specific teams.

Before you begin

Verify that you have an AI specialist created and configured.

Role required: sn_aia.admin

About this task

Configure access settings to control which workspaces and users can interact with your AI specialist. You can also manage different copies of AI specialists configured for specific assignment groups or teams with varying access requirements.

Access management includes workspace permissions, role-based security, publishing status, and copy creation privileges. These settings determine the operational scope and security boundaries for your AI specialist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to configure from the available list.
3. In the node view, select the first node representing the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and do not require modification for access management.
4. Scroll down to the **Management** section in the AI specialist guided setup.

   The Management section contains all access control and operational settings for the AI specialist.
5. Configure workspace access by defining the workspaces where the AI specialist can operate.

   Workspace access determines where agents can monitor the progress and activity of the AI specialist. Users can only interact with the AI specialist within the specified workspaces.
6. Configure role-based access by selecting which roles have permission to use the AI specialist.

   Users without the specified roles cannot invoke the AI specialist or review its work. Role configuration ensures that only authorized users can interact with the AI specialist.
7. Set the publishing status by selecting whether to publish the AI specialist.

   Publishing controls whether the AI specialist can perform work on records. An unpublished AI specialist remains inactive even if it meets all other access requirements.
8. Configure copy creation permissions by selecting whether users with the defined roles can create copies of the AI specialist.

   Copy creation allows teams to customize AI specialist behavior for specific assignment groups or use cases. Different copies can have varying configurations while maintaining the same core functionality.

   For example, you can configure an AI specialist copy for one assignment group to perform specific tasks that differ from those assigned to another group. For more information, see Create a copy of an AI specialist.
9. Select **Save** to apply your access configuration changes.

   You can modify additional AI specialist settings before saving. All changes are applied when you select **Save**.

   ⚠ **Warning:** If you navigate to a different page or close the browser without selecting **Save**, your changes are lost and must be reconfigured.

Result

Your AI specialist now has configured workspace access, role-based security, publishing status, and copy creation permissions. Users can interact with the AI specialist according to the access settings you defined.

What to do next

Verify that the access configuration works as expected by testing the AI specialist with users who have the required roles in the specified workspaces. Monitor AI specialist activity to confirm that access restrictions are properly enforced.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a copy of an AI specialist in AI Agent Studio

Create a new copy of an AI specialist to configure different settings for different assignment groups

Before you begin
Role required: sn_aia.admin

About this task
The base AI specialist can be configured to cover general or the most likely situations. Creating a copy of an AI specialist allows you to make specific changes for different assignment groups, such as different capabilities. You can also specify exactly which roles have access to the copy.

You can't change the tasks of an AI specialist at the copy level. Tasks must be configured for the base AI specialist.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to copy.
3. In the node view, select the first node of the AI specialist.

   The first node contains the main configuration settings for the AI specialist. The other nodes represent the individual agents that comprise the underlying architecture and do not require access or modification to create a copy of an AI specialist.
4. Scroll down to the **Management** section in the AI specialist guided setup to configure the different access settings.
5. In the Copies section, select **Add copy**.
6. Review the basic details and profile of the base AI specialist, then make changes for the specific copy.

   For example, you may want to change the name of the AI specialist or its department or description.
7. Assign the copy of the AI specialist to an assignment group.
8. Select a manager for the AI specialist.

   A manager might be the Service Desk Manager whose team the AI specialist will be a part of.
9. Select the roles to access this copy of the AI specialist.

Result
A new instance of an AI specialist is configured for a new assignment group.

What to do next
The copy of the AI specialist can be made available to users by publishing and activating the base AI specialist.

Deactivate an AI specialist in AI Agent Studio

Deactivate an AI specialist in AI Agent Studio so that it no longer acts on records.

Before you begin
Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Agentic solutions**.
2. Select the AI specialist you want to deactivate.
3. Select the pencil icon to open the AI specialist's setup.
4. By the **Save** button, select the more options icon , then select **Deactivate**.

Result
Your AI specialist is turned off.

What to do next
You can make changes to your AI specialist, such as changing the profile or modifying the tasks, to affect its behavior. Once you have made edits, you can preview the AI specialist and reactivate it later.

Use AI specialists in the legacy AI Agent Studio

Onboard and view the performance and activity of AI specialists in the legacy AI Agent Studio.

Review the performance of an AI specialist in the legacy AI Agent Studio

Review the performance analytics of an AI specialist to track their task execution success. You can use the analytics to tune the AI specialist to suit your business needs.

Before you begin
Role required: sn_aia.admin

About this task
Monitoring AI specialist performance helps you identify where your AI specialist succeeds or fails. The analytics help you decide whether to change aspects of the AI specialist's profile or tasks to improve performance. Regular monitoring helps you identify areas of concern.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to view the performance of.
3. Navigate to the **Performance** tab in the AI specialist guided setup.
4. Review the performance analytics of the AI specialist.

   You can filter all metrics by date and assignment group.

Overview AI specialist performance metrics

See how your AI specialist is performing overall.

Section name	Individual metrics
At a glance	○ *`Durable auto-resolve rate (%)`*: Percentage of incidents the AI specialist resolved without reassigning to a human agent, and not reopened. ○ *`Coverage rate (%)`*: Percentage of assigned incidents that the AI specialist attempted to resolve.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Section name	Individual metrics
Routing journey	○ *1. Closed incidents in eligible assignment group(s)*: All incidents in assignment group(s) the AI specialist is part of. ○ *2. Closed incidents assigned to AI specialist*: Based on AWA or assignment rules, incidents assigned to the AI Specialist for triage. ○ *3. Closed incidents attempted by AI specialist*: Incidents where the AI specialist has the confidence level to propose a solution or take autonomous action.
Incident outcomes	○ *All incident outcomes*: Percentage and counts of results of the AI specialist's attempts: resolved, reassigned to a human agent, reopened, generated a new ticket, or in-progress ○ *Incident outcomes over time*: Trend of AI specialist result outcomes
Resolution details	○ *Mean time to resolution*: Average time between the incident being assigned to the AI specialist and the time a response was generated that was later accepted ○ *Mean time to first response*: Average time between the incident being assigned to the AI specialist and the time a response was generated
Reassignment reasons	○ *Reasons for reassignment*: Percentage and total counts of incidents that were reassigned to a human agent broken down by cause ○ *Reasons for reassignment over time*: Trend of AI specialist reassignment broken down by reason
Follow-ups	○ *Follow up rate (%)*: Percentage of attempted incidents where the AI specialist needed a follow-up to ask for further information. ○ *Count of incidents that required a follow up*: Count of incident records that required at least one additional message by the AI specialist

What to do next

If you want to change which records the AI specialist picks up, you can change the capabilities or assignment groups in the AI specialist's profile. See Edit the profile of an AI specialist for more information.

To learn more about changing the specific tasks that the AI specialist performs on a record, see Edit the tasks of an AI specialist.

You can test the AI specialist on a specific record of your choosing by previewing the AI specialist.

Manage access to an AI specialist in the legacy AI Agent Studio

Control workspace access, user roles, and publishing settings for your AI specialist and its copies configured for specific teams.

Before you begin

Verify that you have an AI specialist created and configured.

Role required: sn_aia.admin

About this task

Configure access settings to control which workspaces and users can interact with your AI specialist. You can also manage different copies of AI specialists configured for specific assignment groups or teams with varying access requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access management includes workspace permissions, role-based security, publishing status, and copy creation privileges. These settings determine the operational scope and security boundaries for your AI specialist.

Procedure

1. Navigate to **AI Agent Studio** > **Create and manage**.
2. Select the AI specialist you want to configure from the available list.
3. Select the **Management** tab in the AI specialist guided setup.

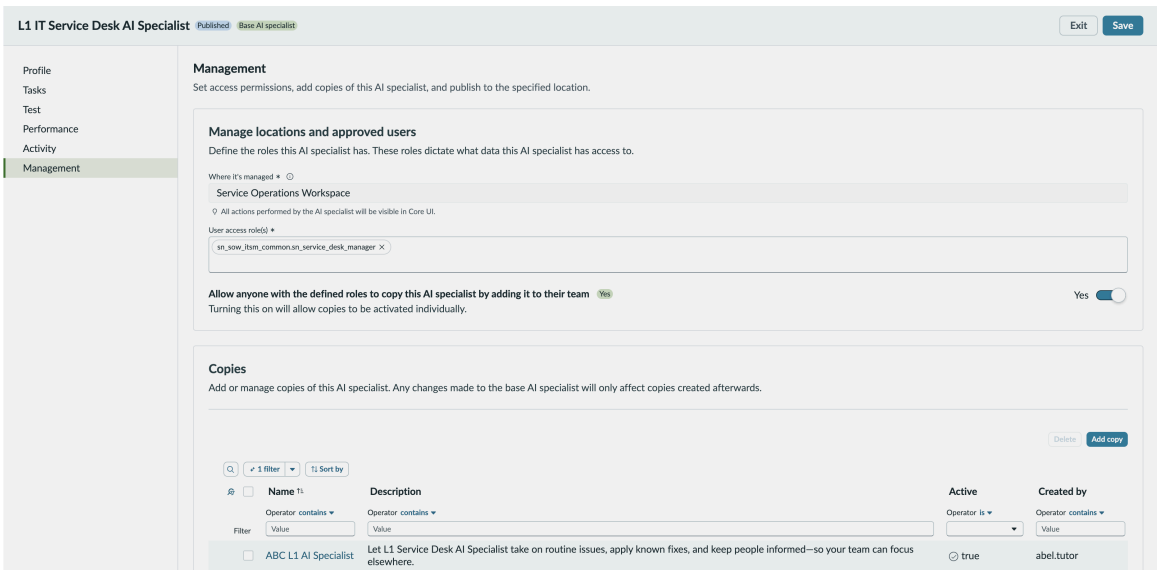
   The Management tab contains all access control and operational settings for the AI specialist.
4. Configure workspace access by defining the workspaces where the AI specialist can operate.

   Workspace access determines where agents can monitor the progress and activity of the AI specialist. Users can only interact with the AI specialist within the specified workspaces.
5. Configure role-based access by selecting which roles have permission to use the AI specialist.

   Users without the specified roles cannot invoke the AI specialist or review its work. Role configuration ensures that only authorized users can interact with the AI specialist.
6. Configure copy creation permissions by selecting whether users with the defined roles can create copies of the AI specialist.

   Copy creation allows teams to customize AI specialist behavior for specific assignment groups or use cases. Different copies can have varying configurations while maintaining the same core functionality.

   For example, you can configure an AI specialist copy for one assignment group to perform specific tasks that differ from those assigned to another group. For more information, see Create a copy of an AI specialist.



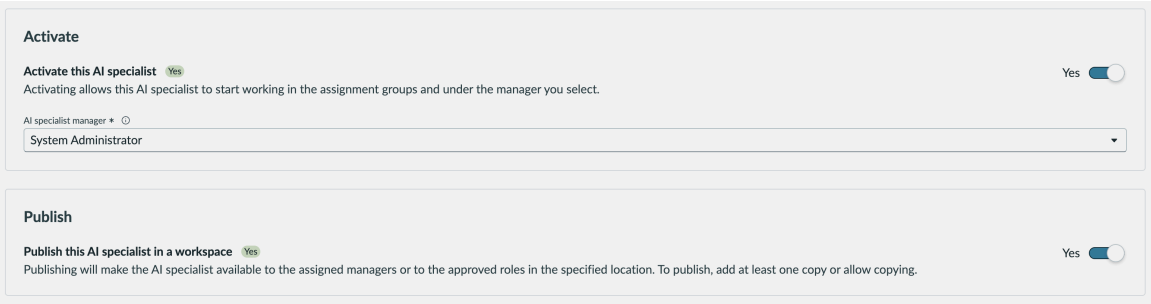
7. Set the active status of the AI specialist.

   Activation controls whether the AI specialist performs work. If an AI specialist is inactive, it won't work on any tasks, even if it is published.
8. Set the publishing status by selecting whether to publish the AI specialist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Publishing controls whether the AI specialist can be seen in workspaces and be assigned to a manager. An unpublished AI specialist remains inactive even if it meets all other access requirements.

If an AI specialist is unpublished, then it will not be visible for Service Desk Managers or other members of the assignment group, even if it is active.



9. Select **Save** to apply your access configuration changes.

   You can modify additional AI specialist settings before saving. All changes are applied when you select **Save**.

   Warning: If you navigate to a different page or close the browser without selecting **Save**, your changes are lost and must be reconfigured.

Result
Your AI specialist now has configured workspace access, role-based security, publishing status, and copy creation permissions. Users can interact with the AI specialist according to the access settings you defined.

What to do next
Verify that the access configuration works as expected by testing the AI specialist with users who have the required roles in the specified workspaces. Monitor AI specialist activity to confirm that access restrictions are properly enforced.

Create a copy of an AI specialist in the legacy AI Agent Studio

Create a copy of an AI specialist to configure different settings for different assignment groups

Before you begin
Role required: sn_aia.admin

About this task
The base AI specialist can be configured to cover general or the most likely situations. Creating a copy of an AI specialist allows you to make specific changes for different assignment groups. You can also specify exactly which roles have access to the copy.

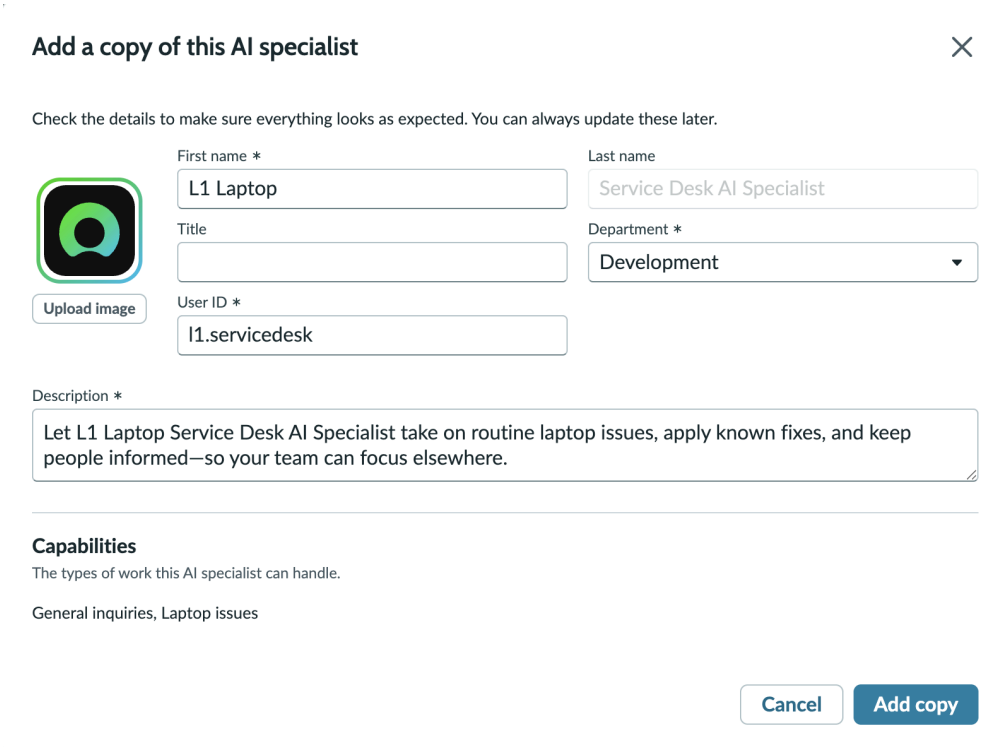
You can't change the kinds of tasks an AI specialist has at the copy level, only their configurations.

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select the AI specialist you want to preview.
3. Select the **Management** tab in the AI specialist guided setup to configure the different access settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Copies section, select **Add copy**.
5. Review the basic details and profile of the base AI specialist, then make changes for the specific copy.

   For example, you may want to change the name of the AI specialist or its department or description.



6. Assign the copy of the AI specialist to an assignment group.
7. Select a manager for the AI specialist.

   A manager might be the Service Desk Manager whose team the AI specialist will be a part of.
8. Select the roles to access this copy of the AI specialist.

Result
A new instance of an AI specialist is configured for a new assignment group.

What to do next
The copy of the AI specialist can be made available to users by publishing and activating the base AI specialist.

Deactivate an AI specialist in the legacy AI Agent Studio

Deactivate an AI specialist in the legacy AI Agent Studio so that it no longer acts on records and lists.

Before you begin
Role required: sn_aia.admin

Procedure
1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. In the **AI specialists** tab, select the AI specialist you want to view the activity of.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the more options button ⋯ to open the drop-down menu.
4. Select **Deactivate**.

Result
Your AI specialist is turned off.

What to do next
You can make changes to your AI specialist, such as changing the profile or modifying the tasks, to affect its behavior. Once you have made edits, you can preview the AI specialist and reactivate it later.

Reference for Autonomous Workforce

Reference for Autonomous Workforce provides additional information about the roles associated with AI specialists.

AI Specialist Manager role

The AI Specialist Manager role enables editing, testing, and monitoring AI specialists in AI Agent Studio and Service Operations Workspace.

Contains Roles

List of roles contained within the role.

- *sn_aia.viewer*
- *skill_manager*

Agentic workflows

Agentic workflows are AI-driven workflow orchestrations that use one or more AI agents to achieve a specific outcome. They go beyond single-step automation by dynamically planning, executing, and adapting actions based on context, data, and intermediate results.

Agentic workflows handle routine but variable procedures, such as investigation, remediation, and analysis, where the exact steps may differ from case to case.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Agentic workflows overview

Agentic workflows use multiple AI agents to achieve specific outcomes. Different workflows offer different available tasks. Many agentic workflow templates are available for you to activate, duplicate, or customize. For more information, see Activate an agentic workflow template and Duplicate an agentic workflow.

For more information about the in-product agentic AI experience, see In-product agentic AI. You can create UI actions for your agentic workflows in AI Agent Studio. Open the agentic workflow, navigate to the Select channels and access step in the guided setup, and create a UI action.

What an agentic workflow does

Agentic workflows can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Achieve an outcome, not just complete a task

  The workflow focuses on resolving a business problem or completing a goal, rather than executing a single action.

- Coordinate multiple AI agents and skills

  Agentic workflows can invoke generative AI skills and AI agents as needed to gather information, reason over data, take action, and verify results.

- Adapt to variability

  Workflows can adjust execution paths based on conditions, findings, or system responses, making them suitable for non-deterministic scenarios such as troubleshooting or analysis.

- Operate across systems and records

  Agentic workflows interact with the ServiceNow AI Platform and connected systems to read data, update records, and trigger downstream actions.

How agentic workflows are used

Agentic workflows are commonly used to:

- Resolve tasks that follow a repeatable decision pattern but vary in execution.
- Investigate issues by gathering and analyzing contextual data.
- Execute remediation steps based on findings.
- Assist users with analytical or exploratory workflows.

Depending on the product and configuration, agentic workflows can be triggered automatically or initiated by a user through a contextual UI or action.

Available agentic workflows

The following tables describe the available agentic workflows that are included in the ServiceNow applications, grouped by workflow area.

IT and digital operations

Product	Available agentic workflows
Enterprise Asset Management	• Help repair enterprise assets • Help manage enterprise asset requests
IT Operations Management	ITOM Visibility • Pattern diagnostic • Analyze potential impact • Firewall management task creation ITOM AIOps

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Product	Available agentic workflows
ServiceNow Otto for Customer Service Management (CSM)	• Accelerate complaint case handling • Provide Customer 360 insights • Triage cases
Field Service Management	Create a work order
ServiceNow Otto for Manufacturing Commercial Operations (MCO)	Execute recall campaigns faster
ServiceNow Otto for Public Sector Digital Services (PSDS)	Help manage public information requests
Sales Customer Relationship Management	Help nurture new leads
Customer Success Management	• Analyze risk and recommend solutions • Draft and schedule touchpoint meetings • Monitor engagement health • Support renewals and expansions
Telecommunications, Media, and Technology (TMT)	• Analyze network incident • Customer voice quality issue resolutions • Help remediate bill issues • Service test and repair • Smart Actions for Telecom
Service Exchange	• Service Exchange Knowledge Assistant • Service Exchange onboarding
ServiceNow Otto for Care Team Operations	Request care team assistance

Employee experiences

Product	Available agentic workflows
Now Assist for Finance and Supply Chain (FSC)	Conversational intake for sourcing and procurement
Purchase Order Management	• Define PO exception mitigation strategy • Email Intent to Action

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Product	Available agentic workflows
Contract Management Pro	• Conversational contract search and insights • Manage contract repository
ServiceNow Otto for Core Business Suite (CBS)	CBS setup
ServiceNow Otto for Health and Safety	• Create actions for safety incidents • Help resolve health and safety cases agentic workflow • Health safety incident patterns assistant agentic workflow
ServiceNow Otto for HR Service Delivery (HRSD)	• Help resolve tuition requests • Help resolve tuition reimbursement requests • Predict service and transfer HR cases • Resolve noncritical HR cases • Resolve critical HR cases • Generate onboarding ramp-up plan • Recommend catalog and order guide tasks in Onboarding Journey • Offboarding knowledge transfer plan generation • Schedule interviews
Legal Service Delivery	• Conversational contract search and insights • Triage legal requests
ServiceNow Otto for Supplier Lifecycle Operations (SLO)	Email intent to action
ServiceNow Otto for Workplace Service Delivery (WSD)	• Automate map updates • Help manage workplace reservations • Manage temporary space closures • Optimize cleaning activities • Process images for new tasks • Workplace Concierge

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Platform

Product	Available agentic workflows
Now Assist for Zero Copy Connector	Explore ERP models
Now Assist in Notifications	Email Intent to Action
Now Assist Platform	• Analyze incident trends • Classify tasks • Error Analysis and Remediation workflow • Generate my work plan • Generate resolution plans • Help optimize team productivity • Identify ways to improve services • Investigate IT problems • Notification agent • Process images for tasks • Suggest survey responses
ServiceNow Otto for Configuration Management Database (CMDB)	• Create configuration item • Provide advice on CMDB governance • Search CMDB
ServiceNow Otto for Vault	• Access observer configuration • Classify assets with ServiceNow Vault agents • Field encryption and auto-generate access policies • Field encryption with Vault module • Securing custom apps with Vault agents • Summarize access observer logs

App development

Product	Available agentic workflows
Build Agent	Create in-app agents, skills, and workflows
ServiceNow Otto for Creator	Create a theme using ServiceNow Otto®

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In-product experience for agentic workflows

Dedicated spaces in workspaces and in the Core UI enable you to use agentic workflows directly in record forms. You can view agentic workflow progress and previous executions, and you can answer follow-up questions for ones that require human supervision.

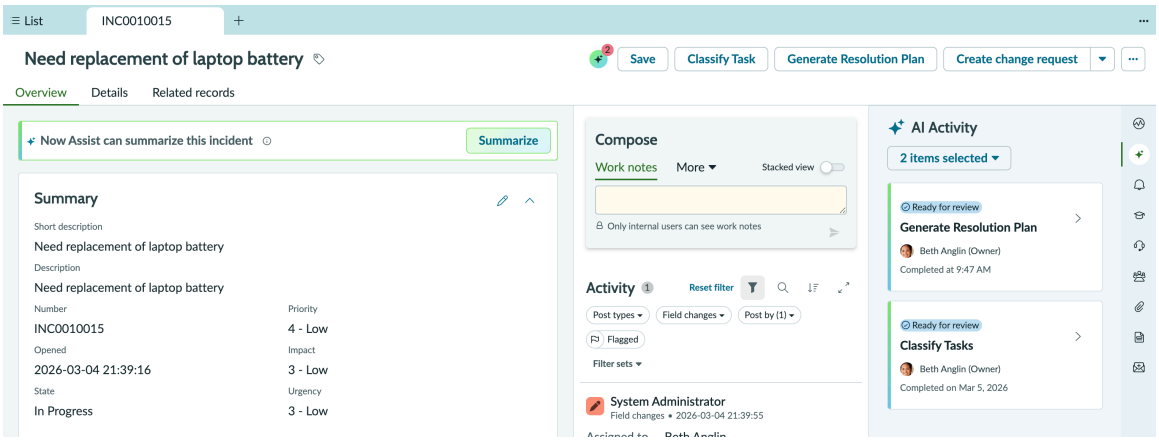
Agentic AI in the Core UI and workspaces

Agentic workflows can help you accomplish complex tasks, such as generating resolution notes for cases and incidents or investigating problems and root causes. You can view agentic workflows running on a record in the AI Workflows panel, available in both the Core UI form and in workspaces. For agentic workflows that require human supervision, you can answer questions, approve next steps, or provide other input. In addition to monitoring current progress, you can review historical runs to compare results.

To create UI actions for your agentic workflows, open the agentic workflow in AI Agent Studio, navigate to the Select channels and access step in the guided setup, and create a UI action.

If the AI Workflows panel is not visible, check the following:

- Ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`.
- Check whether the Workspace user preferences have **Show the sidebar** toggled on. If this setting is not enabled, the AI Workflows panel will not display. To access this setting, select the profile icon at the top right of the screen, then select **Preferences**. The setting is located on the Workspace tab.



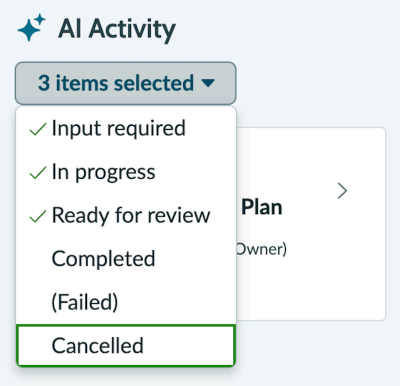
Agentic workflow execution list

The list of agentic workflow cards can be filtered by execution state, and you can change the active filters at any time.

Note: The *Ready for review* state differs from the *Completed* state in that the former indicates the workflow has generated some output. Agentic workflows without an output are marked only as *Completed*.

The *Supervised by* field identifies the user responsible for answering follow-up questions. Only the specified user can provide answers to progress the agentic workflow, though others can view the questions asked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Each card displays the current or final processing message. To view the full list of processing messages, select the agentic workflow card to open the details.

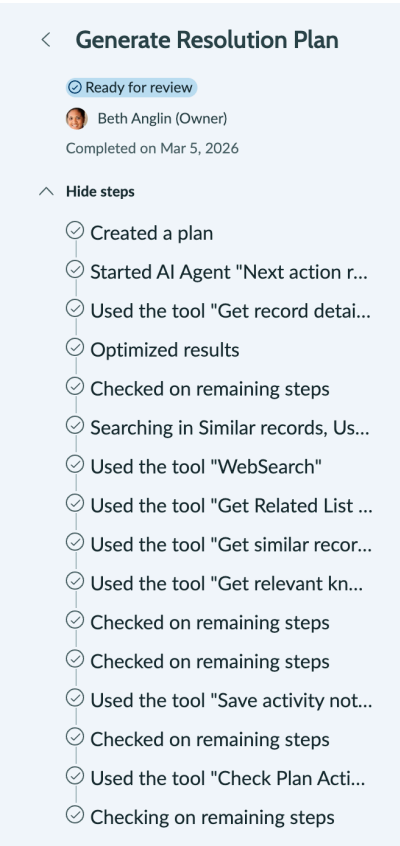
For currently running workflows, time estimates based on previous executions are displayed. For completed workflows, the cards show the total time taken.

The execution list also displays the results of any workflows triggered in the ServiceNow Otto panel or triggered automatically by events, once they are complete.

Agentic workflow execution details

When you select a specific agentic workflow, you can view its processing messages and history. Processing messages indicate which steps the agentic workflow has already completed and which are still in progress.

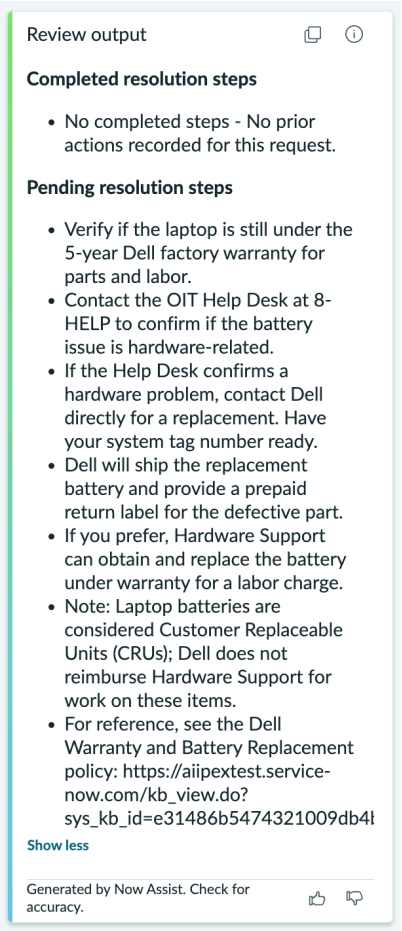
You can modify the processing messages for an AI agent or tool in AI Agent Studio. For an AI agent, open the AI agent and go to the Select channels and access step. For a tool, open the AI agent, go to the Add tools and information step, and select the tool to open the form modal.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The history section of the card can display previous answers to follow-up questions. For completed agentic workflows, you can review the final output in the history if one exists. When an output is available, you can view the sources behind the AI's reasoning by selecting the information icon. Citations can include Knowledge Base articles and lists of records.

To copy the text of the final output of an agentic workflow, select the copy icon.



Fields updated with agentic AI

When an agentic workflow changes the value of a field, ServiceNow Otto displays a label beneath the field value indicating that the value was modified by AI.

AI presence indicator

While an agentic workflow is in progress on a record, an icon appears at the top of the record form alongside other UI actions. Selecting it shows how many agentic workflows are running on the record and the general status of each.

To cancel an agentic workflow that is in progress, select the more options icon on the agentic workflow card, and then select **Cancel**.

Alerts for agentic workflow status changes and required input

When an agentic workflow changes states, such as when it completes or has a follow-up question, an alert appears at the top of the screen. If the workflow generates an output, you can select the **Review** button to view the final result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable the in-product experience for agentic workflows

Enable the AI Workflows panel and UI actions for agentic workflows on forms in the Core UI and workspaces to track agentic AI executions.

Before you begin
Role required: admin

About this task
Agentic workflows can perform work on certain records, and you can track their progress or provide input in the AI Workflows panel available for forms and workspaces. See In-product agentic AI for more details about the functions and features of the AI Workflows panel.

The following task describes the process for enabling the system property that allows you to see the AI Workflows panel and see UI actions for agentic workflows: *`com.glide.agentic_processes_view.enabled`*.

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow. See Select channels and access for agentic workflows for more information.

Procedure
1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. In the *Name* field, enter `com.glide.agentic_processes_view.enabled`.
4. In the *Value* field, enter `true`.

Result
The In-product agentic experience, including the AI Workflows panel, is available.

What to do next
Monitor agentic workflow execution on forms in the Core UI and workspaces, or create UI actions to grant users access.

Platform agentic workflows

You can use the available Platform agentic workflows to achieve business outcomes with self-executing autonomous AI agents.

Use the following agentic workflows that are available with ServiceNow AI Platform.

Available agentic workflows for Platform

Agentic workflow name	Description	Available AI agents
Analyze task trends	Detects recurring patterns, predicts disruptions, and enables proactive resolutions with actionable recommendations.	Issue trend analysis AI Agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available agentic workflows for Platform (continued)

Agentic workflow name	Description	Available AI agents
Classify tasks	Triages tasks by updating fields, evaluating sentiment, and summarizing.	Record field value prediction AI agent
Generate my work plan	Provides a personalized work plan based on current work and historical data of previous work.	Prioritize work AI agent
Generate resolution plan	Analyzes tasks, generates resolution summaries, and updates comments or work notes.	• Next best action recommendation AI agent • Resolution Action AI Agent
Help optimize team productivity	Identifies backlog items, evaluates team member performance on previous assignments, and allocates work based on similarity to those previous assignments.	Work Allocator AI Agent
Identify escalation signals	Assesses and reports tickets that are at risk of escalation.	Proactive Escalation AI agent
Identify ways to improve service	Analyzes feedback, trends, and metrics and provides recommendations to help optimize processes.	Survey Analysis AI agent
Investigate problems	Provides insights from incident or problem details.	Problem investigation AI agent
Process images for tasks	Processes images and converts them to tasks.	• Image Processor Agent • Document and visual insights AI agent
Process task closure	Triages tickets for closure eligibility and guides through reviewing, documenting, and closing them.	Task Closure Eligibility AI Agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available agentic workflows for Platform

(continued)

Agentic workflow name	Description	Available AI agents
Propose survey responses	Suggests answers for survey questions.	• Survey response suggestion AI agent • Survey filling data collection AI agent

Important: By default, all agentic workflows and AI agent records are read only.

To run the AI agents autonomously, you must either activate the agentic workflow template or duplicate the agentic workflow, and then proceed with the following steps:

- Activate the agentic workflow.
- Activate all agents within the agentic workflow.
- Activate the trigger to invoke the agentic workflow automatically. If you prefer to invoke it manually, activating the trigger isn't necessary.

Tools mapped to AI agents in agentic workflows

To find the tools mapped to AI agents used in the agentic workflows, you can perform the following steps:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**
2. In the Agentic workflows tab, select the agentic workflow.
3. In the **Describe and connect** step of the guided setup, select the AI agent you want to see the tools for.
4. Go to the **Add tools and information** step.
5. Review the tools mapped to the AI agent.
6. Repeat for all AI agents in the agentic workflow.

Agentic workflows and UI actions

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

If you don't see your UI actions after configuring it in AI Agent Studio, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`.

There might be AI agents installed on your instance that are not used in agentic workflows. To learn how to see all agents that are available to you, see Find AI agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Platform Analyze task trends agentic workflow

Use the Platform Analyze task trends agentic workflow to detect recurring task patterns so that you can understand the root cause and get recommendations to prevent them from happening in future.

Analyze task trends overview

The Analyze task trends agentic workflow enhances task management by detecting recurring patterns, predicting disruptions, and suggesting proactive resolution to reduce downtime and improve reliability. Tasks are grouped and analyzed by AI to analyze common recurring issues and root causes, and there are citations for representative records for each group. The LLM then generates resolution recommendations based on the analysis and displays it to you.

After the analysis is generated, you can continue the conversation to do the following:

- Get a summary of each group analysis. You have to specify which group you would like to get a summary of.
- Download the analysis as a PDF or Word document.
- Get more information by asking follow-up questions. For example, you can ask why certain suggestions were generated.
- Analyze the next ten groups. Each analysis is done for ten groups at a time. You can continue analyzing more groups with the same filters within the same conversation, but the other actions for the previous group are no longer available.

The exact options for follow-up actions available can be configured.

By default, the Analyze task trends agentic workflow only analyzes closed tasks, but you can configure it to also investigate open tasks. See the *`Additional configuration`* section for how to enable that option.

The default input fields considered for analysis are the following:

- Short Description
- Description
- Resolution Notes
- Resolution Code
- Subcategory
- Category

You can con figure additional input fields using a Now Assist Skill Config Var Set [sn_nowassist_skill_config_var_set]. See the Additional configuration section for more information.

The agents, tools, and triggers associated with the Analyze task trends agentic workflow are provided by AI applications. You can activate the agentic workflow template by making triggers active and setting the display settings to include the ServiceNow Otto panel. If you want to change this agentic workflow's instructions, you must duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance. You can get this by installing any other AI application.

For this agentic workflow to behave as expected, you should have at least 500 records on your task table.

You must also configure Group Action Framework (GAF). See Group Action Framework for more information on what GAF is and how to set it up. The Incident, Case and HR Case tables use the default GAF records, but you can configure GAF for other task tables.

GAF is set up for certain applications for you. If you want the agentic workflow to have its own system of categorization different from the main application, you can clone an existing action strategy skill and use the clone in the var set described in the *Additional configuration* section. This enables you to train the groupings differently for different agentic resources.

Note: If you create a clone of an action strategy skill, ensure that *Optimized prediction* is enabled to use AI Search as your fallback. You can leave it unchecked if you don't use AI Search on your instance.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_analyze_trnds.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

In the data access settings, you must also add the necessary roles to enable reading of the tables for the records you want to access for trend analysis. For example, you can add the itil role to the agentic workflow's list of approved roles so that it can access Incident records.

Additional configuration

You can change different settings related to the agentic workflow by changing values for the Now Assist Skill Config Var Set. To access the variable set and make changes, do the following while in the Platform AI Agents and Skills scope:

- Go to the Now Assist Skill Config [sn_nowassist_skill_config] table.
- Open the record named *Analyze Task Trends*.
- In the Now Assist Skill Config Var Set related list, select *Task Trends Input Config*.
- Edit the variable values.
- Save or update the record.

Time is a required filter specification in the user utterance. If you want users to be able to filter tasks by fields other than time, you can configure a *Task Table Config* var set. One for the Task table is provided as part of the application. If you want to create one for a specific table, you can create a Now Assist Skill Config Var Set [sn_nowassist_skill_config_var_set]. The *Skill Config* is `Analyze Task Trends`, and the *Config Type* is `Prompt Parameter Configuration`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task Trends Input Config configuration

Config field	Description	Default value
Post Analysis Actions	List of possible follow-up actions a user can take before the agentic workflow completes.	• Get a summary • Get more info • Analyze next 10 groups • Download analysis
Analysis Time Frame	Range of time, in months, for the trends analyzer to look at records to identify trends. You can specify smaller ranges when running the agentic workflow, but this value defines the maximum limit.	3
Active record analysis	Enable this setting for the agentic workflow to include open tasks in its analysis. **Note:** If you select this option, you need to set the sn_uxc_gen_ai.active_records_enabled_tables system property and run a Group Action Framework script to ensure that the open tasks are grouped and accessible for analysis. 1. Go to the System Properties [sys_properties] table, then open the record for *sn_uxc_gen_ai.active_records_enabled_tables*. The **Value** should be set to `Incident`. Other tables for active records are not supported at this time. 2. Go to the GAF scheduled script execution [sn_gaf_sysauto_script] table, then open the record *GAF - Active Records Run Offline Flow*. Select **Execute now** to run the script. The job may take some time to complete.	False
GAF Record Limit	Number of records analyzed per GAF record grouping. See the previous *Prerequisites and setup* section.	8

Prompt parameter configuration

Config field	Description	Default value
Input Table	Table that these potential filter conditions belong to	Task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prompt parameter configuration (continued)

Config field	Description	Default value
Input Fields	Additional fields that the agentic workflow can consider as context for its analysis	None
Filter Fields	Fields that users can include when invoking the agentic workflow If you want to add new fields, use the dot-walked display-label format like the default values.	• Assignment group.Name • Service.Name • Configuration item.Name
Group Skill ID	The Group Action Framework grouping skill dedicated to arranging records into categories	No default
Action Skill ID	The Group Action Framework action skill dedicated to selecting and mapping representative records for each group and summarizing them See Group Action Framework for information about setting up GAF.	No default
Auto Classify Frequency	When the grouping and action skills run again to incorporate new records for analysis	No default **Note:** If you provide a Group Skill ID and an Action Skill ID but leave the Auto Classify Frequency empty, it will default to 24 hours.

Accessing the Analyze task trends agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Analyze task trends**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in a new browser tab, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

Agentic workflows can be accessed in the Core UI and in workspaces in the AI Activity panel. From there, you can track their progress, provide or review input, and see the results of the work

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

If you don't see your UI actions after configuring it in AI Agent Studio, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Testing the Analyze task trends agentic workflow

You can manually test an agentic workflow execution or access on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Start a manual test, select a test type and the name of the workflow, and use utterances in the Task field like the following samples. See Test an agentic workflow execution.

If you want to evaluate the agentic workflow over many different execution logs, run an automated evaluation.

Sample utterance

After the workflow has been activated in AI Agent Studio, use similar queries to the following to run the agentic workflow in the *ServiceNow Otto* panel. You can also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin role.

Each utterance must include the name of the table and the time frame to analyze. If the utterance doesn't include these things, the agentic workflow prompts you for more information.

The time frame specified by the user can't exceed the maximum value set by the Analysis time frame configuration.

When invoking the agentic workflow, if you want to use additional filters, such as assignment group, use the name of the field in the utterance. For example, "Analyze incident trends assigned to the Hardware group" is more likely to analyze the correct records than "Analyze Hardware incident trends."

- Analyze incident trends related to payment issues within the last two months
- Analyze case trends within the last month
- Analyze HR case trends with High Priority within the last two years
- Analyze incident and problem trends within the last two weeks

Troubleshooting

When running this agentic workflow, it's possible to see an error that states "I couldn't analyze as I didn't have the required resources." This error occurs when GAF isn't configured for the table you want to analyze. See Configure Group Action Framework for steps to configure GAF for the table. If you're still having issues after GAF is configured, reach out to Now Support.

AI agents used in the Analyze task trends agentic workflow

The following table lists the agents that are used in the Analyze task trends agentic workflow.

Important: In the Select channels and status step of each AI agent's guided setup, make sure that the Status toggle is enabled to activate the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents names and descriptions in the Analyze task trends agentic workflow

AI agent name	AI agent description	Role required
Issue trend analysis AI agent	Analyzes grouped task data to identify recurring issues and root causes. Provides detailed, actionable recommendations using structured analysis.	sn_uxc_gen_ai.platform_ai_analyze_trnds

Other Platform agentic workflows

For more information on other agentic workflows that are associated with the Platform workflow, see Platform agentic workflows.

Platform Classify tasks agentic workflow

Use the Platform Classify tasks agentic workflow to gather relevant information about tasks automatically and make decisions about priorities and assignments.

Classify tasks overview

The Classify tasks agentic workflow can help improve efficiency and accuracy by automatically gathering information, prioritizing tasks, assigning teams, detecting sentiment, and generating task summaries.

The agents, tools, and triggers that are associated with the Classify tasks agentic workflow are provided by AI applications. You can activate the agentic workflow template by making triggers active and setting the display settings to include the ServiceNow Otto panel. If you want to change this agentic workflow's instructions, you must duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version of the agentic workflow instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance, which you can get if you install any other AI application.

For this agentic workflow to behave as expected, you must also configure Group Action Framework (GAF). See Set up AI Search for Group Action Framework and Configure Group Action Framework for more information on getting started with GAF.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_classify_tasks

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the data access settings, you must also add the necessary roles to enable reading of the tables for the records you want to classify. For example, you can add the itil role to the agentic workflow's list of approved roles so that it can access Incident records.

Additional configuration

You can change different settings related to the agentic workflow by changing values for the Now Assist Skill Config Var Set. To access the variable set and make changes, do the following while in the Platform AI Agents and Skills scope:

- Go to the Now Assist Skill Config [sn_nowassist_skill_config] table.
- Open the record named *`Task Classify Tasks Skill Config`*.
- In the Now Assist Skill Config Var Set related list, select *`Field Predictor`*.
- Edit the variable values.
- Save or update the record.

The Classify tasks configuration variable set includes the following variables. You can configure either the AIS fields or the GAF field for determining how the agentic workflow gathers what work the user has. If you configure both, GAF takes priority when running the agentic workflow. For more information about GAF, see Group Action Framework.

Classify tasks configuration

Config field	Description
Search Mode	Options include Keyword, Semantic, or Hybrid. Keyword-based searches look at individual phrases, while semantic-based searches rely on the phrasing of utterances as well. Hybrid utilizes both strategies. Default: Keyword
AIS Search Fields	Fields used by AI Search operations to find similar records for improved prediction context
Capability	OneExtend capability for enhanced field prediction functionality. See Generative AI Controller reference for more details.
GAF Config	Skill configuration for Group AI Framework (GAF).
AIS Return Fields	Fields returned by AI Search to the agentic workflow to base decisions on
GAF Config	Group Action Framework grouping configuration record, which is a collection of groups of records to make searching easier

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classify tasks configuration (continued)

Config field	Description
AIS Search Profile	Profile for AI search, such as ServiceNow Otto for Virtual Agent.
Capability Payload	Server-side script to generate custom payloads for OneExtend capability integration
AIS Fallback Table	Table used if GAF is not configured
Return Fields	Field values returned from identified relevant records
Check for Issue Readiness	Uses the information provided by the Issue Readiness AI agent ⚠ **Warning:** Only enable if the Issue Readiness AI agent is active on your instance. Otherwise, the agentic workflow will not execute.
Fields	Field values to predict and update
Table	Table where you want to execute the agentic workflow on
Search Term Source	Options include Record-based and Utterance-based. Record-based derives search terms for generating context from the record itself. Utterance-based relies on the user-submitted utterance for search term options. Default: Record-based

Accessing the Classify tasks agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Classify tasks**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in a new browser tab, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

Agentic workflows can be accessed in the Core UI and in workspaces in the AI Activity panel. From there, you can track their progress, provide or review input, and see the results of the work

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

If you don't see your UI actions after configuring it in AI Agent Studio, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Testing the Classify tasks agentic workflow

You can manually test an agentic workflow execution or access on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Start a manual test, select a test type and the name of the workflow, and use utterances in the Task field like the following samples. See Test an agentic workflow execution.

If you want to evaluate the agentic workflow over many different execution logs, run an automated evaluation.

Sample utterance

After the workflow has been activated in AI Agent Studio, enter these or similar phrases in the ServiceNow Otto panel to trigger the workflow. You must have the sn.now_assist_panel_user role to run the workflow. You can also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin role.

- Populate the priority and assignment group for INC0001
- Populate the empty fields on INC0001
- Find the priority for INC001

AI agents used in the Classify tasks agentic workflow

The following table lists the agents that are used in the Classify tasks agentic workflow.

Important: In the Define availability step of each AI agent's guided setup, make sure that the Status toggle is enabled to activate the AI agent.

AI agents names and descriptions in the Classify tasks agentic workflow

AI agent name	AI agent description	Role required
Record field value prediction AI agent	Fetches, predicts, creates, and updates records with the provided details. Provides summary and justification for recommendations.	sn_uxc_gen_ai.platform_ai_field_predictor

Other Platform agentic workflows

For more information on other agentic workflows that are associated with the Platform workflow, see Platform agentic workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Platform Generate my work plan agentic workflow

Use the Platform Generate my work plan agentic workflow to create personalized work plans for currently assigned work.

Generate my work plan overview

The Generate my work plan agentic workflow creates personalized work plans based on current assigned work. This reduces manual effort and guesswork in work planning. The AI agents identify and retrieve all work assigned to the user, predict effort required to complete work, and generate an actionable work plan. Effort is estimated based on historical records related to the open work items. Generated work plans emphasize the highest priority work by examining the following information and can result in faster resolution and fewer missed SLAs.

- User sentiment
- Short description
- Priority
- Description
- Due date
- Escalation
- State
- Updated
- Number
- Impact
- SLA

Along with the plan itself, the agentic workflow also provides reasoning behind its decisions for creating the plan.

The agents, tools, and triggers associated with the Generate my work plan agentic workflow are provided by AI applications. You can activate the agentic workflow template by adding triggers and setting the display settings to include the ServiceNow Otto panel. To change this agentic workflow's instructions, duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance. You can get this by installing any other AI application.

Now LLM is not a supported LLM provider for the Generate my work plan agentic workflow.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_work_planner.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

In the data access settings, add the necessary roles to enable reading of the tables for the records you want to access for potential work plans. For example, add the itil role to the agentic workflow's list of approved roles so that it can access Incident records.

Additional configuration

Change different settings related to the agentic workflow by changing values for the Now Assist Skill Config Var Set. To access the variable set and make changes, do the following while in the Platform AI Agents and Skills scope:

- Go to the Now Assist Skill Config [sn_nowassist_skill_config] table.
- Open the record named *`Generate my work plan config`*.
- In the Now Assist Skill Config Var Set related list, select *New*.
- Enter a name for your Config Var Set.
- Set Config Type to be either `User schedule` or `Generate my work plan`.
- Save the Var Set record.
- Set the variables for the config type.
- Save the Var Set.

The work plan config var set includes general variables for running the agentic workflow.

Work plan config type configurations

Config field	Description
Schedule job	Creates a scheduled job that automatically runs, allowing users to see updated prioritization suggestions after making progress in their work. Default: Unselected.
Schedule job frequency	How long after a record in the original work plan is updated for the agentic workflow to run again. Default: 30 minutes
Predict estimates	Predict estimated time to complete work per record.
Exclude task table	By default, certain fields are used for prioritizing work on the Task table. You can configure what fields to use on individual tables, such as the Incident table. Enable this to only plan for tables configured and not other records which are task or extension of task tables.
Max tasks	The maximum number of tasks that can be recommended to a user for their work plan. Default: 30 tasks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Incident config var set includes the following variables. Configure either the AIS fields or the GAF field for determining how the agentic workflow gathers what work the user has. If you configure GAF, it takes priority when running the agentic workflow. For more information about GAF, see Group Action Framework.

Use this config var set as a template to change any values for other tables, such as the Case or HR Case tables.

Note: If you select *Exclude task table* in the work plan config var set, only the tables that have these var sets configured are included for work in the suggested work plan.

Incident table config type configuration

Config field	Description
Table	Table for record types that someone can work on
Conditions	Filter criteria for determining eligible tasks
Record fields	Fields passed to the workflow for analysis
Time worked	Custom or edited field for specifying time worked. By default, the agentic workflow uses the *Time worked* field.
AIS Search Profile	Specific AI Search profile
AIS Search Fields	Fields AI Search looks at for determining similarity
AIS Return Fields	Fields returned by AI Search to the agentic workflow to base decisions on
GAF Config	Group Action Framework grouping configuration record, which is a collection of groups of records to make searching easier.
Assigned to field	The field for the user who works on the record. By default, the agentic workflow uses the *assigned_to* field.

Order by	JSON object array containing the ordering information for how work records are prioritized.
	
	Default is as follows. Any direction other than “DESC” is considered ascending in order.
	
	`[`
	`{ column: 'priority', direction: ''},`
	`{ column: 'due_date', direction: ''},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident table config type configuration (continued)

Config field	Description
	`{ column: 'escalation', direction: 'DESC' }, { column: 'sys_created', direction: 'DESC' } ]`

By default, the Generate my work plan agentic workflow relies on the User [sys_user] record's Schedule field. If there is no schedule defined on the User record, the workflow consults the Schedule [chm_schedule] table for the user. If neither are present, the assumed schedule is a weekday schedule from 8:00 a.m. to 5:00 p.m.

Change what tables and fields to look for schedule information with the *`User schedule`* config type.

Generate my work plan User schedule configuration

Config field	Description
Table	Table where user schedule information is stored
Conditions	(Optional) Conditions to determine what user schedule to associate with the user.
Schedule column	Field where specific schedule information is stored

Accessing the Generate my work plan agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Generate my work plan**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in AI Agent Studio, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

Access agentic workflows in the Core UI and in workspaces in the AI Activity panel. From there, track their progress, provide or review input, and see the results of the work performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. Select a UI action as a possible way to access the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't see your UI actions after configuring it in AI Agent Studio, verify that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Testing the Generate my work plan agentic workflow

Manually test an agentic workflow execution or access on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Start a manual test, select a test type and the name of the workflow, and use utterances in the Task field like the following samples. See Test an agentic workflow execution.

To evaluate the agentic workflow over many different execution logs, run an automated evaluation.

Sample utterance

After the workflow is activated in AI Agent Studio, enter `What should I work on today?` or similar phrases in the ServiceNow Otto panel to trigger the workflow. You must have the sn.now_assist_panel_user role to run the workflow. Also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin role.

Users must have the sn_uxc_gen_ai.platform_ai_work_planner role to execute the agentic workflow.

AI agents used in the Generate my work plan agentic workflow

The following table lists the agents used in the Generate my work plan agentic workflow.

Important: In the Select channels and status step of each AI agent's guided setup, verify that the Status toggle is enabled to activate the AI agent.

AI agents names and descriptions in the Generate my work plan agentic workflow

AI agent name	AI agent description	Role required
Prioritize work AI Agent	Dynamically orders tasks based on parameters like urgency, priority, SLAs, sentiment, and impact.	sn_uxc_gen_ai.platform_ai_work_planner

Other Platform agentic workflows

For more information on other agentic workflows associated with the Platform workflow, see Platform agentic workflows.

Platform Generate resolution plan agentic workflow

Use the Platform Generate resolution plan agentic workflow to fetch task record details, generate resolution summary steps, and update comments or work notes.

Generate resolution plan overview

The Generate resolution plan agentic workflow can help resolve tasks by collecting record details and generating resolution summaries that can be added to comments or work notes. Due to the dynamic nature of AI agents, this agentic workflow can be used for tasks that require complex logic even when provided with minimal details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The agents, tools, and triggers that are associated with the Generate resolution plan agentic workflow are provided by AI applications. You can activate the agentic workflow template by making triggers active and setting the display settings to include the ServiceNow Otto panel. If you want to change this agentic workflow's instructions, you must duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version of the agentic workflow instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance, which you can get if you install any other AI application.

For this agentic workflow to behave as expected, you must also configure Group Action Framework (GAF). See Set up AI Search for Group Action Framework and Configure Group Action Framework for more information on getting started with GAF.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_grp_workflow.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

In the data access settings, you must also add the necessary roles to enable reading of the tables for the records you want to access for potential resolution plans. For example, you can add the itil role to the agentic workflow's list of approved roles so that it can access Incident records.

Additional configuration

You can change different settings related to the agentic workflow by changing values for the Now Assist Skill Config Var Set. To access the variable set and make changes, do the following while in the Platform AI Agents and Skills scope:

- Go to the Now Assist Skill Config [sn_nowassist_skill_config] table.
- Open the record named *`Generate Resolution Plans Skill Config`*.
- In the Now Assist Skill Config Var Set related list, select the configuration variable set you want to edit.
- Set the variables for the configuration type.
- Save the Var Set.

The Generate resolution plan configuration variable set includes the following variables. You can configure either the AIS fields or the GAF field for determining how the agentic workflow gathers what work the user has. If you configure both, GAF takes priority when running the agentic workflow. For more information about GAF, see Group Action Framework.

Review button params configuration

Config field	Description	Default value
Show button	Display a UI action for reviewing a generated resolution plan	Enabled
Button label	Label for the UI action button to review a generated resolution plan	Review

Next Best Action Recommender configuration

Config field	Description
Search Mode	Options include Keyword, Semantic, or Hybrid. Keyword-based searches look at individual phrases, while semantic-based searches rely on the phrasing of utterances as well. Hybrid utilizes both strategies. Default: Keyword
Include Decomposition Agent in the workflow	Determines whether the Decomposition Agent, one of the agents in the workflow, is used. If this is unselected, the Next best action recommendation AI agent still runs.
use_websearch	Enables the agentic workflow to use web searches to help collect relevant information for generating the resolution plan
AIS Semantic Indexed Names	???A
script_to_run	Optional script to run when the Next best action recommendation AI agent executes
save_activity	Determines whether a tool creates an activity record on the sys_aia_agent_execution_activity table when saving resolution notes
AIS Search Profile	Profile for AI search, such as ServiceNow Otto for Virtual Agent.
Return Fields	Field values returned from identified relevant records
GAF Config	Group Action Framework grouping configuration record, which is a collection of groups of records to make searching easier

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Next Best Action Recommender configuration (continued)

Config field	Description
AIS Search Fields	Fields used by AI Search to determine what work a user has
AI Search Matching Threshold	Threshold value for whether AI Search considers a record to be related and relevant
Table	Table which has the records you want to generate resolution plans for
Related List Tables	Tables which contain related records that you want the AI agent to explore before generating resolution plans

Decomposition Agent configuration

Config field	Description
agent	Name of the AI agent to use for generating resolution actions
tablesinfo	Table information for providing context for generated action steps

Accessing the Generate resolution plan agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Generate Resolution Plan**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in a new browser tab, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

Agentic workflows can be accessed in the Core UI and in workspaces in the AI Activity panel. From there, you can track their progress, provide or review input, and see the results of the work performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't see your UI actions after configuring it in AI Agent Studio, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Testing the Generate Resolution Plan agentic workflow

You can manually test an agentic workflow execution or access on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Start a manual test, select a test type and the name of the workflow, and use utterances in the Task field like the following samples. See Test an agentic workflow execution.

If you want to evaluate the agentic workflow over many different execution logs, run an automated evaluation.

Sample utterance

After the workflow has been activated in AI Agent Studio, enter these or similar phrases in the ServiceNow Otto panel to trigger the workflow. You must have the sn.now_assist_panel_user role to run the workflow. You can also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin role.

- Generate resolution plan for INC0001
- Create detailed resolution steps for INC0001
- Resolve INC0001

UI action

After upgrading to the latest version of the Generate resolution plan agentic workflow, previous UI actions associated with the workflow may need to be recreated.

1. Find the UI action in the UI Action [sys_ui_action] table by searching for "Generate Resolution Plan".
2. Deactivate the existing UI action.
3. Repair the sn-ai-engagement-experience plugin.
4. Ensure that the *com.glide.agentic_processes_view.enabled* system property is enabled.
5. Open the agentic workflow in AI Agent Studio, scroll down to the **Channels** section, and add a new UI action.

AI agents used in the Generate resolution plan agentic workflow

The following table lists the agents that are used in the Generate resolution plan agentic workflow.

Important: In the Select channels and status step of each AI agent's guided setup, make sure that the Status toggle is enabled to activate the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents names and descriptions in the Generate resolution plan agentic workflow

AI agent name	AI agent description	Role required
Next best action recommendation AI agent	Identifies the steps for resolving tasks by referencing the similar task details and reviewing knowledge articles.	sn_uxc_gen_ai.platform_ai_next_best_action
Decomposition Agent	Analyzes and breaks down each previous resolution step into smaller, actionable substeps, then creates records	sn_uxc_gen_ai.platform_ai_resolution_action_ai_agent

Other Platform agentic workflows

For more information on other agentic workflows associated with the Platform workflow, see Platform agentic workflows.

Platform Help optimize team productivity agentic workflow

Use the Platform Help optimize team productivity agentic workflow to gather relevant information about tasks automatically and make decisions about priorities and assignments.

Help optimize team productivity overview

The Help optimize team productivity agentic workflow offers multiple capabilities that can enhance your team's performance. Improving assignments based on previous work and balancing workloads, the agentic workflow can address problems that traditional work assignment rules may have.

The agentic workflow performs the following tasks:

- Analyzes historical performance of team members
- Calculates workloads relative to each team member's typical capacity
- Enables proactive team management with data-driven insights

The agents, tools, and triggers that are associated with the Help optimize team productivity agentic workflow are provided by AI applications. You can activate the agentic workflow template by making triggers active and setting the display settings to include the ServiceNow Otto panel. If you want to change this agentic workflow's instructions, you must duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version of the agentic workflow instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance, which you can get if you install any other AI application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_help_allocate_work.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

In the data access settings, you must also add the necessary roles to enable reading of the tables for records assigned to team members. For example, you can add the itil role to the agentic workflow's list of approved roles so that it can access Incident records.

Additional configuration

You can change different settings related to the agentic workflow by changing values for the Now Assist Skill Config Var Set. To access the variable set and make changes, do the following while in the Platform AI Agents and Skills scope:

- Go to the Now Assist Skill Config [sn_nowassist_skill_config] table.
- Open the record named *Optimal Ticket Assignment*.
- In the Now Assist Skill Config Var Set related list, select *Work Allocator*.
- Edit the variable values.
- Save or update the record.

The Help optimize team productivity configuration variable sets include the following variables.

Help optimize team productivity Work Allocator configuration

Config field	Description
Tickets per batch	The number of tickets processed by the agentic workflow for evaluation. Default: 25
Metrics Calculation Window	How many days back to include in metric calculations. Default: 600
Assignment Group	The assignment group whose tickets are used for evaluation, analysis, and recommendations.
Table for Query	The table used to gather information about the work assigned to team members.
Backlog Ticket Query	Filter conditions for determining what counts as "backlog" work for team members to complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Help optimize team productivity Work Allocator configuration (continued)

Config field	Description
Similarity Score Table	The table used for gathering information about other work that has been previously assigned to team members.
Similarity Score Fields	Fields to consider for calculating which tasks are similar to the one that needs assigning. For example, selecting category and subcategory as similarity score fields includes those fields in calculating whether a team member has worked on similar assignments within the metric calculation window.

Help optimize team productivity Trigger frequency configuration

Config field	Description
Enable scheduled job	Enable the agentic workflow to run on its own using a scheduled job.
Assignment Group	The assignment group whose tickets are used for evaluation, analysis, and recommendations.
Scheduled job	The name of the scheduled job that runs to trigger the agentic workflow.
Scheduler frequency	How often the scheduled job runs and triggers the agentic workflow.

Accessing the Help optimize team productivity agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Help optimize team productivity**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in a new browser tab, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

Testing the Help optimize team productivity agentic workflow

You can manually test an agentic workflow execution or access on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Start a manual test, select a test type and the name of the workflow, and use utterances in the Task field like the following samples. See Test an agentic workflow execution.

If you want to evaluate the agentic workflow over many different execution logs, run an automated evaluation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample utterance

After the workflow has been activated in AI Agent Studio, enter "Give me optimized assignment evaluations for the Software assignment group" or similar phrases in the ServiceNow Otto panel to trigger the workflow. You must name the specific assignment group you're allocating work for.

You must have the sn.now_assist_panel_user role to run the workflow. You can also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin role.

AI agents used in the Help optimize team productivity agentic workflow

The following table lists the agents that are used in the Help optimize team productivity agentic workflow.

Important: In the Define availability step of each AI agent's guided setup, make sure that the Status toggle is enabled to activate the AI agent.

AI agents names and descriptions in the Help optimize team productivity agentic workflow

AI agent name	AI agent description	Role required
Work Allocator AI Agent	Streamlines ticket management by automatically fetching backlog tickets, evaluating agent workloads and performance metrics, and assigning tickets to agents in a way that optimizes distribution and operational efficiency.	sn_uxc_gen_ai.platform_ai_help_allocate_work

Other Platform agentic workflows

For more information on other agentic workflows that are associated with the Platform workflow, see Platform agentic workflows.

Platform Identify ways to improve service agentic workflow

Use the Platform Identify ways to improve service agentic workflow to analyze feedback, performance metrics, and historical trends that identify areas for service improvement.

Identify ways to improve service overview

The Identify ways to improve service agentic workflow optimizes service delivery and customer satisfaction by analyzing feedback, metrics, and trends to provide actionable process improvement recommendations. After the analysis is generated, you can continue the conversation to ask follow-up questions or download the analysis as a PDF or Word document.

AI applications provide the agents, tools, and triggers for the Identify ways to improve service agentic workflow. You can activate the agentic workflow template by making triggers active and setting the display settings to include the ServiceNow Otto panel. To change this agentic workflow's instructions, duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance. You can get this by installing any other AI application.

Because this agentic workflow relies on survey data, you must have Assessment records associated with task tables to analyze.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_improve_services.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

In the data access settings, add the necessary roles to enable reading of the Assessment table and other required tables. For example, add the itil role to the agentic workflow's list of approved roles so it can access Incident records.

Additional configuration

You can change agentic workflow settings by changing values for the Now Assist Skill Config Var Set. To access the variable set and make changes, do the following while in the Platform AI Agents and Skills scope:

- Go to the Now Assist Skill Config [sn_nowassist_skill_config] table.
- Open the record named *`Identify ways to improve service`*.
- In the Now Assist Skill Config Var Set related list, select *`Survey analysis input config`*.
- Edit the variable values.
- Save or update the record.

Survey analysis input configuration

Config field	Description	Default value
Maximum number of records	Maximum number of records included in analysis	500
Analysis Time Frame	Time range, in months, for the survey analyzer to examine records to identify trends. Users can specify smaller ranges when running the agentic workflow, but this value defines the maximum limit.	3

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Survey analysis input configuration (continued)

Config field	Description	Default value
Post Analysis Actions	List of possible follow-up actions a user can take before the agentic workflow completes.	• Download analysis • Get more info

Survey Filter configuration

Config field	Description	Default value
Table name	Table that the filter applies to	Assessment Instance [asmt_assessment_instance]
Fields	Fields that the user can add when invoking the agentic workflow	Metric type.Name

Task Filter configuration

The following is the default configuration for the Task table. You can make additional Skill Config Var Sets for other tables, such as Incident or Case.

Config field	Description	Default value
Table name	Table that the filter applies to	Task [task]
Fields	Fields that the user can add when invoking the agentic workflow	• Assignment group.Name • Service.Name • Configuration item.Name

Accessing the Identify ways to improve service agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Identify ways to improve service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The first step of the guided setup includes a complete list of included AI agents. Selecting an AI agent name opens it in a new browser tab, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

You can access agentic workflows in the Core UI and in workspaces in the AI Activity panel. From there, you can track their progress, provide or review input, and see the results of the work performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

If you don't see your UI actions after configuring it in AI Agent Studio, verify that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Testing the Identify ways to improve service agentic workflow

You can manually test an agentic workflow execution or access on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Start a manual test, select a test type and the workflow name, and use utterances in the Task field like the following samples. See Test an agentic workflow execution.

To evaluate the agentic workflow over many different execution logs, run an automated evaluation.

Sample utterance

After the workflow is activated in AI Agent Studio, enter similar phrases to the following in the ServiceNow Otto panel to trigger the workflow. You can also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin role.

When invoking the agentic workflow, if you want to use additional filters, such as metric name or category, use the name of the field in the utterance. For example, "Identify ways to improve services for the Hardware category" is more likely to analyze the correct records than "Identify ways to improve Hardware."

- Make suggestions for continuous service improvement based on surveys within the last 3 months
- Summarize surveys to improve Hardware services based on survey results within the last 2 years
- Give ideas for improving case resolution based on Post-Case metric type survey results over the last month

AI agents used in the Identify ways to improve service agentic workflow

The following table lists the agents used in the Identify ways to improve service agentic workflow.

Important: In the Select channels and access of each AI agent's guided setup, verify that the Status toggle is enabled to activate the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents names and descriptions in the Identify ways to improve service agentic workflow

AI agent name	AI agent description	Role required
Survey Analysis AI agent	Acquires survey data within the specified time range and analyzes it for ways to improve services	sn_uxc_gen_ai.platform_ai_improve_services

Other Platform agentic workflows

For more information on other agentic workflows associated with the Platform workflow, see Platform agentic workflows.

Platform Investigate problems agentic workflow

Use the Platform Investigate problems agentic workflow to perform root cause and risk assessments so that you can create an actionable resolution plan for a problem.

Investigate problems overview

The Investigate problems agentic workflow can help to assist agents and subject matter experts (SMEs) in investigating problems in their IT landscape. A problem can be associated with many incidents, and any investigator must be aware of a large number of details when looking at a problem. The agentic workflow can help provide insights from the incident and problem details and suggest plans or possible solutions.

The agents, tools, and triggers that are associated with the investigate problems agentic workflow are provided by AI applications. You can activate the agentic workflow template by making triggers active and setting the display settings to include the ServiceNow Otto panel. If you want to change this agentic workflow's instructions, you must duplicate it, adjust the settings to suit your specific needs, and activate the duplicated version of the agentic workflow instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance, which you can get if you install any other AI application.

Because this agentic workflow analyzes problems and incidents related to those problems, you must have records on the Problem and Incident table.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_problem_investigator.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the data access settings, you must also add the necessary roles to enable reading of the tables for Problems and related records. For example, you can add the itil role to the agentic workflow's list of approved roles so that it can access Incident records.

Accessing the Investigate problems agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Investigate problems**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in a new browser tab, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

Agentic workflows can be accessed in the Core UI and in workspaces in the AI Activity panel. From there, you can track their progress, provide or review input, and see the results of the work performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

If you don't see your UI actions after configuring it in AI Agent Studio, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Testing the Investigate problems agentic workflow

You can manually test an agentic workflow execution or access on the Testing page of AI Agent Studio if you have the sn.aia_admin role and all other roles configured in the security controls. Start a manual test, select a test type and the name of the workflow, and use utterances in the Task field like the following samples. See Test an agentic workflow execution.

If you want to evaluate the agentic workflow over many different execution logs, run an automated evaluation.

Sample utterance

After the workflow has been activated in AI Agent Studio, enter `investigate the problem PRB001` or similar phrases in the ServiceNow Otto panel to trigger the workflow. You can also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin role.

Troubleshooting

If a Problem has a large number of related incidents, you may run into an error that states "This model's maximum context length is 128000 tokens. However, your messages resulted in [X] tokens. Please reduce the length of the messages." This maximum token count is in place for all generative AI skills, so there is currently no way to work around this error. You can try the agentic workflow again using a different Problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents used in the Investigate problems agentic workflow

The following table lists the agents that are used in the Investigate problems agentic workflow.

Important: In the Define availability step of each AI agent's guided setup, make sure that the Status toggle is enabled to activate the AI agent.

AI agents names and descriptions in the Investigate problems agentic workflow

AI agent name	AI agent description
Problem investigation AI agent	Identifies the root causes, performs an impact assessment, and plans resolutions.

Other Platform agentic workflows

For more information on other agentic workflows associated with the Platform workflow, see Platform agentic workflows.

Platform Process images for new tasks agentic workflow

Use the Platform Process images for new tasks agentic workflow to convert images to actionable tasks.

Process images for new tasks overview

The process images for new tasks agentic workflow can help decrease manual data entry and improve task organization by automatically converting images into task records. First, the agentic workflow extracts information from the image, such as error messages, and presents the analysis to the user. Then, the user is presented with the details of the task, such as short description, category, and priority, before it is submitted so that they can make any changes. Once the information is confirmed, the agentic workflow creates an incident record and attaches the image.

The agents, tools, and triggers that are associated with the process images for new tasks agentic workflow are provided by AI applications. You can activate the agentic workflow template and set the display settings to include the ServiceNow Otto panel. If you want to change this agentic workflow's instructions, you must duplicate it to create a custom agentic workflow, adjust the settings to suit your specific needs, and activate the duplicated version of the agentic workflow instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance, which you can get if you install any other AI application.

Users must have the `sn_uxc_gen_ai.platform_ai_image_processor` role to invoke the agentic workflow.

If you want the ability for users to create tasks from images using ServiceNow Otto for Virtual Agent, you must activate the Image Processor Agent, Record management AI agent, and Document and visual insights AI agent and set the display to include Virtual Agent. This agentic workflow cannot be discovered in Virtual Agent, so you must enable the individual AI agents that comprise it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_image_processor.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

In the data access settings, you must also add the necessary roles to enable reading of the tables for the records you want to be able to make tasks on. For example, you can add the itil role to the agentic workflow's list of approved roles so that it can access Incident records.

Additional configuration

You can change different settings related to the agentic workflow by changing values for the Now Assist Skill Config Var Set. To access the variable set and make changes, do the following while in the Platform AI Agents and Skills scope:

- Go to the Now Assist Skill Config [sn_nowassist_skill_config] table.
- Open the record named *Image to task config*.
- In the Now Assist Skill Config Var Set related list, select the *Tables Mapping* configuration variable set.
- Set the variables for the configuration type.
- Save the Var Set.

Tables Mapping configuration

Config field	Description
role_and_table_map	When a user triggers this agentic workflow, it checks the role of the invoking user and uses the map to determine what tables a user can make a record on. For example, if you map itil to Incident table, then users with the itil role can make Incident records with images.
get_location_details	Determines whether information about the image's location is included in metadata extraction.
tableslist	List of tables where you can make tasks from images

Accessing the Process images for new tasks agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Process images for new tasks**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in a new browser tab, where you can see the full description, role,

© 2026 ServiceNow, Inc. All rights reserved.

list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

Agentic workflows can be accessed in the Core UI and in workspaces in the AI Activity panel. From there, you can track their progress, provide or review input, and see the results of the work performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

If you don't see your UI actions after configuring it in AI Agent Studio, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Sample utterance

After the workflow has been activated in AI Agent Studio, enter `Convert image to new task` or similar phrases in the ServiceNow Otto panel to trigger the workflow. You can also run this workflow on the Testing page of AI Agent Studio with the same utterance in the Task field if you have the sn.aia_admin and sn_uxc_gen_ai.platform_ai_image_processor roles.

AI agents used in the Process images for new tasks agentic workflow

The following table lists the agents that are used in the Process images for new tasks agentic workflow.

Important: In the Define availability step of each AI agent's guided setup, make sure that the Status toggle is enabled to activate the AI agent.

AI agents names and descriptions in the Process images for new tasks agentic workflow

AI agent name	AI agent description	Role required
Document and visual insights AI agent	Extracts information from images.	platform_ml_di.creation_agent

Other Platform agentic workflows

For more information on other agentic workflows associated with the Platform workflow, see Platform agentic workflows.

Platform Propose survey responses agentic workflow

Use the Platform Propose survey responses agentic workflow to assist requesters in completing surveys.

Propose survey responses overview

The Propose survey responses agentic workflow can help simplify and increase survey responses. Many callers end up not filling out surveys after requests have been fulfilled, and this agentic workflow helps them to make informed decisions to answer survey questions quickly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When this agentic workflow and trigger are activated, the assignee receives an email with AI-suggested answers to their survey based on the associated Incident or Request. They then have the option to accept the AI-generated answers with a link at the bottom of the email. They can also choose to fill out the survey manually.

The agents, tools, and triggers that are associated with the Propose survey responses agentic workflow are provided by AI applications. You can activate the agentic workflow template by making the trigger active. If you want to change this agentic workflow's instructions, you must duplicate it, adjust the settings to suit your needs, and activate the duplicated version of the agentic workflow instead.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Prerequisites and setup

To access this workflow, you must have ServiceNow Otto for Platform installed on your instance, which you can get if you install any other AI application.

You can use this workflow for any survey triggered on the Incident or Request table. For example, this agentic workflow can be used by the Short Customer Satisfaction Survey with Smiley Face when an Incident is closed. You can change existing surveys, and the agentic workflow can still propose answers. The agentic workflow can also be used for custom surveys triggered by the Incident or Request table as long as there's a trigger associated with the survey. See Configure a trigger condition for a survey for instructions on adding a trigger to a survey.

Propose survey responses isn't available for ServiceNow Otto panel.

Role filtering

Required role: sn_uxc_gen_ai.platform_ai_survey_response.

Agentic workflows and their AI agents use role masking to determine which users can access them. Ones installed with your applications have specific roles that come included with the application. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

In the data access settings, you must also add the necessary roles to enable reading of survey tables and other related tables.

Accessing the Propose survey responses agentic workflow

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Propose survey responses**.

The first step of the guided setup includes a complete list of included AI agents. Selecting the name of an AI agent opens it in a new browser tab, where you can see the full description, role, list of steps, and tools. Tools are displayed in the second step of the AI agent guided setup, Add tools and information.

In-product agentic AI and UI actions

Agentic workflows can be accessed in the Core UI and in workspaces in the AI Activity panel. From there, you can track their progress, provide or review input, and see the results of the work

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

performed. For more information, see In-product agentic AI for more details about the AI Activity panel.

To enable users to access agentic workflows with UI actions, you can open the agentic workflow in AI Agent Studio and navigate to the **Select channels and access** step. You can select a UI action as a possible way to access the workflow

If you don't see your UI actions after configuring it in AI Agent Studio, ensure that the property *com.glide.agentic_processes_view.enabled* is set to `true`. See Enable the in-product experience for agentic workflows.

Sample utterance

After the workflow has been activated in AI Agent Studio, you need to set a trigger for the workflow to run. This workflow cannot be triggered from the ServiceNow Otto panel.

If you want to test the agentic workflow in AI Agent Studio and you have the sn.aia_admin role, enter the following phrase in the Testing page in the Task field: `Help me with survey AINST00XXXX. List of fields to extract inc/case/req details: number, short_description, description, calendar_stc, escalation, reopen_count, close_code, close_notes, state, priority, caller_id`. You must include the list of fields to extract.

AI agents used in the Propose survey responses agentic workflow

The following table lists the agents that are used in the Propose survey responses agentic workflow.

Important: In the Define availability step of each AI agent's guided setup, make sure that the Status toggle is enabled to activate the AI agent.

AI agents names and descriptions in the Propose survey responses agentic workflow

AI agent name	AI agent description	Role required
Survey response suggestion AI agent	Suggests answers to questions based on record details.	sn_uxc_gen_ai.platform_ai_survey_response
Survey filling data collection AI agent	Collects the data related to the record and the survey questions to gather feedback.	sn_uxc_gen_ai.platform_ai_survey_response

Other Platform agentic workflows

For more information on other agentic workflows that are associated with the Platform workflow, see Platform agentic workflows.

AI specialists

AI specialists are autonomous AI units within the ServiceNow Autonomous Workforce. Each AI specialist is purpose-built to perform a specific job function and deliver complete workflow outcomes, working within your organization's existing governance, identity, and access controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key characteristics

Unlike task-based AI agents, AI specialists plan, execute, and complete multi-step work autonomously.

- Outcome-oriented execution: AI specialists own end-to-end workflows rather than individual tasks. They can investigate, take action, and resolve work autonomously.
- Built-in governance and identity: Each AI specialist operates as a user record and inherits least-privilege access automatically, helping make actions auditable and policy-conforming.
- Role-aligned design: AI specialists are aligned with familiar job roles (for example, Service Desk or IT Operations), so you can assign and manage them alongside human teams.
- Continuous monitoring and feedback: You can view an AI specialist's activity, execution history, and performance, and provide direct feedback to improve outcomes over time.

Note: Depending on your license, you will have access to certain application features, generative AI skills, agentic workflows, and AI agents. For more information, see ServiceNow product tiers.

Available AI specialists

The following table lists examples of AI specialists available as part of the Autonomous Workforce. Availability may vary by product, release, or licensing.

Product	Available AI specialists
Sourcing and Procurement Operations (SPO)	AI L1 SPO Service Desk Specialist
IT Service Management	L1 IT Service Desk AI Specialist
Finance and Supply Chain	AI L1 APO Service Desk Specialist

Related topics

Autonomous Workforce

AI Desktop Actions

ServiceNow® AI Desktop Actions enables you to design, configure, and manage desktop actions that automate repetitive tasks in your desktop and web environment. AI agents can autonomously and semi-autonomously process instructions, generate execution plans, and run desktop actions across legacy systems, thick client applications, and web applications without APIs.

- Automating multi-step desktop or web tasks that involve conditional logic, so agents can focus on work that needs a human touch.
- Adapting to changes in application state and UI in real-time, reducing the need to maintain rigid scripts.
- Helping detect and recover from errors by evaluating context and trying alternative approaches when something doesn't go as expected.

Types of desktop actions

There are two types of desktop actions: defined path and adaptive path. Both enable AI agents to automate tasks on behalf of users, but they differ in how steps are designed and executed.

Defined desktop actions for desktop and web-based tasks (deterministic)

With defined path desktop actions, you record with AI or capture a fixed sequence of steps in the AI Desktop Actions Windows application. The AI agent executes these predefined steps in order without deviation.

Best for: Repeatable tasks with consistent steps and predictable UI interactions.

Adaptive desktop actions for web-based tasks (probabilistic)

With adaptive path desktop actions, you describe what task you want to accomplish at a high level for desktop and web-based tasks. The desktop tasks include cross-application processes. The web-based tasks include performing tasks on web applications or websites. The AI agent processes the request, generates an execution plan, and dynamically determines the specific steps needed to complete the task.

Best for: Tasks that require flexibility, decision-making, or adaptation to changing UI elements.

For more information, see When to use adaptive vs. defined path desktop actions.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about scripts (and associated script records) in which ServiceNow Otto for code generation is called. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring AI Desktop Actions

Create desktop actions with AI Desktop Actions to automate repetitive tasks on your desktop and web environment using AI agents and agentic workflows.

AI Desktop Actions overview

AI Desktop Actions is a no-code solution that helps you automate repetitive tasks in legacy desktop and web-based applications lacking APIs or backend integrations. AI Desktop Actions leverages AI agents created in the ServiceNow AI Platform to interact with desktop and web applications, perform UI-based tasks, and automate end-to-end workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Desktop actions are tools used by AI agents—they are not AI agents themselves. Think of it this way:

- **AI Agent**: The orchestrator that receives user requests and coordinates task execution
- **Desktop Action Tool**: The capability the AI agent uses to interact with desktop or web applications

Defined desktop actions

You can use AI Desktop Actions to execute predefined automation sequences on your desktop. Defined path actions provide consistent, repeatable workflows for common desktop tasks. AI Desktop Actions is a client application that is installed on the Windows operating system. The app offers two workspaces, the Design workspace, where you create and configure desktop automations, and the Execution workspace, where those automations run. The Design workspace enables you to automate multi-step processes by recording with AI or manually capturing a fixed sequence of steps. Execution workspace enables AI agents to execute desktop actions in an isolated desktop session.

The Design workspace lets you build multi-step desktop actions by recording or manually capturing steps. The Execution workspace runs desktop actions in an isolated desktop session and is launched automatically when you test a desktop action or trigger an automation from the ServiceNow Otto panel. You don't open the Execution workspace manually. For more information, see Defined path desktop actions for desktop and web-based tasks.

Adaptive desktop actions

Desktop application for macOS

You can automate desktop and web-based tasks that involve adaptive steps using desktop actions. You describe the task in the chat interface of AI Desktop Actions for macOS. Screenshots of each step appear in the preview window of the execution workspace so you can monitor progress.

Browser extension for macOS and Windows

You can automate web-based tasks that involve adaptive steps using desktop actions. You configure desktop actions in AI Agent Studio as part of a AI agent tool configuration. When a user describes a task in the ServiceNow Otto panel, the AI agent uses the desktop action tool to open a separate browser tab and performs the task. Screenshots of each step appear in the **Web view** tab of the ServiceNow Otto panel enhanced chat so you can monitor progress.

For example, opening the application, selecting fields, and completing a workflow. The AI agent checks the state of the page and adjusts the sequence based on the user's goal. Because the steps are adjusted dynamically, results may vary. Review the output for accuracy before accepting it. For more information, see Adaptive path desktop actions for web-based tasks.

How it fits into ServiceNow workflows

AI Desktop Actions integrates with AI Agent Studio, enabling you to publish, manage, and incorporate desktop actions into your broader ServiceNow workflows. This integration lets you automate both cloud and desktop applications, giving your AI agents broader capabilities within ServiceNow.

Creating desktop actions from Task Mining

Build desktop automations by transforming task mining observations into production-ready desktop actions and AI agents.

- Workstation users capture desktop processes using the Task Mining agent.
- Business analysts review captured tasks and submit automation requests in Task Mining.
- Technical users generate automation blocks (on-screen and background tasks) and create desktop actions and associated AI agent in Automation Center.
- Authorized users execute the completed automations (desktop actions) in AI Desktop Actions using the deployed AI agent.

To learn more about desktop action creation journey from Task Mining, see Building desktop automations from Task Mining data.

Impersonating users

You can trigger AI agents from the ServiceNow Otto panel while impersonating another user, provided the impersonated user has the required roles. The sn_aia.admin role is required to use AI Agent Studio, and the now_assist_panel_user role is required to trigger AI agents that execute desktop actions in the Execution workspace. For more information, see Impersonating users.

What to explore next

To learn more about configuring and using AI Desktop Actions, see:

- Configure AI Desktop Actions
- Defined desktop actions in AI Desktop Actions
- Creating AI agents and adding desktop action tool
- Examples of creating desktop actions
- Examples of executing desktop actions using AI agents
- Components installed with AI Desktop Actions
- System requirements and limitations in AI Desktop Actions

Adaptive desktop actions for web-based tasks

Adaptive desktop actions enables AI agents to automate repetitive tasks across web applications through a browser extension. The agent interacts directly with the browser by clicking, typing, and scrolling, without preconfigured APIs, scripts, or back-end logic.

Adaptive desktop actions overview

Desktop actions are tools that AI agents use to interact with web applications through a browser extension.

When you configure an AI agent and select Desktop action as a tool, you choose how it operates:

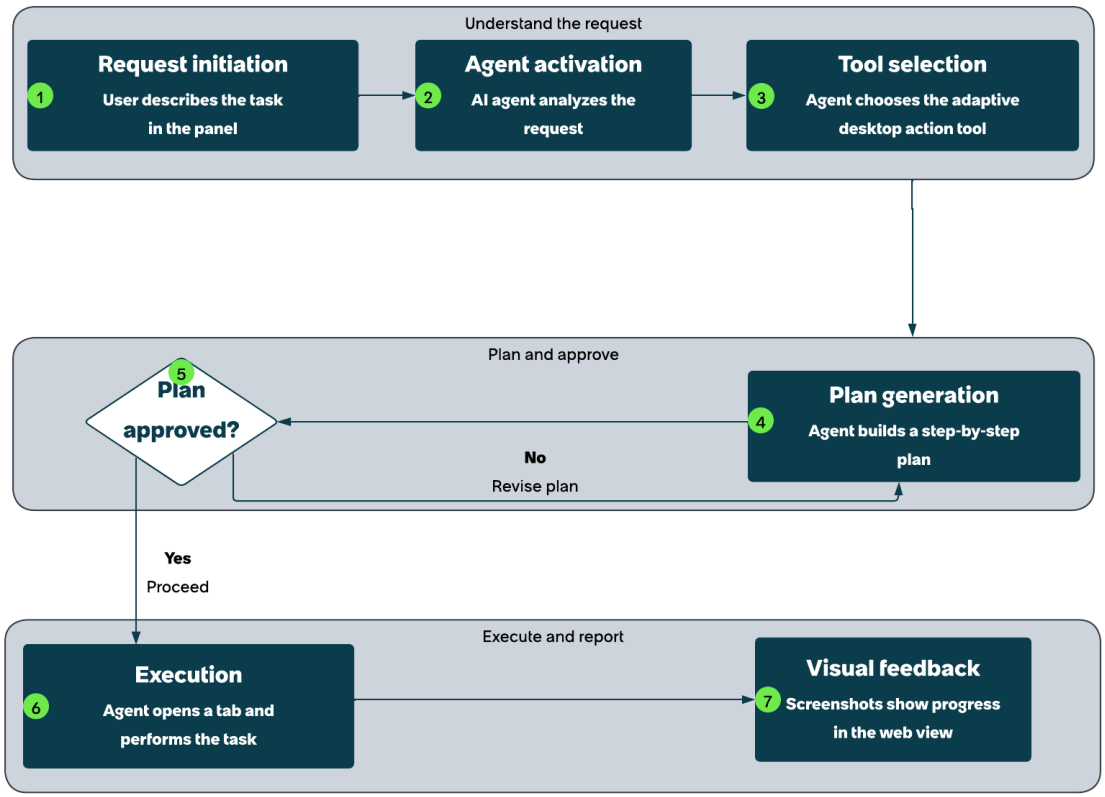
Desktop action operating modes

Mode	How it works	Use when
Defined path	Follows fixed steps preconfigured in AI Desktop Actions.	The workflow is stable and steps are known in advance.
Adaptive path	Works from a high-level goal. Dynamically plans and executes steps based on your instructions.	The workflow varies or steps cannot be fully defined in advance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specify a high-level goal — such as updating user roles or scheduling maintenance — and the agent plans and executes the steps to complete it. You can take manual control at any point.

How adaptive desktop actions work



LLM provider

Adaptive desktop actions use AWS Anthropic Sonnet model provider.

Users

Adaptive desktop actions are available to all users who perform tasks across enterprise applications and automate repetitive work.

Users and descriptions

Users	Description
Administrators	Manage permissions, roles, and agentic workflows
Developers	Build and configure AI agents with desktop action tools
Fulfillers	Automate routine fulfillment tasks across multiple systems
Requestors	Manage browser extensions and submit requests that trigger AI agents to automate web workflows

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operating desktop actions

You access desktop actions through the ServiceNow Otto panel that has enhanced chat enabled. The AI agent provides updates on its progress in the chat interface. As the agent works, you receive:

- Real-time status updates in the chat
- Periodic screenshots of the web pages the agent navigates
- Notifications when external websites require login credentials

When you close the chat, you have the option to delete the chat log, including all screenshots containing sensitive information. For more information, see Delete an AI agent chat log.

To run multiple tasks at once in adaptive desktop actions, open each task in a separate Chrome browser window, each with a different user profile,logging in with different ServiceNow users. This lets the tasks run in parallel instead of one at a time.

Third-party website access

When you use ServiceNow desktop actions to visit, access, log in to, or otherwise interact with (collectively, “Access”) websites, applications, or other digital properties owned or operated by a third party (“Third Party Services”), that Access is a direct interaction between you and the Third Party Services. You're responsible for adhering to any applicable terms and conditions, including all policies or statements governing the use of personal data, of the third party.

Important:

ServiceNow AI Desktop Actions rely on “computer use,” a beta technology provided by Anthropic. As a result, AI Desktop Actions users are subject to unique risks, including as described in Anthropic's documentation. Notwithstanding anything to the contrary in any customer agreement, or any other agreement governing a customer's use of ServiceNow offerings, ServiceNow AI Desktop Actions are provided “as is” and without representations or warranties of any kind, including any warranty that AI Desktop Actions will be uninterrupted, error free, or free of harmful components, or that any data, including customer data, will be secure or not otherwise lost or damaged.

Adaptive desktop actions for desktop and web-based tasks

Let an AI agent perform automated actions directly on your desktop across browsers, desktop applications, and files using AI Desktop Actions. You maintain control and can pause the automation at any time to review or adjust steps.

Adaptive desktop actions overview

AI Desktop Actions extends the ServiceNow AI Platform and executes adaptive tasks on your desktop and applications without manual intervention. AI Desktop Actions is a client application that is installed on the macOS machine. AI Desktop Actions can autonomously process instructions, generate execution plans, and run desktop actions across legacy applications, thick client applications, and web applications. The application can do the following:

- Open and interact with web browsers
- Operate desktop applications
- Manage files and documents
- Perform multi-step workflows across different applications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The application presents its execution plan for your review and approval before taking any action on your desktop.

AI Desktop Actions benefits

AI Desktop Actions delivers the following benefits:

Reduced manual effort

Automation handles repetitive, multi-step tasks across applications without user intervention.

User control and transparency

You review the AI agent's execution plan before it runs and can pause execution to make manual adjustments at any time.

Optimized performance

The AI agent batches consecutive actions into single execution calls where possible, minimizing round trips and reducing overall execution time.

Governance and consent

Explicit user consent is required before the AI agent can access desktop, third-party services, and files. Administrator-configured security policies may restrict AI agent resource access based on your organization's requirements.

Execution visibility

Real-time status tracking shows whether the AI agent is initiating, running, or paused. Non-UI tasks that are processed in the background are tagged in AI steps to clarify execution context.

How it works

User request

You describe the task you want automated in natural language. For example: "Copy last month's invoices from PDFs in the Example folder into a new spreadsheet and save the spreadsheet with name "Nov 2026 invoices" on Desktop."

AI planning

The AI Desktop Actions analyzes your request and creates a detailed execution plan with numbered steps.

Plan review

The AI Desktop Actions presents the execution plan and Legal Disclaimer for your review. You can accept the plan or request modifications before proceeding.

Execution

On your approval, AI agent executes the planned steps on your desktop. The execution workspace shows real-time status, such as Initiated, Running, Input needed, or Stopped.

Control takeover

You can take manual control of the execution in the following scenarios:

- When AI agents require input, more information, or additional context, it pauses execution and status changes to **Input needed**. You can either provide the details in the chat interface or select **Take control** to perform the step manually.
- When you observe that AI agent does not execute the steps according to your expectations, you can select **Take control**. The AI agent pauses the execution and waits for you to make manual changes. You can then return control to the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After you're done, give control back to the AI agent. You can provide notes describing any manual changes you made, ensuring the AI agent resumes with correct context.

Requirements and scope

The following requirements apply before using AI Desktop Actions:

- Supported environments: The feature works with web browsers, installed desktop applications, and local file systems on the M-series macOS. Performance and compatibility depend on your target application behavior and configurations.
- System permissions: On the macOS machine, you must grant the application two system permissions before use:
  - **Screen Recording**: Enables the agent to see what is on your screen
  - **Accessibility**: Enables the agent to control your keyboard and mouse

  You're prompted to grant these permissions when you first launch the application. The application requires a restart after permissions are granted.

Third-party website access

When you use ServiceNow desktop actions to visit, access, log in to, or otherwise interact with (collectively, “Access”) websites, applications, or other digital properties owned or operated by a third party (“Third Party Services”), that Access is a direct interaction between you and the Third Party Services. You're responsible for adhering to any applicable terms and conditions, including all policies or statements governing the use of personal data, of the third party.

Important:

ServiceNow AI Desktop Actions rely on “computer use,” a beta technology provided by Anthropic. As a result, AI Desktop Actions users are subject to unique risks, including as described in Anthropic's documentation. Notwithstanding anything to the contrary in any customer agreement, or any other agreement governing a customer's use of ServiceNow offerings, ServiceNow AI Desktop Actions are provided “as is” and without representations or warranties of any kind, including any warranty that AI Desktop Actions will be uninterrupted, error free, or free of harmful components, or that any data, including customer data, will be secure or not otherwise lost or damaged.

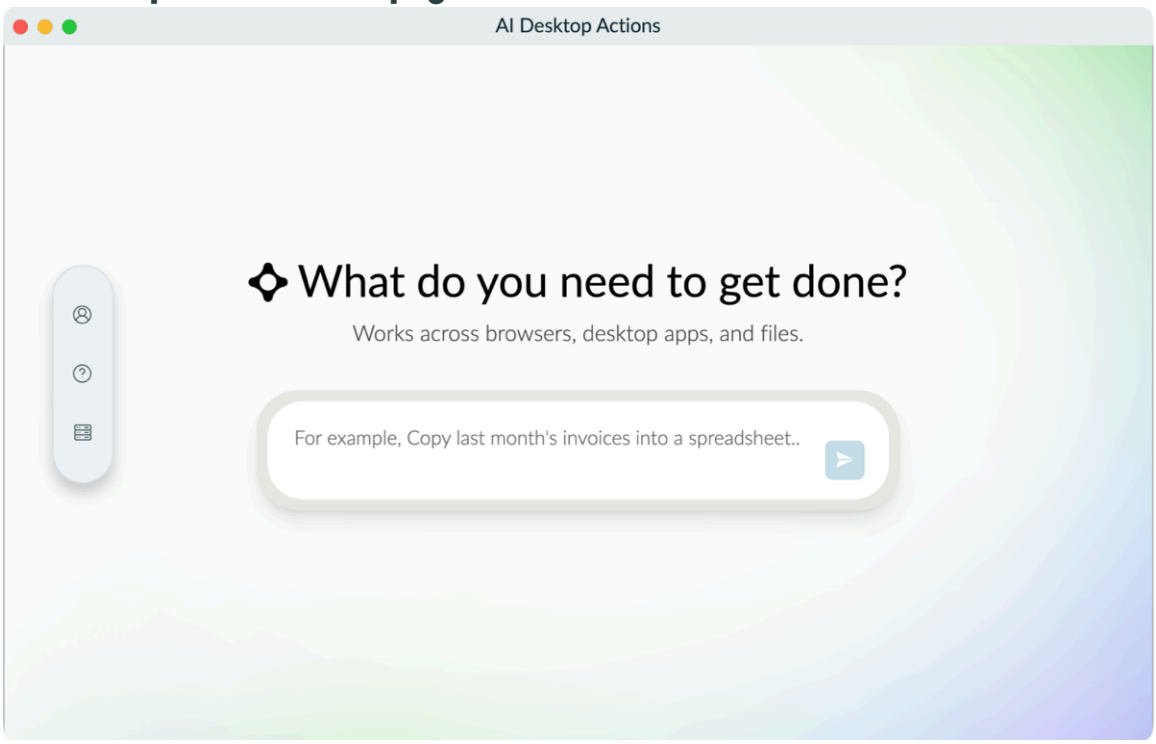
AI Desktop Actions user interface

The AI Desktop Actions application includes a task input field, an execution workspace, and status indicators that show the current state of AI agent task execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Desktop Actions home page



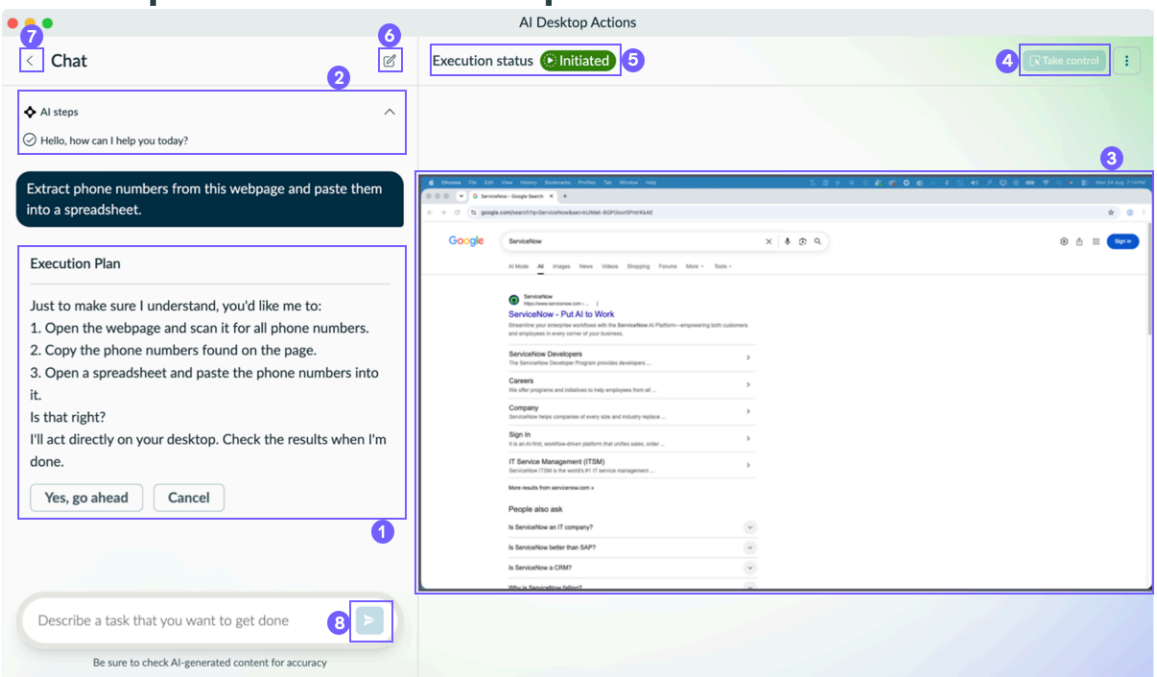
Task input field

The input field is where you describe the task to accomplish in natural language. The field accepts text describing the task to perform across browsers, desktop apps, and files. The description must be specific and include complete context. The field includes a placeholder example to guide you on the type of input expected and the **Send Message** button that triggers the action.

Access to profile and documentation

A dedicated section enables you to view your profile information, access product documentation, and check the product version.

AI Desktop Actions execution workspace



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Execution plan

The AI-generated plan that appears before execution begins. AI Desktop Actions restates your request in plain language, breaks it into numbered steps, and asks for approval. This prevents unintended steps and gives you a chance to correct any misunderstandings.

2. AI steps

A real-time breakdown of the AI agent's processing steps and observations as it executes your task. AI steps may differ from the execution plan presented. Each step shows what the AI agent observes on screen, identifies potential issues, and explains its decision for the next step. This transparency lets you follow the AI agent's decision-making and understand the reason for each step.

3. Preview window

The virtual desktop displaying only the files, folders, or applications that AI agent opens as part of automation execution. This window lets you monitor what the AI agent is doing in real time. The preview updates as steps are performed. You can only interact with this virtual desktop through the preview window.

4. Control buttons

- **Take control**: Pauses execution and gives manual control to you. Use this to intervene if the task is not proceeding as expected or requires human input.
- **Return control**: Return control back to AI agent. After you return control, a confirmation dialog appears prompting you to enter handoff notes for the AI agent. These notes help the AI agent interpret the changes you made.

5. Execution status

The current state of the task, such as Initiated, Running, Completed, Failed, or Stopped. The status badge updates as the AI progresses through steps. For more information about the statuses, see Execution status.

6. New chat

Option to begin a fresh conversation. Clears the current task and resets the chat interface to accept a new request.

> **Note:** The preview window continues to show the applications it opened for the previous task.

7. Back button

Option available in the chat interface to return to the home screen.

8. Start/Stop agent

Option to start or stop execution immediately. Use the Stop button to cancel an in-progress task.

Execution status

The execution status indicates the current state of the AI agent's task execution.

Status	Description	What you can do
Ready	The AI Desktop Actions application is open and waiting for you to describe a task. No execution has started yet. This is the initial state after launching the application or after completing a previous execution.	Enter your task description in the text field and select the **Send Message**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status	Description	What you can do
		button to send your request to AI agent.
Initiated	AI Desktop Actions has initiated your request. The AI agent creates an execution plan and waits for your approval before performing actions on your desktop.	Review the execution plan. Select **Yes, go ahead** to proceed, or **Cancel** to modify your request.
Running	The AI agent is actively performing the planned steps on your desktop.	Monitor progress. Select **Take control** to pause execution and make manual changes.
Input needed	The AI agent has paused execution because it needs additional information or input from you to continue. This might be credentials, a decision, clarification about how to proceed, or confirmation for a background operation. The AI agent may also pause if it needs confirmation on the resource access.	• Provide the requested information through the chat interface. • Select **Take control** to make manual changes in the preview screen.
You have control	Execution is paused and the desktop is under your control. The AI agent has paused performing actions and is waiting for you to take actions.	Make manual changes to your desktop or applications. After you're done, you can return the control, provide handoff notes, and let AI agent resume.
Success	The AI agent has successfully completed all planned steps. The task is finished and the agent displays results or summary information.	Review the completed task results. You can start a new task or close the application.
Failed	The AI Desktop Actions encountered an error or was unable to complete the task. An error message describes the cause of the failure.	Review the error message. You can start a new task with modified request.
Stopped	You stopped the execution before the AI agent could complete the task. The task is halted and no further actions are taken.	You can start a new task.

Reusable skills in adaptive desktop actions

Reusable skills save steps from completed adaptive desktop actions, allowing future requests with similar intent to run those steps with new data. This accelerates repeated tasks and reduces AI token consumption.

Important:

This feature is in beta. It may change as the feature evolves. Report issues through ServiceNow Support.

Generative AI may produce inaccurate or incomplete information. Always validate AI-generated content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reusable skills overview

Note: This feature is managed by the sn_desktop_core.enable_reusable_assets system property. This is set to `false` by default. You must set the value to `true` to use this feature. For more information, see Components installed with AI Desktop Actions.

When the AI agent runs an adaptive desktop action, it plans each step at run time. Planning every step on every run takes time, even when you repeat a task that the AI agent completed before.

When the sn_desktop_core.enable_reusable_assets system property is set to `true`, the application records the steps of each run and saves the recording to your instance. The instance divides the recording into skills, one for each sub-task. For example, a single run might produce one skill for logging in to an application and another skill for filling in a form.

The next time you submit a request with the same intent but different data, the AI agent searches for a matching skill. If it finds one, it runs the saved steps with the data from your new request instead of planning each step again. The AI agent uses the defined desktop action approach and reduces AI token consumption.

Key benefits

Reusable skills provide the following benefits:

- Shorter run time for repeated tasks, because a matching skill runs saved steps instead of planning each step.
- Saves AI token consumption.
- No change to how you work, because you describe tasks the same way and the AI agent searches for matching skills automatically.

Supported applications and actions

Reusable skills work with the following types of applications:

- Native macOS applications, such as TextEdit and Notes
- Installed applications that provide macOS accessibility information
- Web applications in Google Chrome

UI actions are saved as skills because they run on the UI. These include selecting an element, entering text in a field, or choosing an item from a list.

Non-UI actions, such as working with Microsoft Excel, Microsoft Word, or the file system, aren't saved as skills because they run in the background. The AI agent plans those actions each time the task runs.

Taking control while a skill runs

If you take control during a skill's execution and then return it to the AI agent, the AI agent replans them. The agent does not use the saved steps. This applies only to the current skill. Subsequent skills in your request run their saved steps as usual (unless you take control again).

For example, your request uses two skills with five steps each. You take control during step two of the first skill, then return control. The AI agent replans the remaining steps of the first skill (using adaptive desktop action approach). The agent runs the second skill using the saved steps (using defined desktop actions approach).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For information on the Take control feature, see Take control of AI Desktop Actions execution.

Considerations

Consider the following when you use reusable skills:

- The AI agent might not find a matching skill even when one exists for the same intent. When this happens, the AI agent plans and runs the steps as usual and records the run.
- Saved steps rely on the accessibility information that a desktop application provides, such as field labels or a unique ID for each field. If a desktop application doesn't provide this information, saved steps might enter data in the wrong field. For example, a phone number might be entered in an email address field. This consideration doesn't apply to web applications in Google Chrome.

Execute adaptive desktop actions for desktop and web

Defined desktop actions for desktop and web-based tasks

Automate desktop and web-based tasks that involve fixed steps using AI Desktop Actions.

AI Desktop Actions is a client application that is installed on the Windows operating system. The app offers two workspaces, the Design workspace, where you create and configure desktop automations, and the Execution workspace, where those automations run. Design workspace enables you to automate multi-step processes by recording with AI or manually capturing steps. Execution workspace enables AI agents to execute desktop actions in an isolated desktop session.

Defined desktop actions are categorized into two categories.

- **On-screen tasks**: These desktop actions help you simulate humans interacting with UI elements on your thick client applications, legacy systems, or SaaS applications without APIs. These actions include clicking buttons, typing into text boxes, selecting from dropdown menus, and more.
- **Background tasks**: These desktop actions include prebuilt connectors that enable your AI agents to interact with various applications and system components in the background.

Key interfaces related to AI Desktop Actions

Design workspace

Create, manage, and test desktop actions that define how automations interact with desktop and web applications. You can create desktop actions by recording with AI or manually capturing steps.

Execution workspace

Automatically runs desktop actions in an isolated desktop session during testing or execution. You don't open this workspace directly.

AI Agent Studio overview

Create, manage, and test AI agents that run desktop actions.

ServiceNow Otto panel

Trigger desktop actions from within ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These components work together to separate design, execution, and monitoring, ensuring secure and reliable desktop automation.

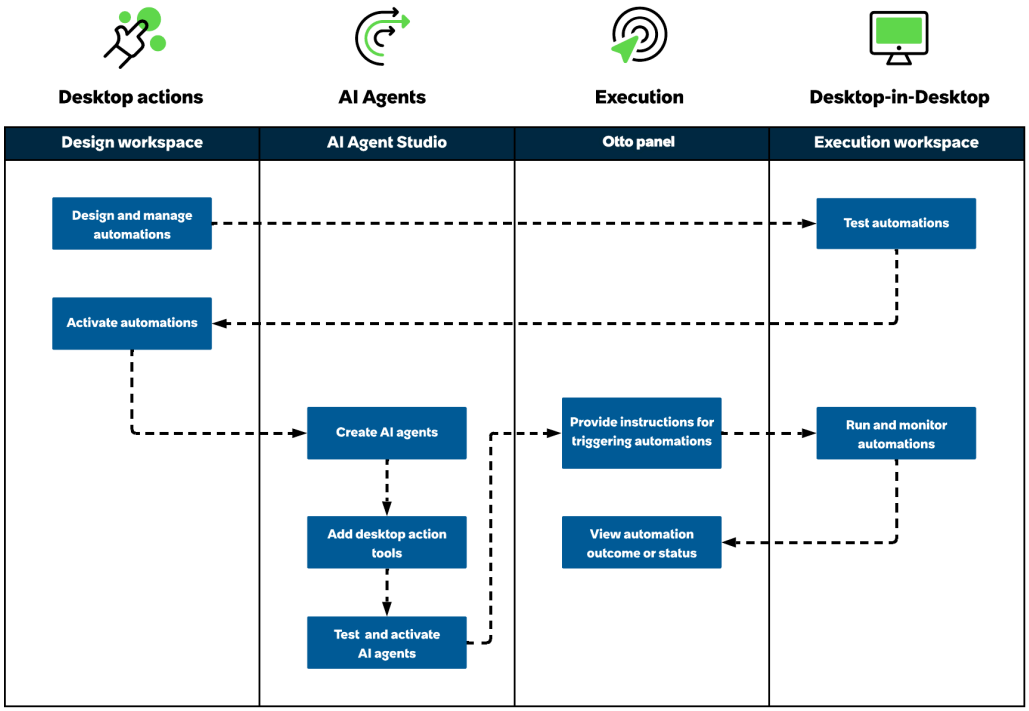
AI Desktop Actions users

User	Description
Administrators	Set up and deploy the AI Desktop Actions application.
Developers	Design, manage, and deploy automation solutions within their organization.
Business users	Automate repetitive desktop tasks without extensive technical knowledge.
Process owners	Optimize business processes by automating manual desktop interactions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How AI Desktop Actions works end-to-end

Workflow for automating fixed steps using desktop actions



This workflow shows how AI Desktop Actions works end to end from designing desktop actions to running them during execution. As you move through the workflow, note which steps you perform manually and which steps are handled automatically by the system.

Important: Access to the Design workspace and Execution workspace depends on the user's role.

- When users with the AI Agent Admin (sn_aia.admin) role sign in from their desktop, they can access the Home page and Design workspace to create desktop actions. When they test a desktop action, the Execution workspace launches automatically.
- When users with the ServiceNow Otto panel user (now_assist_panel_user) role trigger an automation from the ServiceNow Otto panel, the Execution workspace launches automatically to run the desktop action.

You don't open the Execution workspace directly. It launches automatically when you test or run a desktop action.

- With the AI Agent Admin role, use the no-code Design workspace to create reusable desktop actions that AI agents can execute. You can visually create and simulate application interactions, such as clicks, text entry, and extraction that mimic human behavior using screen and UI element recognition.
- When you test a desktop action, the system automatically launches the Execution workspace in an isolated desktop session. You do not open or manage the Execution workspace directly.
- Activate your desktop actions from the Design workspace so that AI agents can use them as tools in AI Agent Studio.
- Create AI agents by providing simple text instructions in AI Agent Studio.
- Add your designed desktop actions as tools to your AI agents.
- Verify your AI agents function correctly with their integrated tools.

For more information, see Defined desktop actions in AI Desktop Actions and Creating AI agents and adding desktop action tool.

AI Desktop Actions capabilities

Design desktop actions

- Create, configure, and manage reusable desktop actions with application metadata.
- With the Recorder feature, automatically record and capture user interactions and contextual information while you perform actions on desktop applications. You can record with AI for accurate anchor insertion and generating screen context.
- Additionally, manually capture screens, define UI interactions, and structure steps in a no-code Design workspace.

Run in the background

Enable silent and non-intrusive execution of agent tasks, supporting uninterrupted user workflows.

Support for diverse applications on Windows

Automate tasks across a wide variety of environments and UI types, including legacy systems, thick client applications, and web applications on Windows operating system.

Core desktop capabilities

Support common desktop actions such as form filling, application clicks, and OS file handling.

Performance

Supports automations with native integration to AI Agent Studio.

Seamless integration

Publish configured desktop actions directly to AI Agent Studio for easy access and deployment.

Important: Access to the Design workspace and Execution workspace depends on the user's role.

- When users with the AI Agent Admin (sn_aia.admin) role sign in from their desktop, they can access the Home page and Design workspace to create desktop actions. When they test a desktop action, the Execution workspace launches automatically.
- When users with the ServiceNow Otto panel user (now_assist_panel_user) role trigger an automation from the ServiceNow Otto panel, the Execution workspace launches automatically to run the desktop action.

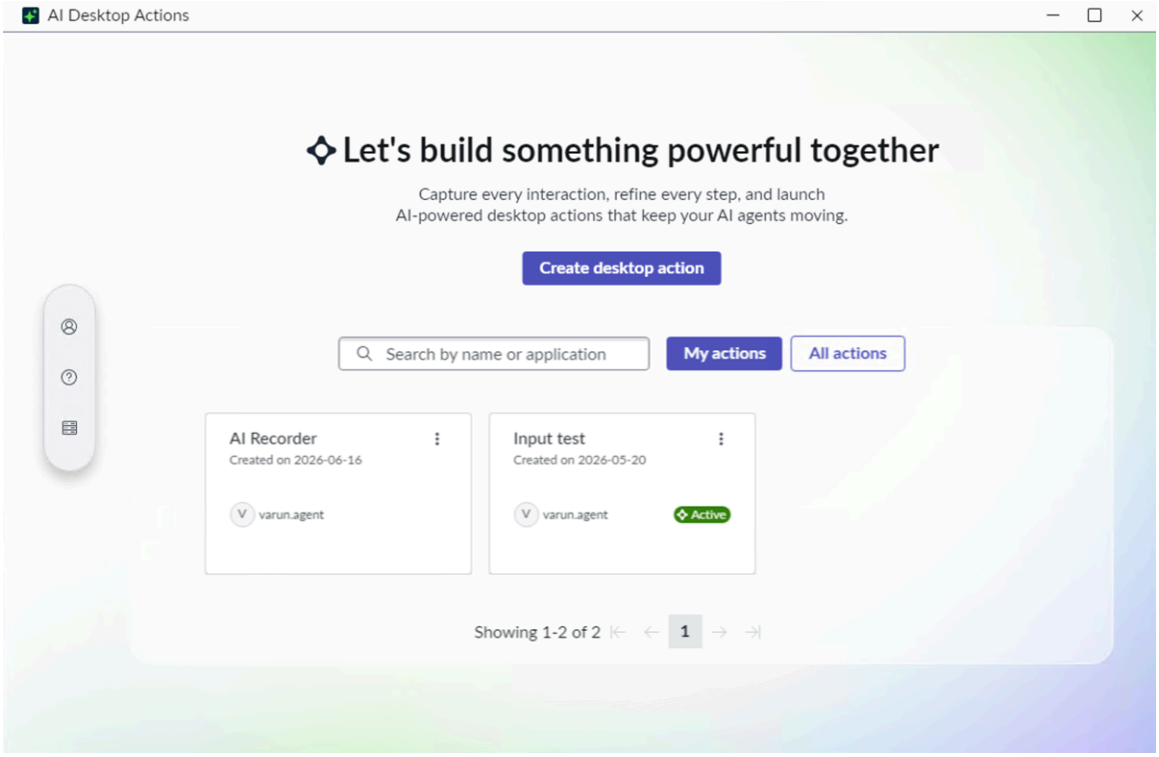
You don't open the Execution workspace directly. It launches automatically when you test or run a desktop action.

AI Desktop Actions home page

The home page provides an intuitive interface to help you quickly create, track, and manage your desktop actions. You can easily find and manage your existing desktop actions and monitor their status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Desktop Actions home page



When you log in to AI Desktop Actions, the home page is the first screen you see. The home page lets you interact with various functionalities.

Create desktop action

You can create desktop actions by manually capturing steps or auto-capture steps through recording.

Search and manage actions

You can search for specific actions and manage them directly from the home page.

My Actions and All Actions

My Actions tab shows only the actions published by the logged in user. **All Actions** tab shows list of all actions available on the instance the logged in user is connected to.

Desktop action cards

Configured desktop actions with details, such as created date, user who created, applications added, and activation status.

Edit desktop actions

You can modify a desktop action by selecting the **Edit** option for each card. Any changes you make are saved and reflected on the home page.

First-time user onboarding

When you open AI Desktop Actions for the first time, an onboarding wizard guides you through steps to create and activate a desktop action.

Select **Skip intro** to bypass the onboarding wizard and go to the home page. Select the **Don't show this again** option to prevent the wizard from appearing the next time you open the app. After completing the onboarding wizard, select **Get started** to start creating desktop actions.

Access to profile and documentation

A dedicated section enables you to view your profile information,

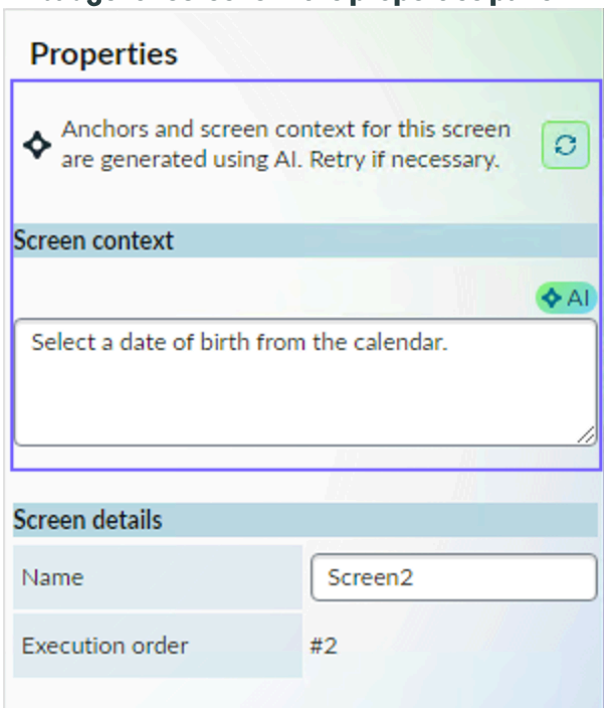
What AI generates after recording

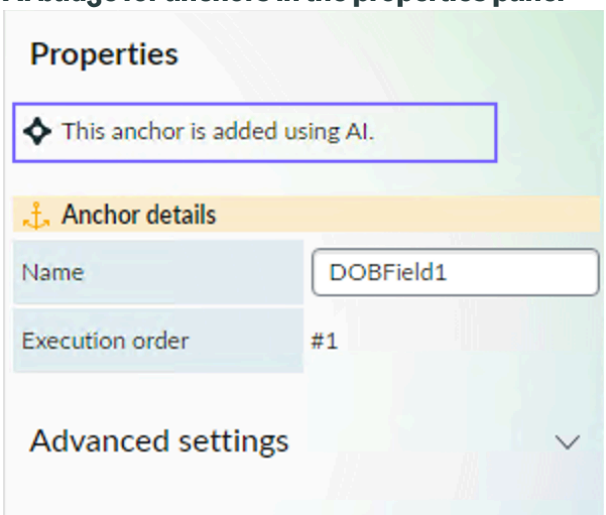
When you use record with AI option, AI badge, AI analysis retry option, and screen context are shown in the properties panel for each screen. If you aren't satisfied with the results, you can regenerate anchors and screen context by selecting **Retry** .

AI badge for screens in the properties panel



An AI badge appears for each anchor generated using AI.

AI badge for anchors in the properties panel



AI Desktop Actions Design tab

The Design workspace provides a no-code environment for creating, managing, and testing your desktop actions. You can either auto-capture or manually record a series of steps you perform on your computer, such as clicking buttons, entering text, selecting from drop-down, or interacting with different applications. You can then save this sequence as a reusable desktop action.

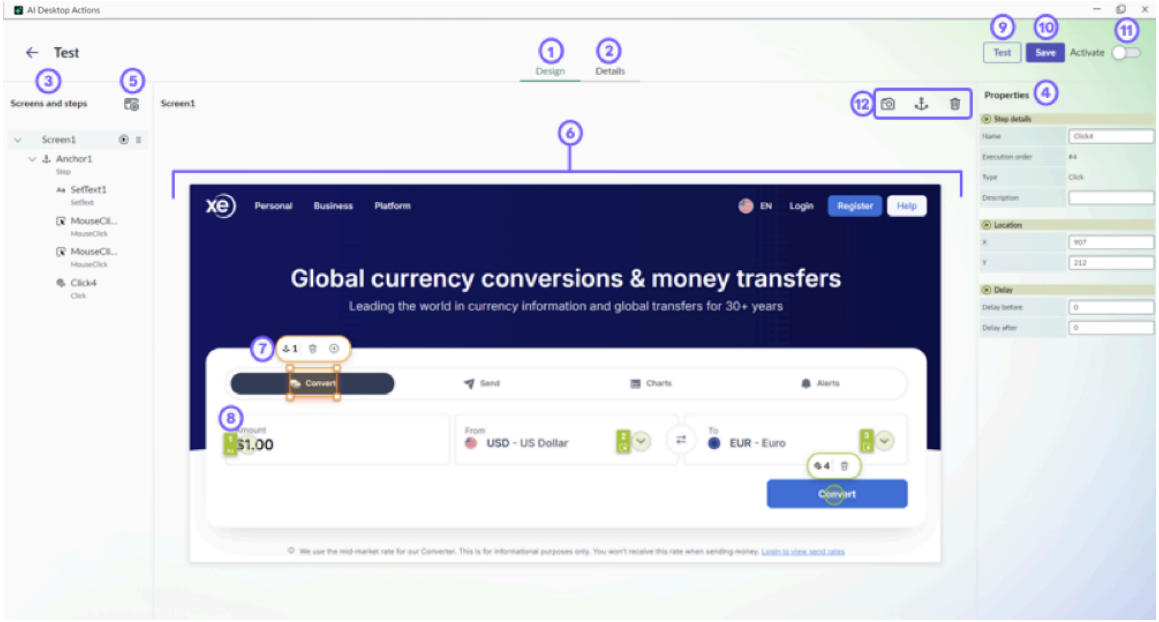
Design tab



No.	Element	Description
1	**Design** tab	Enables you to design your desktop actions by adding screens, anchors, and steps.
2	**Details** tab	Enables you to add details to your desktop actions, such as name, description, and applications that this desktop action interacts with. You can also review the inputs and outputs of this desktop action.
3	**Screens and Steps** panel	Shows all the captured screens and added anchors and steps in a sequence the desktop action must perform them. You can drag and move these items to change the order. You can also run a screen-level test by selecting the Run screen test icon .
4	**Properties** panel	Enables you to configure the properties for screens, anchors, and steps.
5	**Capture options**	Provides two options for capturing interactions with applications that you want to automate. • **Auto-capture steps**: Automatically records the steps that you perform for the task that you want to automate. • **Manual capture screens**: Enables you to capture the screens manually, insert anchors, and add steps that you want to automate.
6	Captured screen	The application screen that you captured. You can delete any screen by selecting the **Delete** icon from the Screens and steps panel.
7	**Anchor**	An anchor is a reference point on the screen that helps the automation identify and interact

Related topics

- Defined desktop actions in AI Desktop Actions
- Automate repetitive tasks by auto-capturing steps in AI Desktop Actions
- Extend a desktop action by manually capturing steps in AI Desktop Actions
- Example: Automate badge request management using AI Desktop Actions
- Example: Automate shipping management tasks using AI Desktop Actions
- Screen, anchor, and step properties in AI Desktop Actions

Action recorder in AI Desktop Actions

With Action recorder, you can capture steps to automate repetitive tasks in AI Desktop Actions. You can save the steps that you perform on application elements as a reusable desktop action.

Action recorder helps you record your interactions with desktop applications to create automated workflows. By recording steps, you can automate tasks that replicate your interactions. The recorded actions are displayed as screenshots in the Design workspace with anchors and steps automatically added.

The recorder captures the following items:

- Visual snapshots of your screen at key interaction points.
- Steps in the form of the buttons, fields, and other interface components you interact with.

Record with AI

Record with AI is the recommended way to create desktop actions. Record with AI generates more accurate anchor positions automatically, reducing the time you spend on manual anchor adjustments.

When you record with AI, after you finish recording, AI analyzes the recording, validates anchor positions, and corrects inaccuracies before you save or activate the action. AI also generates a screen context for each captured screen and description for the desktop action. Screen context is a description of what the screen does and what it contains, which helps reviewers and AI agents understand the screen's intent.

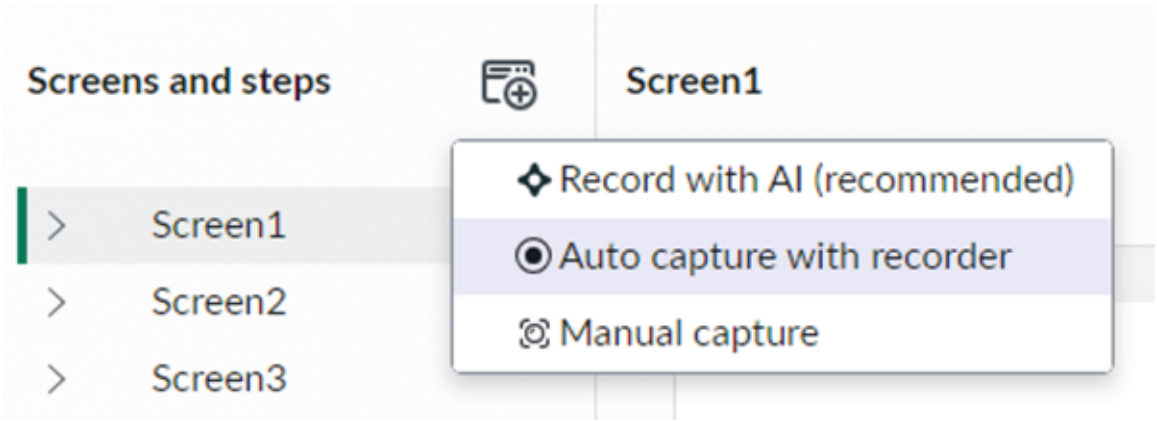
After AI processing completes, a confirmation banner appears: `AI analysis complete. Verify AI generated anchors and screen contexts before continuing.` Review and refine the AI-generated anchors and screen contexts before activating the action.

> **Important:** Record with AI feature requires the ServiceNow AI Lens skill to be active on your instance and you must have the sn_desktop_core.desktop_action_user role. If these conditions aren't met, the **Record with AI** option is unavailable. Contact your ServiceNow administrator for help.

Capture modes

You can select a capture mode from the **Capture options** menu in the **Screens and Steps** panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Record with AI (recommended)

Records your interactions by capturing screens and adding steps and uses AI to automatically validate anchor positions and generate screen contexts at design time, reducing the risk of automation failures at runtime.

Auto capture with recorder

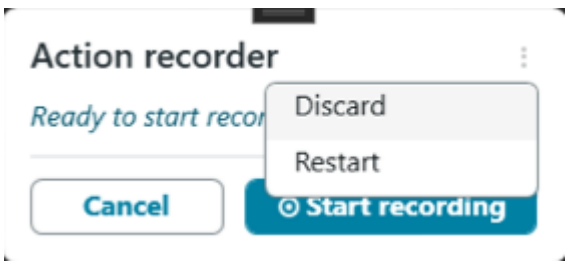
Records your interactions automatically and adds anchors and steps without AI processing.

Manual capture

Captures screens without automated recording, giving you full control over what is captured.

Recorder controls

You can select any of the following options from the **More options** menu on the Action recorder panel:



- **Start recording**: Start recording the steps
- **Pause**: Skip recording steps
- **Restart**: Restart recording the steps
- **Discard**: Discard the recording if it doesn't meet your needs
- **Stop recording**: Stop recording steps

Each step that you perform is captured sequentially and the type of UI action is displayed for each step. For example, Capturing Mouse Left Click event.

Limitations

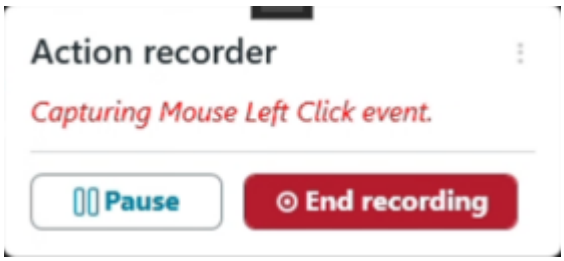
Scrolls performed using a laptop touchpad aren't captured.

Tips for accurate recording

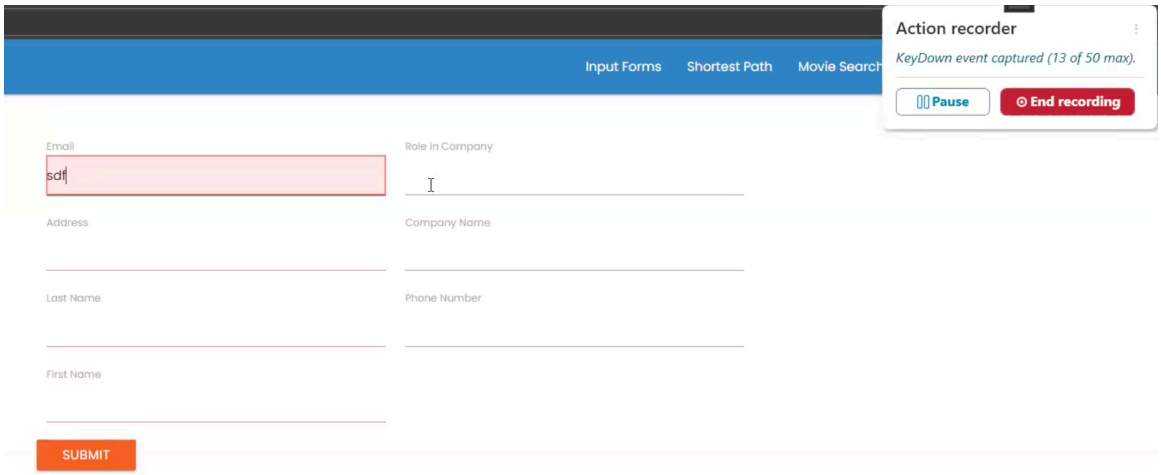
Follow these tips to improve the accuracy of your recordings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Before performing any action, ensure the highlighter is visible on the target control. Recording too quickly may prevent the recorder from capturing the action sequence correctly.
- Avoid performing steps too quickly. When the message in the Action recorder panel appears in red, wait for the recorder to finish processing the current step before continuing.



Proceed with the next step when the red highlight box appears around the element you interact with and the message in the Action recorder panel changes to blue.



- Temporarily hovering components, such as drop-downs, multi-select fields, reference fields, and date pickers may not always be captured during recording, or may generate inaccurate anchors. Review the recording after completion and recapture any affected steps as needed.
- When selecting check boxes or radio buttons, click as close to the center of the control as possible to avoid activating areas outside the intended element.
- Scrolling the page or hovering over a field may result in inaccurate anchors. Avoid both while recording.
- Perform scrolls in small increments, one scroll at a time, so the recorder captures each scroll action accurately.
- On the desktop home screen, the system may select the Windows icon instead of the Chrome icon as the anchor due to differences in the desktop layout between the main and inset user sessions. Verify that the correct icon is selected after recording.
- In rare instances, latency between capturing a screenshot and retrieving control details may cause an anchor to reflect an element from a subsequent screen rather than the intended one. If this occurs, recapture the affected screen.

How screens are captured

During recording, the steps that you perform are captured as screens. Related steps are captured in the same screen, for example, the steps related to filling in the text fields in the same window. A new screen is captured in the following conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Window is changed
2. Button is clicked or option is selected that might change the layout
3. Page is scrolled
4. Special keyboard keys are used, such as Enter or Tab

This helps maintain the correct screen context and reliable automation replay.

You can capture a maximum of 50 steps using the recorder in a recording session. While auto-capturing steps, a counter displays the remaining number of steps you can capture (for example, "35 of 50 max"). Recording stops automatically after you capture 50 steps. If you need to capture additional steps, start a new recording session. The new recording adds screens and steps to those captured in the previous recording.

AI Desktop Actions Execution workspace

Execution workspace enables you to test, run, and monitor your desktop actions. It enables you to observe how your automations interact with desktop applications, including handling situations where human input is needed.

Important: Access to the Design workspace and Execution workspace depends on the user's role.

- When users with the AI Agent Admin (sn_aia.admin) role sign in from their desktop, they can access the Home page and Design workspace to create desktop actions. When they test a desktop action, the Execution workspace launches automatically.
- When users with the ServiceNow Otto panel user (now_assist_panel_user) role trigger an automation from the ServiceNow Otto panel, the Execution workspace launches automatically to run the desktop action.

You don't open the Execution workspace directly. It launches automatically when you test or run a desktop action.

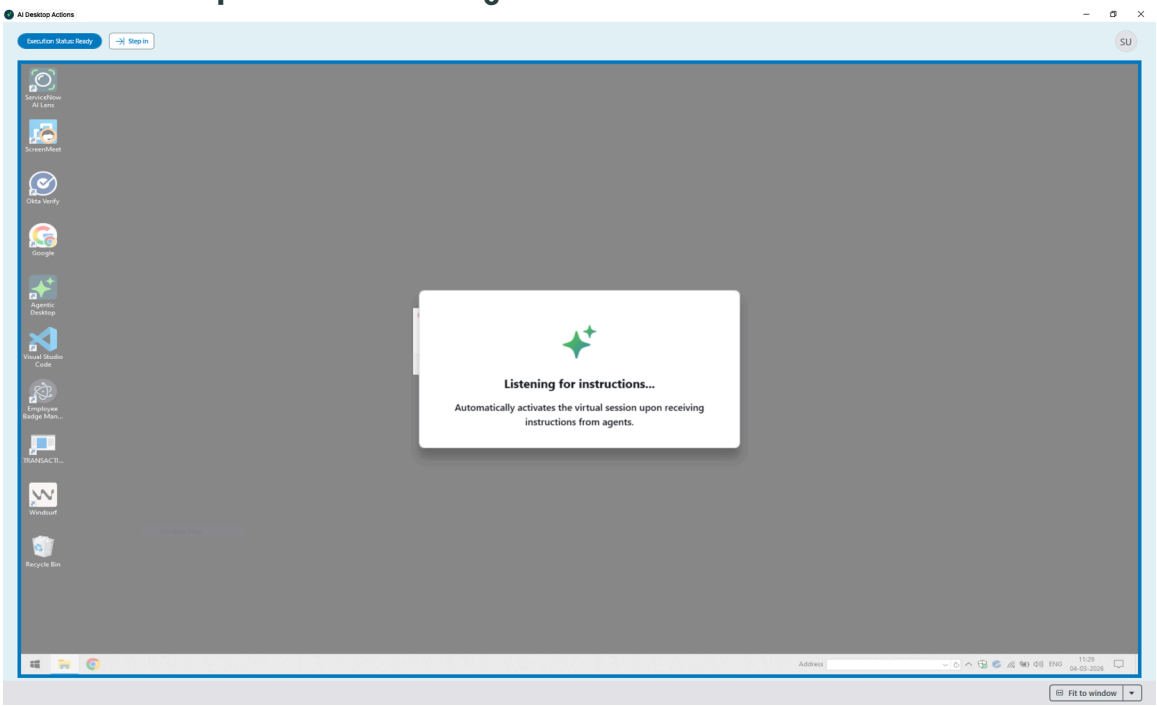
This session acts as a virtual environment where the automations run in isolation. While desktop actions run in the Execution workspace, you can continue working on other desktop tasks.

Note:

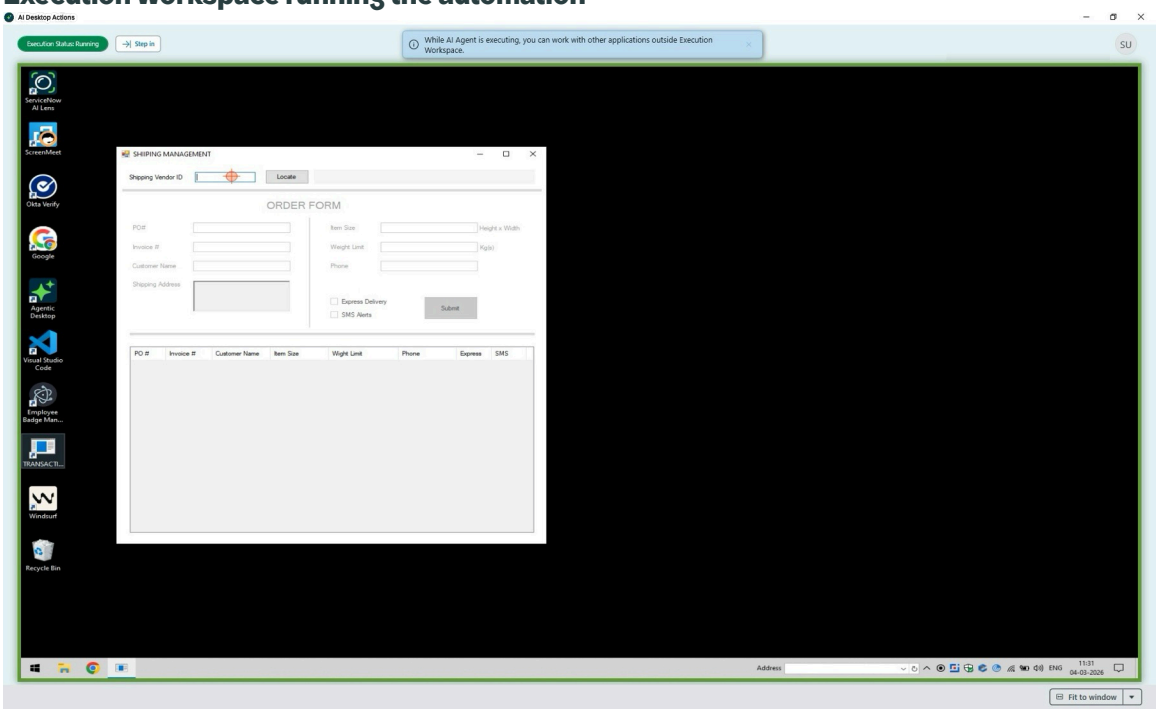
To avoid conflicts, don't run the AI Desktop Actions Execution workspace and RPA Attended Desktop mode at the same time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution workspace before executing automation



Execution workspace running the automation



Execution workspace features

Execution workspace offers the following features:

Desktop-in-Desktop (DiD) mode

A virtual environment where your automation executes. You can monitor the execution of your desktop actions and how they interact with desktop applications.

Step in/Step out

You can manually take control to provide an input by selecting **Step in**. Once done, you can leave the control by selecting **Step out**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions the AI Agent to wait for user input during execution. Otherwise, the automation cannot proceed.

Single execution

The system supports one automation execution at a time within the workspace.

Smart sizing

Smart Sizing enables your desktop sessions automatically adapt to your display. This ensures each captured desktop session is fully visible, readable, and usable, regardless of the device resolution and scaling.

Fit to window: Automatically scales the desktop session to fit within the Execution workspace while keeping it fully visible and readable.

Original resolution: Displays the desktop session at its original resolution. Scroll bars appear if the desktop session is larger than the Execution workspace.

Execution statuses

Execution workspace shows the following statuses throughout the execution process.

Execution status	Description
Ready	Automation execution is ready to be initiated. The workspace is waiting for instructions from AI Agent Studio.
Initiated	Automation execution is initiated. The workspace has received the execution plan from AI Agent Studio. **Note:** When you launch Execution workspace for the first time, it takes longer to move to the Running state because it is setting things up for you.
Running	Automation execution is running. The workspace executes the steps defined in the desktop actions.
Success	Automation execution is completed successfully. The workspace executed the steps defined in the desktop actions and the outcome is shown on the ServiceNow Otto panel, such as the automation execution completed successfully and incident created successfully.
Failed	Automation execution is failed. The workspace couldn't execute the automation due to an error.
Canceled	Automation execution is canceled. The user canceled the execution manually.

When to use adaptive vs. defined path desktop actions

Use this guide to determine which type of desktop action best fits your automation scenario before you begin configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are two types of desktop actions: defined path and adaptive path. Both enable AI agents to automate tasks on behalf of users, but they differ in how steps are executed, what applications they support, and how they handle variation in the user interface.

Key differences

Area	Defined path	Adaptive path
How steps are determined	You record a fixed sequence of steps in the AI Desktop Actions Windows application	The AI agent generates and adjusts steps dynamically based on a high-level goal you describe
Supported applications	Desktop applications, thick client applications, and web-based applications	Web-based applications and websites only
Environment	Runs on the Windows desktop	Requires Google Chrome and the ServiceNow Web Automation browser extension
Handles UI changes	Steps may fail if the application UI changes	Adjusts to changes in UI state at runtime
Handles conditional logic	Requires a separate desktop action for each conditional path	Evaluates conditions at runtime and determines the appropriate path
Result consistency	Consistent and repeatable — steps execute in the same order every time	Results may vary between runs due to the non-deterministic nature of AI
Configuration location	AI Desktop Actions Windows application and AI Agent Studio **Note:** Background task desktop actions can't be configured in AI Desktop Actions, but you can add them in AI Agent Studio as tools.	AI Agent Studio

Choose defined path when

Use defined path desktop actions for scenarios where the steps are known, fixed, and don't change between executions:

- The task involves a legacy desktop application or thick client that does not have an API or web interface. For example, automatically processing badge-related requests in a facilities management desktop application.
- The task follows the same sequence of steps every time, regardless of the data involved. For example, entering shipping data into a shipping management application using a fixed form structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Your organization requires predictable, auditable automation where every execution follows an identical sequence.
- The application runs on Windows and does not require a browser.

Choose adaptive path when

Use adaptive path desktop actions for scenarios where the steps can't be fully predicted in advance, or where the application UI may change between executions:

- The task is web-based and involves conditional logic. For example, the next steps depend on the outcome of a previous action, such as reviewing an incident record and routing it differently based on its current state.
- The web application updates its UI frequently.
- You want the AI agent to determine the most efficient path to complete a goal, rather than following a prescribed sequence.
- The task requires navigating multiple web pages or making decisions based on page content. For example, finding the latest invoice from a vendor portal and returning a summary.

When you aren't sure which to use

If your task is web-based and you're uncertain whether the steps always be the same, start with adaptive path. Adaptive path actions require less upfront design work and can handle variation that would cause a defined path action to fail. If you find that results are inconsistent and the task is always performed the same way, consider switching to defined path.

If your task involves a non-browser desktop application, defined path is your only option. Adaptive path requires Google Chrome and can't interact with applications outside the browser.

Note:

Defined path desktop actions can automate both desktop applications and web-based tasks. Adaptive path desktop actions support web-based tasks only and require Google Chrome with the ServiceNow Web Automation browser extension installed.

Supporting information for AI Desktop Actions

Get a quick overview of the important information that is related to the AI Desktop Actions application.

Supported versions

Support for adaptive desktop actions is added from Australia Patch 2.

Supported user interfaces

To design and run AI-powered desktop actions using ServiceNow AI agents, install the AI Desktop Actions application. For more information, see Configure AI Desktop Actions.

Licensing requirements

The AI Desktop Actions application requires a ServiceNow Pro Plus or Enterprise Plus license.

Application information

This app has the following dependencies:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI Desktop Actions Core (sn_desktop_core)
- ServiceNow Otto AI web agents (sn_naa)
- ServiceNow AI agents

Configure AI Desktop Actions

You can enable the AI Desktop Actions application if you have the admin role.

Before you begin

To get started with AI Desktop Actions, you must have:

- A ServiceNow Pro Plus or Enterprise Plus license.
- An instance on Australia Patch 2 or later.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.

Role required: administrator

About this task

AI Desktop Actions isn't a standalone store application that you can install directly. To enable AI Desktop Actions on your instance, you must install other generative AI applications, such as ServiceNow Otto for IT Service Management (ITSM) or ServiceNow Otto for Customer Service Management (CSM).

- Review the AI Desktop Actions application listing in ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Refer to the document to see the prebuilt skills that exist and are currently available for purchase in AI packages and to review the number of assists consumed.
- Perform these steps in your ServiceNow instance.

For more information about the components installed, see Components installed with AI Desktop Actions.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for and select a generative AI application, such as ServiceNow Otto for IT Service Management (ITSM) or ServiceNow Otto for Platform.
3. Select **Install**.

What to do next

Defined desktop action

Download and install the AI Desktop Actions installer on your system to automate repetitive tasks that involve fixed steps in your desktop and web environment. For more information, see Download AI Desktop Actions installer for defined desktop actions.

Adaptive desktop action

Install the Chrome browser extension and configure allowed websites to automate repetitive tasks that involve adaptive steps for web applications. For more information, see Install the Google Chrome extension for adaptive desktop actions and Configure allowed websites for adaptive desktop actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration for adaptive path desktop actions

Adaptive path desktop actions automatically adjust their behavior based on user context and system conditions. Configure these settings to optimize desktop action performance and user experience across different scenarios.

Install the Google Chrome extension for adaptive desktop actions

Install the ServiceNow Web Automation Chrome extension to the Google Chrome browser. The browser extension enables AI agents to interact with web applications during task execution.

Before you begin

- At least one AI agent that uses one or more adaptive desktop actions must exist in the ServiceNow® instance you plan to connect to.
- You must be logged in to your ServiceNow® instance.
- You must have permissions to install browser extensions in Chrome.

Role required: none

About this task

Follow the procedure to download and install the extension from the Google Chrome webstore. Install the Google Chrome browser extension on each device where you want to invoke an AI agent to automate tasks.

Using the ServiceNow Web Automation browser extension, an AI agent opens a browser tab to navigate to web applications.

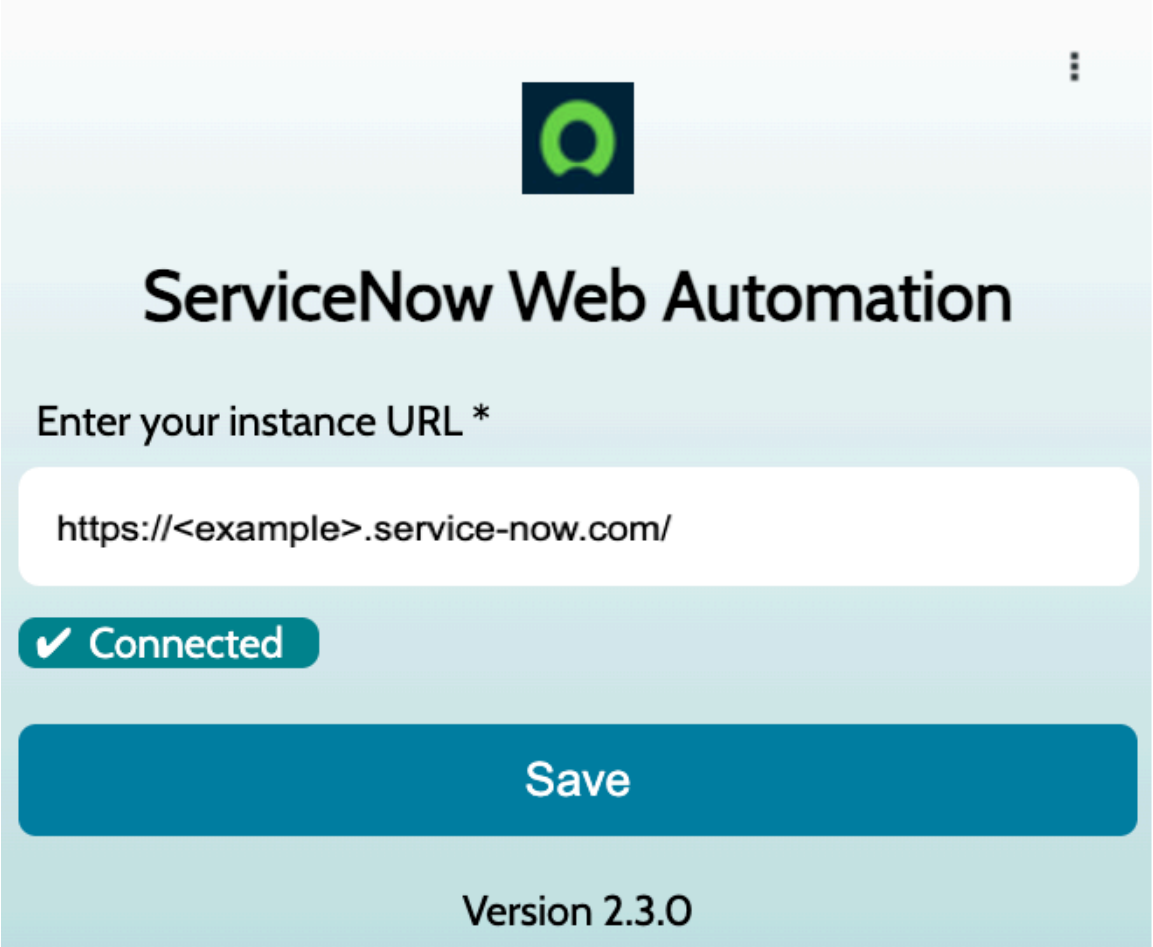
When you log out of the ServiceNow instance, the message `Disconnected` appears in the browser extension. This message also appears when any browser window to your instance is inactive. The extension must be connected for AI agents to interact with the web applications.

Note: Verify that you open only one tab with active ServiceNow® instance.

Procedure

1. Download the Google Chrome browser extension from the Google Chrome webstore by navigating to:
   https://chromewebstore.google.com/detail/servicenow-rpa-chrome-ext/bnaofpgjajbimmicdiipemhmheafhgkb
2. Select **Add to Chrome**.
3. In the Add ServiceNow Web Automation dialog, select **Add extension**.
4. In your Google Chrome browser address bar, enter `chrome://extensions/`.
5. Select **Details** on the *ServiceNow* **Web Automation** card, and then select the **Pin to toolbar** option.
   The extension icon appears in the Chrome toolbar.
6. Select the *ServiceNow* **Web Automation** extension icon in the browser toolbar.
7. In the **Enter your instance URL** field, enter the ServiceNow instance you want to connect to, in the format `https://<instance-name>.service-now.com/`.
   The confirmation message appears in the browser extension: `Connected`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Trouble?

Verify that you're connected to the ServiceNow® instance that has at least one AI agent that uses one or more adaptive desktop actions.

Note: If any browser windows were already open with the instance, you must reload the windows to connect successfully to the browser extension.

8. In the browser extension panel, select **Save**.

What to do next

After installing the browser extension, configure websites that AI agents can access for automating web tasks. For detailed instructions, see Configure allowed websites for adaptive desktop actions.

Configure allowed websites for adaptive desktop actions

Specify a list of websites that AI agents configured with adaptive desktop actions are permitted to open and perform tasks.

Before you begin

Set your application scope to ServiceNow Otto AI web agent.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

AI agents configured with adaptive desktop actions perform tasks on web applications or websites. You can control the websites that AI agents access by updating a system property, *sn_naa.allowed_websites*. This system property allows access to all websites, with a single asterisk (*) as the default value. When you enter a list of allowed sites, the AI agents are restricted to only the sites in the list.

Note: AI agents operate through the browser extension, which means they can only access content within the browser and are unable to interact with desktop applications or other local files, except for downloading files. The AI agents can't access the downloaded files as well from the desktop. Use defined desktop actions for uploading data from the local system.

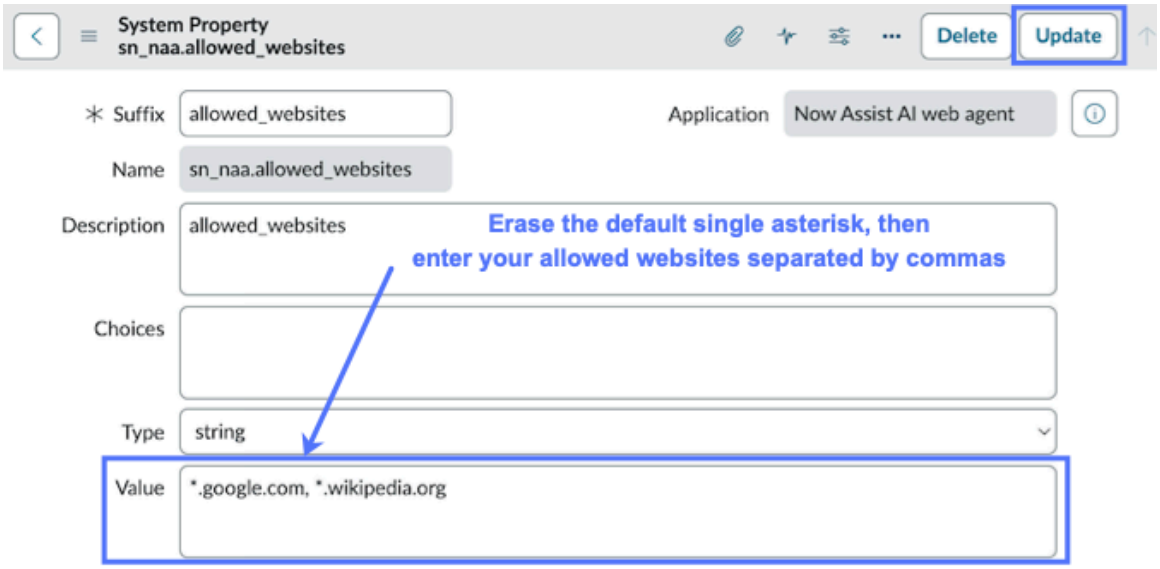
When configuring an allow list, include your organization's websites. Work with your stakeholders to determine which websites to include. If an AI agent tries to access a website not on the allow list, the system stops the request and displays an error message. An AI agent can open websites defined in tool actions that aren't on the allow list. However, the AI agent can't perform any actions on those websites.

Note: The AI agent checks its access to the internet by first opening the Google website. If the AI agent isn't allowed to open the Google website, it can't proceed with its task. Be sure to include `google.com` or `*.google.com` in the allowed list.

Procedure

1. Navigate to **All**.
2. In the filter navigator, enter `sys_properties.list`.
3. In the System Properties table, search and select the *sn_naa.allowed_websites* property.
   The System Property form opens.
4. In the **Value** field, delete the single asterisk (*) and enter the websites that you want to allow for AI agents to access.
   The following guidance apply:
   - Separate the websites using commas (comma-separated list).
   - Enter websites as hostnames without protocols, such as `example.com`.
   - Allow all subdomains on a website by using an asterisk. The format `*.example.com` allows abc.example.com, xyz.example.com, and so forth.
   - Be sure to include access to Google website by entering `google.com` or `*.google.com`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Update** to save your changes.

What to do next

- Create an AI agent
-
-

File upload and download in adaptive desktop actions

Upload files to web forms and track file downloads during automated browser tasks. The agent validates file safety, confirms the target field with the reasoning model, and escalates to the user when it can't proceed safely.

Important:

Generative AI may produce inaccurate or incomplete information. Always validate AI-generated content.

Overview of the feature

Previously, a file could not be downloaded from or uploaded to a browser when using adaptive desktop actions. The tasks that required attaching a document or had a downloadable output were impacted. Now, these issues are resolved.

Key benefits

This functionality provides the following benefits:

- Completes tasks that require attaching a document, such as uploading a file to a form or a ticket.
- Completes tasks that produce downloadable output, such as exporting a report.
- Confirms upload success or failure with an actionable reason, instead of assuming the result.
- Reuses a file downloaded earlier in the same task as the input to a later upload step.
- Hands off to a the user when the agent can't proceed safely, rather than guessing or retrying indefinitely.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Considerations

- A downloaded file's path carries forward automatically only within the same task session. If the upload happens in a different session, the agent asks the user for the file path instead of guessing.
- Blocked file types and download status values are listed in the file transfer reference.
- Automated downloads require Chrome configuration. For more information, see Configure Chrome to download files automatically.

Related topics

Configure Chrome to download files automatically

Considerations for file upload and download

Configure Chrome to download files automatically

Configure Chrome so that the files can automatically complete downloads without manual intervention, and each download's status and path can be tracked automatically.

Before you begin

Role required: none

About this task

The agent needs to detect when a download completes and capture the resulting file name and path. Chrome's default behavior is to prompt the user to choose a save location for every download. This blocks the detection. Turning off the default behavior enables the agent to save the downloaded file automatically and track it.

Procedure

1. Enter `chrome://settings/downloads` in the Chrome address bar, and press **Enter**.
2. Turn off the **Ask where to save each file before downloading** option.

Result

The files get downloaded automatically without any prompt. The Web agent extension can now detect each download's completion and report its status and file path to the reasoning layer.

Related topics

File upload and download in adaptive desktop actions

Considerations for file upload and download

Credential and dynamic parameter management

Logs in automatically when a goal references stored credentials configured for a website, without exposing sensitive values in chat or asking you to provide the input.

Key benefits

This functionality provides the following benefits:

- Skips manual login steps for websites that already have stored credentials configured.
- Keeps sensitive values, such as passwords, out of the chat and out of the agent's plan.
- Falls back to manual login when credentials aren't configured, so the task can continue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How it works

If your goal doesn't reference stored credentials, or references credentials that aren't defined for the website, the agent asks you to log in manually:

1. The agent prompts you to log in.
2. Switch to the website's browser window and log in.
3. Confirm in chat so the agent can continue.

If your goal references stored credentials, the agent logs in automatically with dynamic parameters already configured for that website:

1. The agent retrieves the corresponding values from the stored credentials.
2. The agent enters the values on the website's login page. You don't need to provide anything in chat.

Sensitive value handling

- Values marked as sensitive in the stored credentials are never displayed, in chat or elsewhere.
- Non-sensitive values, such as a username, might appear as part of the agent's plan.

Considerations

- To use stored credentials, an administrator must first define them as desktop action parameters. For more information, see Enable AI agents to securely access parameters in AI Desktop Actions.
- To trigger automatic login, phrase your goal in such a way that it explicitly references the stored parameter names, as shown in the following examples.
  - Go to https://www.example.com/ and authenticate using parameter 'user_name' and parameter 'password'.
  - Open https://www.example.org/ and log in with stored 'user_name' and stored 'password', then select Transactions.
  - Open https://www.example.net/ and log in using username from reference 'user_name' and password from reference 'password'. Then navigate to 'Task List', remove any filters, choose Pending status, and select Save.

Related topics

Enable AI agents to securely access parameters in AI Desktop Actions

Configuring AI Desktop Actions for adaptive desktop actions for desktop and web

Adaptive desktop actions adjust their execution based on user context and system conditions. Configure these settings to optimize desktop action performance and user experience across different scenarios for desktop and web-based tasks.

Download AI Desktop Actions installer for adaptive desktop actions

Download and install the AI Desktop Actions installer on your macOS machine for running adaptive desktop actions.

Before you begin

- This task must be completed in the ServiceNow instance.
- Administrator privileges are required to install the AI Desktop Actions installer on the macOS system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_aia.admin or now_assist_panel_user

Procedure

1. Navigate to **All** > **AI Desktop Actions** > **Downloads**.
2. On the AI Desktop Actions Downloads page, do any of the following actions to download the required application for macOS:
   - Select the download icon ( ).
   - Select the copy link ( ). In a browser, right-click and select the **Paste and go** option.

   The system might prompt you to save or open the file.
3. Run the application installation file (.pkg file).
4. Follow the onscreen instructions to complete the installation.

   AI Desktop Actions is installed for all users by default, but you can choose to install it for your account only or specify a disk location during setup.

What to do next

- Configure policies and rules to control access to various resources. For more information, see Controlling what AI Desktop Actions can access.
- Use AI Desktop Actions to run adaptive desktop actions for desktop and web. For more information, see Execute adaptive desktop actions for desktop and web.

Controlling what AI Desktop Actions can access

Control which desktop resources, such as files, folders, websites, and applications, AI Desktop Actions can access within your organization.

Create policies for defined user criteria and resource access rules to enforce consistent resource restrictions across your organization.

Key concepts

Policy

Collection of resource access rules that applies to a specific user group or set of users based on defined user criteria. Only active policies are enforced. For example, a "Finance Team Policy" restricts AI agents from accessing payroll documents.

Resource access rule

A specific rule that controls access to one type of resource, such as a file, folder, website, or application. Each rule specifies the resource type, match pattern, access level (allow or deny), and permissions. Rules can be reused across multiple policies.

Policy-rule mappings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mappings that connect policies to the resource access rules they enforce. One policy can link to multiple rules, and one rule can be linked to multiple policies. When you update a rule, the change applies everywhere it is linked.

User criteria

The condition that determines which users are subject to a policy. User criteria typically reference group membership, department, role, company, or other user attributes. For example, "members of the Finance group" or "users assigned to the Accounting role."

Resource type

The category of resource being controlled: File, Folder, Website, or Application. Each resource type has specific field options, match types, and value formats.

Resource types and details

Resource type	Details
File	• **Match type**: Exact, Wildcard • **Value**: File path using forward slashes (for example, `username/documents/report.pdf`) • **Permissions**: Read, Create, Update, and Delete • Wildcard examples: ○ `**/*.pdf` — All PDF files anywhere ○ `**/*.log` — All log files anywhere ○ `/documents/**/*.xlsx` — All Excel files in the documents folder and subfolders ○ `/tmp/**` — All files in the tmp folder and subfolders
Folder	• **Match type**: Exact, Wildcard • **Value**: Folder path using forward slashes (for example, `/payroll`) • **Permissions**: Read, Create, Update, and Delete • Wildcard examples: `/private/**` — Private folders and all contents
Website	• **Match type**: Exact, Wildcard • **Value**: Domain name (for example, `github.com`, `*.internal.company.com`) • **Permissions**: Not applicable • Wildcard examples: ○ `*.servicenow.com` — All ServiceNow subdomains ○ `github.com` — Exact domain match

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource types and details (continued)

Resource type	Details
Application	• **Match type**: Not applicable • **Value**: Application name as seen in the Application folder (for example, `chrome`, `python`, `Microsoft Excel`) • **Permissions**: Not applicable

How it works

When a user begins a task, the system checks which active policies apply to that user based on user criteria, such as group membership. The system then uses the combined active resource access rules from all applicable policies to determine which resources the AI agent can access.

1. When user logs in, the system identifies the user and their applicable policies based on user criteria.
2. When the user provides a task, all active resource access rules from the user's applicable policies are retrieved.
3. Before accessing any resource: file, folder, URL, application, the system checks whether the resource is permitted by the resource access rules.
4. If a resource is restricted by any policy, the AI agent stops execution.
5. If a resource is permitted by any policy, the AI agent automatically executes the task.

Default policy and rules

The following policy and rules are available by default with installation of the AI Desktop Actions application.

Default policy and rules

Name	Type	Description
Default Desktop Actions Policy	Policy	Default desktop actions policy with standard resource access rules
Allow ServiceNow	Rule	Allow access to ServiceNow websites
Allow Calculator	Rule	Allow access to Calculator application
Allow Text Files	Rule	Allow access to text files
Allow Downloads	Rule	Allow access to Downloads folder
Deny Terminal	Rule	Deny access to Terminal application
Deny Run Shell Script	Rule	Deny access to Run Shell Script application
Deny Automator	Rule	Deny access to Automator application
Deny Script Editor	Rule	Deny access to Script Editor application

If you need AI Desktop Actions to access one of these apps for a specific task, you can update the resource access rules to allow these applications.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning: Restricted applications can execute system-level commands and scripts that aren't available through the graphical interface. If the AI agent proposes an alternate plan that involves restricted applications, review the plan carefully before granting access. After the task completes, revert access to Deny.

Policy evaluation order

When AI Desktop Actions needs to access a resource, policies are evaluated in this order.

The system collects all active policies where the current user matches the user criteria, then gathers all active resource access rules linked to those policies. If any rule explicitly denies access to the resource, access is refused — Deny takes precedence. If any rule explicitly allows access, access is granted. If no rule matches, the user is prompted during execution to allow or deny access to the resource for that task. For security-sensitive resources, create explicit rules rather than relying on runtime prompts.

Common use cases

Protect sensitive files

Create a "Restricted Files" policy that denies AI agent access to payroll folders, HR documents, or financial records. Apply the policy to the Finance group.

Limit external website access

Create a policy that allows access only to company-internal websites. Apply it to the IT Operations group.

Control application access

Create a policy that restricts access to applications outside an approved developer toolset to avoid accidental launches of unknown or untrusted applications.

Role-based automation

Create separate policies for different roles, such as HR, Finance, Operations, with resource restrictions appropriate to each role's responsibilities.

Temporary restrictions

Temporarily deactivate a policy during maintenance, then reactivate it when complete. Deactivated policies aren't enforced.

Known policy behaviors and limitations

Multiple permission prompts for same resource

If a resource is not explicitly declared in a rule, the AI agent may ask for permission multiple times for the same resource during a single goal. This is expected behavior when no rule matches a resource.

The system checks each resource access independently. For operations such as Read, Write, Update, and Delete on the same resource, each operation may trigger a prompt if no rule covers that specific operation.

Create explicit Allow or Deny rules for resources your organization uses frequently. Use wildcard patterns to cover resource categories efficiently. For example, instead of creating separate rules for each URL, use a wildcard pattern like `*.internal.company.com` to allow all internal company subdomains in one rule.

Denied applications take precedence

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If any policy rule explicitly denies access to a resource, that Deny decision takes precedence over any Allow rules. The AI agent can't access the resource, regardless of other permissions.

Verify that your Allow and Deny rules are carefully balanced. A broad Deny rule overrides more specific Allow rules.

Default allow behavior when no rule matches

If no policy rule matches a resource, the AI agent prompts you for access during execution. This provides flexibility but may leave sensitive resources unprotected if not explicitly restricted.

Use a default-deny approach: create explicit Allow rules for resources you want AI agents to access, rather than relying on implicit allow for unspecified resources.

Related topics

Create a desktop action policy

Create a desktop action access rule

Known issues and limitations of adaptive desktop actions

Create a desktop action policy

Desktop action policies control which users are subject to resource access rules. Configure a policy to define the user criteria and link the rules that govern automated resource access.

Before you begin

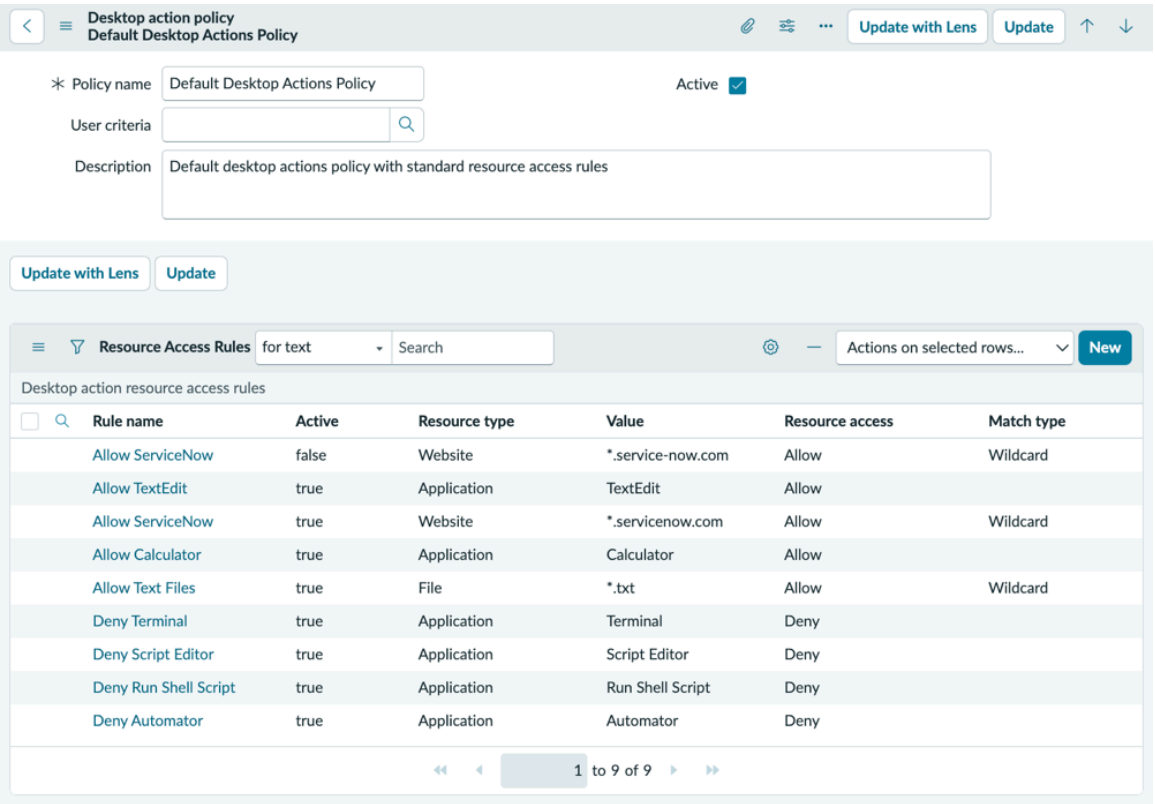
This task must be performed in the ServiceNow instance.

Role required: sn_aia.admin

About this task

The Desktop action policy form includes the following fields and the Resource Access Rules related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **AI Desktop Actions** > **Desktop Action Policies**.
2. Select **New**.
3. On the Desktop action policy form, fill in the fields.

Field	Description
Policy name	A descriptive name for the policy. Use concise, role-specific or function-specific names so administrators can identify the policy's purpose. Example: Finance Team Policy, IT Operations Policy, Sales Read-Only
Active	Option to enforce the policy. Only active policies are applied to the users. Deactivated policies are stored but not enforced. **Note:** You must add at least one resource access rule to the policy before activating it. To use an existing rule: Save your policy first, then navigate to the Resource Access Rule record and link this policy from its Policies related list. This saves you from recreating the same rule. Once linked, return to the policy and activate it.
User criteria	Defines users who are subject to this policy. Supports Users, Groups, Roles, Departments, Locations, Companies, and Match All. When left blank, no restriction is applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Example: "members of Finance group" or "users assigned to Accounting role" or "users in Marketing department"
Description	Description of the policy explaining the policy's purpose, affected resources, and rationale. Example: "Restricts automated access to payroll, HR records, and financial reports for non-Finance users. Finance team members can manually access these resources when needed."

4. From the form header, select **Save**.
5. Add rules to the policy.
   You can either create rules for this policy or link existing rules. Rules can be linked to multiple policies, so you can reuse rules across different policies.
   - From the Resource Access Rules related list, select **New** to create a resource access rule. For more information, see Create a desktop action access rule.
   - To link an existing resource access rule, navigate to the Resource Access Rule record. On the Policy related list, select **Edit** to add the policies to link to this rule. For more information, see the step for linking policy.
6. On the Desktop action policy form, select **Active**.
7. Select **Submit**.

Create a desktop action access rule

Configure rules to enforce security boundaries for AI agents in your organization. Resource access rules define which files, folders, websites, and applications AI Desktop Actions can access.

Before you begin

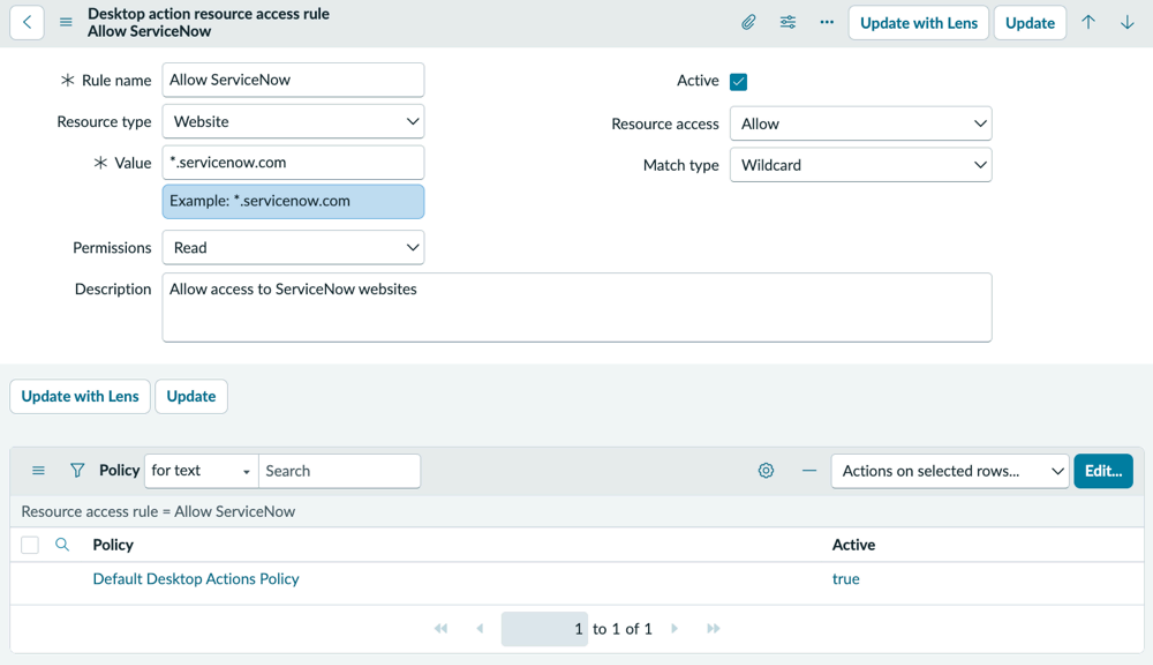
This task must be performed in the ServiceNow instance.

Role required: sn_aia.admin

About this task

The Desktop action resource access rule form includes fields for configuring the rule and a Policy related list for linking the rule to policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information about the default resource access rules available with the installation of the application, see Default policy and rules.

Procedure

1. Navigate to **All** > **AI Desktop Actions** > **Desktop Action Access Rules**.
   Access rules can also be created from the related list of a policy record, which links the rule to that policy.
2. Select **New**.
3. On the Desktop action resource access rule form, fill in the fields.

Field	Description
Rule name	A descriptive name for the rule. Keep names specific to the resource or restriction so rules are easy to identify when linked to multiple policies. Example: Restrict Payroll Folder, Allow GitHub, Block Excel Files
Active	Option to enable or disable the rule. Only active rules are evaluated during policy checks.
Resource type	The type of resource this rule applies to: ○ File ○ Folder ○ Website ○ Application This determines which match type and permission options are available.
Resource access	Whether the rule permits or blocks access: ○ **Allow**: AI agent can access the resource. ○ **Deny**: AI agent can't access the resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Deny rules take precedence over Allow rules. If any rule explicitly denies access to a resource, the agent can't access it, regardless of any other Allow rules. If no rule matches a resource (neither Allow nor Deny), the AI agent prompts the user for the access during execution. To enforce strict security, create explicit Allow rules for only the resources AI agents should access. Example: If you have an Allow rule for `*.xlsx` (allow Excel files) and a Deny rule for `/payroll/**` (deny payroll folder), the AI agent can access `/documents/report.xlsx` but can't access `/payroll/report.xlsx`.
Value	The resource identifier (path, URL, or app name) to match against. The format depends on match type and resource type. Example: /payroll/*, *.github.com, chrome, */Documents/*.pdf
Match type	Match types determine how the Value field is compared against actual resources on the user's system: ○ **Exact**: The value must match exactly (case-sensitive). Use for precise, single-item restrictions. Example: Value: `/payroll/salaries.xlsx` matches only that exact file, not `/payroll/salaries.pdf` or `/payroll`. Value: `github.com` matches only that exact domain. ○ **Wildcard**: The value must match with patterns using wildcards. Use `*` to match any characters at the current level (single directory or domain part). Use `**` to match any characters recursively across multiple directory levels. Works for file paths, folders, application names, and website domains. Example: Value: `**/*.log` matches `/tmp/app.log`, `/var/logs/app.log`, and any .log file anywhere. Value: `*.github.com` matches `api.github.com`, `user.github.com`, but not `github.io`. **Note:** This field does not apply to the Application resource type.
Permissions	The specific operations allowed: ○ **Read**: The AI agent has read-only access to the resource. ○ **Create**: The AI agent can read and create the resource. ○ **Update**: The AI agent can read, create, and update the resource. ○ **Delete**: The AI agent can read, create, update and delete the resource. **Note:** This field does not apply to the Application and Website resource type.
Description	Description explaining what the rule controls, why it's necessary, and what resources are affected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Example: Denies automated access to payroll folder (/payroll/*). Agents can't read, write, or execute files in this location. Finance team must manually handle payroll documents.

4. From the form header, select **Save**.
5. Link the rule to the policies.
   a. In the Policy related list, select **Edit**.
   b. From the Collection column, select the policies to add, then move them to the Policy List column.
   c. Select **Save**.
6. Select **Submit**.

What to do next

Execute adaptive desktop actions on your desktop. For more information, see Execute adaptive desktop actions for desktop and web.

Take manual control of automation during execution. For more information, see Take control of AI Desktop Actions execution.

Configuring AI Desktop Actions for defined path desktop actions

Configure AI Desktop Actions to execute predefined automation sequences on your desktop. Defined path actions provide consistent, repeatable workflows for common desktop tasks.

Download AI Desktop Actions installer for defined desktop actions

Download the AI Desktop Actions installer so that you can install AI Desktop Actions on your Windows machine for designing and running defined desktop actions.

Before you begin

- Perform this task in the ServiceNow instance.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- Confirm that you install the AI Desktop Actions installer using Windows administrator privileges.
- Confirm that the Desktop-in-Desktop settings are configured correctly.
- Add the end users who interact with the Execution workspace of AI Desktop Actions to the Remote Desktop Users group on the target machine and provide Remote Desktop access permissions for seamless automation execution.

  If your organization uses Group Policy, add the end users to a Microsoft Active Directory group that is permitted to use Remote Desktop through Group Policy on each target machine where desktop actions run.

  - Local changes to the Remote Desktop Users group are temporary unless they align with Microsoft Active Directory entitlements.
  - If the user is not entitled, Group Policy refresh automatically removes them from the group.

Role required: Windows administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Desktop Actions** > **Downloads**.
2. In the AI Desktop Actions Downloads page, do any of the following actions to download the required application for Windows:
   - Select the download icon ( ).
   - Select the copy link ( ). In a browser, right-click and select the **paste and go** option.

   The system might prompt you to save or open the file.

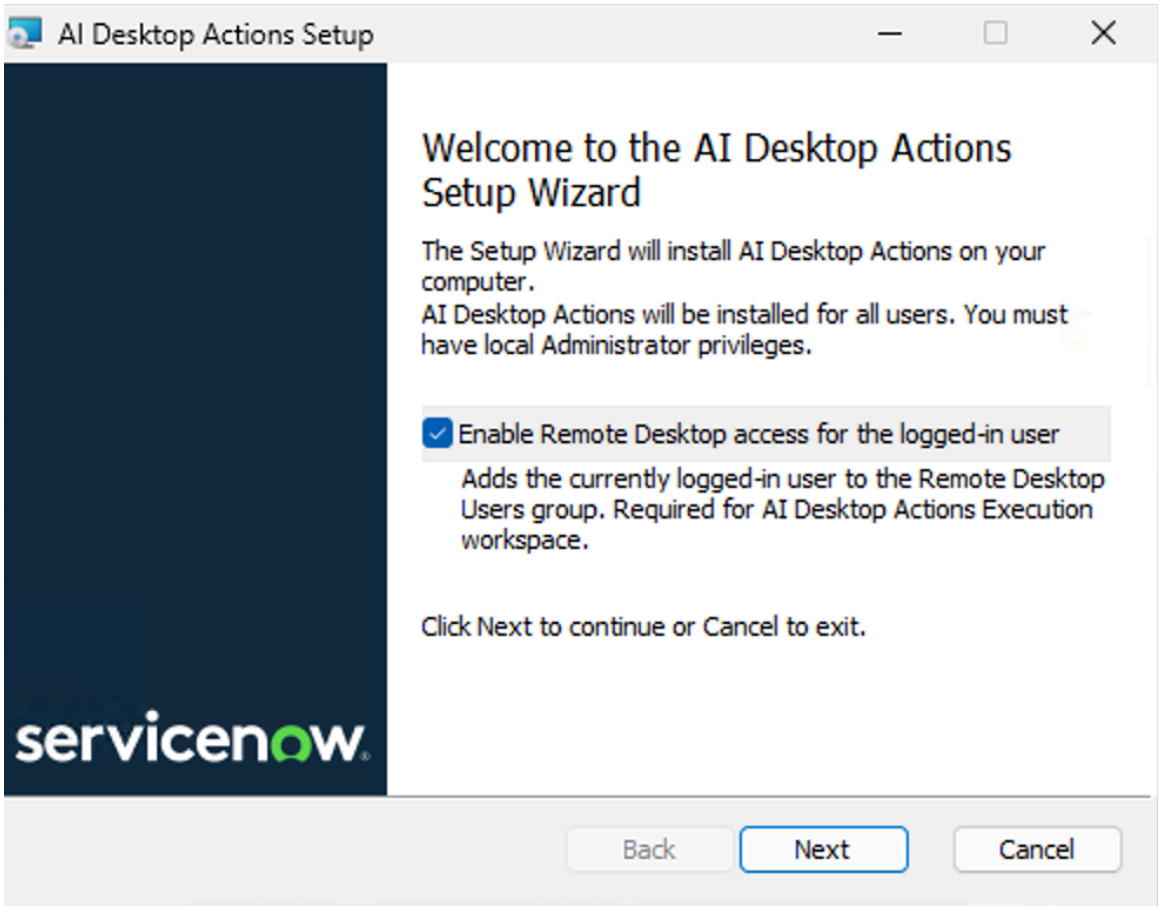
   Note: Depending on your browser setting, the browser might automatically save the file to your Downloads folder.

3. Execute the application installation file (.msi file).
4. Follow the on-screen instructions to install the application.

   AI Desktop Actions is installed in a per-machine folder by default, making it available to all users. You can change the folder location during setup.

5. Keep the option **Enable Remote Desktop access for the logged-in user** selected to automatically add the logged-in user to the Remote Desktop Users group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

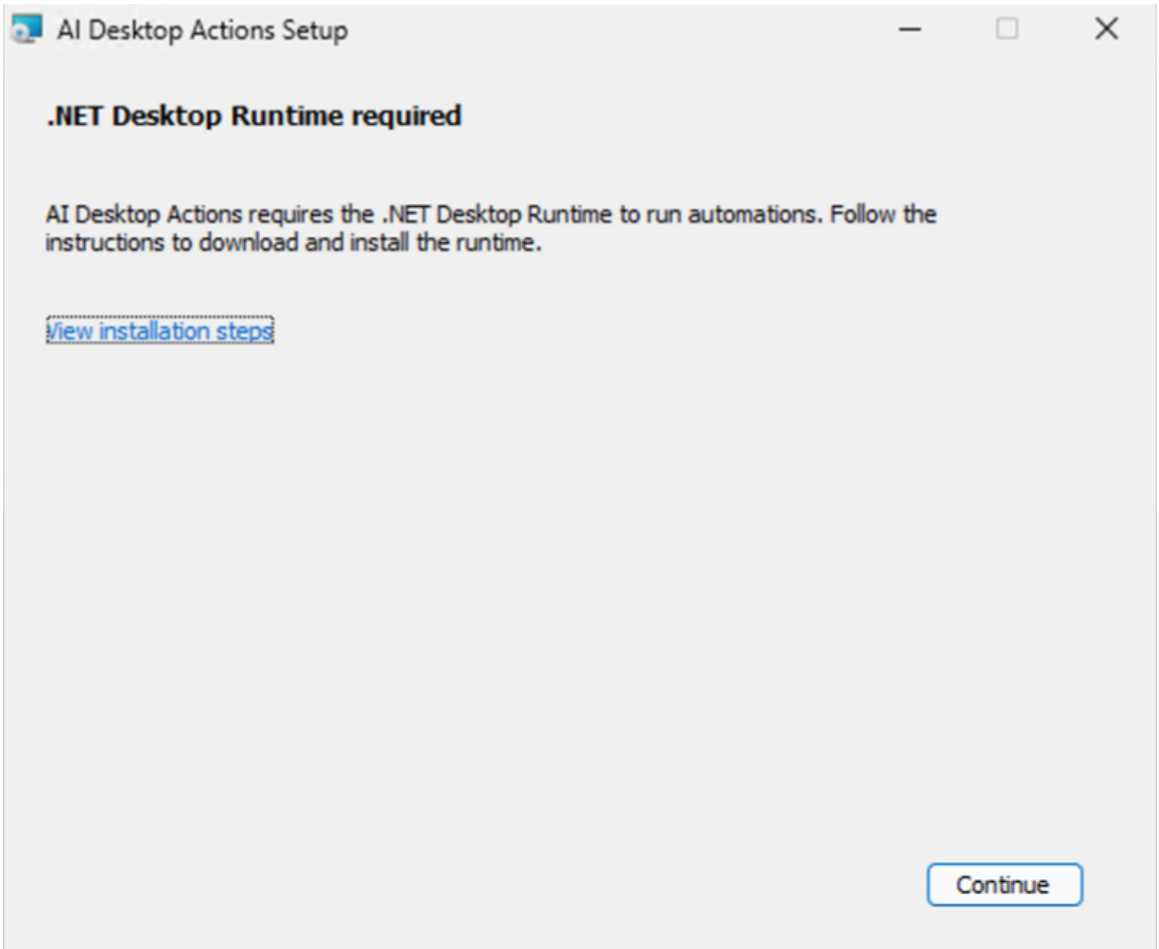


6. If not already installed, download and install the .Net Desktop Runtime framework.

   The installer validates if required .NET Desktop Runtime is installed or not on the user machine. If not installed, the installer provides a link to instructions for downloading and installing the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

same. For more information, see Download and install .Net Desktop Runtime for AI Desktop Actions.



Trouble?

If AI Desktop Actions is not installed using Windows administrator privileges, you may encounter issues with the desktop session in the Execution workspace. To fix the issue, perform the following steps.

1. Navigate to the **SessionRegistry** folder of the AI Desktop Actions installation directory.
2. Right-click **SN.AGENTICDESKTOP.SESSION.REGISTER.exe** and select **Run as administrator**.
3. Restart your system.

What to do next

Use AI Desktop Actions to design defined desktop actions. For more information, see Defined desktop actions in AI Desktop Actions.

Download and install .Net Desktop Runtime for AI Desktop Actions

Reduce setup time and prevent installation errors by downloading and installing .Net Desktop Runtime following the instructions.

Before you begin

Ensure that you have installed the AI Desktop Actions MSI. For more information, see Download AI Desktop Actions installer for defined desktop actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The AI Desktop Actions installer guides you through installation of .NET Desktop Runtime during the setup.

Procedure

1. Copy the following script to your clipboard.

```
Write-Host "--- Initializing Agentic Environment Setup ---"
 -ForegroundColor Cyan
$ErrorActionPreference = "Stop"

$downloadUrl = "https://dot.net/v1/dotnet-install.ps1"
$workingDir = $PSScriptRoot
$scriptPath = Join-Path $workingDir "dotnet-install.ps1"

try {
    Write-Host "[1/3] Downloading official Microsoft
 installer..." -ForegroundColor Yellow
    Invoke-WebRequest -Uri $downloadUrl -OutFile $scriptPath

    Write-Host "[2/3] Installing .NET 9.0.10..."
 -ForegroundColor Yellow
    Set-Location $workingDir

    & .\dotnet-install.ps1 `
        -Architecture x64 `
        -InstallDir "C:\Program Files\dotnet\" `
        -Runtime windowsdesktop `
        -Version 9.0.10

    & .\dotnet-install.ps1 `
        -Architecture x64 `
        -InstallDir "C:\Program Files\dotnet\" `
        -Runtime dotnet `
        -Version 9.0.10

    Write-Host ""
    Write-Host "--- SUCCESS: System is ready for Agentic
 Desktop ---" -ForegroundColor Green
}
catch {
    Write-Host ""
    Write-Host "--- ERROR: Installation failed ---"
 -ForegroundColor Red
    Write-Host $_.Exception.Message -ForegroundColor Red
}

Write-Host ""
Write-Host "Press any key to exit..."
$null = $Host.UI.RawUI.ReadKey("NoEcho,IncludeKeyDown")
```

2. Paste the script in any text editor.

3. Save the file with a `.ps1` extension.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **File** > **Save As**.

b. In the **File name** field, enter a name and save the file with a `.ps1` extension.
Example: `myscript.ps1`

c. Set **Save as type** to **All Files (.)**.

d. Choose a location such as Documents or Desktop.

e. Select **Save**.

4. Run the script in Windows PowerShell.

a. Select **Start**.

b. Search for **Windows PowerShell**.

c. Select **Run as administrator**.

d. Use the `cd` command to move to the folder where you saved the script.
Example:

```
cd C:\Users\YourName\Documents
```

e. Run the script by entering the following command.
Example:

```
.\myscript.ps1
```

Result
.NET Desktop Runtime is downloaded and installed on your system.

What to do next
Use AI Desktop Actions to design desktop actions. For more information, see Defined desktop actions in AI Desktop Actions.

Enable AI agents to securely access parameters in AI Desktop Actions

Enable AI agents to securely access stored values, such as credentials and other input data, through Desktop Action Parameter records. Parameters protect sensitive values and provide dynamic inputs to desktop actions during agent execution.

Only users with the sn_aia.admin role can create Parameter records. Parameter records store the names of values that an AI agent accesses during desktop action execution. A separate Parameter record is required for each distinct value.

Parameter record settings

Each Parameter record includes two fields that control how parameter values are stored and retrieved at execution time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting	Description
Shared - selected	Makes the parameter available to all users. When selected, only one Parameter Value record can be created under the parameter, and only a user with the sn_aia.admin role can create it. During execution, the agent always uses the single Parameter Value record regardless of which user triggered the agent. For example, use this setting for a service account or shared API key that all agents use to connect to the same system.
Shared - not selected	Enables multiple users with the sn_aia.admin or now_assist_panel_user role to create Parameter Value records under the Parameter record to store values. Only one Parameter Value record can be created per user for each Parameter record. If multiple users must trigger the same AI agent, each user must create a Parameter Value record for their own credentials or inputs. During execution, the agent retrieves the Parameter Value record that belongs to the user who triggered the agent. For example, use this setting when each user connects with their own credentials, such as individual usernames and passwords for an internal application.
Mark As Sensitive	Encrypts values of all associated Parameter Value records. The agent decrypts the value at execution time. When not selected, values are passed to the agent as plain text. For example, enable this setting for passwords, API keys, or any value that should not be visible in plain text in the instance.

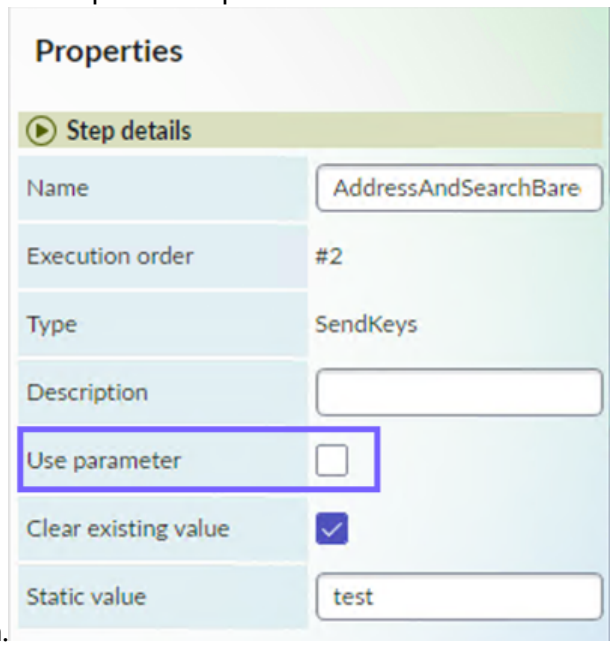
Important:

The **Shared** and **Mark As Sensitive** fields can only be edited when there are no associated Parameter Value records.

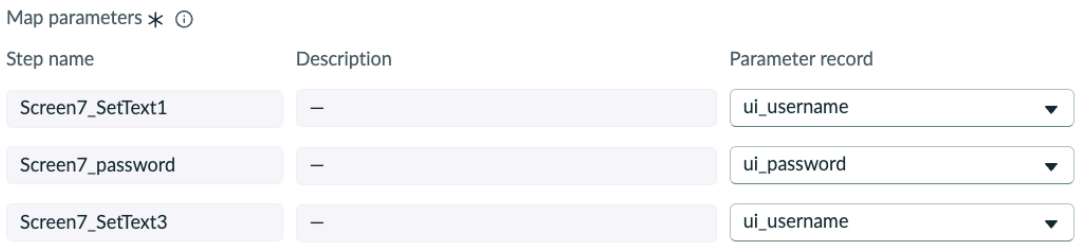
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map parameters to inputs of on-screen task desktop action

In the Design workspace of the AI Desktop Actions application, you can select the **Use parameter** check box for desktop action inputs that must retrieve values from the parameter records during execution.



In AI Agent Studio, when you add a desktop action tool that contains inputs configured for parameters, the **Map parameters** section appears in the modal. Each input configured for a parameter is listed by step name and description, with a **Parameter record** drop-down.



The following rules apply to parameter mapping:

- All inputs configured for parameters must be mapped to a Parameter record before the desktop action can be saved.
- The same Parameter record can be mapped to multiple inputs.
- Each input can only be mapped to one Parameter record.

Note: If you specify values for inputs configured for parameters in the agent instructions or in the ServiceNow Otto panel, the mapped parameter values override them.

Important:

If you update a desktop action in AI Desktop Actions client application after mapping its inputs in AI Agent Studio, the agent continues to use the previous mapping until you reopen the tool configuration and save it again.

If you rename an input in the desktop action, the agent treats it as a new input and the existing mapping for that input is removed. You must remap the renamed input before the desktop action can be saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SSH parameter example

Note:

The following example applies to SSH connector, background task desktop actions. For on-screen task desktop actions, parameter values are supplied through the **Map parameters** section in AI Agent Studio and aren't referenced in agent instructions.

Only users with the sn_aia.admin role can create Parameter records for SSH desktop actions. To store both a username and a password, the AIA admin must create two separate Parameter records, one for the username (for example, `un_username_group`) and one for the password (for example, `un_password_group`).

Users with the sn_aia.admin or now_assist_panel_user role can then create Parameter Value records under each Parameter record to store the values. Only one Parameter Value record can be created per user for each Parameter record.

Example: AI Agent instructions during execution

The following example shows how an AI agent instruction can reference stored parameter names:

`Connect to SSH server and retrieve my session info. Here are my details:`

- `IP address: 172.27.50.123`
- `Port: 22`
- `Retrieve the user name stored in "un_username_group" and the password stored in "un_password_group" parameter records.`

Note: When triggering an AI agent, explicitly specify in your instructions whether the credentials are provided directly or stored in Parameter records. If Parameter records are used, clarify that the record names are for reference only and that the agent must retrieve the username and password from those records.

Verify that you use the exact names of the Parameter records. Parameter record names are case sensitive. For example, "UserName" and "username" are treated as different values.

Related topics

Create a Desktop action parameter record

Create a parameter value record

Create a Desktop action parameter record

Create a Desktop action parameter record to store a name that an AI agent references when accessing credentials or other values during desktop action execution.

Before you begin

Perform this task in the ServiceNow instance.

For SSH connector desktop actions, verify that you have an active SSH server.

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Parameter records are supported for on-screen tasks and SSH background tasks. Use them to replace fixed values with configured ones for on-screen tasks and username and password for SSH.

Procedure

1. Navigate to **All** > **AI Desktop Actions** > **Desktop Action Parameters**.
2. Select **New**.
3. Fill in the following fields.

Desktop action parameter fields

Field	Description
Name	Enter a unique name for the parameter. The AI agent references this name when retrieving the stored value. For example, `un_username_group` or `un_password_group`.
Description	Enter a description of what value this parameter stores.
Shared	Option to make this parameter available to all users. When selected, only one Desktop action parameter value record can be created under this parameter, and only a user with the sn_aia.admin role can create it. During execution, the AI agent uses this single value regardless of which user triggered the agent.
Mark As Sensitive	Option to encrypt all associated Desktop action parameter value records. The agent decrypts the value at execution time.

Important:

Shared and **Mark As Sensitive** can only be edited when there are no associated parameter value records.

4. Select **Submit**.

Result

The Desktop action parameter record is created and appears in the Desktop Action Parameters list. You can now create Desktop action parameter value records under this parameter. For more information, see Create a parameter value record.

Create a parameter value record

Create a Desktop action parameter value record to store the value that an AI agent retrieves during desktop action execution.

Before you begin

Perform this task in the ServiceNow instance.

At least one Desktop action parameter record must exist.

Role required: sn_aia.admin or now_assist_panel_user

Note:

For shared parameters, only users with the sn_aia.admin role can create Desktop action parameter value records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Desktop Actions** > **Desktop Action Parameters**.
2. Select the Parameter record for which you want to store a value.
3. In the Desktop action parameter values related list, select **New**.
4. Fill in the following fields.

Desktop action parameter value fields

Field	Description
Name	Read-only. Inherited from the parent Desktop action parameter record.
User	The user this value record belongs to. Defaults to the user creating the record. Users with the sn_aia.admin role can change this field to assign the value record to a different user. **Note:** This field is not shown for shared parameters.
Value	Enter the value the agent retrieves at execution time, such as a username, password, or other credential. **Note:** The **Value** field displays as plain text or encrypted text depending on the **Mark As Sensitive** setting on the parent parameter record.

5. Select **Submit**.

Result

The Desktop action parameter value record is created and appears in the Desktop action parameter values related list on the Parameter record.

Defined desktop actions in AI Desktop Actions

Desktop actions enable you to automate repetitive tasks on your desktop and web applications. This capability helps you streamline repetitive tasks, improve efficiency, and integrate desktop application workflows into your ServiceNow processes.

Desktop actions are tools that AI agents use to interact with web and desktop applications. When you configure an AI agent and select desktop action as a tool, you define whether the AI agent follows a defined path (fixed steps designed in AI Desktop Actions) or an adaptive path (high-level goal described in the tool configuration). Unlike adaptive path desktop actions that dynamically plan execution, defined path desktop actions enable AI agents to execute preconfigured workflows through a fixed sequence of steps.

Types of defined desktop actions

AI agents use these desktop actions to interact with desktop applications, perform UI-based tasks, and automate end-to-end workflows. There are two types of desktop actions that can be added as tools to AI agents:

On-screen task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These desktop actions help you simulate humans interacting with UI elements on your thick client applications, legacy systems, or SaaS applications without APIs. These actions include clicking buttons, typing into text boxes, selecting from dropdown menus, and more. These desktop actions make it easier to automate repetitive tasks. They encapsulate repeatable UI interactions, such as screens, anchors, and steps. You can create, manage, and test your desktop actions using the no-code Design workspace.

Example: Filling in fields on a payroll application, updating inventory in a point-of-sale system, or submitting a request through a desktop insurance claims app.

You can access and view the existing desktop actions in the ServiceNow instance by navigating to **All** > **AI Desktop Actions** > **Desktop Actions**. You can see the details of related desktop action applications, AI agents, and desktop action execution records for on-screen task, and AI agents and desktop action execution records for background desktop actions.

Background task

These desktop actions include prebuilt connectors that enable your AI agents to interact with various applications and system components in the background. These connectors streamline automation by offering actions for common tasks, reducing the need for complex scripting. Each connector focuses on a specific application or system area, providing a collection of related methods. You can't create background task desktop actions.

Example: Reading data from Microsoft Excel, extracting emails from Microsoft Outlook, generating a PDF, compressing files into a ZIP, fetching records from a database, or sending a system notification.

Background task desktop actions are supported for the following applications:

Note: For the AI agents to perform Background task automations, the following applications must already be installed on the end-user's system.

Application	Description
Microsoft Excel	Enables AI agents to perform standard actions on the Microsoft Excel documents. For example, data manipulation, content modification, and information retrieval from spreadsheets. The following methods are supported: • ReadData • WriteData • FindAndReplace **Note:** CSV and password-protected files aren't supported.
Microsoft Outlook	Enables AI agents to perform standard actions on the Microsoft Outlook application. For example, you can automate sending or replying to emails. The following methods are supported:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Description
	• DeleteMail • ForwardMail • GetMailsFromFolder • MoveMail • Reply • SaveAllAttachments • SendMail • GetMail • MarkAsRead • MarkAsUnread **Note:** Only the classic view is supported. Shared inboxes aren't supported.
Microsoft Word	Enables AI agents to perform standard actions on the Microsoft Word documents. For example, you can replace text in a document. The following methods are supported: • GetText • InsertText • ReplaceText **Note:** Password-protected files aren't supported.
PDF	Enables AI agents to perform standard actions on the PDF documents. For example, extracting text, converting to Excel or Images, and merging and spiting files. The following methods are supported: • GetText • ConvertToExcel • ConvertToImages • Merge • Split **Note:** Password-protected files aren't supported. You can't manipulate e-signed PDFs such as performing merge and split. This action corrupts the PDF files.
PowerShell	Enables AI agents to execute PowerShell commands and scripts and returns the results. The following methods are supported:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Description
	• InvokeCommand • InvokeScript **Note:** Each PowerShell step runs in a new session. Output from one step isn't carried over to the next step.
SQL	Enables AI agents to execute custom SQL queries against supported databases (MSSQL, ORACLE, MYSQL, OLEDB, ODBC) and returns results as JSON. The following method is supported: ExecuteQuery
Secure Shell (SSH)	Enables AI agents to securely connect to remote servers to run SSH commands and scripts; and returns the execution results. This connector supports non-interactive commands. The following method is supported: RunCommand **Note:** Each SSH step runs in a new session. Output from one step isn't carried over to the next step.
System Actions	Enables AI agents to perform standard Windows system operations. For example, starting an app, creating a ZIP file, or deleting any file or folder. The following methods are supported: • StartApp • Terminate • DateTimeNow • SetEnvironmentVariable • GetEnvironmentVariable • CopyFileOrFolder • DeleteFileOrFolder • WriteToFile • ReadFromFile • GetFilesFromFolder • ExtractFile • CreateZip

Ways to create desktop actions

Note: If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for user input during execution. Otherwise, the automation can't proceed.

You can create on-screen desktop actions in the following ways:

Auto-capture screens and steps

With Action recorder, you can record your interactions with desktop applications to create automated workflows. It records every step you take, including clicks, keystrokes, and data entry, along with visual and contextual information. By recording steps, you can automate tasks that replicate your interactions. You can save the recorded screens and steps as a reusable desktop action. For more information, see Action recorder in AI Desktop Actions.

Manually capture screens and steps

You can manually take a screen capture, add anchors and steps to automate a series of steps you perform on your computer, such as clicking buttons, typing text, or interacting with different applications, and then save this sequence as a reusable desktop action.

Benefits of desktop actions

- Eliminate manual effort by automating repetitive tasks for frequent desktop activities.
- Execute complex sequences of steps quickly and consistently.
- Connect desktop application processes with your broader ServiceNow automations.
- Standardize task execution to minimize human error.
- You can record steps directly on your desktop applications.
- Automate tasks that span across multiple desktop applications.
- Save recorded sequences as desktop actions to use them in various automations.
- Review, rearrange, edit, or delete individual steps within a recorded action.

How the Design workspace works

Record steps

Capture your interactions with desktop applications, including clicks, text input, and screen navigation.

Define steps

Specify individual steps like Click, Set Text, or Get Text to interact with elements on your screen.

Application details

Select and store the desktop applications involved in your automations in the **Details** tab.

Organize screens

Structure your recorded steps by application screens, making it easy to review and edit.

Save and publish

Store your desktop actions in your ServiceNow instance for reuse and deployment.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What you can automate

Desktop actions support a wide range of desktop application interactions, including:

- Entering data into forms.
- Extracting information from applications.
- Navigating through application menus and screens.
- Performing steps like saving files or generating reports.
- Transferring data between different desktop applications.

Automate repetitive tasks by recording steps with AI in AI Desktop Actions

Create desktop actions by recording steps with AI to automate repetitive tasks in AI Desktop Actions. AI validates anchor positions and generates screen contexts automatically after recording, reducing the risk of automation failures at runtime.

Before you begin

Familiarize yourself with the Design workspace and Action recorder. For more information, see AI Desktop Actions Design workspace and Action recorder in AI Desktop Actions.

To access the AI Desktop Actions functionality, perform the following steps:

- Enable AI Desktop Actions on your ServiceNow instance. For more information, see Configure AI Desktop Actions.
- Download the AI Desktop Actions installer to automate repetitive tasks across applications and systems. For more information, see Download AI Desktop Actions installer for defined desktop actions.

Confirm that the following system requirements are met:

- Windows 11 operating system is used.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- No extended monitors are connected.
- Theme must match between the systems used for recording and execution.
- The ServiceNow AI Lens skill must be active on your instance. Contact your ServiceNow administrator if you're unsure whether this condition is met.

Role required: sn_desktop_core.desktop_action_user

About this task

Record with AI generates more accurate anchor positions automatically, reducing the time you spend on manual anchor adjustments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you record with AI, after you finish recording, AI analyzes the recording, validates anchor positions, and corrects inaccuracies before you save or activate the desktop action. AI also generates a screen context for each captured screen and description for the desktop action. Screen context is a description of what the screen does and what it contains, which helps reviewers and AI agents understand the screen's intent.

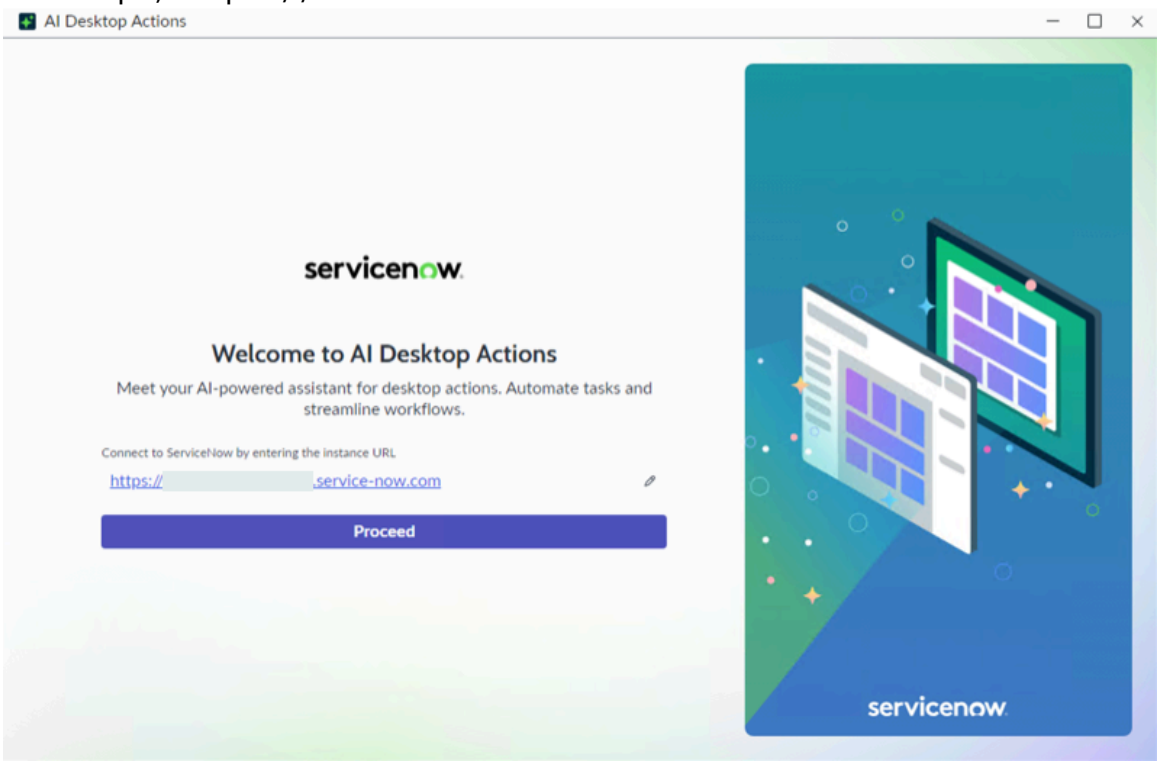
Note: If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for the user input during execution. Otherwise, the automation can't proceed.

The *sn_desktop_core.record_with_ai* property is enabled by default, making **Record with AI** the default recording option. Turn off this property to set the manual recorder as the default recording option.

Procedure

1. From your Windows system, launch the AI Desktop Actions application.
2. On the login page, in the **Add ServiceNow URL** field, enter the ServiceNow instance URL.

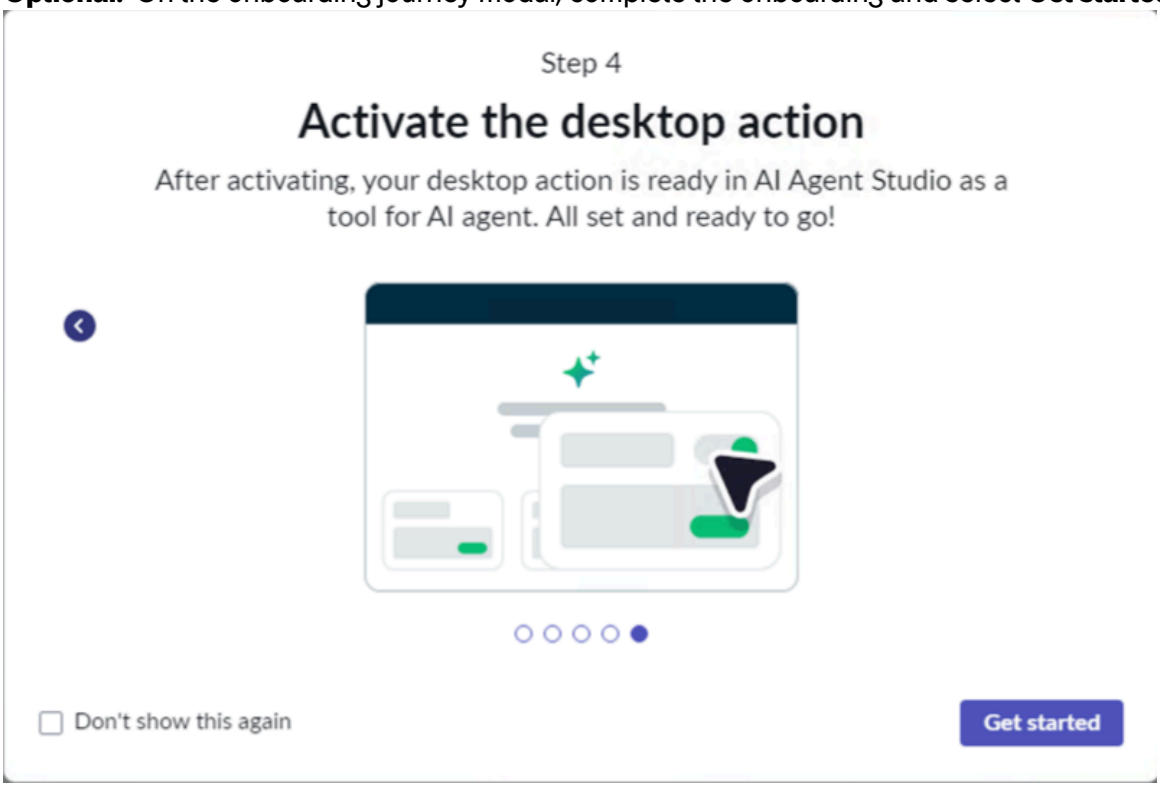
   Example
   For example, `https://<instance name>.service-now.com`.



3. Select **Proceed**.
4. Log in to your ServiceNow account by entering your user name and password.
   Your must have the sn_aia.admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

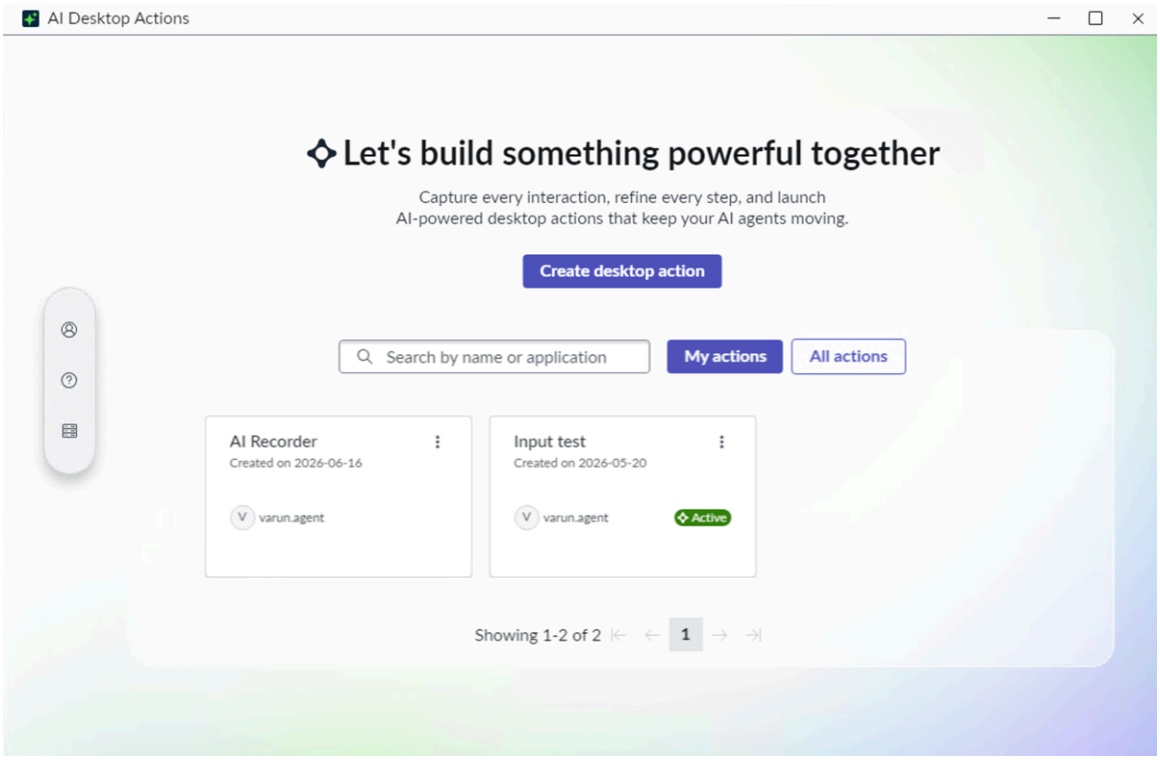
5. **Optional:** On the onboarding journey modal, complete the onboarding and select **Get started**.



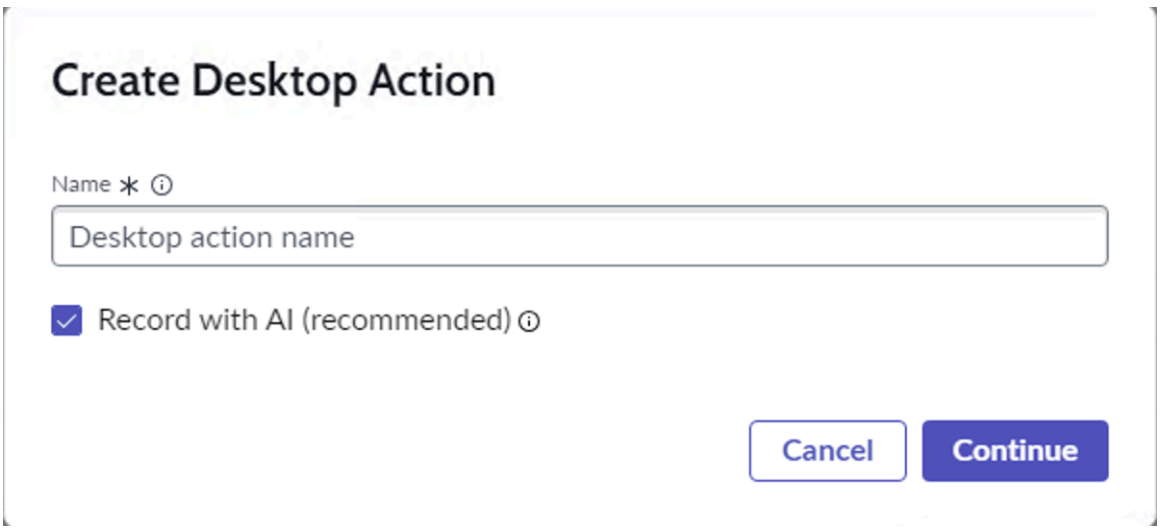
If you launch the AI Desktop Actions for the first time, the onboarding journey widget appears. You can select **Don't show me again** to hide the widget the next time you launch AI Desktop Actions or **Skip intro** to skip the onboarding.

6. On the AI Desktop Actions home page, select **Create desktop action**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

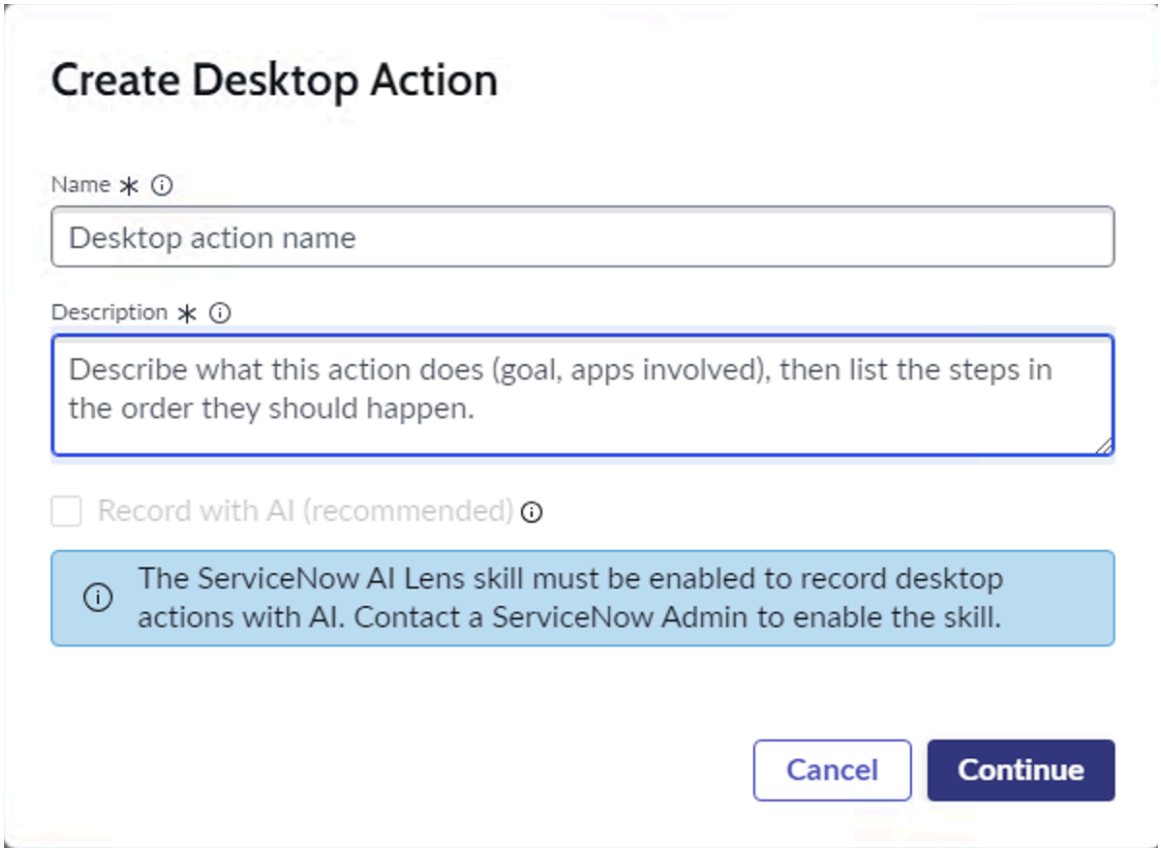


7. In the Create Desktop Action dialog, keep the **Record with AI (recommended)** check box selected.

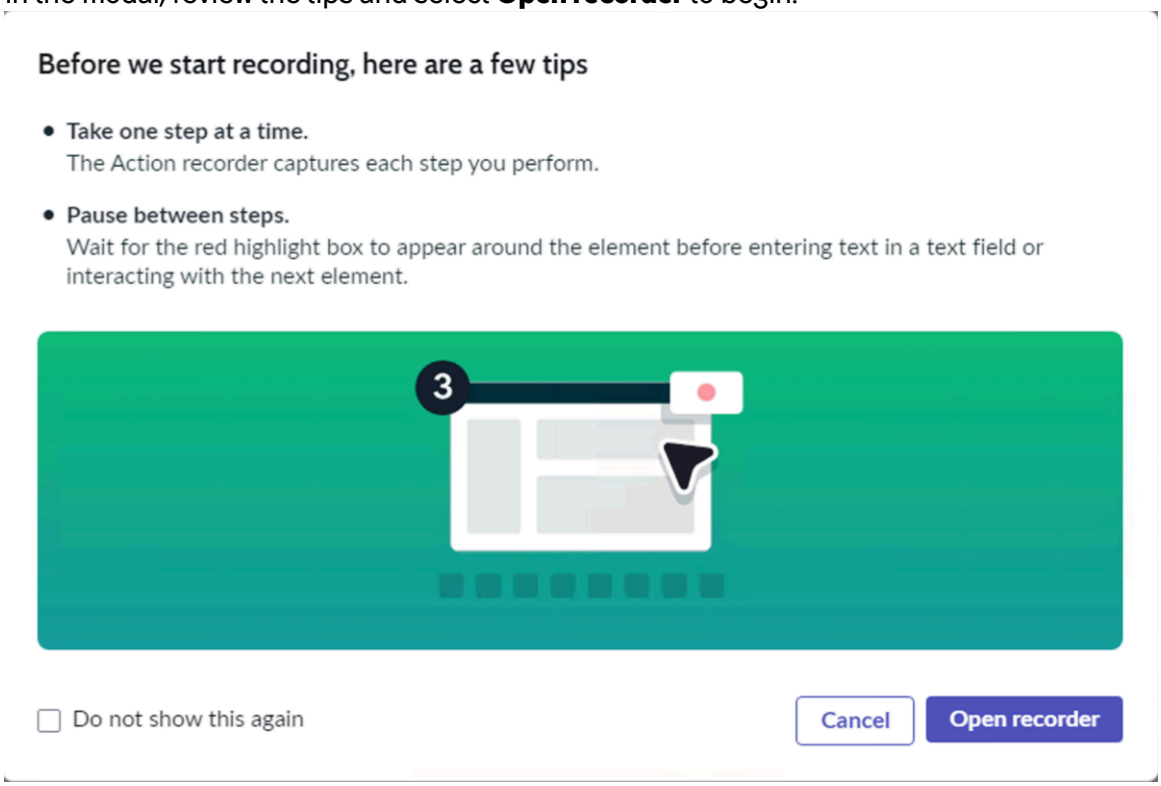


Important: If the **Record with AI (recommended)** check box is unavailable, the ServiceNow AI Lens is inactive on your instance. Contact your ServiceNow administrator to enable it. You can still create desktop actions using auto-capture mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

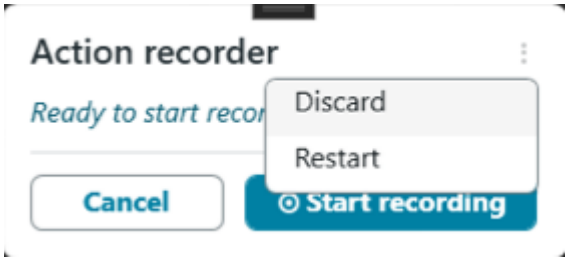


8. Enter a name for the desktop action.
9. Select **Continue**.
10. In the modal, review the tips and select **Open recorder** to begin.



The AI Desktop Actions window is minimized and the Action recorder panel is launched. You can freely drag and reposition the Action recorder panel anywhere on your desktop screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. Open the applications that you want to record steps for.
12. From the Action recorder panel, select **Start recording**.

    Important: Before you start recording, review the tips for accurate capturing of anchors and steps. For more information, see Tips for accurate recording.

    You will see a "Recording started" message on the Action recorder panel. You can select any of the following options when needed from the **More options** menu:

    - **Pause**: Skip recording steps
    - **Restart**: Restart recording the steps

      You will lose the recorded screens and steps.

    - **Discard**: Discard the recording if it doesn't meet your needs
13. Perform the steps that you want to automate.

    Each step that you perform is captured sequentially and the type of UI action is displayed for each step. For example, Capturing Mouse Left Click event.

    You can capture maximum of 50 steps using the recorder in a recording session. While auto-capturing steps, a counter displays the remaining number of steps you can capture using the recorder (for example, "35 of 50 max"). Recording stops automatically after you capture 50 steps. If you must capture additional steps, start a new recording session. The new recording adds screens and steps to those captured in the previous recording.

14. After you're done with all the steps, select **End recording** on the Action recorder panel.

    You will see the "Draft workflow saved" message on the Action recorder panel.

    AI processes the recording in three stages:

    a. Analyzing your recording with AI

    b. Inserting anchors

    c. Generating screen contexts
    You must not close the application during processing.

    The recorded steps are displayed as screenshots in the Design workspace with anchors and steps automatically added.

15. When the `AI analysis complete` banner appears, review the AI-generated anchors and screen contexts.

    Note: If two applications in the frame have similar logos or visual elements, verify that the anchor position is unique to the target application to avoid incorrect element identification during automation.

    Anchors and screen context generated by AI are marked with an AI badge in the properties panel. For each screen, review the screen context and edit it if needed.

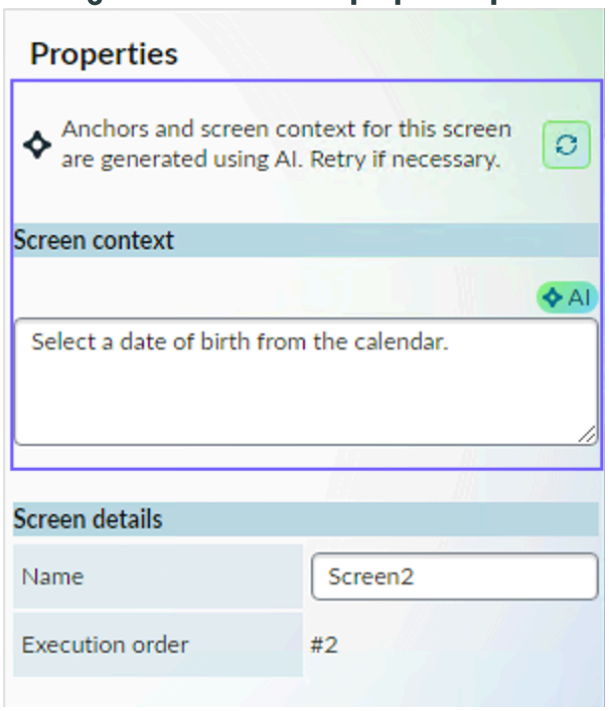
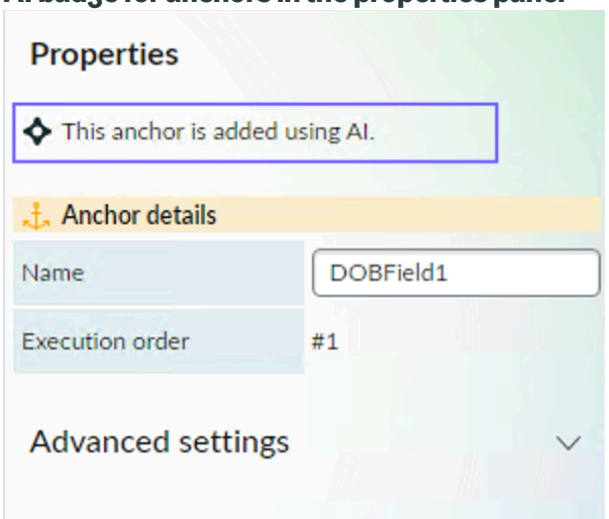
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI badge for screens in the properties panel



AI badge for anchors in the properties panel



Note: The accuracy of AI-generated anchors depends on the application's accessibility, performance, and UI complexity. Always review before activating.

16. **Optional:** To regenerate the screen context and anchor position for a specific screen, select **Retry** in the screen properties panel.
17. Review the sequence of captured screens and adjust if necessary.
    You can adjust the sequence by dragging the screens in the Screens and steps panel.
18. Review and adjust steps.
    You can modify the sequence by adding, removing, or dragging steps.

    a. From the Anchor control menu, select the **Add step** icon ⊕.

    b. Select the type of step to perform for this step from the contextual menu.

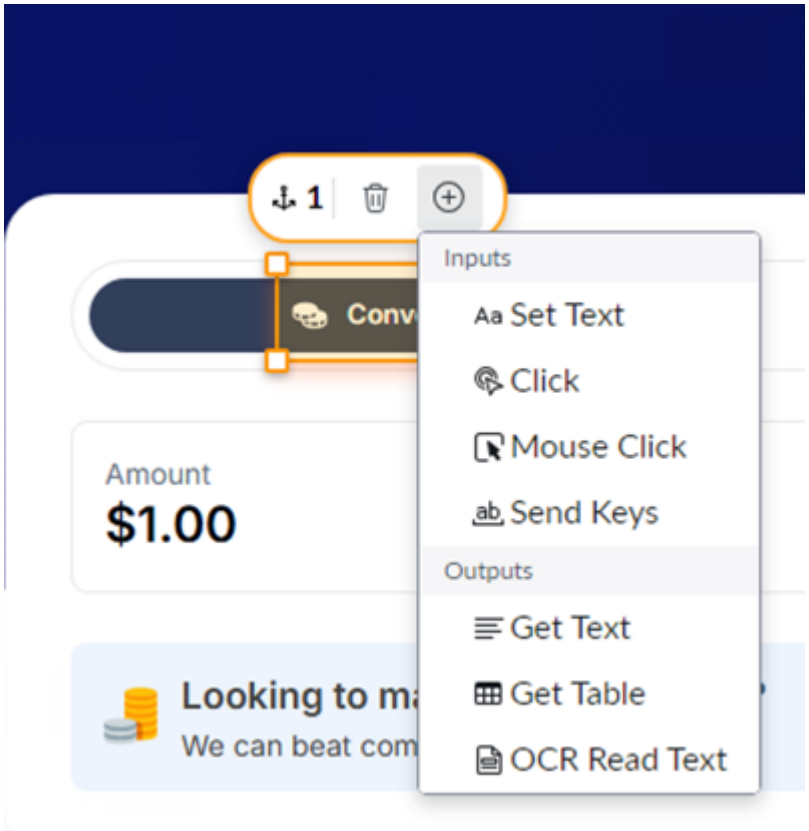
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Description of the actions

Goal	Step	Type	Example
Enter text in a field	Set Text	Input	Enter any text data such as a user name, an address, a survey response, or in any situation where text entry is accepted. **Note:** If you set a static value for this field, the automation uses it during execution and doesn't prompt you for input from the ServiceNow Otto panel.
Simulate a mouse click	Click	Input	Click a button, open a menu, or perform any step typically performed by a mouse click.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Step	Type	Example
Simulate an alternative mouse action (for example, right-click, drag, scroll, or paste)	Mouse Click	Input	Perform various mouse device actions, such as right-click and select an object or scroll on a web page.
Simulate a key press or a key function	Send Keys	Input	Perform keyboard shortcuts, such as copying text by entering `Ctrl + C` on fields and elements. **Note:** If you set a static value for this field, the automation uses it during execution and doesn't prompt you for input from the ServiceNow Otto panel.
Capture text from a window or web page	Get Text	Output	Receive text from the source area.
Capture a table	Get Table	Output	Receive table from the source area when the text is in the table format. **Note:** For the step to capture table data successfully, the data must already be in the table form. The step can't convert ordinary text to table data.
Read text from an image	OCR Read Text	Output	Recognize text from images and return it in the standard text format.

You can add multiple steps representing your automation steps.

19. Configure the properties for added screens, anchors, and steps in the Properties panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Screen, anchor, and step properties in AI Desktop Actions.

20. **Optional:** Modify the auto-generated names for all added screens, anchors, and steps.

    (Optional) You can modify the auto-generated names following these naming guidelines.

    - Name fields must not be empty.
    - Name fields must contain only alphanumeric characters. Spaces and special characters are not permitted.
    - Each name must be unique at its respective parent level.
        - Each screen must have a unique name at the desktop-action level.
        - Each anchor must have a unique name at the screen level.
        - Each step must have a unique name at the anchor level.

What to do next

1. Configure the details of your desktop action. For more information, see Add details to desktop actions in AI Desktop Actions.
2. Test and activate the desktop action so that it can be added as a tool to AI agents. For more information, see Test and activate a desktop action in AI Desktop Actions.
3. Add the desktop action as a tool to AI agents in AI Agent Studio. For more information, see Add a defined desktop action tool to an AI agent for desktop and web-based task.

- No extended monitors are connected.
- Theme must match between the systems used for recording and execution.

Familiarize yourself with the Design workspace and Action recorder. For more information, see AI Desktop Actions Design workspace and Action recorder in AI Desktop Actions.

Role required: sn_aia.admin

About this task

Note: To create desktop actions with AI-assisted anchor validation and automatic screen context generation, use Record with AI instead.

You can record steps that you want to automate for desktop and web applications and save them as desktop actions of type on-screen task that AI agents can simulate while executing automations.

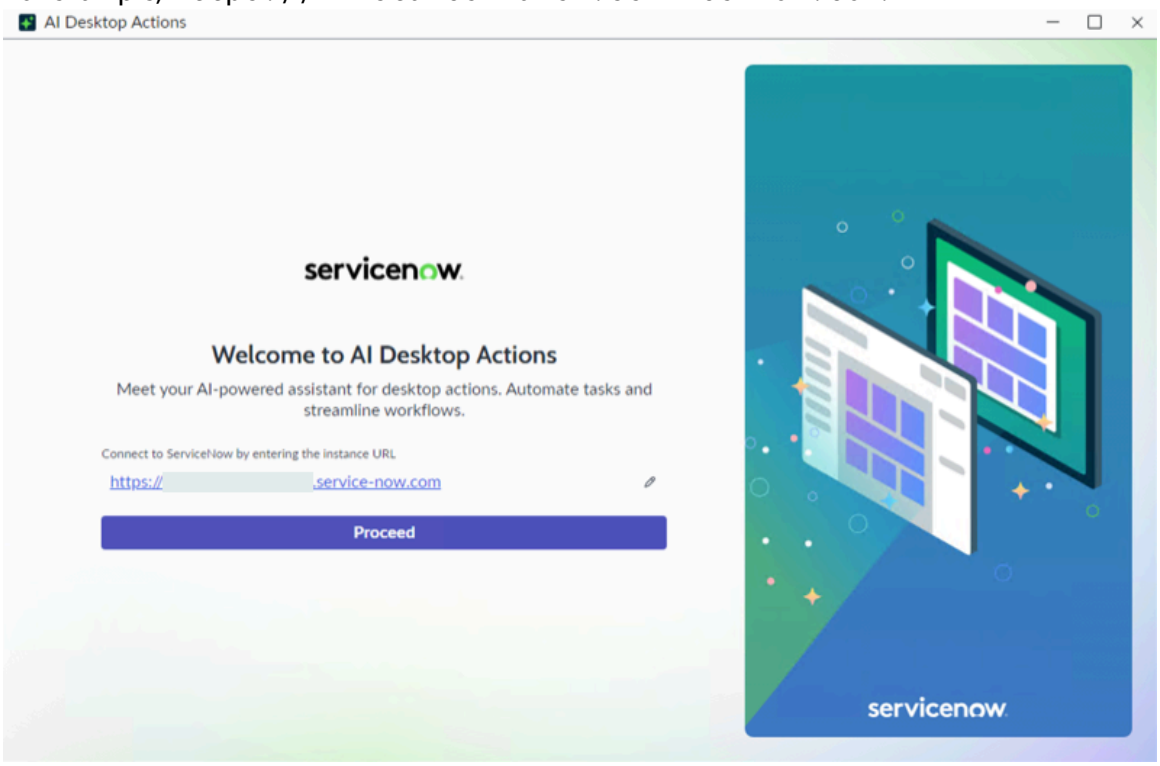
With Action recorder, you can record every step you perform on desktop applications, including clicks, keystrokes, and data entry, along with visual and contextual information. This detailed recording of steps allows automated tasks to reliably replicate your interactions.

Note: If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for the user input during execution. Otherwise, the automation can't proceed.

Procedure

1. From your Windows system, launch the AI Desktop Actions application.
2. On the login page, in the **Add ServiceNow URL** field, enter the ServiceNow instance URL.

   Example
   For example, `https://<instance name>.service-now.com`.



3. Select **Proceed**.

Extend a desktop action by manually capturing steps in AI Desktop Actions

Extend the automation logic in a desktop action by manually capturing steps in AI Desktop Actions.

Before you begin

To access the AI Desktop Actions functionality, perform the following steps:

- Enable AI Desktop Actions on your ServiceNow instance. For more information, see Configure AI Desktop Actions.
- Download the AI Desktop Actions installer to automate repetitive tasks across applications and systems. For more information, see Download AI Desktop Actions installer for defined desktop actions.

Confirm that the following system requirements are met:

- Windows 11 operating system is used.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- No extended monitors are connected.
- Theme must match between the systems used for recording and execution.
- Remote Desktop must be enabled on your machine and your account must be granted Remote Desktop access permissions before you start using the AI Desktop Actions Execution workspace.

Familiarize yourself with the Design workspace and Action recorder. For more information, see AI Desktop Actions Design workspace and Action recorder in AI Desktop Actions.

Role required: sn_aia.admin

About this task

Note: To create desktop actions with AI-assisted anchor validation and automatic screen context generation, use Record with AI instead.

You can simulate a user interaction in an automation by manually capturing screens and defining steps.

Using the controls in the window, you can capture an area of an application window. You can then set one or more anchors, and define steps that represent the user interactions in that window.

- **Anchor**: Anchors help specify the target area for the interaction by defining a static area from which steps can be defined at a relative distance.
- **Step**: Steps are your sequential interactions of type click, select, type, scroll, and more.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

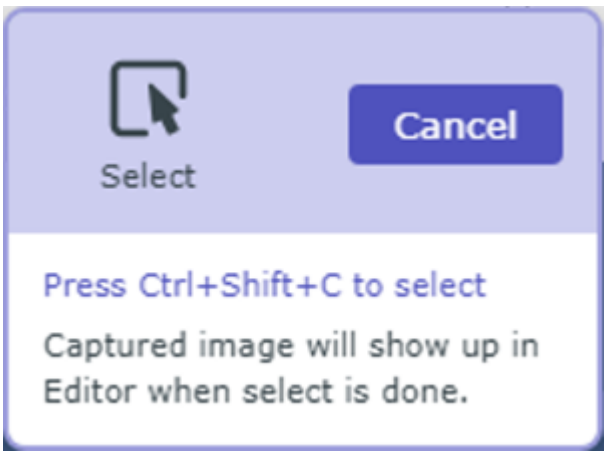
You can also extend the desktop action logic using the **Record with AI (Recommended)** or **Auto capture with recorder** options. For more information, see Automate repetitive tasks by recording steps with AI in AI Desktop Actions and Automate repetitive tasks by auto-capturing steps in AI Desktop Actions.

The AI Desktop Actions window is minimized and the Capture panel is launched.



c. Open the applications that you want to automate steps for.

d. Capture the area of the external application's window by selecting the **Select** icon on the Capture panel or pressing the `Ctrl + Shift + C` on the keyboard.

> **Note:** If the `Ctrl + Shift + C` shortcut conflicts with another application on the your machine, such as Zoom, then you must use the **Select** button to initiate manual screen capture.

For example, you can capture the area surrounding a button or a text field in a web browser.

The cursor icon changes to the + icon.

e. Drag the + icon and select the required screen area.

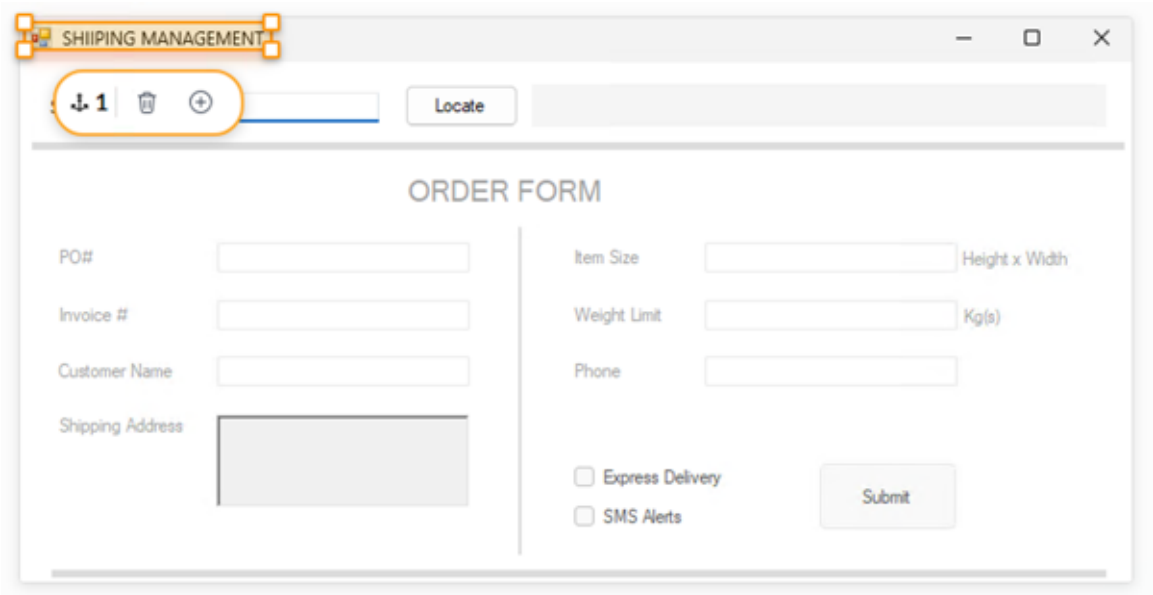
When you leave the + icon, the selected area is captured as a screenshot in the Design workspace.

If you aren't satisfied with the captured screen, you can recapture the screen area by selecting the **Capture image** icon .

8. Insert anchors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Insert an anchor on the captured screen by selecting the **Add anchor** icon .



Note: If two applications in the frame have similar logos or visual elements, verify that the anchor position is unique to the target application to avoid incorrect element identification during automation.

An anchor is a reference point on the screen that helps the automation identify and interact with a nearby UI elements. During execution, the system uses computer vision to locate the anchor and then identifies the UI elements at a related distance from the anchor. Anchors improve the stability and accuracy of steps when the target element's location may shift or when the UI layout varies across sessions.

Note: Don't use dynamically changing UI elements as anchors. If an element changes its color, text, or state after an action (for example, after a click), select a different anchor that remains static on the screen.

b. Move the anchor to a part of the captured image that won't change.
For example, move the anchor to a title or field label.

If the area under the anchor doesn't exactly match the corresponding area of the captured image, the anchor isn't recognized, and the steps aren't performed as intended. Choose a static area of the image for setting your anchor.

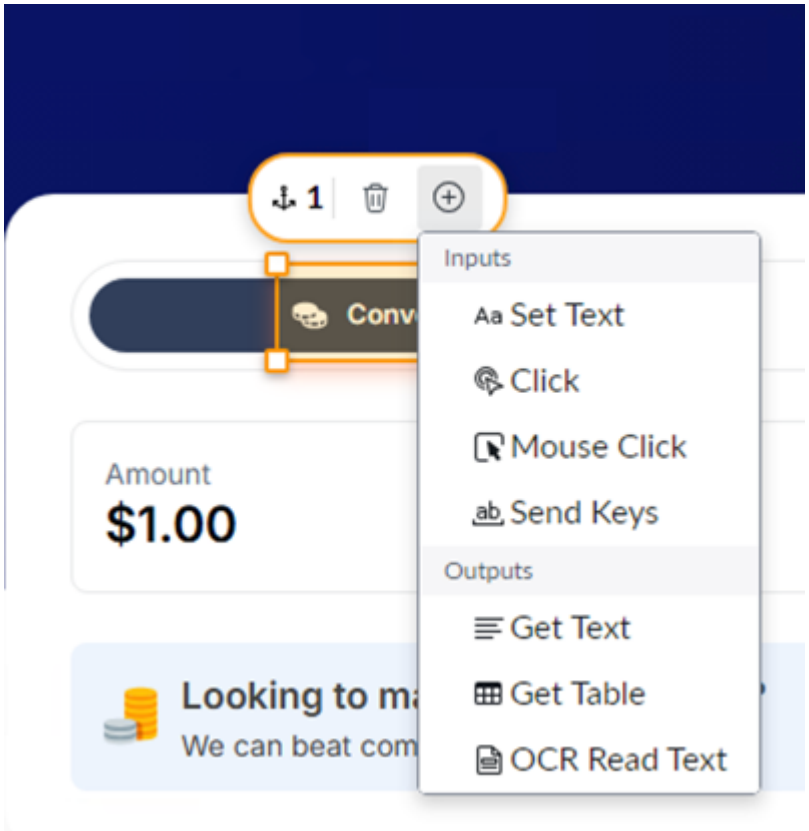
You can add multiple anchors on each screen. Multiple anchors let you define the geographical relationship between anchor and target with greater accuracy when targeting different locations in the image.

9. Configure the steps.

a. From the Anchor control menu, select the **Add step** icon ⊕.

b. Select the type of step to perform for this step from the contextual menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Description of the actions

Goal	Step	Type	Example
Enter text in a field	Set Text	Input	Enter any text data such as a user name, an address, a survey response, or in any situation where text entry is accepted. **Note:** If you set a static value for this field, the automation uses it during execution and doesn't prompt you for input from the ServiceNow Otto panel.
Simulate a mouse click	Click	Input	Click a button, open a menu, or perform any step typically performed by a mouse click.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Goal	Step	Type	Example
Simulate an alternative mouse action (for example, right-click, drag, scroll, or paste)	Mouse Click	Input	Perform various mouse device actions, such as right-click and select an object or scroll on a web page.
Simulate a key press or a key function	Send Keys	Input	Perform keyboard shortcuts, such as copying text by entering `Ctrl + C` on fields and elements. **Note:** If you set a static value for this field, the automation uses it during execution and doesn't prompt you for input from the ServiceNow Otto panel.
Capture text from a window or web page	Get Text	Output	Receive text from the source area.
Capture a table	Get Table	Output	Receive table from the source area when the text is in the table format. **Note:** For the step to capture table data successfully, the data must already be in the table form. The step can't convert ordinary text to table data.
Read text from an image	OCR Read Text	Output	Recognize text from images and return it in the standard text format.

You can add multiple steps representing your automation steps.

10. Configure the properties for added screens, anchors, and steps in the Properties panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Screen, anchor, and step properties in AI Desktop Actions.

11. **Optional:** Modify the auto-generated names for all added screens, anchors, and steps.

    (Optional) You can modify the auto-generated names following these naming guidelines.

    - Name fields must not be empty.
    - Name fields must contain only alphanumeric characters. Spaces and special characters are not permitted.
    - Each name must be unique at its respective parent level.
        - Each screen must have a unique name at the desktop-action level.
        - Each anchor must have a unique name at the screen level.
        - Each step must have a unique name at the anchor level.

What to do next

1. Configure the details of your desktop action. For more information, see Add details to desktop actions in AI Desktop Actions.
2. Test and activate the desktop action so that it can be added as a tool to AI agents. For more information, see Test and activate a desktop action in AI Desktop Actions.
3. Add the desktop action as a tool to AI agents in AI Agent Studio. For more information, see Add a defined desktop action tool to an AI agent for desktop and web-based task.

Add a defined desktop action tool to an AI agent for desktop and web-based task

Examples of creating desktop actions

Examples of executing desktop actions using AI agents

Add details to desktop actions in AI Desktop Actions

Add desktop action details, such as name, description, and associated applications, and review inputs and outputs.

Before you begin

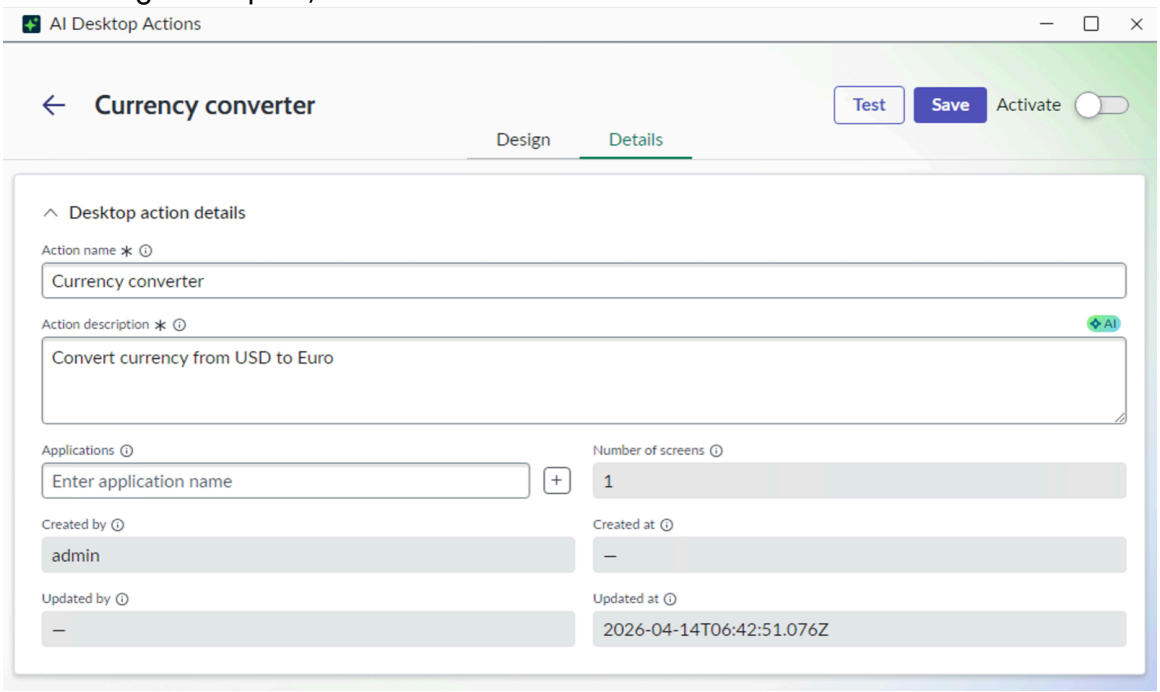
- Capture your automation steps. For more information, see Automate repetitive tasks by auto-capturing steps in AI Desktop Actions or Extend a desktop action by manually capturing steps in AI Desktop Actions.
- Configure the properties for screens, anchors, and steps. For more information, see Screen, anchor, and step properties in AI Desktop Actions.

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Design workspace, select the Details tab.



2. **Optional:** In the Desktop action details section, edit the name of the desktop action.
   The description in the **Action description** field is auto-filled when you select the **Record with AI** option and an AI badge appears.
3. **Optional:** In the **Application** list, select the applications you want to automate.
   The list displays the applications available on the ServiceNow instance. If an application isn't listed, you can add it by selecting the **Add** icon [+].
4. In the Input and output parameters section, review the parameters related to steps for each screen.
5. Select **Save**.

   You can save the desktop action after all the required fields are configured.

What to do next

Test and activate the desktop action so that it's available as a tool in the AI Agent Studio. You can add this tool to the AI agents that execute desktop actions in your desktop environment. For more information, see Test and activate a desktop action in AI Desktop Actions.

Test and activate a desktop action in AI Desktop Actions

Test the desktop action and then activate it so that it's available as a tool in the AI Agent Studio. You can add this tool to the AI agents that execute desktop actions in your desktop environment.

Before you begin

- Capture your automation steps. For more information, see Automate repetitive tasks by recording steps with AI in AI Desktop Actions, Automate repetitive tasks by auto-capturing steps in AI Desktop Actions, or Extend a desktop action by manually capturing steps in AI Desktop Actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

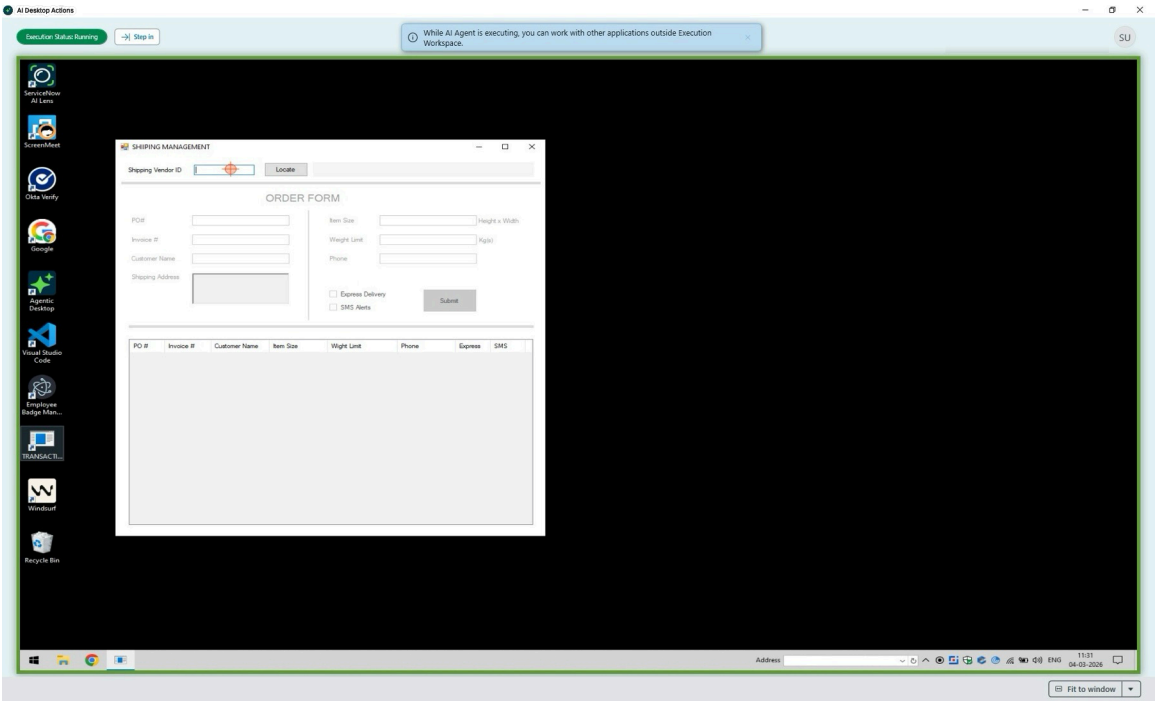
- Configure the properties for screens, anchors, and steps. For more information, see Screen, anchor, and step properties in AI Desktop Actions.
- Add desktop action details, such as name, description, and associated applications, and review inputs and outputs. For more information, see Add details to desktop actions in AI Desktop Actions.

Role required: sn_aia.admin

About this task

You can test the desktop action before you activate it. You can also test individual screens to quickly identify and troubleshoot issues.

Execution workspace is launched to run and test the selected screen or the desktop action.



After you run the test by entering the required inputs manually, test results are shown either for a screen or for entire desktop action in the Execution workspace. While running tests, if you do not see the Execution workspace coming forth, switch to the Execution workspace manually.

While working on a desktop action, the test values you enter are retained across test runs until you close the desktop action or reset the test values.

Procedure

1. From the desktop action header, select **Test**.
2. Option 1: Run the screen-level test.

   a. In the Test modal, enter required inputs for the screen that you want to test.

   b. Select **Test screen**.
   The Execution workspace is launched.

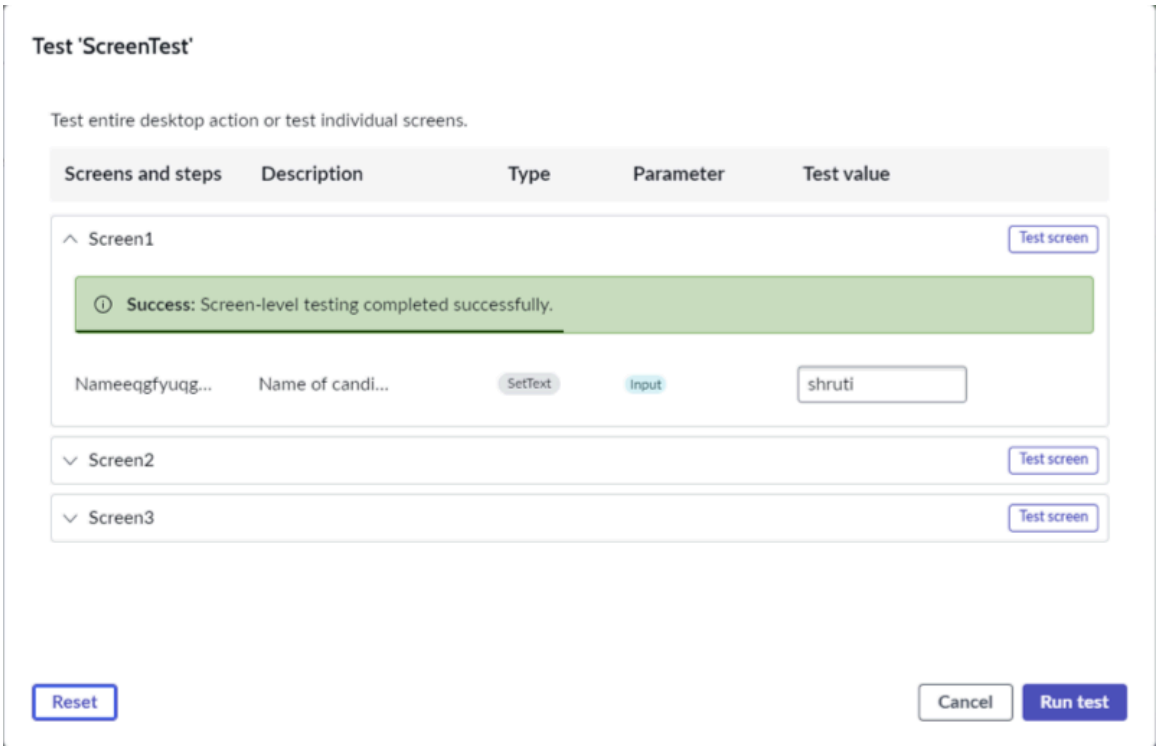
   c. Enter the Windows Security credentials.
   Observe the test run in the Execution workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

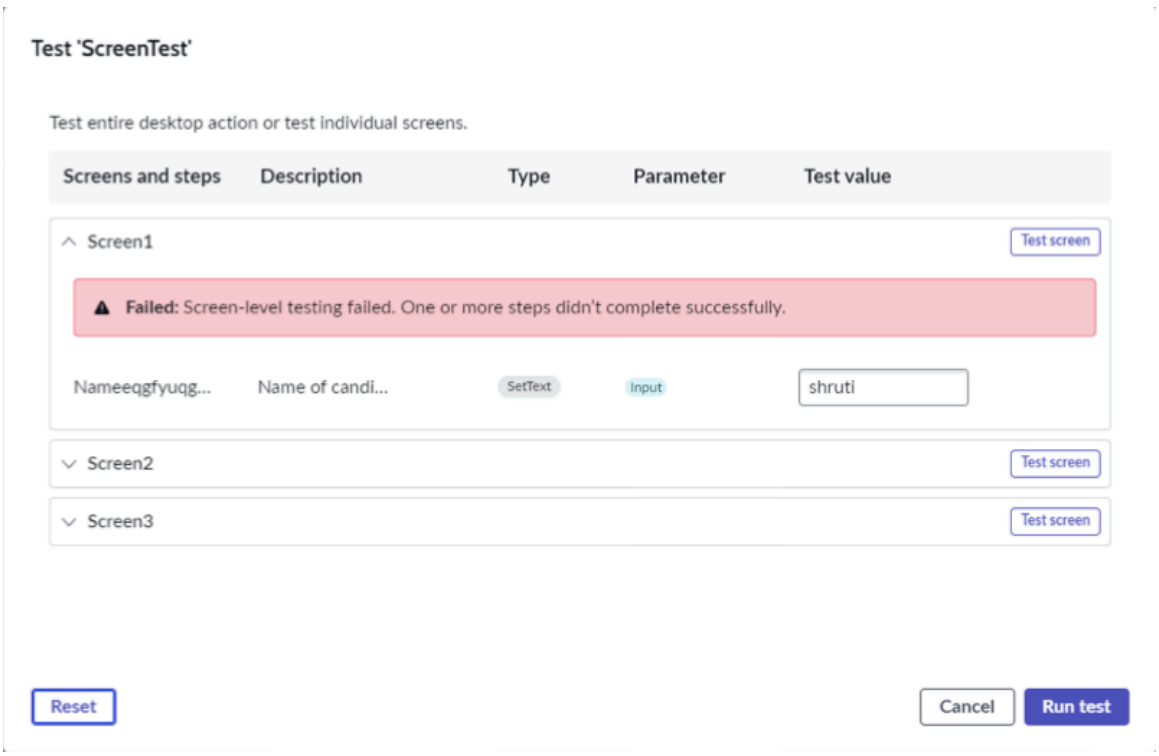
Note: If any pop up is blocking the automation from running, step in to clear the pop up so that you can see the test run in the Execution workspace.

d. After the test run is complete, check the status in the Test modal.

- If test is successful, proceed with testing the next screen.



- If test isn't successful, fix the issue highlighted in the error message and run the screen-level test again.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. **Optional:** Reset test data by selecting **Reset**.

f. **Optional:** Cancel running test by selecting **Cancel**.

3. Option 2: Run the Desktop action-level test.

a. In the Test modal, enter the required input values in the desktop action.

- **Show inputs** - Shows all the required input fields.
- **Show all** - Shows all fields.

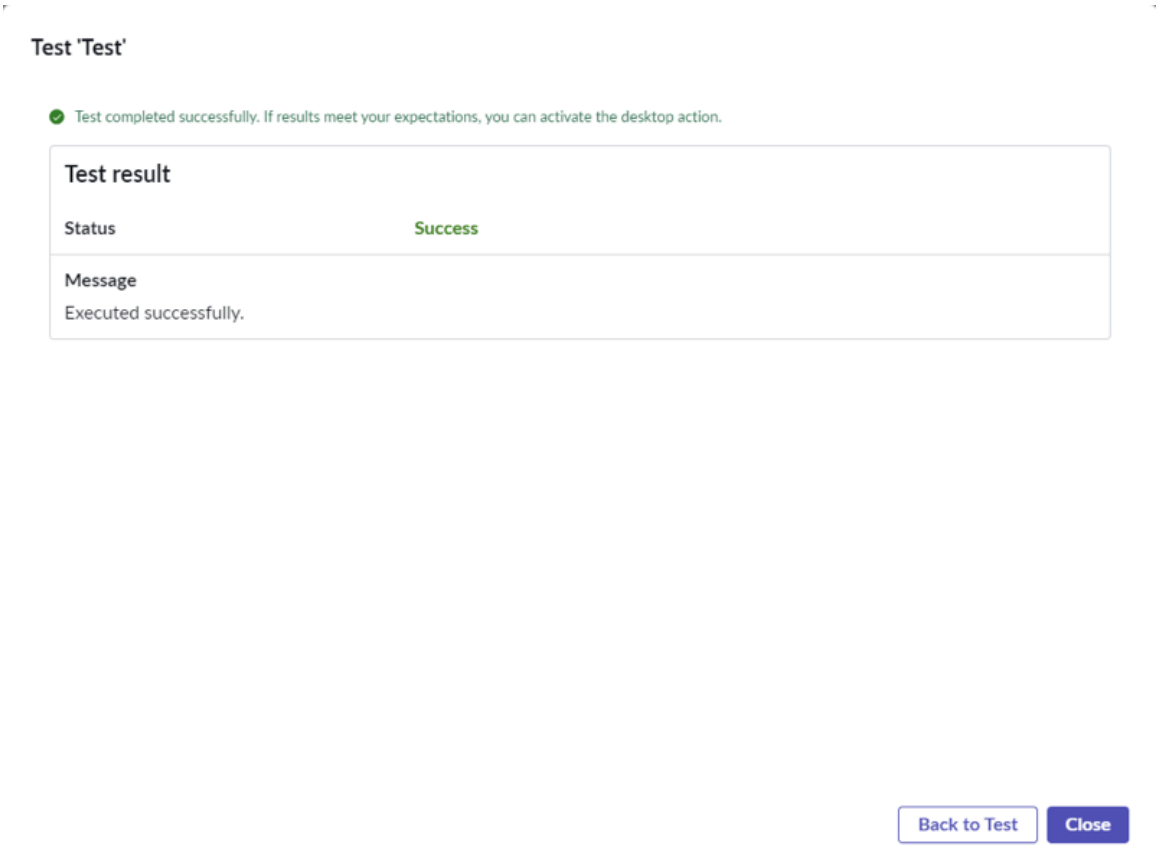
b. Select **Run test**.
The Execution workspace is launched.

c. Enter the Windows Security credentials.
Observe the test run in the Execution workspace.

> **Note:** If any pop up is blocking the automation from running, step in to clear the pop up so that you can see the test run in the Execution workspace.

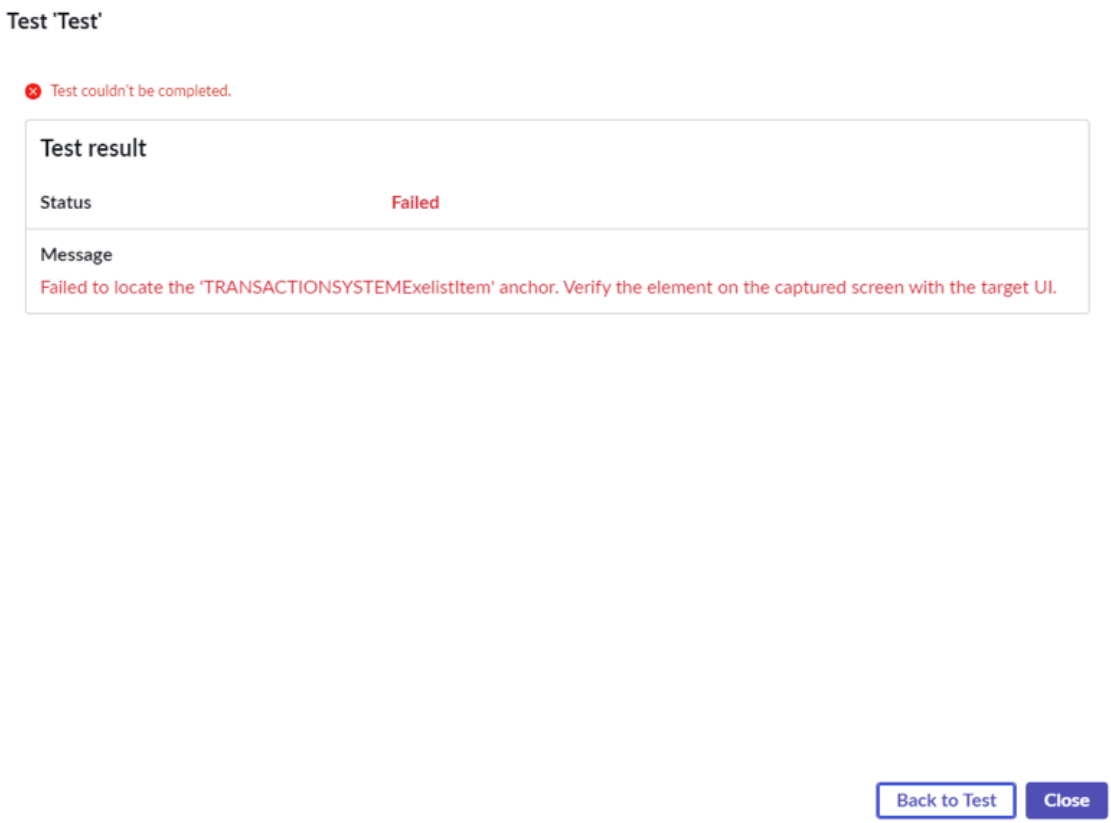
d. After the test run is complete, check the status in the Test modal.

- If test is successful, proceed with activating the desktop action.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If test isn't successful, select **Back to Test** to check the configuration and run the test again.



4. **Optional:** Cancel running test by selecting **Cancel**.
5. After a successful completion of the desktop action test and when you're satisfied with the result, select **Activate** to publish the desktop action in AI Agent Studio.

   Important: If you recorded the desktop action using Record with AI, an alert appears if any screens have failed anchors. Resolve the issues before activating to verify reliable automation at runtime.

   The **Activate** button sets the desktop action as active or inactive. Only the activated on-screen desktop actions can be selected from the drop-down in AI Agent Studio.

   Note: After activation, save the desktop action to make it available as a tool in AI Agent Studio.

Trouble?
If you get en error that the file size is beyond 10 MB, you can increase the file size in a payload by creating system properties in the ServiceNow instance. For more information, see Increase payload limit through system properties.

What to do next
Create an AI agent. For more information, see Creating AI agents and adding desktop action tool.

Enable AI agents to perform desktop actions by adding desktop actions as tools. For more information, see .

Screen, anchor, and step properties in AI Desktop Actions

Learn about the properties of screens, anchors, and steps. There are multiple types of steps and each step type has distinct properties. You can update the properties to modify the behavior of the steps.

Screen

Screen properties

Property	Description
Name	Unique name for the captured screen. The updated name reflects in the Screens and steps panel.
Execution order	Order in which the screen is executed when multiple screens are captured. You can drag the screen at the desired order in the Screens and steps panel.

Anchor

Anchor properties

Property	Description
Name	Unique name of the added anchor. The updated name reflects in the Screens and steps panel.
Execution order	Order in which the anchor is executed when multiple anchors are added.
X	Location of the top-left corner of the anchor on the screen along the X-axis.
Y	Location of the top-left corner of the anchor on the screen along the Y-axis.
Width	Width of the area highlighted as anchor.
Height	Height of the area highlighted as anchor.
Convert to grayscale	Option to convert the captured screen as a grayscale image. The default value is False.
Search in Scale	Option to specify whether the component scales the target image before trying to match the source image. The scaling is done in an increment of 10% each between 100% and 150%. The default value is False.
Confidence threshold	Specifies the accuracy in matching the image captured before the component performs a step. The value of 1 defines a 100% match while 0.5 defines 50% match. The default value is 0.95 or 95% match.
Retry with scroll	Option to scroll the target image before trying to match the source image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Anchor properties (continued)

Property	Description
Wait for image	Option to specify if the automation must wait for the image to appear on the screen. The default value is True.
Max wait time	Number of seconds to wait for the image or application to appear on the screen.
Delay before	Delay in number of seconds before the anchor is executed. The automation waits until the specified time elapses before executing the anchor.
Delay after	Delay in number of seconds after the anchor is executed. The automation will wait until the specified time elapses before executing the next anchor.

Step

Common properties for steps

The following properties apply to all steps - Set Text, Click, Mouse Click, Send Keys, Get Text, Get Table, and OCR Read Text.

Common properties

Property	Description
Name	Unique name of the step. The updated name reflects in the Screens and steps panel.
Execution order	Order in which this step is executed when multiple steps are set up. This order is assigned when you add a step from the anchor. You can drag the step under its anchor at the desired order in the Screens and Steps panel.
Type	Type of the step, such as Set Text, Get Text, Mouse Click.
Description	Helpful description of this step.
X	Location of the green plus icon along the X-axis relative to the anchor.
Y	Location of the green plus icon along the Y-axis relative to the anchor.
Delay before	Delay in seconds before the action is executed.
Delay after	Delay in seconds after the action is executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set Text

Set Text properties

Property	Description
Use parameter	Option to supply the value from a Desktop action parameter record mapped in AI Agent Studio. When selected, the Static value field is not used.
Static value	The text to enter in the field when Use parameter is not selected.

Mouse Click

Mouse Click properties

Property	Description
Mouse click type	Type of mouse click action to set for this step: • Left click • Left double click • Middle click • Right click • Right double click • Move • Drag • Drop • Scroll down • Scroll up • Paste

Send Keys

Send Keys properties

Property	Description
Clear existing value	Option to specify if the step clears the existing value on a field before setting the text.
Use parameter	Option to supply the value from a Desktop action parameter record mapped in AI Agent Studio. When selected, the Static value field is not used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Send Keys properties (continued)

Property	Description
Static value	The text to enter in the field when Use parameter is not selected.
Focus with mouse click	Option to use the mouse click to focus on the area in the application where the mouse inputs are passed.

OCR Read Text

OCR Read Text properties

Property	Description
Width	Width of the area in image to recognize and get the text.
Height	Height of the area in image to recognize and get the text.

Increase payload limit through system properties in AI Desktop Actions

By default, maximum 10 MB of file size is allowed in a scripted REST API request payload. Increase the payload limit to 15 MB by creating system properties in the global scope.

Before you begin

You must do this procedure in the ServiceNow instance.

Role required: system admin

About this task

If you already have these properties configured for your instance, you can update the value to 15 MB to increase the limit.

Procedure

1. Navigate to **All**.
2. In the filter navigator, enter `sys_properties.list`.
3. In the System Properties table, select **New** to add the *`glide.rest.max_content_length`* property.

   a. On the form, fill in the fields.

Field	Description	Value
Name	Name of this system property	glide.rest.max_content_length
Description	Explanation for this property	For example: `Revised payload for a scripted REST request body.`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Value
Type	Data type of this system property	integer
Value	The maximum size, in megabytes, for a scripted REST request body. The default value is 10 MB.	15

b. Select **Submit**.

4. In the System Properties table, select **New** to add the *glide.rest.scripted.max_inbound_content_length_mb* property.

a. On the form, fill in the fields.

Field	Description	Value
Name	Name of this system property	glide.rest.scripted.max_inbound_content_leng
Description	Explanation for this property	For example: `Revised payload for a scripted REST request body.`
Type	Data type of this system property	integer
Value	The maximum size, in megabytes, for a scripted REST request body. The default value is 10 MB. **Note:** Even if glide.rest.scripted.max_inbound_content_length_mb is set, the request body is limited to the value of glide.rest.max_content_length.	15

b. Select **Submit**.

Creating AI agents and adding desktop action tool

Create an AI agent and add desktop action tool in AI Agent Studio to mimic human-like intelligence while executing desktop actions for repetitive tasks in web and desktop environment.

AI agent and agentic workflow for AI Desktop Actions

In the ServiceNow agentic ecosystem, an AI agent is a set of large language model (LLM) instructions and tools that can perform specific tasks. The AI agents can perform specific tasks and functions, often using natural language instead of traditional code. For more information creating AI agents, see Create an AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents process instructions, generate execution plans, and run desktop actions autonomously and semi-autonomously across legacy systems, thick client applications, and web applications lacking APIs or backend integrations. AI agents can interpret your goal and map them to one or more desktop actions via metadata (capabilities, inputs, and outputs).

Use AI agents to do the following tasks for your organization:

- Generate a dynamic execution plan for desktop or web-based tasks
- Coordinate with other AI agents to complete subtasks
- Process human input during task execution when required
- Collaborate with users to resolve issues that require human judgment

Trigger conditions aren't supported for AI agents that execute desktop actions. You must manually trigger these agents from the system where the AI Desktop Actions application is installed.

For adaptive desktop actions, an AI agent named **Web Automation Agent** and agentic workflow named **Web Automation** are provided by default when you install AI Desktop Actions. You can create a different agentic workflow referencing this AI agent or AI agent that you created. For more information about creating agentic workflows, see Create an agentic workflow.

Desktop action tool for an AI agent

Desktop actions are tools that AI agents use to interact with web and desktop applications. An AI agent uses a desktop action to automate tasks in desktop-based or web-based applications on the end user's system. You can create a desktop action or add an existing one as a tool to your AI agent. For more information about adding desktop action tools, see Add a desktop action tool to an AI agent.

There are two types of desktop actions.

Defined desktop action

Created in the AI Desktop Actions client application on the Windows machine, then added as a tool to an AI agent.

Adaptive desktop action

Configured in AI Agent Studio during AI agent tool configuration. There are two ways the adaptive desktop actions run:

- **Desktop applications**: AI agents run these desktop actions in the AI Desktop Actions client application on the macOS machine. For more information, see Adaptive desktop actions for desktop and web-based tasks.

  ⚠ **Warning:** This is a beta feature in this release. Functionality, behavior, and execution logic may change in subsequent releases. Test these desktop actions thoroughly in a test environment before deploying to production. Report issues or feedback through your support channels.

- **Web based applications**: AI agents run these desktop actions in the Google Chrome browser through a browser extension. For more information, see Adaptive desktop actions for web-based tasks.

Testing an AI agent or agentic workflow

Test an AI agent or agentic workflow that uses adaptive desktop actions in AI Agent Studio to evaluate its performance. For more information, see Manually test an agentic AI asset.

Examples of creating desktop actions

Learn the key concepts and workflow for creating end-to-end desktop actions and building automations for your desktop environments.

The tasks that you can automate are done manually on desktop-native applications and repetitive in nature. Here are examples:

Badge management automation

Shows how an HR team automates the end-to-end workflow for issuing, replacing, and disabling badges for their employees.

Shipping order processing

Demonstrates how to extract order data from Excel, interact with a shipping management tool, and complete the data processing life cycle.

Example: Automate badge request management using AI Desktop Actions

Automate various tasks related to badge requests through desktop actions using AI Desktop Actions and AI agents.

Your HR representatives manage repetitive badge-related tasks. For example, issuing new badges, distributing temporary badges, replacing lost badges, and disabling badges during offboarding. To streamline and automate this work, you can create a desktop action for each task and assign these actions to an AI Agent in AI Agent Studio.

When new requests come in, HR representatives can trigger the AI agent from the ServiceNow Otto panel. The AI Agent automatically selects and runs the appropriate desktop action. This automation reduces manual effort and enables them to focus on higher-value work.

Create badge desktop action in AI Desktop Actions

Automate various badge-related tasks through desktop actions in AI Desktop Actions.

Before you begin

To access the AI Desktop Actions functionality, perform the following steps:

- Enable AI Desktop Actions on your ServiceNow instance. For more information, see Configure AI Desktop Actions.
- Download the AI Desktop Actions installer to automate repetitive tasks across applications and systems. For more information, see Download AI Desktop Actions installer for defined desktop actions.

Confirm that the following system requirements are met:

- Windows 11 operating system is used.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- No extended monitors are connected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Theme must match between the systems used for recording and execution.
- For record with AI, the ServiceNow AI Lens skill must be active on your instance. Contact your ServiceNow administrator if you're unsure whether this condition is met.

Familiarize yourself with the Design workspace and Action recorder. For more information, see AI Desktop Actions Design workspace and Action recorder in AI Desktop Actions.

Role required: sn_desktop_core.desktop_action_user

About this task

Record with AI generates more accurate anchor positions automatically, reducing the time you spend on manual anchor adjustments.

When you record with AI, after you finish recording, AI analyzes the recording, validates anchor positions, and corrects inaccuracies before you save or activate the desktop action. AI also generates a screen context for each captured screen and description for the desktop action. Screen context is a description of what the screen does and what it contains, which helps reviewers and AI agents understand the screen's intent.

Note: If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for the user input during execution. Otherwise, the automation can't proceed.

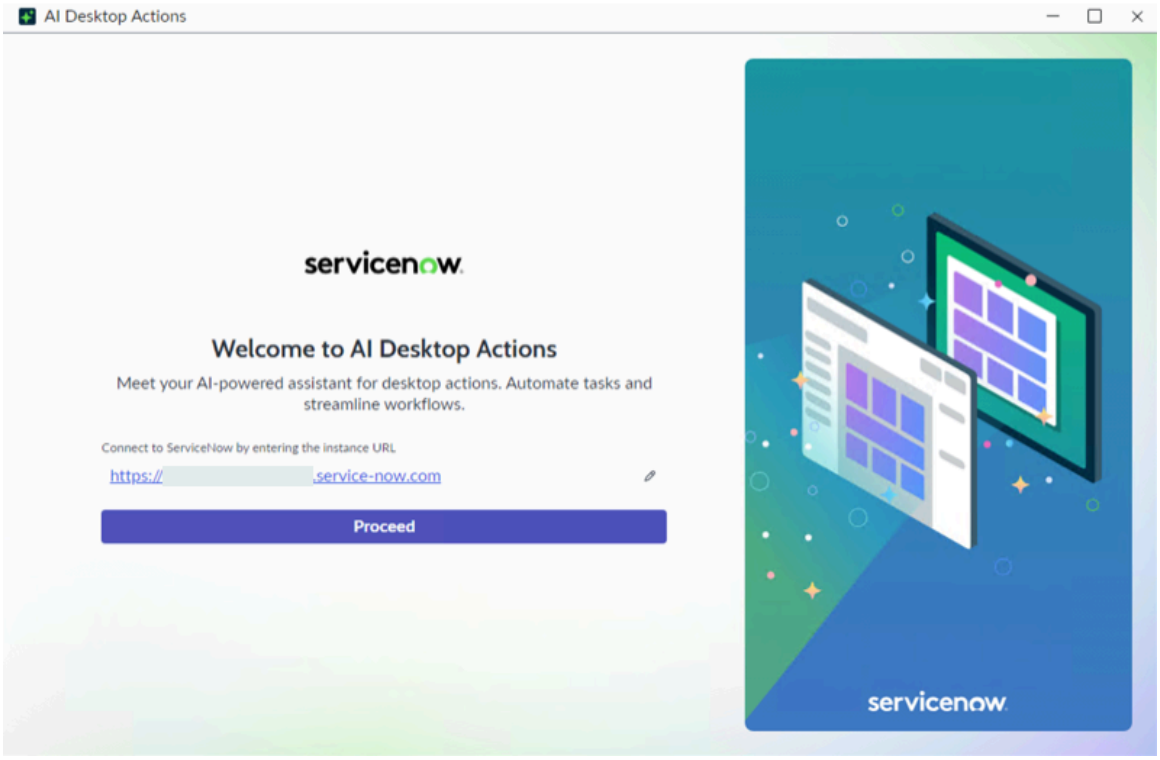
The *sn_desktop_core.record_with_ai* property is enabled by default, making **Record with AI** the default recording option. Turn off this property to set the manual recorder as the default recording option.

Procedure

1. From your Windows system, launch the AI Desktop Actions application.
2. On the login page, in the **Add ServiceNow URL** field, enter the ServiceNow instance URL.

   Example
   For example, `https://<instance name>.service-now.com`.

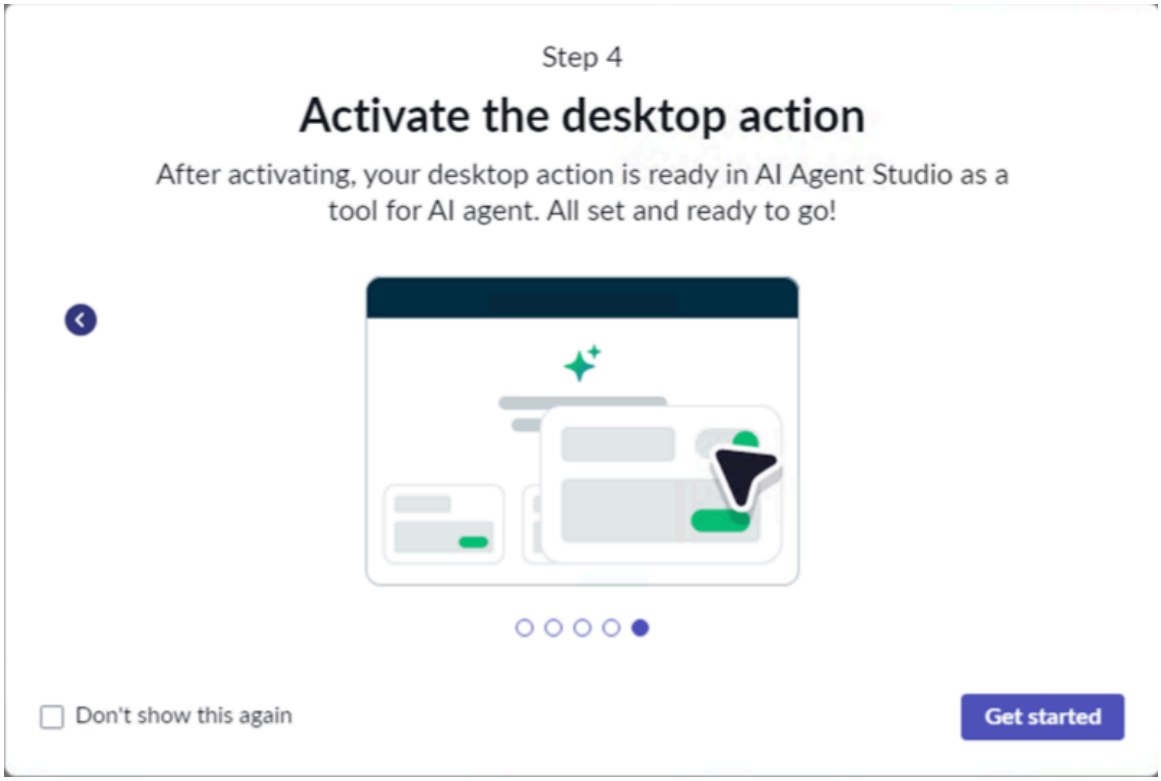
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Proceed**.
4. Log in to your ServiceNow account by entering your user name and password. Your must have the sn_aia.admin role.

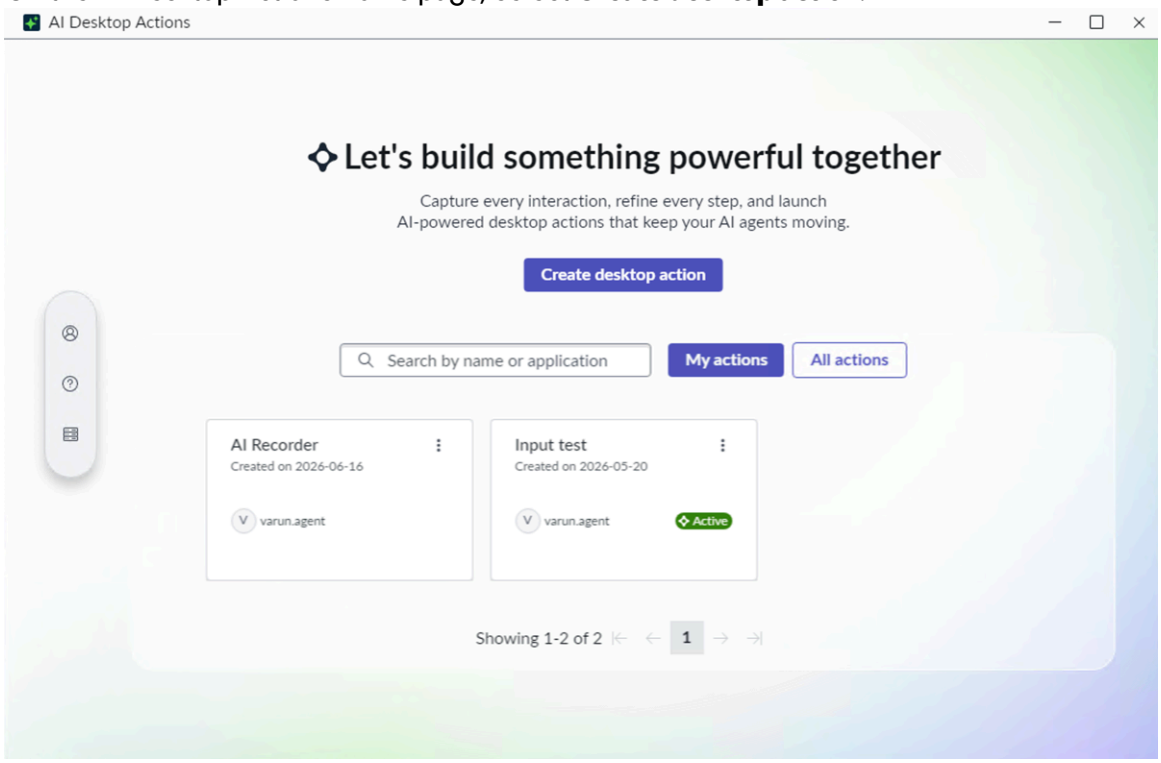
5. **Optional:** On the onboarding journey modal, complete the onboarding and select **Get started**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you launch the AI Desktop Actions for the first time, the onboarding journey widget appears. You can select **Don't show me again** to hide the widget the next time you launch AI Desktop Actions or **Skip intro** to skip the onboarding.

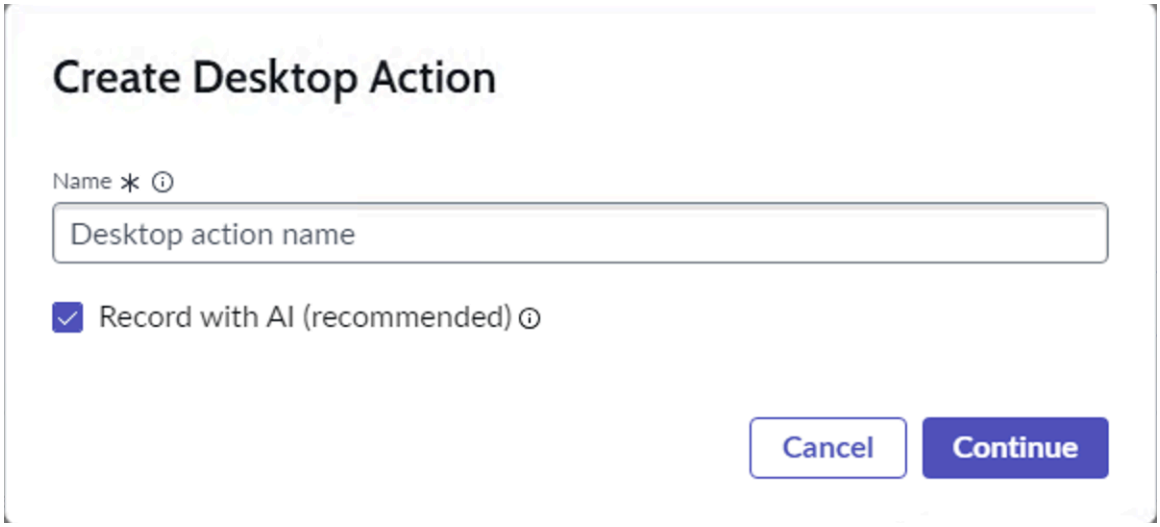
6. On the AI Desktop Actions home page, select **Create desktop action**.



7. In the Create Desktop Action dialog, do one of the following.

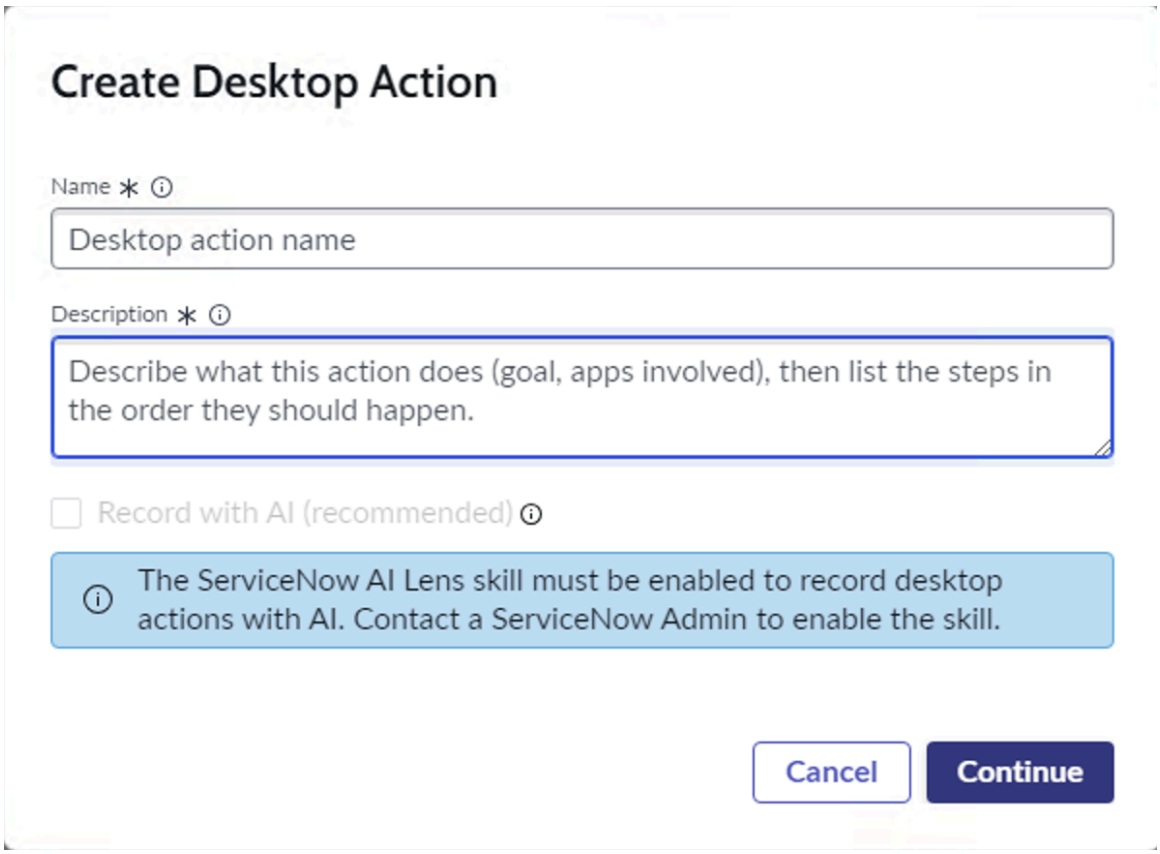
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you want to record with AI, keep the **Record with AI (recommended)** check box selected.



Important: If the **Record with AI (recommended)** check box is unavailable, the ServiceNow AI Lens is inactive on your instance. Contact your ServiceNow administrator to enable it. You can still create desktop actions using auto-capture mode.

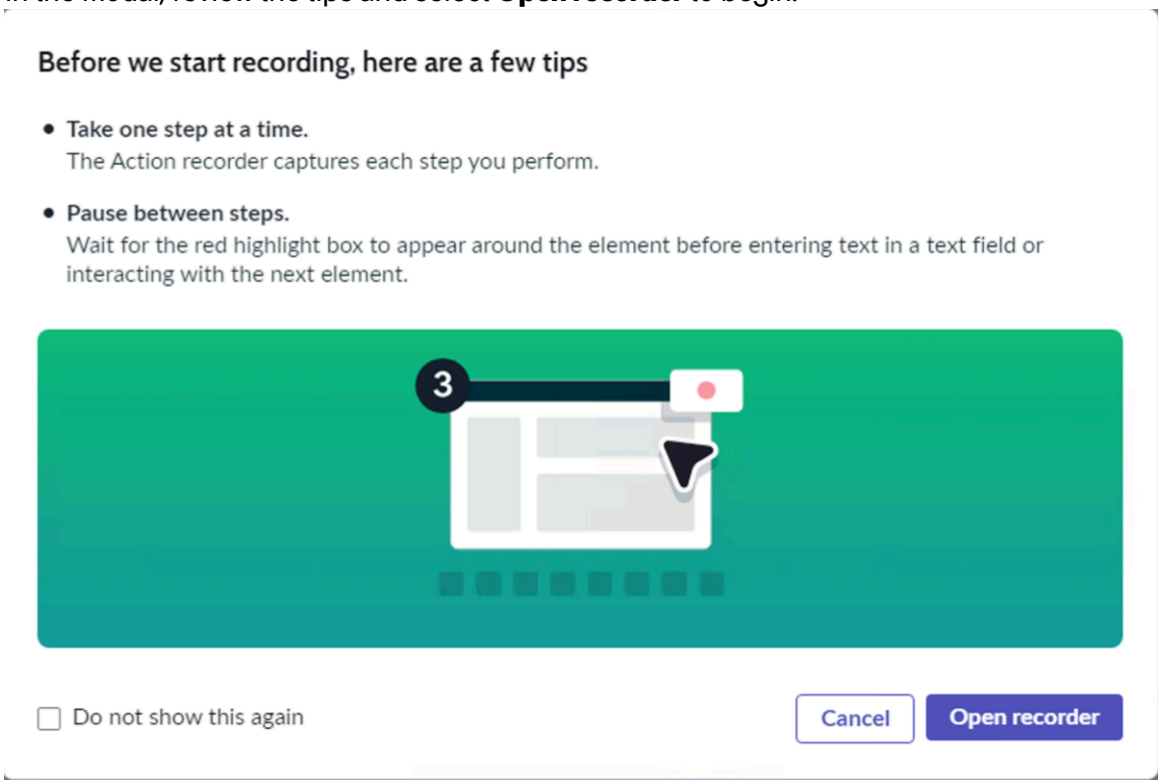
- If you want to use manual recorder, clear the **Record with AI (recommended)** check box.



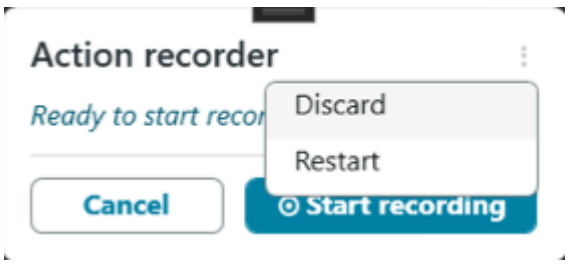
8. In the **Name** field, enter `Create new badge`.
9. In the **Description** field, enter `Desktop action for issuing a badge to a new employee.`
   This field only appears when you clear the **Record with AI (recommended)** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Select **Continue**.
11. In the modal, review the tips and select **Open recorder** to begin.



The AI Desktop Actions window is minimized and the Action recorder panel is launched. You can freely drag and reposition the Action recorder panel anywhere on your desktop screen.



12. Open the **Employee Badge Management** application on your desktop.
13. From the Action recorder panel, select **Start recording**.

> **Important:** Before you start recording, review the tips for accurate capturing of anchors and steps. For more information, see Tips for accurate recording.

You will see a "Recording started" message on the Action recorder panel. You can select any of the following options when needed from the **More options** menu:

- **Pause**: Skip recording steps
- **Restart**: Restart recording the steps

  You will lose the recorded screens and steps.

- **Discard**: Discard the recording if it doesn't meet your needs

14. On the **Employee Badge Management** application, perform the following steps for creating a badge.

The recorder feature records the steps that you perform for creating a badge.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **CREATE BADGE** on the **New Badge** tile.

b. In the New Badge Creation page, search for the employee using the employee ID.

c. After the employee record is found, select **CREATE BADGE** for creating badge.

You see the success message that the new badge is created.

15. After you're done with all the steps, select **End recording** on the Action recorder panel.
You see a "Draft workflow saved" message on the Action recorder panel.

For Record with AI option, AI processes the recording in three stages:

a. Analyzing your recording with AI

b. Inserting anchors

c. Generating screen contexts
You must not close the application during processing.

The recorded steps are displayed as screenshots in the Design workspace with anchors and steps automatically assigned.

Screen1

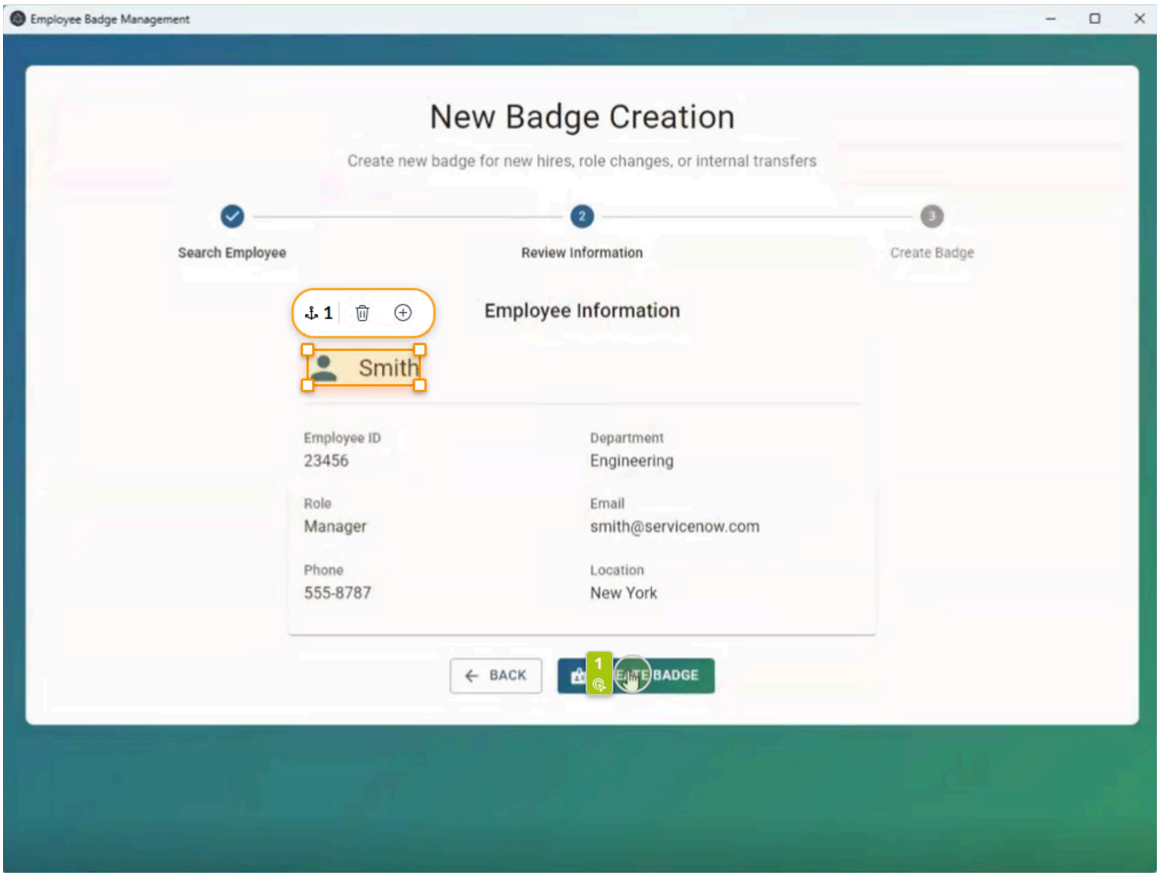
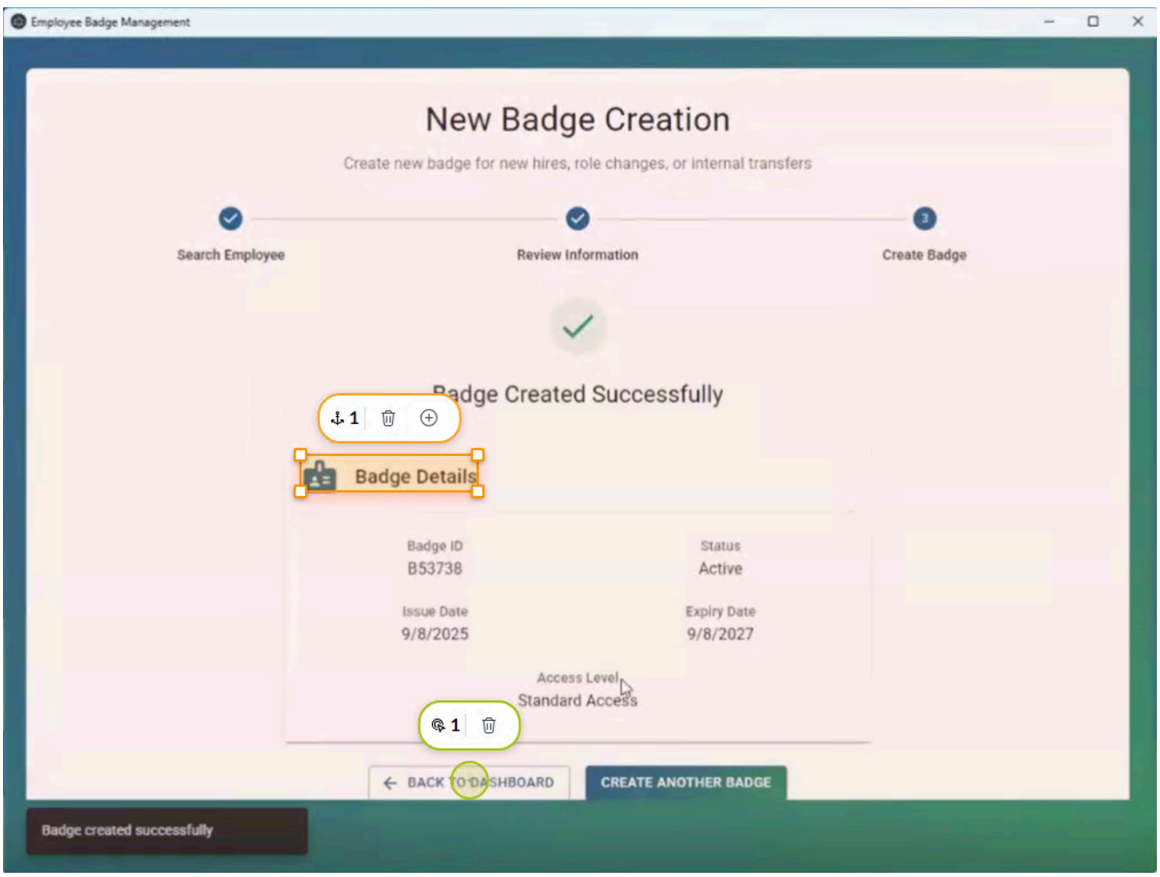
Screen4



Screen5



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

16. Configure the following properties for the captured steps.

Screen > Step	Property	Value
Screen1 > SetText1	Value	admin
Screen1 > SetText2	Value	Enter your password
Screen1 > Click1	Delay after	5
Screen2 > Click2	Delay after	5
Screen3 > Click2	Delay after	10

For more information, see Screen, anchor, and step properties in AI Desktop Actions.

17. **Optional:** Modify the auto-generated names for all added screens, anchors, and steps.

(Optional) You can modify the auto-generated names following these naming guidelines.

- Name fields must not be empty.
- Name fields must contain only alphanumeric characters. Spaces and special characters are not permitted.
- Each name must be unique at its respective parent level.
  - Each screen must have a unique name at the desktop-action level.
  - Each anchor must have a unique name at the screen level.
  - Each step must have a unique name at the anchor level.

18. Select the Details tab.
19. In the Applications list, add Badge Management Application.
20. Select **Save**.
21. Test and activate the desktop action.
For more information, see Test and activate a desktop action in AI Desktop Actions.
22. Similarly, create and activate the following desktop actions.
    - Badge application login
    - Badge application logout
    - Reissue badge
    - Deactivate badge
    - Issue a temporary badge
    - Read Request details

Create AI agents and add tools for badge management

Create an AI agent in AI Agent Studio and add desktop action tools for automating badge-related requests.

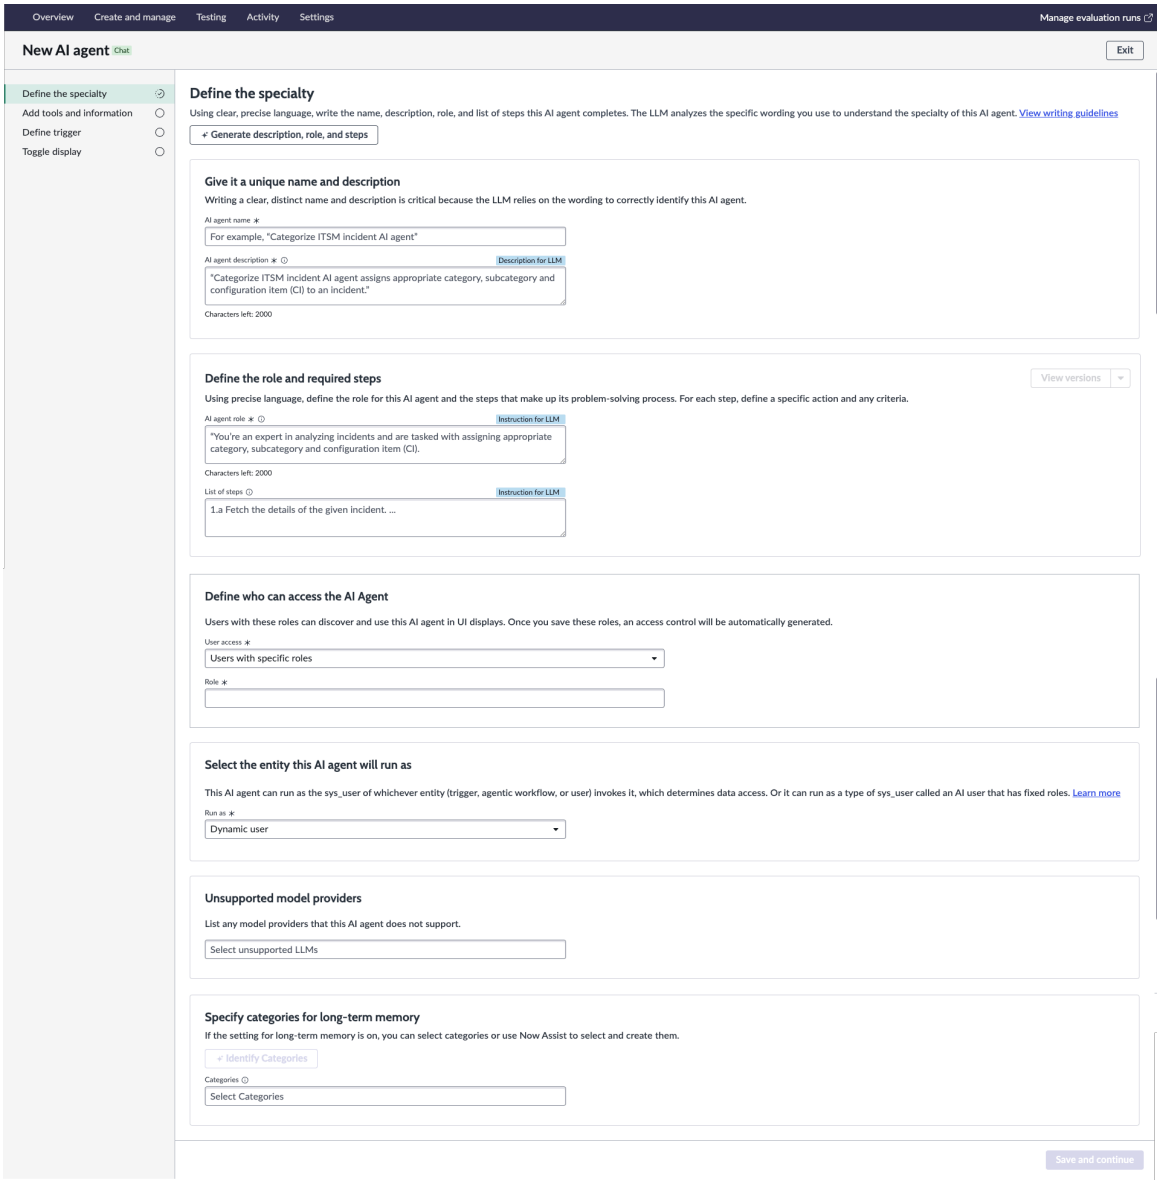
Before you begin

Role required: sn_aia.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. From the **Add** drop-down, select **Chat**.
3. On the New AI Agent page, in the Define the specialty step, define your AI agent and provide the specialties that this agent contains so that the LLM can analyze the wording you use to understand the purpose of the AI agent.



Note: The more details that you provide, the more accurately your AI agent can perform.

a. Describe your AI Agent by giving it a unique name and description.

Give it a unique name and description

Field	Description
AI agent name	Badge Management Agent
AI agent Description	This AI agent takes Requests details and launches the Employee Badge Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	application and perform various tasks—create badges, deactivate badges, replace lost badges, and Reissue the badges. The agent executes the appropriate desktop actions automatically. This reduces manual effort, ensures process consistency, and speeds up the overall employee lifecycle experience.

b. Define the role and necessary steps so that the AI agent can carry out its tasks.

Note: The AI agent uses this information as guidance to tailor its responses and actions.

Define the role and required steps

Field	Description
AI agent role	Automates the intake of badge-related requests and performs accurate, end-to-end execution of badge actions—such as issuance, replacement, temporary provisioning, and deactivation—across the HR and security systems.
List of steps	**Note:** If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for the user input during execution. Otherwise, the automation can't proceed. Read the comma-separated Request numbers from the input by invoking the **Read Request details** desktop action. Launch and log in to the Employee Badge Management application by invoking the **Badge application login** desktop action. Based on the details of each Request, perform one of the following actions that is applicable. ▪ Create a badge i. Create a badge in Employee Badge Management application by invoking **Create new badge** desktop action. ii. If badge creation failed, create an incident with the issue details. Otherwise, continue with other steps. ▪ Deactivate a badge

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	i. Deactivate a badge in Employee Badge Management application by invoking **Deactivate badge** desktop action. ii. If badge deactivation failed, create an incident with the issue details. Otherwise, continue with other steps. ▪ Reissue Badge i. Reissue a badge in Employee Badge Management application by invoking **Reissue badge** desktop action. ii. If badge deactivation failed, create an incident with the issue details. Otherwise, continue with other steps. ▪ Issue a temporary badge i. Issue a temporary badge in Employee Badge Management application by invoking **Issue temporary badge** desktop action. ii. If badge reissue failed, create an incident with the issue details. Otherwise, continue with other steps. Log out of the Employee Badge Management application by invoking the **Badge application logout** desktop action.

c. Select **Save and continue**.
You're directed to the Add tools and information page.

4. On the Add tools and information page, add Desktop actions tools for AI agents to automate your desktop tasks.

a. In the Add tool drop-down list, select **Desktop action**.

b. In the **Select a desktop action** drop-down list, select **Create new badge** desktop action.
This desktop action enables AI agents to create a badge in the Employee Badge Management application.

c. Provide a name and tool description for this desktop action configuration.
Tool description of the desktop action helps with what it's going to do to assist your AI agent.

Note: This description is sent to the large language model (LLM).

d. In the **Execution mode** field, select **Autonomous**.

e. Select **Add**.
The desktop action is added in the Desktop actions list on the Add tools and information page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Similarly, add the following desktop actions related to the badge management to this AI agent.
   - Badge application login
   - Badge application logout
   - Reissue badge
   - Deactivate badge
   - Issue a temporary badge
   - Read Request details

5. Select **Save and continue**.
6. Complete the remaining steps that are necessary.
   For more information, see Create an AI agent.
7. Select **Save and test** to complete the configuration steps or review a previous step by selecting **Back**.

   Selecting Save and test leads you to the AI agent testing page, where you can test the AI agent that you created. For more information, see Manually test the execution of an AI agent.

   To test the AI agent, you must have the sn_aia.admin role and any roles the ACLs configured for the AI agent and its tools require, if applicable.

What to do next

Enable your HR representatives to trigger AI agents from the ServiceNow Otto panel to address badge-related requests.

For more information, see Example: Use AI agents to process badge-related requests automatically.

Example: Automate shipping management tasks using AI Desktop Actions

Automate various tasks related to shipping management through desktop actions using AI Desktop Actions and AI agents.

Your shipping coordinators frequently handle repetitive data-entry tasks. For example, entering PO numbers, invoice details, customer information, shipping addresses, item dimensions, and weights from Excel into the Shipping Management application on their desktops. When there are dozens of rows to process, it becomes time-consuming, error-prone, and significantly slows down their daily workflow.

To streamline this process, you can create a dedicated desktop action that reads each row from the Excel file and automatically inputs the data into the Shipping Management application. You can then assign this action to an AI Agent. When new shipping batches arrive, shipping coordinators simply trigger the AI Agent from the ServiceNow Otto panel. The agent then automatically processes each line item by selecting and running the appropriate desktop action.

Create Process shipping orders desktop action in AI Desktop Actions

Automate various tasks related to shipping management through desktop actions in AI Desktop Actions.

Before you begin

To access the AI Desktop Actions functionality, perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable AI Desktop Actions on your ServiceNow instance. For more information, see Configure AI Desktop Actions.
- Download the AI Desktop Actions installer to automate repetitive tasks across applications and systems. For more information, see Download AI Desktop Actions installer for defined desktop actions.

Confirm that the following system requirements are met:

- Windows 11 operating system is used.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- No extended monitors are connected.
- Theme must match between the systems used for recording and execution.

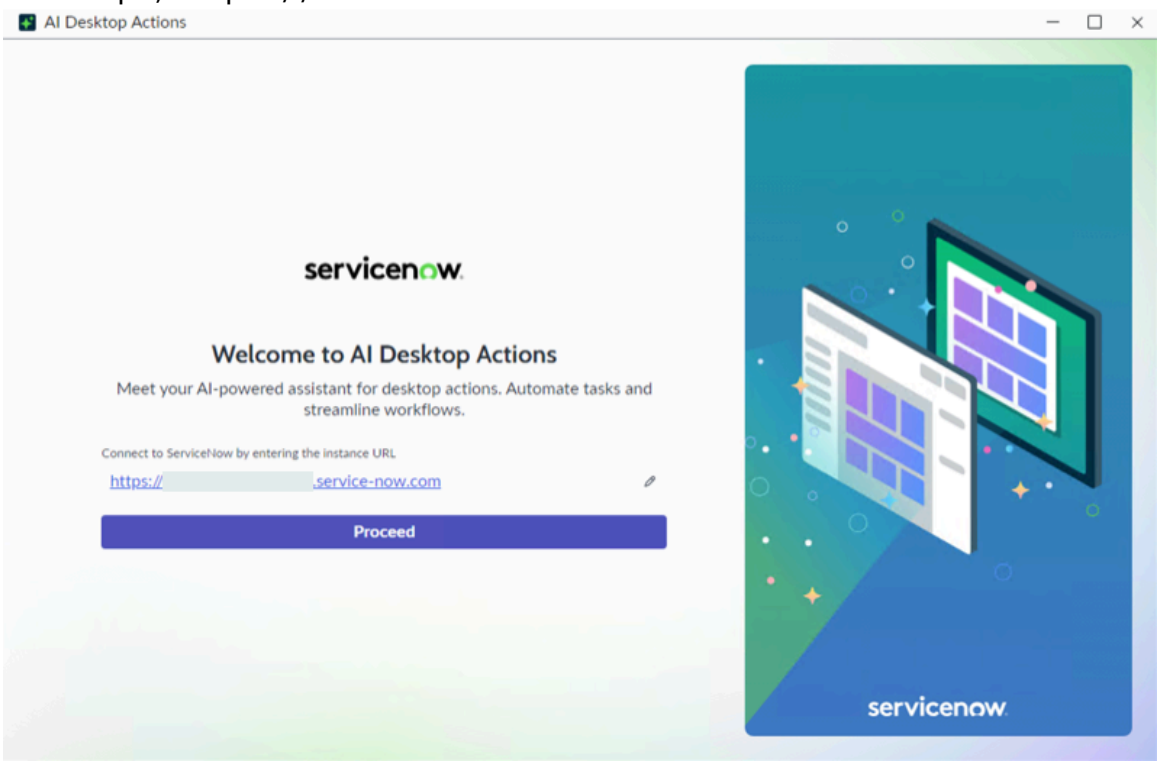
Familiarize yourself with the Design workspace and Action recorder. For more information, see AI Desktop Actions Design workspace and Action recorder in AI Desktop Actions.

Role required: sn_aia.admin

Procedure

1. From your Windows system, launch the AI Desktop Actions application.
2. On the login page, in the **Add ServiceNow URL** field, enter the ServiceNow instance URL.

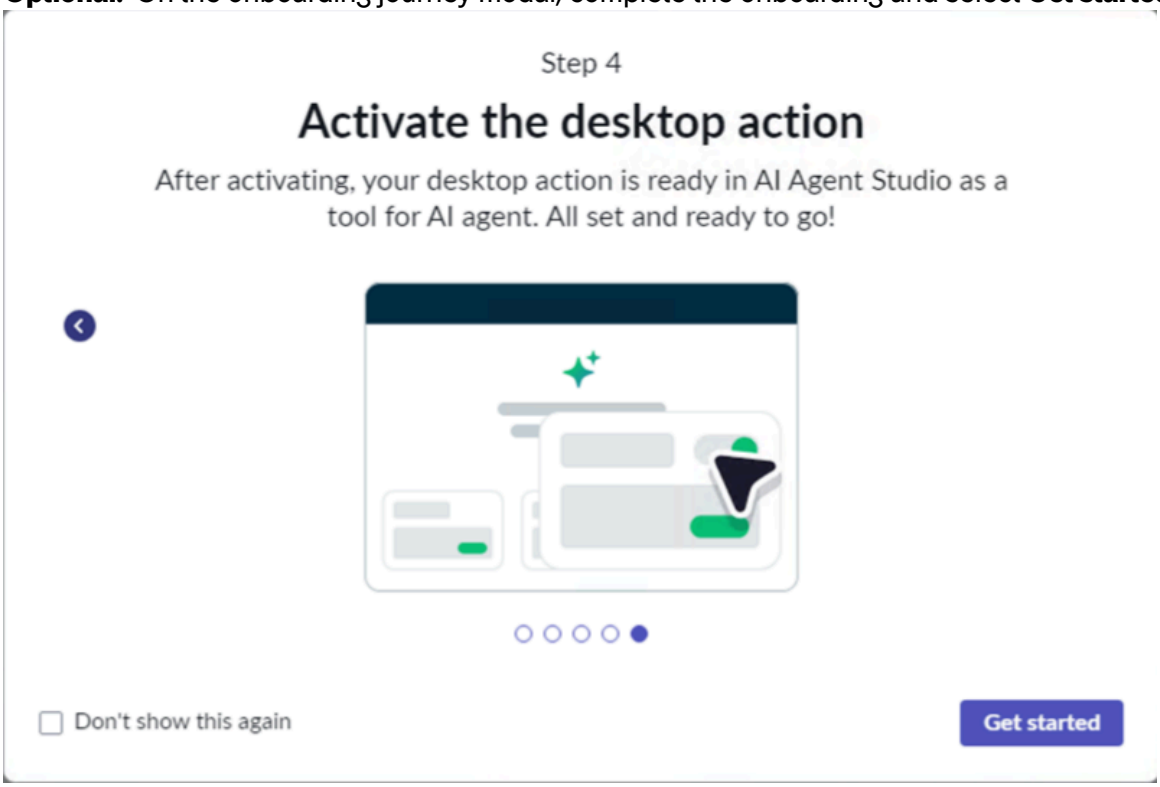
   Example
   For example, `https://<instance name>.service-now.com`.



3. Select **Proceed**.
4. Log in to your ServiceNow account by entering your user name and password.
   Your must have the sn_aia.admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

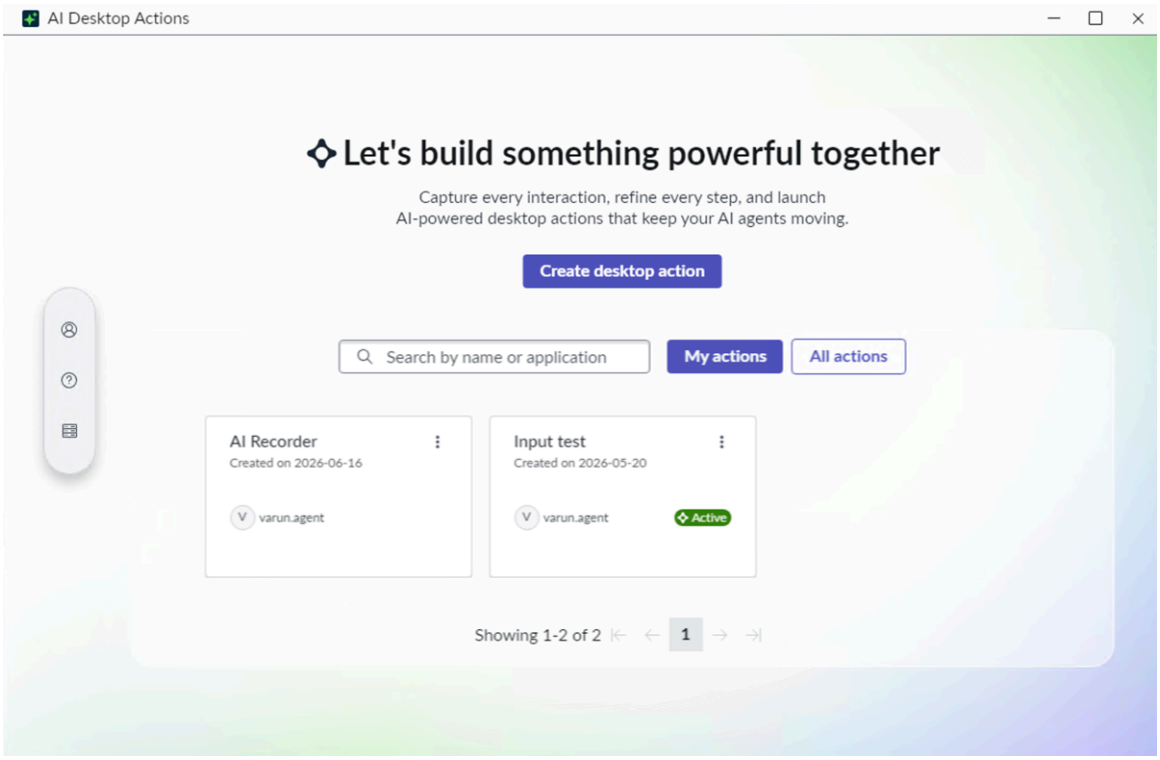
5. **Optional:** On the onboarding journey modal, complete the onboarding and select **Get started**.



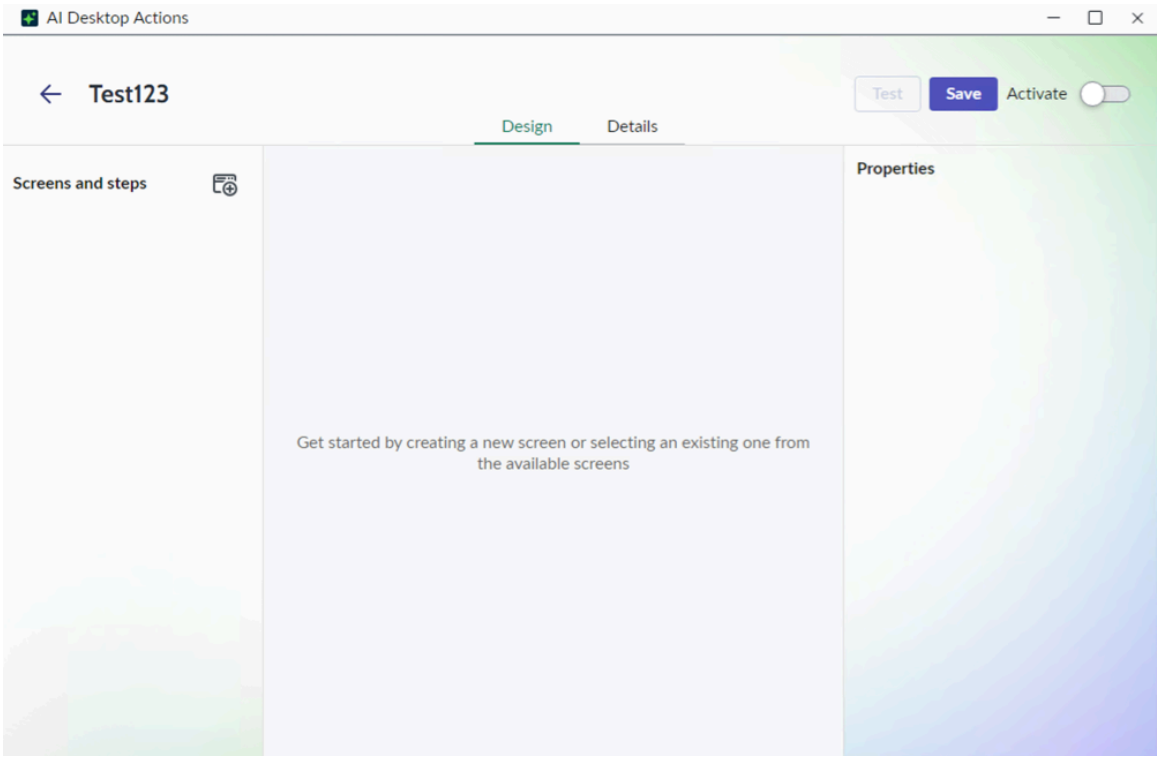
If you launch the AI Desktop Actions for the first time, the onboarding journey widget appears. You can select **Don't show me again** to hide the widget the next time you launch AI Desktop Actions or **Skip intro** to skip the onboarding.

6. On the AI Desktop Actions home page, select an existing desktop action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Design workspace is displayed.

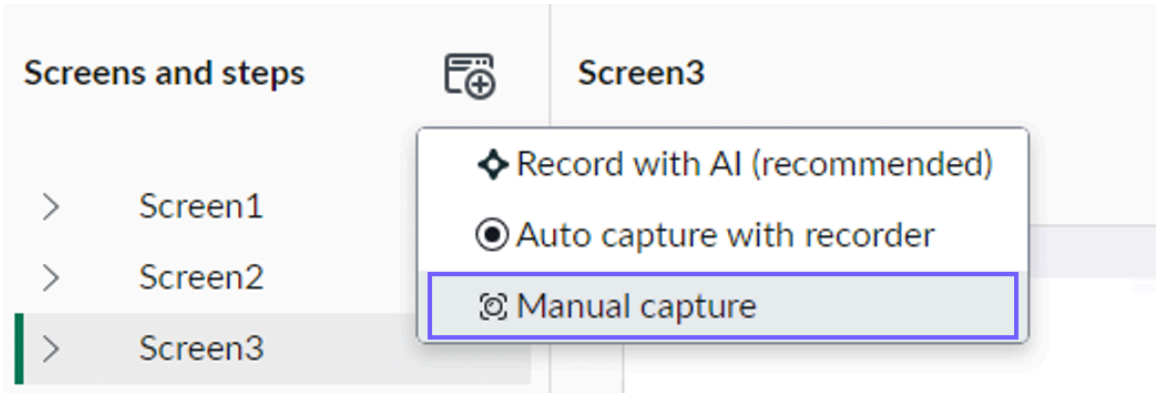


7. Capture screens.

   a. In the Design tab, select the **Capture Options** icon .

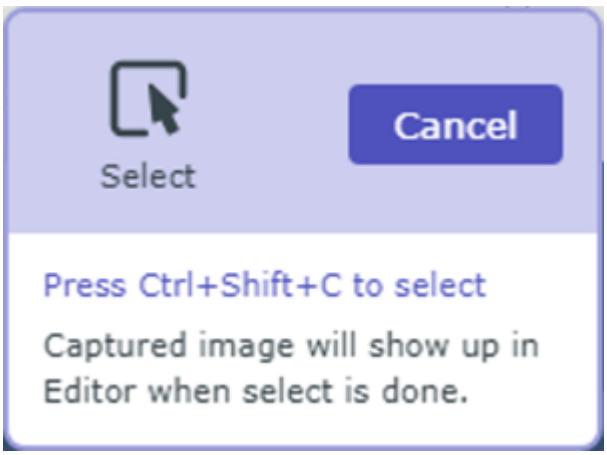
   b. Select **Manual capture**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



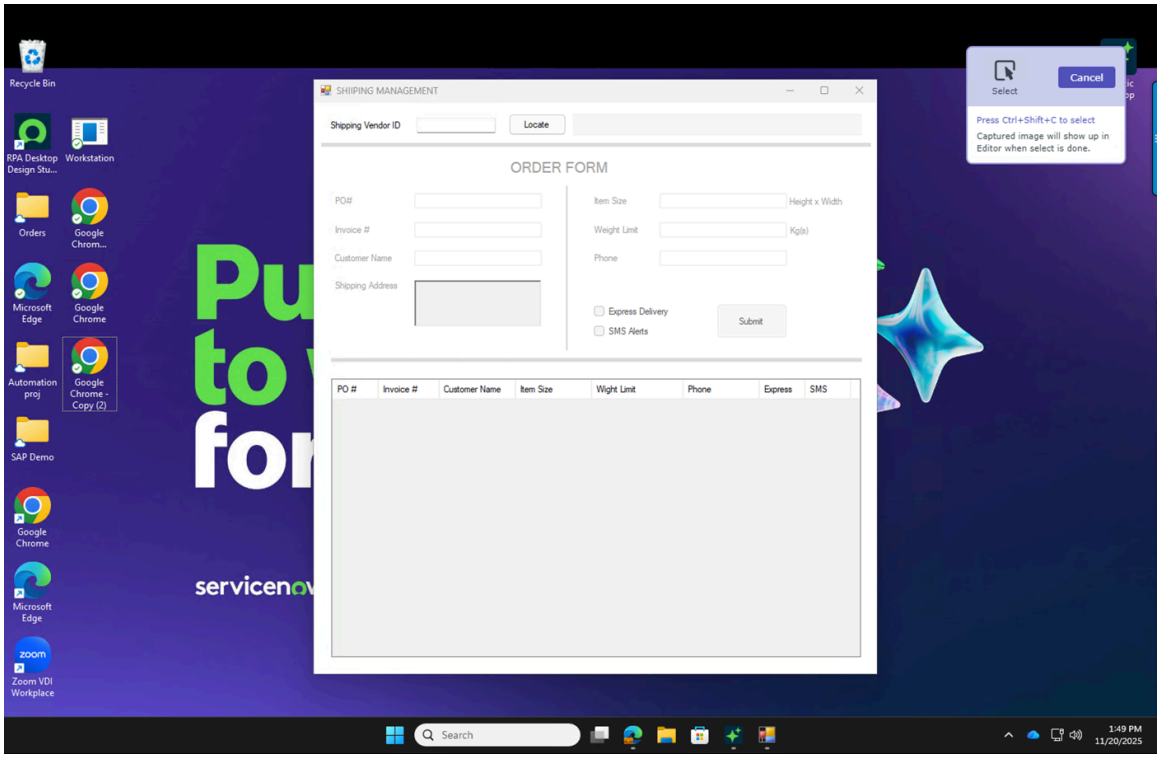
You can also extend the desktop action logic using the **Record with AI (Recommended)** or **Auto capture with recorder** options. For more information, see Automate repetitive tasks by recording steps with AI in AI Desktop Actions and Automate repetitive tasks by auto-capturing steps in AI Desktop Actions.

The AI Desktop Actions window is minimized and the Capture panel is launched.



c. Open the Shipping Management application from your desktop.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Capture the area of the external application's window by selecting the **Select** icon on the Capture panel or pressing the `Ctrl + Shift + C` on the keyboard.

> **Note:** If the `Ctrl + Shift + C` shortcut conflicts with another application on the your machine, such as Zoom, then you must use the **Select** button to initiate manual screen capture.

For example, you can capture the area surrounding a button or a text field in a web browser.

The cursor icon changes to the + icon.

e. Drag the + icon and select the required screen area.

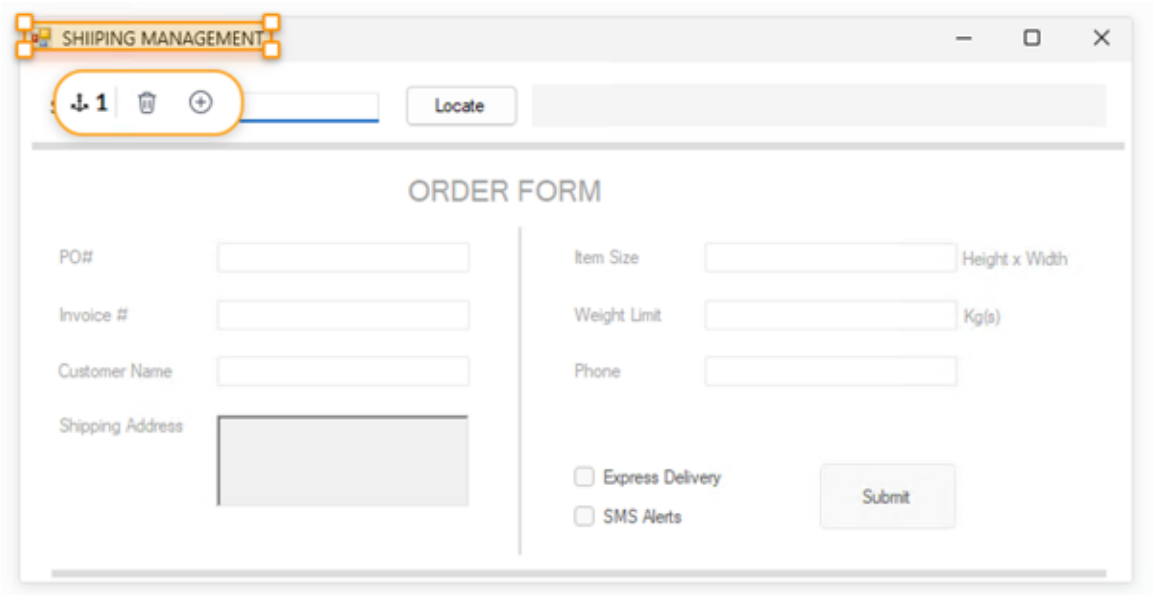
When you leave the + icon, the selected area is captured as a screenshot in the Design workspace.

If you aren't satisfied with the captured screen, you can recapture the screen area by selecting the **Capture image** icon .

8. Insert anchors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Insert an anchor on the captured screen by selecting the **Add anchor** icon .



Note: If two applications in the frame have similar logos or visual elements, verify that the anchor position is unique to the target application to avoid incorrect element identification during automation.

An anchor is a reference point on the screen that helps the automation identify and interact with a nearby UI elements. During execution, the system uses computer vision to locate the anchor and then identifies the UI elements at a related distance from the anchor. Anchors improve the stability and accuracy of steps when the target element's location may shift or when the UI layout varies across sessions.

Note: Don't use dynamically changing UI elements as anchors. If an element changes its color, text, or state after an action (for example, after a click), select a different anchor that remains static on the screen.

b. Move the anchor to a part of the captured image that won't change.
For example, move the anchor to a title or field label.

If the area under the anchor doesn't exactly match the corresponding area of the captured image, the anchor isn't recognized, and the steps aren't performed as intended. Choose a static area of the image for setting your anchor.

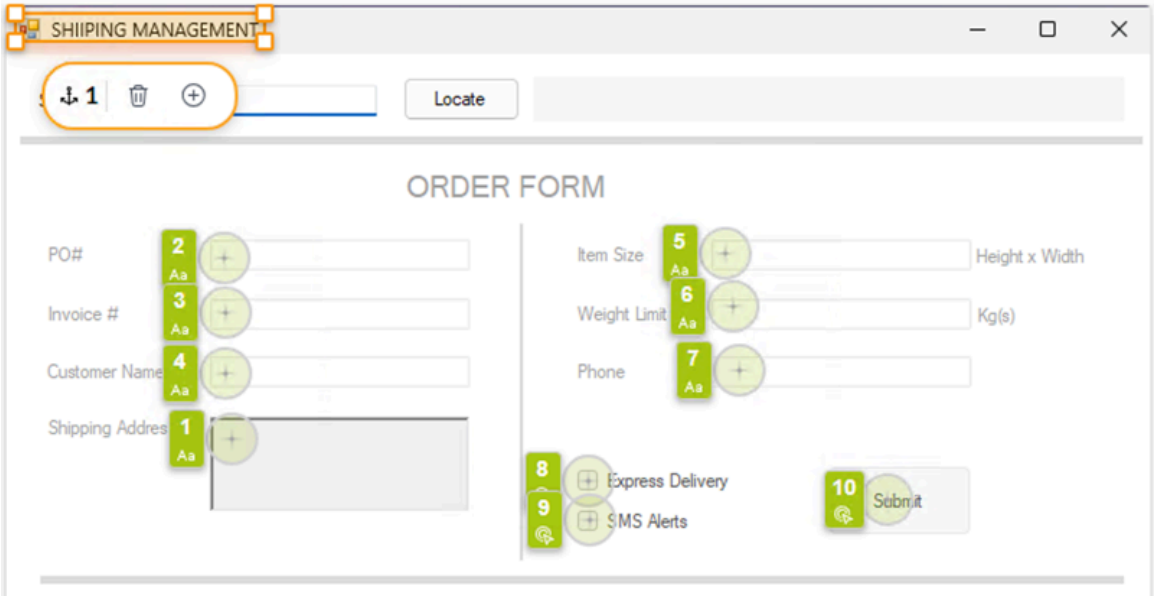
You can add multiple anchors on each screen. Multiple anchors let you define the geographical relationship between anchor and target with greater accuracy when targeting different locations in the image.

9. Configure the steps.

a. From the Step control menu, select the **Add step** icon ⊕.

b. Select the type of step for each field on the ORDER FORM from the contextual menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Number	Field	Step
1	PO#	Set Text
2	Invoice#	Set Text
3	Customer Name	Set Text
4	Shipping Address	Set Text
5	Item size	Set Text
6	Weight limit	Set Text
7	Phone	Set Text
8	Express Delivery	Click
9	SMS Alerts	Click
10	Submit	Click

10. Configure the properties for added screens, anchors, and steps in the Properties panel. For more information, see Screen, anchor, and step properties in AI Desktop Actions.
11. **Optional:** Modify the auto-generated names for all added screens, anchors, and steps.

    (Optional) You can modify the auto-generated names following these naming guidelines.

    - Name fields must not be empty.
    - Name fields must contain only alphanumeric characters. Spaces and special characters are not permitted.
    - Each name must be unique at its respective parent level.
        - Each screen must have a unique name at the desktop-action level.
        - Each anchor must have a unique name at the screen level.
        - Each step must have a unique name at the anchor level.
12. Select the Details tab.
13. In the Applications list, add Shipping Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

14. Select **Save**.
15. Test and activate the desktop action.
    For more information, see Test and activate a desktop action in AI Desktop Actions.
16. Similarly, create and activate the **Shipping Management login** desktop action.

Create AI agents and add tools for shipping orders

Create an AI agent in AI Agent Studio and add desktop action tools for Shipping Management task automation.

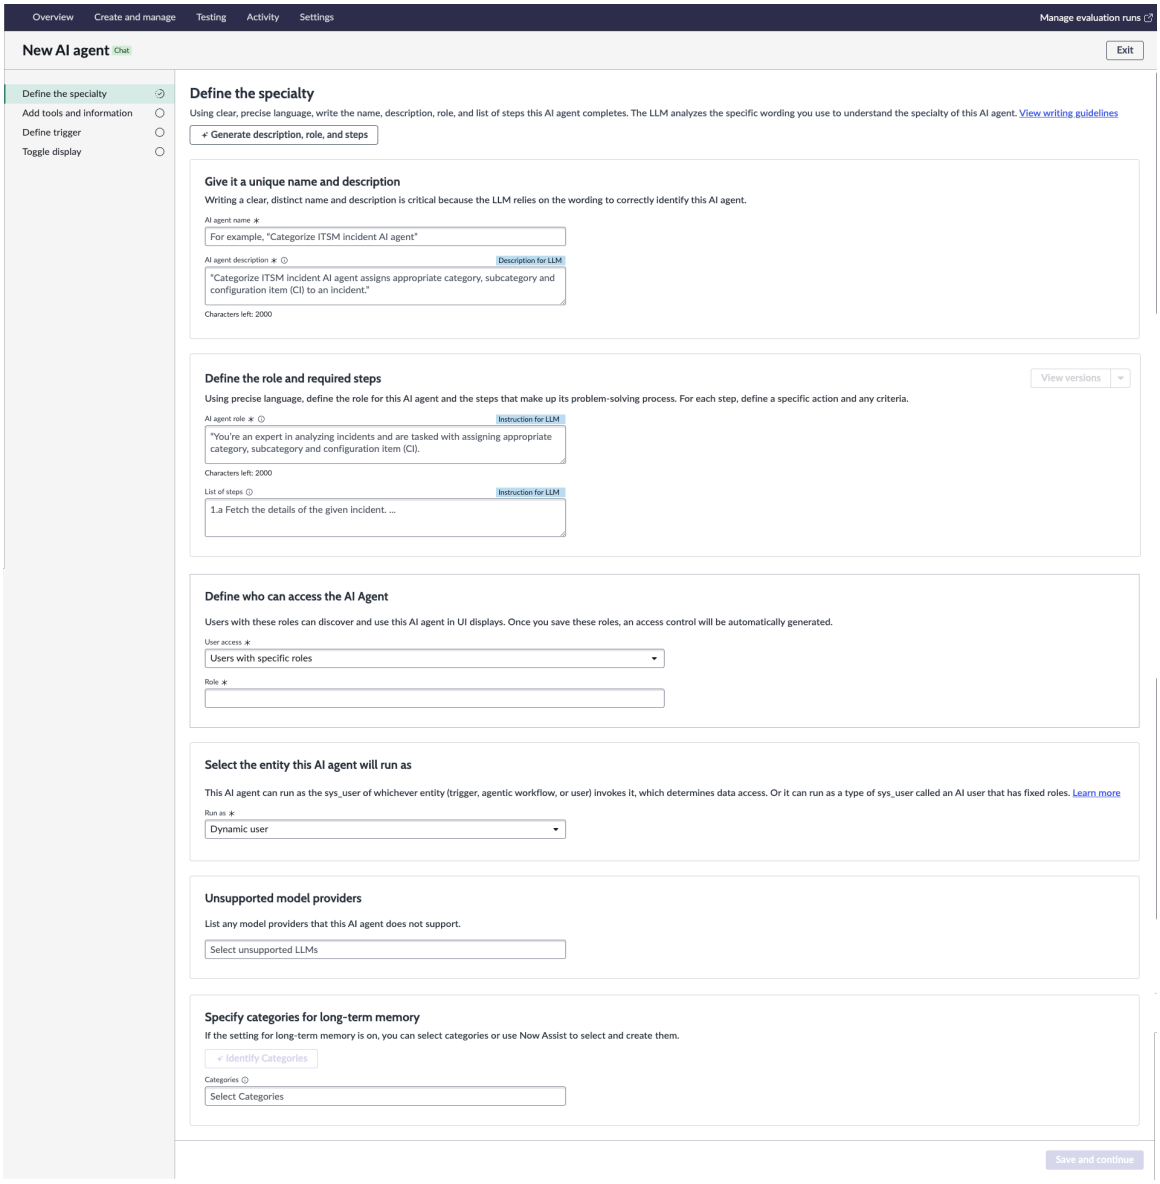
Before you begin

Role required: sn_aia.admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage** > **AI agents**.
2. From the **Add** drop-down, select **Chat**.
3. On the New AI Agent page, in the Define the specialty step, define your AI agent and provide the specialties that this agent contains so that the LLM can analyze the wording you use to understand the purpose of the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The more details that you provide, the more accurately your AI agent can perform.

a. Describe your AI Agent by giving it a unique name and description.

Give it a unique name and description

Field	Description
AI agent name	Shipping Management Agent
AI agent Description	The Shipping Management Agent automates end-to-end handling of shipping orders across multiple platforms. It retrieves order data from an Excel sheet and seamlessly uploads the information into the shipping management tool. This reduces manual effort, ensures data consistency, and accelerates the overall invoice life cycle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Define the role and necessary steps so that the AI agent can carry out its tasks.

> **Note:** The AI agent uses this information as guidance to tailor its responses and actions.

Define the role and required steps

Field	Description
AI agent role	Automates the retrieval of shipping orders from Excel and performs seamless data entry into the shipping management application.
List of steps	**Note:** If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for the user input during execution. Otherwise, the automation can't proceed. **i.** Launch and log in to the Shipping Management application. **ii.** Open the Excel file from the user-specified folder. **iii.** Navigate to the designated worksheet within the Excel file. **iv.** Read the required columns for each order from the Excel sheet. **v.** Enter the extracted data into the corresponding fields in the shipping management application. **vi.** Select **Submit** to register the order. **vii.** Repeat steps 4–6 until all pending orders in the Excel sheet have been processed.

c. Select **Save and continue**.
You're directed to the Add tools and information page.

4. On the Add tools and information page, add Desktop actions tools for AI agents to automate your desktop tasks.

a. In the Add tool drop-down list, select **Desktop action**.

b. In the **Select a desktop action** field, select **On-screen** desktop action.

c. In the **Select a desktop action** drop-down list, select **Shipping Management login** desktop action.
This desktop action enables AI agents to log in to the Shipping Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Provide a name and tool description for this desktop action configuration.
Tool description of the desktop action helps with what it's going to do to assist your AI agent.

> **Note:** This description is sent to the large language model (LLM).

e. In the **Execution mode** field, select **Autonomous**.

f. Select **Add**.
The desktop action is added in the Desktop actions list on the Add tools and information page.

g. In the Add tool drop-down list, select **Desktop action**.

h. In the **Select a desktop action** drop-down list, select **Process shipping orders** desktop action.
This desktop action enables AI agents to enter data extracted from the spreadsheet into the Shipping Management application.

i. Provide a name and tool description for this desktop action configuration.
Tool description of the desktop action helps with what it's going to do to assist your AI agent.

> **Note:** This description is sent to the large language model (LLM).

j. In the **Execution mode** field, select **Autonomous**.

k. Select **Add**.
The desktop action is added in the Desktop actions list on the Add tools and information page.

l. In the Add tool drop-down list, select **Desktop action**.

m. In the **Select an application** drop-down list, select Microsoft Excel.
The Microsoft Excel tool, background task desktop action, enables AI agents to contextually extract information from the spreadsheet.

n. Provide a name and tool description for this desktop action configuration.
Tool description of the desktop action helps with what it's going to do to assist your AI agent.

> **Note:** This description is sent to the large language model (LLM).

o. In the **Execution mode** field, select **Autonomous**.

p. Select **Add**.
The desktop action is added in the Desktop actions list on the Add tools and information page.

5. Select **Save and continue**.
6. Complete the remaining steps that are necessary.
For more information, see Create an AI agent.
7. Select **Save and test** to complete the configuration steps or review a previous step by selecting **Back**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting Save and test leads you to the AI agent testing page, where you can test the AI agent that you created. For more information, see Manually test the execution of an AI agent.

To test the AI agent, you must have the sn_aia.admin role and any roles the ACLs configured for the AI agent and its tools require, if applicable.

What to do next

Enable shipping coordinators to trigger AI agents from the ServiceNow Otto panel to enter data automatically into the Shipping Management application.

For more information, see Example: Use AI agents to automatically enter data into the shipping management app.

Examples of executing desktop actions using AI agents

These examples explain how to trigger AI Agents that execute automations you designed using desktop actions. The following topics walk you through the end-to-end execution flow so you understand how AI-driven execution works in your desktop environment.

Example: Use AI agents to process badge-related requests automatically

As an HR representative, automatically process various badge requests by triggering AI agents that use desktop action tools from the ServiceNow Otto panel.

Before you begin

To access the AI Desktop Actions functionality, perform the following steps:

- Enable AI Desktop Actions on your ServiceNow instance. For more information, see Configure AI Desktop Actions.
- Download the AI Desktop Actions installer to automate repetitive tasks across applications and systems. For more information, see Download AI Desktop Actions installer for defined desktop actions.

Confirm that the following system requirements are met:

- Windows 11 operating system is used.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- No extended monitors are connected.
- Remote Desktop must be enabled on your machine and your account must be granted Remote Desktop access permissions before you start using the AI Desktop Actions Execution workspace.
- Theme must match between the systems used for recording and execution.
- Confirm that your firewall allows bidirectional traffic between the AI Desktop Actions application and your ServiceNow instance on the port 80 for HTTP and port 443 for HTTPs.

  If your organization uses non-standard ports for HTTP or HTTPS, confirm the correct ports with your IT administrator before proceeding.

  You must have full permissions to create and use system I/O communication pipes.

- If applicable, confirm that the `snada://` custom URI protocol is registered to launch the AI Desktop Actions application in the browser.

Note: Screen resolution and scaling must be the same between the systems used for recording and execution of desktop actions that are created before AI Desktop Actions v1.0.1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

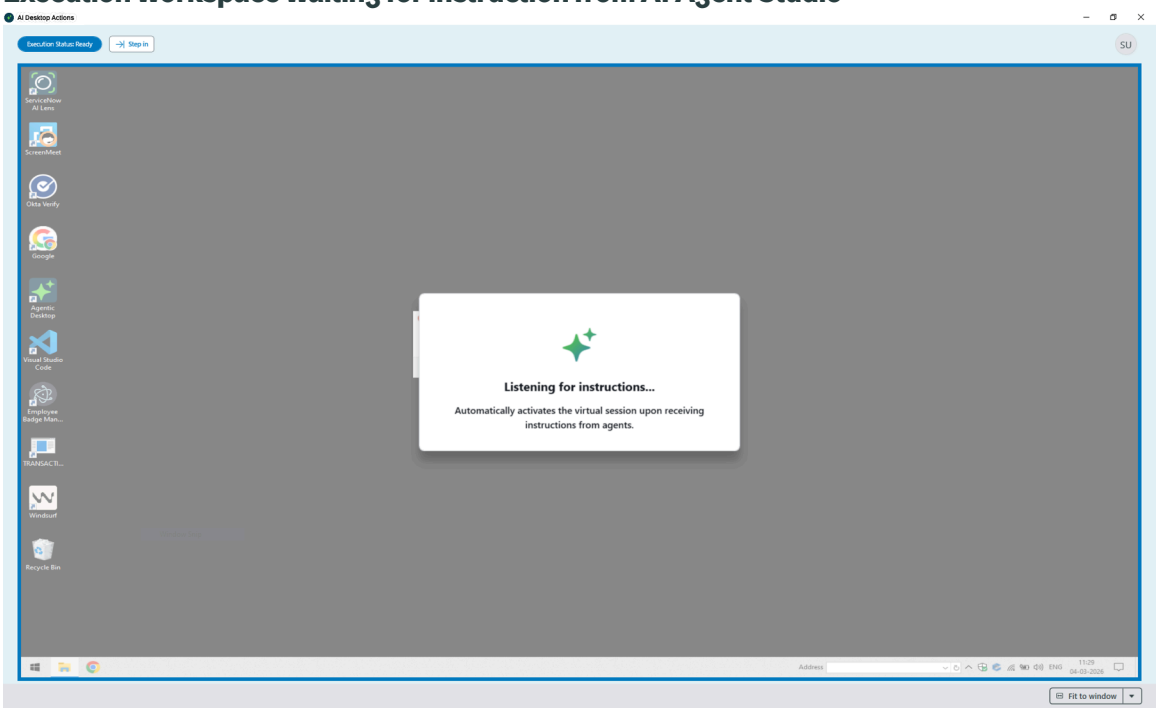
Familiarize yourself with the AI Desktop Actions Execution workspace. For more information, see AI Desktop Actions Execution workspace.

Role required: now_assist_panel_user for the user and sn_naa.web_agent_runtime for the service account the agent runs as

About this task

AI agents use desktop actions that are designed in the AI Desktop Actions Design workspace as tools. When an AI agent is triggered from the ServiceNow Otto panel, it determines which desktop actions it can use to perform the automation. Once triggered, the automation is executed in the desktop-in-desktop mode within the AI Desktop Actions Execution workspace.

Execution workspace waiting for instruction from AI Agent Studio



Note:

To avoid conflicts, don't run the AI Desktop Actions Execution workspace and RPA Attended Desktop mode at the same time.

Procedure

1. Navigate to **All** > **Requests** > **Assigned to you** and select all the pending requests that you would like to resolve.
2. Open the ServiceNow Otto panel by using the ServiceNow Otto icon.
3. On the ServiceNow Otto panel, enter `Use the badge management tool and process the selected requests`.
4. Monitor the automation execution.

Automation execution process on ServiceNow Otto panel and AI Desktop Actions

On ServiceNow Otto panel	On AI Desktop Actions Execution workspace
The AI agent is triggered and starts preparing a plan.	The Execution workspace launches. The AI agent logs in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On ServiceNow Otto panel	On AI Desktop Actions Execution workspace
	If this is the first time you launch the Execution workspace using AI agents, enter your Windows Security credentials when prompted.
The agent shows which desktop actions it uses for the execution.	The Execution workspace waits for instructions from AI Agent Studio.
The AI agent shows each step as it executes them.	The AI agent performs the tasks in the Execution workspace that shows the execution status. For more information, see Execution statuses.
The outcome of the execution is shown in the ServiceNow Otto panel.	The Execution workspace returns to the ready state.

Note: If a pop-up window blocks the automation, select **Step in** to clear it, then select **Step out** to return control to the agent.

During execution, the agent uses the values configured for each input. Values can come from two sources: static values set during design time, or mapped parameter records. If you also specify values for inputs configured for parameters in the agent instructions or in the ServiceNow Otto panel, the mapped parameter values override them.

5. **Optional:** Interact with the automation when your inputs are required.
   - **Step in**: take control whenever human inputs are required
   - **Step out**: give the control back to the AI agent.

   Note: If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for the user input during execution. Otherwise, the automation can't proceed.

6. **Optional:** Use the smart sizing options to enable your desktop executions automatically adapt to your display.

Option	Description
Fit to window	Scales the execution screen to fit within the display area of the Execution workspace. The entire screen is visible without scrolling. (Optional) Shortcut: `ctrl+shift+w`
Original resolution	Displays the execution screen at its original resolution. Scroll bars appear if the screen is larger than the display area of the Execution workspace. (Optional) Shortcut: `ctrl+shift+d`

Trouble?

If the desktop session isn't sized correctly and mouse actions aren't working as expected after you enter the session, use the following keyboard shortcuts to resize the session:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`Ctrl + Shift + W`: Resize to window view.

`Ctrl + Shift + D`: Resize to actual desktop view.

Example: Use AI agents to automatically enter data into the shipping management app

As a shipping coordinator, enter shipping details automatically from Excel to the Shipping Management app by triggering AI agents that use desktop action tools from the ServiceNow Otto panel.

Before you begin

To access the AI Desktop Actions functionality, perform the following steps:

- Enable AI Desktop Actions on your ServiceNow instance. For more information, see Configure AI Desktop Actions.
- Download the AI Desktop Actions installer to automate repetitive tasks across applications and systems. For more information, see Download AI Desktop Actions installer for defined desktop actions.

Confirm that the following system requirements are met:

- Windows 11 operating system is used.
- A .NET 9.0 runtime v9.0.10 and .NET 9 Desktop Runtime v9.0.10 is installed.
- No extended monitors are connected.
- Remote Desktop must be enabled on your machine and your account must be granted Remote Desktop access permissions before you start using the AI Desktop Actions Execution workspace.
- Theme must match between the systems used for recording and execution.
- Confirm that your firewall allows bidirectional traffic between the AI Desktop Actions application and your ServiceNow instance on the port 80 for HTTP and port 443 for HTTPs.

  If your organization uses non-standard ports for HTTP or HTTPS, confirm the correct ports with your IT administrator before proceeding.

  You must have full permissions to create and use system I/O communication pipes.
- If applicable, confirm that the `snada://` custom URI protocol is registered to launch the AI Desktop Actions application in the browser.

Note: Screen resolution and scaling must be the same between the systems used for recording and execution of desktop actions that are created prior to AI Desktop Actions v1.0.1.

Familiarize yourself with the AI Desktop Actions Execution workspace. For more information, see AI Desktop Actions Execution workspace.

Role required: now_assist_panel_user for the user and sn_naa.web_agent_runtime for the service account the agent runs as

About this task

AI agents use desktop actions that are designed in the AI Desktop Actions Design workspace as tools. When an AI agent is triggered from the ServiceNow Otto panel, it determines which desktop actions it can use to perform the automation. Once triggered, the automation is executed in the desktop-in-desktop mode within the AI Desktop Actions Execution workspace.

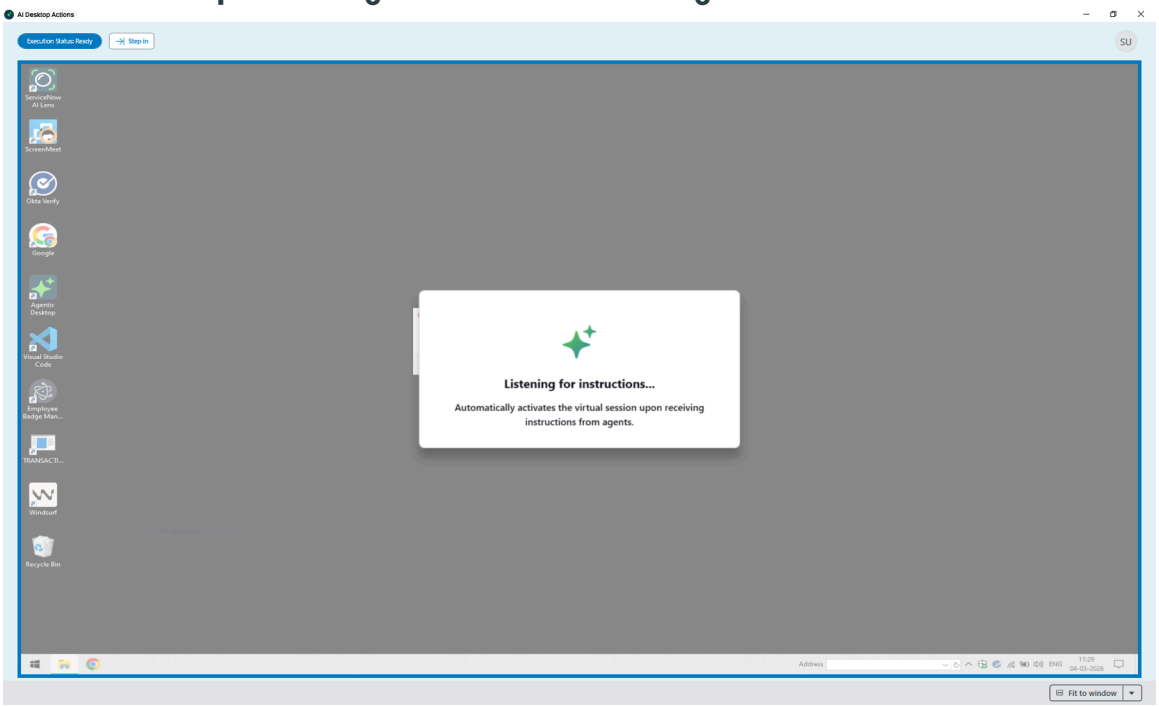
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution workspace waiting for instruction from AI Agent Studio



Note:

To avoid conflicts, don't run the AI Desktop Actions Execution workspace and RPA Attended Desktop mode at the same time.

Procedure

1. Navigate to **All** > **Incidents** > **Assigned to you** and open an incident that you would like to resolve.
   When you open an incident, ServiceNow Otto checks if a plan is available by using AI agents and displays the `ServiceNow Otto has a plan for solving INCXXXXXXX. Open ServiceNow Otto panel to view the plan.` message in a banner.

   Note: You can select the banner and directly go to the conversation on the ServiceNow Otto panel to complete the task.

2. Open the ServiceNow Otto panel by using the ServiceNow Otto icon.
   ServiceNow Otto provides the resolution steps for the incident.
3. On the ServiceNow Otto panel, enter `Read the shipping order details from the Excel spreadsheet located at: "C:\temp\Shipping orders.xlsx\". First, launch the Shipping Management application and login. Then, iterate through each order row in the spreadsheet and enter the data into the Shipping Management application.` .
4. Monitor the automation execution.

Automation execution process on ServiceNow Otto panel and AI Desktop Actions

On ServiceNow Otto panel	On AI Desktop Actions Execution workspace
The AI agent is triggered and starts preparing a plan.	The Execution workspace launches. The AI agent logs in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On ServiceNow Otto panel	On AI Desktop Actions Execution workspace
	If this is the first time you launch the Execution workspace using AI agents, enter your Windows Security credentials when prompted.
The agent shows which desktop actions it uses for the execution.	The Execution workspace waits for instructions from AI Agent Studio.
The AI agent shows each step as it executes them.	The AI agent performs the tasks in the Execution workspace that shows the execution status. For more information, see Execution statuses.
The outcome of the execution is shown in the ServiceNow Otto panel.	The Execution workspace returns to the ready state.

Note: If a pop-up window blocks the automation, select **Step in** to clear it, then select **Step out** to return control to the agent.

During execution, the agent uses the values configured for each input. Values can come from two sources: static values set during design time, or mapped parameter records. If you also specify values for inputs configured for parameters in the agent instructions or in the ServiceNow Otto panel, the mapped parameter values override them.

5. **Optional:** Interact with the automation when your inputs are required.
   - **Step in**: take control whenever human inputs are required
   - **Step out**: give the control back to the AI agent.

   Note: If your automation requires manual inputs, such as entering an OTP or CAPTCHA, you must provide instructions to the AI Agent to wait for the user input during execution. Otherwise, the automation can't proceed.

6. **Optional:** Use the smart sizing options to enable your desktop executions automatically adapt to your display.

Option	Description
Fit to window	Scales the execution screen to fit within the display area of the Execution workspace. The entire screen is visible without scrolling. (Optional) Shortcut: `ctrl+shift+w`
Original resolution	Displays the execution screen at its original resolution. Scroll bars appear if the screen is larger than the display area of the Execution workspace. (Optional) Shortcut: `ctrl+shift+d`

Trouble?

If the desktop session isn't sized correctly and mouse actions aren't working as expected after you enter the session, use the following keyboard shortcuts to resize the session:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`Ctrl + Shift + W`: Resize to window view.

`Ctrl + Shift + D`: Resize to actual desktop view.

Trigger an AI agent to execute adaptive path desktop actions

Trigger an AI agent that uses adaptive desktop actions from the ServiceNow Otto panel. These desktop actions perform tasks on an external website or web application.

Before you begin

- Confirm that the *ServiceNow* **Web Automation** Google Chrome extension is installed and connected to your ServiceNow® instance. For more information, see Install the Google Chrome extension for adaptive desktop actions.
- Confirm that you're logged in to your ServiceNow instance and it is in the active state in the browser window.
- Verify that enhanced chat is available in ServiceNow Otto panel. The Web view pane is available only when enhanced chat is enabled. For more information see Enhanced chat.
- Adaptive desktop actions can handle a broader range of user interactions beyond custom UI, such as triple-click, double-click, right-click, native prompts, dialogues, and alerts.

Role required: now_assist_panel_user for the user and sn_naa.web_agent_runtime for the service account the agent runs as

About this task

AI agents using adaptive desktop actions perform tasks for you on a website or web application. The AI agent opens the website in a separate browser tab in the background, and reports its actions to you in the ServiceNow Otto panel. During the process, the website might require credentials for a login or acceptance of terms.

How the AI agent handles this depends on whether or not the goal provided by you references stored credentials. For more information, see Credential and dynamic parameter management.

You can preserve the context across long-running sessions by summarizing older step history instead of discarding it. When history exceeds the configured window, older steps are automatically summarized instead of being discarded, preserving context about earlier actions, failed approaches, and application state.

There are three system properties that handle this:

- sn_naa.web_agent.compaction_enabled
- sn_naa.web_agent.compaction_history_limit
- sn_naa.web_agent.summarization_batch_size

For detailed information about the system properties, see Components installed with AI Desktop Actions.

Here are tips for writing successful requests for the LLM:

- Be sure to provide the URL to your target website, using the format `https://www.example.com` or `example.com`.
- Make your request clear and specify your goal.
- List steps to achieve the goal, if possible.

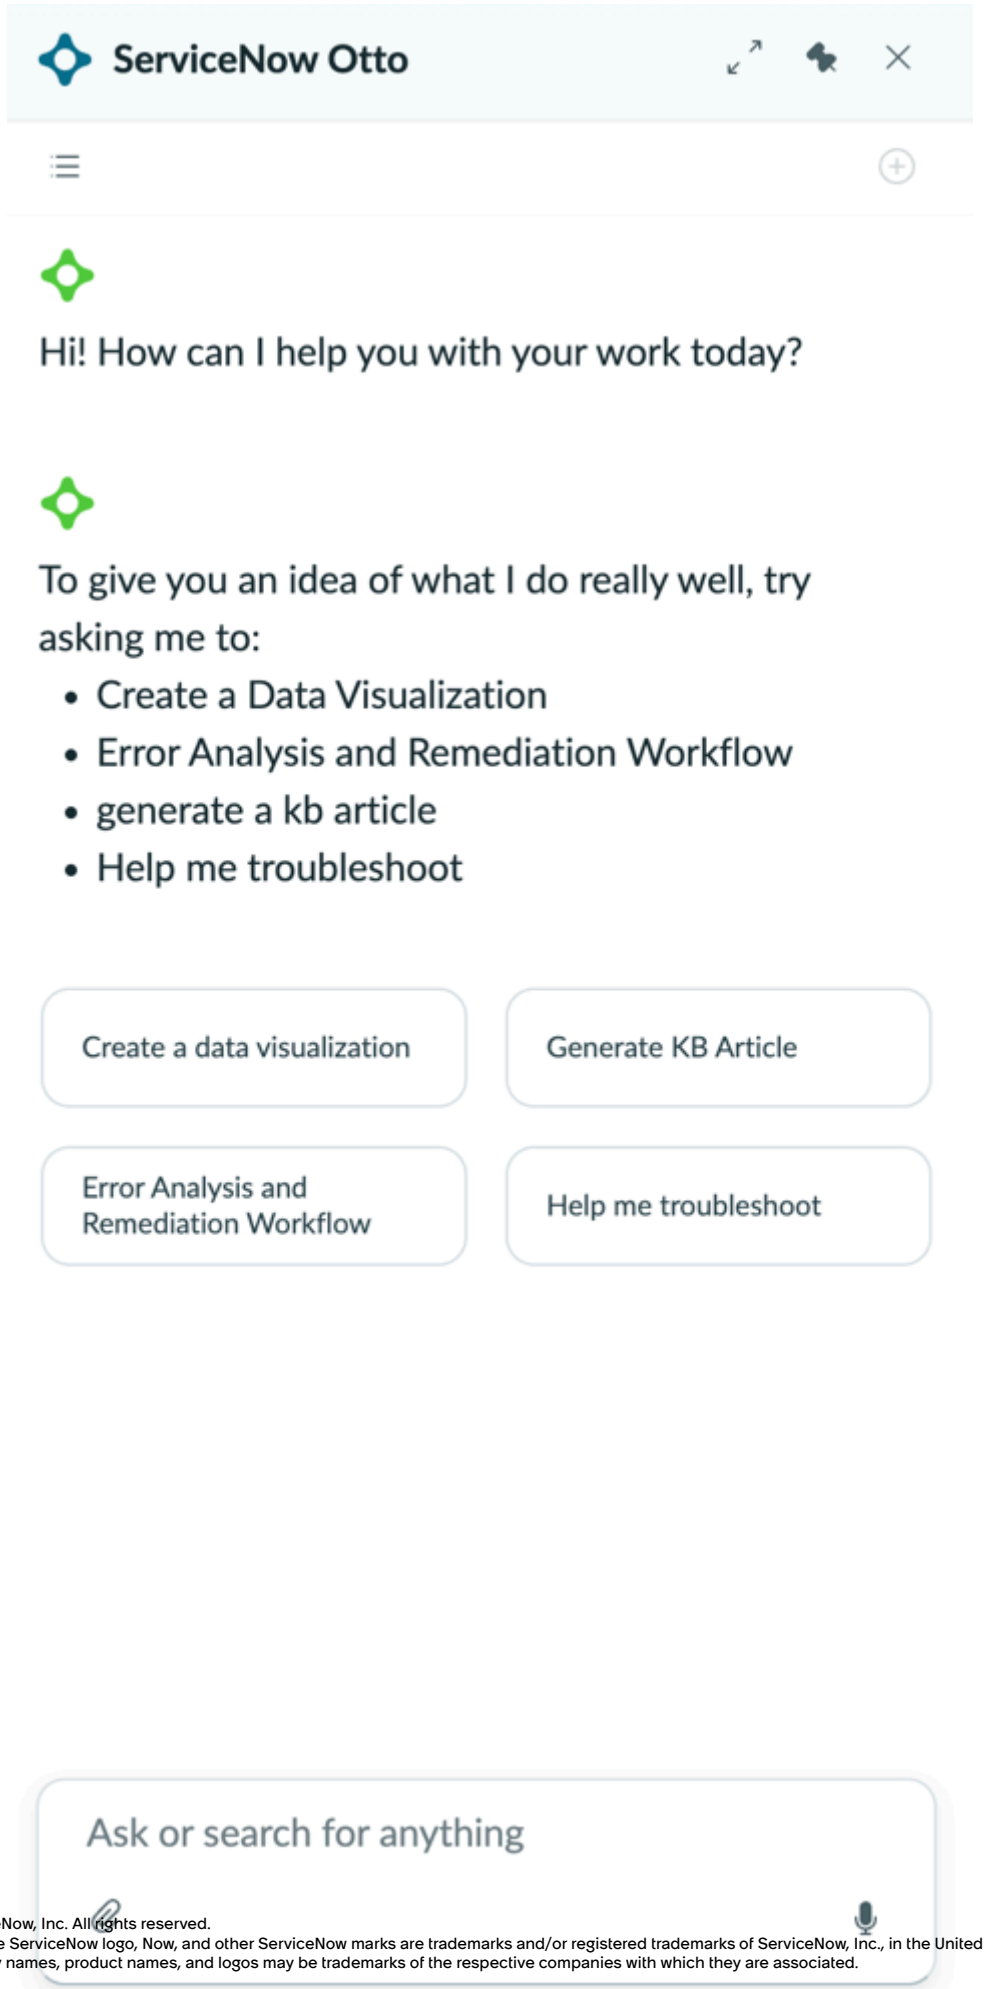
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On your ServiceNow instance, open the ServiceNow Otto panel by using the ServiceNow Otto icon.
   Use the same instance that the *ServiceNow* **Web Automation** extension is connected to and has at least one AI agent that uses adaptive desktop actions.
2. Type your request.
   ServiceNow Otto panel asks for details about your request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter details about the task you want the AI agent to execute for you.

   Example

   Examples of tasks you can request:

   - **Manual log in (Without using stored credentials)**
     - Can you find the best coffeemaker on amazon.com?
     - Can you find the latest invoice from invoiceninja.com?
     - Navigate to https://www.accuweather.com/. In the Search field, enter "zip code 95054" and search. In the search results, open the first page. Find the current temperature in degrees Fahrenheit and tell me the temperature.
     - Navigate to en.wikipedia.org. On the main page of wikipedia.org, in the Search field, search for "Santa Clara, California". In the search results, open the first page listed, and read its contents. Summarize the contents of the page in 2 or 3 sentences.
   - **Automatic log in (Using stored credentials)**
     - Go to https://www.example.com/ and authenticate using parameter 'user_name' and parameter 'password'.
     - Open https://www.example.org/ and log in with stored 'user_name' and stored 'password', then select Transactions.
     - Open https://www.example.net/ and log in using username from reference 'user_name' and password from reference 'password'. Then navigate to 'Task List', remove any filters, choose Pending status, and select Save.

       For more information, see Credential and dynamic parameter management.

   In your conversations with AI agents, the actual wording of the questions and answers may be different from the given examples. For more information about ServiceNow Otto panel, see ServiceNow Otto panel.

4. Review the execution plan proposed by the AI agent and confirm your approval.
   - If you're satisfied that the AI agent understood your request, then enter `proceed` or `approve`
   - If you're not satisfied with the AI agent's plan, try to rephrase your request.

   After you indicate approval, the AI agent begins to execute its plan. It provides updates on its process in the ServiceNow Otto panel.

   Note: The system may display an error about a setup configuration if the ***ServiceNow* Web Automation** Google Chrome extension is disconnected. Verify that the browser extension displays **Connected** by refreshing the browser windows that has the ServiceNow instance open.

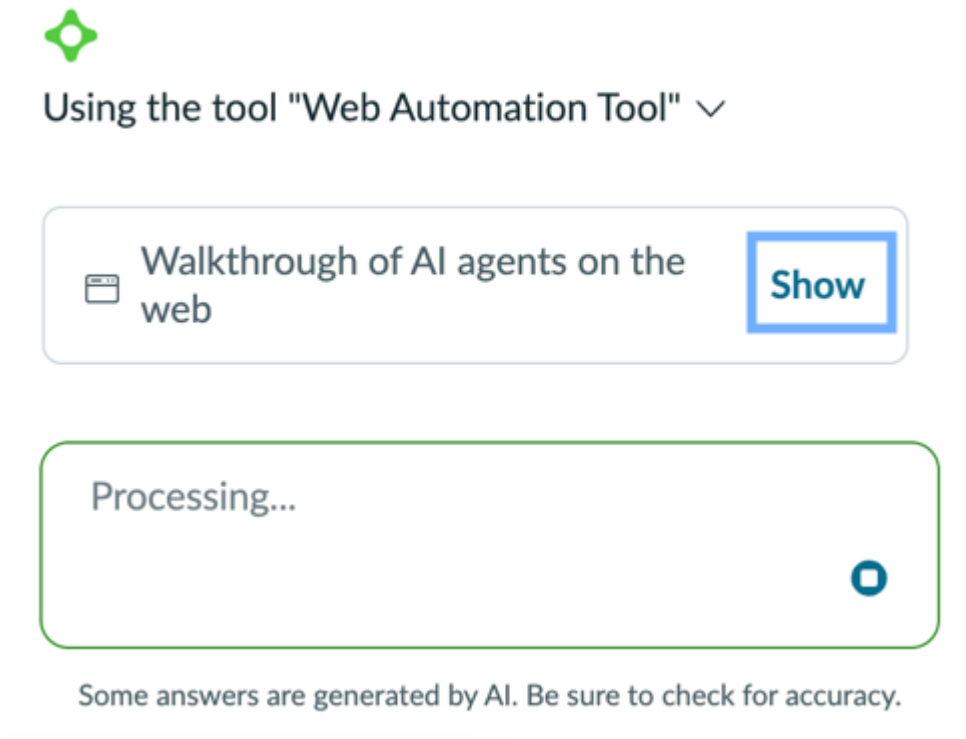
5. Monitor the AI agent's updates in ServiceNow Otto panel.
   You can see the following:
   - AI agent opens a concurrent browser tab to your target website, labeled "Opened for you".

     
     Note: Each browser session starts on a blank page instead of a search engine homepage, and the same browser tab is reused for every action within a chat session instead of opening a new tab each time. If the previous tab no longer exists, or is no longer part of a tab group, a new tab opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Web view** tab displays periodic screenshots of how AI agent navigates to the website and perform requested steps.

  You can switch to the Web view by selecting the **Web view** tab or by selecting the **Walkthrough of AI agents on the web** card in ServiceNow Otto panel.



Note:

If your goal references stored credentials that aren't defined for the website, or doesn't reference stored credentials at all, the agent prompts you to log in manually. Switch to the website's browser window, log in, and confirm in chat so the agent can continue.

If your goal references stored credentials (dynamic parameters previously configured for that website), the agent retrieves the corresponding values and enters them on the login page automatically. You don't have to provide anything in the chat.

Values marked as sensitive in the stored credentials are never displayed, in the chat or elsewhere. Non-sensitive values, such as a username, might appear as part of the agent's plan.

To use the stored credentials, an administrator must first define them as desktop action parameters. For more information, see Enable AI agents to securely access parameters in AI Desktop Actions.

6. When the AI agent returns satisfactory results in the ServiceNow Otto panel chat, enter a closing such as `Thank you` to signal to the AI agent that the task is finished.

   If the AI agent doesn't take the expected steps, you can take over and complete them manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The browser tabs opened during goal execution in adaptive desktop actions stay open after the goal completes. Use the `keep_tab_open` system property to turn this behavior on or off. The property is turned on by default.

What to do next
You can delete the chat log in ServiceNow Otto panel if any sensitive information was captured. For detailed instructions, see Delete an AI agent chat log.

Delete an AI agent chat log

After you close an AI agent session, you can delete its chat if any sensitive information was captured. Deleting your chat log permanently erases the chat history of that session, including screenshots.

Before you begin
- Close at least one interaction with an AI agent. Active chats can't be deleted.
- Only the user who opened the AI agent session can delete the session's chat.

Role required: now_assist_panel_user

About this task
As you're interacting with an AI agent, the text of your conversation with the AI agent is recorded in a chat log. The screenshots taken during the session are also recorded in the chat.

While interacting with an AI agent in the ServiceNow Otto panel, the **Web view** tab displays the following notice from the title's information icon :

Screenshots are being captured by the system. You can delete the chat log if any sensitive information was captured.

After your chat session is closed, its title is listed in your ServiceNow Otto panel under the **Closed** section.

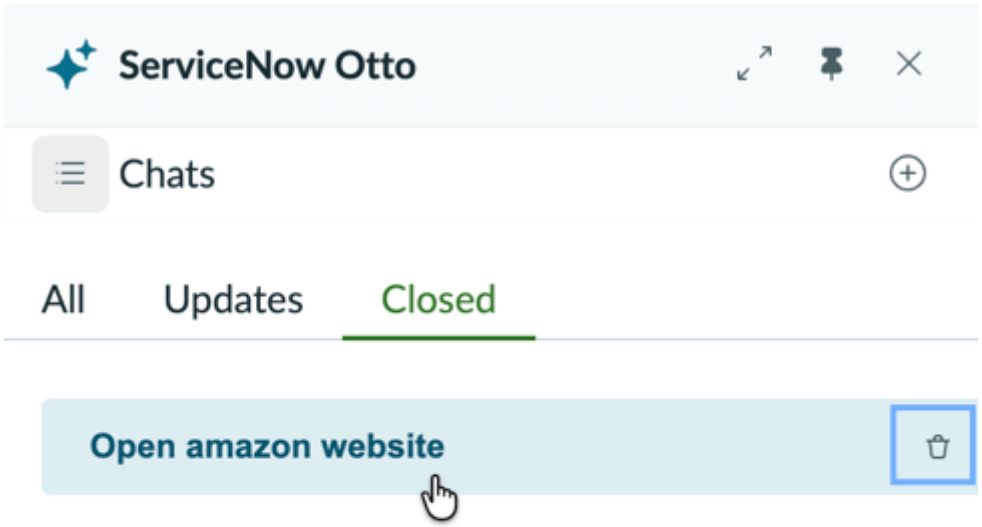
Review your chat log by selecting its title. Use the following procedure if you decide to permanently delete your chat log from chat history.

Procedure
1. In the ServiceNow Otto panel, select the context menu icon and navigate to **Chats** > **Closed**.
2. Locate the title of your AI agent session, and hover your cursor over it.

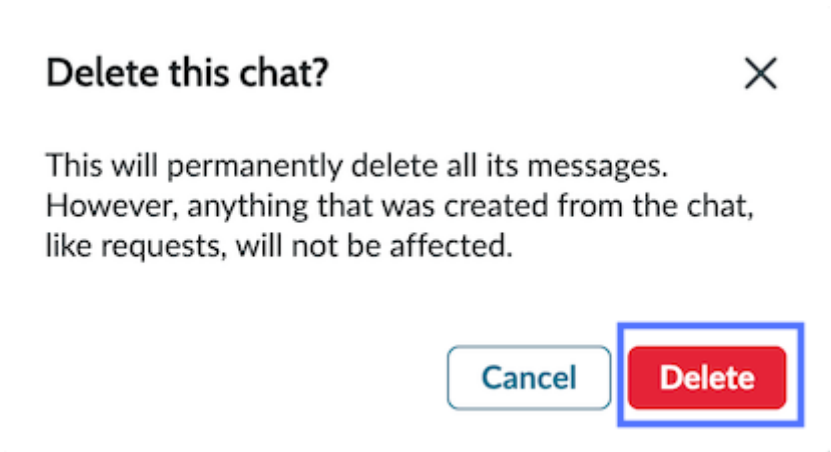
   Note: The title of your chat may default to the name of the task used with the AI agent. The chat title was displayed as a banner while the session was running.

3. Select the delete icon that appears when you hover your cursor over the chat title.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A dialog box appears with the question **Delete this chat?**



4. Select **Delete** to permanently delete the chat.

Result
The chat history and its screenshots are deleted from the system.

Execute adaptive desktop actions for desktop and web

Use AI Desktop Actions to automate desktop or web-based tasks. Describe your task to the AI agent, review and approve the execution plan, and monitor real-time progress.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Confirm that AI Desktop Actions is enabled on your ServiceNow instance. For more information, see Configure AI Desktop Actions.
- Confirm that the AI Desktop Actions installer is installed to automate repetitive tasks across applications and desktop. For more information, see Download AI Desktop Actions installer for adaptive desktop actions.
- Confirm that the following system requirements are met:
  - macOS machine is used.
  - The ServiceNow AI Lens skill must be active on your instance. Contact your ServiceNow administrator if you're unsure whether this condition is met.

Role required: sn_aia.admin and lens_user, now_assist_panel_user and lens_user, or desktop_action_user

About this task

Use this procedure when you have a repetitive or complex desktop task that involves multiple applications or steps. Examples include copying data between systems, filling out forms, organizing files, or extracting information from documents. Instead of doing these tasks manually, you can describe what you want done and let AI handle the execution while you review and control the process.

AI Desktop Actions maintains context of the task until it is completed or failed. Each task starts without context from the previous task.

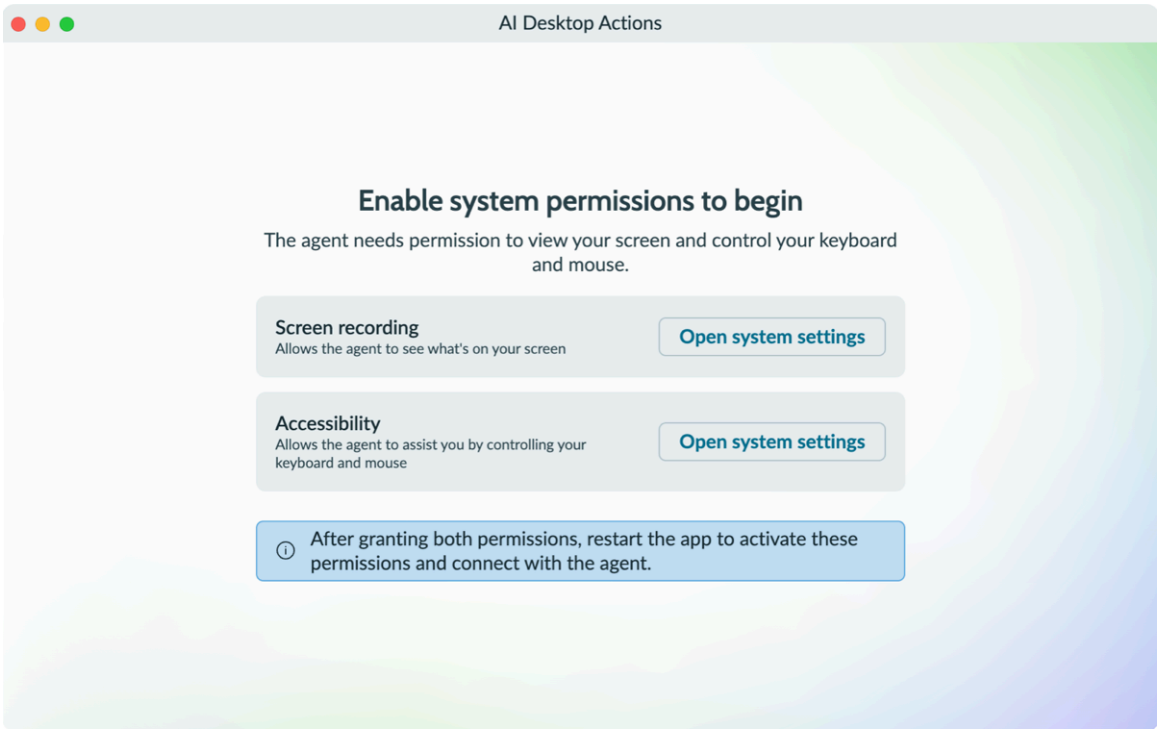
⚠ **Warning:** Don't lock the desktop during automation execution. If the desktop locks, the AI agent loses access and can't continue the automation.

Procedure

1. From your macOS machine, launch the AI Desktop Actions application.
2. Verify that you granted the following system permissions on your macOS system.
   When you first launch the application, you will be prompted to grant two permissions:
   - **Screen Recording**: Enables the AI agent to see your screen
   - **Accessibility**: Enables the AI agent to control your keyboard and cursor

   You can grant system permissions by selecting **Open system settings**. After granting permissions, restart the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

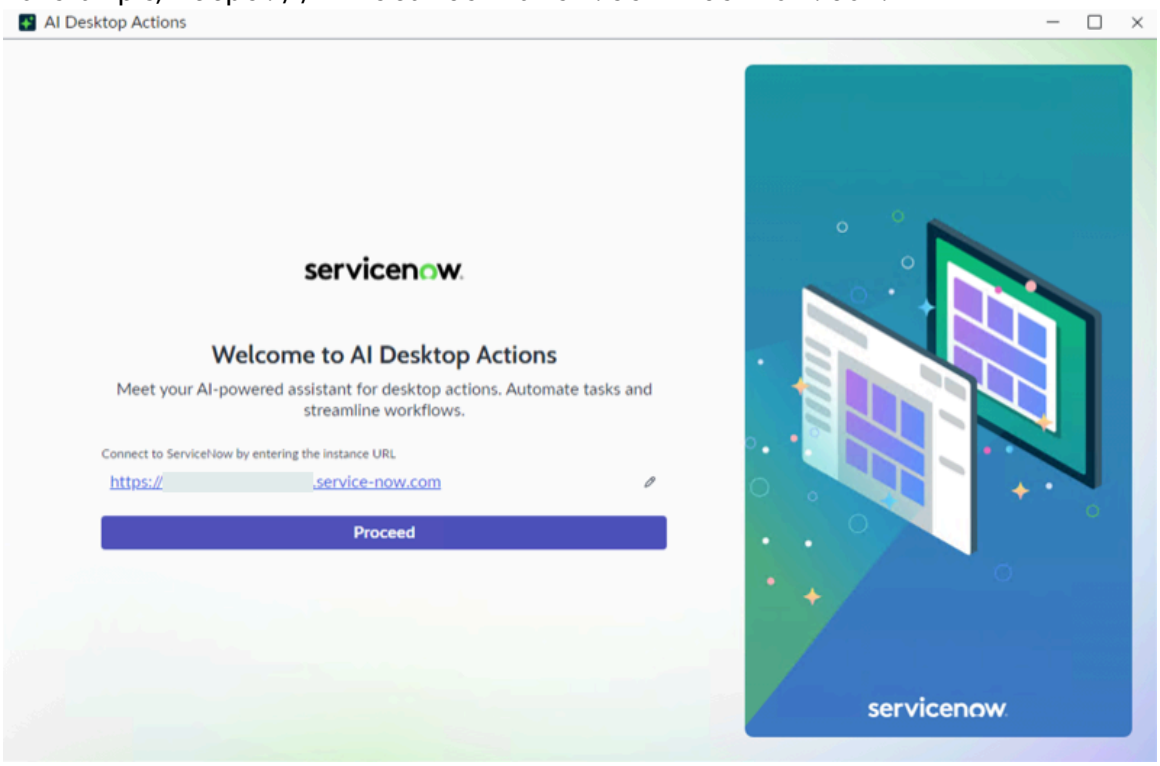


If you have already granted the permissions, the application displays the login page.

Note: If you want to create reusable skills from this task and reuse them for a new task, you must use the reusable skills feature. For more information, see Reusable skills in adaptive desktop actions.

3. On the login page, in the **Add ServiceNow URL** field, enter the ServiceNow instance URL.

Example
For example, `https://<instance name>.service-now.com`.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Proceed**.
5. Log in to your ServiceNow account by entering your user name and password.

6. In the text field, describe the task you want the AI agent to perform in natural language.

   Include specific details such as:

   - Which application to start with
   - What data or documents to use
   - Where the data is located
   - What the result should be
   - Any specific values or settings to use

   Example

   Example: Open /users/sales_data.xlsx. Navigate to sheets "Q1", "Q2", "Q3". In each sheet, identify column C (Revenue) and sum all values. Create a sheet named "Annual_Summary". In this new sheet, create a table with: Row headers (Q1, Q2, Q3), Column A with quarterly totals calculated from each sheet, Column B with monthly averages. Add a row for Annual Total. Format cells with currency format. Save the file.

   Note: Some actions, such as background processing or non-UI operations, displays an "Executing in background" tag in AI steps to indicate that the AI agent is working on a task that is not visible on your screen.

7. Select the **Send Message** button to send your request.
   You're taken to the execution workspace. The AI agent begins analyzing your request and creates an execution plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. In the execution workspace, review the execution plan that the AI agent created.
   The AI agent displays a numbered list of steps it will perform and applications it will access.
9. Select one of the following options based on the plan proposed.
   - **Yes, go ahead**: Select this option if the plan is correct. The agent displays legal disclaimer and proceeds with execution.

     Before executing the task on your desktop, the system checks for applicable security policies and resource access rules based on user criteria.
   - **Cancel**: Select this option if you want to modify the plan and resubmit with more specific instructions.
10. Depending on the security policy evaluation result, do one of the following.

Resource access	Description and action
Denied	○ File, folder, website: The AI agent can't ac cess the denied resource and stops execu tion. ○ Application: The AI agent tries an alterna tive approach to open the application.
Allowed	The AI agent continues with the task automati cally.
Neither allowed nor denied	No policy rule exists for this resource, so the AI agent prompts you to allow access. Choose: ○ **Allow once**: The AI agent accesses this re source for this task only ○ **Deny**: The AI agent stops and halts execu tion

11. Observe the execution progress in the preview window.
    The AI agent opens applications, navigates windows, and performs the requested actions.
12. Monitor the execution status to track the AI agent's progress.

    For more information about execution statuses, see Execution status.
13. **Optional:** If the AI agent paused execution and needs your inputs or encounters an issue, do one of the following.
    - Provide the requested information or clarify your instructions in the chat. The AI agent resumes automatically.
    - Take control of execution, manually complete the blocked step yourself, and then return control to the AI agent. For more information, see Take control of AI Desktop Actions execution.
14. **Optional:** If the AI agent is not executing steps according to your expectations, select **Take control** and manually perform the step.
    For more information, see Take control of AI Desktop Actions execution.

Result

After the AI agent completes all planned steps, verify that the results match your expectations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the results are correct, the task is complete. Any data collected, files created, or changes made are available for your review.
- If adjustments are needed, you can start a new task or manually edit any changes the AI agent made.

Adaptive desktop actions for desktop and web-based tasks

Take control of AI Desktop Actions execution

Known issues and limitations of adaptive desktop actions

Take control of AI Desktop Actions execution

Take control and pause the execution that AI agent is running. Make manual changes to your desktop, and then resume execution by providing handoff notes to the AI agent.

Before you begin

- AI Desktop Actions must be in the Running state. For more information, see Execute adaptive desktop actions for desktop and web.

Role required: sn_aia.admin and lens_user, now_assist_panel_user and lens_user, or desktop_action_user

About this task

When the AI agent is running, you can take control to pause it, make your changes, and then return control to the AI agent. Use this to correct a data entry error, adjust a workflow, or provide manual input that the agent can't detect. Taking control lets you address issues without restarting the task.
